Review and Approval: Revision to any portion of this Directory will be posted by the lead Task Force in the NPCC Open Process for a 45 day review and comment period. Upon addressing all the comments in this forum, the Directory document will be sent to the remaining Task Forces for their recommendation to seek RCC approval.

Upon approval of the RCC, this Directory will be sent to the Full Member Representatives for their final approval if sections pertaining to the Requirements and Criteria portion have been revised. All voting and approvals will be conducted according to the most current "NPCC. Bylaws" in effect at the time the ballots are cast.

Revisions pertaining to the Appendices or other portions of the document such as links, etc., only require RCC approval.
Errata may be corrected by the Lead Task Force at any time.

This Directory will be updated at least once every three years and as often as necessary to keep it current and consistent with NERC, Regional Reliability Standards and other NPCC documents.

Table 1

Planning Design Criteria: Contingency events, Fault type and Performance requirements to be applied to bulk power system elements

~~*Compliance with Directory#1 shall be demonstrated for all requirements listed in the table below that are not required for compliance with the NERC Reliability Standards.*~~

Category	**Contingency** events Simulate the removal of all elements that protection systems, including Special Protection Systems, are expected to automatically disconnect for each event that involves an AC fault.	**Fault** type (permanent) **On the listed elements where applicable**	**Performance** requirements
I **Single Event**	1. Fault on ~~Loss of~~ any of the following: a. transmission circuit b. transformer c. shunt device d. generator e. bus section	Three-phase **fault** with **normal fault clearing**	i. to ix.
	2. Opening of any circuit breaker	No fault	
	3. Loss of single pole of a direct current facility	No fault	
	4. Fault on~~Loss of~~ any of the following: a. transmission circuit b. transformer c. shunt device d. generator e. bus section	Phase to ground fault with **delayed fault clearing**	
	5. Fault~~Loss~~ on~~of~~ a circuit breaker	Phase to ground ~~internal~~ **fault,** with **normal fault clearing**	
	6. Simultaneous fault~~loss~~ on ~~of~~ two adjacent transmission circuits on a multiple circuit tower.	Phase to ground **faults** on different phases of each circuit, with **normal fault clearing**	
	7. Simultaneous permanent loss of both poles of a direct current bipolar facility	Without an ac fault	
	8. The failure of a circuit breaker to operate when initiated by a **SPS** after a fault ~~the loss of~~on the following: a. transmission circuit b. transformer c. shunt device d. generator e. bus section f. opening of any circuit breaker (without a fault)	Phase to ground **fault**, with **normal fault clearing**	

Performance requirements in Table#1 mapped to Sections# 5.4.1 and Section# 5.4.2.

Category	**Contingency** events Simulate the removal of all elements that protection systems, including Special Protection Systems, are expected to automatically disconnect for each event that involves an AC fault.	**Fault** type (permanent) **On the listed elements where applicable**	**Performance** requirements
II Event(s) after a first loss and after System Adjustment	1. Following the loss of any critical : a. transmission circuit, b. transformer, c. series or shunt compensating device or d. generator e. Single pole of a direct current facility and after System Adjustment, Categor~~y~~ies I **Contingencies** shall also apply.	Any Category I event as described above.	Performance requirements i to ix apply **Area** generation and **power** flows are adjusted between outages by the use of resources available within ten minutes following notification and other system adjustments such as HVDC and phase angle regulator adjustments that can be made within 30 minutes.

Performance Requirements~~:~~ for the contingencies defined in Table 1 :

i. Loss of a major portion of the system or unintentional separation of a major portion of the system shall not occur.

ii. Loss of small or radial portions of the system pre-determined by studies is acceptable provided the performance requirements are not violated for the remaining **bulk power system**.

iii. Voltages and loadings shall be within applicable limits for the ~~applicable~~ pre-**contingency** conditions.

iv. Voltages and loadings shall be within **applicable emergency limits** for post-**contingency** conditions.

v. Adequate reactive power resources and appropriate controls shall be available to maintain voltages within applicable limits.

vi. The **stability** of the **bulk power system** shall be maintained during and following the most severe **contingencies,** with due regard to successful and unsuccessful ~~automatic~~ **reclosing**.

vii. For each of the **contingencies** that involve~~s a **normal**~~ **fault clearing**, **stability** shall be maintained when the simulation is based on **fault clearing** initiated by the **"system A" protection group**, and also shall be maintained when the simulation is based on **fault clearing** initiated by the **"system B" protection group**. When applying this requirement to **contingency** Event ***no 6***, the failure of a **protection group** shall apply only to one circuit at a time.

viii. Regarding **contingency** ***no 6***, if multiple circuit towers are used only for station entrance and exit purposes, and if they do not exceed five towers at each station, then this condition is an acceptable risk and therefore can be excluded. Other similar situations can be excluded on the basis of acceptable risk, provided that the Reliability Coordinating Committee specifically accepts each request for exclusion. (See Appendix E.)

ix. Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner.

Table 2

Planning Criteria: Extreme Contingency and System Conditions, Fault type and Performance Assessments to be applied to bulk power system elements

~~*Compliance with Directory#1 shall be demonstrated for all requirements listed in the table below that are not required for compliance with the NERC Reliability Standards.*~~

Category	**Contingency** events Simulate the removal of all elements that protection systems, including Special Protection Systems, are expected to automatically disconnect for each event that involves an AC fault.	**Fault** type (permanent) and/or **condition applied** **On the listed elements where applicable**	**Performance** to be assessed
Extreme Contingency	1. Loss of the entire capability of a generating station.	No Fault	i, ii, iii.
	2. Loss of all transmission circuits emanating from a generating station, switching station, substation or dc terminal.	No Fault	
	3. Loss of all transmission circuits on a common right-of-way.	No Fault	
	4. Fault~~Loss~~ on of any of the following: a. transmission circuit b. transformer c. shunt device d. generator e. bus section	Three-phase **fault** with **delayed fault clearing (**with due regard to successful and unsuccessful ~~automatic~~ **reclosing**.)	
	5. ~~Loss~~ Fault on ~~of~~ a circuit breaker	Three-phase ~~internal~~ **fault**, with **normal fault clearing**	
	6. Sudden loss of a large load or major load center.	No Fault	
	7. The effect of severe power swings arising from disturbances outside the ~~Council's~~ NPCC's interconnected systems.	Fault applied as necessary.	
	8. Failure of a **Special Protection System**, to operate when required following the normal contingencies listed in Table 1, Category I, Single Event.	As listed in Table 1, Category I, Single Event.	
	9. The operation or partial operation of a **Special Protection System** for an event or condition for which it was not intended to operate.	No Fault	
	10. Sudden loss of fuel delivery system to multiple plants, (e.g. gas pipeline contingencies).	No Fault.	
	Any additional extreme contingencies identified by each Planning Coordinator Area.	Fault applied as necessary.	
Extreme	Contingency events listed in Table 1, Category I, Single Event	Peak **load** conditions resulting from extreme weather.	i(b, c), ii, iii.

Performance assessments in Table#2 mapped to Section#5.6.

NPCC Directory #1
Table 2

Category	**Contingency** events Simulate the removal of all elements that protection systems, including Special Protection Systems, are expected to automatically disconnect for each event that involves an AC fault.	**Fault** type (permanent) and/or **condition applied** **On the listed elements where applicable**	**Performance** to be assessed
System Conditions **Extreme System Conditions**		Generating unit(s) fuel shortage (e.g. gas supply adequacy or low hydro) under normal weather peak conditions	i(c), ii, iii

Performance Assessment

i. Model the following pre-contingency conditions:

   a. transfers within or between Transmission Planner and Planning Coordinator Areas should be studied at values not expected to be exceeded more than 25% of the time.

   b. highly probable dispatch patterns of generation for the transfers being studied

   c. appropriate load representation (e.g. active and reactive power as a function of voltage) for transient tests and post transient load flows.

ii. Examine post contingency steady state conditions, as well as stability, overload, cascading outages and voltage collapse to obtain an indication of system robustness and determine the extent of any widespread system disturbance

iii. Where assessment concludes there are serious consequences, an evaluation of implementing a change to design or operating practices to address such contingencies shall be conducted.

Table 3

Operating Criteria: Contingency events, Fault type and Performance requirements to be applied to bulk power system elements to establish transfer capabilities.

~~*Compliance with Directory#1 shall be demonstrated for all requirements listed in the table below that are not required for compliance with the NERC Reliability Standards.*~~

~~Category~~	**Contingency** events Simulate the removal of all elements that protection systems, including Special Protection Systems, are expected to automatically disconnect for each event that involves an AC fault.	**Fault** type (permanent) **On the listed elements where applicable**	**Performance** requirements	
			Normal Transfer Capability	**Emergency** Transfer Capability (only after an **Emergency** is identified)
~~I~~ ~~Single Event~~	1. Fault on~~Loss of~~ any of the following: a. transmission circuit b. transformer c. shunt device d. generator e. bus section	Three-phases **fault**, with **normal fault clearing**	i.,ii, iii,iv,v, vi, vii ~~to~~ viii, ~~xi~~, x, xi.	i, ii, iii, iv, v, vi, vii,viii ~~ix,~~ x, xii,
	2. Opening of any circuit breaker	No fault		
	3. Loss of single pole of a direct current facility	No fault		
	4. Fault on~~Loss of~~ any of the following: a. transmission circuit b. transformer c. shunt device d. generator e. bus section	Phase to ground fault, with **delayed fault clearing**	i,ii,iii,iv,vii,viii,ix,x,xi,	Contingency Events 4 through 8 do not apply after an emergency is identified.
	5. Fault on ~~Loss of~~ a circuit breaker	Phase to ground ~~internal~~ **fault,** with **normal fault clearing**		
	6. Simultaneous fault on ~~loss of~~ two adjacent transmission circuits on a multiple circuit tower.	Phase to ground **faults** on different phases of each circuit, with **normal fault clearing**		
	7. Simultaneous permanent loss of both poles of a direct current bipolar facility	Without an ac fault		
	8. The failure of a circuit breaker to operate when initiated by a **SPS** after a fault on the ~~the loss of the~~ following: a. transmission circuit b. transformer c. shunt device d. generator e. bus section	Phase to ground **fault**, with **normal fault clearing**		

Performance requirements in Table#3 mapped to Sections# 5.5, Section# 5.5.1., and 5.5.2.

	9. ~~opening of any circuit breaker (without a fault)~~			
	9. The failure of a circuit breaker to operate when initiated by a SPS after opening of any circuit breaker.	No fault.	i. i,ii,iii,iv,vii,viii,ix,x, xi,	

Performance Requirements for the contingencies defined in Table 3:

i. Loss of a major portion of the system or unintentional separation of a major portion of the system shall not occur.

ii. Loss of small or radial portions of the system pre-determined by studies is acceptable provided it does not violate the performance requirements for the remaining BPS.

iii. Individual Reliability Coordinator Areas shall be operated in a manner such that **Contingencies** and conditions applied can be withstood without causing **significant adverse impact** on other Reliability Coordinator Areas.

~~ii.~~iv. Voltages and loadings shall be within applicable limits for the ~~applicable~~ pre-**contingency** conditions.

~~iii.~~v. Voltages and loadings shall be within **applicable emergency limits** for post-**contingency** conditions.

~~iv.~~vi. Adequate reactive power resources and appropriate controls shall be available to maintain voltages within applicable limits.

~~v.~~vii. The **stability** of the **bulk power system** shall be maintained ~~during and following the most severe **contingencies**~~**,** with due regard to successful and unsuccessful ~~automatic~~ **reclosing**.

~~vi.~~viii. For each of the **contingencies** that involve ~~a **normal**~~ **fault clearing**, **stability** shall be maintained when the simulation is based on **fault clearing** initiated by the **"system A" protection group**, and also shall be maintained when the simulation is based on **fault clearing** initiated by the **"system B" protection group**. When applying this requirement to **contingency** Event ***no 6***, the failure of a **protection group** shall apply only to one circuit at a time.

~~vii.~~ix. Regarding **contingency *no 6***, if multiple circuit towers are used only for station entrance and exit purposes, and if they do not exceed five towers at each station, then this condition is an acceptable risk and therefore can be excluded. Other similar situations can be excluded on the basis of acceptable risk, provided that the Reliability Coordinating Committee specifically accepts each request for exclusion. (See Appendix E.)

~~viii. Individual Reliability Coordinator Areas shall be operated in a manner such that **Contingencies** and conditions applied can be withstood without causing **significant adverse impact** on other Reliability Coordinator Areas.~~

~~ix.~~x. Appropriate adjustments shall be made to Reliability Coordinator Area operation to accommodate the impact of **protection group outages**, including the **outage** of a **protection group** which is a part of a **Type I special protection system**. For typical periods of forced outage or maintenance of a **protection group**, it can be assumed, unless there are indications to the contrary, that the remaining **protection** will function as designed. If the **protection group** will be out of service for an extended period of time, additional adjustments to operations may be appropriate considering other system conditions and the consequences of possible failure of the remaining **protection group.**

~~x.~~xi. Normal transfer levels shall not require system adjustments before attempting manual~~ly~~ reclosing of ~~faulted~~ elements unless specific instructions describing alternate actions are in effect to maintain stability of the **BPS**.

~~xi.~~xii. Emergency transfer levels may require system adjustments before attempting ~~manually reclosing~~manual reclosing of ~~faulted~~ elements to maintain stability

of the **bulk power system**.

Operating to the contingencies listed above in Table 3 is considered to provide an acceptable level of **bulk power system** security. However, under high risk conditions, such as severe weather, the expectation of the occurrence of contingencies not listed in Table 3 and/or the associated consequences may be judged to be significantly greater. When these conditions exist, consideration should be given to operating in a more conservative manner.

Appendix A – Reserved for Future Use

Appendix B - Guidelines and Procedures for NPCC Transmission Reviews

1.0 Introduction

NPCC has established a Reliability Assessment Program to bring together work done by NPCC, Transmission Planners and Planning Coordinators relevant to the assessment of **BPS reliability**. As part of the Reliability Assessment Program, the Task Force on System Studies (TFSS) is charged on an ongoing basis with conducting periodic reviews of the **reliability** of the planned **bulk power ~~transmission~~ system** of each Planning Coordinator Area of NPCC ~~and the transmission interconnections to other Planning Coordinator Areas.~~ The purpose of these reviews is to determine whether each Planning Coordinator Area's planned bulk power transmission system is in conformance with the NPCC Directory #1 *Design and Operation of the Bulk Power System*. The annual Area Transmission Review required in R12 is presented for this purpose. It is expected that this Review will cover Directory #1 requirements as they apply to the **bulk power system**.

2.0 Purpose of Review Presentation

The purpose of the presentation associated with an Area Transmission Review is to demonstrate that the Planning Coordinator's planned **bulk power system** based on its projection of available **demand**, transmission, and **resources**, is in conformance with the Directory #1 criteria. By such a presentation, the Task Force will satisfy itself that the criteria have been met and, in general, that the **reliability** of the NPCC Interconnected Systems will be maintained.

3.0 Study Year To Be Considered

It is suggested that a study year of 4 to 6 years from the reporting date is a realistic one, both from the viewpoint of minimum lead times required for construction, and the ability to alter plans or facilities. The reviews may be conducted for a longer term beyond 6 years to address identified marginal conditions that may have longer lead-time solutions.

4.0 Types and Frequency of Reviews

As described in requirement **R12,** each Planning Coordinator is required to present an annual transmission review to TFSS. However, the review presented by the Planning Coordinator may be one of three types: a Comprehensive (or Full) Review, an Intermediate (or Partial) Review, or an Interim Review.

A Comprehensive Review is a thorough assessment of the Planning Coordinator's entire bulk power transmission system, and includes sufficient analyses to fully address all aspects of an Area Transmission Review as described in **R12.**

In the years between Comprehensive Reviews, Planning Coordinators may conduct either an Interim Review, or an Intermediate Review, depending on the extent of the Planning

Coordinator's system changes since its last Comprehensive Review. If the system changes are relatively minor, the Planning Coordinator may conduct an Interim Review. In an Interim Review, the Planning Coordinator provides a summary of the changes in planned facilities and forecasted system conditions since its last Comprehensive Review and a brief discussion and assessment of the impact of those changes on the bulk power transmission system. No new analyses are required for an Interim Review.

If the Planning Coordinator's system changes since its last Comprehensive Review are moderate or concentrated in a portion of the Planning Coordinator's system, the Planning Coordinator may conduct an Intermediate Review. An Intermediate Review covers all the elements of a Comprehensive Review, but the analyses may be limited to addressing only those issues considered to be of significance, considering the extent of the system changes.

In March of each year, after a Planning Ceoordinator presents a proposal for the type of review to be conducted during the current year, TFSS will consider each Planning Coordinator's proposal. TFSS will either indicate their concurrence, or require the Planning Coordinator to conduct a more extensive review if the Task Force feels that such is warranted based on the Planning Coordinator's system changes since its last Comprehensive Review.

5.0 Format of Presentation – Comprehensive and Intermediate Review

a) Introduction

- Reference the most recent Area Comprehensive Review and any subsequent Intermediate or Interim reviews as appropriate.
- Describe the type and scope of this review.
- For a Comprehensive Review, describe the existing and planned **bulk power system** facilities included in this review.
- Describe changes in system facilities, **bulk power system elements** and **loads** since the most recent Comprehensive Review.
- Include maps and one-line diagrams of the system showing proposed changes as necessary.
- Describe the demand levels to be studied, according to the range of forecast system demands.
- Identify projected firm transfers and interchange schedules.

b) Present the scope of the analyses. The analyses conducted for a Comprehensive Review should be thorough, but an Intermediate Review may focus on specific areas of the system, specific system conditions, or a more limited set of "critical" **contingencies**.

c) Steady State Assessment

- Present the **load** model, power factor, demand side management, and other modeling assumptions used in the analysis. Discuss the methodology used in voltage assessments. (An Intermediate Review may refer to the discussion from the last Comprehensive Review.)
- Provide supporting information on the **contingencies** selected for evaluation and an explanation of why **contingencies** not simulated would produce less severe results.
- Provide information on the generation dispatch conditions assumed in the analysis.
- Include plots of "base case" **load** flows with all lines in service for the various conditions studied, e.g., peak, off-peak, and heavy transfers.
- Present the effects of major planned changes on the system.
- Identify applicable transfer limits within and between Planning Coordinator Areas.
- Show the adequacy of voltage performance and voltage control capability for the planned bulk power transmission system.

d) Stability Assessment

Present and/or refer to significant studies showing the effect of **contingencies** on the system and report on the most severe **contingencies** in the following manner:

- Provide supporting information on the **contingencies** selected for evaluation and an explanation of why **contingencies** not simulated would produce less severe results.
- The nature of the **fault** applied, **elements** switched, and **fault clearing** times.
- Plots of angles versus time for significant machines, response of real and reactive power control devices ~~HVdc and SVC response~~, voltages at significant buses and significant interface flows.

For a Comprehensive or Intermediate Review, present the **load** model and other modeling assumptions used in the analysis. (An Intermediate Review may refer to the discussion from the last Comprehensive Review.)

e) **Fault** Current Assessment

- Present the methodology and assumptions used in the **fault** current assessment. (An Intermediate Review may refer to the discussion from the last Comprehensive Review.)

- Present instances where **fault** levels exceed equipment capabilities and measures to mitigate such occurrences.

- Present changes to **fault** levels at stations adjacent to other Planning Coordinator Areas.

f) Extreme **Contingency** Assessment

- Present the scope of the analyses including a description of the system conditions assessed. The analyses conducted for a Comprehensive Review should be thorough, but an Intermediate Review may focus on specific areas of the system, specific system conditions, or a more limited set of "critical" **contingencies**.

- Provide supporting information on the extreme **contingencies** selected for evaluation and an explanation of why the remaining **contingencies** not simulated would produce less severe results.

- Review the results for widespread cascading due to overloads, instability or voltage collapse caused by extreme **contingencies**

- In the case where **contingency** assessment reveals serious consequences, conduct an evaluation of implementing a change to address such **contingencies**.

g) Extreme System Condition Assessment

- Present the scope of the analyses including a description of the system conditions assessed. The analyses conducted for a Comprehensive Review should be thorough, but an Intermediate Review may focus on specific areas of the system, specific system conditions, or a more limited set of "critical" **contingencies**.

- Provide the rationale for the loss of fuel supply conditions selected for evaluation and an explanation of why other loss of fuel supply conditions not simulated would produce less severe results.

- Provide supporting information on the **contingencies** selected for evaluation and an explanation of why the remaining **contingencies** not simulated would produce less severe results.

- In the case where extreme condition assessment reveals serious consequences, conduct an evaluation of implementing measures to mitigate such consequences.

h) Review of **Special Protection Systems (SPSs)**

- Present the scope of review. A Comprehensive Review should review all the existing, new, and modified **SPSs** included in its transmission plan. An Intermediate Review may focus on the new and modified **SPSs**, and just those existing **SPSs** that may have been impacted by system changes since they were last reviewed.

- Present the need and utilization for Type I and Type II **SPSs.** For instances where a **SPS** utilization is anticipated to increase, the TFSS should inform the Task Force on Coordination of Planning (TFCP) of this finding.

- Review the validity of the classification of Type III **SPSs**. For instances where a **SPS** which was formerly considered to have only local consequences is identified as having the potential for inter- Planning Coordinator Area effects, for the time period being reviewed, the TFSS should notify the Task Force on Coordination of Planning, System Protection and Coordination of Operation. In such instances a complete review of the **SPS** should be made, as per the *Procedure for NPCC Review of New or Modified Bulk Power System Special Protection Systems (SPS)* in Directory #7.

i) Review of Dynamic Control Systems (DCSs)

Review of potential consequences of failure or misoperation of Dynamic Control Systems (DCS), as defined in NPCC Document C-33 *Procedure for Analysis and Classification of Dynamic Control Systems*. For Type I and Type II DCSs, present and/or refer to appropriate **stability** studies analyzing the consequences of failure or misoperation in accordance with the Joint Working Group (JWG)-1 report, "Technical Considerations and Suggested Methodology for the Performance

Evaluation of Dynamic Control Systems". A Comprehensive Review should address all potentially impactful existing and new DCSs, but an Intermediate Review may focus on new DCSs and only those existing DCSs that may have been impacted by system changes since they were last reviewed.

j) Review of Exclusions to the Directory#1 *Criteria*

Review any exclusions granted under NPCC *Guidelines for Requesting Exclusions to Simultaneous Loss of Two Adjacent Transmission Circuits on a Multiple Circuit Tower* (Appendix E). A Comprehensive Review should address all exclusions, but an Intermediate Review may focus on just those exclusions that may have been impacted by system changes since they were last reviewed.

k) Overview Summary of System Performance for Year Studied

6.0 Format of Presentation - Interim Review

a) Introduction of Interim Review

b) Reference the most recent Comprehensive Review and any subsequent Intermediate or Interim Reviews as appropriate.

c) Changes in Facilities (Existing and Planned) and Forecasted System Conditions Since the Last Comprehensive Review.

- **Load** Forecast
- Generation **Resources**
- **Bulk Power System elements**
- Transmission Facilities
- **Special Protection Systems**
- Dynamic Control Systems
- Exclusions

d) Brief Impact Assessment and Overview Summary

The Planning Coordinator will provide a brief assessment of the impact of these changes on the **reliability** of the interconnected **bulk power system**, based on engineering judgment and internal and joint system studies as appropriate.

7.0 Documentation

The documentation required for a Comprehensive or Intermediate Review should be in the form of a report addressing each of the items of the above presentation format. The report should be accompanied by the Planning Coordinator's **bulk power system** map and one-line diagram, summary tables, figures, and appendices, as appropriate. The report may include references to other studies performed by the Planning Coordinator or by utilities within the Planning Coordinator Area that are relevant to the Area Transmission Review, with appropriate excerpts from those studies.

The documentation required for an Interim Review should be in the form of a short summary report (normally not exceeding 5 pages), containing a description of system changes and a brief assessment on their impact on the **reliability** of the interconnected **bulk power system**

8.0 Task Force Follow-Up Procedures

8.1 Once a Planning Coordinator has presented its Transmission Review report to the TFSS, TFSS will review the Planning Coordinator's report and any supporting documentation and consider whether to accept the report as complete and in full conformance with these Guidelines :

a. If the report is found to be unacceptable, TFSS will indicate to the Planning Coordinator the specific areas of deficiency, and request the Planning Coordinator to address those deficiencies.

b. If there is no concurrence about the results and conclusion(s) of the Planning Coordinator's Review, TFSS will indicate to the Planning Coordinator the specific areas of disagreement, and work with the Planning Coordinator to try to achieve concurrence. If agreement has not been reached within a reasonable period of time, TFSS will prepare a summary of the results of its review, and present the summary to the TFCP.

c. If the report is considered as complete and in full conformance with these Guidelines, TFSS will accept the report.

8.2 If the Area Transmission Review indicates an overall **bulk power system** reliability concern (not specific to the Planning Coordinator's planned bulk power transmission system), TFSS will consider what additional studies may be necessary to address the concern, and prepare a summary discussion and recommendation to the Task Force on Coordination of Planning

8.3 Upon completion of an Area Review, TFSS will report the results of the review to the Task Force on Coordination of Planning. The TFCP will then review and vote on the completeness and acceptability of the Area Transmission Review and report its finding to the Reliability Coordinating Committee for a final review and approval.

Appendix C - Procedure for Testing and Analysis of Extreme Contingencies

1.0 Introduction

Extreme **Contingencies** (ECs) are tested "as a measure of system strength" in order to identify potential patterns of weakness in the bulk power transmission system. This procedure for the testing and analysis of ECs should be used when testing ECs for NPCC studies or studies submitted for NPCC review.

This procedure applies to transmission planning studies that consider the overall performance of the interconnected systems of the NPCC Planning Coordinator Areas. It principally applies to NPCC - wide studies of the **bulk power system** and generally does not apply to studies normally conducted by NPCC Transmission Planner and Planning Coordinators that concentrate on individual or a limited number of facilities. This procedure also applies to Area Transmission Reviews, and may be applicable to other studies conducted by the Transmission Planner and Planning Coordinators, and even to individual facility investigations, where such studies and investigations consider the overall performance of the interconnected systems of the NPCC Planning Coordinator Areas. Certain Transmission Planners or Planning Coordinators may elect to completely mitigate the effects of specific ECs.

Finally, this procedure should be followed in multi-regional studies in which NPCC is an active participant, to the extent that this is within the scope of such multi-regional efforts.

2.0 Choosing Contingencies for Testing

The ECs are defined as per **Requirement R9.** Testing should focus on those ECs expected to have the greatest potential effect on the interconnected system. Particular attention should be paid to **contingencies** which would result in major angular power shifts, e.g., interruption of shorter transmission paths carrying heavy power flows, leaving longer transmission paths as the only remaining paths. Additionally, **contingencies** which would result in reversal of major power transfers, e.g. loss of major ties in a neighboring region or Area when said region or Area was transferring power away from the area of interest, should be considered for their impact in subjecting the system to severe power swings. In considering specific **contingencies** to be investigated in an NPCC study, all relevant testing done at the Transmission Planner and Planning Coordinator level should first be reviewed.

In general, a **contingency** in a particular Planning Coordinator Area should be studied, if requested by any other Transmission Planner or Planning Coordinator, based on a reasonable surmise that the requesting Entity may be adversely affected.

3.0 Modeling Assumptions

As referenced in Table 2, performance assessment “i” for **R9**, the assumed generation dispatch, transfers levels, load levels and **load** representation are major considerations in EC tests. It is not the intent to test the worst imaginable extreme, but EC tests should be severe.

The specification of appropriate **load** representation applies to long term stability tests or post-transient power flows as well as **transient stability** tests.

4.0 Evaluating Individual Test Results

A question in evaluating the results of a particular test run is - “Does the system "pass" or "fail" for this **contingency**?” While in the final analysis this is a matter of informed engineering judgment, factors which should be considered include:

1. Lines or transformers loaded above **short time emergency ratings**,

2. Buses with voltage levels in violation of **applicable emergency limits**, (which vary depending on the location within the system),

3. Magnitude and geographic distribution of such overloads and voltage violations across the system,

4. Transient generator angles, frequencies, voltages and power,

5. Operation of Dynamic Control Systems and **Special Protection Systems** (**SPS**),

6. Oscillations that could cause generators to lose synchronism or lead to dynamic instability,

7. Net loss of source resulting from any combination of loss of synchronism of one or more units, generation rejection or runback initiated by SPS, or any other defined system separation,

8. Identification of the extent of the Planning Coordinator Area (s) involved for any indicated instability or islanding (the involvement of more than one Planning Coordinator Area, should be a major consideration),

9. **Relay** operations or the proximity of apparent impedance trajectories to **relay** trip characteristics,

10. The angle across opened breakers,

11. Adequacy of computer simulation models and data.

Finally, a judgment should be attempted as to whether a "failure" is symptomatic of a basic system weakness, or just sensitivity to a particular EC. For example, should failures turn up for several EC tests in a particular part of the system, it is likely that a basic system weakness has been identified.

The loss of portions of the system should not necessarily be considered a failed result, provided that these losses do not jeopardize the integrity of the overall BPS.

NPCC study groups should avoid characterizations like "successful" and "unsuccessful" when commenting on individual runs. Rather, the specific initial conditions directly causing or related to the failure, the complete description of the nature of the failure (e.g., voltage collapse, instability, system separation, as well as the facilities involved), and the extent of potential impact on other Planning Coordinator Areas should be reported.

5.0 Evaluating the Results of EC Tests

EC test reports should focus on those portions of the system in which basic system weaknesses may be developing, rather than on the results of one specific **contingency**.

Any patterns of weaknesses should be identified, which may include reference to earlier NPCC studies and/or Transmission Planner, Planning Coordinator or member system investigations. There is also a need to distinguish between a "failed" test which indicates sensitivity only to a particular **contingency** run and a "failed" test which indicates a more general system weakness (always keeping in mind the severity of possible consequences of the **contingency**). Actions taken by member systems, Transmission Planners or Planning Coordinators to reduce the probability of occurrence or mitigate the consequences of the **contingency** should also be cited.

NPCC follow-up, after publication of a final report, is appropriate only for instances of possible general system weakness. In these instances, the results should be specifically referred to the affected Transmission Planner(s) or Planning Coordinator(s) for further and more detailed investigation with subsequent reporting to NPCC.

Appendix D - Guidelines for Area Review of Resource Adequacy

1.0 Introduction

NPCC has established a Reliability Assessment Program to bring together work done by the NPCC and Planning Coordinators relevant to the assessment of **bulk power system reliability**. As part of the Reliability Assessment Program, each Planning Coordinator submits to the Task Force on Coordination of Planning its Area Review of Resource Adequacy, which is an annual assessment to demonstrate that the proposed resources of each NPCC Planning Coordinator will meet NPCC resource adequacy planning requirements, consistent with these guidelines. The Task Force is charged, on an ongoing basis, with reviewing and recommending NPCC Reliability Coordinating Committee approval of these reviews of **resource** adequacy of each Planning Coordinator Area of NPCC.

The NPCC role in monitoring conformance with the NPCC Directory #1 - *Design and Operation of Bulk Power System* is essential because under this criterion, each Planning Coordinator determines its resource requirements by considering interconnection assistance from other Planning Coordinators, on the basis that adequate **resources** will be available in those Planning Coordinator Areas. Because of this reliance on interconnection assistance, inadequate **resources** in one Planning Coordinator Area could result in adverse consequences in another Planning Coordinator Area.

It is recognized that all Planning Coordinators may not necessarily express their own **resource** adequacy criterion as stated in Requirements R4, R5, and R6 of the Directory #1 criteria. However, the Directory #1 criteria provide a reference point against which a Planning Coordinator's **resource** adequacy criterion can be compared.

2.0 Purpose of Presentation

The purpose of the presentation associated with a resource adequacy review is to show that each Planning Coordinator's proposed resources are in accordance with the NPCC Directory #1 - Design and Operation of the Bulk Power System. By such a presentation, the Task Force will satisfy itself that the proposed resources of each NPCC Planning Coordinator will meet the NPCC Resource Adequacy Requirements, as defined NPCC Directory #1, over the time period under consideration.

3.0 Format of Presentation and Report – Comprehensive Review

Each Planning Coordinator should include in its presentations and in the accompanying report documentation, as a minimum, the information listed below. At its own discretion,

the Planning Coordinator may discuss other related issues not covered specifically by these guidelines.

3.1 Executive Summary

3.1.1 Briefly illustrate the major findings of the review.

3.1.2 Provide a table format summary of major assumptions and results.

3.2 Table of Contents

3.2.1 Include listing of all tables and figures.

3.3 Introduction

3.3.1 Reference the previous NPCC Area Review.

3.3.2 Compare the proposed resources and load forecast covered in this NPCC review with that covered in the previous review

3.4 Resource Adequacy Criterion

3.4.1 State the Planning Coordinator's resource adequacy criterion.

3.4.2 State how the Planning Coordinator criterion is applied; e.g., load relief steps.

3.4.3 Summarize resource requirements to meet the criteria for the time period under consideration. If interconnections to other Planning Coordinators and regions are considered in determining this requirement, indicate the value of the interconnections in terms of megawatts. In the calculation of available **resources**, supply- side resources from neighboring systems are limited to firm capacity backed purchases.

3.4.4 Provide either an estimate of the resources required to meet the NPCC criteria or a statement as to the comparison of the two criteria, if the Planning Coordinator criterion is different from the NPCC criterion

3.5 Resource Adequacy Assessment

3.5.1 Evaluate proposed resources versus the requirement to reliably meet projected electricity demand assuming the Planning Coordinator's most likely load forecast.

3.5.2 Evaluate proposed resources versus the requirement to reliably meet projected electricity demand assuming the Planning Coordinator's high load growth scenario.

3.5.3 Describe load and resource uncertainties on projected Planning Coordinator Area reliability and describe mechanisms to mitigate anticipated material adverse effects on reliability.

3.5.4 Describe anticipated effects from proposed major changes to market rules on Planning Coordinator Area reliability.

3.5.5 Summarize resource adequacy studies conducted since the previous Area Review, as appropriate

3.6 ~~Proposed Resource Capacity Mix~~ Reliability Impacts Due to Environmental Regulations and Fuel Supply Issues.

3.6.1 Discuss anticipated material adverse effects on reliability resulting from the proposed resources fuel supply and transportation. ~~or environmental considerations~~.

3.6.2 Discuss anticipated reliability impacts related to an Area's compliance with State, Federal or Provincial requirements (such as environmental, renewable energy, or greenhouse gas reductions).

3.7 Mitigation Measures for Environmental Regulations and Fuel Supply Issues

~~3.6.2~~3.7.1 Describe available mechanisms to mitigate anticipated reliability impacts of resource fuel supply, demand resource response, fuel transportation issues and/or environmental considerations.

~~Discuss anticipated reliability impacts related to an Area's compliance with State, Federal or Provincial requirements (such as environmental, renewable energy, or greenhouse gas reductions).~~

4.0 Format of Presentation and Report – Annual Interim Review

The Annual Interim Review should include a reference to the most recent Comprehensive Review; a listing of major changes in: facilities and system conditions, load forecast, generation resources availability; related fuel supply and transportation information, environmental considerations, demand response programs, transfer capability and emergency operating procedures. In addition, the assessment should also include a comparison of major changes in market rules, implementation of new rules, locational requirements, and installed capacity requirements. Finally, the report should include a

brief impact assessment and an overall summary.

The Planning Coordinator will provide a brief assessment of the impact of these changes on the reliability of the interconnected bulk power system. This assessment should be based on engineering judgment, internal system studies and appropriate joint interconnected studies. To the extent that engineering judgment or existing studies can be used to clearly demonstrate that a Planning Coordinator Area is expected to meet the NPCC resource adequacy criterion, detailed system LOLE studies are not required.

The documentation for the Annual Interim Review should be in the form of a summary report (normally not exceeding three to five pages.)

Sections A and B should describe the reliability model and program used for the resource adequacy studies discussed in Section 3.5. Section C should describe the Task Force follow-up procedures.

A. Description of Resource Reliability Model

1.1 Load Model

1.1.1 Description of the **load** model and basis of period **load** shapes.

1.1.2 How **load** forecast uncertainty is handled in model.

1.1.3 How the electricity demand and energy projections of interconnected entities within the Planning Coordinator Area that are not members of the Planning Coordinator Area are addressed.

1.1.4 How the effects (demand and energy) of demand-side management programs (e.g., conversion, interruptible demand, direct control **load** management, demand (**load**) response programs) are addressed.

1.2 Supply Side Resource Representation

1.2.1 Resource Ratings

1.2.1.1 Definitions.

1.2.1.2 Criteria for verifying **ratings**. Reference NPCC Directory#9 Verification of Gross and Net Real Power Capability and Directory#10 Verification of Gross and Net Reactive Power Capability.

1.2.2 Unavailability Factors Represented

1.2.2.1 Type of unavailability factors represented; e.g., forced outages, planned outages, partial derating, etc.

1.2.2.2 Source of each type of factor represented and whether generic or individual unit history provides basis for existing and new units

1.2.2.3 Maturity considerations, including any possible allowance for in-service date uncertainty.

1.2.2.4 Tabulation of typical unavailability factors.

1.2.3 Purchase and Sale Representation

1.2.3.1 Describe characteristics and level of dependability of transactions.

1.2.4 Retirements.

1.2.4.1 Summarize proposed retirements.

1.3 Representation of Interconnected System in Multi-Area Reliability Analysis, including which Planning Coordinator Areas and regions are considered, interconnection capacities assumed, and how expansion plans of other Planning Coordinators and regions are considered.

1.4 Modeling of Variable and Limited Energy Sources.

1.5 Modeling of Demand Side Resources and Demand (Load) Response Programs.

1.5.1 Description should include how such factors as in-service date uncertainty, **rating**, availability, performance and duration are addressed.

1.6 Modeling of all Resources.

1.6.1 Description should include how such factors as in-service date uncertainty; capacity value, availability, **emergency** assistance, scheduling and deliverability are addressed.

1.7 Other assumptions i.e., internal transmission limitations, maintenance over-runs, fuel supply and transportation and environmental constraints.

1.8 Incorporate the reliability impacts of market rules.

B. Other Factors, If Any, Considered in Establishing Reserve Requirement Documentation

The documentation required to meet the requirements of the above format should be in the form of summaries of studies performed within a Planning Coordinator Area, including references to applicable reports, summaries of reports or submissions made to regulatory agencies.

C. Task Force Follow-Up Procedures

Once a specific Planning Coordinator has made a presentation or a series of presentations to the Task Force on Coordination of Planning, the latter shall:

1.1 Prepare a brief summary of key issues discussed during the presentation.

1.2 Note where further information was requested and the results of such further interrogations.

1.3 Note the specific items that require additional study and indicate the responsibilities for undertaking these studies.

1.4 Recommend to the Reliability Coordinating Committee whether the Resource Adequacy Review is suitable for approval.

Appendix E - Guidelines for Requesting Exclusions to Simultaneous Loss of Two Adjacent Transmission Circuits on a Multiple Circuit Tower.

1.0 Introduction

Directory #1 allows for requests for exclusion from the simultaneous loss of two adjacent transmission circuits on multiple circuit towers on the basis of acceptable risk. All exclusions must be reviewed by the applicable Task Forces and approved by the Reliability Coordinating Committee (RCC). An acceptance of a request for exclusion is dependent on the successful demonstration that such exclusion is an acceptable risk. These guidelines describe the procedure to be followed and the supporting documentation required when requesting exclusion, and establishes a procedure for periodic review of exclusions of record.

2.0 Documentation

The documentation supporting a request for exclusion to the Criteria includes the following:

2.1 A description of the facilities involved, including geographic location, length and type of construction, and electrical connections to the rest of the interconnected power system;

2.2 Relevant design information pertinent to the assessment of acceptable risk, which might include: details of the construction of the facilities, geographic or atmospheric conditions, or any other factors that influence the risk of sustaining the loss of adjacent transmission circuits on a multiple circuit tower;

2.3 An assessment of the consequences of the loss of adjacent transmission circuits on a multiple circuit tower, including, but not limited to, a discussion of levels of exposure and probability of occurrence of **significant adverse impact** on the **bulk power system** ;

2.4 For existing facilities, the historical outage performance, including cause, for such **contingencies** on the specific facility (facilities) involved as compared to that of other multiple circuit tower facilities;

2.5 For planned facilities, the estimated frequency of adjacent transmission circuit multiple circuit tower **contingencies** based on the historical performance of facilities of similar construction located in an area with similar geographic climate and topography.

3.0 Procedure for obtaining an Exclusion

The following procedure is used to obtain an exclusion:

3.1 The entity requesting the exclusion (the Requestor) submits the request and supporting documentation to the Task Force on System Studies (TFSS) after acceptance has been granted by the Requestor's own Planning Coordinator, if such process is applicable.

3.2 TFSS reviews the request, verifies that the documentation requirements have been met, and determines the acceptability of the request.

3.3 If TFSS deems the request acceptable, TFSS requests the Task Force on Coordination of Planning (TFCP), the Task Force on Coordination of Operation (TFCO), and the Task Force on System Protection (TFSP) to review the request. The Requestor provides copies of the request and supporting documentation to the other Task Forces as directed by TFSS. If additional information is requested by the other Task Forces as part of their assessment, the Requestor provides this information directly to the interested Task Force, with a copy to the TFSS. The other Task Forces review the request and indicate their acceptance or non-acceptance to TFSS.

3.4 If all Task Forces deem the request for exclusion acceptable, the TFSS will forward a recommendation for approval to the RCC.

3.5 Exclusion requests will be effective upon approval by the RCC.

NPCC Directory #1
Appendix F

Appendix F – Procedure for Operational Planning Coordination

1.0 Introduction

The Reliability Coordinators (RC) of the Northeast Power Coordinating Council, Inc. (NPCC) require access to the security data specified in this procedure in order to adequately assess the reliability of the NPCC **bulk power system**. All users of the electric systems, including market participants, should supply such data to the NPCC Reliability Coordinators. Coordination among and within the Reliability Coordinator Areas (RC Area) of NPCC is essential to the reliability of interconnected operations. Timely information concerning system conditions should be transmitted by the NPCC RC Areas to other RC Areas as needed to assure reliable operation of the **bulk power system**. One aspect of this coordination is to ensure that adjacent RC Areas and neighboring systems are advised on a regular basis of expected operating conditions, including generator, transmission and system **protection**, including Type I **special protection system,** outages that may materially reduce the ability of an RC Area to contribute to the reliable operation of the interconnected system, or to receive and/or render assistance to another RC Area. To the extent practical, the coordination of outage schedules is desirable in order to limit the severity of such impacts.

To ensure that there is effective coordination for system **reliability** concerns, this document establishes procedures for the exchange of information regarding load/capacity forecasts, including firm sales and firm purchases, generator outage schedules, and transmission outage schedules for those **elements** that may have an adverse impact on other RC Area(s). It also details general action that may be taken to improve the communication of problems as well as specific topics that may be discussed in regularly scheduled conference calls or ad -hoc conference calls arranged in anticipation of problems such as capacity deficiency or inadequate light load margin in one or more RC Areas.

NPCC participants and other recipients of the information provided by processes in this guideline should adhere to the NPCC Critical Energy Infrastructure Information Non – Disclosure agreement.

2.0 Load/Capacity Forecasts

2.1 Twice yearly by May 15th and November 15th respectively, the Operations Planning Working Group (CO 12) will perform a summer and winter assessment for the next season.

The results will be reviewed by the NPCC TFCO and the NPCC Reliability Coordinating Committee (RCC) ~~in advance~~during the ~~of the~~ spring and autumn meetings of both groups and documented in the summer and winter NPCC Reliability Assessment reports.

2.2 Each week, each RC Area will review its weekly net resource capacity margin, as defined in Attachment A, for the twelve weeks to follow and forward the information to the NPCC Staff for distribution to all NPCC RC Areas. If an NPCC RC Area identifies a deficiency or light load condition, the RC Area should identify the cause(s) and mitigation measures that have been implemented, or will be implemented, to manage the issue.

3.0 Generator Outage Coordination

3.1 Each RC Area should exchange current and expected generator outages that may have a significant impact on an adjacent RC Area or neighboring systems or a significant impact on the transfer capability between RC Areas.

4.0 Transmission Outage Coordination

4.1 Advance Planning of Transmission Facility Outages

Each RC should exchange critical transmission **element** outages as identified in the coordination agreements with their interconnected neighbors, **elements** identified on the Facilities Notification List and multiple transmission **element** outages that may have an adverse impact on external energy transfers. Each Reliability Coordinator shall minimize the duration of outages to facilities that impact inter-Reliability Coordinator Areas.

4.2 Facilities Notification List

The NPCC Facilities Notification List, Attachment D, has two components:

1) the NPCC Transmission Facilities Notification List; and
2) the list of NPCC Type I **special protection systems**.

The Facilities Notification List is developed by each RC Area and specifies all facilities that, if removed from service, may have a significant, direct or indirect impact on another RC Area's transfer capability. The cause of such impact might include stability, voltage, and/or thermal considerations.

Prior to October 1st of each year, each RC Area will review and update its Facilities Notification List and coordinate necessary changes with other appropriate NPCC RC Areas. Prior to January 1st, and after review by the TFCO, the jointly developed, updated and approved Facilities Notification List will be posted on the NPCC secure website.

It should be noted that revisions to the Facilities Notification List will not follow the NPCC Process for Open Review due to the secure nature of the information

contained, and Attachment D is not openly published with this Procedure.

A temporary reconfiguration of the network may result in an outage to one or more facilities not listed in Attachment D having an impact on other NPCC RC Areas. It is the responsibility of the RC experiencing the condition to notify impacted RCs in a timely manner and provide updated status reports during the condition.

4.3 Notifications of Transmission **Element** Outages:

4.3.1 Notification requirements for Transmission **Element** Outages should be defined in interconnection coordination agreements. The time frames identified below are the minimum notification requirements.

4.3.2 Reliability Coordinators will advise affected RCs of all planned and unplanned outages of **elements** on the Facilities Notification List and those multiple transmission **element** outages that may have an adverse impact on external energy transfers.

All outages to equipment listed in the Facilities Notification List and those multiple transmission **element** outages that may have an adverse impact on external energy transfers should be planned with as much advance notice as practical.

Normally, notification for outages on **elements** covered by this instruction will be submitted to the appropriate RC Areas at least two (2) working days prior to the time the **element** is to be taken out of service.

When an RC Area receives an outage notification from another RC Area, prompt attention will be given to the notification and appropriate comments rendered.

4.3.3 An RC Area will not normally remove from service any transmission **elements,** which might have a **reliability** impact on an RC Area without prior notification to and appropriate review by that RC Area. In the event of an **emergency** condition, each RC Area may take action as deemed appropriate. Other RC Areas should be notified immediately.

An RC Area will make every effort to reschedule routine (non-emergency) transmission outages that severely degrade the reliability of an adjacent RC Area or neighboring system.

4.3.4 Each RC Area will advise the other affected RC Areas of any **protection** outage associated with RC Area tie line facilities Coordination agreements may identify additional reporting requirements associated with **protection** outages.

5.0 Specific Communications

Conditions in an RC Area that may have an impact on another RC Area should be communicated in a clear and timely manner. Specific communications are conducted as follows:

5.1 Weekly

Each Thursday a conference call will be initiated by the NPCC Staff to discuss operations expected during the seven-day period starting with the following Sunday. Operations personnel from the NPCC RC Areas and, as necessary, adjacent RC Areas will participate. In advance of the conference call, each RC Area will prepare the data specified in Attachments A and B, and forward it to the NPCC Staff a minimum of one hour in advance of the scheduled call. The completed "NPCC Weekly Conference Call Generating Capacity Worksheet," Attachment B, together with the list of "Twelve Weeks Projections of Net Margins," will be forwarded to the conference call participants by the NPCC Staff.

Each RC will review its weekly capacity margins for the next twelve week period. If a deficiency or light load condition is identified, the RC will identify the cause of the deficiency or light load condition and discuss proposed mitigation measures.

The NPCC Staff will prepare Conference Call Notes that will be forwarded to the conference call participants and members of the TFCO by the following Friday afternoon.

Items of particular concern that should be ~~discussed~~ addressed during the weekly conference call are described in Attachment C.

5.2 Emergency Preparedness Conference Call

Whenever adverse system operating or weather conditions are expected, any RC Area may request the NPCC Staff to arrange an Emergency Preparedness Conference Call (NPCC Document C-01) to discuss operating details with appropriate operations management personnel from the NPCC RC Areas and neighboring systems.

5.3 Daily Conference Calls

Each of the NPCC Reliability Coordinator Area control rooms participate in a regularly scheduled daily conference call. The goal of this call is to alert NPCC Reliability Coordinators of any potential emerging problems. Subjects for discussion are limited to credible events which could impact the ability of a Reliability Coordinator to serve its load and meet its operating reserve obligations, or which would impose a burden to the Interconnection.

Procedure for Operational Planning Coordination – Attachment A

Load and Capacity Table Instructions
and
Generating Capacity Worksheet Instructions

Week Beginning	The seven day period for which data is to be reported is defined as starting with the Sunday following the conference call through the following Saturday.
Installed Generating Capacity (Line Item 1)	Include all available generation at its maximum demonstrated capability for the appropriate seasonal capability period.
~~Independent Power Producers~~Other Generating Capacity ~~(~~(Line Item 2)	Include all available generation not included in Item#1 .~~Any entity that owns or operates an electricity generating facility that is not included in an electric utility's rate base.~~ This item ~~term~~ includes, but is not limited to, co generators,~~ and~~ small power producers and all other nonutility electricity producers, such as exempt wholesale generators~~,~~ who sell electricity
Firm Purchases (Line Item ~~2~~3)	Include only those transactions where capacity is delivered. Exclude "energy only" transactions.
Firm Sales (Line Item ~~3~~4)	Include only those transactions where capacity is delivered. Exclude "energy only" transactions.
Net Capacity (Line Item ~~4~~5)	Add Installed Generating Capacity and Firm Purchases. Subtract Firm Sales. (Line 1+Line 2-Line3)
Peak Load Forecast (Line Item ~~5~~6)	The peak load forecast along with the day during which the peak is expected to occur should be the best estimate of the RC Area's maximum peak load exposure anticipated for the week reported.
Available Reserve (Line Item ~~6~~7)	Subtract Peak Load Forecast from Net Capacity. (Line 4-Line5.)
Demand Side Management (Line Item ~~7~~8)	Include only maximum capability which can be obtained by operator initialization within four (4)

	hours.

Attachment A (continued)	
Known Unavailable Capacity~~bility~~ (Line Item ~~8~~9)	Include all known outages, as well as those deratings or unit outages presently forced out, unavailable, on extended cold standby or which are anticipated to remain out of service. This would also include capacity unavailable due to transmission constraints.
Net Reserve (Line Item ~~9~~10)	Available Reserve plus Demand Side Management minus Known Unavailable Capacity. (Line 6+Line 7-Line 8)
Required Operating Reserve (Line Item 1~~0~~)	The methodology used by each RC Area in calculating operating reserves should, at a minimum, meet the requirements of NPCC Directory # 5, "Reserve." Methodologies differing from the Directory #5 requirements should be clarified in Attachment B, "NPCC Weekly Conference Call Generating Capacity Worksheet," under the tab for "Operating Reserve."
Gross Margin (Line Item 1~~2~~1)	Subtract Required Operating Reserve from Net Reserve. (Line 9-Line 10)
Unplanned Outages (Line Item 1~~3~~2)	Estimate the amount of generating capacity which will be unavailable. This quantity should be based on historical averages for forced outages and deratings.
Net Resource Capacity Margin (Line Item 1~~4~~3)	Subtract Unplanned Outages from Gross Margin. A positive value reflects surplus reserve. A negative value reflects a deficiency. (Line 11-Line 12)
Forecast High / Low Temperatures and Days (Line Item 1~~5~~4)	Include the expected high and low temperatures for the RC Area for the week, and indicate the day on which they are expected to occur.

Attachment A (continued)	
Seasonal High / Low Temperatures (Line Item 165)	Include the expected high and low forecast seasonal temperatures for the RC Area.
Minimum Load Forecast (Line Item 176)	The minimum load forecast, -indicating the day on which it is ~~they are~~ expected to occur should be the best estimate of the RC Area's minimum load exposure anticipated for the week reported.
Minimum Resources (Line Item 187)	The Minimum Resources are the Reliability Coordinator Area's total expected on-line generator minimum output capability and must-take purchases.
Light Load Margin (Line Item 198)	Subtract Minimum Resources from Minimum Load Forecast. A negative number indicates a light load condition. (Line 176-Line 187)

Procedure for Operational Planning Coordination – Attachment B

NPCC Weekly Conference Call Generating Capacity Worksheet

The "NPCC Weekly Conference Call Generating Capacity Worksheet" is an active spreadsheet used each week to assist in the calculation of the data discussed during the weekly conference call. A blank template is available from the NPCC office.

Procedure for Operational Planning Coordination - Attachment C

CONDITIONS FOR DISCUSSION

Items of particular concern that should be discussed during a conference call can include, but are not limited to, the following:

- anticipated weather;
- largest first and second contingencies;
- operating reserve requirements and expected available operating reserve;
- capacity deficiencies;
- potential fuel shortages or potential supply disruptions which could lead to energy shortfalls;
- light load margins;
- general and specific voltage conditions throughout each system or RC Area;
- status of short term contracts and other scheduled arrangements, including those that impact on operating reserves;
- additional capability available within twelve hours and four hours;
- generator outages that may have a significant impact on an adjacent RC Area or neighboring system;
- transmission outages that may have an adverse impact on external energy transfers;
- potential need for emergency transfers;
- expected transfer limits and limiting elements;
- a change or anticipated change in the normal operating configuration of the system, such as the temporary modification of relay **protection** schemes so that the usual and customary levels of **protection** will not be provided, or the arming of **special protection systems** not normally armed, or the application of abnormal operating procedures; and
- update of the abnormal status of NPCC Type I **special protection systems** forced out of service

Attachment D

NPCC Facilities Notification List

Attachment D is not publicly available due to the confidential nature of the information presented.

Appendix G - Procedures for Inter Reliability Coordinator Area Voltage Control

1.0 Introduction

This Procedure provides general principles and guidance to Reliability Coordinators and Transmission Operators for effective inter- Transmission Operator Area voltage control, consistent with the NPCC, Directory #1, "Design and Operation of the Bulk Power System". Specific methods to implement this Procedure may vary among Reliability Coordinators and Transmission Operators, depending on local requirements. Coordinated inter- Transmission Operator Area voltage control is necessary to regulate voltages to protect equipment from damage and prevent voltage collapse. Coordinated voltage regulation reduces electrical losses on the network and lessens equipment degradation. Local control actions are generally most effective for voltage regulation. Occasions arise when adjacent Reliability Coordinators and Transmission Operators can assist each other to compensate for deficiencies or excesses of **reactive power** and improve voltage profiles and system security.

2.0 Principles

Each Reliability Coordinator and Transmission Operator operates, in accordance with NPCC, Directory #1, "Design and Operation of the Bulk Power System" criteria, their own individual or joint operating policies, procedures and applicable interconnection agreements. Adjacent Reliability Coordinators and Transmission Operator should be familiar with the respective criteria and procedures of their neighboring Reliability Coordinators and Transmission Operator Areas, and should mutually agree upon procedures for inter- Transmission Reliability Coordinator and Operator Area voltage control.

In the event the system state changes to a condition that requires a voltage or reactive corrective action, the Reliability Coordinator and Transmission Operator for the Area in which the condition is originating from should immediately take corrective action. If the corrective control actions are ineffective, or the Reliability Coordinator and Transmission Operator for the Area have insufficient reactive resources to control the problem, assistance may be requested from other Reliability Coordinators and Transmission Operator Areas.

Whether inter- Reliability Coordinator and Transmission Operator Area voltage control is carried out through specific or general procedures, the following should be considered and implemented if applicable:

2.1 To effectively coordinate voltage control, location and placement of metering for **reactive power** resources and voltage controller status should be the same between adjacent Reliability Coordinators and Transmission Operator Areas;

2.2 the availability of **voltage regulating transformers** in the proximity of **tie lines**;

2.3 voltage levels, limits, and regulation requirements for stations on either side of an inter- Reliability Coordinator and Transmission Operator Area interface;

2.4 the circulation of **reactive power** (export at one tie point in exchange for import at another);

2.5 **tie line** reactive losses as a function of active **power** transfer;

2.6 the sharing of the reactive requirements of **tie lines** and series regulating equipment (either equally or in proportion to line lengths, etc.);

2.7 the transfer of **reactive power** from one Reliability Coordinator and Transmission Operator Area to another

2.8 reactive **reserve** of on-line generators;

2.9 shunt reactive device availability and switching strategy;

2.10 **static VAR compensator** availability, reactive **reserve**, and control strategy;

2.11 each Reliability Coordinator and Transmission Operator Area should anticipate voltage trends and initiate corrective action in advance of critical periods of heavy and light **loads.**

2.12 Each Reliability Coordinator and Transmission Operator Area should maintain a mix of static and dynamic resources, including reactive **reserves**

3.0 Procedure for Triennial Monitoring and Reporting of Inter-Area Voltage Control

3.1 On, or shortly before, the first of July, the Task Force Coordination of Operations (TFCO) Secretary will write to each TFCO member, requesting a written response by the end of July in the form of:

a) A copy of any new or revised procedures, principles, or understandings (such as minutes of an operating committee meeting between Reliability Coordinators and Transmission Operator Areas) between the reporting Reliability Coordinator and adjacent Reliability Coordinators~~.~~, or,

b) a response indicating no change to existing procedures, principles, or understandings currently on file at NPCC.

3.2 The TFCO Secretary will summarize the responses and will forward it to TFCO members at least two weeks prior to the October TFCO meeting.

3.3 Following TFCO review and acceptance of the responses, the TFCO Chairman will forward the summary to the Chairman of the Reliability Coordinating Committee (RCC) for informational purposes. This will normally be forwarded three weeks prior to the next regularly scheduled RCC meeting.

1.0 Introduction

1.1 Title: Design and Operation of the Bulk Power System

1.2 Directory Number: 1

1.3 Objective:

The objective of this Directory is to provide a "design-based approach" to design and operate the **bulk power system** to a level of reliability that will not result in the loss or unintentional separation of a major portion of the system from any of the contingencies referenced in **R7** and **R14.** The intent of this approach is to avoid instability, voltage collapse and widespread cascading outages. Loss of small portions of a system (such as radial portions) may be tolerated provided these do not jeopardize the reliability of the remaining **bulk power system**.

In NPCC the technique for achieving this level of reliability is to require that the **bulk power system** be designed and operated to meet the performance requirements for the representative **contingencies** as specified in this Directory. Simulations shall be used to assess and analyze these **contingencies. Contingency** events shall be applied on **bulk power system** elements and the resulting performance requirements shall be monitored on the **bulk power system.**

The characteristics of a reliable **bulk power system** include adequate **resources** and transmission to reliably meet projected customer electricity demand and energy requirements as prescribed in this document.

1.4 Effective Date: December 1, 2009

1.5 Background

This Directory was developed from the NPCC A-2 criteria document - *Basic Criteria for the Design and Operation of Interconnected Power Systems* (May 6, 2004 version). Guidelines and Procedures for consideration in the implementation of this Directory are provided in the Appendices.

1.6 Applicability

1.6.1 Functional Entities

Reliability Coordinators
Transmission Operators
Balancing Authorities
Planning Coordinators
Transmission Planners

Resource Planners
Generator Owners
Transmission Owners

1.6.2 Applicability of NPCC Criteria:

The requirements of an NPCC Directory apply only to those facilities defined as NPCC **bulk power system** elements and identified through the performance based methodology of NPCC Document A-10, "*Classification of Bulk Power System Elements*," the list of which is maintained by the NPCC Task Force on System Studies and approved by the NPCC Reliability Coordinating Committee."

Requirements to abide by an NPCC Directory may also reside in external tariff requirements, bilateral contracts and other agreements between facility owners and/or operators and their assigned Reliability Coordinator, Planning Coordinator, Transmission Operator, Balancing Authority and/or Transmission Owner as applicable and may be enforceable through those external tariff requirements, bilateral contracts and other agreements. NPCC will not enforce compliance to the NPCC Directory requirements in this document on any entity that is not an NPCC Full Member.

2.0 Defined Terms:

Unless specifically noted in this document terms in bold typeface are defined in the NPCC Glossary of Terms.

3.0 NPCC Full Member Criteria:

Information for Planning and Operational Assessments

R1 Each Functional Entity that owns equipment shall submit verified information representing the physical or control characteristics of its equipment for system modelling and reliability analysis of the **bulk power system**.

R2 Each Planning Coordinator and Reliability Coordinator shall collect and maintain information needed for system modelling and reliability analysis of the **bulk power system** as submitted in accordance with Requirement R1.

R2.1 This information shall be submitted to NPCC upon request.

R3 Each Reliability Coordinator shall share and coordinate forecast system information d real-time information to enable and enhance the analysis and modeling of the interconnected **bulk power system** by security application software on energy management systems.

Resource Adequacy

R4 Each Planning Coordinator or Resource Planner shall probabilistically evaluate resource adequacy of its Planning Coordinator **Area** portion of the **bulk power system** to demonstrate that the loss of **load** expectation (LOLE) of disconnecting **firm load** due to resource deficiencies is, on average, no more than 0.1 days per year.

R4.1 Make due allowances for demand uncertainty, scheduled outages and deratings, forced outages and deratings, assistance over interconnections with neighboring Planning Coordinator **Areas**, transmission transfer capabilities, and capacity and/or load relief from available operating procedures.

R5 Each Planning Coordinator shall report and obtain Reliability Coordinating Committee (RCC) approval for its Review of **Resource** Adequacy. Appendix D provides guidance for the Area Review of **Resource** Adequacy.

R5.1 The Review of **Resource** Adequacy will be presented to the NPCC Task Force on Coordination of Planning (TFCP). Comprehensive and Interim reviews shall be presented to the TFCP before the beginning of the first time period covered by the assessment.

R5.2 A Comprehensive Review of **Resource** Adequacy is required every three years and will cover a time period of five years. If changes in planned

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

facilities or forecasted system conditions warrant, TFCP may require a Comprehensive Review of **Resource** Adequacy in less than 3 years.

R5.3 In subsequent years, each Planning Coordinator shall conduct an Annual Interim Review of **Resource** Adequacy that will cover, at a minimum, the remaining years studied in the Comprehensive Review of **Resource** Adequacy.

R6 Each Reliability Coordinator shall coordinate outages and deratings of **resources** to verify adequate **resources** will be available to meet the forecasted demand and **reserve** requirements. Appendix F provides guidance for Operational Planning Coordination.

R6.1 A Summer and Winter Reliability Assessment will be presented to the NPCC Task Force on Coordination of Operation (TFCO) every year.

Transmission Planning

R7 Each Transmission Planner and Planning Coordinator shall plan the system to meet the respective performance requirements for the **contingencies** as specified in Table 1 in the design of its **bulk power system**.

R7.1 Credible combinations of system conditions which stress the system shall be modelled including, load forecast, inter-Area and intra-Area transfers, transmission configuration, active and reactive resources, generation availability and other dispatch scenarios.

R8 Each Transmission Planner and Planning Coordinator shall assess the impact of the extreme **contingencies** listed in Table 2. Appendix C provides guidance for testing and analyzing extreme contingencies.

R9 Each Transmission Planner and Planning Coordinator shall assess the impact of extreme system conditions, one condition at a time, subject to contingencies as listed in the “Extreme System Conditions” category of Table 2.

R10 Each Transmission Planner and Planning Coordinator shall have procedures and implement a system design that ensures equipment capabilities are adequate for fault current levels with all transmission and generation facilities in service for all operating conditions which are not prohibited by a procedure and coordinate these procedures with materially affected Transmission Planner and Planning Coordinator Areas.

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

R11 Each Planning Coordinator shall conduct and obtain Reliability Coordinating Committee (RCC) approval for its Transmission Review. Appendix B provides guidance for Transmission Reviews.

R11.1 A Comprehensive Transmission Review is required at least once every five years or if major or pervasive system changes have occurred. If changes in the planned facilities or forecasted system conditions warrant, the Task Force on System Studies (TFSS) may require a Comprehensive Transmission Review in less than five years.

R11.2 The proposal for the type of annual Transmission Review shall be presented to TFSS by March of the year during which the review is conducted. Approval for the type of Transmission Review shall be obtained from the TFSS. The annual Transmission Review shall be presented to the TFSS by April of the following year.

R11.3 If the results of the Transmission Review indicate that the planned **bulk power system** will not be in conformance with NPCC Directory #1, the Transmission Review shall incorporate a corrective action plan to achieve conformance.

Special Protection Systems

R12 Each Functional Entity that proposes a new or modified SPS shall consider the complexity of the scheme and the consequences of correct or incorrect operation as well as its benefits.

R12.1 Provide a rationale and justification to the TFCP including factors such as project delays, temporary construction configurations, unusual combinations of system conditions, equipment outages and infrequent contingencies.

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

Transmission Operation

R13 Each Reliability Coordinator and Transmission Operator shall establish **normal transfer capabilities** and **emergency transfer capabilities, for** its portion of the **bulk power system** to meet the respective performance requirements for the **contingencies** as specified in Table 3.

R14 Each Reliability Coordinator and **Transmission** Operator shall operate to **normal transfer capabilities** unless an **emergency,** in accordance with NPCC Directory# 2, is identified.

R15 Each Reliability Coordinator and Transmission Operator shall make system adjustments once an **emergency** has been identified, including the pre-**contingency** disconnection of **firm load,** to avoid exceeding **emergency transfer capabilities.**

R16 Each Reliability Coordinator and Transmission Operator shall assess the status of the **bulk power system** immediately after the occurrence of any **contingency** and prepare for the next **contingency as specified in Table 3**.

R16.1 Voltage reduction and shedding of firm load shall be deployed to return the system to a secure state, if other system adjustments are not adequate. Voltage reduction need not be initiated and firm load need not be shed to observe a post contingency loading requirement until the **contingency** occurs, provided that adequate response time for this action is available.

R16.2 System adjustments shall be completed as quickly as possible following any **contingency,** but within 30 minutes after the occurrence of any **contingency** specified in Table 3.

R17 Each Reliability Coordinator shall notify the applicable Reliability Coordinators of forced outages of any facility as per the NPCC Transmission Facilities Notification List and of any other condition which may impact inter-Area reliability.

R18 Each Reliability Coordinator shall coordinate scheduled outages of facilities that are on the NPCC Transmission Facilities Notification List sufficiently in advance of the outage to permit the affected Reliability Coordinators to maintain reliability. Appendix F provides guidance for Operational Planning Coordination.

R18.1 Review and update its Facilities Notification List and submit the list to the NPCC Task Force on Coordination of Operation (TFCO) annually.

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

R19 Each Reliability Coordinator shall coordinate voltage control between Transmission Operator Areas. Appendix G provides guidance for Inter- Reliability Coordinator Area Voltage Control.

R19.1 Metering for **reactive power** resources and voltage controller status shall be consistent between adjacent Transmission Operators.

R19.2 Upon request from the TFCO, perform an Inter-Area Voltage Control Assessment.

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

4.0 Compliance:

Compliance with the requirements set forth in this Directory will be in accordance with the NPCC Criteria Compliance and Enforcement Program (CCEP).

Compliance with Directory#1 shall be demonstrated for all requirements that are not required for compliance with the NERC Reliability Standards and NPCC will not enforce duplicate sanctions for the same violation.

Prepared by: Task Force on Coordination of Planning

Review and Approval: Revision to any portion of this Directory will be posted by the lead Task Force in the NPCC Open Process for a 45 day review and comment period. Upon addressing all the comments in this forum, the Directory document will be sent to the remaining Task Forces for their recommendation to seek RCC approval.

Upon approval of the RCC, this Directory will be sent to the Full Member Representatives for their final approval if sections pertaining to the Requirements and Criteria portion have been revised. All voting and approvals will be conducted according to the most current "NPCC. Bylaws" in effect at the time the ballots are cast.

Revisions pertaining to the Appendices or other portions of the document such as links, etc., only require RCC approval.
Errata may be corrected by the Lead Task Force at any time.

This Directory will be updated at least once every three years and as often as necessary to keep it current and consistent with NERC, Regional Reliability Standards and other NPCC documents.

Table 1

Planning Design Criteria: Contingency events, Fault type and Performance requirements to be applied to bulk power system elements

Category	**Contingency** events Simulate the removal of all elements that protection systems, including Special Protection Systems, are expected to automatically disconnect for each event that involves an AC fault.	**Fault** type (permanent) **On the listed elements where applicable**	**Performance** requirements
I **Single Event**	1. Fault on any of the following: a. transmission circuit b. transformer c. shunt device d. generator e. bus section	Three-phase **fault** with **normal fault clearing**	i. to ix.
	2. Opening of any circuit breaker	No fault	
	3. Loss of single pole of a direct current facility	No fault	
	4. Fault on any of the following: a. transmission circuit b. transformer c. shunt device d. generator e. bus section	Phase to ground fault with **delayed fault clearing**	
	5. Fault on a circuit breaker	Phase to ground **fault,** with **normal fault clearing**	
	6. Simultaneous fault on two adjacent transmission circuits on a multiple circuit tower.	Phase to ground **faults** on different phases of each circuit, with **normal fault clearing**	
	7. Simultaneous permanent loss of both poles of a direct current bipolar facility	Without an ac fault	
	8. The failure of a circuit breaker to operate when initiated by a **SPS** after a fault on the following: a. transmission circuit b. transformer c. shunt device d. generator e. bus section f. opening of any circuit breaker (without a fault)	Phase to ground **fault**, with **normal fault clearing**	

Category	**Contingency** events Simulate the removal of all elements that protection systems, including Special Protection Systems, are expected to automatically disconnect for each event that involves an AC fault.	**Fault** type (permanent) **On the listed elements where applicable**	**Performance** requirements
II Event(s) after a first loss and after System Adjustment	1. Following the loss of any critical: a. transmission circuit, b. transformer, c. series or shunt compensating device or d. generator e. Single pole of a direct current facility and after System Adjustment, Category I **Contingencies** shall also apply.	Any Category I event as described above.	Performance requirements i to ix apply **Area** generation and **power** flows are adjusted between outages by the use of resources available within ten minutes following notification and other system adjustments such as HVDC and phase angle regulator adjustments that can be made within 30 minutes.

Performance Requirements for the contingencies defined in Table 1:

i. Loss of a major portion of the system or unintentional separation of a major portion of the system shall not occur.

ii. Loss of small or radial portions of the system pre-determined by studies is acceptable provided the performance requirements are not violated for the remaining **bulk power system**.

iii. Voltages and loadings shall be within applicable limits for the pre-**contingency** conditions.

iv. Voltages and loadings shall be within **applicable emergency limits** for post-**contingency** conditions.

v. Adequate reactive power resources and appropriate controls shall be available to maintain voltages within applicable limits.

vi. The **stability** of the **bulk power system** shall be maintained during and following the most severe **contingencies,** with due regard to successful and unsuccessful **reclosing.**

vii. For each of the **contingencies** that involve **fault clearing**, **stability** shall be maintained when the simulation is based on **fault clearing** initiated by the **"system A" protection group** and also shall be maintained when the simulation is based on **fault clearing** initiated by the **"system B" protection group**. When applying this requirement to **contingency** Event ***no 6***, the failure of a **protection group** shall apply only to one circuit at a time.

viii. Regarding **contingency *no 6***, if multiple circuit towers are used only for station entrance and exit purposes and if they do not exceed five towers at each station, then this condition is an acceptable risk and therefore can be excluded. Other similar situations can be excluded on the basis of acceptable risk, provided that the Reliability Coordinating Committee specifically accepts each request for exclusion. (See Appendix E.)

ix. Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner.

Table 2

Planning Criteria: Extreme Contingency and System Conditions, Fault type and Performance Assessments to be applied to bulk power system elements

.

Category	**Contingency** events Simulate the removal of all elements that protection systems, including Special Protection Systems, are expected to automatically disconnect for each event that involves an AC fault.	**Fault** type (permanent) and/or **condition applied** **On the listed elements where applicable**	**Performance** to be assessed
Extreme Contingency	1. Loss of the entire capability of a generating station.	No Fault	i, ii, iii.
	2. Loss of all transmission circuits emanating from a generating station, switching station, substation or dc terminal.	No Fault	
	3. Loss of all transmission circuits on a common right-of-way.	No Fault	
	4. Fault on of any of the following: a. transmission circuit b. transformer c. shunt device d. generator e. bus section	Three-phase **fault** with **delayed fault clearing (**with due regard to successful and unsuccessful **reclosing**.)	
	5. Fault on a circuit breaker	Three-phase **fault**, with **normal fault clearing**	
	6. Sudden loss of a large load or major load center.	No Fault	
	7. The effect of severe power swings arising from disturbances outside the NPCC's interconnected systems.	Fault applied as necessary.	
	8. Failure of a **Special Protection System**, to operate when required following the normal contingencies listed in Table 1, Category I, Single Event.	As listed in Table 1, Category I, Single Event.	
	9. The operation or partial operation of a **Special Protection System** for an event or condition for which it was not intended to operate.	No Fault	
	10. Sudden loss of fuel delivery system to multiple plants, (e.g. gas pipeline contingencies).	No Fault.	
	Any additional extreme contingencies identified by each Planning Coordinator Area.	Fault applied as necessary.	
Extreme System Conditions	Contingency events listed in Table 1, Category I, Single Event	Peak **load** conditions resulting from extreme weather.	i (b, c), ii, iii.
		Generating unit(s) fuel shortage (e.g. gas supply adequacy or low hydro) under normal weather peak conditions	i (c), ii, iii

Category	**Contingency** events Simulate the removal of all elements that protection systems, including Special Protection Systems, are expected to automatically disconnect for each event that involves an AC fault.	**Fault** type (permanent) and/or **condition applied** **On the listed elements where applicable**	**Performance** to be assessed
Extreme System Conditions			

Performance Assessment

i. Model the following pre-contingency conditions:

   a. transfers within or between Transmission Planner and Planning Coordinator Areas should be studied at values not expected to be exceeded more than 25% of the time.

   b. highly probable dispatch patterns of generation for the transfers being studied

   c. appropriate load representation (e.g. active and reactive power as a function of voltage) for transient tests and post transient load flows.

ii. Examine post contingency steady state conditions, as well as stability, overload, cascading outages and voltage collapse to obtain an indication of system robustness and determine the extent of any widespread system disturbance

iii. Where assessment concludes there are serious consequences, an evaluation of implementing a change to design or operating practices to address such contingencies shall be conducted.

Table 3

Operating Criteria: Contingency events, Fault type and Performance requirements to be applied to bulk power system elements to establish transfer capabilities.

	Contingency events Simulate the removal of all elements that protection systems, including Special Protection Systems, are expected to automatically disconnect for each event that involves an AC fault.	**Fault** type (permanent) **On the listed elements where applicable**	**Performance** requirements	
			Normal Transfer Capability	**Emergency** Transfer Capability (only after an **Emergency** is identified)
	1. Fault on any of the following: a. transmission circuit b. transformer c. shunt device d. generator e. bus section	Three-phases **fault**, with **normal fault clearing**	i, .ii, iii, iv, v, vi, vii, viii, x, xi.	i, ii, iii, iv, v, vi, vii,viii x, xii.
	2. Opening of any circuit breaker	No fault		
	3. Loss of single pole of a direct current facility	No fault		
	4. Fault on any of the following: a. transmission circuit b. transformer c. shunt device d. generator e. bus section	Phase to ground fault, with **delayed fault clearing**	i,ii,iii,iv,vii,viii,ix,x,xi,	Contingency Events 4 through 8 do not apply after an emergency is identified.
	5. Fault on a circuit breaker	Phase to ground **fault,** with **normal fault clearing**		
	6. Simultaneous fault on two adjacent transmission circuits on a multiple circuit tower.	Phase to ground **faults** on different phases of each circuit, with **normal fault clearing**		
	7. Simultaneous permanent loss of both poles of a direct current bipolar facility	Without an ac fault		
	8. The failure of a circuit breaker to operate when initiated by a **SPS** after a fault on the following: a. transmission circuit b. transformer c. shunt device d. generator e. bus section	Phase to ground **fault**, with **normal fault clearing**		

	9. The failure of a circuit breaker to operate when initiated by a SPS after opening of any circuit breaker.	No fault.	i,ii,iii,iv,vii,viii,ix,x,xi,	

Performance Requirements for the contingencies defined in Table 3:

i. Loss of a major portion of the system or unintentional separation of a major portion of the system shall not occur.

ii. Loss of small or radial portions of the system pre-determined by studies is acceptable provided it does not violate the performance requirements for the remaining **BPS**.

iii. Individual Reliability Coordinator Areas shall be operated in a manner such that **Contingencies** and conditions applied can be withstood without causing **significant adverse impact** on other Reliability Coordinator Areas.

iv. Voltages and loadings shall be within applicable limits for the pre-**contingency** conditions.

v. Voltages and loadings shall be within **applicable emergency limits** for post-**contingency** conditions.

vi. Adequate reactive power resources and appropriate controls shall be available to maintain voltages within applicable limits.

vii. The **stability** of the **bulk power system** shall be maintained, with due regard to successful and unsuccessful **reclosing**.

viii. For each of the **contingencies** that involve **fault clearing**, **stability** shall be maintained when the simulation is based on **fault clearing** initiated by the **"system A" protection group**, and also shall be maintained when the simulation is based on **fault clearing** initiated by the **"system B" protection group**. When applying this requirement to **contingency** Event ***no 6***, the failure of a **protection group** shall apply only to one circuit at a time.

ix. Regarding **contingency *no 6***, if multiple circuit towers are used only for station entrance and exit purposes, and if they do not exceed five towers at each station, then this condition is an acceptable risk and therefore can be excluded. Other similar situations can be excluded on the basis of acceptable risk, provided that the Reliability Coordinating Committee specifically accepts each request for exclusion. (See Appendix E.)

x. Appropriate adjustments shall be made to Reliability Coordinator Area operation to accommodate the impact of **protection group outages**, including the **outage** of a **protection group** which is a part of a **Type I special protection system**. For typical periods of forced outage or maintenance of a **protection group**, it can be assumed, unless there are indications to the contrary, that the remaining **protection** will function as designed. If the **protection group** will be out of service for an extended period of time, additional adjustments to operations may be appropriate considering other system conditions and the consequences of possible failure of the remaining **protection group.**

xi. Normal transfer levels shall not require system adjustments before attempting manual reclosing of elements unless specific instructions describing alternate actions are in effect to maintain stability of the **BPS.**

xii. Emergency transfer levels may require system adjustments before attempting manual reclosing of elements to maintain stability of the **bulk power system**.

Operating to the contingencies listed above in Table 3 is considered to provide an acceptable level of **bulk power system** security. However, under high risk conditions, such as severe weather, the expectation of the occurrence of contingencies not listed in Table 3 and/or the associated consequences may be judged to be significantly greater. When these conditions exist, consideration should be given to operating in a more conservative manner.

Appendix A – Reserved for Future Use

Appendix B - Guidelines and Procedures for NPCC Transmission Reviews

1.0 Introduction

NPCC has established a Reliability Assessment Program to bring together work done by NPCC, Transmission Planners and Planning Coordinators relevant to the assessment of **BPS reliability**. As part of the Reliability Assessment Program, the Task Force on System Studies (TFSS) is charged on an ongoing basis with conducting periodic reviews of the **reliability** of the planned **bulk power system** of each Planning Coordinator Area of NPCC The purpose of these reviews is to determine whether each Planning Coordinator Area's planned bulk power transmission system is in conformance with the NPCC Directory #1 *Design and Operation of the Bulk Power System*. The annual Area Transmission Review required in R12 is presented for this purpose. It is expected that this Review will cover Directory #1 requirements as they apply to the **bulk power system**.

2.0 Purpose of Review Presentation

The purpose of the presentation associated with an Area Transmission Review is to demonstrate that the Planning Coordinator's planned **bulk power system** based on its projection of available **demand**, transmission, and **resources**, is in conformance with the Directory #1 criteria. By such a presentation, the Task Force will satisfy itself that the criteria have been met and, in general, that the **reliability** of the NPCC Interconnected Systems will be maintained.

3.0 Study Year To Be Considered

It is suggested that a study year of 4 to 6 years from the reporting date is a realistic one, both from the viewpoint of minimum lead times required for construction, and the ability to alter plans or facilities. The reviews may be conducted for a longer term beyond 6 years to address identified marginal conditions that may have longer lead-time solutions.

4.0 Types and Frequency of Reviews

As described in requirement **R12,** each Planning Coordinator is required to present an annual transmission review to TFSS. However, the review presented by the Planning Coordinator may be one of three types: a Comprehensive (or Full) Review, an Intermediate (or Partial) Review, or an Interim Review.

A Comprehensive Review is a thorough assessment of the Planning Coordinator's entire bulk power transmission system, and includes sufficient analyses to fully address all aspects of an Area Transmission Review as described in **R12.**

In the years between Comprehensive Reviews, Planning Coordinators may conduct either an Interim Review, or an Intermediate Review, depending on the extent of the Planning Coordinator's system changes since its last Comprehensive Review. If the system

changes are relatively minor, the Planning Coordinator may conduct an Interim Review. In an Interim Review, the Planning Coordinator provides a summary of the changes in planned facilities and forecasted system conditions since its last Comprehensive Review and a brief discussion and assessment of the impact of those changes on the bulk power transmission system. No new analyses are required for an Interim Review.

If the Planning Coordinator's system changes since its last Comprehensive Review are moderate or concentrated in a portion of the Planning Coordinator's system, the Planning Coordinator may conduct an Intermediate Review. An Intermediate Review covers all the elements of a Comprehensive Review, but the analyses may be limited to addressing only those issues considered to be of significance, considering the extent of the system changes.

In March of each year, after a Planning Coordinator presents a proposal for the type of review to be conducted during the current year, TFSS will consider each Planning Coordinator's proposal. TFSS will either indicate their concurrence, or require the Planning Coordinator to conduct a more extensive review if the Task Force feels that such is warranted based on the Planning Coordinator's system changes since its last Comprehensive Review.

5.0 Format of Presentation – Comprehensive and Intermediate Review

a) Introduction

- Reference the most recent Area Comprehensive Review and any subsequent Intermediate or Interim reviews as appropriate.
- Describe the type and scope of this review.
- For a Comprehensive Review, describe the existing and planned **bulk power system** facilities included in this review.
- Describe changes in system facilities, **bulk power system elements** and **loads** since the most recent Comprehensive Review.
- Include maps and one-line diagrams of the system showing proposed changes as necessary.
- Describe the demand levels to be studied, according to the range of forecast system demands.
- Identify projected firm transfers and interchange schedules.

b) Present the scope of the analyses. The analyses conducted for a Comprehensive Review should be thorough, but an Intermediate Review may focus on specific

areas of the system, specific system conditions, or a more limited set of "critical" **contingencies**.

c) Steady State Assessment

- Present the **load** model, power factor, demand side management, and other modeling assumptions used in the analysis. Discuss the methodology used in voltage assessments. (An Intermediate Review may refer to the discussion from the last Comprehensive Review.)

- Provide supporting information on the **contingencies** selected for evaluation and an explanation of why **contingencies** not simulated would produce less severe results.

- Provide information on the generation dispatch conditions assumed in the analysis.

- Include plots of "base case" **load** flows with all lines in service for the various conditions studied, e.g., peak, off-peak, and heavy transfers.

- Present the effects of major planned changes on the system.

- Identify applicable transfer limits within and between Planning Coordinator Areas.

- Show the adequacy of voltage performance and voltage control capability for the planned bulk power transmission system.

d) Stability Assessment

Present and/or refer to significant studies showing the effect of **contingencies** on the system and report on the most severe **contingencies** in the following manner:

- Provide supporting information on the **contingencies** selected for evaluation and an explanation of why **contingencies** not simulated would produce less severe results.

- The nature of the **fault** applied, **elements** switched, and **fault clearing** times.

- Plots of angles versus time for significant machines, response of real and reactive power control devices, voltages at significant buses and significant interface flows.

For a Comprehensive or Intermediate Review, present the **load** model and other modeling assumptions used in the analysis. (An Intermediate Review may refer to the discussion from the last Comprehensive Review.)

e) **Fault** Current Assessment

- Present the methodology and assumptions used in the **fault** current assessment. (An Intermediate Review may refer to the discussion from the last Comprehensive Review.)

- Present instances where **fault** levels exceed equipment capabilities and measures to mitigate such occurrences.

- Present changes to **fault** levels at stations adjacent to other Planning Coordinator Areas.

f) Extreme **Contingency** Assessment

- Present the scope of the analyses including a description of the system conditions assessed. The analyses conducted for a Comprehensive Review should be thorough, but an Intermediate Review may focus on specific areas of the system, specific system conditions, or a more limited set of "critical" **contingencies**.

- Provide supporting information on the extreme **contingencies** selected for evaluation and an explanation of why the remaining **contingencies** not simulated would produce less severe results.

- Review the results for widespread cascading due to overloads, instability or voltage collapse caused by extreme **contingencies**

- In the case where **contingency** assessment reveals serious consequences, conduct an evaluation of implementing a change to address such **contingencies**.

g) Extreme System Condition Assessment

- Present the scope of the analyses including a description of the system conditions assessed. The analyses conducted for a Comprehensive Review should be thorough, but an Intermediate Review may focus on specific areas of

the system, specific system conditions, or a more limited set of "critical" **contingencies**.

- Provide the rationale for the loss of fuel supply conditions selected for evaluation and an explanation of why other loss of fuel supply conditions not simulated would produce less severe results.

- Provide supporting information on the **contingencies** selected for evaluation and an explanation of why the remaining **contingencies** not simulated would produce less severe results.

- In the case where extreme condition assessment reveals serious consequences, conduct an evaluation of implementing measures to mitigate such consequences.

h) Review of **Special Protection Systems (SPSs)**

- Present the scope of review. A Comprehensive Review should review all the existing, new, and modified **SPSs** included in its transmission plan. An Intermediate Review may focus on the new and modified **SPSs**, and just those existing **SPSs** that may have been impacted by system changes since they were last reviewed.

- Present the need and utilization for Type I and Type II **SPSs.** For instances where a **SPS** utilization is anticipated to increase, the TFSS should inform the Task Force on Coordination of Planning (TFCP) of this finding.

- Review the validity of the classification of Type III **SPSs**. For instances where a **SPS** which was formerly considered to have only local consequences is identified as having the potential for inter- Planning Coordinator Area effects, for the time period being reviewed, the TFSS should notify the Task Force on Coordination of Planning, System Protection and Coordination of Operation. In such instances a complete review of the **SPS** should be made, as per the *Procedure for NPCC Review of New or Modified Bulk Power System Special Protection Systems (SPS)* in Directory #7.

i) Review of Dynamic Control Systems (DCSs)

Review of potential consequences of failure or misoperation of Dynamic Control Systems (DCS), as defined in NPCC Document C-33 *Procedure for Analysis and Classification of Dynamic Control Systems*. For Type I and Type II DCSs, present

and/or refer to appropriate **stability** studies analyzing the consequences of failure or misoperation in accordance with the Joint Working Group (JWG)-1 report, "Technical Considerations and Suggested Methodology for the Performance Evaluation of Dynamic Control Systems". A Comprehensive Review should address all potentially impactful existing and new DCSs, but an Intermediate Review may focus on new DCSs and only those existing DCSs that may have been impacted by system changes since they were last reviewed.

j) Review of Exclusions to the Directory#1 *Criteria*

Review any exclusions granted under NPCC *Guidelines for Requesting Exclusions to Simultaneous Loss of Two Adjacent Transmission Circuits on a Multiple Circuit Tower* (Appendix E). A Comprehensive Review should address all exclusions, but an Intermediate Review may focus on just those exclusions that may have been impacted by system changes since they were last reviewed.

k) Overview Summary of System Performance for Year Studied

6.0 Format of Presentation - Interim Review

a) Introduction of Interim Review

b) Reference the most recent Comprehensive Review and any subsequent Intermediate or Interim Reviews as appropriate.

c) Changes in Facilities (Existing and Planned) and Forecasted System Conditions Since the Last Comprehensive Review.

- **Load** Forecast
- Generation **Resources**
- **Bulk Power System elements**
- Transmission Facilities
- **Special Protection Systems**
- Dynamic Control Systems
- Exclusions

d) Brief Impact Assessment and Overview Summary

The Planning Coordinator will provide a brief assessment of the impact of these changes on the **reliability** of the interconnected **bulk power system**, based on engineering judgment and internal and joint system studies as appropriate.

7.0 Documentation

The documentation required for a Comprehensive or Intermediate Review should be in the form of a report addressing each of the items of the above presentation format. The report should be accompanied by the Planning Coordinator's **bulk power system** map and one-line diagram, summary tables, figures, and appendices, as appropriate. The report may include references to other studies performed by the Planning Coordinator or by utilities within the Planning Coordinator Area that are relevant to the Area Transmission Review, with appropriate excerpts from those studies.

The documentation required for an Interim Review should be in the form of a short summary report (normally not exceeding 5 pages), containing a description of system changes and a brief assessment on their impact on the **reliability** of the interconnected **bulk power system**

8.0 Task Force Follow-Up Procedures

8.1 Once a Planning Coordinator has presented its Transmission Review report to the TFSS, TFSS will review the Planning Coordinator's report and any supporting documentation and consider whether to accept the report as complete and in full conformance with these Guidelines :

a. If the report is found to be unacceptable, TFSS will indicate to the Planning Coordinator the specific areas of deficiency, and request the Planning Coordinator to address those deficiencies.

b. If there is no concurrence about the results and conclusion(s) of the Planning Coordinator's Review, TFSS will indicate to the Planning Coordinator the specific areas of disagreement, and work with the Planning Coordinator to try to achieve concurrence. If agreement has not been reached within a reasonable period of time, TFSS will prepare a summary of the results of its review, and present the summary to the TFCP.

c. If the report is considered as complete and in full conformance with these Guidelines, TFSS will accept the report.

8.2 If the Area Transmission Review indicates an overall **bulk power system** reliability concern (not specific to the Planning Coordinator's planned bulk power transmission system), TFSS will consider what additional studies may be

necessary to address the concern, and prepare a summary discussion and recommendation to the Task Force on Coordination of Planning

8.3 Upon completion of an Area Review, TFSS will report the results of the review to the Task Force on Coordination of Planning. The TFCP will then review and vote on the completeness and acceptability of the Area Transmission Review and report its finding to the Reliability Coordinating Committee for a final review and approval.

Appendix C - Procedure for Testing and Analysis of Extreme Contingencies

1.0 Introduction

Extreme **Contingencies** (ECs) are tested "as a measure of system strength" in order to identify potential patterns of weakness in the bulk power transmission system. This procedure for the testing and analysis of ECs should be used when testing ECs for NPCC studies or studies submitted for NPCC review.

This procedure applies to transmission planning studies that consider the overall performance of the interconnected systems of the NPCC Planning Coordinator Areas. It principally applies to NPCC - wide studies of the **bulk power system** and generally does not apply to studies normally conducted by NPCC Transmission Planner and Planning Coordinators that concentrate on individual or a limited number of facilities. This procedure also applies to Area Transmission Reviews, and may be applicable to other studies conducted by the Transmission Planner and Planning Coordinators, and even to individual facility investigations, where such studies and investigations consider the overall performance of the interconnected systems of the NPCC Planning Coordinator Areas. Certain Transmission Planners or Planning Coordinators may elect to completely mitigate the effects of specific ECs.

Finally, this procedure should be followed in multi-regional studies in which NPCC is an active participant, to the extent that this is within the scope of such multi-regional efforts.

2.0 Choosing Contingencies for Testing

The ECs are defined as per **Requirement R9.** Testing should focus on those ECs expected to have the greatest potential effect on the interconnected system. Particular attention should be paid to **contingencies** which would result in major angular power shifts, e.g., interruption of shorter transmission paths carrying heavy power flows, leaving longer transmission paths as the only remaining paths. Additionally, **contingencies** which would result in reversal of major power transfers, e.g. loss of major ties in a neighboring region or Area when said region or Area was transferring power away from the area of interest, should be considered for their impact in subjecting the system to severe power swings. In considering specific **contingencies** to be investigated in an NPCC study, all relevant testing done at the Transmission Planner and Planning Coordinator level should first be reviewed.

In general, a **contingency** in a particular Planning Coordinator Area should be studied, if requested by any other Transmission Planner or Planning Coordinator, based on a reasonable surmise that the requesting Entity may be adversely affected.

3.0 Modeling Assumptions

As referenced in Table 2, performance assessment “i” for **R9**, the assumed generation dispatch, transfers levels, load levels and **load** representation are major considerations in EC tests. It is not the intent to test the worst imaginable extreme, but EC tests should be severe.

The specification of appropriate **load** representation applies to long term stability tests or post-transient power flows as well as **transient stability** tests.

4.0 Evaluating Individual Test Results

A question in evaluating the results of a particular test run is - “Does the system "pass" or "fail" for this **contingency**?” While in the final analysis this is a matter of informed engineering judgment, factors which should be considered include:

1. Lines or transformers loaded above **short time emergency ratings**,

2. Buses with voltage levels in violation of **applicable emergency limits**, (which vary depending on the location within the system),

3. Magnitude and geographic distribution of such overloads and voltage violations across the system,

4. Transient generator angles, frequencies, voltages and power,

5. Operation of Dynamic Control Systems and **Special Protection Systems** (**SPS**),

6. Oscillations that could cause generators to lose synchronism or lead to dynamic instability,

7. Net loss of source resulting from any combination of loss of synchronism of one or more units, generation rejection or runback initiated by SPS, or any other defined system separation,

8. Identification of the extent of the Planning Coordinator Area (s) involved for any indicated instability or islanding (the involvement of more than one Planning Coordinator Area, should be a major consideration),

9. **Relay** operations or the proximity of apparent impedance trajectories to **relay** trip characteristics,

10. The angle across opened breakers,

11. Adequacy of computer simulation models and data.

Finally, a judgment should be attempted as to whether a "failure" is symptomatic of a basic system weakness, or just sensitivity to a particular EC. For example, should failures turn up for several EC tests in a particular part of the system, it is likely that a basic system weakness has been identified.

The loss of portions of the system should not necessarily be considered a failed result, provided that these losses do not jeopardize the integrity of the overall **BPS.**

NPCC study groups should avoid characterizations like "successful" and "unsuccessful" when commenting on individual runs. Rather, the specific initial conditions directly causing or related to the failure, the complete description of the nature of the failure (e.g., voltage collapse, instability, system separation, as well as the facilities involved), and the extent of potential impact on other Planning Coordinator Areas should be reported.

5.0 Evaluating the Results of EC Tests

EC test reports should focus on those portions of the system in which basic system weaknesses may be developing, rather than on the results of one specific **contingency**.

Any patterns of weaknesses should be identified, which may include reference to earlier NPCC studies and/or Transmission Planner, Planning Coordinator or member system investigations. There is also a need to distinguish between a "failed" test which indicates sensitivity only to a particular **contingency** run and a "failed" test which indicates a more general system weakness (always keeping in mind the severity of possible consequences of the **contingency**). Actions taken by member systems, Transmission Planners or Planning Coordinators to reduce the probability of occurrence or mitigate the consequences of the **contingency** should also be cited.

NPCC follow-up, after publication of a final report, is appropriate only for instances of possible general system weakness. In these instances, the results should be specifically referred to the affected Transmission Planner(s) or Planning Coordinator(s) for further and more detailed investigation with subsequent reporting to NPCC.

Appendix D - Guidelines for Area Review of Resource Adequacy

1.0 Introduction

NPCC has established a Reliability Assessment Program to bring together work done by the NPCC and Planning Coordinators relevant to the assessment of **bulk power system reliability**. As part of the Reliability Assessment Program, each Planning Coordinator submits to the Task Force on Coordination of Planning its Area Review of Resource Adequacy, which is an annual assessment to demonstrate that the proposed resources of each NPCC Planning Coordinator will meet NPCC resource adequacy planning requirements, consistent with these guidelines. The Task Force is charged, on an ongoing basis, with reviewing and recommending NPCC Reliability Coordinating Committee approval of these reviews of **resource** adequacy of each Planning Coordinator Area of NPCC.

The NPCC role in monitoring conformance with the NPCC Directory #1 - *Design and Operation of Bulk Power System* is essential because under this criterion, each Planning Coordinator determines its resource requirements by considering interconnection assistance from other Planning Coordinators, on the basis that adequate **resources** will be available in those Planning Coordinator Areas. Because of this reliance on interconnection assistance, inadequate **resources** in one Planning Coordinator Area could result in adverse consequences in another Planning Coordinator Area.

It is recognized that all Planning Coordinators may not necessarily express their own **resource** adequacy criterion as stated in Requirements R4, R5, and R6 of the Directory #1 criteria. However, the Directory #1 criteria provide a reference point against which a Planning Coordinator's **resource** adequacy criterion can be compared.

2.0 Purpose of Presentation

The purpose of the presentation associated with a resource adequacy review is to show that each Planning Coordinator's proposed resources are in accordance with the NPCC Directory #1 - Design and Operation of the **Bulk Power System**. By such a presentation, the Task Force will satisfy itself that the proposed resources of each NPCC Planning Coordinator will meet the NPCC Resource Adequacy Requirements, as defined NPCC Directory #1, over the time period under consideration.

3.0 Format of Presentation and Report – Comprehensive Review

Each Planning Coordinator should include in its presentations and in the accompanying report documentation, as a minimum, the information listed below. At its own discretion, the Planning Coordinator may discuss other related issues not covered specifically by these guidelines.

3.1 Executive Summary

3.1.1 Briefly illustrate the major findings of the review.

3.1.2 Provide a table format summary of major assumptions and results.

3.2 Table of Contents

3.2.1 Include listing of all tables and figures.

3.3 Introduction

3.3.1 Reference the previous NPCC Area Review.

3.3.2 Compare the proposed resources and load forecast covered in this NPCC review with that covered in the previous review

3.4 Resource Adequacy Criterion

3.4.1 State the Planning Coordinator's resource adequacy criterion.

3.4.2 State how the Planning Coordinator criterion is applied; e.g., load relief steps.

3.4.3 Summarize resource requirements to meet the criteria for the time period under consideration. If interconnections to other Planning Coordinators and regions are considered in determining this requirement, indicate the value of the interconnections in terms of megawatts. In the calculation of available **resources**, supply- side resources from neighboring systems are limited to firm capacity backed purchases.

3.4.4 Provide either an estimate of the resources required to meet the NPCC criteria or a statement as to the comparison of the two criteria, if the Planning Coordinator criterion is different from the NPCC criterion

3.5 Resource Adequacy Assessment

3.5.1 Evaluate proposed resources versus the requirement to reliably meet projected electricity demand assuming the Planning Coordinator's most likely load forecast.

3.5.2 Evaluate proposed resources versus the requirement to reliably meet projected electricity demand assuming the Planning Coordinator's high load growth scenario.

3.5.3 Describe load and resource uncertainties on projected Planning Coordinator Area reliability and describe mechanisms to mitigate anticipated material adverse effects on reliability.

3.5.4 Describe anticipated effects from proposed major changes to market rules on Planning Coordinator Area reliability.

3.5.5 Summarize resource adequacy studies conducted since the previous Area Review, as appropriate

3.6 Reliability Impacts Due to Environmental Regulations and Fuel Supply Issues.

3.6.1 Discuss anticipated material adverse effects on reliability resulting from the proposed resources fuel supply and transportation.

3.6.2 Discuss anticipated reliability impacts related to an Area's compliance with State, Federal or Provincial requirements (such as environmental, renewable energy, or greenhouse gas reductions).

3.7 Mitigation Measures for Environmental Regulations and Fuel Supply Issues

3.7.1 Describe available mechanisms to mitigate anticipated reliability impacts of resource fuel supply, demand resource response, fuel transportation issues and/or environmental considerations.

4.0 Format of Presentation and Report – Annual Interim Review

The Annual Interim Review should include a reference to the most recent Comprehensive Review; a listing of major changes in: facilities and system conditions, load forecast, generation resources availability; related fuel supply and transportation information, environmental considerations, demand response programs, transfer capability and emergency operating procedures. In addition, the assessment should also include a comparison of major changes in market rules, implementation of new rules, locational

requirements, and installed capacity requirements. Finally, the report should include a brief impact assessment and an overall summary.

The Planning Coordinator will provide a brief assessment of the impact of these changes on the reliability of the interconnected **bulk power system**. This assessment should be based on engineering judgment, internal system studies and appropriate joint interconnected studies. To the extent that engineering judgment or existing studies can be used to clearly demonstrate that a Planning Coordinator Area is expected to meet the NPCC resource adequacy criterion, detailed system LOLE studies are not required.

The documentation for the Annual Interim Review should be in the form of a summary report (normally not exceeding three to five pages.)

Sections A and B should describe the reliability model and program used for the resource adequacy studies discussed in Section 3.5. Section C should describe the Task Force follow-up procedures.

A. Description of Resource Reliability Model

1.1 Load Model

1.1.1 Description of the **load** model and basis of period **load** shapes.

1.1.2 How **load** forecast uncertainty is handled in model.

1.1.3 How the electricity demand and energy projections of interconnected entities within the Planning Coordinator Area that are not members of the Planning Coordinator Area are addressed.

1.1.4 How the effects (demand and energy) of demand-side management programs (e.g., conversion, interruptible demand, direct control **load** management, demand (**load**) response programs) are addressed.

1.2 Supply Side Resource Representation

1.2.1 Resource Ratings

1.2.1.1 Definitions.

1.2.1.2 Criteria for verifying **ratings**. Reference NPCC Directory#9 Verification of Gross and Net Real Power Capability and Directory#10 Verification of Gross and Net Reactive Power Capability.

1.2.2 Unavailability Factors Represented

1.2.2.1 Type of unavailability factors represented; e.g., forced outages, planned outages, partial derating, etc.

1.2.2.2 Source of each type of factor represented and whether generic or individual unit history provides basis for existing and new units

1.2.2.3 Maturity considerations, including any possible allowance for in-service date uncertainty.

1.2.2.4 Tabulation of typical unavailability factors.

1.2.3 Purchase and Sale Representation

1.2.3.1 Describe characteristics and level of dependability of transactions.

1.2.4 Retirements.

1.2.4.1 Summarize proposed retirements.

1.3 Representation of Interconnected System in Multi-Area Reliability Analysis, including which Planning Coordinator Areas and regions are considered, interconnection capacities assumed, and how expansion plans of other Planning Coordinators and regions are considered.

1.4 Modeling of Variable and Limited Energy Sources.

1.5 Modeling of Demand Side Resources and Demand (Load) Response Programs.

1.5.1 Description should include how such factors as in-service date uncertainty, **rating**, availability, performance and duration are addressed.

1.6 Modeling of all Resources.

1.6.1 Description should include how such factors as in-service date uncertainty; capacity value, availability, **emergency** assistance, scheduling and deliverability are addressed.

1.7 Other assumptions i.e., internal transmission limitations, maintenance over-runs, fuel supply and transportation and environmental constraints.

1.8 Incorporate the reliability impacts of market rules.

B. Other Factors, If Any, Considered in Establishing Reserve Requirement Documentation

The documentation required to meet the requirements of the above format should be in the form of summaries of studies performed within a Planning Coordinator Area, including references to applicable reports, summaries of reports or submissions made to regulatory agencies.

C. Task Force Follow-Up Procedures

Once a specific Planning Coordinator has made a presentation or a series of presentations to the Task Force on Coordination of Planning, the latter shall:

1.1 Prepare a brief summary of key issues discussed during the presentation.

1.2 Note where further information was requested and the results of such further interrogations.

1.3 Note the specific items that require additional study and indicate the responsibilities for undertaking these studies.

1.4 Recommend to the Reliability Coordinating Committee whether the Resource Adequacy Review is suitable for approval.

Appendix E - Guidelines for Requesting Exclusions to Simultaneous Loss of Two Adjacent Transmission Circuits on a Multiple Circuit Tower.

1.0 Introduction

Directory #1 allows for requests for exclusion from the simultaneous loss of two adjacent transmission circuits on multiple circuit towers on the basis of acceptable risk. All exclusions must be reviewed by the applicable Task Forces and approved by the Reliability Coordinating Committee (RCC). An acceptance of a request for exclusion is dependent on the successful demonstration that such exclusion is an acceptable risk. These guidelines describe the procedure to be followed and the supporting documentation required when requesting exclusion, and establishes a procedure for periodic review of exclusions of record.

2.0 Documentation

The documentation supporting a request for exclusion to the Criteria includes the following:

2.1 A description of the facilities involved, including geographic location, length and type of construction, and electrical connections to the rest of the interconnected power system;

2.2 Relevant design information pertinent to the assessment of acceptable risk, which might include: details of the construction of the facilities, geographic or atmospheric conditions, or any other factors that influence the risk of sustaining the loss of adjacent transmission circuits on a multiple circuit tower;

2.3 An assessment of the consequences of the loss of adjacent transmission circuits on a multiple circuit tower, including, but not limited to, a discussion of levels of exposure and probability of occurrence of **significant adverse impact** on the **bulk power system** ;

2.4 For existing facilities, the historical outage performance, including cause, for such **contingencies** on the specific facility (facilities) involved as compared to that of other multiple circuit tower facilities;

2.5 For planned facilities, the estimated frequency of adjacent transmission circuit multiple circuit tower **contingencies** based on the historical performance of facilities of similar construction located in an area with similar geographic climate and topography.

3.0 Procedure for obtaining an Exclusion

The following procedure is used to obtain an exclusion:

3.1 The entity requesting the exclusion (the Requestor) submits the request and supporting documentation to the Task Force on System Studies (TFSS) after acceptance has been granted by the Requestor's own Planning Coordinator, if such process is applicable.

3.2 TFSS reviews the request, verifies that the documentation requirements have been met, and determines the acceptability of the request.

3.3 If TFSS deems the request acceptable, TFSS requests the Task Force on Coordination of Planning (TFCP), the Task Force on Coordination of Operation (TFCO), and the Task Force on System Protection (TFSP) to review the request. The Requestor provides copies of the request and supporting documentation to the other Task Forces as directed by TFSS. If additional information is requested by the other Task Forces as part of their assessment, the Requestor provides this information directly to the interested Task Force, with a copy to the TFSS. The other Task Forces review the request and indicate their acceptance or non-acceptance to TFSS.

3.4 If all Task Forces deem the request for exclusion acceptable, the TFSS will forward a recommendation for approval to the RCC.

3.5 Exclusion requests will be effective upon approval by the RCC.

Appendix F – Procedure for Operational Planning Coordination

1.0 Introduction

The Reliability Coordinators (RC) of the Northeast Power Coordinating Council, Inc. (NPCC) require access to the security data specified in this procedure in order to adequately assess the reliability of the NPCC **bulk power system**. All users of the electric systems, including market participants, should supply such data to the NPCC Reliability Coordinators. Coordination among and within the Reliability Coordinator Areas (RC Area) of NPCC is essential to the reliability of interconnected operations. Timely information concerning system conditions should be transmitted by the NPCC RC Areas to other RC Areas as needed to assure reliable operation of the **bulk power system**. One aspect of this coordination is to ensure that adjacent RC Areas and neighboring systems are advised on a regular basis of expected operating conditions, including generator, transmission and system **protection**, including Type I **special protection system,** outages that may materially reduce the ability of an RC Area to contribute to the reliable operation of the interconnected system, or to receive and/or render assistance to another RC Area. To the extent practical, the coordination of outage schedules is desirable in order to limit the severity of such impacts.

To ensure that there is effective coordination for system **reliability** concerns, this document establishes procedures for the exchange of information regarding load/capacity forecasts, including firm sales and firm purchases, generator outage schedules, and transmission outage schedules for those **elements** that may have an adverse impact on other RC Area(s). It also details general action that may be taken to improve the communication of problems as well as specific topics that may be discussed in regularly scheduled conference calls or ad -hoc conference calls arranged in anticipation of problems such as capacity deficiency or inadequate light load margin in one or more RC Areas.

NPCC participants and other recipients of the information provided by processes in this guideline should adhere to the NPCC Critical Energy Infrastructure Information Non – Disclosure agreement.

2.0 Load/Capacity Forecasts

2.1 Twice yearly by May 15th and November 15th respectively, the Operations Planning Working Group (CO 12) will perform a summer and winter assessment for the next season.

The results will be reviewed by the NPCC TFCO and the NPCC Reliability Coordinating Committee (RCC) during the spring and autumn meetings of both groups and documented in the summer and winter NPCC Reliability Assessment reports.

2.2 Each week, each RC Area will review its weekly net resource capacity margin, as defined in Attachment A, for the twelve weeks to follow and forward the information to the NPCC Staff for distribution to all NPCC RC Areas. If an NPCC RC Area identifies a deficiency or light load condition, the RC Area should identify the cause(s) and mitigation measures that have been implemented, or will be implemented, to manage the issue.

3.0 Generator Outage Coordination

3.1 Each RC Area should exchange current and expected generator outages that may have a significant impact on an adjacent RC Area or neighboring systems or a significant impact on the transfer capability between RC Areas.

4.0 Transmission Outage Coordination

4.1 Advance Planning of Transmission Facility Outages

Each RC should exchange critical transmission **element** outages as identified in the coordination agreements with their interconnected neighbors, **elements** identified on the Facilities Notification List and multiple transmission **element** outages that may have an adverse impact on external energy transfers. Each Reliability Coordinator shall minimize the duration of outages to facilities that impact inter-Reliability Coordinator Areas.

4.2 Facilities Notification List

The NPCC Facilities Notification List, Attachment D, has two components:

1) the NPCC Transmission Facilities Notification List; and
2) the list of NPCC Type I **special protection systems**.

The Facilities Notification List is developed by each RC Area and specifies all facilities that, if removed from service, may have a significant, direct or indirect impact on another RC Area's transfer capability. The cause of such impact might include stability, voltage, and/or thermal considerations.

Prior to October 1st of each year, each RC Area will review and update its Facilities Notification List and coordinate necessary changes with other appropriate NPCC RC Areas. Prior to January 1st, and after review by the TFCO, the jointly developed, updated and approved Facilities Notification List will be posted on the NPCC secure website.

It should be noted that revisions to the Facilities Notification List will not follow the NPCC Process for Open Review due to the secure nature of the information

contained, and Attachment D is not openly published with this Procedure.

A temporary reconfiguration of the network may result in an outage to one or more facilities not listed in Attachment D having an impact on other NPCC RC Areas. It is the responsibility of the RC experiencing the condition to notify impacted RCs in a timely manner and provide updated status reports during the condition.

4.3 Notifications of Transmission **Element** Outages:

4.3.1 Notification requirements for Transmission **Element** Outages should be defined in interconnection coordination agreements. The time frames identified below are the minimum notification requirements.

4.3.2 Reliability Coordinators will advise affected RCs of all planned and unplanned outages of **elements** on the Facilities Notification List and those multiple transmission **element** outages that may have an adverse impact on external energy transfers.

All outages to equipment listed in the Facilities Notification List and those multiple transmission **element** outages that may have an adverse impact on external energy transfers should be planned with as much advance notice as practical.

Normally, notification for outages on **elements** covered by this instruction will be submitted to the appropriate RC Areas at least two (2) working days prior to the time the **element** is to be taken out of service.

When an RC Area receives an outage notification from another RC Area, prompt attention will be given to the notification and appropriate comments rendered.

4.3.3 An RC Area will not normally remove from service any transmission **elements,** which might have a **reliability** impact on an RC Area without prior notification to and appropriate review by that RC Area. In the event of an **emergency** condition, each RC Area may take action as deemed appropriate. Other RC Areas should be notified immediately.

An RC Area will make every effort to reschedule routine (non-emergency) transmission outages that severely degrade the reliability of an adjacent RC Area or neighboring system.

4.3.4 Each RC Area will advise the other affected RC Areas of any **protection** outage associated with RC Area tie line facilities Coordination agreements may identify additional reporting requirements associated with **protection** outages.

5.0 Specific Communications

Conditions in an RC Area that may have an impact on another RC Area should be communicated in a clear and timely manner. Specific communications are conducted as follows:

5.1 Weekly

Each Thursday a conference call will be initiated by the NPCC Staff to discuss operations expected during the seven-day period starting with the following Sunday. Operations personnel from the NPCC RC Areas and, as necessary, adjacent RC Areas will participate. In advance of the conference call, each RC Area will prepare the data specified in Attachments A and B, and forward it to the NPCC Staff a minimum of one hour in advance of the scheduled call. The completed "NPCC Weekly Conference Call Generating Capacity Worksheet," Attachment B, together with the list of "Twelve Weeks Projections of Net Margins," will be forwarded to the conference call participants by the NPCC Staff.

Each RC will review its weekly capacity margins for the next twelve week period. If a deficiency or light load condition is identified, the RC will identify the cause of the deficiency or light load condition and discuss proposed mitigation measures.

The NPCC Staff will prepare Conference Call Notes that will be forwarded to the conference call participants and members of the TFCO by the following Friday afternoon.

Items of particular concern that should be addressed during the weekly conference call are described in Attachment C.

5.2 Emergency Preparedness Conference Call

Whenever adverse system operating or weather conditions are expected, any RC Area may request the NPCC Staff to arrange an Emergency Preparedness Conference Call (NPCC Document C-01) to discuss operating details with appropriate operations management personnel from the NPCC RC Areas and neighboring systems.

5.3 Daily Conference Calls

Each of the NPCC Reliability Coordinator Area control rooms participate in a regularly scheduled daily conference call. The goal of this call is to alert NPCC Reliability Coordinators of any potential emerging problems. Subjects for discussion are limited to credible events which could impact the ability of a

Reliability Coordinator to serve its load and meet its operating reserve obligations, or which would impose a burden to the Interconnection.

Procedure for Operational Planning Coordination – Attachment A

Load and Capacity Table Instructions and Generating Capacity Worksheet Instructions

Week Beginning	The seven day period for which data is to be reported is defined as starting with the Sunday following the conference call through the following Saturday.
Installed Generating Capacity (Line Item 1)	Include all available generation at its maximum demonstrated capability for the appropriate seasonal capability period.
Other Generating Capacity(Line Item 2)	Include all available generation not included in Item#1. This item includes, but is not limited to, co-generators, small power producers and all other nonutility electricity producers, such as exempt wholesale generators who sell electricity.
Firm Purchases (Line Item 3)	Include only those transactions where capacity is delivered. Exclude “energy only” transactions.
Firm Sales (Line Item 4)	Include only those transactions where capacity is delivered. Exclude “energy only” transactions.
Net Capacity (Line Item 5)	Add Installed Generating Capacity and Firm Purchases. Subtract Firm Sales. (Line 1+Line 2-Line3)
Peak Load Forecast (Line Item 6)	The peak load forecast along with the day during which the peak is expected to occur should be the best estimate of the RC Area’s maximum peak load exposure anticipated for the week reported.
Available Reserve (Line Item 7)	Subtract Peak Load Forecast from Net Capacity. (Line 4-Line5.)
Demand Side Management (Line Item 8)	Include only maximum capability which can be obtained by operator initialization within four (4) hours.

Attachment A (continued)	
Known Unavailable Capacity (Line Item 9)	Include all known outages, as well as those deratings or unit outages presently forced out, unavailable, on extended cold standby or which are anticipated to remain out of service. This would also include capacity unavailable due to transmission constraints.
Net Reserve (Line Item 10)	Available Reserve plus Demand Side Management minus Known Unavailable Capacity. (Line 6+Line 7-Line 8)
Required Operating Reserve (Line Item 11)	The methodology used by each RC Area in calculating operating reserves should, at a minimum, meet the requirements of NPCC Directory # 5, "Reserve." Methodologies differing from the Directory #5 requirements should be clarified in Attachment B, "NPCC Weekly Conference Call Generating Capacity Worksheet," under the tab for "Operating Reserve."
Gross Margin (Line Item 12)	Subtract Required Operating Reserve from Net Reserve. (Line 9-Line 10)
Unplanned Outages (Line Item 13)	Estimate the amount of generating capacity which will be unavailable. This quantity should be based on historical averages for forced outages and deratings.
Net Resource Capacity Margin (Line Item 14)	Subtract Unplanned Outages from Gross Margin. A positive value reflects surplus reserve. A negative value reflects a deficiency. (Line 11-Line 12)
Forecast High / Low Temperatures and Days (Line Item 15)	Include the expected high and low temperatures for the RC Area for the week, and indicate the day on which they are expected to occur.

Attachment A (continued)	
Seasonal High / Low Temperatures (Line Item 16)	Include the expected high and low forecast seasonal temperatures for the RC Area.
Minimum Load Forecast (Line Item 17)	The minimum load forecast, indicating the day on which it is expected to occur should be the best estimate of the RC Area's minimum load exposure anticipated for the week reported.
Minimum Resources (Line Item 18)	The Minimum Resources are the Reliability Coordinator Area's total expected on-line generator minimum output capability and must-take purchases.
Light Load Margin (Line Item 19)	Subtract Minimum Resources from Minimum Load Forecast. A negative number indicates a light load condition. (Line 17-Line 18)

Procedure for Operational Planning Coordination – Attachment B

NPCC Weekly Conference Call Generating Capacity Worksheet

The "NPCC Weekly Conference Call Generating Capacity Worksheet" is an active spreadsheet used each week to assist in the calculation of the data discussed during the weekly conference call. A blank template is available from the NPCC office.

Procedure for Operational Planning Coordination - Attachment C

CONDITIONS FOR DISCUSSION

Items of particular concern that should be discussed during a conference call can include, but are not limited to, the following:

- anticipated weather;
- largest first and second contingencies;
- operating reserve requirements and expected available operating reserve;
- capacity deficiencies;
- potential fuel shortages or potential supply disruptions which could lead to energy shortfalls;
- light load margins;
- general and specific voltage conditions throughout each system or RC Area;
- status of short term contracts and other scheduled arrangements, including those that impact on operating reserves;
- additional capability available within twelve hours and four hours;
- generator outages that may have a significant impact on an adjacent RC Area or neighboring system;
- transmission outages that may have an adverse impact on external energy transfers;
- potential need for emergency transfers;
- expected transfer limits and limiting elements;
- a change or anticipated change in the normal operating configuration of the system, such as the temporary modification of relay **protection** schemes so that the usual and customary levels of **protection** will not be provided, or the arming of **special protection systems** not normally armed, or the application of abnormal operating procedures; and
- update of the abnormal status of NPCC Type I **special protection systems** forced out of service

Attachment D

NPCC Facilities Notification List

Attachment D is not publicly available due to the confidential nature of the information presented.

Appendix G - Procedures for Inter Reliability Coordinator Area Voltage Control

1.0 Introduction

This Procedure provides general principles and guidance to Reliability Coordinators and Transmission Operators for effective inter- Transmission Operator Area voltage control, consistent with the NPCC, Directory #1, "Design and Operation of the **Bulk Power System**". Specific methods to implement this Procedure may vary among Reliability Coordinators and Transmission Operators, depending on local requirements. Coordinated inter- Transmission Operator Area voltage control is necessary to regulate voltages to protect equipment from damage and prevent voltage collapse. Coordinated voltage regulation reduces electrical losses on the network and lessens equipment degradation. Local control actions are generally most effective for voltage regulation. Occasions arise when adjacent Reliability Coordinators and Transmission Operators can assist each other to compensate for deficiencies or excesses of **reactive power** and improve voltage profiles and system security.

2.0 Principles

Each Reliability Coordinator and Transmission Operator operates, in accordance with NPCC, Directory #1, "Design and Operation of the **Bulk Power System**" criteria, their own individual or joint operating policies, procedures and applicable interconnection agreements. Adjacent Reliability Coordinators and Transmission Operator should be familiar with the respective criteria and procedures of their neighboring Reliability Coordinators and Transmission Operator Areas, and should mutually agree upon procedures for inter- Transmission Reliability Coordinator and Operator Area voltage control.

In the event the system state changes to a condition that requires a voltage or reactive corrective action, the Reliability Coordinator and Transmission Operator for the Area in which the condition is originating from should immediately take corrective action. If the corrective control actions are ineffective, or the Reliability Coordinator and Transmission Operator for the Area have insufficient reactive resources to control the problem, assistance may be requested from other Reliability Coordinators and Transmission Operator Areas.

Whether inter- Reliability Coordinator and Transmission Operator Area voltage control is carried out through specific or general procedures, the following should be considered and implemented if applicable:

2.1 To effectively coordinate voltage control, location and placement of metering for **reactive power** resources and voltage controller status should be the same between adjacent Reliability Coordinators and Transmission Operator Areas;

2.2 the availability of **voltage regulating transformers** in the proximity of **tie lines**;

2.3 voltage levels, limits, and regulation requirements for stations on either side of an inter- Reliability Coordinator and Transmission Operator Area interface;

2.4 the circulation of **reactive power** (export at one tie point in exchange for import at another);

2.5 **tie line** reactive losses as a function of active **power** transfer;

2.6 the sharing of the reactive requirements of **tie lines** and series regulating equipment (either equally or in proportion to line lengths, etc.);

2.7 the transfer of **reactive power** from one Reliability Coordinator and Transmission Operator Area to another

2.8 reactive **reserve** of on-line generators;

2.9 shunt reactive device availability and switching strategy;

2.10 **static VAR compensator** availability, reactive **reserve**, and control strategy;

2.11 each Reliability Coordinator and Transmission Operator Area should anticipate voltage trends and initiate corrective action in advance of critical periods of heavy and light **loads.**

2.12 Each Reliability Coordinator and Transmission Operator Area should maintain a mix of static and dynamic resources, including reactive **reserves**

3.0 Procedure for Triennial Monitoring and Reporting of Inter-Area Voltage Control

3.1 On, or shortly before, the first of July, the Task Force Coordination of Operations (TFCO) Secretary will write to each TFCO member, requesting a written response by the end of July in the form of:

a) A copy of any new or revised procedures, principles, or understandings (such as minutes of an operating committee meeting between Reliability Coordinators and Transmission Operator Areas) between the reporting Reliability Coordinator and adjacent Reliability Coordinators, or,

b) a response indicating no change to existing procedures, principles, or understandings currently on file at NPCC.

3.2 The TFCO Secretary will summarize the responses and will forward it to TFCO members at least two weeks prior to the October TFCO meeting.

3.3 Following TFCO review and acceptance of the responses, the TFCO Chairman will forward the summary to the Chairman of the Reliability Coordinating Committee (RCC) for informational purposes. This will normally be forwarded three weeks prior to the next regularly scheduled RCC meeting.

Subject: Posting of TFSP Technical Comparison and Directory#3 Retirement Recommendation

NPCC Full Member Committee:

On March 20th, 2014 FERC issued a Final Rule approving Reliability Standard PRC -005-2 *Protection System Maintenance*. The revised standard provides latitude for time and performance based relay maintenance programs in addition to incorporating the new definition of Protection Systems.

Concurrent with the development of PRC -005-2 the NPCC Task Force on System Protection (TFSP) has completed a technical evaluation of the criteria in Directory#3 *Maintenance Criteria BPS Protection* in order to insure that the criteria is not inconsistent with the revised version of PRC -005-2.

The TFSP comparison examined all aspects of the Directory#3 criteria including : 1) Maintenance on Protection Assemblies 2) DC Circuit Trip Testing 3)Battery Bank and Charger Testing 4) Breaker Trip Testing 5) Telecommunication Testing 6) UFLS Systems Testing.

Accordingly, the TFSP has concluded that subject to the Canadian Provincial adoption of PRC -005-2 and within NPCC no significant reliability gaps exist with regard to maintenance intervals and activities and the criteria in Directory#3 can be retired.

Please find attached the following documents for your review and comment:

- TFSP Technical Comparison and Recommendation.
- Mapping document demonstrating where the Directory#3 criteria maps to in PRC-005-2.
- A TFSP comment form containing questions designed to facilitate Member feedback to the TFSP.

In accordance with the NPCC Directory Development and Revision Manual the TFSP will review all comments in order to gauge Full Member sentiment on this issue and comments will be received for forty five days through July 7th, 2014.

The NPCC Open Process review may be accessed through the following link:

https://www.npcc.org/Standards/SitePages/NonStandardsList.aspx

Please contact me with questions regarding Directory content or document review.

Thanks.

TASK FORCE ON SYSTEM PROTECTION

Review of

NPCC BULK POWER SYSTEM MAINTENANCE CRITERIA - DIRECTORY NO. 3

As Compared to

NERC PROTECTION SYSTEM MAINTENANCE STANDARD PRC-005-2

And

Task Force on System Protection RECOMMENDATION to Retire DIRECTORY NO. 3

May 22, 2014

Executive Summary

The Northeast Power Coordinating Council (NPCC) has had a long history of establishing Regional reliability requirements for Operations, Planning and also for Bulk Power System protection maintenance. The original set of NPCC's Regional reliability requirements were first established in1969 and, through the years, NPCC has revised, maintained, and enforced this program of more stringent reliability requirements, part of which are contained in the NPCC Directory 3, "Bulk Power System Maintenance Criteria."

NPCC under the NERC Regional Delegation Agreement "RDA" must adhere to the NERC Rules of Procedure (ROP). In the current ROP, Appendix 2, NERC has defined Regional Criteria to mean *"..reliability requirements developed by a Regional Entity that are necessary to implement, to augment, or to comply with Reliability Standards, but which are not Reliability Standards. Such Regional Criteria may be necessary to account for physical differences in the Bulk Power System but are not inconsistent with Reliability Standards nor do they result in lesser reliability. Such Regional Criteria are not enforceable pursuant to NERC delegated authorities, but may be enforced through other available mechanisms. Regional Criteria may include specific acceptable operating or planning parameters, guides, agreements, protocols or other documents."* As part of NPCC's responsibilities under the RDA, NPCC must adhere to the ROP and continually evaluate the regional reliability requirements contained in the criteria documents against all new and revised NERC Reliability Standards. This evaluation must determine if, as defined above, the Regional reliability requirements need revision or continue to be needed to implement, augment or comply with Reliability Standards, and also to ensure that the Regional reliability requirements are not inconsistent with the Reliability Standards.

With the recent approval of the NERC Maintenance and Testing Standard PRC-005-2 by FERC set for implementation starting on April 1, 2015, the Task Force on System Protection (TFSP) has initiated and completed a comprehensive review of Directory 3 against the requirements of the PRC-005-2. This new results-based NERC standard contains a comprehensive set of maximum maintenance intervals and minimum maintenance activities for all BES protections. The review by TFSP was initiated upon approval of the PRC-005-2 by the NERC Board of Trustees and to fulfill the responsibilities as outlined in NPCC's RDA and the NERC ROP. In addition, with the more stringent version of NERC reliability standard requirements now appearing in PRC-005-2, it was identified by the TFSP that there may no longer be a justifiable reliability related need for continuance of the Regional reliability requirements contained in Directory 3. Additionally the TFSP identified that with the implementation of the new standard, entities within NPCC could be subjected to two sets of compliance requirements, one for NPCC BPS protections and one for BES protections (under the new BES definition).

TFSP has concluded that while some of the protection maintenance intervals specified in Directory 3 are more stringent than those in PRC-005-2, most of the maintenance interval increases specified in PRC-005-2 are either minor increases or justifiable based on technical merit. There are two protection system maintenance activities identified in PRC-005-2 that have significantly longer intervals than those in Directory 3, however, based on experience and judgment, TFSP believes that these extended intervals do not pose a significant risk to reliability. TFSP will initiate the addition of requirements to Directory 4 that will dictate additional monitoring for the two protection system components referenced above. These additional requirements will apply to new or modified NPCC BPS protections.

Based on this technical review, TFSP is recommending the retirement of the criteria portion of Directory 3. In addition, and in conformance with the NPCC Board of Directors expectation that the NPCC Regional reliability requirements are, and will remain cost effective. TFSP's review of PRC-005-2 vs. Directory 3 considered costs. This determination by TFSP to retire Directory 3 was also supported by cost-benefit considerations. The remaining Regional reliability requirements in Directory 3 will no longer be cost effective and of sufficient reliability benefit to retain (when also considering the above referenced revisions envisioned for Directory 4) upon implementation of PRC-005-2.

I. Background

In 1969, NPCC had established the Minimum Maintenance Practices for Protective Relays and Associated Devices. These minimum maintenance practices were based on the results of a special questionnaire/survey of maintenance practices of NPCC members and consideration of practices of utility companies outside of NPCC. This document served as a guide until 1986.

In 1986 this guide was renamed a Criteria document "A-4 Maintenance Criteria for Bulk Power System Protection". Its applicability was limited to those relays and associated devices comprising the protective relaying systems associated with the NPCC Bulk Power System, which was defined in the NPCC Bulk Power System Protection Philosophy, established in 1970, as the interconnected electrical network "comprising generation and transmission facilities of the member companies on which faults or disturbance can have a significant effect outside of the local area." Minimum maintenance of protective relay systems and associated devices includes verifying inputs and outputs, making visual inspections, checking for proper operating characteristics including a designated significant coordinating point, and performing trip tests as required to ensure satisfactory operation of the protective equipment as a system.

In 1995, NPCC implemented revised maintenance intervals for protective relays based on a report provided by the TFSP's SP-5 Working Group on the Bulk Power System Protection Maintenance Practices and Intervals. This comprehensive study, based on the Markov modeling technique and using actual members' data, resulted in a calculated optimal interval of approximately 10 years for microprocessor-based relays. Taking a very conservative approach, the interval was changed from 2 years for all protective systems to the following maintenance intervals which considered the protection design technology and the BPS element to be protected:

	Maintenance Intervals for Protection Technology		
Protection Groups for	Electromechanical	Solid-State	Microprocessor-Based
Transmission Line	2 years	2 years	4 years
Transformer, Bus, Shunt Reactor, and Capacitor	4 years	4 years	4 years
All other	2 years	2 years	2 years

In 2004, an update to the SP-5 study was performed by an Ad Hoc Working Group of TFSP members. The intervals for microprocessor-based relays were subsequently extended from 4 years to 6 years. Note that TFSP continued to take a cautious approach even though the updated study result reaffirmed the optimal interval to be approximately 10 years for all the protection groups based on the updated data for Mean-Time-To-Failure (MTTF) and probability of protection group failure being hidden (P_H) parameters.

In 2008, further revisions were made by the Task Force in an effort to align the NPCC criteria with the maintenance practices and intervals recommended in the NERC Technical Reference Paper on Protection System Maintenance developed by the NERC System Protection and Control Task Force (SPCTF). The SPCTF had also used the Markov model to calculate the optimal interval for microprocessor-based relays and had come up with similar conclusion as the NPCC Ad Hoc Working Group. The NPCC protection system maintenance criteria were then revised to incorporate the following six maintenance activities and intervals for all protection systems of the bulk power system were further extended as follows:

1. Protection Assembly Testing (modified as Table 1 below)
2. DC Circuit Trip Testing
3. Battery Banks and Chargers Testing
4. Breaker Trip Testing
5. Telecommunication Testing
6. Underfrequency Load Shedding and Generator Underfrequency Tripping

Table 1 - INTERVALS FOR PROTECTION ASSEMBLY TESTING

	Non-Self Monitored **Protection Assembly** Note (1)	Microprocessor-Based **Protection Assembly** Note (2)	Microprocessor-Based **Protection Assembly** Note (3)
All **Protection Groups**	**4 years**	**6 years**	**8 years**

Notes:

*(1) Non-Self Monitored **protection** assemblies include electromechanical **relays** and solid state **relays**.*

*(2) Microprocessor-based **protection** assemblies where the principal fault-sensing and logic components include self-monitoring or self- checking, and the failure alarm is annunciated to a 24/7 staffed Operations Center that can initiate an investigation of the problem.*

*(3) Microprocessor-based **protection** assemblies as per Note (2), plus additional self - monitoring or self- checking of ac voltage and current input integrity, and the failure alarm is annunciated to a 24/7 staffed Operations Center that can initiate an investigation of the problem.*

In 2009 Directory 3 was again reviewed through the NPCC Open Process ending with a number of clarifying and editorial changes and no changes to any of the existing testing requirements in the document itself. Additional language was also incorporated into Appendix B of the document to provide guidance that credit can be obtained for normal breaker operations if the equipment design permits verification and documentation of breaker tripping by each individual trip coil.

II. Review of NPCC Criteria against NERC Standard

In April 2013 NPCC Standard Staff conducted a preliminary comparison of the criteria contained within Directory#3 *Maintenance Criteria for BPS Protection* against the requirements in the PRC-005-2 *Protection System Maintenance* which at that time had just been approved by the NERC Board of Trustees. The comparison indicates instances where PRC-005-2 provides more granularity in the approach to testing of specific components within a protection system however there were instances where the D3 criteria appears to be more specific or more stringent than PRC-005-2.

A formal review of Directory 3 against PRC-005-2 was initiated by the TFSP at the November 2013 meeting and again at the January 2014 meeting. The results of TFSP's review for each requirement in Directory 3 are as follows:

Part 1 - Maintenance on Protection Assembly (Directory 3, Section 5.2) compared to Protective Relay (PRC-005-2, Table 1-1)

With testing intervals on Protection Assembly shown in Table 1 above, Directory 3 maintenance includes:

1. Making visual inspection
2. Verify inputs and outputs
3. For microprocessor based relays, confirm that the intended version of software is installed.
4. Verify correct protection operation
5. Verify the integrity of current and voltage transformers and associated circuitry. This verifies that the correct secondary quantities are input to the relay. For microprocessor relays, verify the internal analog inputs with an independent source.

<u>TFSP Review:</u> The testing and maintenance activities in Directory 3 and NERC PRC-005-2 are similar with the sole exception of the need for visual inspections in Directory 3. TFSP concluded that there is no explicit need to have this as an activity since it occurs

regularly in the course of protection maintenance and is likely represented in evidence as nothing more than a check-box.

The most significant difference is the 12-year maximum maintenance interval for monitored relays in PRC-005-2 vs. 6 years and 8 year intervals in Directory 3. However, Directory 3 allows for a 5 month grace period for the scheduled testing of protective relays. In order to meet the 12 year interval of PRC-005-2 (with no grace period) most entities will need to schedule this testing well in advance of the 12 year maximum interval or risk being in non-compliance. So in fact this is in alignment with the 10-year intervals derived in prior analysis by SP-5 and the ad hoc working group using the Markov model. TFSP concludes that the maximum maintenance intervals prescribed in PRC-005-2 are adequate for BPS protection.

As an added note, not all relay components in a microprocessor based relay are necessarily a part of the self-monitoring and that there is an IEEE working group on relay self-monitoring that will address this area.

Part 2 - DC Circuit Trip Test (Directory 3, Section 5.3) and Breaker Trip Test (Directory 3, Section 5.5) compared to Control Circuitry Associated with Protective Function (PRC-005-2, Table 1-5)

Directory 3, Section 5.3 requires DC Circuit Trip tests to verify the protection equipment operation from the trip outputs of the protection assembly up to the breaker trip coil at intervals of 4 years for non-monitored and 6 years for monitored DC circuits (6 years in cases where DC circuit continuity through to the trip coil is alarmed and annunciated upon loss of continuity to a 24/7 staffed operations center that can initiate an investigation of the problem).

Directory 3, Section 5.5 requires the testing of the breaker to trip via each trip coil every two years except for Nuclear plant BPS unit breaker trip tests where they shall be completed at an interval not to exceed three years.

<u>TFSP Review</u>: The table below compares the DC circuit tests prescribed in PRC-005-2 versus those found in Directory 3.

DC Circuit Tests	***PRC-005-2 Intervals***	***Directory 3 Intervals***
DC circuitry up to the trip coils (unmonitored)	*6*	*4*
DC circuitry up to the trip coils (monitored)	*6*	*6*
Actuators of circuit breakers(trip coils), interrupting devices, or mitigating devices	*6*	*2**
Electromechanical lockout devices (unmonitored)	*6*	*4*

Electromechanical lockout devices (monitored)	*6*	*6*
Unmonitored control circuitry	*12*	*4*
Monitored control circuitry	*None*	*6*

**3 years for BPS nuclear unit breakers*

Note that PRC-005-2 mandates operation of each trip coil on a 6 year interval compared to the 2 years for Directory 3. This appears to be a four years difference, however there are no grace periods allowed in PRC-005-2 meaning these tests would likely need to be scheduled on something less than a 6 year time frame. In addition, TFSP members consulted internal breaker experts at their utilities and the conclusion is that extended time for breaker trip coil testing does not pose a significant gap in reliability. In many cases, members do provide trip coil monitoring for breakers that are part of BPS protections and in light of this, TFSP will propose adding a requirement for trip coil monitoring in D4 to these breakers to enhance protection design reliability.

Although a large difference is shown for maximum maintenance intervals for unmonitored DC control circuitry between PRC-005-2, which allows for 12 years between testing periods and the 4 years mandated by Directory 3, TFSP review indicates that PRC-005-2 has taken the approach that DC wiring has a low probability of failure that does not require frequent maintenance. TFSP agrees with the approach taken in PRC-005-2. TFSP also has no data to support the necessity for the current 4 years testing interval required in Directory 3. In addition, a review of the NPCC Misoperations data from 2011 through the 3rd Quarter of 2013 by SP-7 indicated that of the 544 misoperations, 43, or approximately 8%, were caused by problems in the DC System. Almost all of these were unnecessary trips due to grounded wires, induced transients on DC wiring, or water damage. There was no evidence of failure to trip misoperations due to DC wiring. It is likely that very few of these misoperations would have been prevented by use of conventional DC circuit monitoring or increased maintenance frequency.

Part 3 - Battery Banks and Chargers Testing (Directory 3, Section 5.4) compared to Station DC Supply Tests (PRC-005-2, Tables 1-4(a) through 1-4(f))

Directory 3 requires monthly voltage verification of non-monitored station battery bank(s) and no testing required for monitored battery bank voltage alarms that are annunciated to a 24/7 staffed Operations Center that can initiate an investigation of the problem.

TFSP Review: The battery testing in PRC-005-2 is much more comprehensive. In addition an entity can take credit for increased battery monitoring to perform less direct maintenance. Increased monitoring results in a more reliable component overall so TFSP is supportive of this approach.

Part 4 – Breaker Trip Testing (Directory 3, Section 5.5)

TFSP Review: See Part 2 above.

Part 5 – Telecommunication Testing (Directory 3, Section 5.6) Compared to Communication Systems Testing (Table 1-2)

Section 5.6.1: Directory 3 requires testing of terminal equipment using the same intervals as for the protection assembly.

Section 5.6.2: Testing of channel health is required as follows:

> For telecommunication system channels that are not continuously monitored, the signal adequacy shall be tested every month and the ability of a channel to perform its intended function shall be verified every twelve months. An example of such a system is On/Off Power Line Carrier.
>
> For trip equipment which uses frequency shift keying (FSK) mode of communication and the channel (for example, Guard Signal) is continuously monitored, the ability to perform its intended trip function shall be verified every twelve months. Failure of the channel shall be annunciated to a 24/7 staffed Operations Center that can initiate an investigation of the problem.
>
> For telecommunication system channels that are continuously monitored and continuously provide verification of trip capability to an Operator, no additional testing is necessary. Failure of the channel or of the trip capability shall be annunciated to a 24/7 staffed Operations Center that can initiate an investigation of the problem.

TFSP Review:

The maintenance intervals and activities described in PRC-005-2 for the terminal teleprotection equipment are in alignment with maintenance activities for protective relays. The same rationale applies for both Directory 3 Section 5.6.1 and PRC-005-2 Table 2 so TFSP is satisfied with this approach for the same reasons as discussed in Part 1 above.

For telecommunication system channels that are not continuously monitored, PRC-005-2 requires testing at 4 month intervals as opposed to 1 month in Directory 3 Section 5.6.2. It is observed that this change does not create a significant reliability gap since there are no grace periods allowed in PRC-005-2. This means that maintenance activities must be scheduled well before the maximum maintenance intervals, likely in 2 month intervals or so, in order to ensure compliance.

For teleprotection equipment which uses frequency shift keying (FSK) mode of communication and the channel is continuously monitored by a guard signal, PRC-005-2 has established a philosophy that communication systems are analogous to the DC connection from the relay to the trip coil (p.85 of Supplementary Reference). Therefore the intervals established for unmonitored communication systems is set at 6 years, forcing more frequent maintenance than for monitored systems which is set at 12 years. This is a significant deviation from Directory 3 which requires yearly verification of channel performance. In Directory 3 this activity is entitled Channel Health but in reality, it is actually a check of terminal equipment performance in addition to channel health. TFSP believes more credit should be given in recognition for monitoring of channel health and supports the approach taken in PRC-005-2 for this activity. TFSP will propose adding a requirement to utilize only monitored teleprotection circuits in D4 to BPS protections to enhance protection design reliability. TFSP also noted that we now have formal thorough misoperations reporting framework at the NPCC and NERC levels. If as a result of increasing this maintenance interval, there is a noticeable increase in misoperations due to telecommunication equipment or communication channel failure, it will become evident to SP-7, TFSP, and/or NERC SPCS. These groups will then be tasked to address the issue.

It should be noted in PRC-005-2 fully monitored communication systems still must be verified every 12 years which is actually more stringent than Directory 3 which requires no testing.

Part 6 – Underfrequency Load Shedding and Generator Underfrequency Tripping (Directory 3, Section 5.7) Compared to Maintenance Activities and Intervals for Distributed UFLS and Distributed UVLS Systems Testing (Table 3)

Directory 3 requires testing of the UFLS relay on the same frequency as other BPS protection relays based on relay technology. However because of the distributed nature of this load shedding protection, DC circuit tests, DC battery/charger tests and breaker test trips need not take place more often than tests for other protections on that same breaker. For generators rated 20 MW and above, Directory 3 requires the correct calibration of generator underfrequency tripping relays be verified at an interval not exceeding that specified in Table1 above for the Protection Assembly.

<u>TFSP Review</u>: The testing requirements for UFLS in PRC-005-2 for protective relays are in alignment with intervals and activities for BES protective relays. PRC-005-2 does not require any testing of DC circuitry between the protective relay/EM auxiliary or lockout relays and the trip coils of non-BES devices. Elimination of this testing, which is required in Directory 3, does not pose a reliability risk because of the distributed nature of the underfrequency load shedding protection where random failures to trip do not

compromise the objectives of the UFLS program. TFSP concludes that the testing activities and intervals described in PRC-005-2 for UFLS are adequate.

Generator UF relays for generators part of the BES are included in PRC-005-2 and will be on the same maintenance schedule as other BES protective relays.

Conclusion and Recommendations

1. Most of the maximum maintenance intervals (and corresponding maintenance activities) identified in NERC standard PRC-005-2 are not vastly different than those intervals prescribed in NPCC Directory 3. The new results based continent wide standard is a large improvement over PRC-005-1 and is much more specific than its predecessor standard. Furthermore the intervals established in PRC-005-2 for maintenance on the relays themselves are very much in line with the comprehensive report furnished by the SP5 working group on the Bulk Power System Protection Maintenance Practices and Intervals, which was updated in 2004. This report was delivered to TFSP, who at the time, decided to initially take a conservative approach which NPCC members were willing to accept, with the understanding that data would be periodically reviewed with the intent to extend the maintenance interval if appropriate. The subsequent review in 2004 resulted in maintenance intervals being further extended from the original interval.

2. Two requirements in Directory 3 that are significantly more stringent than related PRC-005-2 requirements are:
   a) Section 5.5 - The ability of the breaker(s) to trip via each trip coil shall be verified every two years in Directory 3 vs. a maximum 6-year interval in PRC-005-2
   b) Section 5.6.2 - For trip equipment which uses frequency shift keying (FSK) mode of communication and the channel (for example, Guard Signal) is continuously monitored, the ability to perform its intended trip function shall be verified every twelve months vs. the 12 year testing requirement in PRC-005-2.

   For item 2a) above, TFSP determined that this is not a significant gap as there are no grace periods allowed in PRC-005-2 meaning these tests must be scheduled on something less than a 6 year time frame or the entity would risk violating this requirement. In addition, TFSP members consulted internal breaker experts at their utilities and the conclusion is that extended time for breaker trip coil testing does not pose a gap in reliability.

   For item 2b) above TFSP resolved that monitoring of communication circuit health should provide entities lengthier maintenance intervals. The current test specified in Directory 3 is actually a check of terminal equipment performance in addition to channel health.

   TFSP also noted that we now have formal thorough misoperations reporting framework at the NPCC and NERC levels. If as a result of increasing this

maintenance interval, there is a noticeable increase in misoperations due to telecommunication equipment or communication channel failure, it will become evident to SP-7, TFSP, and/or NERC SPCS. These groups will then be tasked to address the issue.

3. Based on this review, the Task Force intends to supplement the two items noted above with a proposal to enhance the design requirements in Directory 4 for these issues namely:

   - Establish design requirements for monitoring all BPS communication circuits used in protection systems with a provision for fail-safe alarms.
   - Establish design requirement for breaker trip coil monitoring on breakers used for BPS protections.

   TFSP acknowledges that these design requirements will not improve reliability of existing protection facilities; however, they will be applicable to new or revised BPS protections. The communication systems may also be controlled by a third party, thus may require members to mitigate any reliability issues as deemed appropriate by corrective actions in the analysis of protection system Misoperations.

In conclusion, TFSP determined from this review, comparing Directory 3 and PRC-005-2, that there would be minimal, if any impact to reliability of the NPCC Bulk Power System. TFSP recommends the following actions;

a. the criteria portion in Directory 3 containing the Regional reliability requirements, be retired effective April 1, 2015 to coincide with the FERC approved enforcement implementation start date of PRC-005-2,
b. Directory 4 be revised as discussed above prior to the retirement to ensure no reliability gaps exist
c. any remaining guideline or procedural document which may be of benefit to NPCC be retained as a resource document(s).

Proposed Mapping of NPCC Directory 3 - Maintenance Criteria for Bulk Power System Protection

Section	Criteria/Requirement in The Directory	PRC-005-2 Equivalent	Rationale/Justification
Section 5.1	**General criteria** (Criteria/requirement language not excerpted herein)	None. This Section can be removed since it does not stipulate any specific criteria or requirements.	No specific criteria or requirements. Sections 5.2 to 5.7 provide the specific criteria and requirements for protection system maintenance.
Section 5.2	**Protection Assembly Testing Requirement**s There are 5 sub-sections under this Section, and a Table 1 that specifies the maintenance intervals.	See below.	See below.
	5.2.1 Make visual inspections	None. This Section can be removed for reasons indicated under the Rationale column.	This maintenance activity is not required in the NERC PRC-005-2 standard. However, elimination of the requirement to actually record this activity does not pose a risk to reliability as other mandated testing activities would likely reveal deficiencies. In addition, this is an activity that is likely carried out anyway by entities in the course of protection maintenance to varying degrees.
	5.2.2 Verify inputs and outputs, 5.2.3 Confirm that the intended version of software is installed (microprocessor-based relays),	Table 1-1. These Sections can be removed.	The criteria/requirements in Sections 5.2.2 to 5.2.4 are covered by the verification details in Table 1-1 of the NERC PRC-005-2 standard.

Section	Criteria/Requirement in The Directory	PRC-005-2 Equivalent	Rationale/Justification
	5.2.4 Verify correct protection operation, 5.2.5 Verify the integrity of current and voltage transformers and associated circuitry. This verifies that the correct secondary quantities are input to the relay. For microprocessor relays, verify the internal analog inputs with an independent source.		
	Table 1 – Interval for Protection Assembly Testing (Not per verbatim) Requires that protection Assembly testing be performed on an interval not exceeding that specified in Table 1 for bulk power system protection groups. Table 1 stipulates that, for all protection groups, the maintenance interval for: Self Monitored Protection Assembly – 4 year Microprocessor-Based Protection Assembly – 6 years, where the principal fault-sensing and logic components include self monitoring or self checking, and the failure alarm is annunciated to a 24/7 staffed Operations Center that can initiate an investigation of the problem. Microprocessor-Based Protection Assembly – 8 years for additional self monitoring or self checking of ac voltage and current input integrity, and the failure alarm is annunciated to a 24/7 staffed Operations Center that can initiate an investigation of the problem.	Table 1-1. Table 1 of Directory 3 can be removed.	There are no grace periods allowed in the NERC PRC-005-2 standard, meaning that maintenance activities must be scheduled well before the maximum maintenance intervals, likely 18 months or so or the entity will risk non-compliance. The perceived differences in maintenance intervals on protective relays between Directory 3 and PRC-005-2 will not pose a reliability gap. Also, similar to the previous work performed by both NPCC SP-5 WG and the Ad Hoc working group back in 2003, the NERC SPCS and PRC-005-2 drafting team used data from across NERC as well as Markov modeling – which were used to determine optimal maintenance intervals. The numbers that were generated were in line with the previous recommendations from SP-5 WG and the Ad Hoc working group: 10 years for transmission lines and 10 years for transformers, buses, etc. On this basis, it is TFSP's view that the intervals established in PRC-005-2 are justified. .
Section 5.3	**Protection Group DC Circuits Testing Requirements** Tests performed in Section 5.2 above verify the operation of the ac signaling, measuring relays, and verify a protection assemblies' ability to initiate a trip output(s). However, to	Table 1-5. This Section can be removed.	While the NPCC criteria appear to be more stringent than the NERC PRC-005-2 standard, which allows for 12 years between testing periods for all DC circuitry, PRC-005-2 has taken the approach that DC wiring is a low risk item that does not require more frequent maintenance as the risk

Section	Criteria/Requirement in The Directory	PRC-005-2 Equivalent	Rationale/Justification
	verify operation of the protection group as a system, DC circuit testing is required. These tests verify the protection equipment operation from the trip outputs of the protection assembly up to breaker trip coils. DC circuit testing can be achieved by verifying overlapping protection group equipment zones, normally bound by test switches, or by test tripping the protection group. DC circuit test tripping shall be performed on an interval not exceeding that specified in Table 2 for bulk power system protection groups: Table 2 (Not per verbatim) For dc circuit tripping, the testing intervals shall be 4 years and 6 years for non-monitored and monitored circuitry, respectively.		posed by failed wiring is low. TFSP agrees with the approach taken in PRC-005-2 and has no evidence to support the need for more frequent maintenance intervals for DC circuit testing. Misoperations data going back to 2011 was reviewed and there was no evidence of failure to trip misoperations due to DC wiring.
Section 5.4	**Battery Banks and Chargers Testing Requirements** Voltage verification of the station battery bank(s) shall be performed on an interval not exceeding that specified in Table 3 for bulk power system protection groups: Table 3 (Not per verbatim) Non-monitored battery bank voltage shall be tested once a month. There is no requirement for testing monitored battery bank voltage providing that battery bank Voltage alarms are annunciated to a 24/7 staffed Operations Center that can initiate an investigation of the problem.	Table 1-4(a) to Table 1-4(c). This Section can be removed.	The battery testing in the NERC PRC-005-2 standard is much more comprehensive than the Directory 3 requirement. In addition, an entity can take credit for increased battery monitoring to perform less direct maintenance. Increased monitoring results in a more reliable component overall. TFSP is supportive of this approach, and assesses that there is no reliability gap if the NPCC criteria for battery bank testing were to be removed.
Section 5.5	**Breaker Trip Testing Requirements** The ability of the breaker(s) to trip via each trip coil shall be verified every two years with the following exception: Nuclear plant bulk power system unit breaker trip tests shall	Table 1-5. This Section can be removed.	The NERC PRC-005-2 standard mandates operation of each trip coil on a 6 year interval compared to the 2 years for Directory 3. This is not a significant gap as there are no grace periods allowed in PRC-005-2 meaning these tests must be scheduled on something less than a 6 year

Section	Criteria/Requirement in The Directory	PRC-005-2 Equivalent	Rationale/Justification
	be completed at an interval not to exceed three years.		interval. In addition TFSP members were asked to solicit advice internally from breaker experts and the conclusion is that extended time for breaker trip coil testing outlined in PRC-005-2 versus Directory 3 does not pose a gap in reliability. However TFSP will address this perceived gap by proposing the addition of a requirement for trip coil monitoring to Directory 4 to enhance protection design reliability for NPCC BPS breaker trip coils.
Section 5.6	**Telecommunication Testing Requirements** There are two sub-sections under Section 5.6.		
	5.6.1 Terminal Equipment Telecommunications terminal equipment shall be tested on the same time interval as the protection assemblies as per Table 1 above. (See requirements in Table 1 under Section 5.2, above)	Table 1-2 This Section can be removed.	The maintenance intervals (6, 12 years) and activities described in the NERC PRC-005-2 standard for the telecommunication terminal equipment are in alignment with the similar activities for protective relays (Section 5.2, above). The same rationale applies.
	5.6.2 1. For telecommunication system channels that are not continuously monitored, the signal adequacy shall be tested every month and the ability of a channel to perform its intended function shall be verified every twelve months. An example of such a system is On/Off Power Line Carrier. 2. For trip equipment which uses frequency shift keying (FSK) mode of communication and the channel (for example, Guard Signal) is continuously monitored, the ability to perform its intended trip function shall be verified every twelve months. Failure of the channel shall be annunciated to a 24/7 staffed Operations Center that can initiate an investigation of the problem.	Table 1-2. This Section can be removed.	1. The maintenance activity for unmonitored communication channels is actually set at 4 months in the NERC PRC-005-2 standard and a change in this interval does not create a significant reliability gap. There are no grace periods allowed in PRC-005-2 meaning that maintenance activities must be scheduled well before the maximum maintenance interval likely 2 months or so. 2. PRC-005-2 has established a philosophy that communication systems are analogous to the DC connection from the relay to the trip coil (p.85 of Supplementary Reference). Therefore the maintenance intervals established for unmonitored communication systems is set at 6 years, forcing more

Section	Criteria/Requirement in The Directory	PRC-005-2 Equivalent	Rationale/Justification
	3. For telecommunication system channels that are continuously monitored and continuously provide verification of trip capability to an Operator, no additional testing is necessary. Failure of the channel or of the trip capability shall be annunciated to a 24/7 staffed Operations Center that can initiate an investigation of the problem.		frequent maintenance than for monitored systems which is set at 12 years. This is a significant deviation from the yearly activities prescribed by Directory 3. However TFSP believes more credit should be given by providing for longer maintenance intervals for monitored channel health of communication channels. In addition, TFSP will propose the addition of a requirement to Directory 4 requiring the use of monitored communication channels for lines at NPCC BPS stations. 3. Fully monitored communication systems still must be maintained every 12 years in PRC-005-2which is actually more stringent than Directory 3.
5.7	**Underfrequency Load Shedding and Generator Underfrequency Relay Testing Requirements** There are two sub-sections under Section 5.7.		
	5.7.1 Protection group DC circuit tests, battery bank and charger tests and breaker trip tests for protection required by the NPCC Automatic Underfrequency Load Shedding Program, need not be performed more frequently than the protection group DC circuit tests, battery bank and charger tests and breaker trip tests for other protection on the same breaker. Because of the distributed nature of this load shedding protection, random failures to trip do not compromise the objectives of the NPCC Automatic Underfrequency Load Shedding Program.	Table 3. This Section can be removed.	The testing requirements for UFLS in the NERC PRC-005-2 standard for protective relays are in alignment with intervals and activities for BES protective relays. TFSP supports these intervals as previously outlined in the above rationale. PRC-005-2 does not require any testing of DC circuitry between the protective relay/electromechanical auxiliary or lockout relays and the trip coils of non-BES devices. Elimination of this testing which is alluded to in Directory 3 does not pose a significant reliability risk for the very reason outlined in the last sentence of 5.7.1.
	5.7.1 Protection group DC circuit tests, battery bank and	Table 3.	Generator UF relays for generators part of the BES are in

Section	Criteria/Requirement in The Directory	PRC-005-2 Equivalent	Rationale/Justification
	charger tests and breaker trip tests for protection required by the NPCC Automatic Underfrequency Load Shedding Program, need not be performed more frequently than the protection group DC circuit tests, battery bank and charger tests and breaker trip tests for other protection on the same breaker. Because of the distributed nature of this load shedding protection, random failures to trip do not compromise the objectives of the NPCC Automatic Underfrequency Load Shedding Program.	This Section can be removed.	fact included in NERC PRC-005-2 standard and will be on the same maintenance schedule as other BES protective relays. Removing this requirement from Directory 3 does not leave a reliability gap.
Appendix A	**Definition of Terms**	NPCC Glossary of Terms	With the deletion of this Directory, this Appendix no longer serves any purpose.
Appendix B	**Guideline and Procedure for Maintenance of Bulk Power System Protection** This Appendix provides the guidelines and procedures for consideration in the implementation of this Directory. Excerpt of the appendix is not extracted herein.	A stand-alone B or C Document, to be determined.	To be provided.

TFSP Technical Comparison
Directory#3 Maintenance Criteria BPS Protection
PRC-005-2 Protection System Maintenance

Background Information

On March 20th, 2014 FERC issued a Final Rule approving Reliability Standard PRC -005-2 *Protection System Maintenance*.

Accordingly, the TFSP has concluded that subject to the provincial adoption of PRC -005-2 within NPCC no significant reliability gaps exist and the criteria in Directory#3 can be retired.

1. The TFSP has determined that the Directory#3 criteria regarding the frequency of trip coil testing is more stringent than PRC-005-2 (2 years vs. 6 years in the standard). However, for the reasons referenced in the attached report, TFSP concluded that this is not a significant reliability gap and the criteria while more stringent than the standard can be retired.

   Do you agree with the TFSP conclusion?

   Yes ☐

   No ☐

Comments:

2. Currently for teleprotection equipment using Frequency Shift Keying whose channel health is continuously monitored the Directory#3 criteria require verification of the trip function every 12 months vs. the 12 year requirement in PRC-005-2. However the TFSP has concluded that teleprotection equipment whose channel health is continuously monitored can support PRC-005-2 maintenance intervals. Therefore the TFSP has concluded that this is not a significant reliability gap and the criteria while more stringent than the standard can be retired.

   Do you agree with the TFSP conclusion?

   Yes ☐

   No ☐

NPCC Directory Development and Revision Manual
Comments Requested

Background Information

Consistent with NPCC's overall recognition of industry's concern regarding the balance between cost and incremental reliability benefit, the Regional Standards Committee (RSC) has approved revisions to the Directory Development and Revision Manual used to develop and revise the NPCC Criteria. These revisions will incorporate aspects of the NPCC Cost Effectiveness and Analysis Procedure (CEAP) into the Directory Manual.

Additionally, other revisions to the Manual are being proposed in response to separate concerns expressed by NPCC Full Members in various forums.

The following questions have been developed by NPCC Staff in order to solicit further comment from NPCC Members during the Open Process posting to consider these changes.

1. During its review of NPCC Directory#1 the CO7/CP11 Working Group proposed a change to the overall Directory format described in the Directory Manual.

   This change would result in the removal from all NPCC Directories of the section within each Directory that lists the individual NERC Standards associated with the subject Directory.

   Additionally, the CO7/CP11 Working Group also recommended omitting the language within each Directory that refers to more stringent criteria since this language may no longer be accurate given that NERC standards are evolving beyond the criteria.

   CO7/CP11 reasoned that since the criteria contained within a Directory is applicable to the A-10 defined NPCC Bulk Power System (BPS), lists of ERO Standards within a Directory are no longer appropriate.

   Similarly, CO7/CP11 felt that the blanket statement……'These criteria are in addition to, more stringent than, and more specific than NERC standard requirements"….was no longer absolutely true since in some cases the NERC requirements could be more stringent than the criteria.

   Do you agree with the CO7/CP11 suggestion to revise the Directory Manual, such that the lists of individual NERC standards and the language referencing more stringent criteria are removed from each Directory?

   Yes ☐

   No ☐

Comments:

DRAFT

NPCC Directory Development and Revision Manual
Comments Requested

2. The section of the Manual that describes revisions to the Appendix section of a Directory has been revised.

   Formerly, a revision to the Appendix section of a Directory required RCC approval

   The Manual has been revised such that for changes to **only** the Appendix section of a Directory only Task Force approval of such revisions will be required.

   Do you agree with this revision to the Manual?

   Yes ☐

   No ☐

Comments:

3. Regarding the future disposition of NPCC 'B' Guidelines and 'C' Procedures incorporated within Directories as an Appendix and stand- alone B and C Guidelines and Procedures that were never incorporated within a Directory, it has been suggested that all such documents should be contained in a NPCC Reference document.

   The purpose of the Reference document would be to house all documents that support the criteria in one location. In this manner revisions to these documents could be achieved outside the more rigorous approval process for the criteria.

   Do you agree that Appendices should be removed from each of the Directories and included along with remaining B and C documents into a single NPCC Reference document?

   Yes ☐

   No ☐

APPENDIX A - DIRECTORY FORMAT TEMPLATE 22

APPENDIX B – NPCC REQUEST FOR CLARIFICATION 26

I. EXECUTIVE SUMMARY

The purpose of the Northeast Power Coordinating Council, Inc. ("NPCC") is to enhance the reliability of the international, interconnected bulk power system in Northeastern North America through the development of more stringent and regionally specific criteria.

NPCC Directories have been developed in order to provide a consistent and comprehensive set of reliability requirements for the Northeast, while consolidating related information for NPCC Criteria, Guidelines, Procedures as well as FERC and NERC approved Regional Standards into one document.

~~NPCC Directories and the criteria contained within, apply only to NPCC Full Members. However, there may be additional requirements within tariffs or interconnection agreements that hold non-Members responsible for complying with the criteria within each Directory.~~

This document provides guidance to NPCC Task Forces~~,~~ and NPCC Full Members when establishing a new or revised Directory~~, or~~ when retiring or consolidating an existing Directory and also clarifies the roles and responsibilities of the NPCC Task Forces responsible for Directory content.

The NPCC Regional Standards Committee (RSC) working with the lead Task Force for each Directory has overall responsibility for managing the Directory project. Individual Directories are under the control of a lead NPCC Task Force which is responsible for coordinating review among all other Task Forces which have jurisdiction over either a portion of the criteria or one or more of the Appendices in the Directory.

NPCC also recognizes the industry concern surrounding the cost of maintaining the more stringent or more specific NPCC criteria contained within the NPCC Directories and the the NPCC Board of Directors has expressed strong support for the appropriate balance between the incremental reliability benefit achieved by the criteria versus the cost to maintain or implement those criteria.

Accordingly, the fundamental review methodology of the NPCC Cost Effectiveness Analysis Procedure (CEAP) has been incorporated into the Directory Development and Revision Manual.

II. BACKGROUND

NPCC Directories have been developed consistent with the NPCC Bylaws which provide for the establishment of regionally specific reliability criteria, guidelines and procedures and within each Directory NPCC's reliability criteria has been reviewed and translated to insure that the criteria is not inconsistent with the ERO standards as required by the NERC Rules of Procedure.

Each Directory also contains former B and C documents which have been renamed as Appendices and are functionally relevant to the documents criteria. Consistent with NPCC Document A-1 *Criteria for Review and Approval of Documents* the purpose of an Appendix continues to support the achievement of system performance related to the criteria and the consistent implementation, interpretation and monitoring of the criteria requirements.

Phase 1 of the Directory Project was initiated by the NPCC Reliability Coordinating Committee (RCC) in order to demonstrate consistency with NERC Standards and to effectively group documents together according to functional topics. During Phase 1 an initial translation of the existing criteria document was performed in addition to identifying and eliminating language within the criteria that duplicated existing NERC Reliability Standards.

Also during Phase 1, Functional Model language was introduced and the corresponding 'B' Guidelines and 'C' Procedures were incorporated into each Directory as Appendices.

The resulting Directory created a single source reference for all entities while providing a method to demonstrate consistency with NERC Standards.

Phase 2 of the Directory Project was initiated in order to reformat the Criteria section of each document into specific and measurable NERC style requirements which will promote the NPCC regional criteria as more specific or more stringent within each Directory. Phase 2 will also facilitate the development of the NPCC Criteria Compliance Enforcement Program (CCEP) by providing the respective requirements of that program.

A mapping document has been provided on the Directory page of the NPCC Website and has been organized in a manner that provides guidance on where a Directory's content originated (A Criteria, B Guideline, or C Procedure). The mapping document provides tracking of specific content language from documents that were translated or replaced by

Directories and their Appendices. A link to the Directory Flowchart and the Directory Mapping documents is provided in the References section of this manual.

All of NPCC'S A criteria documents except A-1 (*Criteria for Review and Approval of Documents*), A-10 (*Classification of BPS Elements*) and A-15 (*Disturbance Monitoring Equipment Criteria)* documents, all of NPCC's A criteria documents have been translated into the Directories. However, although ma ny of the B Guideline and C Procedure documents have been transferred to Directories as Appendices in support of the relevant criteria, not all B and C documents were determined to be related to a Directory and as a result some stand- alone B Guideline and C Procedure documents will remain at the conclusion of the Directory project.

~~The NPCC Regional Standards Committee (RSC) working with the lead Task Force for each Directory has overall responsibility for managing the Directory project.~~

~~The Directories are organized to demonstrate that NPCC regional criteria are more specific than and/or more stringent than and consistent with NERC Reliability Standards.~~

~~Each Directory contains an Introduction, along with sections that identify NERC ERO Standards and NPCC Regional Standards that are associated with the Directory~~.

~~Additionally, each Directory is comprised of a section that describes the NPCC regionally specific criteria and was developed from the related NPCC 'A' documents.~~

~~The appropriate Type 'B' Guideline and Type 'C' Procedure documents are also included within each Directory as Appendices. Although the Appendices in a Directory are functionally associated with the subject criteria in the document, they do not contain NPCC criteria and are included within the Directory in order to achieve acceptable performance and consistent implementation of the criteria.~~

~~A mapping document has been provided on the Directory page of the NPCC Website and has been organized in a manner that provides guidance on where a Directory's content originated (A Criteria, B Guideline, or C Procedure).~~

~~The mapping document provides tracking of specific content language from documents that were translated or replaced by Directories and their Appendices. A link to the Directory Flowchart and the Directory Mapping documents is provided in the References section of this manual.~~

~~Phase 1 of the Directory Project was initiated by the NPCC Reliability Coordinating Committee (RCC) in order to demonstrate consistency with NERC Standards and to effectively group documents together according to functional topics.~~

~~During Phase 1 an initial translation of the existing criteria document was performed in addition to identifying and eliminating language within the criteria that duplicated existing NERC Reliability Standards.~~

~~Additionally, Functional Model language was introduced and the corresponding 'B' Guidelines and 'C' Procedures were incorporated into each Directory as appendices.~~

~~The resulting Directory created a single source reference for all entities while providing a method to demonstrate consistency with NERC Standards.~~

~~Phase 2 of the Directory Project was initiated in order to reformat the Criteria section of each document into specific and measurable NERC style requirements which will~~

~~promote the NPCC regional criteria as more specific or more stringent within each Directory.~~

~~Phase 2 will also facilitate the development of the NPCC Criteria Compliance Enforcement Program (CCEP) by providing the respective requirements of that program.~~

~~Although the Regional Standards Committee is responsible for the overall Directory program, individual Directories are under the control of a lead NPCC Task Force which is responsible for coordinating review among all other Task Forces which have jurisdiction over either a portion of the criteria or one or more of the Appendices in the Directory.~~

~~IV.~~III. APPLICABILITY OF NPCC CRITERIA

The requirements of an NPCC Directory apply only to those facilities defined as NPCC bulk power system elements and identified through the performance based methodology of NPCC Document A-10, "Classification of Bulk Power System Elements," the list of which is maintained by the NPCC Task Force on System Studies and approved by the NPCC Reliability Coordinating Committee.

Requirements to abide by an NPCC Directory may also reside in external tariff requirements, bilateral contracts and other agreements between facility owners and/or operators and their assigned Reliability Coordinator, Planning Coordinator, Transmission Operator, Balancing Authority and/or Transmission Owner as applicable and may be enforceable through those external tariff requirements, bilateral contracts and other agreements. NPCC will not enforce compliance to the NPCC Directory requirements in this document on any entity that is not an NPCC Full Member.

IV. TASK FORCE ROLES AND RESPONSIBILITIES:

Formatted: Heading 1, Numbered + Level: 1 + Numbering Style: I, II, III, … + Start at: 1 + Alignment: Right + Aligned at: 0" + Indent at: 0.25"

Formatted: Font: (Default) New York, Font color: Black

With the development of the Directories it has been recognized that in certain cases the jurisdictional boundaries of Task Force ownership have been crossed and additional guidance when coordinating Directory review among Task Forces is necessary.

In general, revisions and clarifications to a Directory shall be coordinated by the Lead Task Force of the document. Revisions to a Directory can be initiated in a fully bi-directional manner; that is either by the Lead Task Force responsible for the document or by another Task Force who is responsible for some portion (criteria or appendices) of the document.

This process will allow each Directory to remain under the control of the respective Lead Task Force which has the necessary expertise to keep each document current and accurate while also providing a means to coordinate component review of those segments of the Directory that may be under the control of another Task Force.

The Lead Task Force can initiate a full revision of the Directory in accordance with the NPCC Reliability Assessment Program (NRAP) date of approval or some need to revise the criteria section of the document. A link to the NRAP documents is provided in the References section of this manual.

The Lead Task Force will also notify other Task Forces under whose jurisdiction either a portion of the criteria or Appendices exists in order to coordinate the total document review and revision. Similarly, a Task Force which is not the Lead Task Force of the Directory, but is responsible for some portion of the document, shall coordinate a necessary revision to their section of the document through the Lead Task Force of the Directory.

V. DIRECTORY DEVELOPMENT AND REVISION PROCEDURE

1. NEW DIRECTORY

Any NPCC Full Member may request the development of a new Directory.

The request shall be made to the NPCC Manager of Reliability Criteria via email and shall contain the background and justification for the development of the new Directory. The NPCC Manager of Reliability Criteria shall forward the request to the Regional Standards Committee (RSC) in order for the RSC to review the request and assign its development to the appropriate NPCC Task Force.

Included in the transmittal of the request to the RSC, the NPCC Manager of Reliability Criteria shall request the RSC to authorize a Cost Effectiveness Analysis utilizing the NPCC CEAP procedure for this evaluation. The Lead Task Force responsible for developing the new Directory shall draft an initial version of the document consistent with the Directory template in Attachment A.

The RSC working with the NPCC Standards Program Area shall utilize the NPCC CEAP to perform an initial analysis of the cost benefit of the proposed Directory via the Cost Benefit Analysis (CBA) section of the CEAP. Subsequent to RSC review and approval of the CBA the NPCC Manager of Reliability Criteria shall post the draft Directory to the NPCC Open Process for 45 days.

At the conclusion of the 45 day Open Process ~~,~~ period, the Lead Task Force will discuss the comments submitted and deliberate on whether the criteria requirements are developed enough to begin the Cost Effectiveness Analysis (CEA) portion of the CEAP and where appropriate request the RSC to initiate the CEA.

~~post responses to comments on the NPCC Open Process portal.~~

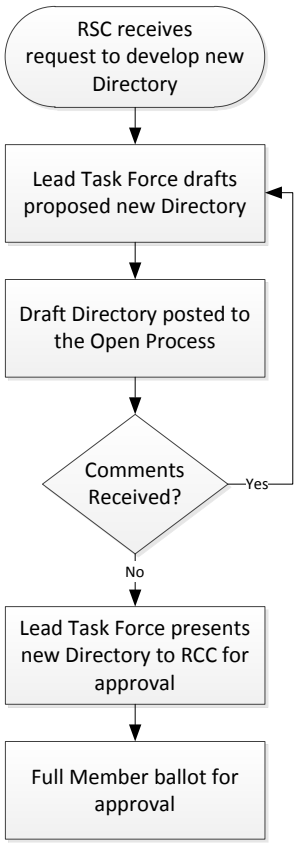
If the responses to comments received on the draft result in substantive changes to the document, then the revised draft shall be reposted to the Open Process for a successive 45 day posting period. Alternatively, i~~I~~f no substantive changes are developed which would require additional postings of a revised draft, the new Directory is presented to the Reliability Coordinating Council (RCC) for approval.

Additionally, the RSC in accordance with the CEAP will use the responses to the CEA survey to develop a recommendation based on the cost effectiveness of the proposed Directory. Upon RCC approval the document is submitted for a ballot to the NPCC Full Member Representatives along with the RCC recommendation of approval.[1]

The process for establishing a new Directory is represented below in Figure 1:

[1] Approval of a new or revised Directory requires a 2/3rd majority of Full Member voting representatives in accordance with the NPCC Bylaws.

Figure 1: New Directory



2. DIRECTORY REVISIONS

a. REVISIONS TO THE CRITERIA SECTION OF A DIRECTORY

Any NPCC Full Member may request a revision to the criteria within a Directory. A request to revise the criteria section of an NPCC Directory shall be submitted to the Lead Task Force responsible for the document. The Lead Task Force shall notify each affected NPCC Task Force which has jurisdiction over either a portion of the criteria or one or more of the appendices within the Directory that a request to revise the criteria in the document has been received.

The Lead Task Force shall review the request to revise the criteria and shall also consider conforming changes to appendices as a result of the criteria revision if necessary.

The NPCC Manager of Reliability Criteria shall post the Directory containing the revised criteria to the NPCC Open Process review for 45 days.

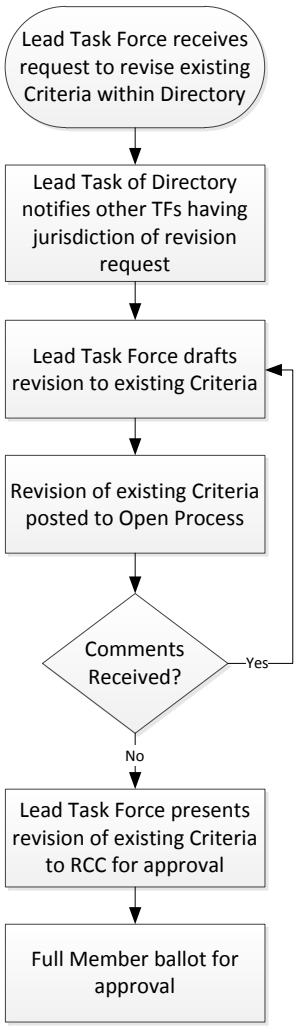
At the conclusion of the 45 day Open Process, the Lead Task Force will discuss the comments submitted and post responses to comments on the NPCC Open Process portal. If the responses to the comments received on the criteria revision result in substantive changes to the document, then the revised Directory criteria shall be reposted to the Open Process for a successive 45 day posting period.

Alternatively, i~~I~~f no substantive changes are developed which would require additional postings of a revised draft of the Directory, then the Directory is presented to the Reliability Coordinating Council (RCC) for approval.Upon RCC approval the document is submitted for a ballot to the NPCC Full Member Representatives along with the RCC recommendation of approval.

Approval of the revised Directory criteria requires a 2/3rd majority of Full Member voting representatives in accordance with the NPCC Bylaws.

The process for revisions to the criteria in an existing Directory is represented below in Figure 2:

Figure 2: Revisions to Criteria



b. REVISIONS TO THE APPENDIX SECTION OF A DIRECTORY

Any NPCC Full Member may request an Appendix within a Directory to be revised or retired. Revisions or retirements of Appendices shall only require Task Force ~~RCC~~ approval.

A request to revise or retire an Appendix of a NPCC Directory shall be submitted to the Task Force responsible for the Appendix. The Task Force responsible for the Appendix shall notify the Lead Task Force of the Directory that a request to revise or retire an appendix within the document has been received.

The Lead Task Force of the Directory shall be responsible for notifying all Task Forces which have jurisdiction over either the criteria or one or more of the other Appendices within the Directory that a request to revise or retire an appendix has been received.

After the Task Force responsible for the revised Appendix request reviews the subject appendix they will forward the Directory containing the draft revised Appendix to the Lead Task Force of the Directory.The Lead Task Force shall be responsible for posting the Directory which contains the revised or retired Appendix to the NPCC Open Process review for 45 days. **Additionally, although the entire Directory will be posted to the open process, the Lead Task Force will limit the comments solicited to only the subject Appendix.**

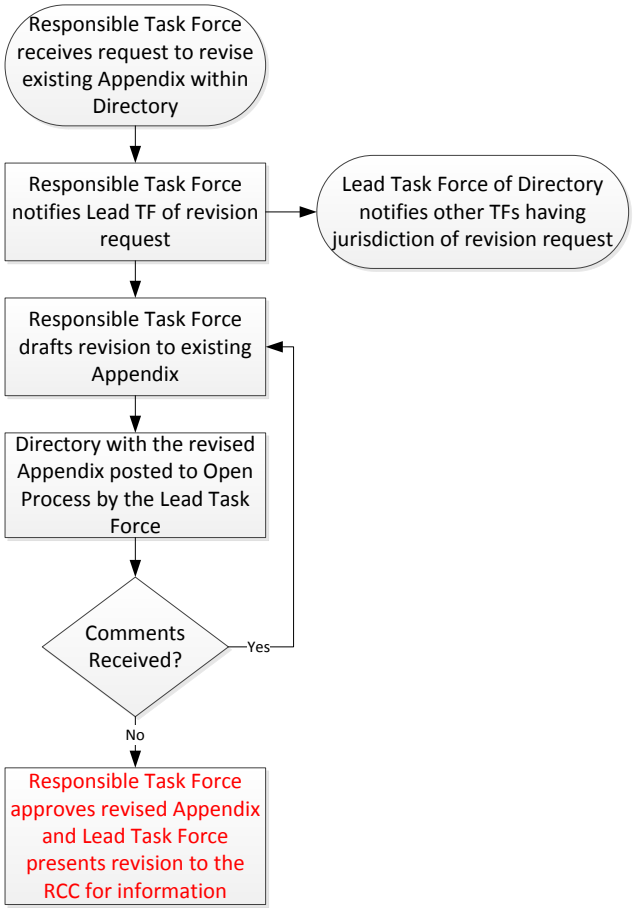
Formatted: Font: Bold

At the conclusion of the 45 day Open Process, the Lead Task Force will forward the comments submitted on the Appendix to the Task Force responsible for the revised or retired Appendix. If the responses to the comments received on the revised or retired Appendix result in substantive change (s) to the Appendix, then the Directory containing the revised or retired Appendix shall be reposted to the Open Process for a successive 45 day review period by the Lead Task Force of the entire Directory. Alternatively, ~~;~~ if no substantive changes are developed which would require additional postings the revised or retired Appendix shall be voted on by the Task Force responsible for the Appendix.

The lead Task Force for the Directory containing the revised or retired Appendix shall distribute the Directory containing the revised or retired Appendix to the Reliability Coordinating committee for informational purposes.~~entire Directory containing the draft of the revised or retired Appendix will be presented to the Reliability Coordinating Council (RCC) for approval~~.

The process for revisions to the appendices within an existing Directory is represented below in Figure 3:

Figure 3: Revisions to Appendices



Responsible Task Force receives request to revise existing Appendix within Directory
Responsible Task Force notifies Lead TF of revision request
Lead Task Force of Directory notifies other TFs having jurisdiction of revision request
Responsible Task Force drafts revision to existing Appendix
Directory with the revised Appendix posted to Open Process by the Lead Task Force
Comments Received?
Yes
No
Responsible Task Force approves revised Appendix and Lead Task Force presents revision to the RCC for information

c. REVISIONS TO THE NPCC GLOSSARY OF TERMS

The NPCC Glossary of Terms contains the definitions of all terms found within the NPCC Directories, Criteria, Guidelines, and Procedures and which are not already defined in the NERC Glossary of Terms or are regionally specific. The Glossary of Terms is intended to be a repository of all NPCC defined terms and contains the Full Member approved definition of that term as developed by the Task Force responsible for the Directory in which the term resides.

The Glossary is organized into two sections, one containing all defined terms within the Directories (including Appendices) which support the NPCC Criteria and another section for definitions found within remaining B and C documents.

The process of establishing or revising a NPCC defined term shall be considered a revision to the Directory in which the term resides in order to capture the context of its use within the document. Accordingly, the entire Glossary is not subject to the Open Process for a revision to an individual definition.

The development and review of a new definition or a revision to an existing NPCC specific definition contained within the Glossary will be coordinated by the Lead Task Force for the Directory in which the defined term resides.

Any NPCC Full Member may request that a new or revised term be added to the NPCC Glossary of Terms by forwarding a request to the Lead Task Force for the Directory in which the defined term resides. When the subject term resides in multiple Directories, the requestor shall forward the request to each of the Task Forces for the Directories in which the defined term resides and the individual Task Forces shall coordinate their review of the request, by assigning one of the Task Forces as the Lead Task Force for the review.

After the Lead Task Force in which the defined term resides has completed its review they will post the subject Directory containing the new or revised term to the NPCC Open Process for 45 days. When the new or revised term appears in multiple Directories, the designated Lead Task Force for the review shall include in the posting notice a comprehensive list of references to all occurrences of the defined term in other NPCC Directories, including each Directory in which the term resides.

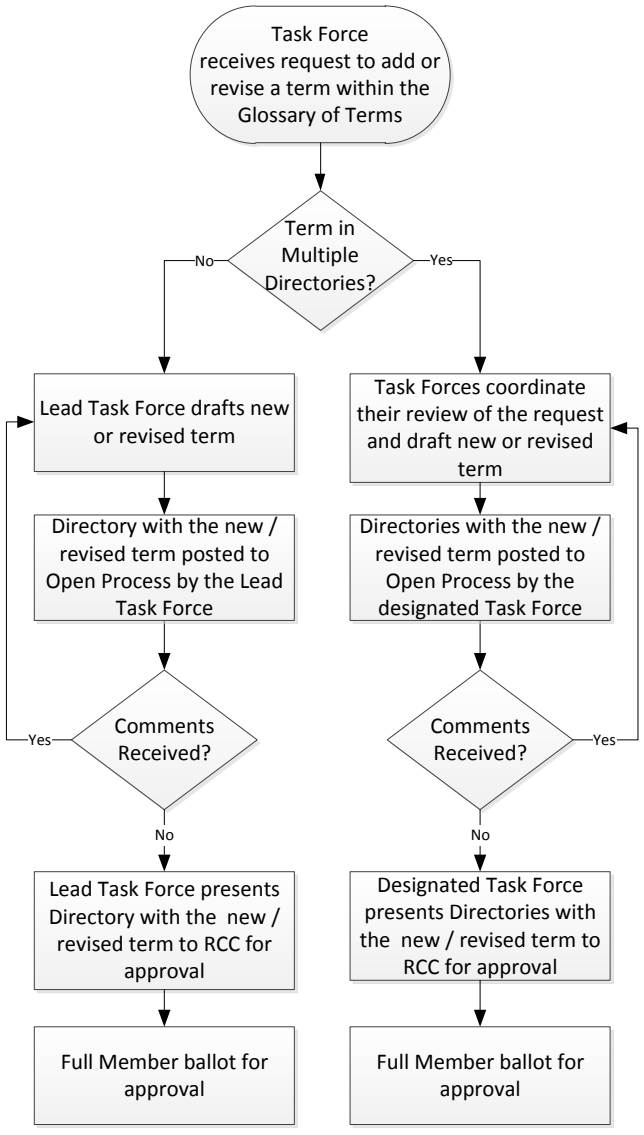
At the conclusion of the 45 day Open Process, if responses to comments received on the new or revised term result in further substantive change to the term, then the Directory containing the new or revised term shall be reposted to the Open Process for a successive 45 day posting period by the Lead Task Force for the subject Directory. Alternatively, ~~;~~ if no substantive changes to the term are developed which would require an additional

posting, then the Directory containing the new or revised term will be presented to the Reliability Coordinating Council (RCC) by the Lead Task Force for approval.

Upon RCC recommendation the Directory containing the new or revised term will be balloted by the Full Members. Upon Full Member approval of the new or revised term the Glossary will be updated by the Lead Task Force of the document in which the term resides.

The process for revisions to the Glossary of Terms is represented below in Figure 4:

Figure 4: Revisions to the NPCC Glossary of Terms



d. Withdrawal Of Revision Requests

Any NPCC Full Member which has initiated a request to develop a new Directory, revise an existing Directory or revise an NPCC Glossary Term may withdraw the request by notifying the NPCC Manager of Reliability Criteria.

3. Directory Retirement

Upon identification of the need to retire an existing Directory, the Lead Task Force responsible for the Directory shall notify the NPCC Manager of Reliability Criteria of its proposal to retire a Directory.

The proposal shall include the rationale for the retirement and a statement regarding the impact of retirement on the reliability of the Bulk Power System. The NPCC Manager of Reliability Criteria shall post the proposal, along with supporting documentation to the NPCC Open Process for 45 days.

At the conclusion of the 45 day Open Process, the Lead Task Force will review the comments submitted and post responses on the NPCC Open Process portal. The NPCC Manager of Reliability Criteria shall present the proposal to retire the Directory to the Reliability Coordinating Council (RCC) for approval.

Upon RCC approval the proposal to retire the Directory will be submitted for a ballot to the NPCC Full Member Representatives along with the RCC recommendation to retire the document.

4. Maintenance of Links and Errata

The maintenance of Links and the correction of errors found in a Directory or its Appendices shall be the responsibility of NPCC Standards staff. An error may be classified as Errata provided its correction does not change the scope or intent of the Directory and has no impact on the end user of the Directory.

Errata and Link revisions are updated as needed and require only the Lead TF approval prior to publishing and notifications to the applicable regulatory jurisdictions if required.

NPCC staff will also maintain a record of the change on the Directory Revision History page within the document.

VI. DIRECTORY CLARIFICATION PROCESS

a. REQUEST FOR CRITERIA CLARIFICATION

Any NPCC Full Member may request a clarification of the criteria within a Directory.

The NPCC Full Member seeking the clarification shall submit a ***Request for Criteria Clarification*** form [2] to the NPCC Manager of Reliability Criteria explaining the clarification required and the specific circumstances surrounding the request. The NPCC Manager of Reliability Criteria shall review the request and work with the originator to make certain that the request is clearly written, seeks clarity regarding the intent or purpose of the criteria and is not a question on a compliance aspect of the criteria.

The Manager of Reliability Criteria shall notify the originator of the *Request for Criteria Clarification* if the Request has been denied by providing the originator with a written response explaining the circumstances of the denial.

The Manager of Reliability Criteria will forward an approved *Request for Criteria Clarification* to the NPCC Task Force designated as the Lead Task Force for the subject Directory. The Lead Task Force shall notify each NPCC Task Force which has jurisdiction over either another portion of the criteria and /or one or more of the appendices within the subject Directory, that a ***Request for Criteria Clarification*** has been received. The Lead Task Force shall also forward the request to the affected Task Force(s).

The Lead Task Force for the Directory or the Task Force having jurisdiction shall review the request among its Members and provide a response to the NPCC Manager of Reliability Criteria within 60 calendar days. The Manager of Reliability Criteria shall post the ***Request for Criteria Clarification***, along with the response(s) provided by the Lead Task Force to the NPCC Open Process for 45 days.

[2] The Request for Clarification Form is included in Appendix B of this document.

The Lead Task Force will consider all comments received on the posted clarification and if necessary revise the clarification based on these comments. If the Lead Task Force revises the clarification substantively on the basis of comments received the clarification shall be reposted to the NPCC Open Process for a successive 45 day posting period.

The Manager of Reliability Criteria will coordinate a response to all commenters on behalf of the Lead Task Force.The Lead Task Force response to a Directory clarification request shall provide the requested explanation without expanding on the criteria and should be sufficiently concise to eliminate any ambiguity.

The NPCC Manager of Reliability Criteria shall review the clarification provided by the Lead Task Force or the Task Force having jurisdiction to insure that it is clear and provides the requested explanation without expanding on the criteria.

The Lead Task Force response to a ***Request for Criteria Clarification*** shall be presented to the NPCC Reliability Coordinating Committee (RCC) for final approval prior to posting the clarification to the NPCC website.

The detailed results of the ***Request for Criteria Clarification*** shall be retained by the Lead Task Force and the NPCC Standards Staff along with a recommendation on whether the language within the document should be revised in order to provide additional clarity.

b. APPEALS

Any NPCC Full Member that has submitted a ***Request for Clarification*** may appeal the rendered Task Force response.

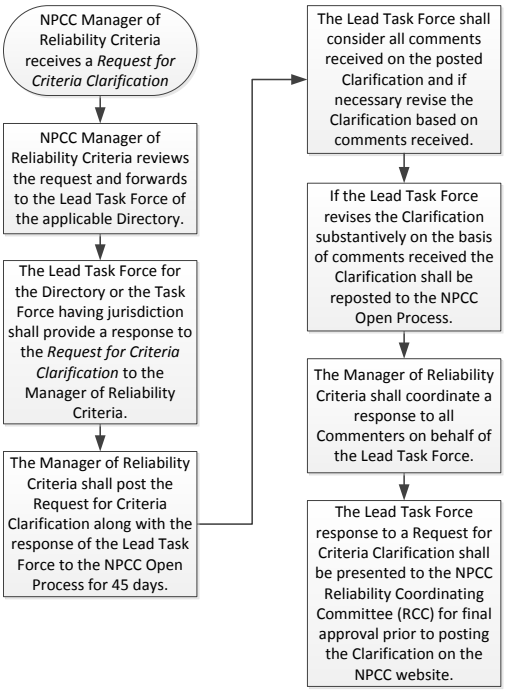
The appellant shall submit a written complaint to the NPCC Manager of Reliability Criteria describing the substantive or procedural action or inaction associated with the Clarification Request process.

The appellant shall also describe in the complaint the actual or potential adverse impact to the appellant.

Assisted by any necessary NPCC Standards Staff and Lead Task Force resources, the NPCC Manager of Reliability Criteria shall prepare a written response addressed to the appellant as soon as practical, but not more than forty-five (45) calendar days after receipt of the complaint.

The process for a Criteria Clarification Request is represented below in Figure 5:

Figure 5: Request for Criteria Clarification



VII. REVIEW AND APPROVAL OF THE NPCC DIRECTORY DEVELOPMENT AND REVISION MANUAL

The NPCC Directory Development and Revision Manual will be reviewed for possible revisions at least once every five (5) years or more frequently if required.

A notification of a pending RSC review and re-approval of the Manual shall be posted on the NPCC website. All revisions to this Manual shall be posted to the NPCC Open Process Review for 45 days.

The Regional Standards Committee (RSC) shall respond to all comments received and shall have final approval over the revised document.

VIII. DIRECTORY FORMAT AND VERSION CONTROL

Each Directory will be formatted in accordance with the Directory Template in Appendix A of this document.

The Task Force Revision Review Record on the cover page of each Directory shall contain the date of the most recent version of the Directory as approved by the Full Members of NPCC.

The Revision History record on page 2 of each Directory shall contain a record of all revisions to the document, including maintenance of errata and links.

Regional Reliability Reference Directory # XX

Task Force XXXXX Revision Review Record:
XX/XX, 20XX

Adopted by the Members of the Northeast Power Coordinating Council, Inc. June 26th, 2009 based on recommendation by the Reliability Coordinating Committee, in accordance with Section VIII of the NPCC Amended and Restated Bylaws dated July 24, 2007 as amended to date.

Revision History

Version	Date	Action	Change Tracking (New, Errata or Revisions)
0		**Effective Date**	**New**

Format for NPCC Directories (Phase 2)

Effective Dates (Denotes date of adoption by the Membership)

Revision History (Depicts revision history and tracks key changes)

Table of Content (Self-explanatory)

A. Introduction

Title: Self-explanatory

Directory #: Self-explanatory

Objective: State the reliability objective that this Directory intended to meet (i.e., achieving specific performance target/outcome, mitigating particular risks, establishing the minimum capability level, etc.)

Effective Date: Identify which parts of the Directory become effective on which dates.

Background: Provide information related to this creation or revision of this Directory, e.g., which A, B or C documents are mapped into this Directory; the general basis of the Directory, etc.

Applicability: Identify the entities that are assigned reliability requirements and/or which facilities need to conform to the stipulated criteria.

B. NERC ERO Reliability Standard Requirements

A list of the NERC standards associated with this Directory.

C. NPCC Regional Reliability Standard Requirements

A list of NPCC Regional Standards associated with this Directory.

D. NPCC Full Member, More Stringent Requirements, Criteria and Measures

Requirements

List the requirements and criteria that the applicable entities or facilities must comply with.

E. Compliance

Compliance with the requirements set forth in this Directory will be in accordance with the NPCC Criteria Compliance and Enforcement Program (CCEP).

Measures and corresponding Levels of Non Compliance for these requirements are contained within the compliance template associated with this Directory.

Prepared by:	Task Force XX (Lead Task Force for the Directory)
Review and Approval:	Revision to any portion of this Directory will in accordance with the NPCC Directory Development and Revision Manual and will be posted by the Lead Task Force in the NPCC Open Process for a 45 day review and comment period. Upon satisfactorily addressing all of the comments in this forum, the Directory will be sent to the RCC for its approval. Upon approval of the RCC, this Directory will be sent to the Full Member Representatives for their final approval if sections pertaining to the Requirements and Criteria portion have been revised. All voting and approvals will be conducted according to the most current "NPCC. Bylaws" in effect at the time the ballots are cast. Revisions pertaining to the Appendices or any other portion of the document such as links, glossary terms, etc., only RCC Members will need to conduct the final approval ballot of the document. This Directory will be updated at least once every three years and as often as necessary to keep it current and consistent with NERC, Regional Reliability Standards and other NPCC documents.

Members Regional Standards Committee

Re: NPCC Directory Development and Revision Manual

Ladies and Gentlemen:

Consistent with NPCC's overall recognition of the need to balance cost and incremental reliability benefit, the Directory Development and Revision Manual has been revised to incorporate provisions of the NPCC Cost Effectiveness and Analysis Procedure (CEAP) into the section of the Manual that governs the development of new criteria.

Accordingly, the concept of cost consideration has been introduced into the Executive Summary section of the Manual, along with specific steps related to the CEAP in the section of the Manual that addresses the development of new criteria.

Additionally, other revisions to the Manual are being proposed in response to separate concerns expressed by NPCC Full Members in various forums including:

- The addition of a new section addressing the applicability of NPCC criteria.
- Clarification of the disposition of NPCC B Procedures and C Guideline documents (or Appendices when contained within a Directory.) in the Background section of the Manual.
- Revisions to the approval process for Directory Appendices.
- Elimination of the section of a Directory that lists the associated NERC Standards.

The RSC has overall responsibility for managing the NPCC Directories and upon RSC endorsement these revisions will be posted to the NPCC Open Process to receive Full Member comments.

Very truly yours,

Gerry Dunbar

May 15, 2013

VIA ELECTRONIC FILING

Ms. Kimberly D. Bose
Secretary
Federal Energy Regulatory Commission
888 First Street, NE
Washington, D.C. 20426

RE: Errata to Petition of the North American Electric Reliability Corporation for Approval of Proposed Reliability Standards COM-001-2 and COM-002-4
Docket No. RM14-13-000

Dear Ms. Bose:

On May 14, 2014, the North American Electric Reliability Corporation ("NERC") filed a Petition for approval of proposed Reliability Standards COM-001-2 and COM-002-4 with the Federal Energy Regulatory Commission. The Petition incorrectly notes that Requirement R1 of Reliability Standard EOP-008-1 is proposed for retirement. The Implementation Plans referenced in the Petition list the correct proposed retirements for approval. The following changes in strikethrough font illustrate the necessary corrections to the language in the Petition. NERC is not requesting retirement of EOP-008-1, Requirement R1.

Page 22

> Of particular note in the Implementation Plan, the standard drafting team concluded that Requirement R5 in COM-001-1.1 is redundant with EOP-008-1, Requirement R1 and, therefore, has not been carried forward in proposed COM-001-2. ~~As a result, NERC proposes EOP-008-1, Requirement R1 for retirement.~~

Pages 1-2

> NERC also requests approval of: (i) new defined terms "Operation Instruction", "Interpersonal Communication", and "Alternative Interpersonal Communication" for inclusion in the NERC Glossary of Terms; (ii) the Implementation Plans for the proposed Reliability Standards (Exhibits C and D); (iii) the associated Violation Risk Factors ("VRFs") and Violation Severity Levels ("VSLs") (Exhibits A, B, K, and L); and (iv) the retirement

3353 Peachtree Road NE
Suite 600, North Tower
Atlanta, GA 30326
404-446-2560 | www.nerc.com

of the currently-effective Reliability Standards COM-001-1.1~~, EOP-008-1 (Requirement R1),~~ and COM-002-2 as listed in the Implementation Plans.

Page 45

- approve the retirement of the currently effective Reliability Standards COM-001-1.1~~, EOP-008-1 (Requirement R1),~~ and COM-002-2, as proposed in the Implementation Plans.

Respectfully submitted,

/s/ William H. Edwards

COMPLIANCE FILING OF THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

The North American Electric Reliability Corporation ("NERC")[1] submits this compliance filing in accordance with the Commission's January 16, 2013 Order in Docket No. FA11-21-000.[2] In the January 16 Order, the Commission approved a Settlement Agreement between the Office of Enforcement ("Enforcement") and NERC related to Enforcement's findings and recommendations arising out of its 2012 performance audit of NERC. Specifically, Section II.7(b)(i) of the Settlement Agreement requires that:

> Within forty-five days of the end of each quarter, beginning with the quarter ending March 31, 2013, NERC will file with the Commission the unaudited report of the NERC budget-to-actual spending variances during the preceding quarter. This report will include information regarding sources and uses of operating and working capital reserves and will match or exceed the level of detail of the quarterly budget-to-actual variance report of NERC expenditures attached to the agenda of NERC Board of Trustees Finance and Audit Committee's October 2012 meeting.[3]

Attached hereto is the unaudited report of NERC's budget-to-actual variance information for the first quarter of 2014, in accordance with the January 16 Order. This variance information was

---

[1] NERC was certified by FERC as the electric reliability organization ("ERO") authorized by Section 215 of the Federal Power Act. FERC certified NERC as the ERO in its order issued July 20, 2006 in Docket No. RR06-1-000. *Order Certifying North American Electric Reliability Corporation as the Electric Reliability Organization and Ordering Compliance Filing*, 116 FERC ¶ 61,062 (2006) ("ERO Certification Order").

ATTACHMENT

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Summary of Results as of March 31, 2014

Through March 31, 2014, NERC was $1.5M, 10.2%, under its expense and fixed asset budget. As reflected in the following table and as further explained below, NERC is projecting to be approximately $939.1k, 1.7%, under budget at year end, due primarily to projected: (i) lower than budgeted personnel expense related to timing of hiring open positions; (ii) lower than budgeted travel expense after taking into account 2013 actual results, which reflected the implementation of various travel and expense control initiatives, and projected staffing levels; and, (iii) reduced office costs, primarily related to lower than budgeted expense for maintenance and service agreements. It's important to keep in mind that this projection is preliminary and subject to change. This year end projection will be utilized in preparation of the initial draft of NERC's 2015 business plan and budget, which will be posted on May 16th. It will be further refined and updated as part of the second quarter variance report and the final draft of the 2015 business plan and budget which is scheduled to be posted on July 15th.

YTD Actual versus YTD Budget and 2014 Projection versus 2014 Total Budget by Category

	2014 Actual	2014 Budget	2014 Variance Over(Under)	%	2014 Projection	2014 Annual Budget	2014 Projected Variance from Budget Over(Under)	%

Following is a brief summary of variances by major categories:

- Personnel expenses were under budget $315.2k, 3.6%, and are projected to be $417.1k, 1.2% under budget at year end due primarily to timing of hiring open positions. There were 11.7, 6.2%, fewer FTEs on staff than budgeted through March 31, 2014. The 2014 budget for personnel expenses and total FTEs reflects a 4% adjustment to account for attrition and timing of hiring open positions.
    - Salaries expense, which consists of salaries, incentive compensation, employment agency fees and temporary office services, was $214.6k, 3.3%, under budget through March 31st,

and is projected to be under budget $200.5k, 0.8%, at year end due primarily to having fewer FTEs on staff than budgeted.

- Payroll taxes were over budget $91.8k, 14%, through March 31st, and are projected to be over budget $137.0k, 8.7%, at year end due to a higher maximum salary subject to taxes in 2014 than was budgeted. Higher than budgeted expense through March 31st was also due to timing related to payroll taxes paid in February in connection with the payout of incentive compensation.
- Employee Benefits were $106.6k, 12.6%, under budget due to having fewer FTEs on staff than budgeted and due to lower employee relocation costs than budgeted. Benefits are projected to be under budget $185.0k, 5.5%, at year end due to having fewer FTEs on staff and lower than budgeted renewal costs.
- Retirement costs were $85.8k, 10.8%, under budget due to having fewer FTEs on staff. Retirement costs are projected to be $168.6k, 5.8%, under budget at year end due to timing of hiring open positions which delays eligibility in the savings and investment plan.

- Meeting, travel and conferencing expenses were collectively under budget $93.6k, 9.8%, through March 31st, and are projected to be $237.5k, 6.3%, under budget at year end. Travel expenses were under budget $51.8k through March, 2014, and are projected to be $198.2k under budget at year end after taking into consideration 2013 actual costs. Total travel expense in 2013 was $2.0M, approximately $400k less than the amount budgeted for 2014.
- Consultant and Contract expenses were $527.4k, 27.4%, under budget primarily due to timing of the budget versus actual payments for numerous projects throughout the organization. Total year end expenses are projected to be close to budget. The following table summarizes existing and projected over budget variances by department.
  - Regional Oversight for Compliance – The over budget projection is for additional consulting support in connection with regional RAI pilot program oversight.
  - RAPA - The over budget projection is related to: (i) contract support for data modeling and analysis needed due to staff vacancies, and which is offset by lower than budgeted personnel expenses and, (ii) change orders related to generation databases that were approved in 2013, but were not completed and fully invoiced until 2014.
  - Human Resources – The over budget projection is related to higher than budgeted consulting costs for executive and staff training and development.

SUMMARY OF CONSULTANT AND CONTRACT EXPENSES BY DEPARTMENT

	As of March 31, 2014

- Office Costs, Professional Services and Miscellaneous expenses were $93.6k, 6.4%, under budget due to: (i) lower than budgeted costs for maintenance and service agreements; and (ii) lower than budgeted costs for attorney fees. These lower than budgeted costs were offset by slightly higher than budgeted costs related to closing the capital financing loan. Office costs are projected to be $238.4k, 6.8%, under budget due to lower than budgeted costs for maintenance and service agreements.
- Other Non-Operating Expenses were $33.1k, 92.0%, under budget through March 31st, and are projected to be $64.6k, 44.9%, under budget at year end due to a lower than budgeted interest expense and a delay in closing the capital financing program loan. The actual interest rate on the loan, which closed in January, 2014 instead of fourth quarter, 2013, is 2.9%. The 2014 budget was developed using an interest rate of 3.5%.
- Fixed Asset Purchases, which excludes the credit for depreciation, were $434.2k, 55.7%, under budget due to timing of expenses.

The following table summarizes contract and consulting cost incurred through March 31, 2014 related to the development of various enterprise software applications, including use of reserves.

Total project spending as of 3/31/2014

	2013			2014			Total		
Project	Actual	Budget	Use of Reserves	Actual	Budget	Use of Reserves	Actual	Budget	Use of Reserves
BES	822,327	644,736	177,591	153,595	200,000	-	975,922	844,736	177,591
SBS	250,131	245,000	5,131	216,735	215,000	-	466,866	460,000	5,131
EIDS	638,755	432,500	206,255	23,461	325,000	-	662,216	757,500	206,255
TOTAL	1,711,213	1,322,236	388,977	393,791	740,000	-	2,054,854	2,062,236	388,977

The development of the EIDS application is on hold. A technical audit of the vendor's code revealed significant architecture issues. The company is re-evaluating and will be consulting with the Regional Entities regarding the future approach to development of this application. The costs incurred through March 31,2014 in the development of this application expensed, rather than capitalized after a technical review of the code developed by the vendor revealed that (1) the software is not useable in its current form, (2) significant changes and costs would need to be incurred to attempt to make the application useable and even assuming that could be done, operation and maintenance of the software would be unduly expensive and cumbersome, (3) costs to complete or modify the software to attempt to make it useable will significantly exceed budget and (4) the likely path forward for the development this application will be to use a completely different architecture and starting platform. A more detailed discussion of the results of the company's technical audit of the vendor's code, as well as steps to strengthen the management and oversight of the development of this and other enterprise applications is included in the background materials for the May 6, 2015 Standards Oversight and Technology Committee meeting. Management is undertaking a review of capital spending needs and priorities for the balance of the year. The plan is to work within the confines of the overall 2014 fixed asset budget.

OPERATING RESERVE ANALYSIS

The December 31, 2013 working capital and operating reserve balance was $6.3M, inclusive of the adjustment for future liabilities. The 2013 ending balance was approximately $2.0M less than budgeted as a result of: (i) an error in the calculation of the projected year-end 2013 balance that occurred during development of the 2014 business plan and[1]; and (ii) the delay in closing the capital financing loan until January, 2014. The beginning year shortfall was partially offset by $808.2k, which is the non-current portion of the proceeds from the initial capital financing draw which took place on January 31st. Management has revised its internal control procedures to prevent reoccurrence of this error in the future.

As of March 31, 2014, the balance in available working capital and operating reserves was approximately equal to budget. Through March 31st, management approved the use of $139.7k of Unknown Contingency Reserves for contract and consulting support related to: (1) $80.2k for review of the regional entity RAI pilot programs; (2) $55.0k for data modeling and change orders related to generation databases; and (3) $4.5k for executive and staff training and development. The current balances in the Known Contingency Reserve, Unknown Contingency Reserve and the System Operator Reserves as of March 31, 2014 were $1.0M, $942.6k, and $1.5M, respectively.

The current year-end projected reserve balance is $2.1M, $635.9k less than budget and which is primarily due to the lower than budgeted actual starting reserve balance described above. The projected year-end balances in Known Contingency Reserves, Unknown Contingency Reserves and the System Operator Reserves is $1.0M, $74.8k, and 1.1M, respectively.

[1] In the preparation of the projected working capital and operating reserves as part of the 2014 budget development process, an incorrect assumption was made that the release of the penalty funding from restriction per applicable accounting policy increased the available operating reserve balance. However, when the restriction expires, the penalty funds are transferred from restricted cash to unrestricted cash to fund current year operations and only represent an increase in working capital or operating reserves when assessments are not reduced by an equivalent amount. This was not the case in the 2013 budget where penalty funds were used to reduce assessments as required by NERC's current penalty fund policy.

OPERATING RESERVE ANALYSIS - March 31, 2014

Washington, D.C. 20426

Re: Petition of the North American Electric Reliability Corporation for Approval of Amendments to Exhibit B of the Delegation Agreement with SERC Reliability Corporation – Amendments to the SERC Reliability Corporation Bylaws
Docket No. RR14-___-000

Dear Ms. Bose:

The North American Electric Reliability Corporation ("NERC") respectfully submits the "Petition of the North American Electric Reliability Corporation for Approval of Amendments to Exhibit B of the Delegation Agreement with SERC Reliability Corporation – Amendments to the SERC Reliability Corporation Bylaws." The primary purpose of these amendments is to: 1) support SERC Reliability Corporation's ("SERC's") application for tax-exempt status under § 501(c)(6) of the Internal Revenue Code; and 2) clarify and modify certain SERC-specific corporate governance matters. After examination, NERC concurs with SERC's determination that the amendments to the SERC Bylaws do not affect any of the qualifications for the delegation of authority from NERC to SERC, and will not adversely impact SERC's ability to function as a Regional Entity. The amended SERC Bylaws continue to satisfy the five governance criteria specified in Exhibit B of the SERC Regional Delegation Agreement ("SERC RDA").

This filing consists of: (1) this transmittal letter; (2) the narrative text of the Petition which follows this transmittal letter; and (3) Attachments 1, 2, and 3 to the Petition which respectively contain: i) SERC's March 3, 2014 letter to NERC requesting approval of the amendments and explaining their purpose; ii) a clean version of the amended Exhibit B of the SERC RDA; and iii) a redlined version of the amended Exhibit B of the SERC RDA. All of these documents are transmitted in a single PDF file.

Please contact the undersigned if you have any questions concerning this filing.

Respectfully submitted,

/s/ Thomas DeVita

Attachment 3: Amended Exhibit B of the Delegation Agreement Between North American Electric Reliability Corporation and SERC Reliability Corporation – Redlined version

I. INTRODUCTION

Pursuant to § 215(e)(4) of the Federal Power Act[1] ("FPA") and 18 C.F.R. §§ 39.8 and 39.10 (2012), the North American Electric Reliability Corporation ("NERC") respectfully requests the Federal Energy Regulatory Commission's (the "Commission's") approval of amendments to the Amended and Restated Regional Delegation Agreement between NERC and the SERC Reliability Corporation ("SERC"), one of the eight NERC Regional Entities (the "SERC RDA"). The proposed amendments to the SERC RDA consist exclusively of amendments to Exhibit B, the SERC Bylaws. The SERC Bylaws are "Regional Entity Rules" as defined in 18 C.F.R. § 39.1,[2] and amendments to the SERC Bylaws thereby require Commission approval in accordance with 18 C.F.R. § 39.10(a).[3]

Attachment 1 to this Petition is SERC's March 3, 2014 letter to NERC requesting approval of the amendments to the SERC Bylaws, and explaining the purposes of the amendments. **Attachments 2** and **3** are clean and redlined versions, respectively, of the proposed amended Exhibit B of the SERC RDA.

[1] 16 U.S.C. §824o (2005).
[2] The term "Regional Entity Rule" is defined as "…the bylaws, a rule of procedure or other organizational rule or protocol of a Regional Entity."
[3] "A Regional Entity shall submit a Regional Entity Rule or Rule change to the Electric Reliability Organization and, if approved by the Electric Reliability Organization, the Electric Reliability Organization shall file the proposed Regional Entity Rule or Rule change with the Commission for approval."

III. PROPOSED AMENDMENTS TO THE DELEGATION AGREEMENT BETWEEN NERC AND SERC RELIABILITY CORPORATION

On March 3, 2014, NERC received correspondence from SERC requesting approval of the amendments to the SERC Bylaws, and explaining the purposes of the amendments. This letter is featured as **Attachment 1** to this petition. As described more fully in **Attachment 1**, the amendments to the SERC Bylaws may be summarized as follows:

1. *Cover Page and Table of Contents*

    a. *Cover Page*
        i. Changed the date on the cover page to reflect the most recent date of approval by the SERC Board of Directors. This updated date appears on every subsequent page of the Bylaws.

    b. *Table of Contents*
        i. Changed various numbers in the table of contents to reflect changes in pagination caused by the amendments to the SERC Bylaws.

2. *Article II - Membership*

    a. *Section 2.2 - Eligibility*
        i. Added language clarifying that, for purposes of the SERC Bylaws, the terms "Bulk Power System," "Reliability Standards," and "Regional Entity" shall be as defined in 16 U.S.C. § 824o.
        ii. Added a reference to Section 3.2 (SERC's Geographic Region) for additional clarity regarding the identification of entities eligible for membership in the Corporation.

    b. *Section 2.6 - Powers*
        i. Added a section to clarify that, notwithstanding any other provisions of the Bylaws, Member Companies shall be non-voting members and shall have no power or authority or right to vote with respect to the actions of the Corporation (including the dissolution or merger of the Corporation). This language specifically includes an exception for the appointment of SERC Directors.[4]

[4] Exhibit B of the SERC RDA is composed of five distinct governance criteria, in addition to the SERC Bylaws. The second governance criterion requires that "[t]he Regional Entity has established rules that assure its independence of the users and owners and operators of the bulk power system, while assuring fair stakeholder representation in the selection of its directors." *See also* 16 U.S.C. §§ 824(o) (c)(2)(A) and (e)(4)(B), 18 C.F.R. § 39.8(c)(2), and Order No. 672 at P 728.

3. *Article IV - Board of Directors*

    a. *Section 4.2 – Composition and Eligibility*
        i. **Added** language requiring that corporate affiliates consolidate and coordinate their representation on the SERC Board and any SERC Board-level committees.

    b. *Section 4.13 - Duties*
        i. **Capitalized** the "C" of "Corporation's" in subsection (b).

4. *Article XI - Dissolution*

    a. *Section 11.2 - Distribution of Assets*
        i. **Changed** the language of this provision to replace the reference to "Section 501(c)(3)" of the Internal Revenue Code with "Section 501(c)(6)."
        ii. **Added** "1986" to specify the version of the Internal Revenue Code being referred to.
        iii. **Deleted** language authorizing the assets of SERC, upon corporate dissolution, to be transferred to federal, state or local governments.

5. *Article XIII - Indemnification*

    a. *Section 13.1 - Indemnification of Directors, Committee Members, Officers, Employees and Agents*
        i. **Added** the categories of "Alternate Directors" and "Customer Advisors" to the indemnification provision of Article XIII.

6. *Article XIV - Amendment of the Bylaws*
        i. **Added** "Articles of Incorporation" to the procedure governing amendments to the SERC Bylaws, thereby extending this procedure to amendment of the SERC Articles of Incorporation as well.

IV. SERC RELIABILITY CORPORATION AND NERC APPROVALS FOR THE PROPOSED AMENDMENTS

The proposed amendments to the SERC Bylaws were approved by the SERC Board of Directors in October 2012 and October 2013, and were approved by the NERC Board of Trustees on May 7, 2014. In making the determination to approve the proposed amendments to the SERC Bylaws, NERC determined that the amended SERC Bylaws continue to satisfy the five Governance criteria stated in Exhibit B of the SERC RDA.

V. CONCLUSION

Accordingly, NERC respectfully requests that the Commission approve the proposed amendments to the SERC RDA shown in **Attachment 3** to this Petition as amendments to Regional Entity Rules.

Respectfully submitted,

/s/ Thomas DeVita

Re: Amendments to the SERC Reliability Corporation Bylaws

Dear Charlie:

In accordance with the Amended and Restated Delegation Agreement dated June 12, 2012 ("Delegation Agreement") between the North American Electric Reliability Corporation ("NERC") and SERC Reliability Corporation ("SERC"), I am providing you with amended SERC Bylaws for its North Carolina corporation, which were approved by the SERC Board of Directors ("Board") on October 24, 2012 and October 23, 2013. The nature of and reasons for the amendments are set forth below. The amendments do not affect any of the qualifications for the delegation of authority from NERC to SERC, and will not have any adverse impact on the ability of SERC to function as a Regional Entity under the Delegation Agreement.

Accordingly, SERC requests that: (1) NERC approve the amended SERC Bylaws as consistent with the Delegation Agreement; (2) the amended SERC Bylaws be forwarded to the Federal Energy Regulatory Commission ("FERC") for approval; and (3) upon FERC approval, the amended SERC Bylaws become effective as part of the Delegation Agreement.

I. Background

SERC is in the process of transitioning from an Alabama non-profit corporation to a North Carolina non-profit corporation, in consideration of its current base of operations and lack of substantial nexus to the state of Alabama. As part of this, SERC has formed a North Carolina corporation. In October 2012, the SERC Board approved the Articles of Incorporation and initial Bylaws for the North Carolina non-profit corporation. At this time, the Board directed staff to consider whether it would be appropriate to seek tax exempt status under Section 501(c)(3) of the Internal Revenue Code, rather than under Section 501(c)(6), the current status of the Alabama corporation. The initially approved Bylaws of the North Carolina corporation contained language necessary to support the 501(c)(3) application. The Bylaws approved by the Board in October 2012 also contained other minor changes as discussed below.

After consideration, it was decided that it would be preferable to maintain the same tax status for the North Carolina corporation, rather than to seek tax exempt status under Section 501(c)(3), and in October 2013, the SERC Board unanimously approved amendments to the SERC Bylaws to codify this decision. Further details on the amendments to the Bylaws are discussed below.

Clean and redlined versions of the amended Bylaws reflecting the comprehensive changes made are provided as Attachments 1 and 2 to this letter. Upon approval, the amended Bylaws would become Exhibit B to the Delegation Agreement.

SERC Reliability Corporation

II. Change to support 501(c)(6)application

In section 11.2, the "Distribution of Assets" provision was amended to remove language necessary for 501(c)(3) status. Section 501(c)(6) of the Internal Revenue Code requires different language in the Bylaws than is required under Section 501(c)(3). The changes necessary to support this recommendation are needed prior to filing an application for tax exempt status for the North Carolina corporation.

III. Other Changes

(1) Table of Contents (updating to reflect changes in pagination caused by the amendments to the Bylaws)
(2) Section 2.2 (adding language to state that the terms "Bulk Power System", "Reliability Standards" and "Regional Entity" shall be as defined in 16 U.S.C. § 824o)
(3) Section 2.6 (adding this Section to clarify that Member Companies shall be non-voting members and shall have no power or authority or right to vote with respect to the actions of the Corporation)
(4) Section 4.2 (adding language to require corporate affiliates to consolidate and coordinate their representation on the Board and any Board level committees)
(5) Section 13.1 (adding "Alternate Director" and "Customer Advisor" to reflect that this Section applies to these representatives)
(6) Article 14 (expanding this Article to apply to the Articles of Incorporation)

IV. Conclusion

As detailed above, the amendments to the SERC Bylaws do not impact SERC's qualifications to serve as a Regional Entity with delegated authority from NERC and do not affect the ability of SERC to function as a Regional Entity under the Delegation Agreement. Accordingly, SERC requests that NERC approve the amended Bylaws as consistent with the Delegation Agreement, and forward the amended Bylaws to FERC for approval and adoption as a replacement for Exhibit B to the Delegation Agreement.

Please contact me if you have any questions.

Sincerely,

Marisa Sifontes

AMENDED AND RESTATED

BYLAWS

OF

SERC RELIABILITY CORPORATION
[Hereinafter referred to as the "Corporation"]

A North Carolina Nonprofit Corporation

ARTICLE I - OFFICES

1.1 **Principal Office**. The principal office of the Corporation shall be located in the City of Charlotte, Mecklenburg County, North Carolina. The Board of Directors may by resolution change the location of this office from time to time.

1.2 **Other Offices**. The Corporation may have other offices at such place or places as the Board of Directors may from time to time appoint or the business of the Corporation may require.

ARTICLE II - MEMBERSHIP

2.1 **General**. The Corporation shall be a membership corporation. Entities that meet the eligibility requirements and apply for membership in the Corporation shall hereinafter be referred to individually as a "Member Company" and collectively as "Member Companies".

2.2 **Eligibility**. Membership in the Corporation is open to any entity in the SERC Region (defined in Section 3.2 below) that is a user, owner or operator of the Bulk Power System and is subject to the jurisdiction of the Federal Energy Regulatory Commission for the purpose of complying with Reliability Standards established under Section 215 of the Federal Power Act and all amendments thereto. Membership in the Corporation is voluntary; however, membership is predicated on mandatory acceptance of the responsibility to promote, support, and comply with Reliability Standards of the Corporation and the North American Electric Reliability Corporation ("NERC"), and to assist the Corporation in its compliance with the terms and provisions of a Delegation Agreement (a "Delegation Agreement") with NERC, by which NERC delegates authority to propose and enforce Reliability Standards, pursuant to 16 U.S.C. § 824o or the corresponding provisions of any subsequent U.S. Code revisions. For purposes of

these Bylaws, the terms “Bulk Power System”, “Reliability Standards” and “Regional Entity” shall be as defined in 16 U.S.C. § 824o or the corresponding provisions of any subsequent U.S. Code revisions.

2.3 **Termination**. A Member Company may terminate its membership in the Corporation by giving the Board of Directors at least thirty (30) days written notice of its intent to terminate such membership (such Member Companies shall hereinafter be referred to as "Terminated Member Companies"). Terminated Member Companies shall nevertheless continue to be liable for any and all obligations incurred prior to the end of the calendar year in which such notice is given, including, but not limited to, the obligation to pay a pro rata share of any Corporation expense. In addition to termination of membership by the Member Company, the Board of Directors, following notice to the Member Company, may terminate the membership of a Member Company if in the judgment of the Board of Directors that Member Company has violated its obligations and responsibilities to the Corporation. The termination of the membership of a Member Company by the Board of Directors shall require a Supermajority vote, as defined in these Bylaws.

2.4 **Sectors.** Each Member Company shall be classified by the Executive Committee in one of the following seven (7) Sectors (each a “Sector”, and collectively, the “Sectors”):

(a) Investor-Owned Utility Sector – This Sector includes any investor-owned entity with substantial business interest in ownership and/or operation in any of the asset categories of generation, transmission or distribution.

(b) Federal/State Sector – This Sector includes any U.S. federal entity that owns and/or operates electric facilities and/or provides balancing authority services, in any of the asset categories of generation, transmission, or distribution; or any entity that is owned by or subject to the governmental authority of a state and that is engaged in the generation, delivery, and/or sale of electric power to end-use customers primarily within the political boundaries of the state.

(c) Cooperative Sector – This Sector includes any non-governmental entity that is incorporated under the laws of the state in which it operates, is owned by and provides electric service to end-use customers at cost, and is governed by a board of directors that is elected by the membership of the entity; and any non-governmental entity owned by and which provides generation and/or transmission service to such entities.

(d) Municipal Sector – This Sector includes any entity owned by or subject to the governmental authority of a municipality, that is

engaged in the generation, delivery, and/or sale of electric power to end-use customers primarily within the political boundaries of the municipality; and any entity, whose members are municipalities, formed under state law for the purpose of generating or purchasing electricity for sale at wholesale to their members.

(e) Marketer Sector– This Sector includes any entity that is engaged in the activity of buying and selling of wholesale electric power in the SERC Region on a physical or financial basis.

(f) Merchant Electricity Generator Sector – This Sector includes any entity that owns or operates an electricity generating facility or provides balancing authority services for such entities. This includes, but is not limited to, small power producers and all other non-utility producers such as exempt wholesale generators who sell electricity at wholesale.

(g) ISO-RTO Sector – This Sector includes any entity that operates a FERC approved ISO or RTO.

The Executive Committee's classification of a Member Company in a particular Sector may only be changed by the Executive Committee.

2.5 **Transfer of Membership.** A Member Company may not give or otherwise transfer its membership, except to a successor that becomes a Member Company in accordance with the terms and conditions of these Bylaws, and provided that the successor continues to meet its predecessor's obligations.

2.6 **Powers.** Notwithstanding any other provisions of these Bylaws, except for the appointment of Directors as provided in Section 4.2 below, Member Companies shall be non-voting members and shall have no power or authority or right to vote with respect to the actions of the Corporation, specifically including, but not limited to, the dissolution or merger of the Corporation.

ARTICLE III - PURPOSES

3.1 **General Purposes.** The purpose of the Corporation is to promote effective and efficient administration of Bulk Power System reliability in the SERC Region, as defined in Section 3.2. In pursuit of this goal, the Corporation shall:

(a) enter into a Delegation Agreement to serve as a Regional Entity pursuant to 16 U.S.C. § 824o or the corresponding provisions of any subsequent U.S. Code revisions;

(b) promote the development of reliability and adequacy arrangements among the systems in the SERC Region;

(c) participate in the establishment of Reliability Standards;

(d) participate in the measurement of performance relative to these Reliability Standards;

(e) promote conformance to and compliance with these Reliability Standards;

(f) develop and exchange information with respect to planning and operating matters relating to the reliability and adequacy of the Bulk Power System;

(g) review as necessary activities in the SERC Region on reliability and adequacy in order to meet Reliability Standards;

(h) provide a mechanism to resolve disputes on reliability issues in a manner that meets the needs of the parties and the SERC Region; and

(i) provide information with respect to matters considered by the Corporation, where appropriate, to the Federal Energy Regulatory Commission ("FERC") and to other federal and state agencies concerned with reliability and adequacy.

3.2 **Geographic Area.** The Corporation accomplishes its purposes in a geographic area (the "SERC Region") that is defined in Exhibit A of the Amended and Restated Delegation Agreement Between North American Electric Reliability Corporation and SERC Reliability Corporation.

3.3 **Other Statutory Functions.** The Corporation may also perform statutory functions outside of the SERC Region, on behalf of NERC or other Regional Entities. The Corporation may undertake such activities pursuant to a contract that is approved by the Executive Committee.

ARTICLE IV - BOARD OF DIRECTORS

4.1 **General Powers**. The affairs of the Corporation shall be managed by its Board of Directors except as otherwise provided in these Bylaws.

4.2 **Composition and Eligibility**. The Board of Directors shall be comprised of no fewer than three (3) Directors and no more than two (2) Customer Advisors.

Each Director shall be the principal officer or other authorized employee from a Member Company or a company that controls, is controlled by, or is under common control with such Member Company (an "affiliated entity"). Each Member Company, together with any affiliated entities, may appoint one (1) Director to the Board of Directors. For clarification purposes only, each Member Company and all of such Member Company's affiliated entities (including any affiliated entities which may be a separate Member Company) shall have the right to appoint only one (1) Director to serve on behalf of such Member Company and all of such Member Company's affiliated entities. Each Director shall serve until otherwise replaced by the applicable Member Company, together with any affiliated entities. Each Member Company, together with any affiliated entities, may designate one (1) alternate Director, who shall be a principal officer or other authorized employee from the Director's Member Company or an affiliated entity, to serve in the place of the Member Company's Director at any meeting of the Board of Directors (an "Alternate Director"). Directors may not otherwise use proxy votes. Any vacancy occurring among the Directors or Alternate Directors shall be filled by the applicable Member Company, together with any affiliated entities.

Each Customer Advisor shall be a person who is (i) employed by an entity that receives service at retail and does not otherwise sell, purchase, or transmit power over the Bulk Power System or own, operate or maintain, control or operate facilities or systems that are part of the Bulk Power System; (ii) a state public utility commission representative; or (iii) any other customer advocate. Should the Board of Directors not include two (2) Customer Advisors, the Board of Directors may elect additional Customer Advisors to fill such vacancies. The term of these Customer Advisors shall be for a two (2) year period.

The Chair of FERC and the chair or president of any State Utility Commission in a state in which electric service is provided by a Member Company of the Corporation shall be invited to designate an observer to attend meetings of the Board.

4.3 **Regular Meetings of the Board**. Unless otherwise determined by the Chair, a regular meeting of the Board of Directors shall be held without other notice than these Bylaws on the fourth Wednesday in the months of April and October in each year. Notwithstanding the foregoing, the Chair may elect to hold a regular semi-annual meeting of the Board of Directors on another date provided that the Board receives at least ten (10) days advance notice. If the day fixed for the meeting shall be a legal holiday in the State of North Carolina, the meeting shall be held on the next succeeding business day. The Board of Directors may designate any place as the place of meeting for any meeting. The Board of Directors may provide by resolution the time and place for the holding of additional regular meetings of the Board without other notice than the resolution. Directors or any committee designated by the Board of Directors may participate in such Board or committee meetings by means of a telephone conference, webcast or any other communication by means of which all persons participating in the

meeting can hear each other at the same time, and participation by such means shall constitute presence in person at such meeting.

4.4 **Special Meetings of the Board**. Special meetings of the Board of Directors may be called at the request of the Chair, or by Directors holding twenty percent (20%) or more of the Individual Votes. The Chair may fix any place as the place for holding any special meeting of the Board.

4.5 **Notice of Special Meetings**. Notice of any special meeting of the Board of Directors shall be given at least two (2) days prior to the special meeting by written notice delivered personally, or sent by mail or electronic mail to each Director at the address as shown by the records of the Corporation. If mailed, such notice shall be deemed to be delivered when deposited in the United States mail in a sealed envelope so addressed, with postage prepaid. If sent by electronic mail, such notice shall be deemed to be delivered when sent via electronic mail. Any Director may waive notice of any meeting. The attendance of a Director at any meeting shall constitute a waiver of notice of such meeting, except where a Director attends a meeting for the express purpose of objecting to the transaction of any business because the meeting is not lawfully called or convened. Neither the business to be transacted at, nor the purpose of, any special meeting of the Board need be specified in the notice or waiver of notice of such meeting, unless specifically required by law or by these Bylaws.

4.6 **Election of Board Officers and Executive Committee**. Biennially, at the April meeting, the Board of Directors shall elect Board Officers from among the Directors for the positions of Chair, Vice Chair, and Secretary-Treasurer, each for a term of two (2) years beginning on July 1st after the election. No Director may serve in more than one (1) Board Officer position at the same time. The Chair shall conduct all meetings and shall be responsible for the preparation of the agenda. In the Chair's absence, the Vice Chair shall serve as acting Chair. In the event that a Board Officer cannot complete his or her term, the Board of Directors may hold a special election to elect a replacement Board Officer for the remainder of the unexpired term.

At the same time, the Board shall also approve representatives to the Executive Committee nominated by the Sectors to serve for a period of two (2) years. Each Sector may also elect alternates to the Executive Committee, and, if a Sector has more than one (1) representative on the Executive Committee, such Sector shall designate the priority of succession by such alternates.

4.7 **Agenda**. As far in advance of each regular and special meeting as practical, an agenda shall be distributed to each Director and Customer Advisor.

4.8 **Voting Definitions**.

(a) "Adjusted Weighted Vote" shall mean the number of votes of each Director determined in the manner set forth in Section 4.9 hereof.

(b) "Simple Majority" shall require the presence of a quorum and the (i) concurrence of Directors whose combined Individual Votes are greater than fifty percent (50%) of the total Individual Votes of all Directors present at the meeting and entitled to vote on the issue (the “Individual Vote Test”), (ii) concurrence of Directors whose combined Adjusted Weighted Votes are greater than fifty percent (50%) of the total Adjusted Weighted Vote of all Directors at the meeting and entitled to vote on the issue (the “Adjusted Weighted Vote Test”), and (iii) for at least one of the Individual Vote Test or the Adjusted Weighted Vote Test, on an individual Sector basis, the positive vote shall outweigh the negative vote for at least three Sectors.

(c) "Supermajority" shall require the presence of a quorum and the concurrence of (i) Directors whose combined Individual Votes equal or exceed two-thirds (2/3) of the total Individual Votes of all Directors present at the meeting and entitled to vote on the issue, provided that a quorum is present, and (ii) Directors whose combined Adjusted Weighted Votes are greater than two-thirds (2/3) of the total Adjusted Weighted Vote of all Directors present at the meeting and entitled to vote on the issue.

(d) "Individual Vote" shall mean a single vote accorded to each Director.

(e) "Given Year" shall mean the applicable fiscal year for which the Adjusted Weighted Votes are calculated.

(f) "Reporting Year" shall mean the fiscal year immediately preceding the Given Year.

(g) "Previous Year" shall mean the fiscal year immediately preceding the Reporting Year.

4.9 **Determination of Adjusted Weighted Vote**. The Directors’ Adjusted Weighted Votes for a Given Year shall be determined by the following formula:

V = 10(1/N) + 30(B/C) + 30(D/E) + 30(F/G)

V = % of Adjusted Weighted Vote

N = total number of Member Companies

B = Member Company’s Previous Year internal peak demand

C = total of factor B for all Member Companies

D = Member Company's owned generating capacity as of January 1 of the Reporting Year

E = total of factor D for all Member Companies

F = Member Company's sum of circuit miles of transmission times the respective operating voltage for facilities of 69 kV and above as of December 31 of the Previous Year

G = total of factor F for all Member Companies

4.10 **Voting; Manner of Acting; Voting Rights; Quorum; Proxies**.

(a) Except as otherwise provided in these Bylaws, all actions by the Board of Directors require approval by a Simple Majority vote.

(b) A motion shall be deemed to have passed if it passes either:

(i) the Individual Vote Test; or
(ii) the Adjusted Weighted Vote Test;

and, for purposes of the failed test (any test that is not satisfied), on an individual Sector basis, the positive votes outweigh the negative votes in every Sector but one.

(c) Directors holding two-thirds (2/3) of the Individual Votes shall constitute a quorum for action by the Board. If Directors holding less than two-thirds (2/3) of the Individual Votes are present at the meeting, a majority of the Directors present may adjourn the meeting from time to time without further notice.

(d) The intent of Section 4.8(b)(iii) and Section 4.10(b) is to ensure that no two Sectors should be able to control any decision and that a single Sector should not be able to veto any matter, respectively (other than amendments to these Bylaws). In the event that either of the foregoing shall nevertheless occur, the Member Companies shall promptly revise the provisions of these Bylaws so that no two Sectors shall be able to control any decision and no single Sector shall be able to veto any matter.

4.11 **Compensation**. Directors shall not receive any compensation from the Corporation for their services to the Corporation.

4.12 **Informal Action by Directors**. Any action required by law to be taken at a meeting of Directors, or any action which may be taken at a meeting of Directors, may

be taken without a meeting if all of the Directors consent in writing to the action so taken.

4.13 **Duties**. The Board of Directors shall have the exclusive responsibility to:

(a) Authorize distributions;

(b) Recommend to members or approve dissolution, merger or the sale, pledge or transfer of substantially all of the Corporation's assets;

(c) Fill vacancies on any of the Board's committees;

(d) Adopt, amend, or repeal the Articles of Incorporation or Bylaws;

(e) Form or dissolve committees of the Board as it deems necessary to carry out the business of the Corporation; and

(f) Resolve any disputes regarding the Member Companies and the Corporation, if those issues cannot be resolved by the standing committees or subcommittees of the Corporation and are not otherwise subject to NERC's dispute provisions for non-compliance with Reliability Standards.

ARTICLE V - CORPORATE OFFICERS

5.1 **Corporate Officers**. The Board of Directors shall appoint a President & Chief Executive Officer, Vice President, Secretary, and Treasurer of the Corporation. Two (2) or more of such offices may be held by the same person, except for the offices of President & Chief Executive Officer and Secretary. The Board of Directors may appoint such other officers and assistant officers as it deems necessary.

5.2 **President & Chief Executive Officer**. The President shall be the Chief Executive Officer of the Corporation and shall manage the operations of the Corporation to the end that its purposes shall be accomplished. The Board Officers shall determine the compensation and benefits for the President & Chief Executive Officer (President). The President shall:

(a) Attend all Board of Directors meetings of the Corporation and NERC Stakeholder and Board of Trustees, meetings, as appropriate;

(b) Assist and coordinate the preparation of testimony and reports;

(c) Coordinate subregional activities and interregional affairs, to include data collection;

(d) Install and maintain an adequate system of accounts and records;

(e) Arrange for meetings as directed;

(f) Assist the Corporation Committee Chairs as appropriate;

(g) Manage the business affairs of the Corporation, including the Corporation staff;

(h) Maintain minutes of all the Corporation-related meetings; and

(i) Provide other assistance to the Corporation and NERC, as appropriate.

5.3 **Vice President.** The Vice President shall perform such duties and exercise such powers as may be assigned to him or her from time to time by the Board of Directors, the Executive Committee, or the President. In the absence of the President, or in the case of the President's inability to act, the Vice President shall perform the duties and exercise the powers of the President, but subject to the control of the Board of Directors and the Executive Committee. The Board Officers shall determine the compensation and benefits of the Vice President.

5.4 **Secretary.** The Secretary shall be custodian of the records and of the seal of the Corporation and in general shall perform all duties incident to the office of Secretary and such other duties as may, from time to time, be assigned to him or her by the Board of Directors, the Executive Committee, or the President.

5.5 **Treasurer.** The Treasurer shall have charge and custody of, and be responsible for, all funds and securities of the Corporation and deposit all such funds in the name of the Corporation in such banks, trust companies, or other depositaries as shall be selected in accordance with the provisions of these Bylaws; and in general, perform all of the duties incident to the office of Treasurer and such other duties as from time to time may be assigned to him or her by the Board of Directors, the Executive Committee, or the President.

ARTICLE VI - EXECUTIVE COMMITTEE

6.1 **Executive Committee Representatives**. The Executive Committee shall be comprised of twelve (12) Sector representatives from the Board of Directors, consisting of:

(a) The Investor-Owned Utility Sector shall have three (3) representatives;

(b) The Federal/State Sector shall have two (2) representatives;

(c) The Cooperative Sector shall have two (2) representatives;

(d) The Municipal Sector shall have two (2) representatives;

(e) The Marketer Sector shall have one (1) representative;

(f) The Merchant Electricity Generator Sector shall have one (1) representative; and

(g) The ISO-RTO Sector shall have one (1) representative.

It is the desire of the Board of Directors that the Cooperative and Municipal sectors have representation from both transmission dependent and transmission owning Members. Each Sector shall be responsible for nominating their representative(s) and alternates from among the Directors. The Chair of the Board shall serve as Chair of the Executive Committee and shall conduct all meetings and shall be responsible for the preparation of the agenda. In the event that a representative on the Executive Committee is unable to complete a term, the Sector's alternate shall replace such representative.

6.2 **Ex Officio Representatives**. The Chair, Vice Chair, and Secretary-Treasurer of the Board of Directors shall also be ex officio representatives on the Executive Committee, but shall not have voting rights unless such Board Officer is also elected by a Sector to the Executive Committee pursuant to Section 6.1 above.

6.3 **Authority of Executive Committee**. Except as limited by Section 55A-8-25 of the North Carolina Nonprofit Corporation Act and Section 4.13 of these Bylaws, the Executive Committee is empowered to make all such decisions and take such actions as are deemed to be necessary for the operation of the Corporation.

6.4 **Action.** Each voting representative on the Executive Committee shall have one vote. The presence of three-quarters (3/4) of the voting representatives on the Executive Committee shall constitute a quorum. The positive vote of two-thirds

(2/3) of Executive Committee voting representatives present and voting is necessary to pass a particular action.

ARTICLE VII - OTHER COMMITTEES

7.1 **Designation by Board**. The Board of Directors, by resolution adopted by a Simple Majority vote, may designate Board committees and standing committees, as shall be necessary to address the purposes of the Corporation. Each Board committee shall have at least two Directors among its members.

7.2 **Rules for Governance**. Each committee shall adopt rules for its own governance that are not inconsistent with these Bylaws, rules adopted by the Board of Directors, applicable NERC or FERC rules or regulations, or applicable state or federal laws. Each committee shall maintain its rules for governance in a written scope document that is approved by the Board of Directors.

7.3 **Ad-Hoc Support Committees**. The Board or its committees may, from time to time, appoint ad-hoc committees to research and/or advise it on compliance or technical issues or matters, among other things. Such ad-hoc committees may be formed on an as-needed basis and may vary in makeup depending on the needs of the Board or its committees.

ARTICLE VIII - MISCELLANEOUS

8.1 **Conflicts of Interest.** All Directors, Alternate Directors, Customer Advisors, and Board committee representatives shall comply with the Corporation's Standards of Conduct policy that prohibits conflicts of interest, as such conflicts could cast doubt on the ability of such persons to act with total objectivity with regard to the overall interests of the Corporation.

8.2 **Contracts**. The Board of Directors may authorize any officer or agent of the Corporation, in addition to the officers so authorized by these Bylaws, to enter into any contract or execute and deliver any instrument in the name of and on behalf of the Corporation, and such authority may be general or confined to specific instances.

8.3 **Checks, Drafts, etc**. All checks, drafts, or orders for the payment of money, notes or other evidences of indebtedness issued in the name of the Corporation, shall be signed by an authorized officer or agent of the Corporation and in such manner as shall from time to time be determined by resolution of the Executive Committee. In the absence of such determination by the Executive Committee, such

instruments shall be signed by the Board's Secretary-Treasurer, the Corporation's President, or the Corporation's Finance Director, as stipulated by the Executive Committee. The Corporation's Finance Director may arrange audits of financial records, sign appropriate documents, and perform such duties normally performed by the Board's Secretary-Treasurer, except duties assigned to the Corporation's President.

8.4 **Deposits**. All funds of the Corporation shall be deposited from time to time to the credit of the Corporation in such banks, trust companies, or other depositories as the Corporation's President may select.

8.5 **Books and Records**. The Corporation shall keep correct and complete books and records of account and shall also keep minutes of the proceedings of the Board of Directors and committees having any of the authority of the Board of Directors, and shall keep at its registered or principal office a record giving the names and addresses of the Directors. All books and records of the Corporation may be inspected by any Director, or agent or attorney representing any Director, for any proper purpose at any reasonable time.

8.6 **Seal**. The corporate seal shall be in circular form and shall have inscribed thereon the name of the Corporation, the words "Corporate Seal", and such other word or words, if any, as may be determined by the Board of Directors to be inscribed thereon.

8.7 **Fiscal Year.** The fiscal year of the Corporation shall begin on the first day of January and end on the last day of December in each year.

ARTICLE IX - EXPENSES

9.1 **Allocation of Specific Expenses.** The expenses of Directors and Board Officers shall be borne by that person's regular employer.

9.2 **Statutory Functions.** The Corporation anticipates that as a general rule all of its expenses shall be incurred in the furtherance of statutory activities pursuant to Section 215 of the Federal Power Act, and that all such expenses shall be funded by NERC, subject to FERC approval.

9.3 **Non-Statutory Functions.** Notwithstanding Section 9.2, the Board of Directors may from time to time authorize the Corporation to participate in non-statutory activities (i.e., activities not described in Section 215 of the Federal Power Act). In the event that the Corporation proposes to engage in non-statutory activities, such activities shall be identified in the Corporation's annual business plan that is submitted to NERC and, if approved by NERC, shall be submitted to FERC for approval in advance of engaging in such non-statutory activities. The expenses incurred by the Corporation for

any such approved non-statutory activities shall be allocated by the Board of Directors to the beneficiaries of such activities on a basis proposed in the business plan submitted for NERC and FERC approval.

ARTICLE X - DISPUTE RESOLUTION PROCESS

10.1 **Dispute Resolution.** All disputes regarding non-compliance with Reliability Standards shall be handled in accordance with the NERC Rules of Procedure. The organizational units of the Corporation shall deal with all other disputes within the framework of their respective organizations. For such other disputes, Member Companies of the Corporation are encouraged to utilize the appropriate Dispute Resolution Process within the Corporation prior to seeking resolution at NERC, FERC, or with legal counsel.

ARTICLE XI - DISSOLUTION

11.1 **Dissolution**. The Corporation may be voluntarily dissolved upon unanimous consent of its Member Companies, and in accordance with Section 55A-14-02 of the North Carolina Nonprofit Corporation Act, as amended from time to time.

11.2 **Distribution of Assets**. Upon dissolution of the Corporation as provided in Section 11.1, the residual assets, after payment of all just obligations, shall be distributed exclusively to organizations which are exempt from federal income tax under Section 501(c)(6) of the Internal Revenue Code of 1986, or corresponding provisions of any subsequent federal tax laws, as the Board of Directors shall determine.

ARTICLE XII - WAIVER OF NOTICE

12.1 **Waiver.** Whenever any notice is required to be given under the provisions of the North Carolina Nonprofit Corporation Act or under the provisions of the articles of incorporation or the Bylaws of the Corporation, a waiver thereof in writing signed by the person or persons entitled to such notice, whether before or after the time stated therein, shall be deemed equivalent to the giving of such notice.

ARTICLE XIII - INDEMNIFICATION

13.1 **Indemnification of Directors, Alternate Directors, Customer Advisors, Committee Members, Officers, Employees and Agents**. Every person who is, or has served as, a Director, Alternate Director, Customer Advisor, committee member, Officer, employee, or agent of the Corporation shall be indemnified by the Corporation in the manner and to the extent authorized by the North Carolina Nonprofit Corporation Act. The foregoing rights of indemnification shall be without prejudice to any other rights to which any such Director, Alternate Director, Customer Advisor, committee member, Officer, employee, or agent may be entitled as a matter of law.

ARTICLE XIV - AMENDMENT OF THE BYLAWS AND ARTICLES OF INCORPORATION

14.1 **Amendment of the Bylaws and Articles of Incorporation**. After a request by twenty percent (20%) of the Board of Directors or an affirmative vote of the Executive Committee, a proposal to amend the Bylaws or the Articles of Incorporation shall be put before the Board of Directors at any regular or special meeting for a vote. Copies of the proposed amendments shall be distributed to the Board of Directors at least thirty (30) days before the meeting at which they are to be considered. An amendment to the Bylaws or the Articles of Incorporation shall be adopted after being approved by a Supermajority vote of the Board of Directors, provided that a quorum is present.

AMENDED AND RESTATED

BYLAWS

OF

SERC RELIABILITY CORPORATION
[Hereinafter referred to as the "Corporation"]

A North Carolina Nonprofit Corporation

ARTICLE I - OFFICES

1.1 **Principal Office**. The principal office of the Corporation shall be located in the City of Charlotte, Mecklenburg County, North Carolina. The Board of Directors may by resolution change the location of this office from time to time.

1.2 **Other Offices**. The Corporation may have other offices at such place or places as the Board of Directors may from time to time appoint or the business of the Corporation may require.

ARTICLE II - MEMBERSHIP

2.1 **General**. The Corporation shall be a membership corporation. Entities that meet the eligibility requirements and apply for membership in the Corporation shall hereinafter be referred to individually as a "Member Company" and collectively as "Member Companies".

2.2 **Eligibility**. Membership in the Corporation is open to any entity in the SERC Region (defined in Section 3.2 below) that is a user, owner or operator of the Bulk Power System and is subject to the jurisdiction of the Federal Energy Regulatory Commission for the purpose of complying with Reliability Standards established under Section 215 of the Federal Power Act and all amendments thereto. Membership in the Corporation is voluntary; however, membership is predicated on mandatory acceptance of the responsibility to promote, support, and comply with Reliability Standards of the Corporation and the North American Electric Reliability Corporation ("NERC"), and to assist the Corporation in its compliance with the terms and provisions of a Delegation Agreement (a "Delegation Agreement") with NERC, by which NERC delegates authority to propose and enforce Reliability Standards, pursuant to 16 U.S.C. § 824o or the corresponding provisions of any subsequent U.S. Code revisions. For purposes of

these Bylaws, the terms “Bulk Power System”, “Reliability Standards” and “Regional Entity” shall be as defined in 16 U.S.C. § 824o or the corresponding provisions of any subsequent U.S. Code revisions.

2.3 **Termination**. A Member Company may terminate its membership in the Corporation by giving the Board of Directors at least thirty (30) days written notice of its intent to terminate such membership (such Member Companies shall hereinafter be referred to as "Terminated Member Companies"). Terminated Member Companies shall nevertheless continue to be liable for any and all obligations incurred prior to the end of the calendar year in which such notice is given, including, but not limited to, the obligation to pay a pro rata share of any Corporation expense. In addition to termination of membership by the Member Company, the Board of Directors, following notice to the Member Company, may terminate the membership of a Member Company if in the judgment of the Board of Directors that Member Company has violated its obligations and responsibilities to the Corporation. The termination of the membership of a Member Company by the Board of Directors shall require a Supermajority vote, as defined in these Bylaws.

2.4 **Sectors.** Each Member Company shall be classified by the Executive Committee in one of the following seven (7) Sectors (each a “Sector”, and collectively, the “Sectors”):

(a) Investor-Owned Utility Sector – This Sector includes any investor-owned entity with substantial business interest in ownership and/or operation in any of the asset categories of generation, transmission or distribution.

(b) Federal/State Sector – This Sector includes any U.S. federal entity that owns and/or operates electric facilities and/or provides balancing authority services, in any of the asset categories of generation, transmission, or distribution; or any entity that is owned by or subject to the governmental authority of a state and that is engaged in the generation, delivery, and/or sale of electric power to end-use customers primarily within the political boundaries of the state.

(c) Cooperative Sector – This Sector includes any non-governmental entity that is incorporated under the laws of the state in which it operates, is owned by and provides electric service to end-use customers at cost, and is governed by a board of directors that is elected by the membership of the entity; and any non-governmental entity owned by and which provides generation and/or transmission service to such entities.

(d) Municipal Sector – This Sector includes any entity owned by or subject to the governmental authority of a municipality, that is

engaged in the generation, delivery, and/or sale of electric power to end-use customers primarily within the political boundaries of the municipality; and any entity, whose members are municipalities, formed under state law for the purpose of generating or purchasing electricity for sale at wholesale to their members.

(e) Marketer Sector– This Sector includes any entity that is engaged in the activity of buying and selling of wholesale electric power in the SERC Region on a physical or financial basis.

(f) Merchant Electricity Generator Sector – This Sector includes any entity that owns or operates an electricity generating facility or provides balancing authority services for such entities. This includes, but is not limited to, small power producers and all other non-utility producers such as exempt wholesale generators who sell electricity at wholesale.

(g) ISO-RTO Sector – This Sector includes any entity that operates a FERC approved ISO or RTO.

The Executive Committee's classification of a Member Company in a particular Sector may only be changed by the Executive Committee.

2.5 **Transfer of Membership.** A Member Company may not give or otherwise transfer its membership, except to a successor that becomes a Member Company in accordance with the terms and conditions of these Bylaws, and provided that the successor continues to meet its predecessor's obligations.

2.6 **Powers.** Notwithstanding any other provisions of these Bylaws, except for the appointment of Directors as provided in Section 4.2 below, Member Companies shall be non-voting members and shall have no power or authority or right to vote with respect to the actions of the Corporation, specifically including, but not limited to, the dissolution or merger of the Corporation.

ARTICLE III - PURPOSES

3.1 **General Purposes.** The purpose of the Corporation is to promote effective and efficient administration of Bulk Power System reliability in the SERC Region, as defined in Section 3.2. In pursuit of this goal, the Corporation shall:

(a) enter into a Delegation Agreement to serve as a Regional Entity pursuant to 16 U.S.C. § 824o or the corresponding provisions of any subsequent U.S. Code revisions;

(b) promote the development of reliability and adequacy arrangements among the systems in the SERC Region;

(c) participate in the establishment of Reliability Standards;

(d) participate in the measurement of performance relative to these Reliability Standards;

(e) promote conformance to and compliance with these Reliability Standards;

(f) develop and exchange information with respect to planning and operating matters relating to the reliability and adequacy of the Bulk Power System;

(g) review as necessary activities in the SERC Region on reliability and adequacy in order to meet Reliability Standards;

(h) provide a mechanism to resolve disputes on reliability issues in a manner that meets the needs of the parties and the SERC Region; and

(i) provide information with respect to matters considered by the Corporation, where appropriate, to the Federal Energy Regulatory Commission ("FERC") and to other federal and state agencies concerned with reliability and adequacy.

3.2 **Geographic Area.** The Corporation accomplishes its purposes in a geographic area (the "SERC Region") that is defined in Exhibit A of the Amended and Restated Delegation Agreement Between North American Electric Reliability Corporation and SERC Reliability Corporation.

3.3 **Other Statutory Functions.** The Corporation may also perform statutory functions outside of the SERC Region, on behalf of NERC or other Regional Entities. The Corporation may undertake such activities pursuant to a contract that is approved by the Executive Committee.

ARTICLE IV - BOARD OF DIRECTORS

4.1 **General Powers**. The affairs of the Corporation shall be managed by its Board of Directors except as otherwise provided in these Bylaws.

4.2 **Composition and Eligibility**. The Board of Directors shall be comprised of no fewer than three (3) Directors and no more than two (2) Customer Advisors.

Each Director shall be the principal officer or other authorized employee from a Member Company or a company that controls, is controlled by, or is under common control with such Member Company (an "affiliated entity"). Each Member Company, together with any affiliated entities, may appoint one (1) Director to the Board of Directors. For clarification purposes only, each Member Company and all of such Member Company's affiliated entities (including any affiliated entities which may be a separate Member Company) shall have the right to appoint only one (1) Director to serve on behalf of such Member Company and all of such Member Company's affiliated entities. Each Director shall serve until otherwise replaced by the applicable Member Company, together with any affiliated entities. Each Member Company, together with any affiliated entities, may designate one (1) alternate Director, who shall be a principal officer or other authorized employee from the Director's Member Company or an affiliated entity, to serve in the place of the Member Company's Director at any meeting of the Board of Directors (an "Alternate Director"). Directors may not otherwise use proxy votes. Any vacancy occurring among the Directors or Alternate Directors shall be filled by the applicable Member Company, together with any affiliated entities.

Each Customer Advisor shall be a person who is (i) employed by an entity that receives service at retail and does not otherwise sell, purchase, or transmit power over the Bulk Power System or own, operate or maintain, control or operate facilities or systems that are part of the Bulk Power System; (ii) a state public utility commission representative; or (iii) any other customer advocate. Should the Board of Directors not include two (2) Customer Advisors, the Board of Directors may elect additional Customer Advisors to fill such vacancies. The term of these Customer Advisors shall be for a two (2) year period.

The Chair of FERC and the chair or president of any State Utility Commission in a state in which electric service is provided by a Member Company of the Corporation shall be invited to designate an observer to attend meetings of the Board.

4.3 **Regular Meetings of the Board**. Unless otherwise determined by the Chair, a regular meeting of the Board of Directors shall be held without other notice than these Bylaws on the fourth Wednesday in the months of April and October in each year. Notwithstanding the foregoing, the Chair may elect to hold a regular semi-annual meeting of the Board of Directors on another date provided that the Board receives at least ten (10) days advance notice. If the day fixed for the meeting shall be a legal holiday in the State of North Carolina, the meeting shall be held on the next succeeding business day. The Board of Directors may designate any place as the place of meeting for any meeting. The Board of Directors may provide by resolution the time and place for the holding of additional regular meetings of the Board without other notice than the resolution. Directors or any committee designated by the Board of Directors may participate in such Board or committee meetings by means of a telephone conference, webcast or any other communication by means of which all persons participating in the

meeting can hear each other at the same time, and participation by such means shall constitute presence in person at such meeting.

4.4 **Special Meetings of the Board**. Special meetings of the Board of Directors may be called at the request of the Chair, or by Directors holding twenty percent (20%) or more of the Individual Votes. The Chair may fix any place as the place for holding any special meeting of the Board.

4.5 **Notice of Special Meetings**. Notice of any special meeting of the Board of Directors shall be given at least two (2) days prior to the special meeting by written notice delivered personally, or sent by mail or electronic mail to each Director at the address as shown by the records of the Corporation. If mailed, such notice shall be deemed to be delivered when deposited in the United States mail in a sealed envelope so addressed, with postage prepaid. If sent by electronic mail, such notice shall be deemed to be delivered when sent via electronic mail. Any Director may waive notice of any meeting. The attendance of a Director at any meeting shall constitute a waiver of notice of such meeting, except where a Director attends a meeting for the express purpose of objecting to the transaction of any business because the meeting is not lawfully called or convened. Neither the business to be transacted at, nor the purpose of, any special meeting of the Board need be specified in the notice or waiver of notice of such meeting, unless specifically required by law or by these Bylaws.

4.6 **Election of Board Officers and Executive Committee**. Biennially, at the April meeting, the Board of Directors shall elect Board Officers from among the Directors for the positions of Chair, Vice Chair, and Secretary-Treasurer, each for a term of two (2) years beginning on July 1st after the election. No Director may serve in more than one (1) Board Officer position at the same time. The Chair shall conduct all meetings and shall be responsible for the preparation of the agenda. In the Chair's absence, the Vice Chair shall serve as acting Chair. In the event that a Board Officer cannot complete his or her term, the Board of Directors may hold a special election to elect a replacement Board Officer for the remainder of the unexpired term.

At the same time, the Board shall also approve representatives to the Executive Committee nominated by the Sectors to serve for a period of two (2) years. Each Sector may also elect alternates to the Executive Committee, and, if a Sector has more than one (1) representative on the Executive Committee, such Sector shall designate the priority of succession by such alternates.

4.7 **Agenda**. As far in advance of each regular and special meeting as practical, an agenda shall be distributed to each Director and Customer Advisor.

4.8 **Voting Definitions**.

(a) "Adjusted Weighted Vote" shall mean the number of votes of each Director determined in the manner set forth in Section 4.9 hereof.

(b) "Simple Majority" shall require the presence of a quorum and the (i) concurrence of Directors whose combined Individual Votes are greater than fifty percent (50%) of the total Individual Votes of all Directors present at the meeting and entitled to vote on the issue (the "Individual Vote Test"), (ii) concurrence of Directors whose combined Adjusted Weighted Votes are greater than fifty percent (50%) of the total Adjusted Weighted Vote of all Directors at the meeting and entitled to vote on the issue (the "Adjusted Weighted Vote Test"), and (iii) for at least one of the Individual Vote Test or the Adjusted Weighted Vote Test, on an individual Sector basis, the positive vote shall outweigh the negative vote for at least three Sectors.

(c) "Supermajority" shall require the presence of a quorum and the concurrence of (i) Directors whose combined Individual Votes equal or exceed two-thirds (2/3) of the total Individual Votes of all Directors present at the meeting and entitled to vote on the issue, provided that a quorum is present, and (ii) Directors whose combined Adjusted Weighted Votes are greater than two-thirds (2/3) of the total Adjusted Weighted Vote of all Directors present at the meeting and entitled to vote on the issue.

(d) "Individual Vote" shall mean a single vote accorded to each Director.

(e) "Given Year" shall mean the applicable fiscal year for which the Adjusted Weighted Votes are calculated.

(f) "Reporting Year" shall mean the fiscal year immediately preceding the Given Year.

(g) "Previous Year" shall mean the fiscal year immediately preceding the Reporting Year.

4.9 **Determination of Adjusted Weighted Vote**. The Directors' Adjusted Weighted Votes for a Given Year shall be determined by the following formula:

V = 10(1/N) + 30(B/C) + 30(D/E) + 30(F/G)

V = % of Adjusted Weighted Vote

N = total number of Member Companies

B = Member Company's Previous Year internal peak demand

C = total of factor B for all Member Companies

D = Member Company's owned generating capacity as of January 1 of the Reporting Year

E = total of factor D for all Member Companies

F = Member Company's sum of circuit miles of transmission times the respective operating voltage for facilities of 69 kV and above as of December 31 of the Previous Year

G = total of factor F for all Member Companies

4.10 **Voting; Manner of Acting; Voting Rights; Quorum; Proxies**.

(a) Except as otherwise provided in these Bylaws, all actions by the Board of Directors require approval by a Simple Majority vote.

(b) A motion shall be deemed to have passed if it passes either:

(i) the Individual Vote Test; or
(ii) the Adjusted Weighted Vote Test;

and, for purposes of the failed test (any test that is not satisfied), on an individual Sector basis, the positive votes outweigh the negative votes in every Sector but one.

(c) Directors holding two-thirds (2/3) of the Individual Votes shall constitute a quorum for action by the Board. If Directors holding less than two-thirds (2/3) of the Individual Votes are present at the meeting, a majority of the Directors present may adjourn the meeting from time to time without further notice.

(d) The intent of Section 4.8(b)(iii) and Section 4.10(b) is to ensure that no two Sectors should be able to control any decision and that a single Sector should not be able to veto any matter, respectively (other than amendments to these Bylaws). In the event that either of the foregoing shall nevertheless occur, the Member Companies shall promptly revise the provisions of these Bylaws so that no two Sectors shall be able to control any decision and no single Sector shall be able to veto any matter.

4.11 **Compensation**. Directors shall not receive any compensation from the Corporation for their services to the Corporation.

4.12 **Informal Action by Directors**. Any action required by law to be taken at a meeting of Directors, or any action which may be taken at a meeting of Directors, may

be taken without a meeting if all of the Directors consent in writing to the action so taken.

4.13 **Duties**. The Board of Directors shall have the exclusive responsibility to:

(a) Authorize distributions;

(b) Recommend to members or approve dissolution, merger or the sale, pledge or transfer of substantially all of the ~~c~~Corporation's assets;

(c) Fill vacancies on any of the Board's committees;

(d) Adopt, amend, or repeal the Articles of Incorporation or Bylaws;

(e) Form or dissolve committees of the Board as it deems necessary to carry out the business of the Corporation; and

(f) Resolve any disputes regarding the Member Companies and the Corporation, if those issues cannot be resolved by the standing committees or subcommittees of the Corporation and are not otherwise subject to NERC's dispute provisions for non-compliance with Reliability Standards.

ARTICLE V - CORPORATE OFFICERS

5.1 **Corporate Officers**. The Board of Directors shall appoint a President & Chief Executive Officer, Vice President, Secretary, and Treasurer of the Corporation. Two (2) or more of such offices may be held by the same person, except for the offices of President & Chief Executive Officer and Secretary. The Board of Directors may appoint such other officers and assistant officers as it deems necessary.

5.2 **President & Chief Executive Officer**. The President shall be the Chief Executive Officer of the Corporation and shall manage the operations of the Corporation to the end that its purposes shall be accomplished. The Board Officers shall determine the compensation and benefits for the President & Chief Executive Officer (President). The President shall:

(a) Attend all Board of Directors meetings of the Corporation and NERC Stakeholder and Board of Trustees, meetings, as appropriate;

(b) Assist and coordinate the preparation of testimony and reports;

(c) Coordinate subregional activities and interregional affairs, to include data collection;

(d) Install and maintain an adequate system of accounts and records;

(e) Arrange for meetings as directed;

(f) Assist the Corporation Committee Chairs as appropriate;

(g) Manage the business affairs of the Corporation, including the Corporation staff;

(h) Maintain minutes of all the Corporation-related meetings; and

(i) Provide other assistance to the Corporation and NERC, as appropriate.

5.3 **Vice President.** The Vice President shall perform such duties and exercise such powers as may be assigned to him or her from time to time by the Board of Directors, the Executive Committee, or the President. In the absence of the President, or in the case of the President's inability to act, the Vice President shall perform the duties and exercise the powers of the President, but subject to the control of the Board of Directors and the Executive Committee. The Board Officers shall determine the compensation and benefits of the Vice President.

5.4 **Secretary.** The Secretary shall be custodian of the records and of the seal of the Corporation and in general shall perform all duties incident to the office of Secretary and such other duties as may, from time to time, be assigned to him or her by the Board of Directors, the Executive Committee, or the President.

5.5 **Treasurer.** The Treasurer shall have charge and custody of, and be responsible for, all funds and securities of the Corporation and deposit all such funds in the name of the Corporation in such banks, trust companies, or other depositaries as shall be selected in accordance with the provisions of these Bylaws; and in general, perform all of the duties incident to the office of Treasurer and such other duties as from time to time may be assigned to him or her by the Board of Directors, the Executive Committee, or the President.

ARTICLE VI - EXECUTIVE COMMITTEE

6.1 **Executive Committee Representatives**. The Executive Committee shall be comprised of twelve (12) Sector representatives from the Board of Directors, consisting of:

(a) The Investor-Owned Utility Sector shall have three (3) representatives;

(b) The Federal/State Sector shall have two (2) representatives;

(c) The Cooperative Sector shall have two (2) representatives;

(d) The Municipal Sector shall have two (2) representatives;

(e) The Marketer Sector shall have one (1) representative;

(f) The Merchant Electricity Generator Sector shall have one (1) representative; and

(g) The ISO-RTO Sector shall have one (1) representative.

It is the desire of the Board of Directors that the Cooperative and Municipal sectors have representation from both transmission dependent and transmission owning Members. Each Sector shall be responsible for nominating their representative(s) and alternates from among the Directors. The Chair of the Board shall serve as Chair of the Executive Committee and shall conduct all meetings and shall be responsible for the preparation of the agenda. In the event that a representative on the Executive Committee is unable to complete a term, the Sector's alternate shall replace such representative.

6.2 **Ex Officio Representatives**. The Chair, Vice Chair, and Secretary-Treasurer of the Board of Directors shall also be ex officio representatives on the Executive Committee, but shall not have voting rights unless such Board Officer is also elected by a Sector to the Executive Committee pursuant to Section 6.1 above.

6.3 **Authority of Executive Committee**. Except as limited by Section 55A-8-25 of the North Carolina Nonprofit Corporation Act and Section 4.13 of these Bylaws, the Executive Committee is empowered to make all such decisions and take such actions as are deemed to be necessary for the operation of the Corporation.

6.4 **Action.** Each voting representative on the Executive Committee shall have one vote. The presence of three-quarters (3/4) of the voting representatives on the Executive Committee shall constitute a quorum. The positive vote of two-thirds

(2/3) of Executive Committee voting representatives present and voting is necessary to pass a particular action.

ARTICLE VII - OTHER COMMITTEES

7.1 **Designation by Board**. The Board of Directors, by resolution adopted by a Simple Majority vote, may designate Board committees and standing committees, as shall be necessary to address the purposes of the Corporation. Each Board committee shall have at least two Directors among its members.

7.2 **Rules for Governance**. Each committee shall adopt rules for its own governance that are not inconsistent with these Bylaws, rules adopted by the Board of Directors, applicable NERC or FERC rules or regulations, or applicable state or federal laws. Each committee shall maintain its rules for governance in a written scope document that is approved by the Board of Directors.

7.3 **Ad-Hoc Support Committees**. The Board or its committees may, from time to time, appoint ad-hoc committees to research and/or advise it on compliance or technical issues or matters, among other things. Such ad-hoc committees may be formed on an as-needed basis and may vary in makeup depending on the needs of the Board or its committees.

ARTICLE VIII - MISCELLANEOUS

8.1 **Conflicts of Interest.** All Directors, Alternate Directors, Customer Advisors, and Board committee representatives shall comply with the Corporation's Standards of Conduct policy that prohibits conflicts of interest, as such conflicts could cast doubt on the ability of such persons to act with total objectivity with regard to the overall interests of the Corporation.

8.2 **Contracts**. The Board of Directors may authorize any officer or agent of the Corporation, in addition to the officers so authorized by these Bylaws, to enter into any contract or execute and deliver any instrument in the name of and on behalf of the Corporation, and such authority may be general or confined to specific instances.

8.3 **Checks, Drafts, etc**. All checks, drafts, or orders for the payment of money, notes or other evidences of indebtedness issued in the name of the Corporation, shall be signed by an authorized officer or agent of the Corporation and in such manner as shall from time to time be determined by resolution of the Executive Committee. In the absence of such determination by the Executive Committee, such

instruments shall be signed by the Board's Secretary-Treasurer, the Corporation's President, or the Corporation's Finance Director, as stipulated by the Executive Committee. The Corporation's Finance Director may arrange audits of financial records, sign appropriate documents, and perform such duties normally performed by the Board's Secretary-Treasurer, except duties assigned to the Corporation's President.

8.4 **Deposits**. All funds of the Corporation shall be deposited from time to time to the credit of the Corporation in such banks, trust companies, or other depositories as the Corporation's President may select.

8.5 **Books and Records**. The Corporation shall keep correct and complete books and records of account and shall also keep minutes of the proceedings of the Board of Directors and committees having any of the authority of the Board of Directors, and shall keep at its registered or principal office a record giving the names and addresses of the Directors. All books and records of the Corporation may be inspected by any Director, or agent or attorney representing any Director, for any proper purpose at any reasonable time.

8.6 **Seal**. The corporate seal shall be in circular form and shall have inscribed thereon the name of the Corporation, the words "Corporate Seal", and such other word or words, if any, as may be determined by the Board of Directors to be inscribed thereon.

8.7 **Fiscal Year.** The fiscal year of the Corporation shall begin on the first day of January and end on the last day of December in each year.

ARTICLE IX - EXPENSES

9.1 **Allocation of Specific Expenses.** The expenses of Directors and Board Officers shall be borne by that person's regular employer.

9.2 **Statutory Functions.** The Corporation anticipates that as a general rule all of its expenses shall be incurred in the furtherance of statutory activities pursuant to Section 215 of the Federal Power Act, and that all such expenses shall be funded by NERC, subject to FERC approval.

9.3 **Non-Statutory Functions.** Notwithstanding Section 9.2, the Board of Directors may from time to time authorize the Corporation to participate in non-statutory activities (i.e., activities not described in Section 215 of the Federal Power Act). In the event that the Corporation proposes to engage in non-statutory activities, such activities shall be identified in the Corporation's annual business plan that is submitted to NERC and, if approved by NERC, shall be submitted to FERC for approval in advance of engaging in such non-statutory activities. The expenses incurred by the Corporation for

any such approved non-statutory activities shall be allocated by the Board of Directors to the beneficiaries of such activities on a basis proposed in the business plan submitted for NERC and FERC approval.

ARTICLE X - DISPUTE RESOLUTION PROCESS

10.1 **Dispute Resolution.** All disputes regarding non-compliance with Reliability Standards shall be handled in accordance with the NERC Rules of Procedure. The organizational units of the Corporation shall deal with all other disputes within the framework of their respective organizations. For such other disputes, Member Companies of the Corporation are encouraged to utilize the appropriate Dispute Resolution Process within the Corporation prior to seeking resolution at NERC, FERC, or with legal counsel.

ARTICLE XI - DISSOLUTION

11.1 **Dissolution**. The Corporation may be voluntarily dissolved upon unanimous consent of its Member Companies, and in accordance with Section 55A-14-02 of the North Carolina Nonprofit Corporation Act, as amended from time to time.

11.2 **Distribution of Assets**. Upon dissolution of the Corporation as provided in Section 11.1, the residual assets, after payment of all just obligations, shall be distributed exclusively to organizations which are exempt from federal income tax under ~~Section 501(c)(3)~~Section 501(c)(6) of the Internal Revenue Code of 1986, or corresponding provisions of any subsequent federal tax laws, as the Board of Directors shall determine, ~~or to federal, state, or local governments to be used exclusively for public purposes.~~

ARTICLE XII - WAIVER OF NOTICE

12.1 **Waiver.** Whenever any notice is required to be given under the provisions of the North Carolina Nonprofit Corporation Act or under the provisions of the articles of incorporation or the Bylaws of the Corporation, a waiver thereof in writing signed by the person or persons entitled to such notice, whether before or after the time stated therein, shall be deemed equivalent to the giving of such notice.

ARTICLE XIII - INDEMNIFICATION

13.1 **Indemnification of Directors, Alternate Directors, Customer Advisors, Committee Members, Officers, Employees and Agents**. Every person who is, or has served as, a Director, Alternate Director, Customer Advisor, committee member, Officer, ~~Director by virtue of serving as an Alternate Director,~~ employee, or agent of the Corporation shall be indemnified by the Corporation in the manner and to the extent authorized by the North Carolina Nonprofit Corporation Act. The foregoing rights of indemnification shall be without prejudice to any other rights to which any such Director, Alternate Director, Customer Advisor, committee member, Officer, ~~Alternate Director,~~ employee, or agent may be entitled as a matter of law.

ARTICLE XIV - AMENDMENT OF THE BYLAWS AND ARTICLES OF INCORPORATION

14.1 **Amendment of the Bylaws and Articles of Incorporation**. After a request by twenty percent (20%) of the Board of Directors or an affirmative vote of the Executive Committee, a proposal to amend the Bylaws or the Articles of Incorporation shall be put before the Board of Directors at any regular or special meeting for a vote. Copies of the proposed amendments shall be distributed to the Board of Directors at least thirty (30) days before the meeting at which they are to be considered. An amendment to the Bylaws or the Articles of Incorporation shall be adopted after being approved by a Supermajority vote of the Board of Directors, provided that a quorum is present.

CERTIFICATE OF SERVICE

I hereby certify that I have served a copy of the foregoing document upon all parties listed on the official service list compiled by the Secretary in this proceeding.

Dated at Washington, D.C. this 6th day of June, 2014.

Reliability Standards	**)**	

COMMENTS OF THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION IN RESPONSE TO NOTICE OF PROPOSED RULEMAKING

On March 20, 2014, the Federal Energy Regulatory Commission ("FERC" or the "Commission") issued a Notice of Proposed Rulemaking ("NOPR")[1] proposing to approve proposed Reliability Standards PRC-025-1[2] (Generator Relay Loadability) and PRC-023-3[3] (Transmission Relay Loadability) submitted by the North American Electric Reliability Corporation ("NERC"). NERC supports the Commission's proposal to approve the proposed Reliability Standards as filed. NERC agrees with the Commission that the proposed Reliability Standards will serve to enhance reliability by imposing mandatory requirements governing generator relay loadability, thereby reducing the likelihood of premature or unnecessary tripping of generators during system disturbances. NERC looks forward to the Commission's final rule on these proposed Reliability Standards and respectfully requests that the Commission maintain its proposal to approve the proposed PRC-025-1 and PRC-023-3 Reliability Standards.

---

1 *Generator Relay Loadability and Revised Transmission Relay Loadability Reliability Standards,* 146 FERC ¶ 61,189 (2014) ("NOPR").

2 NERC Sept. 30, 2013 *Petition for Approval of PRC-025-1*, Docket No. RM13-19-000. The purpose of proposed Reliability Standard PRC-025-1 is to set load-responsive protective relays associated with generation Facilities at a level to prevent unnecessary tripping of generators during a system disturbance for conditions that do not pose a risk of damage to the associated equipment.

3 NERC Dec. 17, 2013 *Supplemental Information to Petition for Approval of PRC-025-1*, Docket No. RM14-3-000. The purpose of proposed Reliability Standard PRC-023-3 is to ensure protective relay settings: do not limit transmission loadability; do not interfere with a system operators' ability to take remedial action to protect system reliability; and are set to reliably detect all fault conditions and protect the electrical network from these faults.

Attachment 10: Metrics Concerning Administrative Costs in 2013 NERC and Regional Entity Budgets and Actual Costs

I. INTRODUCTION

The North American Electric Reliability Corporation ("NERC") respectfully submits this filing to provide comparisons of actual to budgeted costs for the year 2013 for NERC and the eight Regional Entities.[1] The Commission originally directed NERC to file, each year, comparisons of actual to budgeted costs for the preceding year, in an order issued October 18, 2007 concerning the 2008 business plans and budgets of NERC and the Regional Entities.[2] As described in §III below, in several subsequent orders, the Commission has clarified and expanded upon the information to be included in the annual actual-to-budget cost comparisons.

The following information is provided in this filing:

- A comparison of the actual funding received and costs incurred by NERC and each Regional Entity for statutory and (where applicable) non-statutory activities for the year ended December 31, 2013, to the budgets of NERC and each Regional Entity for that year, with explanations of significant actual cost-to-budget variances.
- Audited financial statements of NERC and each Regional Entity for the year ended December 31, 2013.
- Metrics concerning NERC and Regional Entity administrative costs in their 2013 budgets and actual results.[3]

This filing includes the following attachments:

Attachment 1: 2013 Actual Cost-to-Budget Comparison and Audited Financial Statements for NERC.

---

[1] The eight Regional Entities are the Florida Reliability Coordinating Council, Inc. ("FRCC"), Midwest Reliability Organization ("MRO"), Northeast Power Coordinating Council, Inc. ("NPCC"), ReliabilityFirst Corporation ("ReliabilityFirst"), SERC Reliability Corporation ("SERC"), Southwest Power Pool, Inc. Regional Entity ("SPP RE"), Texas Reliability Entity, Inc. ("Texas RE"), and Western Electricity Coordinating Council ("WECC").

[2] *North American Electric Reliability Corporation, Order Conditionally Accepting 2008 Business Plan and Budget of the North American Electric Reliability Corporation and Ordering Compliance Filings*, 121 FERC ¶ 61,057 (2007) ("*2008 ERO Budget Order*").

[3] The metrics information is provided in response to P 39 of the Commission's Order issued June 19, 2008. *North American Electric Reliability Corporation, Order Conditionally Accepting Compliance Filing*, 123 FERC ¶61,282 (2008) ("*June 19, 2008 Budget Compliance Order*").

Attachment 2: 2013 Actual Cost-to-Budget Comparison and Audited Financial Statements for FRCC.

Attachment 3: 2013 Actual Cost-to-Budget Comparison and Audited Financial Statements for MRO.

Attachment 4: 2013 Actual Cost-to-Budget Comparison and Audited Financial Statements for NPCC.

Attachment 5: 2013 Actual Cost-to-Budget Comparison and Audited Financial Statements for ReliabilityFirst.

Attachment 6: 2013 Actual Cost-to-Budget Comparison and Audited Financial Statements for SERC.

Attachment 7: 2013 Actual Cost-to-Budget Comparison for SPP RE and 2012 Audited Financial Statements for Southwest Power Pool, Inc.

Attachment 8: 2013 Actual Cost-to-Budget Comparison and Audited Financial Statements for Texas RE.

Attachment 9: 2013 Actual Cost-to-Budget Comparison and Audited Financial Statements for WECC.

Attachment 10: Metrics Concerning Administrative Costs in 2013 NERC and Regional Entity Budgets and Actual Costs

*Persons to be included on the Commission's official service list. NERC requests waiver of the limitation to two persons on the service list in order to include a third person.

III. COMPARISONS OF ACTUAL COSTS TO BUDGETS FOR THE YEAR ENDED DECEMBER 31, 2013

As noted above, in the *2008 ERO Budget Order*, the Commission directed NERC to make annual filings comparing the NERC and Regional Entity budgets to actual costs incurred in the preceding year, "in sufficient detail and with sufficient explanations for the Commission to determine, by program area, the reasons for deviations from the budget and the impacts of those deviations."[4] In the *June 19, 2008 Budget Compliance Order*, which addressed NERC's April 1, 2008 compliance filing to the *2008 ERO Budget Order*, the Commission provided additional direction concerning the presentation of the annual filings comparing NERC's and the Regional Entities' actual to budgeted expenditures:

> 37. To promote consistency and transparency, the Commission directs the use of certain practices and formats in future true-up filings. In particular, Regional Entities must provide a cover letter discussing major areas of actual cost-to-budget variances for all of the Regional Entity's statutory programs in the aggregate. Regional Entities should also follow NERC's template for the presentation of actual costs and budgeted costs on a program-by-program and line-item basis. Significant variances must be explained on a line-item basis with enough particularized information to clearly support each such variance. Regional Entities should refrain from using generic, program area summaries to support significant variances. The cause for each such variance should therefore be clear on its face. Further, each Regional Entity must provide an explanation of the allocation methods it used to allocate indirect costs to the direct statutory program or functional areas, as well as any allocation between any statutory and non-statutory activities.
>
> 38. Cash reserves are meant to handle expenses which exceed the amount budgeted, as well as unforeseen events that could occur at any time. However, in the future, the Commission expects NERC and the Regional Entities to justify the use of cash reserves as variances in the April true-up. Cash reserves should not become a means to fund expected projects outside of the budget approval process. The Commission expects that as NERC and the Regional Entities develop experience in planning and functioning under their budgets the amounts and number of variance will decrease. In addition, the Commission expects that with experience, the explanations for the variances will improve.

In addition, although the following directive in the *2008 ERO Budget Order* was

[4] *2008 ERO Budget Order* at P 23.

expressly applicable to NERC's compliance filing comparing actual expenses to budgets for the year ended December 31, 2007 for NERC and the Regional Entities, NERC has treated the directive as intended to apply to the annual filings comparing actual expenses to budgets for future years as well:

> 66. . . . [T]he Commission reminds NERC and the Regional Entities that, to the extent funding identified as statutory is used to fund non-statutory activities, those funds must be reimbursed (e.g., to load serving entities or to statutory expenditures). NERC is directed to inform the Commission in the . . . compliance filing the extent to which this has occurred and document that the funds have been or will be reimbursed.

The comparisons of 2012 actual-to-budget funding and expenditures for NERC and the Regional Entities are provided in **Attachments 1 through 9**, as follows:

- **Attachment 1:** NERC
- **Attachment 2:** FRCC
- **Attachment 3:** MRO
- **Attachment 4:** NPCC
- **Attachment 5:** ReliabilityFirst
- **Attachment 6:** SERC
- **Attachment 7:** SPP RE
- **Attachment 8:** Texas RE
- **Attachment 9:** WECC

Each Attachment also includes the respective entity's audited financial report for the year ended December 31, 2013, as prepared by its independent public accounting firm.

The comparisons provided in **Attachments 1** through **9** conform to the Commission's directives as quoted above:

- Each comparison contains a cover letter identifying overall actual-to-budget variances in Funding and total Expenses and in major Expense categories, and discussing reasons for major areas of actual cost-to-budget variances.
- Each comparison contains a summary table, prepared using a NERC-supplied template, showing the entity's 2013 budget, 2013 actual amounts, and the variance,

for major line-item categories of Funding and Expenses.

- For those entities that engaged in both statutory and non-statutory activities in 2013, the comparisons include separate summary tables for statutory programs and non-statutory activities, prepared using the NERC-supplied template, showing the entity's 2013 budget, 2013 actual amounts, and the variance, for major line-item categories of Funding and Expenses.[5]
- The comparisons include individual tables, also prepared using a NERC-supplied template, showing 2013 budget, 2013 actual amounts, and the variance, for major line-item categories of Funding and Expenses, for each of the statutory programs[6] (direct costs) and the overhead functions[7] (indirect costs). These tables also provide explanations for significant line-item actual-to-budget variances.[8]

The Attachments also address (generally in the cover letter) (i) where applicable, whether any statutory funds were used in 2013 for non-statutory activities (neither NERC nor any Regional Entity reports using statutory funds for non-statutory activities during 2013); (ii) the impact of the entity's 2013 results on its working cash reserve for statutory programs (*e.g.*, whether working cash reserves were used to fund expenditures during 2013)[9]; (iii) how indirect

[5] FRCC, NPCC, Texas RE and WECC had non-statutory activities in 2013 and each has provided summary tables for statutory and non-statutory activities. NERC, MRO, ReliabilityFirst, SERC and SPP RE did not have non-statutory activities in 2013 (although SPP RE's parent organization, Southwest Power Pool, Inc. had non-statutory activities).

[6] Reliability Standards, Compliance Operations, Enforcement and Organization Registration, Reliability Assessment and Performance Analysis, Training, Education and Operator Certification, and Situation Awareness and Infrastructure Security (including Critical Infrastructure Protection). NERC and SERC have each provided separate tables for (i) Compliance Operations and Organization Registration and (ii) Compliance Enforcement. In addition, NERC has also provided separate tables for Event Analysis and Investigations and for Critical Infrastructure Protection and ES-ISAC (Electricity Sector Information Sharing and Analysis Center).

[7] Committees and Member Forums, General and Administrative, Legal and Regulatory, Information Technology, Human Resources, and Accounting and Finance. Some of the Regional Entities report budget and actual expenditure information for some or all of the overhead functions on a combined basis, in order to protect the confidentiality of compensation information for departments that have a limited number of staff members.

[8] Generally, explanations have been provided for line-item variances that are greater than +/- 10% of the budgeted amount and greater than $10,000 over or under the budgeted amount.

[9] The summary comparison tables for total entity and (where applicable) statutory and non-statutory activities show the "Change in Working Capital" (or in "Operating Reserves") for the 2013 Actual Funding and Expenditures. A positive "Change in Working Capital" means the entity's total Actual Funding exceeded its total Actual Expenditures for the year 2013; therefore, it was not necessary for the entity to use a portion of its cash reserves balance at December 31, 2012 to fund 2013 expenditures.

costs were allocated to the direct statutory programs or functions; and (iv) where applicable, whether, and if so how, costs were allocated between statutory programs and non-statutory activities in 2013.

As it did in its actual cost-to-budget comparisons filed with the Commission for 2011 and 2012,[10] NERC has provided additional information in its 2013 report in **Attachment 1** on (1) actual cost to budget variances for Consultants and Contracts expense, and (2) a detailed analysis and comparison of the major sources of changes in its working capital and operating reserves for 2013, as budgeted and per actual results. The analysis of working capital and operating reserves includes a breakdown of the changes in working capital and operating reserves due to 2013 budgeted operations and to differences in actual funding or expenditures from amounts budgeted, including unbudgeted or above-budget expenditures funded from the Known Contingency Reserve or the Unknown Contingency Reserve. This additional information is also responsive to recommendations adopted in the approved Settlement Agreement for the Commission's financial performance audit of NERC.[11] The table on page 4 of **Attachment 1** shows the actual cost to budget variances for Consultants and Contracts expense for 2013 by NERC program area, and is followed by a detailed narrative discussion of the reasons for actual cost-to-budget variances for Consultants and Contracts expense in each program area (pages 4-5). The analysis of changes in working capital and operating reserves is provided on pages 8-9 of **Attachment 1**, including the

[10] *See* Attachment 1 to *North American Electric Reliability Corporation's Report of Comparisons of Budgeted to Actual Costs for 2011 for NERC and the Regional Entities*, filed May 30, 2012 in Docket No. RR12-11-000 ("*2011 True-Up Filing*"); and Attachment 1 to *North American Electric Reliability Corporation's Report of Comparisons of Budgeted to Actual Costs for 2012 for NERC and the Regional Entities*, filed May 30, 2013 in Docket No. RR13-6-000 ("*2012 True-Up Filing*")

[11] *See North American Electric Reliability Corporation, Order Approving Settlement Agreement*, 142 FERC ¶ 61,054 (2013), Attachment (Settlement Agreement) at §II(8)(a), specifying that NERC will "[i]ncrease the granularity of the NERC budget filings by identifying proposed budgeted expenditures, at a minimum, by the major activities to be undertaken by each program area" (Audit Staff Recommendation 4). NERC also agreed with Audit Staff Recommendation 5 to "[i]ncrease the granularity of the NERC true-up filings in line with the budget filings."

table on page 9 which shows the major sources of generation and additions to operating reserves in 2013 and the major expenditures of operating reserves in 2013.

In addition, in its 2013 report, NERC has also provided (1) details relating to Miscellaneous Expense, reporting actual expenses for employee rewards and recognition, community responsibility activities and charitable contributions (*see* page 6 of **Attachment 1**); and (2) an actual cost-to budget comparison of 2013 Board of Trustees expenses, detailed by Meetings and Travel Expense (Quarterly Board Meetings and Trustee Travel expense) and Professional Services (Independent Trustee Fees and Trustee Search Fees). The information relating to Board of Trustees expenses is provided on page 7 of **Attachment 1**.

Because the NERC and Regional Entity reports in each Attachment identify and discuss major areas of actual-to-budget variances, and the individual tables for each direct statutory program and each indirect cost function contain specific explanations of significant variances on a line-item basis, a detailed, entity-by-entity discussion of the actual-to-budget variances experienced in 2013 by NERC and individual Regional Entities is not provided here. However, the list below describes several recurring drivers of actual-to-budget variances experienced by NERC and the Regional Entities in 2013, as identified by NERC's review of the comparisons.

- A number of entities[12] experienced under-budget variances in Salary Expense and related Personnel Expenses (Payroll Taxes, Employee Benefits and Savings & Retirement), in one or more program areas, due to being unable to fill budgeted positions, due to filling budgeted positions later in the year than was assumed in the budget, or due to employees in existing positions leaving the entity, resulting in a vacant position for a portion of the year. Additionally, having fewer personnel on staff than budgeted tended to reduce Meetings and/or Travel Expense below the budgeted amounts.[13]

[12] The term "entities" is used in this discussion to include NERC as well as Regional Entities.

[13] In the development of their annual budgets, NERC and some of the Regional Entities have begun to address this "vacant position" variance issue by including an "attrition factor" or "labor float factor" into their budget calculations. The attrition factor recognizes that, as in any organization, a portion of the

- In some instances, due to the difficulty in filling budgeted positions, the entity may have found it necessary (i) to pay higher compensation than budgeted to fill a new or vacant position, and/or (ii) to incur costs for temporary staffing services while budgeted positions were vacant.
- In order to address unfilled positions or emergent needs in particular program areas, some entities transferred one or more employees from one program area to another during 2013, or had shared FTEs who spent a greater portion of their time working in one program area and a lesser portion of time in another program area than was reflected in the budget. This resulted in actual cost-to-budget variances in Personnel Expenses and related Meeting and Travel expenses for the program areas involved in such transfers, although not necessarily for the entity as a whole.
- The inability to fill budgeted positions as planned, or the departure of existing employees, also resulted in some instances in higher-than budgeted Consultants & Contracts expense, due to either or both the need to use consultants or contractors to perform work that would have been done by employees, or the need to make greater use than budgeted of personnel recruiting services and search firms.
- Generally, NERC and the Regional Entities allocate Indirect Expenses to the direct statutory programs on the basis of numbers of FTEs in each statutory program. Therefore, due to differences in actual versus budgeted FTEs during the year in individual statutory programs, some entities experienced variances from budget in the amounts of Indirect Expenses allocated to the individual direct statutory programs.
- Some entities experienced higher or lower Employee Benefits expenses than budgeted due to actual renewal rates from services providers for their health and medical benefits programs being different than projected at the time of budget preparation.
- Some entities experienced lower than budgeted Employee Benefits expenses due to decisions by employees not to participate in the entity's medical benefits program. In some cases employees elected to stay on the health and medical programs of previous employers or of their spouse's employer.
- Some entities experienced either higher or lower costs than budgeted for Retirement costs due to greater or lesser participation by employees in the entity's retirement plan than was assumed in the budget.
- A number of entities realized lower than budgeted actual costs for Meetings and Travel due to (i) continuing efforts to make greater use of teleconferencing, Webinars and other virtual meeting capabilities rather than in-person meetings; (ii) holding several meetings in the same hotel or other outside facility, thereby obtaining lower charges; and/or (ii) scheduling meetings at NERC or Regional Entity facilities or the facilities of stakeholders (*e.g.* at the offices of Regional Entity members) rather than in rented, third-party meeting spaces.

---

budgeted positions will be vacant during a part of the year due to delays in filling new or vacant positions and unexpected/unbudgeted departures of existing employees.

- In particular with respect to Meetings and Travel expense, several entities which moved to new offices with larger meeting spaces, or expanded existing offices, in 2013 or in recent prior years have been able to reduce Meetings and Travel expense by holding more meetings in the entity's office rather than in outside facilities.
- Some entities incurred lower than budgeted costs for Conference Calls due to entering into a new contract for teleconferencing services with the existing provider, or entering into a contract with a new provider of these services, at lower costs, during the course of the year.
- Several entities were able to spend less on Consultants and Contracts and/or Professional Services than budgeted, as a result of having work budgeted to be performed by contractors and consultants handled by internal staff of the entity. As some entities have increased their staffing over time, they have seen less need to use outside services, due to increased in-house staff capabilities.
- Some entities experienced lower than budgeted Consultants and Contracts expense due to timing delays or deferrals in planned projects.
- Some entities experienced variances in Office Rent or Office Costs due to new or changed office lease terms (including as a result of moving to a new office or taking additional space in the existing office facility), or due to implementing changes in the manner in which the entity accounted for Office Rent or Office Costs, as compared to the terms or accounting reflected in the budget.
- In addition, some entities which moved to new offices or expanded existing offices to accommodate increased staffing, incurred additional costs for capital expenditures (Furniture & Fixtures CapEx, Equipment CapEx, Computer & Software CapEx, and/or Leasehold Improvements) associated with the move to the new office or expansion of the existing office.
- Some actual cost-to-budget variances within program areas are due to the entity budgeting certain costs entirely in one program area but then recording the actual costs in the program area responsible for incurring the cost (*e.g.*, budgeting all outside legal services in Legal and Regulatory but recording actual outside legal expenses in the program area(s) whose activities necessitate the services).
- Some entities budget Professional Services expense for one or two contested compliance hearing per year (*e.g.*, for outside counsel to handle the hearing or for hearing officer services); if no contested hearings occur during the year, an under-budget variance in Professional Services expenses results.
- For some entities, Information Technology projects or Fixed Asset purchases (*e.g.*, office furniture purchases) that were included in the 2013 budget were either (i) completed, or at least initiated, in late 2012, (ii) not carried out in 2013 (*i.e.*, delayed/deferred to 2014), or (iii) initiated later in 2013 than assumed in the budget and therefore not completed in 2013. This resulted in reduced actual IT costs, Capital Expenditures, and/or Consultants and Contracts expense (where the project was to require the use of consulting services or outside contracts). In other cases, projects that were planned and budgeted for execution and completion in 2012 were not fully

completed in 2012 or were delayed or deferred into 2013, resulting in unbudgeted expenditures in 2013.

- Some entities budgeted certain expenditures as expenses (*e.g.*, as Office Costs), but then determined that the expenditure(s) needed to be capitalized (*i.e.*, recorded as Fixed Asset additions, such as Computer & Software Capital Expenditures or Equipment Capital Expenditures) based on the entity's capitalization policy. The determination to capitalize rather than expense these expenditures also resulted in additional Depreciation expense.
- Some entities experienced higher or lower Funding from Workshop attendance fees, or other programs conducted for industry participants, due to higher or lower attendance at workshops or other programs than projected in the budget, holding more or fewer Workshops than assumed in the budget, making a determination not to charge fees (or charging lower fees) for some programs for which fees had been budgeted, or a combination of these factors.

In addition to the above-described causes of actual-to-budget variances that were experienced by more than one entity, NERC and the Regional Entities experienced other above- or below-budget variances in actual Funding, Expenses and Fixed Asset Additions in individual line items due to particular events and circumstances impacting the particular entity. These variances are identified in the individual actual cost-to-budget comparisons presented in **Attachments 1** through **9**.

NERC and the Regional Entities are taking the actual cost-to-budget comparisons for 2013, as well as year-to-date actual cost-to-budget comparisons for 2014, into account in developing their business plans and budgets for 2015, which are to be submitted to the NERC Board for approval, and then filed with the Commission for approval, in August 2014. In addition, the Regional Entities' working capital and operating reserve policies are being reviewed as part of the 2015 business plan and budget review process.

IV. METRICS CONCERNING ADMINISTRATIVE COSTS IN 2014 NERC AND REGIONAL ENTITY BUDGETS AND ACTUAL COSTS

In the *June 19, 2008 Budget Compliance Order*, the Commission directed NERC to develop additional metrics analyzing its administrative expenses and those of the Regional

Entities, and to present these metrics in future annual actual cost-to-budget filings and Business Plan and Budget filings:

> 39. Our analysis of the Regional Entities' true-up statements indicates that many Regional Entities spent a significant percentage of their 2007 budgets on various administrative functions to support their statutory functions.[13] The amounts spent on administrative functions vary widely among the Regional Entities. . . We recognize that 2007 is the first year that these Regional Entities have prepared a budget for statutory functions and that there are some startup costs that will be unique to 2007. The Commission anticipates, however, that such effects will diminish as NERC and the Regional Entities gain experience preparing their budgets. To promote better transparency, the Commission directs NERC to develop additional metrics to identify, in a uniform manner, information detailing its total expenses for administrative functions as well as the expenses for administrative functions for each Regional Entity. For example, one of the matrices should be the percentage spent by the Regional Entity on administrative functions as a portion of its total approved budgeted funding similar to the information provided in the table attached to this order. These new metrics should be designed to enhance the Commission's ability to compare information provided by the Regional Entities on administrative costs and to understand the reasons for any significant differences in amounts budgeted by different Regional Entities for the same function. The Commission therefore directs NERC to develop these additional metrics for use in the true-up filings for NERC's 2008 and 2009 budgets and for use in NERC's subsequent business plans and budgets beginning with NERC's 2010 Business Plan and Budget.
>
> [13] The Commission considered the amount each Regional Entity spent on administrative functions as a percentage of its total budgeted funding. The administrative functions included in staff's analysis are: Committees and Member Forums, General and Administration, Legal and Regulatory, Information Technology, Human Resources, and Accounting and Finance. A table of administrative expenses spent by each Regional Entity as a percentage of its budgeted funding is included as Attachment A to this order.

The administrative functions cited in footnote 13 of the *June 19, 2008 Budget Compliance Order* (Committees and Member Forums, General and Administration, Legal and Regulatory, Information Technology, Human Resources and Accounting and Finance) are the functions that NERC and the Regional Entities refer to as "indirect costs" in their business plans and budgets and reports of actual expenses. It is appropriate to analyze these indirect costs in the aggregate (as the Commission did in P 39 and footnote 13 of the *June 19, 2008 Budget Compliance Order*),

rather than by individual function, due to certain necessary inconsistencies among the Regional Entities in budgeting and recording these costs. For example, as noted earlier, some of the Regional Entities budget and record all Salary expense for Legal and Regulatory, Human Resources and/or Accounting and Finance under General and Administrative, because they have only one or two employees in each of these functions, and therefore reporting the budgeted and actual Salary expense for these individual functional categories could reveal salary information of individual employees.[14] As stated earlier, the actual cost-to-budget comparisons for 2013, as well as year-to-date actual cost-to-budget comparisons for 2014, are being taken into account in developing the NERC and Regional Entity business plans and budgets for 2015.

Attachment 10 provides the following three sets of metrics comparisons for NERC and the Regional Entities for their 2013 budgets and 2013 actual costs. In addition, **Attachment 10** provides a comparison of these metrics values for 2011, 2012 and 2013 actual results.

- Statutory indirect expenditures as a percent of total statutory expenditures,[15] and statutory direct expenditures per dollar of statutory indirect expenditures (top row of tables on **Attachment 10**).[16]
- Statutory indirect full-time equivalent employees ("FTE") as a percent of total statutory FTE, and ratio of statutory direct FTE to statutory indirect FTE (middle row of tables on **Attachment 10**).
- Total statutory expenditures per total FTE, statutory direct expenditures per direct FTE, statutory indirect expenditures per indirect FTE, and statutory indirect expenditures per total FTE (bottom row of tables on **Attachment 10**).

These are the same metrics that NERC provided in its previous annual filings comparing

[14] In addition, in some instances NERC or a Regional Entity has budgeted all of its projected costs for indirect functions such as General and Administrative, Legal and Regulatory or Information Technology in the indirect program, but has recorded some or all of the actual costs incurred for the function in the statutory program in which work was performed (*e.g.*, recording Professional Services expenses budgeted in Legal and Regulatory in the direct program for which outside legal services were performed).

[15] This is the metric shown in Attachment A to the *June 19, 2008 Budget Compliance Order*.

[16] The term "expenditures" is used in this discussion to mean expenses plus capital expenditures (fixed asset additions net of depreciation).

actual-to-budget costs for NERC and the Regional Entities for 2008, 2009, 2010, 2011 and 2012.[17] In the *June 29, 2009 Budget Compliance Order*, the Commission indicated that these metrics were acceptable.[18]

In reviewing indirect expenditures, it is important to take into consideration that NERC's indirect expenses support more than NERC's internal operations. NERC's indirect expenditures also include support of software applications that interface with Regional Entities. Costs for outside audit resources in connection with Regional Entity oversight, as well as Compliance and Certification Committee oversight of NERC's compliance with its Rules of Procedure, are also included in indirect expenses. In addition, expenses incurred in NERC's legal and executive (General and Administrative) operations, as well as those of the Regional Entities, directly support the activities of the standards, compliance and enforcement, and other statutory program areas. NERC's legal department, as well as those of the Regional Entities, devotes considerable resources to supporting standards development, compliance enforcement and registration matters.

The following subsections provide discussion and analysis of the metrics provided in **Attachment 10**.

Statutory indirect expenditures as a percent of total statutory expenditures, and statutory direct expenditures per dollar of statutory indirect expenditures

The data and metrics in the top row of tables on **Attachment 10** measure the portions of

[17] *Additional Compliance Filing of the North American Electric Reliability Corporation in Response to October 18, 2007 Order – Comparisons of Budgeted to Actual Costs for 2008 for NERC and the Regional Entities*, filed April 1, 2009 in Docket No. RR07-16-005; *North American Electric Reliability Corporation's Report of Comparisons of Budgeted to Actual Costs for 2009 for NERC and the Regional Entities*, filed June 1, 2010 in Docket No. RR08-6-000; *North American Electric Reliability Corporation's Report of Comparisons of Budgeted to Actual Costs for 2010 for NERC and the Regional Entities*, filed May 31, 2011 in Docket No. RR11-4-000; *2011 True-Up Filing; 2012 True-Up Filing.*

[18] *North American Electric Reliability Corporation, Order Conditionally Accepting Compliance Filing*, 127 FERC ¶ 61,307 (2009) ("*June 29, 2009 Budget Compliance Order*"), at PP 13-14.

the total statutory expenditures of NERC and each Regional Entity, and the Electric Reliability Organization ("ERO") in the aggregate, that are being expended on statutory direct functions and on statutory indirect functions. Based on 2013 actual data, statutory indirect expenditures averaged 33.61% of total statutory expenditures for NERC and the Regional Entities, and the average statutory direct expenditure per dollar of statutory indirect expenditure was $1.98.[19] The actual average statutory indirect expenditure percentage was almost equal, and the actual average statutory direct expenditure per dollar of indirect expenditure was equal, to the averages based on the NERC and Regional Entity budgets (33.51% and 1.98, respectively). Further, the 2011 and 2012 actual results are not significantly different from the 2013 actual results for these metrics. The 2013 actual average statutory indirect expenditure percentage was 33.61% while the 2011 and 2012 actual average statutory indirect expenditure percentages were 31.06% and 30.35%, respectively. The three-year average for this metric for 2011, 2012 and 2013 combined was 31.72%. The 2013 actual average statutory direct expenditure per dollar of indirect expenditure was $1.98 while the 2011 and 2012 statutory direct expenditure per dollar of statutory indirect expenditure was $2.22 and $2.29, respectively. The three-year average for 2011, 2012 and 2013 combined for this metric was $2.15.

Looking at the 2013 values of these metrics for the individual entities compared to the 2013 averages, the percentages of actual statutory indirect expenditures to total statutory expenditures for NERC and SPP RE were noticeably higher than the overall weighted and

[19] These figures are essentially weighted averages, *i.e.*, they are calculated using the sums of the total statutory expenditures, total statutory direct expenditures, and total statutory indirect expenditures, for NERC and the eight Regional Entities. Since NERC's and WECC's expenditures are substantially larger than those of the other Regional Entities, the NERC and WECC results significantly influence the weighted averages. (The significance of the WECC data to the averages is further magnified due to the amount of U.S. Department of Energy grant funds and related expenditures included in WECC's 2013 budget and actual results.) The arithmetic averages for these two metrics are 34.53% for statutory indirect expenditures as a percent of total statutory expenditures, and $2.57 for statutory direct expenditures per dollar of statutory indirect expenditures.

arithmetic averages, and their 2013 ratios of actual statutory direct expenditures to statutory indirect expenditures were noticeably lower than the overall weighted and arithmetic averages.

For NERC, its total actual direct statutory expenditures were approximately $337,600 less than budgeted while its total statutory indirect expenditures exceeded budget by approximately $766,300, resulting in its percentage of statutory indirect expenditures to total statutory expenditures rising from 43.06% in its budget to 44.13% actual. NERC's lower-than budgeted direct statutory expenditures was primarily due to: (1) lower than budgeted Personnel Expenses, which were collectively under budget $581,200, due to unfilled positions in the Compliance Enforcement, Situation Awareness and Training, Education, and Operator Certification departments; (2) lower than budgeted Meetings, Travel and Conferencing expenses, which were collectively $620,600 under budget, due primarily to management initiatives to lower these expenses; and (3) higher than budgeted Fixed Asset expenditures due to the capitalization (rather than expensing) of the Enterprise Bulk Electric System Exceptions application and the standards balloting software application.

SPP RE's actual 2013 indirect expense amount was in fact lower than budgeted (by approximately $337,500, or about 6%), but SPP RE's 2012 statutory direct expenditures were also lower than budgeted (by approximately $1,500,000, or about 25%), with the result that SPP RE's percentage of statutory indirect expenditures to total statutory expenditures increased from 47.33% as budgeted to 52.81% actual, and its ratio of statutory direct expenditures to statutory indirect expenditures fell from $1.11 as budgeted to $0.89 actual. In other words, the principal reason for SPP RE's actual percentage of statutory indirect expenditures to total statutory expenditures being higher than budgeted for 2013 was that SPP RE's actual direct statutory

expenditures were much lower than budgeted, not that its actual indirect expenses were higher than budgeted.

As shown by the data provided on the second page of **Attachment 10**, comparisons of the actual 2013 results for this first set of metrics to the actual results for 2012 and 2011 for these metrics show that, over this three-year period, NERC and the Regional Entities, in the aggregate, spent about the same portion of their total statutory expenditures on statutory indirect costs. Further, with only limited exceptions, each entity's annual values for these metrics were fairly consistent over the three-year period. This three-year view indicates that as their organizations and programs mature, with seven years of ERO and delegated function activities, each entity is reaching a steady state in terms of the portions of its total resources that are expended on statutory direct program costs and statutory indirect costs.

Statutory indirect FTE as a percent of total statutory FTE, and ratio of statutory direct FTE to statutory indirect FTE

On average for NERC and the Regional Entities, 2013 actual statutory indirect FTEs were 24.28% of total statutory FTEs, and on average NERC and the Regional Entities had 3.12 statutory direct FTEs per statutory indirect FTE in 2013. The 2013 actual value for statutory indirect FTEs as a percent of total statutory FTEs was slightly lower than the 2012 value for this metric of 24.65% and slightly higher than the 2011 value for this metric of 23.42%; while the 2013 actual value for the number of statutory direct FTEs per statutory indirect FTE was slightly higher than the 2012 value for this metric of 3.06, and lower than the 2011 value for this metric of 3.27. Overall, however, the annual averages for this metric were fairly consistent across the three-year period 2011-2013.

In 2013, the actual percentage of statutory indirect FTEs to statutory total FTEs was less than 25% for each entity in the ERO except NERC (for which the percentage was 30.84%) and

SERC (26.94%); and NERC and each Regional Entity had at least 2.24 statutory direct FTE per statutory indirect FTE. Among the Regional Entities, FRCC, MRO, Texas RE and WECC each had a lower actual percentage of statutory indirect FTEs to statutory total FTEs in 2013 than in 2012 and 2011. NPCC and SERC each experienced higher actual percentages of statutory indirect FTEs to statutory total FTEs in 2013 than in 2012 and 2011. NERC's actual percentage of statutory indirect FTEs to statutory total FTEs in 2013 was approximately equal to its value for this metric in 2012 and was somewhat higher than its value for this metric in 2011. ReliabilityFirst's actual percentage of statutory indirect FTEs to statutory total FTEs in 2013 was lower than its value for this metric in 2012 and higher than its value for this metric in 2011.

Similarly, FRCC, MRO, Texas RE and WECC each had a higher actual ratio of statutory direct FTEs per statutory indirect FTE in 2013 than in 2012 and 2011, while NPCC and SERC each had lower actual ratios of statutory direct FTEs per statutory indirect FTE in 2013 than in 2012 and 2011. NERC's actual ratio of statutory direct FTEs per statutory indirect FTE in 2013 was equal to its 2012 value, and lower than its 2011 value, for this metric. ReliabilityFirst's actual ratio of statutory direct FTEs per statutory indirect FTE in 2013 was higher than its value for this metric in 2012 and lower than its value for this metric in 2011.

The three-year average percentage of actual statutory indirect FTEs to total statutory FTEs was 24.14%. The three-year average actual ratio of statutory direct FTEs per statutory indirect FTE was 3.14. As noted above in the discussion of the first set of metrics, comparisons of the actual 2013 results for this second set of metrics to the actual results for 2012 and 2011 for these metrics show that, over this three-year period, NERC and the Regional Entities, in the aggregate, had about the same percentage of indirect FTEs to total statutory FTEs and about the same ratio of statutory direct FTEs per statutory indirect FTEs for each of the three years (*i.e.*,

the highest annual average value for each metric was within 7% or less of the lowest annual average value for the metric).

Total statutory expenditures per total FTE, statutory direct expenditures per direct FTE, statutory indirect expenditures per indirect FTE, and statutory indirect expenditures per total FTE

The bottom row of metrics in the tables in **Attachment 10** shows the (i) total statutory expenditures per total FTE (total statutory expenditures divided by total number of statutory FTE), (ii) statutory direct expenditures per direct FTE, (iii) statutory indirect expenditures per indirect FTE, and (iv) statutory indirect expenditures per total FTE (statutory indirect expenditures divided by total number of FTE), for NERC and each Regional Entity. For NERC and the eight Regional Entities, in the aggregate:

- The actual average total statutory expenditures per statutory FTE were approximately 7.6% higher than budgeted ($273,210 actual versus $253,971 budgeted).
- The actual average statutory direct expenditures per statutory direct FTE were also approximately 7.6% higher than budgeted ($239,565 actual versus $222,630 budgeted).
- The actual average statutory indirect expenditures per statutory indirect FTE were 7.3% higher than budgeted ($378,131 actual verses $352,402 budgeted).
- The actual average statutory indirect expenditures per total statutory FTE were higher than budgeted by 7.9% ($91,815 actual versus $85,109).

Overall, for NERC and the Regional Entities in the aggregate, the actual 2013 value for each of the first three metrics was lower than the actual values for 2012 and 2011, with only one exception:

- The actual average total statutory expenditures per statutory FTE were $273,210 in 2013, as compared to $278,306 in 2012 and as compared to $291,503 in 2011. The three-year average value for this metric was $281,007.
- The actual average statutory direct expenditures per statutory direct FTE were $239,565 in 2013 as compared to $257,242 in 2012 and as compared to $262,409 in 2011. The three-year average value for this metric was $253,072.

- The actual average statutory indirect expenditures per statutory indirect FTE were $378,131 in 2013 as compared to $342,707 in 2012 and as compared to $386,650 in 2011. The three-year average value for this metric was $369,163.

This latter comparison shows that from 2011 to 2013, the ERO's FTE staffing (both direct function and indirect function personnel) grew faster than statutory expenditures grew, indicating an increase in the efficiency of use of the ERO's personnel.

A final, overall observation on the entire set of metrics data presented in **Attachment 10** (similar to the observation stated earlier based on the first set of metrics), is that, after seven years of ERO operations, as their organizations and programs mature, with only limited exceptions, each of the nine entities appears to be reaching a steady state in terms of the portions of its total statutory expenditures and personnel resources that are being devoted to statutory direct program activities and to statutory indirect activities. While some differences remain in the individual metrics values among the entities, these differences (*i.e.* each entity's metrics values) can be seen as becoming ingrained in their organizational and program structures.

V. CONCLUSION

The North American Electric Reliability Corporation respectfully requests that the Commission accept this filing and Attachments as compliant with the Commission's requirements for annual presentation of comparisons of actual-to-budgeted funding and costs for NERC and the Regional Entities for the year ended December 31, 2013.

Respectfully submitted,

Gerry W. Cauley

ATTACHMENT 1

2013 ACTUAL COST-TO-BUDGET COMPARISON

AND

2013 AUDITED FINANCIAL REPORT

FOR

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

North American Electric Reliability Corporation 2013 Audited Results – Actual to Budget Variance Analysis

For the year ending December 31, 2013, NERC was approximately on budget with a minor over budget variance of $428.6k (0.8%) for total expenses and fixed asset (capital) purchases, inclusive of expenditures of reserves. While there were some significant variances within the expense categories, as further explained below, this minor overall budget variance was primarily due to: (1) higher personnel expenses resulting from the addition of senior personnel, higher than budgeted expenses for temporary office services needed to support NERC's ongoing operations during times of staff vacancies, higher incentive compensation based upon year-end performance results, higher payroll tax expense due to a higher maximum salary limit subject to taxes, and the accrued expense for unused paid time off, which were partially offset by lower than budgeted benefits and retirement costs; and (2) higher than budgeted expenditures of fixed assets due to capitalization of the development costs of the Enterprise Bulk Electric System Exception (BES) software application and furniture and leasehold improvement costs required for the approved increase in lease space for the Atlanta offices. These over budget expenses were offset to a degree by lower travel expenses due to having fewer FTEs on staff, fewer telecommuters, various management initiatives to reduce overall travel expenses, and lower than budgeted consultant and contract expense. Consultant and contract expenses were under budget primarily due to the reclassification of expenses related to development of the BES software application which were partially budgeted under consulting and contract expenses, but were recorded in fixed assets as capitalized software, resulting in the over budget variance in fixed asset additions . All uses of operating reserves received necessary corporate authorizations and are further explained beginning on page 8 under the heading Operating Reserve Analysis.

2013 ACTUAL VERSUS BUDGET BY CATEGORY

	2013 Actual	2013 Budget	2013 Variance Over(Under)	%
TOTAL FUNDING	**52,349,031**	**52,252,656**	**96,375**	**0.2%**
BUDGET - EXPENSES and FIXED ASSETS				
PERSONNEL EXPENSES	32,113,505	31,298,403	815,101	2.6%
MEETINGS, TRAVEL and CONFERENCE CALLS	3,414,306	4,098,310	(684,005)	-16.7%
CONSULTANTS and CONTRACTS	8,293,693	8,816,254	(522,561)	-5.9%
RENT	2,722,106	2,756,840	(34,734)	-1.3%
OFFICE COSTS, PROFESSIONAL SERVICES and MISCELLANEOUS	5,461,481	5,494,346	(32,865)	-0.6%
Other Non-Operating Expenses	203,164	50,000	153,164	306.3%
FIXED ASSET PURCHASES (excludes the credit for depreciation)	2,506,631	1,772,100	734,531	41.4%
TOTAL BUDGET	**54,714,886**	**54,286,253**	**428,631**	**0.8%**
Change in Working Capital and Operating Reserves	**(2,365,855)**	**(2,033,597)**	**(332,256)**	
FTEs	**174.75**	**186.25**	**(11.50)**	**-6.2%**

The following is an explanation the major factors influencing actual to budget performance for 2013:

- **Funding –** Over budget variance is the net effect of over-budget variances in services and software and testing fees and under-budget variances in workshop fees and Interest. Testing fees were over budget primary due to more system operator certification tests taken and more certificate renewals than expected. Services and software were over budget primarily due to licensing of GADS data which was not planned for 2013. Workshop fees were under budget primarily due to elimination of a NASPI workshop and the elimination of fees for a compliance auditor workshop that was held at a Regional Office instead of a hotel. Interest was under-budget primarily due to extremely low rates of return on invested funds.
- **Staff Vacancies and Attrition**- The company ended the year 11.5 FTEs under budget. Staff attrition for 2013 was 19%, down from 26% in 2012.
- **Personnel Expenses** were $815.1k (2.6%) over budget
    - Salaries expense, which is comprised of base salaries, at risk performance compensation, employment agency fees, temporary office services, and accrued vacation, or paid time off expense, was over budget $1.4M (5.9%).
        - Base salaries were over budget $245.5k, primarily due to the addition of senior personnel.
        - At risk performance compensation was $847.7k over budget primarily due to the fact that the budget was not established taking into account historic results. Similar

to previous budgets, the 2013 budget for at risk performance compensation was based on a hypothetical threshold payout level of 70 percent, with the final payout level dependent upon actual performance results, as well as the availability of funding for any payout amounts in excess of budget.[1] At risk performance compensation is subject to finalization and approval of corporate and departmental performance measures and year end performance reviews of personnel, as well as the receipt of management, Corporate Governance and Human Resources Committee and Board of Trustee approvals in accordance with the company's compensation governance policies. Commencing with the 2015 budget, management is proposing to budget at risk performance compensation based on historic results. This should avoid large variances in actual to budgeted expense for this item and more closely track projected actual year end results throughout the year.

  - Temporary office services expenses were approximately $226.9k over budget due to the increased use of temporary staffing to support NERC's ongoing operations during times of staff vacancies.
  - The accrual for earned but unused vacation, or paid time off expense, was increased at year end and resulted in $89.2k in expense that was not budgeted.

- Payroll taxes were $68.0k (4.7%) over budget due to a higher maximum taxable earnings cap than the assumption in the budget.
- Benefits expense, which is comprised of education and training, health and life, workers compensation, and relocation was $212.6k (6.9%) under budget, primarily due to having fewer FTEs on staff than budgeted and due to lower than budgeted renewal costs associated with NERC's health plans. In the 2013 budget, NERC assumed the cost of health plans would increase 10% over 2012, but actual renewal rates, effective April 1, 2013, increased 9%.
- Retirement expenses were $449.6k (16.6%) under budget primarily due to having fewer FTEs on staff, later eligibility dates due to timing of hiring and due to forfeiture of unvested funds related to personnel attrition.

- **Meetings, Travel, Conferencing and Webinar** expenses were under budget $684.0k (16.7%), primarily due to lower travel costs, as explained above. Travel costs, which were $736.5k lower than budget, were slightly offset by higher than budgeted meetings expense. Meetings expense, which includes the cost of rented space and catering for meetings and workshops held in hotels and the cost of catering for meetings held in NERC or Regional Entity offices, was over budget $63.7k

[1] Over the past several years the incentive compensation budget has been based upon a threshold percentage achievement of corporate goals and per employee maximum incentive compensation eligibility. Projected incentive compensation expense was then accrued during the year based upon historic results. Beginning in 2015, the budget will be based on the three year historic average of the actual total company wide incentive compensation payment amount to actual salary expense. This methodology should more closely track actual results and avoid large variances between budgeted and actual incentive compensation expenses.

primarily due to meetings related to the standards reform initiative, Geo-Magnetic Disturbance initiatives and the Reliability Issues Steering Committee, which were not specifically budgeted.

- **Consultants and Contracts** expenses were $522.6k (5.9%) under budget due primarily, as noted above, to the reclassification of expenses related to development of the Enterprise BES software application, which was partially budgeted under consulting and contract expenses in Information Technology, but recorded in fixed assets as capitalized software in the Reliability Assessments and Performance Analysis program. The following table summarizes the over and under budget variances for consultants and contracts by Program area.

CONSULTANTS and CONTRACTS	Actual	Budget	Over(Under)
STANDARDS	310,600	150,000	160,600
COMPLIANCE OPERATIONS	17,282	-	17,282
RELIABILITY ASSESSMENTS and PERFORMANCE ANALYSIS	757,899	685,000	72,899
RELIABILITY RISK MANAGEMENT*	2,764,411	2,863,180	(98,769)
CRITICAL INFRASTRUCTURE DEPARTMENT**	683,667	785,000	(101,333)
TRAINING, EDUCATION and OPERATOR CERTIFICATION	604,214	848,574	(244,360)
POLICY and EXTERNAL AFFAIRS	39,223	150,000	(110,777)
LEGAL and REGULATORY	3,000	-	3,000
INFORMATION TECHNOLOGY	2,039,258	2,721,000	(681,742)
HUMAN RESOURCES	501,367	288,500	212,867
FINANCE and ACCOUNTING	572,770	325,000	247,770
TOTAL CONTRACTS and CONSULTANTS	**8,293,693**	**8,816,254**	**(522,561)**

*Includes Event Analysis and Situation Awareness Departments

**Includes Critical Infrastructure and ES-ISAC

- The over budget variance in the Reliability Standards Program was related to the NERC standards reform initiative which utilized outside expert consulting resources to review existing standards. These costs were funded from Unknown Contingency operating reserves.
- Compliance Operations – Over budget $17.3k for outside consulting assistance in connection with the reliability assurance initiative. These costs were funded from the Unknown Contingency operating reserves.
- Reliability Assessments and Performance Analysis – Over budget $72.9k primarily related to change orders in connection with improvements to the GADS and TADS databases and to evaluate the development of a web-based replacement for pcGAR. These costs were funded from the Unknown Contingency operating reserves.
- Critical Infrastructure Department – Under budget $101.3k due to lower than budget expenses related to cyber risk preparedness assessments and outside contract and consulting support for deployment of the secure communications portal within the ES-ISAC.

- Reliability Risk Management – Collectively under budget $98.8k for events analysis and situation awareness. The use of subject matter experts to support event analysis was not required, resulting in an under budget variance of $98.0k. Situation Awareness was $0.8k under budget due to lower than budgeted costs for additional industry user licensing fees for SAFNR, which were incurred in 2012 but budgeted in 2013, and due to lower than budgeted costs for the current secure alerts system, the replacement of which is included in NERC's 2014 budget. The under budget expenses related to SAFNR and the alerts system were offset by higher than budgeted network communication expenses for NERCnet.
- Training, Education and Operator Certification –$244.4k under budget due to lower than budgeted expenses for consulting and contract support for (1) system operator exam development, (2) web-based course development and, (3) course review in the continuing education program.
- Policy and External Affairs – Under budget $110.8k due to reductions in external contract support and assumption of greater responsibilities by NERC staff.
- Information Technology – Under expense budget $681.7k primarily due to: (1) the reclassification of expenses related to development of the BES Enterprise software application which was partially budgeted ($500k) as consulting and contract expense, but recorded in fixed assets as capitalized software and required expenditure of operating reserves as reflected in the operating reserve analysis; (2) the decision to delay expenditure of $250k for data warehouse design as the company continues to evaluate its requirements in connection with long term IT infrastructure and application planning; and (3) the decision to delay expenditure of $150k for disaster recovery to permit funding of other higher priority projects which required additional funding. The reduction in expense associated with these projects was offset by costs for development of the Event Information Data System (EIDS), which had been recorded in fixed assets during the course of 2013, but were reclassed as consulting and contract expense prior to finalizing the 2013 audited financial report and as described in the company's March 31, 2014 unaudited variance report which has been filed with the Commission. The total EIDS development cost incurred in 2013 was $638.8k and was funded through a combination of budgeted funds and Known Contingency Operating Reserves.
- Human Resources - $212.9k over budget at year end, due primarily to higher than budgeted costs associated with staff and board compensation studies.
- Finance and Accounting - $247.8k over budget to fund additional outside auditor support in connection with various risk management and internal control initiatives and for costs associated with the evaluation and implementation of upgrades to the company's accounting system.

- **Rent** - $34.7k, 1.3%, under budget due to lower than budgeted straight-line rent expense as a result of the refund of an excess tenant improvement associated with the expansion of the Atlanta office.

- **Office Costs, Professional Services and Miscellaneous**
    - Office Costs were $48.2k, 1.5%, over budget primarily due to higher than budgeted, (1) communication expenses (i.e. internet and cellular services), (2) equipment costs to support employee communications, and (3) equipment repair and service contracts related to NERC's leased offices in Atlanta and Washington, DC. These higher than budgeted expenses were offset by lower than budgeted costs related to copying, use taxes and merchant card fees.
    - Professional Services were $74.0k, 3.2%, under budget due lower than budgeted use of outside counsel. The under budget variance for outside counsel expenses was offset by an increase in outside services expenses related to the implementation of a new travel and expense management system which will improve efficiency and internal controls.
    - Miscellaneous expenses, which were $7.0k, 32.6%, under budget, consist of employee rewards and recognition expenses, costs associated with community responsibility activities, and charitable contributions. The total combined cost of year end employee recognition events in both Atlanta and DC was $13.4k.
- **Depreciation** was $366.1k, 23.2%, over budget due primarily to: (1) development costs of the Enterprise BES software application, which were partially budgeted as contract and consultant expense but recorded in fixed Assets as capitalized software; and (2) higher than budgeted amortization of leasehold improvements in NERC's Atlanta and Washington, DC offices.
- **Other Non-Operating Expenses**, were over budget $153.2k, 306.3%, due primarily to recording as an expense the loss on retirement or disposal of certain fixed assets, principally assets in the situation room in Princeton which was closed in 2013, and the expense of moving certain of the assets to other NERC locations.
- **Fixed Asset Purchases**, excluding a credit for depreciation, were $734.5k, 41.5%, over budget primarily due to, (1) capitalization of the development costs of the Enterprise BES software application, as previously noted, and (2) furniture and leasehold improvement costs required for the approved increase in lease space for the Atlanta offices. As described in 2013 quarterly variance reports, the costs associated with the increase in lease space required for the Atlanta office was not fully known and was estimated at the time the budget was developed, but were within the range of projected expenditures at the time the lease amendment and associated improvements were authorized by the board and committee. Total costs also include the use of operating reserve funding for the standards balloting software (SBS) application and the Enterprise BES software application which are further detailed in the Operating Reserve Analysis and received necessary corporate authorizations in accordance with NERC's Working Capital and Operating Reserve Policy.
- **Allocation of Indirect Expenses and Fixed Assets by Program** – Total direct expenses of the administrative programs were $24.4M, which was 1.3M, 5.8% over budget. Direct expenses were over budget primarily due to higher personnel expenses as a result of having more FTEs on staff than budgeted, the addition of senior staff, higher incentive compensation than budgeted, and an

increase in accrued, unused paid time off. The actual and budgeted allocations of indirect expenses by FTE were $202.0k and $172.9k, respectively, for an increase per FTE of $29.1k. Total fixed assets, net of depreciation for the administrative programs were ($272.1k), which was $569.9k, 191.4%, under budget. Total fixed assets was under budget primarily due to lower than budgeted purchases of capitalized computers and software in the Information Technology department as explained in more detail in the variance report for Informaton Technology that follows on page 21. Collectively, the total budget for administrative programs was $766.3k, 3.3% over budget. The actual and budgeted allocations of fixed assets net of depreciation by FTE were ($2.3k) and $2.2k, respectively for a decrease of $4.4k per FTE. The variances in indirect expenses and the allocation of fixed assets reflected in the variance reports by department are the result of the change in costs per FTE and the difference in actual versus budgeted FTE by department.

Use of Statutory Funds for Non-Statutory Activities

NERC does not have non-statutory activities and therefore did not use statutory funds for non-statutory activities.

Board of Trustees Expenses

The following table provides actual and budgeted expenses of the Board of Trustees. The amounts reflected in this table are included in the totals by expense category in the tables presented above. Trustee expenses were under budget $20.8k, 1.5%, primarily due to lower than budgeted trustee compensation, which was due to a reduction in the total number of independent trustees from eleven to ten, offset by an increase in trustee compensation as approved by the Board on August 15, 2013. Trustee travel expenses were over budget primarily due to 2012 travel expense that was recorded and reimbursed in 2013.

Board of Trustee Expenses	2013 Actual	2013 Budget	Variance Over (Under)	%
Meetings and Travel Expenses				
Quarterly Board Meetings	243,984	234,000	9,984	4.3%
Trustee Travel	166,481	155,000	11,481	7.4%
Total Board of Trustees Meetings and Travel Expenses	**410,465**	**389,000**	**21,465**	**5.5%**
Professional Services				
Independent Trustee Fees	931,250	980,000	(48,750)	-5.0%
Trustee Search Fees	6,495	-	6,495	
Total Board of Trustee Professional Services Expenses	**937,745**	**980,000**	**(42,255)**	**-4.3%**
Total Board of Trustee Expenses	**1,348,210**	**1,369,000**	**(20,790)**	**-1.5%**

Operating Reserve Analysis

As detailed by the table on page 9, the use of "Known Contingency Reserves" included: (1) $209.0k for the development of the BES Enterprise software application, of which $50.1k in non-capitalized costs was recorded in contracts and consultants and $772.2k was recorded as capitalized software[2]; (2) $206.3k for EIDS[3]; (3) consulting support for the Reliability Assurance Initiative and risk management audits, collectively $158.2k; and (4) implementation of additional back office accounting and expense management systems, together with consulting support, related to implementation of the FERC Audit recommendations, $92.7k. The use of "Unknown Contingency Reserves" included: (1) the Standards Overview Project, $160.6k; (2) GADS and TADS upgrades and maintenance and development of a web-based replacement application for pcGAR, collectively $253.7k; (3) a total of $164.2k in costs in excess of the tenant improvement allowance associated with an increase in lease space for the Atlanta office, of which $49.6k was recorded as operating expenses and $114.6k of which was recorded in fixed assets[4]; and (4) $5.1k development of the SBS application, which was not specifically budgeted but was available from reserves due to under runs in the IT capital budget which were transferred to reserves[5].

The working capital and operating reserve analysis reflects that NERC's 2013 approved budget included a reduction in assessments associated with the return of $2,033,600 in excess working capital and operating reserves, which would be funded from $1,686,310 from Unknown Contingency Reserves and $347,290 from the System Operator Reserves. The actual reduction in excess working capital and operating reserves was $2,193,106, of which $2,106,494 came from Known and Unknown Contingency Reserves[6] and $86,613 came from the System Operator Reserves. The lower than budgeted reduction in System Operator reserves, ($86,613 compared to the budgeted reduction of $347,290) was due primarily to (1) higher than budgeted funding from testing fees and certificate renewals, and (2) lower than budgeted Contract and Consultant expenses related to exam development.

[2] The total amount budgeted in contracts and consultants was $613.3k.

[3] The total cost of EIDS in 2013 was $638.8k. The total amount budgeted in contracts and consultants and fixed assets was $432.5k

[4] As previously reported, the total cost of construction, furniture, equipment, leasehold improvements, and operating expenses was $915,162. The tenant improvement allowance was $751,007. The difference between these two figures of $164,155 represents the total cash outlay by NERC for the build out of the additional leased space.

[5] Total 2013 development costs of SBS was $250.1, $245k of which was funded from the IT capital budget.

[6] The $2,365,855 reduction in excess working capital and operating reserves from budgeted operations and the use of known and unknown contingencies was offset by the $172,749 adjustment to reserves related to the excess tenant improvement allowance associated with expansion of NERC's Atlanta office.

OPERATING RESERVE ANALYSIS

	2013 Actual	2013 Budget	Generation (Use) of Reserves	2013 Generation (Use) of Reserves in Excess of Budget: Known Contingency Reserves	Unknown Contingency Reserves[1]	System Operator Reserves
Beginning Working Capital and Operating Reserves						
Balance as of 12/31/12 - per audit	8,305,675	5,440,748	2,864,927			
Less: Adjustment for future liabilities	(3,665,375)		(3,665,375)			
Available Working Capital and Operating Reserves	**4,640,300**	**5,440,748**	**(800,448)**	**1,000,000**	**2,036,821**	**1,603,479**
(1) Generation (Use) of Operating Reserves from Budgeted Operations						
Funding	52,262,956	52,252,656	10,300		10,300	
Personnel	(32,113,505)	(31,298,405)	(815,101)		(815,101)

				2013 Reserve Balance		
TOTAL Operating Reserves						
Beginning Balance 1/1/2013	4,640,300	5,440,748	(800,448)	1,000,000	2,036,821	1,603,479
Generation (Use) from Budgeted Operations	732,999	(270,814)	1,003,812	-	819,612	(86,613)
Generation (Use) - Known and Unknown Contingency Reserve	(3,098,855)	(1,762,786)	(1,336,069)	(705,655)	(2,393,200)	
Other adjustments to reserves[2]	172,749		172,749		172,749	
Balance 12/31/13	**2,447,194**	**3,407,148**	**(959,955)**	**294,345**	**635,982**	**1,516,866**

[1]The use of Unknown Contingency Reserves includes the $1,686,310 budgeted reduction in reserves. The 2013 budget also included a $347,290 planned reduction in the System Operator Reserves, for a total budgeted reduction in reserves of $2,033,600.

[2]Represents transactions recorded only on the Statement of Financial Position (balance sheet) and do not impact the Statement of Activities (income statement), including true-up of current versus non-current deferred rent obligation. The increase to reserves in 2013 was due to excess tenant improvement allowance received as part of NERC's expansion in the Atlanta office.

Funding					
Assessments	3,501,894	3,501,894	-		
Penalties	183,113	183,113	-		
Testing		-	-		
Services & Software		-	-		
Workshop Fees	43,650	52,000	(8,350)	-16.1%	Fees collected for Human Performance Workshop less than budgeted. The cost of the workshop, recorded as Meetings Expense, was under budget $5k.
Interest	269	1,423	(1,154)	-81.1%	
Miscellaneous	19	-	19		
Total Funding	3,728,945	3,738,430	(9,485)	-0.3%	
Expenses					
Personnel Expenses					
Salaries	1,612,923	1,340,677	272,246	20.3%	FTEs were over budget 7% due to transfer of staff from another department. Personnel expenses are 18% higher because the 2013 budget for personnel expenses included a 3% reduction in salaries, payroll taxes and retirement costs to budget for attrition and timing of new hires, but the 3% reduction was not applied to budgeted FTEs. Salaries expense was also higher due to higher than budgeted incentive compensation. Higher salaries expense also contributed to higher retirement expenses.
Payroll Taxes	94,740	82,107	12,633	15.4%	
Employee Benefits	129,757	125,336	4,421	3.5%

Personnel Expenses					
Salaries	2,536,703	2,325,293	211,410	9%	The budget for salaries, payroll taxes and retirment expenses were reduced by 3% based upon estimated attrition and timing of hiring, but the reduction was not applied to budgeted FTEs. This department was fully staffed in 2013, resulting in the over budget variance for salaries and payroll taxes. Payroll taxes are also higher due to higher maximum salary subject to FICA tax. Retirement expense was under budget due to timing of hiring which affects elibility. Employee benefits was over budget primarily due to education, training and other benefits that were budgeted in HR.
Payroll Taxes	149,302	119,177	30,125	25%	
Employee Benefits	227,659	185,835	41,825	23%	
Savings & Retirement	217,503	261,724	(44,221)	-17%

Report of Independent Certified Public Accountants

To the Board of Trustees of
North American Electric Reliability Corporation:

We have audited the accompanying financial statements of North American Electric Reliability Corporation (a New Jersey non-profit corporation), which comprise the statements of financial position as of December 31, 2013 and 2012, and the related statements of activities, and cash flows for the years then ended, and the related notes to the financial statements.

Management's responsibility for the financial statements

Management is responsible for the preparation and fair presentation of these financial statements in accordance with accounting principles generally accepted in the United States of America; this includes the design, implementation, and maintenance of internal control relevant to the preparation and fair presentation of financial statements that are free from material misstatement, whether due to fraud or error.

Auditor's responsibility

Our responsibility is to express an opinion on these financial statements based on our audits. We conducted our audits in accordance with auditing standards generally accepted in the United States of America. Those standards require that we plan and perform the audits to obtain reasonable assurance about whether the financial statements are free from material misstatement.

An audit involves performing procedures to obtain audit evidence about the amounts and disclosures in the financial statements. The procedures selected depend on the auditor's judgment, including the assessment of the risks of material misstatement of the financial statements, whether due to fraud or error. In making those risk assessments, the auditor considers internal control relevant to the entity's preparation and fair presentation of the financial statements in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the entity's internal control. Accordingly, we express no such opinion. An audit also includes evaluating the appropriateness of accounting policies used and the reasonableness of significant accounting estimates made by management, as well as evaluating the overall presentation of the financial statements.

Grant Thornton

We believe that the audit evidence we have obtained is sufficient and appropriate to provide a basis for our audit opinion.

Opinion

In our opinion, the financial statements referred to above present fairly, in all material respects, the financial position of North American Electric Reliability Corporation as of December 31, 2013 and 2012, and the results of its operations and its cash flows for the years then ended in accordance with accounting principles generally accepted in the United States of America.

Supplementary information

Our audit was conducted for the purpose of forming an opinion on the financial statements as a whole. The supplemental schedules of expenses shown on pages 15-16 are presented for purposes of additional analysis and are not a required part of the financial statements. Such supplementary information is the responsibility of management and was derived from and relates directly to the underlying accounting and other records used to prepare the financial statements. The information has been subjected to the auditing procedures applied in the audit of the financial statements and certain additional procedures. These additional procedures included comparing and reconciling the information directly to the underlying accounting and other records used to prepare the financial statements or to the financial statements themselves, and other additional procedures in accordance with auditing standards generally accepted in the United States of America. In our opinion, the supplementary information is fairly stated, in all material respects, in relation to the financial statements as a whole.

Grant Thornton LLP

The accompanying notes are an integral part of these financial statements.

Notes to the Financial Statements

1 Organization and Nature of Business

North American Electric Reliability Corporation (the "Corporation" or "NERC") is an international, independent, not-for-profit organization, whose mission is to ensure the reliability of the bulk power system in North America. NERC relies on the diverse and collective expertise of electricity industry participants, subject to government oversight and audit. The Corporation is certified by the U.S. Federal Energy Regulatory Commission ("FERC") as the Electric Reliability Organization ("ERO") within the United States. In the United States, the Corporation has the authority to levy fines and penalties against any of the individual users, owners and operators of the bulk power system for non-compliance with the reliability standards that govern the bulk power system. The Corporation has also been recognized as the ERO by governmental authorities in Canada.

The Corporation's mission is to enhance the reliability and security of the bulk power system in North America. To achieve that, the Corporation develops and enforces reliability standards; monitors the bulk power system; assesses future adequacy and educates, trains and certifies industry personnel. Entities subject to the Corporation's reliability standards account for virtually all the electricity supplied in the United States of America, Canada and a portion of Baja California, Norte, Mexico.

The Corporation is the successor to North American Electric Reliability Council (the "Council") which was formed in 1968 in the aftermath of the November 1965 blackout that affected the northeastern United States and Ontario, Canada. On October 31, 2006, the Council entered into an agreement and plan of merger with the Corporation, a New Jersey non-profit corporation. At the effective date of the merger, January 1, 2007, the separate corporate existence of the Council ceased, and Corporation became the surviving entity. All of the property, assets, rights, privileges, powers, franchises and immunities of the Council became the property of the Corporation. All debts, liabilities and obligations of the Council were also assumed by the Corporation. The Corporation is organized and operates as a business league under Internal Revenue Code Section 501(c) (6). The activities of the Corporation are directed by an independent board of trustees.

The membership of the Corporation is unique. It is a not-for-profit corporation whose members include users, owners and operators of the bulk power system, eight regional entities, large and small end-use customers, state and provincial governmental authorities and any other interested parties.

Annually, the board of trustees approves an operating budget for the Corporation that includes a provision for working capital and operating reserves, which are recovered through assessments to Load-Serving Entities ("LSE"). The determination of the annual working capital and operating reserve requirements and the authorization of management to access these funds is governed by the Corporation's "Working Capital and Operating Reserve Policy". The Corporation assesses each LSE its proportional share of its annual operating budget based on "net energy for load". During 2013, the assessments to LSEs made up approximately 94% of the total funding for the Corporation. Assessments to U.S. entities were offset in 2013 by $2.5M in penalties received in prior years but were restricted from use until 2013 per the Corporation's policy on the "Accounting, Financial Statement and Budgetary Treatment of Penalties Imposed and Received for Violations of Reliability Standards". The Corporation also generates funding from the collection of fees charged for various services. These services include the maintenance of a certification program for system operators, the development of reports and software programs, and the hosting of workshops to educate the industry on various reliability matters.

The Corporation has entered into separate Delegation Agreements, which have been approved by FERC, with eight Regional Entities: Florida Reliability Coordinating Council ("FRCC"), Midwest Reliability Organization ("MRO"), Northeast Power Coordinating Council ("NPCC"), Reliability First Corporation ("RFC"), SERC Reliability Corporation ("SERC"), Southwest Power Pool Regional Entity ("SPP"), Texas Reliability Entity ("TRE") and Western Electricity Coordinating Council ("WECC"). Through these Delegation Agreements, the Corporation has delegated certain of its ERO responsibilities and functions to the Regional Entities.

The Corporation must annually approve the eight Regional Entities' budgets and submit them along with its budget and schedule of assessments to load serving entities to FERC for final approval of the budgets and the U.S. portion of the assessments. The Corporation has the sole responsibility to invoice, collect and disburse the monies approved in the Regional Entities' budgets. These pass-through amounts are not included as revenue and expense in the statement of activities, see related Note 6.

2 Summary of Significant Accounting Policies

Basis of Accounting and Presentation

The financial statements of the Corporation have been prepared on the accrual basis of accounting in conformity with accounting principles generally accepted in the United States of America. Net assets, revenues, expenses, gains and losses are classified based on the existence or absence of restrictions. The Corporation reports information regarding its financial position and activities according to three classes of net assets: unrestricted net assets, temporarily restricted net assets and permanently restricted net assets. There were no permanently restricted net assets as of December 31, 2013 or 2012. Net assets totaling $445,000 and $2,512,500 were temporarily restricted by FERC as of December 31, 2013 and 2012, respectively, to offset future assessments.

Cash and Cash Equivalents

The Corporation considers all highly liquid investments purchased with original maturities of three months or less to be cash and cash equivalents. The Corporation maintains its cash balances with one bank. The accounts at the bank are insured up to certain limits by the Federal Deposit Insurance Corporation. Balances in these accounts may exceed Federally-insured limits from time to time.

Use of Estimates

The preparation of financial statements in conformity with accounting principles generally accepted in the United States of America requires management to make estimates and assumptions that affect the amounts of assets and liabilities and disclosure of contingent assets and liabilities at the date of the financial statements and the reported amounts of revenues and expenses during the reporting period. Actual results could differ from those estimates.

Revenue Recognition

The Corporation recognizes assessment revenue billed to the LSEs on a pro-rata basis over the calendar year. Fees generated for testing, certifications, services and software, workshops and other services are recognized when the test is taken, service rendered and/or workshops are completed.

Penalty income is derived from FERC's approval of assessment of penalties to registered entities regarding enforcement of NERC's Reliability Standards. The penalty income from a registered entity is recorded following closure of the enforcement matter including exhaustion of appeals and the outcome determined. The funds are temporarily restricted due to FERC's requirement that the funds be used to reduce future NERC assessments.

Deferred Revenue

Deferred revenue represents assessments billed and received in advance of the period in which it is earned. Deferred revenue is recognized as revenue in the period in which it is earned.

Accounts Receivable

Accounts receivable are recorded at the original invoice amount, less an estimated allowance for uncollectible accounts. Credit is generally extended on a short-term basis; thus accounts receivable do not bear interest. Accounts receivable are periodically evaluated for collectability based on past experience and an analysis of current accounts receivable collectability. Changes in the estimated collectability of accounts receivable are recorded in the results of operations for the period in which the estimate is revised. Accounts deemed uncollectible are charged to the allowance in the years they are deemed uncollectible.

Property and Equipment

Purchased property and equipment are capitalized at cost. Donated assets are capitalized at the fair market value of the assets on the date of contribution. The Corporation's minimum capitalization policy is for additions greater than $2,000.

Depreciation and amortization is provided by the straight-line method over the estimated useful lives of the related assets as follows:

	Years
Software development	3 years
Furniture and equipment	3-7 years
Leasehold improvements	Term of lease or estimated useful life of the asset, whichever is shorter

Expenditures for maintenance and repairs are charged to operations as incurred while renewals and betterments are capitalized.

Compensated Absences

Employees of the Corporation are entitled to paid time off depending on length of service. At December 31, 2013 and 2012, the Corporation has recorded accrued compensated absences of $543,126 and $453,950 related to days earned, included with accounts payable and accrued expenses on the statements of financial position.

Income Taxes

The Corporation has received a determination letter from the Internal Revenue Service concluding that it is exempt from Federal income taxes under Section 501(c)(6) of the Internal Revenue Code. The Corporation is subject to income taxes on revenues related to unrelated business activities. The Corporation is subject to a proxy tax related to nondeductible lobbying and political expenses incurred. There was no proxy tax incurred in 2013 or 2012.

The Corporation recognizes the tax benefit from an uncertain tax position only if it is more likely than not that the tax position will be sustained on examination by the taxing authority, based on the technical merits of the position. The Corporation is no longer subject to federal and state tax examinations by the respective taxing authorities for the years prior to 2010. Tax years 2010 through 2013 remain subject to examination by major tax jurisdictions.

Subsequent Events

The Corporation discloses material events that occur after the statement of financial position date but before financial statements are issued. In general, these events are recognized in the financial statements if the condition existed at the date of the statement of financial position, but are not recognized if the condition did not exist at the statement of financial position date. The Corporation discloses non-recognized events if required to keep the financial statements from being misleading. Management evaluated events occurring subsequent to December 31, 2013 through May 7, 2014, the date the financial statements were available for issuance.

On January 13, 2014, the company secured a non-revolving credit facility under the Capital Financing Program that was approved by the Board of Trustees and the Federal Energy Regulatory Commission (FERC) as part of the Corporation's 2014 Business Plan and Budget. The interest rate is floating and equal to LIBOR plus 275 basis points, which yielded a rate of 2.91% at closing. The total size of the non-revolving credit facility is $7.5M, with the total authorized borrowings each year limited to the amount approved by the Board of Trustees and FERC in that year's business plan and budget. The Corporation's line of credit was also amended. See Note 4 below.

In April, 2014, management became aware that the sub-tenant under the Washington, D.C. lease, referenced in Note 8, filed for Chapter 11 bankruptcy, but the full impact of the event is not known at this time.

3 Property and Equipment

Property and equipment consist of the following at December 31:

December 31,	2013	2012
Software development	**$ 2,986,517**	$ 1,599,433
Furniture and equipment	**6,860,119**	7,269,259
Leasehold improvements	**1,100,281**	1,241,799
	10,946,917	10,110,491
Accumulated depreciation and amortization	**(5,301,801)**	(4,890,281)
	$ 5,645,116	$ 5,220,210

Depreciation and amortization expense for the years ended December 31, 2013 and 2012 was $1,945,946 and $2,144,184, respectively.

4 Line of Credit

The Corporation has a line of credit with a bank that expires in June 2014. The line of credit provides for up to $4,000,000 of availability to be used for working capital needs. The line of credit accrues interest at prime plus 0.5% (3.25% at December 31, 2013 and 2012). Total borrowings under the line of credit may not exceed 70% of the qualified accounts receivable. The line of credit is collateralized by all existing and future assets and subject to a filing under the Uniform Commercial Code. As part of the line of credit agreement, the Corporation was required to maintain $400,000 in a non-interest bearing account with the lender. The $400,000 is classified within cash and cash equivalents on the statements of financial position. There were no borrowings outstanding at December 31, 2013 or 2012. At December 31, 2013 and 2012, the available amount under the line of credit was reduced by open letters of credit totaling $140,736 and $101,236 respectively, which represents security deposits for the Corporation's office lease agreements. Pursuant to the line of credit agreement, the Corporation is required to comply with financial covenants primarily related to minimum net asset requirements.

In connection with the non-revolving credit facility secured on January 13, 2014, the line of credit was amended and restated. As part of the amended and restated line of credit not, the Corporation is no longer required to maintain the $400,000 non-interest bearing account with the lender.

5 Penalty Income

The Corporation received $445,000 and $100,000 of penalty income in 2013 and 2012, respectively, which is temporarily restricted. The penalty income will be utilized in accordance with the timing of the receipt of the income and FERC's requirement for the use of penalty income to reduce assessments. NERC transferred $2,512,500 of penalty income from temporarily restricted net assets to unrestricted net assets during 2013. During 2012, NERC did not transfer any penalty income from temporarily restricted net assets to unrestricted net assets.

6 Regional Assessments Collected in Advance

In addition to Corporation assessments billed to LSEs or designees, a regional assessment is also billed by the Corporation on behalf of the regional entities. The regional assessment is based on approved budgets of the eight regional entities and remitted to the regional entities by the Corporation. There is a credit risk if the Corporation does not collect the assessments from LSEs or designees before the regional assessments are due to the regional entities. However, the risk is minimal since the Corporation has the ability to reassess and rebill in a subsequent period for any uncollected assessments. Regional assessments billed and remitted for 2013 and 2012 were as follows:

For the Year Ended December 31,	2013	2012
Total regional assessments billed to WECC, ERCOT, individual LSE's and designees	**$113,584,703**	$110,280,847
Total regional assessments remitted to regional entities	**(113,480,310)**	(110,147,242)
Billings over remittances	**$ 104,393**	$ 133,605

As of December 31, 2013 and 2012, regional assessments collected in advance and not yet remitted to the regional entities based upon the remittance schedule set forth in the delegation agreements totaled $9,427,293 and $9,614,829, respectively.

7 Deferred Compensation

Agreements and Life Insurance Policies

During 2005, the Council entered into a deferred compensation agreement (the "Deferred Compensation Agreement") with a retiring executive that provided benefits to the individual upon reaching normal retirement age and was payable over a period selected by the retiring employee. Under certain circumstances, benefits were payable to his surviving spouse. The Corporation assumed the liabilities upon merger with the Council effective January 1, 2007. The present value of the estimated liability under the agreement at December 31, 2007 was accrued using a discount rate of 4.91%. The Corporation provided for some of the benefit funding through a variable universal life policy. Effective October 15, 2008, the Deferred Compensation Agreement was superseded by a new agreement. The variable universal life policy used to fund the liability, including the cash surrender value of the policy, was assigned and transferred to the retired executive in January 2009. In accordance with the new agreement, the Corporation will continue to pay the policy premiums through 2014. At December 31, 2013 and 2012, the present value of the unfunded liability, using a discount rate of 0.75% was $14,257 and $38,968, respectively. The present value of the unfunded liability as of December 31, 2013 is included in current deferred compensation on the statements of financial position. As of December 31, 2012, $24,712 and $14,257 of the present value of the unfunded liability is included in current and non-current deferred compensation, respectively.

On October 15, 2008, the Corporation entered into various Executive Benefit Agreements (the "Agreements") with certain executives and the aforementioned retired executive. The Agreements supersede and replace all previous written or oral agreements between the Corporation and these executives. In accordance with the Agreements, while employed by the Corporation, the executives shall be provided with life insurance coverage, through individual and/or group policies, providing a death benefit equal to the lesser of three times base salary or $500,000, or three times base salary depending upon the executives' employment date. The executives agreed to issue split dollar endorsement agreements with respect to such policies. The executives retired from the Corporation in 2013, and in accordance with the Agreements, ownership of the policies, including the cash surrender value, transferred to the executives within 60 days following termination of employment. The Corporation paid and expensed all the premiums that were due on these policies in 2013, prior to transfer of ownership. When ownership of the policies transferred, the asset and deferred compensation balances on the statements of financial position were written off. At December 31, 2013 and 2012, the cash surrender value of all remaining policies was $0 and $337,414, respectively.

Deferred Compensation Plan

The Corporation established a deferred compensation plan in 2012 in accordance with Internal Revenue Code Section 457 for certain employees, as defined. The plan provides that eligible employees may make elective salary reduction contributions in accordance with limitations established by the Internal Revenue Code. The asset and liability for this deferred compensation plan of $320,660 and $118,243 at December 31, 2013 and 2012, respectively, are included in 457b Plan Assets and non-current deferred compensation on the statements of financial position.

Retiree Medical Benefits

Effective September 1, 2007, the board of trustees approved and adopted a policy to provide medical coverage for a very limited number of current retirees and any and all dependents and transition retirees and any and all dependents, as defined by the board resolution, up to a maximum monthly benefit of $550 paid directly to the applicable insurer. Assumptions used in recording the retiree medical benefits included the 2009 Social Security Administration Actuarial Period Life Table, annual inflation rate of 1.5% and discount rate of 3.8%. At December 31, 2013 and 2012 the accrued retiree medical benefits liability was $276,855 and $241,394, respectively, and is included in non-current deferred compensation on the statements of financial position. The retiree medical expense related to this policy was $26,616 and $22,170, respectively for the years ended December 31, 2013 and 2012.

8 Commitments

Operating Leases

The Corporation leases office space in Washington, D.C. and Atlanta, Georgia under non-cancellable lease agreements, with expiration dates through 2022. The lease for office space in Princeton, NJ expired in 2013.

In 2012, the Corporation entered into an agreement to expand the amount of leased space in Atlanta, Georgia with an expiration date in 2022, which is coterminous with the term of the lease for the original premises.

In 2011, the Corporation entered into separate sub-lease agreements for a portion of the office space in Princeton, New Jersey, which expired in 2013, and for one of the two locations in Washington D.C., with an expiration date of February 2017. As indicated in Note 2, in April 2014, management became aware that the sub-leasee filed for Chapter 11 bankruptcy, but the full impact of the event is not known at this time.

Approximate future minimum payments on office lease space, net of rental income for sub-leased space, at December 31, 2013, for the next five years are as follows:

Years Ending December 31,	Leased Space	Sub-leased Space	Net
2014	$ 2,966,000	$ (276,000)	$ 2,690,000
2015	3,044,000	(286,000)	2,758,000
2016	3,123,000	(248,000)	2,875,000
2017	2,923,000	(50,000)	2,873,000
2018	2,939,000	-	2,939,000
Thereafter	11,490,000	-	11,490,000
	$ 26,485,000	$ (860,000)	$ 25,625,000

The office leases are subject to escalation clauses covering increases in real estate taxes and operating costs over the base year. The Corporation has received tenant improvement allowances as of December 31, 2013 and 2012 totaling $381,632 and $2,256,634, respectively. The difference between rent expense calculated ratably over the lease term and rent paid according to the lease is recorded as a deferred rent obligation on the statement of financial position in the amount of $3,999,899 and $3,741,537 at December 31, 2013 and 2012, respectively.

Office rent expense, net of sub-lease income of $293,000 and $314,080, was $2,574,909 and $2,508,580 for the years ended December 31, 2013 and 2012, respectively.

In April, 2014, management became aware that the sub-tenant under the Washington, D.C. lease filed for Chapter 11 bankruptcy, but the full impact of the event is not known at this time.

Capital Leases

The Corporation has entered into a capital lease agreements for office equipment. Depreciation expense related to these capital leases was $65,407 for each of the years ended December 31, 2013 and 2012.

Assets leased by the Corporation under capital leases are included in fixed assets and capital lease obligation on the statements of financial position and consisted of the following:

December 31, 2013	
Copier leases	$ 196,221
Accumulated depreciation	(150,837)
Net Book Value	$ 45,384

The following is a schedule of future minimum lease payments under these capital leases, together with the future obligation net of interest and maintenance as of December 31, 2013:

Years ending December 31,	Future Minimum Payments
2014	$ 56,697
Less: Amounts representing interest and maintenance	(9,589)
Future Obligation net of Interest and Maintenance	$ 47,108

Contractual Commitments

The Corporation has software license, maintenance support and data management service agreements with varying expiration dates through 2017. The following table is a schedule of future commitments under the terms of the agreements:

Years ending December 31,		Future Minimum Payments
2014	$	196,000
2015		192,000
2016		197,000
2017		51,000
Total Service Agreements	$	636,000

9 Savings and Investment Plan

The Corporation sponsors an employee savings 401(k) plan (the "Plan") whereby eligible participating employees may elect to contribute up to the Internal Revenue Service Code 402(g) (1) limit. The Corporation contributes a 75% match of the participant's elective contribution, provided that the elective contribution does not exceed 6% of eligible compensation. The Corporation also makes a discretionary contribution equal to a percentage of the eligible compensation of all qualifying participants. The additional discretionary contributions are determined annually by the Board of Trustees and are subject to the limitation imposed by the Internal Revenue Service Code 401(a) (17). The Corporation's expenses related to the Plan for the years ended December 31, 2013 and 2012 were $2,252,973 and $1,793,528, respectively. The contributions accrued as of December 31, 2013 and 2012 amounted to $1,788,624 and $1,409,548, respectively, and are included in accrued retirement liabilities in the statements of financial position.

10 Concentration of Credit Risk

The Corporation receives a significant portion of its income from assessments, based upon "net energy for load", to LSEs within the eight regions which are located throughout the United States of America, Canada and a portion of Baja California, Norte, Mexico. LSEs are assessed a proportional share of the Corporation's operating budget as well as a proportional share of the operating budget of the regional entity in whose territory the LSE is located. The Corporation issues quarterly invoices directly to LSEs or, in some circumstances, designees. With respect to LSEs located within Texas Reliability Entity ("TRE"), the Corporation issues a quarterly invoice to Electric Reliability Council of Texas ("ERCOT") which then issues invoices to the LSEs in its region, collects the assessments and remits the funds to the Corporation. The Corporation then remits the regional assessments to TRE. A similar arrangement exists with respect to LSEs located within the Western Electricity Coordinating Council ("WECC"). For LSEs located within the PJM Interconnection ("PJM"), the Corporation issues invoices to PJM which issues invoices to the LSEs, collects the assessments and remits the funds to the Corporation. The Corporation then forwards the regional assessment to Reliability First Corporation ("RFC"), the regional entity. The Corporation is extending credit to the LSEs and designees and is exposed to credit risk to the extent regional assessments are paid by the Corporation to the regional entities prior to collecting assessments from the LSEs or designees. Based on past history, the Corporation believes that the risk of its trade accounts receivable credit exposure is limited.

11 Functional Classification

The Corporation is required to provide information about expenses reported by their functional classification, which is a method of grouping expenses according to the purpose for which costs are incurred. The Corporation groups expenses by operational programs and by administrative programs as defined by FERC.

The following table shows the functional classification of expenses for the years ended December 31, 2013 and 2012:

For the Years Ended December 31,	2013	2012
Operational Programs:		
Reliability Standards	**$ 5,429,867**	$ 4,392,836
Compliance and Organization Registration Certification	**9,404,714**	9,352,528
Reliability Assessment and Performance Analysis	**4,506,619**	4,648,251
Training and Education	**1,696,223**	2,055,853
Situation Awareness and Infrastructure Security	**8,701,517**	9,815,542
	29,738,940	30,265,010
Administrative Programs:		
General & Administrative	**8,656,304**	7,736,048
Legal and Regulatory	**4,046,516**	4,093,557
Information Technology	**7,815,620**	7,211,151
Human Resources	**1,318,387**	1,456,847
Finance and Accounting	**2,771,726**	2,091,487
	24,608,553	22,589,090
Total Expenses	**$ 54,347,493**	$ 52,854,100

Supplemental Schedules of Expenses

For the Years Ended December 31,	2013	2012
Employee costs:		
Payroll taxes (FICA, SUI, FUI, Medicare)	**$ 1,527,728**	$ 1,417,838
Employee benefits - medical	**2,053,703**	1,961,176
Employee benefits - life / disability	**173,915**	169,987
Employee benefits - officers' life	**33,328**	53,188
Insurance - workers' compensation	**54,219**	64,697
Relocation expenses	**149,215**	201,182
Educational	**402,958**	228,433
	$ 4,395,066	$ 4,096,501
Travel and meetings:		
Meetings	**$ 741,766**	$ 569,258
Workshops	**363,969**	490,591
Travel	**2,001,968**	2,268,587
On-line meetings	**306,603**	287,586
	$ 3,414,306	$ 3,616,022

Supplemental Schedules of Expenses (continued)

For the Years Ended December 31,	2013	2012
Services:		
Insurance - commercial	**$ 109,765**	$ 125,932
Contract and consultants	**8,293,693**	9,429,191
Independent trustee fees	**931,250**	970,000
Search fees	**6,495**	160,314
Temporary office services and agency fees	**180,924**	62,749
Accounting and auditing fees	**143,271**	39,926
Legal fees	**845,602**	1,031,825
	$ 10,511,000	$ 11,819,937
Office costs:		
Publications and subscriptions	**$ 76,993**	$ 43,075
Dues	**40,862**	46,079
Postage	**8,022**	14,007
UPS, express mail, etc.	**29,509**	42,202
Telephone	**517,740**	585,469
Office and equipment repair/services	**86,810**	83,775
Copying	**44,720**	21,754
Stationery and office forms	**176**	1,380
Office supplies	**187,170**	177,589
Bank charges	**22,967**	23,392
Sales and use tax	**3,782**	17,935
Card fees	**81,782**	84,058
Internet expenses	**522,100**	688,891
	$ 1,622,635	$ 1,829,606

ATTACHMENT 2

True Up 2013
2013 Budget Variance Explanations Based on Audited Financials

Statutory Funding

Total Funding – Favorable Variance $10k:

Revenue associated with the System Operator Seminars (SOS) (which is self funding) and Maintenance Pass-through expenses were greater than budgeted. Because these are pass through items, expenses will be up by the same amount.

Statutory Expenditures

Total Favorable Variance $668k

Statutory Personnel Expenses

Total Favorable Variance $625k

Replacement positions were filled later than budgeted and two additional positions that were budgeted were unfilled. The savings were partially offset by relocation expenses being expended (none were budgeted), staff educational costs being budgeted as travel but expensed as educational benefit (these will be budgeted and expensed as educational benefits going forward) and a contract programmer being utilized that will be converted to one of the open positions.

The FTE status by Program is:

Reliability Standards Development	**(0.64)**
Compliance Enforcement	**(1.11)**
Reliability Assessment	**(1.07)**
Training & Education	**(0.51)**
Situational Awareness	**(0.20)**
General Administrative	**(0.67)**
Total Statutory FTE Variance	**(4.20)**

Statutory Meeting Expenses

Total Favorable Variance $90k

Travel costs were less than budgeted: Compliance $54k less and other program areas with the remainder. **Favorable Variance $88k**

Conference Calls costs were less than budgeted **Favorable Variance $5k**

Meal costs for Compliance meetings have been greater than anticipated. **Unfavorable Variance $3k**

Statutory Operating Expenses

Total Favorable Variance $96k

Legal fees less than budgeted	-$129k
Office rent allocation miscalculation	-$59k
Reliability Assessment Contract & Consultant expenses	-$42k

(Gas Supply Study & working group projects postponed or not billed)

General Office Costs (Postage, Supplies)	-$39k
Telephone & Internet costs less than budgeted	-$20k
Training & Education Program (Speakers less than budgeted)	-$17k
CEA(SERC) expenses	+$100k
(2014 RC audit moved to 2013 and increased enforcement costs)	
Compliance Software maintenance not budgeted	+$78k
Reliability Assessment Software greater than budgeted	+$32k

Statutory Fixed Asset Expenditures

Total Unfavorable Variance $143k:

Office space build out, furniture and equipment	+$58k
Capitalized Compliance software greater than budgeted	+$110k
New Building Space Deposit timing difference	-$25k

Non Statutory (Member Services) Funding:

Total Funding – Unfavorable Variance $65k:

Pass through billing to members for the FRCCnet Sprint MPLS network is less than expected. Because this is a pass through item, it will affect the expenses by the same amount.

Total Unfavorable Variance $19k

Non Pension Postretirement Benefit Loss unbudgeted **Total Unfavorable Variance $46k**

Non Statutory Expenditures

Total Unfavorable Variance $154k

Non Statutory Personnel Expenses

Total Unfavorable Variance $102k

Operations -

Reliability Coordinator –Less shared employee time spent on Training and Situational Awareness (both Statutory Functions) than budgeted resulting in more time charged to non-statutory. **+.68 FTE** **Total Unfavorable Variance $128k**

Non RC Operations – Relocation for budgeted addition to staff was expended but not budgeted for in 2013. **(.07) FTE** **Total Unfavorable Variance $13k**

Planning - Programming staff that was budgeted for working on Planning Department projects was not hired as of 3rd quarter end. **(.16) FTE** **Total Favorable Variance $39k**

Non Statutory Meeting Expenses

Total Favorable Variance $32k

Operations

Reliability Coordinator – Travel Costs are less than budgeted -$25k offset by meeting expenses and conference call costs +$8k **Total Favorable Variance $17k**

Non RC Operations – Travel costs and conference calls are down -$17k offset by meeting expenses greater than budgeted by +$3k **Total Favorable Variance $14k**

Planning - Travel costs and conference calls less than budgeted -$7k offset by meeting expenses greater than budgeted by +$6k **Total Favorable Variance $1k**

Non Statutory Operating Expenses

Total Favorable Variance $442k

Operations -

Reliability Coordinator –	
Legal Fees for RC less than budget	-$176k
FTMS & OPWG/ATC Case Conversion delay	-$110k
RC Agent Expenses	-$101k
(EMS changes & Visualization Flow project delay & less infrastructure)	
Restoration Drill Consultant delay	-$50k
FTMS less than budget	-$14k
Contingent Liability per GAAP	+$75k
IDC processing unbudgeted	+$57k
Allocated Rent miscalculation	+$26k
Office Costs (supplies, telephone, printing)	+$7k

Total Favorable Variance $286k

Non RC Operations –	
Fuel Reliability Working Group Study delay	-$37k
GMD Vulnerability Study cancelled	-$30k
Security Assessment of FRCCNet delay	-$20k
Telecommunications (including FRCCnet Sprint MPLS network) costs less than budgeted	-$18k
Legal Fees for Non RC less than budget	-$18k
CIP Seminar at FRCC offices instead of hotel & NERC paid for meals	-$12k
Allocated Rent miscalculation	+$8k
Software Maintenance Agreements greater than anticipated	+$8k

Total Favorable Variance $119k

Planning - Certain studies and projects were budgeted to be billed by various members but they have not billed and are not expected to bill for their services. Additionally, legal costs were budgeted that did not occur.

Total Favorable Variance $37k

Non Statutory Fixed Asset Expenditures

Total Unfavorable Variance $6k

Office space build out, furniture and equipment	+$81k
New Building Space Deposit timing difference	-$75k

Other Non-Operating Expenses

Total Unfavorable Variance $520k

Change in Non Pension, Non Cash Post Retirement Obligation of medical insurance to a limited number of grandfathered individuals from actuarial study unbudgeted

Change in Working Capital for the Year ended 12/31/2013:

Addition to Working Capital **$867k**

Statutory – Addition to Working Capital $520k

Member Services Non Statutory – Addition to Working Capital of $347k

Total Net Assets As Of 12/31/2013: Surplus **$2,554k**

Statutory –Surplus of $1,967k

Member Services Non Statutory – Surplus of $ 587k

Statements Concerning Work Completed in 2013:

Compliance Monitoring & Enforcement Program

Although there was significant surplus, the FRCC did complete all work as scheduled for 2013. Specifically, the Compliance Department verifies that:

1. All O&P Compliance audits (12) planned for 2013 were completed as scheduled;
2. All CIP Audits (10) planned for 2013 were completed as scheduled;
3. No Spot Checks were scheduled for 2013; however, the TFE Part-B reviews were conducted under the Spot Check monitoring process.
4. Part A-CIP reviews were completed for all fifty-two (52) TFEs submitted in 2013 per the ROP Appendix 4D and under the new Rule of procedure (18) review/approvals between September 3 and December 31, 2013;
5. Part B-reviews for fifty-two (52) TFEs were completed in 2013 and fifty-one (51) were completed within the one year rule per the ROP Appendix 4D and under the new Rule of procedure (18) approvals between September 3 and December 31, 2013;
6. The annual self-certification of all registered entities in the region was completed on schedule;
7. Review, acceptance or rejection was completed for ninety-one (91) Mitigation Plans submitted by registered entities in 2013 and 2012;
8. Verification of entity completion was finalized for seventy-five (75) Mitigation plans during 2013; and
9. Regional Compliance Assessments were completed for three (3) entity reliability events during 2013.

Reliability Assessment Program

NERC Reliability Assessments (Summer, Winter and Long Term Reliability Assessment) including a Probabilistic Assessment were all completed as scheduled. In addition, the FRCC is supporting the transition to a new Bulk Electric System (BES) definition including assisting with the testing of the new BESnet application, associated training and the development of reference documents to ensure consistent application of the new BES definition and Exception Process throughout NERC.

The FRCC has actively participated in the ERO Events Analysis Process, developed the necessary procedures, and worked with registered entities and NERC to provide meaningful reports and Lessons Learned. FRCC continues to support the NERC Alerts process including the Facility Rating Alert efforts.

Method used to allocate indirect costs to the direct statutory program or functional areas:

The FRCC uses standard cost accounting procedures to allocate general expenses (that cannot be directly assigned) to a specific function. The system used consists of directly expensing as much as possible directly to the function (whether that function is Statutory or Member Services) that incurred the expense. This is accomplished by routing to the responsible departmental heads all invoices pertaining to their job responsibility. The departmental head assigns the functional category and returns the invoice to accounting who assigns the General Ledger Account Number (as specified in the FRCC Accounting Policy Manual – Coding of Invoices for Goods and Services). If the expense cannot be directly charged to a particular function (example rent, payroll taxes, benefits, general office supplies, etc.), the expense is charged to holding accounts by chart of accounts line item to be allocated back to the program areas (to include General & Administrative) at the end of the month. This is done by using the monthly time accounting summarization of FTE by function. So there are two ways expenses are charged to a particular function, either by direct expense or by allocation from the results of the monthly time accounting summarization of FTE by function (including General & Administrative).

The monthly time accounting summarization of FTE by function is calculated using the time sheets that each employee is required to turn in to HR bi-weekly. Each employee allocates eight (8) hours per day to the functions they worked on that day. Their time sheet is reviewed by their departmental head and initialled bi-weekly.

Employees are categorized into 2 groups: Technical Employees – those employees who work directly on functions and have little or no administrative duties (examples would be the Compliance staff and the Engineers) and Non-Technical Staff – those employees who perform support functions that are 80% or greater nonspecific definable by function (examples would be the Accounting staff, the President, the receptionist, etc.). The time from the time sheets are entered into a macro (by employee and function worked on) for the corresponding month being accounted for. The FTE's by program are then calculated and used to allocate the total of the General & Administrative Department back to the program areas on the line "Miscellaneous".

Cash Reserves Statement

No Cash Reserves were used by the FRCC in 2013.

Statement concerning the use of Statutory Funds for Member Services Expenses:

No Statutory Funds were used to pay for Member Services Functions in 2013 and no Member Services Funds were used to pay for Statutory Functions.

INDEPENDENT AUDITORS' REPORT

To the Board of Directors
Florida Reliability Coordinating Council, Inc.

We have audited the accompanying financial statements of Florida Reliability Coordinating Council, Inc., (a nonprofit organization) which comprise the statement of financial position as of December 31, 2013, and the related statements of activities and cash flows for the year then ended, and the related notes to the financial statements.

Management's Responsibility for the Financial Statements

Management is responsible for the preparation and fair presentation of these financial statements in accordance with accounting principles generally accepted in the United States of America; this includes the design, implementation, and maintenance of internal control relevant to the preparation and fair presentation of financial statements that are free from material misstatement, whether due to fraud or error.

Auditor's Responsibility

Our responsibility is to express an opinion on these financial statements based on our audit. We conducted our audit in accordance with auditing standards generally accepted in the United States of America. Those standards require that we plan and perform the audit to obtain reasonable assurance about whether the financial statements are free of material misstatement.

An audit involves performing procedures to obtain audit evidence about the amounts and disclosures in the financial statements. The procedures selected depend on the auditor's judgment, including the assessment of the risks of material misstatement of the financial statements, whether due to fraud or error. In making those risk assessments, the auditor considers internal control relevant to the entity's preparation and fair presentation of the financial statements in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the entity's internal control. Accordingly, we express no such opinion. An audit also includes evaluating the appropriateness of accounting policies used and the reasonableness of significant accounting estimates made by management, as well as evaluating the overall presentation of the financial statements.

We believe that the audit evidence we have obtained is sufficient and appropriate to provide a basis for our audit opinion.

Opinion

In our opinion, the financial statements referred to above present fairly, in all material respects, the statement of financial position of Florida Reliability Coordinating Council as of December 31, 2013 and the changes in its net assets and its cash flows for the year then ended in accordance with accounting principles generally accepted in the United States of America.

Other Matter

Our audit was conducted for the purpose of forming an opinion on the financial statements as a whole. The statutory and non-statutory schedules on Pages 18 to 26 inclusive are presented for purposes of additional analysis and are not a required part of the financial statements. Such information is the responsibility of management and was derived from and relates directly to the underlying accounting and other records used to prepare the financial statements. The information has been subjected to the auditing procedures applied in the audit of the financial statements and certain additional procedures, including comparing and reconciling such information directly to the underlying accounting and other records used to prepare the financial statements or to the financial statements themselves, and other additional procedures in accordance with auditing standards generally accepted in the United States of America. In our opinion, the information is fairly stated in all material respects in relation to the financial statements as a whole.

FLORIDA RELIABILITY COORDINATING COUNCIL, INC.

STATEMENT OF CASH FLOWS
For the year ended December 31, 2013

Cash flows from operating activities:	
Cash received from members	$ 12,705,017
Cash paid to suppliers and employees	(10,561,406)
Net cash provided by operating activities	2,143,611
Cash flows from investing activities	
Purchases of software and equipment	(278,020)
Net cash used by investing activities	(278,020)
Net increase in cash	1,865,591
Cash at beginning of year	$ 4,693,041
Cash at end of year	$ 6,558,632
Reconciliation of increase in net assets to net cash used by operating activities	
Increase in net assets	$ 441,318
Adjustments to reconcile increase in net assets to net cash used by operating activities:	
Depreciation and amortization	138,050
Increase in receivables, prepaid expenses, and other assets	(217,496)
Increase in accounts payable and accrued expenses	1,160,116
Change in postretirement benefit obligation	565,655
Increase in deferred income	55,968
Net cash provided by operating activities	$ 2,143,611

See Notes to Financial Statements.

FLORIDA RELIABILITY COORDINATING COUNCIL, INC.

NOTES TO FINANCIAL STATEMENTS
December 31, 2013

1. General and Summary of Significant Accounting Policies

General – Florida Reliability Coordinating Council, Inc. (the "Company") is a group of electric utilities and energy marketers primarily doing business in the State of Florida. The purpose of the Company is to ensure and enhance the reliability and adequacy of the bulk power supply in Florida (which is defined as the general area encompassed by Peninsula Florida) now and into the future. The Company serves as a Regional Entity with delegated authority from the North American Electric Reliability Corporation ("NERC") for the purpose of proposing and enforcing reliability standards within the FRCC region.

On May 2, 2007, the Company entered into a Delegation Agreement with North American Electric Reliability Corporation ("NERC"), an organization certified by the Federal Energy Regulatory Commission pursuant to Section 215(c) of the Federal Power Act. The Company is required by federal law to assess the reliability of the Bulk Power System. The Federal Energy Regulatory Commission ("FERC") empowered the Company through a Delegation Agreement with NERC to monitor, enforce and implement electric reliability standards under Section 215 of the Federal Power Act. The Company is responsible for establishing the process for development, revision, withdrawals and approval of the Company's Regional Reliability Standards for the region. The Company monitors and enforces compliance with NERC and FERC reliability standards through on-site audits, self-certifications, periodic spot checks, self-reports, event investigation, periodic data submittal, exception reporting and through complaints. The initial term of the agreement is for three years and is renewable for five more years upon a successful compliance audit conducted by NERC.

The Company's source of revenue is split into two parts. The statutory functions, defined as those functions being performed for Reliability Standards and Compliance, are funded by NERC. The member services functions are paid by its members who are assessed for costs and expenses of establishing, developing, operating and maintaining the Company.

A summary of the Company's significant accounting policies consistently applied in preparation of the accompanying financial statements follows:

The financial statements have been prepared on the accrual basis of accounting in accordance with accounting principles generally accepted in the United States of America; consequently, revenues and gains are recognized when earned, and expenses and losses are recognized when incurred.

Concentration of Credit Risk – The Company places its cash with high credit quality institutions. At times, these balances may be in excess of the FDIC insurance limit.

Use of Estimates – Management uses estimates and assumptions in preparing these financial statements in accordance with accounting principles generally accepted in the United States of America. Those estimates and assumptions affect the reported amounts of assets, liabilities, revenues and expenses. Actual results could vary from the estimates that are used.

Income Taxes – The Company has been approved for tax-exempt status under Section 501(c) (6) of the Internal Revenue Code and is exempt from federal and state income taxes. Accordingly, no provision for income taxes is included in the financial statements. Tax years after 2009 remain subject to examination by taxing authorities.

1. General and Summary of Significant Accounting Policies (Continued)

The Company follows Accounting Standard Codification (ASC) 740, "Accounting for Income Taxes" with respect to accounting for uncertainty in income taxes. A tax position is recognized as a benefit only if it is "more likely than not" that the tax position would be sustained in a tax examination, with a tax examination being presumed to occur. The amount recognized is the largest amount of tax benefit that is greater than 50% likely of being realized on examination. For tax positions not meeting the "more likely than not" test, no tax benefit is recorded.

Due to its tax-exempt status, the Company is not subject to U.S. federal income tax or state income tax. The Company's Form 990 has not been subject to examination by the Internal Revenue Service or the State of Florida for the last three years. The Company has not recognized liability for unrecognized tax benefits as it has no known tax positions that would subject the Company to any material income tax exposure. A reconciliation of the beginning and ending amount of unrecognized tax benefits and interest accrued related to unrecognized tax benefits are not included nor is there any interest accrued related to unrecognized tax benefits or interest expense and penalties in operating expenses as there are no unrecognized tax benefits.

Member, Related Party, and Other Receivables – The Company considers all receivables to be fully collectible, usually within 30 to 60 days; accordingly, no allowance for doubtful accounts is required and no late fees are assessed. If amounts become uncollectible, they will be charged to operations when that determination is made and will be paid by the remaining members.

Property and Equipment – Property and equipment with a cost over $500 are capitalized and are stated at cost, less accumulated depreciation and amortization. Depreciation and amortization are provided for in amounts sufficient to relate the cost of depreciable assets to operations over their estimated service lives, principally on a straight-line basis. The estimated lives used in determining depreciation are:

Equipment	5 years
Software	3 years
Furniture and fixtures	7 years
Leasehold improvements	5 years

Leasehold improvements are amortized over the lives of the respective leases or the service lives of the improvements, whichever is shorter.

1. General and Summary of Significant Accounting Policies (Continued)

Line of Credit – The Company secured a line of credit from Bank of America, N.A. for two (2) years in the amount of $1,500,000. The line of credit is intended to be used for short term needs that arise between budget funding periods as a bridge between budget years. The covenants call for a funded debt to total unrestricted and temporarily restricted net assets not exceeding 2.0:1.0 and an out of debt period of 30 days each line year. The total charges and fees for 2 year term were paid in 2013 and amounted to $8,095. As of December 31, 2013, the company has not drawn on the line of credit and is in full compliance with all covenants.

Postretirement Benefits Other Than Pensions – The Company sponsors a postretirement health care plan covering employees hired before October 1, 2003 if the retiree completes 10 years of service prior to retirement, is over the age of 60 at retirement and participates in the Company's IRS qualified retirement or profit-sharing plan at the time of retirement. The plan is noncontributory for retirees (see Note 6).

Date of Management's Review – Management has evaluated events and transactions for potential recognition or disclosure through January 31, 2014, which is the date the financial statements were available to be issued.

2. Fair Value Measurements

Financial Accounting Standards Board ASC 820 establishes a framework for measuring fair value. That framework provides a fair value hierarchy that prioritizes the inputs to valuation techniques used to measure fair value. The hierarchy gives the highest priority to unadjusted quoted prices in active markets for identical assets or liabilities (level 1 measurement) and the lowest priority to unobservable inputs (level 3 measurements). The three levels of the fair value hierarchy under FASB ASC 820 are described below:

Level 1: Inputs to the valuation methodology are unadjusted quoted prices for identical assets or liabilities in active markets that the Organization has the ability to access.

Level 2: Inputs to the valuation methodology include:

- Quoted prices for similar assets or liabilities in active markets
- Quoted prices for identical or similar assets or liabilities in inactive markets
- Inputs other than quoted prices that are observable for that asset or liability
- Inputs that are derived principally from or corroborated by observable market data by correlation or other means

If the asset or liability has a specified (contractual) term, the Level 2 input must be observable for substantially the full term of the asset or liability.

Level 3: Inputs to the valuation methodology are unobservable and significant to the fair value measurement.

2. Fair Value Measurements – (Continued)

The asset's or liability's fair value measurement level within the fair value hierarchy is based on the lowest level of any input that is significant to the fair value measurement. Valuation techniques used need to maximize the use of observable inputs and minimize the use of unobservable inputs.

The following is a description of the valuation methodologies used for the Organization's securities invested in the 457(f) Retirement Plan measured at fair value as of December 31, 2013:

Cash and cash equivalents: The carrying amounts reported in the Statements of Financial Position approximate the fair value because of the short maturities of those instruments.

Mutual funds: Measured at net asset value within in the active market on which the individual securities are traded.

The methods described above may produce a fair value calculation that may not be indicative of the net realizable value or reflective of future fair values. Furthermore, while the Organization believes its valuation methods are appropriate and consistent with other market participants, the use of different methodologies or assumptions to determine the fair value of certain financial instruments could result in a different fair value measurement at the reporting date.

The fair values of the Organization's securities invested in the 457(f) Retirement Plan, classified by level, are as follows:

December 31,	2013			
	Fair Value	Level 1	Level 2	Level 3
Cash and equivalents	$ 851	$ 851	$ -	$ -
Mutual funds - fixed income	17,181	17,181	-	-
Mutual funds - equities	91,143	91,143	-	-
Total	$ 109,175	$ 109,175	$ -	$ -

The fair value and cost of the Organization's securities invested in the 457(f) Retirement Plan, as of December 31, 2013 are as follows:

	Cost Value	Market Value
Cash and equivalents	$ 851	$ 851
Mutual funds - fixed income	17,594	17,181
Mutual funds - equities	70,654	91,143
Total	$ 89,099	$ 109,175

3. Deferred Revenues

The contracts with the members of FRCC have a provision in them that provides that they have 30 days from the date of invoice for a new budgetary year (January through December) to withdraw from membership. Therefore, the Company made a decision to invoice all members on December 1 for the first quarterly installment of the 2014 budget, thus at December 31, 2013 it would be known whether all members are continuing with their membership.

4. Commitments

In December 2003, the Company entered into an agreement with Sprint Communications Company L.P. ("Sprint") to provide certain telecommunication services that are passed through to certain members beginning in 2004 for the Company's network. The initial term of the agreement is 36 months and has been renewed for an additional 12-month period each year thereafter. The agreement calls for the Company to make a minimum service commitment of $96,000 for each contract year of the term.

In December 2006, the Company entered into an agreement with Open Access Technology International, Inc. to provide the Florida Transaction Management System ("FTMS") services for the Company's customers. The initial term of the agreement was 36 months at $3,750 per month and has been renewed for an additional 12-month period each year thereafter. In 2013, the Company renewed this contract for 36 months at an annual cost of $57,000. In addition, several enhancements to the FTMS service were agreed upon of which $27,000 was paid for in 2013 and $27,000 will be paid in 2014 at the completion of the enhancements. The Company also has the option to purchase the system for $100,000; however, at this time, the Company has no intention of doing so.

In November 2007, the Company entered into an agreement to purchase Compliance Tracking System software from Guidance Solutions, Inc. In 2008, the Company entered into an agreement with several of the other regional entities to form a consortium and share the cost of future enhancements and program modules to add to the Compliance Tracking System originally purchased from Guidance Solutions, Inc. In June of 2011, the consortium broke up with certain member regions deciding to change software and vendors and go in a different direction for their Compliance Tracking System. The Company decided to remain with Guidance and has agreed to share costs of software enhancements with one other region that remains with Guidance. The cost of enhancements added or in progress for 2013 was $109,556. The Company is obligated for enhancements in progress as of December 31, 2013 from this regional agreement of approximately $28,800 for enhancements to be completed in 2014. The Company is also obligated for enhancements of their own system for $7,000 to be completed in 2014.

In May of 2013, the Company entered into an agreement with other Eastern Interconnection Reliability Coordinators and created the Interchange Distribution Calculator (IDC) Tools Member Association to manage the IDC Application contract that in prior years was managed by NERC. This tool is used to manage transmission congestion across the Eastern Interconnection. The agreement calls for the Company to make a minimum service commitment of $118,600 for each contract year of the term.

In May of 2013 the Company entered into agreements with Cisco Systems Capital Corporation to provide WebEx online presentation and audio conferencing services.

4. Commitments – (Continued)

The initial term of the agreement is for 36 months and call for the Company to make a total commitment of $130,500 over the 36-month term.

In July 2013, the company entered into an agreement with TW Telecom Holdings, Inc. (TW Telecom) to provide required redundant telecommunications for the FRCCnet wide area network that provides data to the FRCC reliability Coordinator. The initial term of the agreement is 36 months and calls for the Company to make a minimum service commitment of $68,400 for each contract year of the term.

5. Operating Leases

The Company leases its facilities and has operating leases that expire September 30, 2020 at its current location on Bayport Drive. The Bayport Plaza lease required a $150,000 deposit. For all leases, rental payments escalate based on the schedules set forth in the lease agreement. Minimum future rental payments are:

Year ended December 31,	
2014	$ 745,740
2015	766,199
2016	787,166
2017	808,832
2018	831,070
2019 and thereafter	1,498,850
	$ 5,437,857

Rent expense charged to operations during the year ended December 31, 2013 was $720,244, including the effects of lease payment escalations over the term of the leases.

For all leases, the future expense to be recognized including the effects of rent abatements and rent escalations are as follows:

Year Ended December 31,	
2014	$ 750,602
2015	750,602
2016	750,602
2017	750,602
2018	750,602
2019 and thereafter	1,313,557
	$ 5,066,567

6. Postretirement Benefits Other Than Pensions

The Company adheres to ASC 715-30, *Defined Benefit Plans - Other Post Retirement,* which requires companies to report the funded status (defined as the difference between the fair value of plan assets and the plan's benefit obligation) of their postretirement plan. The current year effect is a $519,831 increase to unrestricted net assets.

The following table sets forth the plan's funded status reconciled with the amount shown in the Company's statement of financial position at December 31, 2013:

Accumulated postretirement benefit oligation:	
Plan assets at fair value	-0-
Funded status	-0-
Accrued postretirement benefit obligation:	
Current portion	$ 32,914
Long-term portion	1,373,908
	$ 1,406,822

Since the plan is non-contributory, the entire balance of the accumulated benefit obligation is recorded as a liability in the statement of financial position as of December 31, 2013.

Benefits expected to be paid in each of the next five years are as follows:

Year Ended December 31,	
2014	$ 32,914
2015	35,829
2016	38,717
2017	53,993
2018	56,950
2019 and thereafter	391,970
	$ 610,373

6. Postretirement Benefits Other Than Pensions – (Continued)

The following provides the components of net periodic postretirement benefit cost for the year ended December 31, 2013.

Service Cost	$ (25,156)
Interest Cost	(31,214)
Amortization of unrecognized net obligation	(10,664)
Recognition of net actuarial gain	3,607
Net periodic postretirement benefit cost	(63,427)
Benefits paid during 2013	17,603
Net postretirement benefit loss	$ (45,824)
Items not yet recognized as a component of net periodic postretirement benefit costs	
Unrecognized net loss	$ (404,717)
Unrecognized net transition obligations	(39,983)
Transitional effect of ASC 715-30	(444,700)
Postretirement effect of ASC 715-30 as of December 31 2012	$ 75,131
Net periodic change in postretirement obligation	(519,831)
Postretirement obligation recognized as a component of net periodic benefit cost as of December 31, 2013	$ (444,700)

6. Postretirement Benefits Other Than Pensions – (Continued)

Amounts included in unrestricted net assets and expected to be recognized as components of net periodic benefit gain (cost) next year include amortization of unrecognized net obligation and net actuarial gain of approximately ($11,000) and $3,607, respectively. For measurement purposes, an 8% annual rate increase in the per capita cost of covered health care benefits was assumed for 2015; the rate was assumed to decrease to 7% for 2016; 6% for 2017 and remain at 5% thereafter. The health care cost trend rate assumption has a significant effect on the amounts reported. To illustrate, if assumed health care cost trend rates were increased by one percentage point in each year, the accumulated postretirement benefit obligation at December 31, 2013 would be increased $257,009 and the aggregate of the service and interest cost components of net periodic postretirement benefit cost for the year ended December 31, 2013 would be increased by $9,353.

The weighted average discount rate used in estimating the accumulated postretirement benefit obligation was 3.75%. Mortality was based on the RP-2000 Combined Mortality Tables for Healthy Males and Females. The measurement date of the accumulated postretirement benefit obligation was December 31, 2013.

Glossary: Accumulated postretirement benefit obligation – The actuarial present value of benefits attributed to employee service rendered to a particular date.

Net periodic postretirement benefit gain – The amount recognized in the financial statements as the gain of the postretirement benefit plan for a period.

In December of 2003, the Medicare Prescription Drug, Improvement and Modernization Act of 2003 (Act) was signed into law. The Act includes a special subsidy for employers that sponsor retiree health benefit plans with prescription drug benefits that are as favorable as the Medicare Part D benefit. The Company has not determined whether its plan is actuarially equivalent to the Medicare Part D benefit due to the cost of obtaining such an actuarial computation.

7. Retirement Plan

Effective January 1, 2001, the Company adopted a 401(k) Plan ("Plan") intended to benefit substantially all employees with 6 months of service and 21 years of age. On September 30, 2007, the plan was amended to enable employees with one hour of service to be eligible to enter the plan. Participants can contribute any amount of their compensation for the Plan year, not to exceed the limits determined by the Internal Revenue Code. The Company may make matching contributions with prescribed limits. The Company may also make additional non-elective discretionary contributions to the Plan. The Company made matching contributions to the Plan of $250,909 and a discretionary contribution to the Plan of $434,433 (net of forfeitures) for the year ending December 31, 2013.

Deferred Compensation – The Company implemented an executive deferred compensation plan subject to Section 457(f) of the Internal Revenue Code in 2004. For the year ended December 31, 2013, the Company contributed $8,492 to benefit the participant in this Plan.

In 2013, the Company adopted a Nonqualified 457(b) Retirement Plan ("Retirement Plan"), to be effective January 1, 2014, intended to benefit key managerial employees of the Company. The amount expensed in 2013 and to be funded in 2014 is $16,775.

8. Related Parties

Various members of the Company are founding members of Florida Electric Power Coordinating Group, Inc. ("FCG") and the organizations, excluding the board of directors, are under common management. FCG is a nonprofit organization operating under Section 501(c)(6) of the Internal Revenue Code and is exempt from federal and state income taxes.

The Company is providing FCG with administrative and accounting services, including the use of office space. FCG reimbursed the Company approximately 3.46% of the Company's administrative expenses in 2013. The service agreement with FCG is a one-year agreement that will automatically renew unless canceled in advance by either party. The original agreement was renewed for an additional year in February 2013. At December 31, 2013, the Company had billed and collected a total of $276,901 from FCG relating to the service agreement and has a receivable from FCG in the amount of $19,403.

The Company is purchasing the services from Florida Power and Light ("FPL"), a member of the Company, to fulfill the responsibilities of reliability coordinator, operations planning coordinator, state capacity emergency coordinator as well as various other services. The Company paid FPL $2,073,322 relating all of to these services and at December 31, 2013 had $683,463 of accrued expenses recorded on the books.

9. Concentrations

Two members make up approximately 54.8% of the member services assessments and dues. The same two members comprise 67.1% of the statutory assessment that NERC bills directly in order to fund the Company for its statutory functions.

10. Contingencies

As part of the Company's Delegation Agreement with NERC, the Company has the authority to fine entities within its region for violation of reliability standards. During 2013, six (6) notices of penalty were filed with FERC with settlement agreements addressing alleged violations of reliability standards for the entities within the FRCC region. The penalties totaling $248,000 as of December 31, 2013, were approved by FERC and paid by the entities. The Delegation Agreement Rules of Procedures from NERC stipulate that any penalty monies collected by June 30 of each year, which is between budget submissions, are to be held until they can be accounted for in a budget submission. At year-end December 31, 2013, a total of $481,000 penalty assessment is being held for future use of which $343,000 was accounted for in the 2014 budget submission and will be taken into operating income at the beginning of 2014 to offset funding from all entities in the region. The balance, plus any penalties billed and collected prior to June 30, 2014 will be held and accounted for in the 2015 budget submission.

The Company is the registered entity for the FRCC Region Reliability Coordinator functions and as a Planning Authority within the FRCC region. As a NERC registered entity, the Company must comply with applicable NERC reliability standards. Violations of these standards can result in financial penalties. The Company is involved in various enforcement actions for possible violations of electric reliability standards related to the NERC registered entity functions.

10. Contingencies - (Continued)

Several of the possible violations were self-reported by FRCC which may result in no penalty. At this time, the Company cannot fully determine the effect of the possible penalties that may arise. Based on the limited information available at this time the Company estimates that it is reasonably possible for a penalty to be assessed ranging from $75,000 to $125,000, however the Company cannot conclude that any amount within this range is a better estimate than any other, and accordingly the Company has included $75,000 as an accrued contingent liability.

11. Functional Expenses

The detail of functional expenses for the year ended is as follows:

Statutory expenses:		
Reliability Standards Development	$	229,145
Compliance & Enforcement		4,170,708
Reliability Assessment & Performance Analysis		1,109,679
Training & Education		259,144
Situational Awareness & Infrastructure		16,643
Total statutory expenses	$	5,785,319
Member Services expenses:		
Planning Committee		710,959
Operating Committee		5,424,221
General & Administrative		519,831
Total member services expenses		6,655,011
Total Expenses	$	12,440,330

12. Net Assets

Unrestricted net assets that are designated are FERC-approved for statutory expense or board-approved for member services expense segregations of unrestricted net assets for specific projects. Since designations are voluntary and may be reversed or redirected by the governing board at any time, designated portions of net assets are not considered restricted.

The detail of unrestricted FERC or board-designated net assets is as follows at year end:

Statutory	$ 1,966,888
Member Services	$ 587,073
Total unrestricted-board designated net assets	$ 2,553,961

April 29, 2014

Mr. Michael Walker
Ms. Susan Turpen
North American Electric Reliability Corporation (NERC)

RE: 2013 Budget Variance Explanation Based on Audited Financials

Dear Mr. Walker and Ms. Turpen:

MRO staff reports the audited final numbers to be 7.63% ***under*** budget ($709k). Prior to the annual actuarial calculation of post-retirement medical benefit obligation (discount rate, expected rate of return on plan assets and health care cost trend rate) MRO staff reported to be 4.91% ***under*** budget ($457k).

While MRO was under budget, MRO staff believes the principal responsibilities under the delegation agreement were met in 2013. During 2013, MRO conducted 19 audits and spot checks including 10 on-site and 6 off-site combined CIP and operations and planning audits and 2 off-site operations and planning audits. Additionally, MRO participated in one on-site operations and planning audit and one on-site CIP audit lead by SERC. No spot checks were conducted in 2013. MRO identified 147 new potential violations and closed 140 instances of noncompliance (violations or remediated issues) in 2013. MRO completed all budgeted reliability assessments for the year. In addition, MRO provided oversight on the event analysis of eight events in the Region during 2013.

As requested, the year-to-date variances greater than $10,000 and 10 percent are explained below.

Meeting Expenses (Actual - $223,169 under budget)

- Meeting expenses were under budget by $40,863. This was due to the new MRO facility having provided more opportunities to host meetings, which enabled staff to reduce cost significantly more than originally expected by eliminating the cost of meeting room and audio visual rentals as well as lower catering costs. These cost savings are trended in the 2014 Budget.
- Travel expenses were under budget by $155,747. Greater than budgeted use of the new MRO facility resulted in less travel by MRO staff. Resources were also shifted from auditing to risk assessment and mitigation, which in 2013 required minimum travel.
- Conference call expenses were under budget by $26,559. Upgrades in mid-year 2013 for audio and web conferencing media eliminated costs for the remaining portion of 2013. These cost savings are trended in the 2014 Budget.

380 St. Peter Street, Ste. 800, Saint Paul, MN 55102 MidwestReliability.org P.651.855.1760 F.651.855.1712

Consultants and Contracts (Actual - $82,453 under budget)
MRO had expected to come in on budget by the end of the year. Two expected projects were outsourced; one was approximately 50% completed. Both are expected to be completed in 2014.

Professional Services (Actual - $99,161 under budget)
External counsel is requested when necessary and this cost is difficult to trend.

Other non-Operating Expenses (Actual - $194,304 under budget)
In addition to the review of financials, MRO's independent financial audit requests support for the annual actuarial calculation of post-retirement medical benefit obligation. The actuarial assumptions take into consideration the discount rate, expected rate of return on plan assets and health care cost trend rate. After review and discussion of provided assessments by the relevant third party advisors, a higher post-retirement discount rate of 5.04% (up from 4.12%) and a 6% expected rate of return applied. This rate remains unchanged from the previous year's assumptions and calculation. This resulted in a positive impact to net revenues of $252k in 2013. $58k was included in the net periodic cost and $194k as a non-operating cost.

Fixed Assets (Actual - $52,355 over budget)
MRO staff accelerated some planned projects from 2014.

Change in Assets and Year End
MRO was **under budget by $709k** as explained above.

If you have any questions regarding this report, please contact me at 651-855-1707.

Thank you,

Sue Clarke

Personnel Expenses					
Salaries	819,315	795,326	23,989	3.02%	
Payroll Taxes	52,710	54,654	(1,944)	-3.56%	
Employee Benefits	71,461	71,795	(334)	-0.47%	
Savings & Retirement	149,493	160,752	(11,259)	-7.00%	
Total Personnel Expenses	1,092,979	1,082,527	10,452	0.97%	
Meeting Expenses					
Meetings	7,316	20,000	(12,684)	-63.42%	Approximately the same number of meetings at a much lower cost due to hosting at MRO's facility. Savings resulted from eliminating meeting room and audio visual rental costs as well as lowering catering costs.
Travel	147,655	106,150	41,505	39.10%	Due to the increased number of activities in this area there was more travel than anticipated. Activities included but not limited to BES, RAPA, and Event Analysis meetings at the NERC level. MRO staff also knew that travel (most specifically airfare) was low in our original budget. MRO staff was confident that they would be able to manage to the RAPA budget as a whole.
Conference Calls	2,207	2,500	(293)	-11.72%	Upgrades in mid-year 2013 for audio and web conferencing media eliminated costs for the remaining portion of 2013.
Total Meeting Expenses	157,178	128,650	28,528	22.17%	
Operating Expenses					
Consultants & Contracts	60,555	141,100	(80,545)	-57.08%	RAPA has three contracts that are budgeted based on an estimated number of required hours; actual hours can fluctuate greatly. In the case of 2013 the actual dollars in our Model Building came in 50% lower. MRO also had Event Analysis contingency dollars in our 2013 Budget that were unnecessary and were removed in the 2014 budget.
Rent & Improvements	-	-	-		
Office Costs	24,140	28,400	(4,260)	-15.00%	2013 training dollars were budgeted for two different staffers who are no longer in the department. Actual staff required different training requirements; actual cost was lower than budgeted.

Expenses					
Personnel Expenses					
Salaries	290,642	192,366	98,276	51.09%	
Payroll Taxes	14,177	10,760	3,417	31.76%	
Employee Benefits	14,934	13,435	1,499	11.16%	
Savings & Retirement	44,544	34,693	9,851	28.39%	
Total Personnel Expenses	364,297	251,254	113,043	44.99%	In first quarter 2013 the executives charged their BOD preparation and actual time to G&A rather than to each of their own programs. In addition, costs for third and fourth quarter NERC and BOT meetings were recorded here rather than in Member Forums.
Meeting Expenses					
Meetings	23,221	35,864	(12,643)	-35.25%	Approximately the same number of meetings at a much lower cost due to hosting at MRO's facility. Savings resulted from eliminating meeting room and audio visual rental costs as well as lowering catering costs.
Travel	73,098	60,000	13,098	21.83%	The BOT travel that was budgeted under program Forums(1100) was charged to G&A after 06/30/2013 based on the treatment by the other regions
Conference Calls	163	800	(637)	-79.63%	Upgrades in mid-year 2013 for audio and web conferencing media eliminated costs for the remaining portion of 2013.
Total Meeting Expenses	96,482	96,664	(182)	-0.19%	
Operating Expenses					
Consultants & Contracts	1,912	40,000	(38,088)	-95.22%	Contingent dollars were included for MRO's share of an all-regional project (similar to the Deloitte project in 2012) but were not needed in 2013
Rent & Improvements	-	-	-		
Office Costs	74,806	71,100	3,706	5.21%	
Professional Services	72,500	100,000	(27,500)	-27.50%	Actual compensation required for independent Board members was less than budgeted.

INDEPENDENT AUDITORS' REPORT

To the Board of Directors and Members
Midwest Reliability Organization
Saint Paul, Minnesota

Report on the Financial Statements

We have audited the accompanying financial statements of Midwest Reliability Organization (the "Organization"), which comprise the statements of financial position as of December 31, 2013 and 2012, and the related statements of operations and members' equity and cash flows for the years then ended, and the related notes to the financial statements.

Management's Responsibility for the Financial Statements

Management is responsible for the preparation and fair presentation of these financial statements in accordance with accounting principles generally accepted in the United States of America; this includes the design, implementation, and maintenance of internal control relevant to the preparation and fair presentation of financial statements that are free from material misstatement, whether due to fraud or error.

Auditors' Responsibility

Our responsibility is to express an opinion on these financial statements based on our audits. We conducted our audits in accordance with auditing standards generally accepted in the United States of America. Those standards require that we plan and perform the audits to obtain reasonable assurance about whether the financial statements are free from material misstatement.

An audit involves performing procedures to obtain audit evidence about the amounts and disclosures in the financial statements. The procedures selected depend on the auditors' judgment, including the assessment of the risks of material misstatement of the financial statements, whether due to fraud or error. In making those risk assessments, the auditor considers internal control relevant to the entity's preparation and fair presentation of the financial statements in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the entity's internal control. Accordingly, we express no such opinion. An audit also includes evaluating the appropriateness of accounting policies used and the reasonableness of significant accounting estimates made by management, as well as evaluating the overall presentation of the financial statements.

We believe that the audit evidence we have obtained is sufficient and appropriate to provide a basis for our audit opinion.

Opinion

In our opinion, the financial statements referred to above present fairly, in all material respects, the financial position of the Organization as of December 31, 2013 and 2012, and the changes in its net assets and its cash flows for the years then ended in accordance with accounting principles generally accepted in the United States of America.

NOTE 1 - SIGNIFICANT ACCOUNTING POLICIES

Services

Midwest Reliability Organization (or the "Organization") is a nonprofit organization dedicated to ensuring the reliability of the bulk power system in the north-central part of North America. The Organization is a Regional Entity under the Energy Policy Act of 2005 (United States) and operates under delegated authority from the Federal Energy Regulatory Commission (FERC) via a delegation agreement with the North American Reliability Corporation. Additionally, the Organization operates in the provinces of Saskatchewan and Manitoba through other agreements. The primary focus of the Organization is ensuring compliance with reliability standards utilizing open, fair processes in the public interest and providing assessments on bulk power system reliability. In addition to the Board of Directors, Midwest Reliability Organization has formed four standing committees: Compliance Committee, Planning Committee, Operating Committee and the Standards Committee. The Board of Directors has four committees: Finance and Audit Committee, Governance and Personnel Committee, Dispute Resolution Committee and Hearing Body Committee.

Cash and Cash Equivalents

The Organization considers all highly liquid investments with original maturities of three months or less to be cash equivalents. Cash and cash equivalents are held by one financial institution, Wells Fargo, in three accounts. Escrowed amounts resulting from penalties assessed and collected in the United States are segregated into a separate account.

Receivables

Receivables, if any, result primarily from assessments related to load serving entities (members and nonmembers). No allowance for doubtful accounts is recorded based on historical experience and management's evaluation of receivables. Bad debts are expensed when deemed uncollectible. Receivables are generally unsecured.

Property, Improvements and Equipment

Property, improvements and equipment are stated at cost less accumulated depreciation and amortization. Significant additions or improvements exceeding $3,000 and $2,000 are capitalized for the years ended December 31, 2013 and 2012, respectively, while expenditures for maintenance and repairs are charged to operations as incurred. Depreciation is recorded using the straight-line method over the estimated useful lives of the assets, ranging from three to seven years. Leasehold improvements are amortized using the straight-line method over the shorter of the estimated useful life or the remaining lease term. The cost and related accumulated depreciation of assets sold or disposed of are removed from the accounts, and the resulting gain or loss is included in operations.

Capitalized Software Costs

The Organization capitalizes software development costs incurred and purchased software in upgrading computer software used internally to serve its members. The Organization begins capitalization of these costs after technological feasibility has been determined. The capitalized software, once placed in service, is amortized on the straight-line method over its estimated useful life of three years. Accumulated amortization totaled $439,510 and $384,099 for the years ended December 31, 2013 and 2012, respectively. Amortization expense totaled $55,411 and $108,054 for the years ended December 31, 2013 and 2012, respectively.

NOTE 1 - SIGNIFICANT ACCOUNTING POLICIES (Continued)

Deferred Assessments

Deferred assessments represents penalty assessments paid by load-serving entities, which will be used to offset budget allocations received from NERC.

Tax Status

The Internal Revenue Service has determined that the Organization is exempt from federal income taxes under Section 501(c)(6) of the Internal Revenue Code. They are also exempt from state income taxes. However, any unrelated business income may be subject to taxation.

The Organization follows the accounting standards for contingencies in evaluating uncertain tax positions. This guidance prescribes recognition threshold principles for the financial statement recognition of tax positions taken or expected to be taken on a tax return that are not certain to be realized. No liability has been recognized by the Organization for uncertain tax positions as of December 31, 2013 and 2012. The Organization's tax returns are subject to review and examination by federal and state authorities. The tax returns for the current year as well as fiscal years 2010 and thereafter are open to examination by federal and state authorities.

Revenue and Assessments

The Organization receives its revenues from NERC through a net energy-to-load allocation for all load-serving entities within its geographical area. The revenue allocation is prescribed under the Energy Policy Act of 2005 in the United States and similar arrangements in Saskatchewan and Manitoba. Any other revenues are collected on a fee-for-service basis at no cost, if applicable.

Use of Estimates

The preparation of financial statements in conformity with accounting principles generally accepted in the United States of America requires management to make estimates and assumptions that affect the reported amounts of assets and liabilities and disclosure of contingent assets and liabilities at the date of the financial statements and the reported amounts of revenues and expenses during the reporting period. Actual results could differ from those estimates.

Subsequent Events

The Organization has evaluated subsequent events through April 3, 2014, which is the date that the financial statements were approved and available to be issued.

NOTE 2 - NERC TRANSACTIONS

On October 30, 2007 the Organization entered into a delegation agreement with the North American Electric Reliability Corporation ("NERC") with an executed version dated April 5, 2008 to enforce the Reliability Standards as set by NERC within a designated region. The delegation agreement, which was set to expire in May 2010, was approved for extension by FERC through May 2, 2011. The Organization and NERC completed work on a five-year delegation agreement which was executed and approved by FERC effective January 1, 2011. In connection with the current delegation agreement, the Organization has the ability to propose Reliability Standards and Regional Variances. The Organization has the authority to enforce the Reliability Standards as set by NERC and approved by regulatory authorities within the geographic boundaries. The Organization is subject to oversight from NERC and applicable regulations in the United States, Manitoba, and Saskatchewan.

To ensure the delegated functions have reasonable funding, NERC is to fund the Organization with the monies necessary to carry out its activities as per the agreement. A formula is devised that equitably allocates charges among the end users within the boundaries served by the Organization, based on net energy for load or through such other formula as provided. The Organization provides NERC with a board approved annual operating budget on or before June 30 of each year. Budgeted revenues from NERC were $9,098,927 and $8,349,029 for the years ended December 31, 2013 and 2012, respectively, which agree with the amounts received.

NOTE 3 - LEASE COMMITMENTS

The Organization executed an operating lease for office space in St Paul, Minnesota on January 20, 2012. Rent expense was $237,745 and $330,188 for the years ended December 31, 2013 and 2012, respectively.

Future expected minimum lease payments under the lease as of December 31, 2013 are as follows:

Years Ending December 31	
2014	$ 94,376
2015	266,514
2016	274,537
2017	282,812
2018	291,277
Thereafter	1,200,135
	$ 2,409,651

NOTE 4 - PROPERTY, IMPROVEMENTS AND EQUIPMENT

The following is a schedule of property, improvements and equipment as of December 31:

	2013	2012
Equipment	$ 1,731,631	$ 1,403,378
Furniture	422,802	421,164
Leasehold improvements	321,206	336,548
	2,475,639	2,161,090
Less: Accumulated depreciation	(1,281,070)	(926,223)
Net Property, Improvements and Equipment	$ 1,194,569	$ 1,234,867

NOTE 5 - LINE OF CREDIT

The Organization obtained a revolving line of credit from National Cooperative Service Corporation (NCSC) in February 2008. The line of credit has a credit limit of $2,000,000 and an interest rate equal to the NCSC Line of Credit Rate in effect from time to time, not to exceed the Prevailing Bank Prime Rate as published in the "Money Rates" column of the eastern edition of the *Wall Street Journal* on the publication day immediately preceding the day on which an adjustment in the interest rate becomes effective. The Organization is required to maintain a Debt Service Coverage Ratio of not less than 1.00. The line of credit is secured by substantially all assets of the Organization, and expires on February 26, 2017. There were no outstanding balances at December 31, 2013 or 2012, respectively.

NOTE 6 - RETIREMENT PLANS

Postretirement Health Plan

The Organization has a defined benefit postretirement health plan available to eligible current and future retirees. Information regarding the plan as of December 31 was as follows:

	2013	2012
Change in projected benefit obligation		
Benefit obligation at beginning of year	$ 880,141	$ 662,945
Service cost	169,757	146,199
Interest cost	36,195	29,632
Plan changes	-	-
Actuarial (gain) loss	(200,476)	44,362
Benefits paid	(3,222)	(2,997)
Benefit obligation at end of year	882,395	880,141
Change in plan assets		
Fair value of plan assets at beginning of year	532,807	474,881
Actual return on plan assets	59,097	57,926
Employer contribution	140,542	2,997
Benefits paid	(3,222)	(2,997)
Fair value of plan assets at end of year	729,224	532,807
Unfunded status recognized as a noncurrent liability	$ (153,171)	$ (347,334)
Weighted average assumptions used to calculate the benefit obligation-discount rate	5.04%	4.12%

Net periodic postretirement benefit expense for the years ending December 31 is comprised of the following:

	2013	2012
Components of net periodic benefit cost		
Service cost	$ 169,757	$ 146,199
Interest cost	36,195	29,632
Expected return on plan assets	(35,073)	(35,173)
Amortization of prior service credit	(38,601)	(38,601)
Amortization of actuarial loss	8,405	8,245
Net periodic benefit cost	$ 140,683	$ 110,302
Weighted-average assumptions used to calculate the net periodic benefit cost		
Discount rate	4.12%	4.48%
Expected return on plan assets	6.00%	7.00%
Rate of compensation increases	N/A	N/A

The expected rates of return on plan assets are based on the weighting of the Organization's asset allocations, the 30-year rolling historical average returns, and recent historical average return.

NOTE 6 - RETIREMENT PLANS (Continued)

Assumed health care cost trend rates at December 31 consist of the following:

	2013	2012
Health care cost trend rate assumed for next year	10.1%	10.6%
Rate to which the cost trend rate is assumed to decline (the ultimate trend rate)	5.0%	5.0%
Year that the rate reaches the ultimate trend rate	2025	2025

Assumed health care cost trend rates have a significant effect on the amounts reported for the health care plan. A one-percentage point change in assumed health care trend rates would have the following effects:

	One-Percentage Point	
	Increase	Decrease
Effect on total of service cost and interest cost	$ 52,259	$ (39,675)
Effect on postretirement benefit obligation	194,953	(151,445)

Plan related changes other than net periodic cost included in retirement benefit expense:

	2013	2012
Actuarial (gain) loss arising during the year	$ (232,905)	$ 13,364
Amortization of prior year service cost	38,601	38,601
	$ (194,304)	$ 51,965

The Organization employs a total return investment approach for plan assets with a mix of equity and debt investments used to maximize the long-term appreciation of plan assets for a prudent level of risk. The Organization's plan assets are invested in various funds, which consist of both stocks and bonds. The equity component includes investment in companies of various sizes, with an emphasis on large cap stocks, and represents several investment styles. The equity portion also includes an allocation to international stocks. Investments in bonds are diversified into three portfolios that invest mainly in U.S. treasuries, high quality corporate issues and mortgage securities.

NOTE 6 - RETIREMENT PLANS (Continued)

The fair values of the Organization's postretirement health plan assets at December 31, by asset category, are as follows:

	2013 Quoted Prices in Active Markets for Identical Assets (Level 1)	2012 Quoted Prices in Active Markets for Identical Assets (Level 1)
Asset category		
Cash equivalents	$ 7,490	$ 11,418
Mutual funds-bonds	383,724	322,492
Mutual funds-equities	265,854	159,657
Mutual funds-balanced	72,156	39,240
	$ 729,224	$ 532,807

Cash equivalents - Investments in cash equivalents consist of money market funds and are classified as Level 1 as they are traded in an active market for which closing prices are readily available.

Mutual Funds - Investments in mutual funds are classified as Level 1 as they are traded in an active market for which closing prices are readily available.

While the plan believes its valuation methods are appropriate and consistent with other market participants, the use of different methodologies or assumptions to determine the fair value of certain financial instruments could result in a different estimate of fair value at the reporting date.

Estimated future benefit payments (which reflect expected future service, as appropriate) as of December 31, 2013 are as follows:

Years Ending December 31	
2014	$ 5,259
2015	6,772
2016	7,947
2017	12,769
2018	22,279
2019 - 2023	281,585

It is reasonably possible that changes in these estimates could occur in the near term and that actual results could differ from these estimates and could have a material effect on the financial statements.

The Organization expects to contribute $105,536 to the plan in 2014.

NOTE 6 - RETIREMENT PLANS (Continued)

Defined Contribution Pension Plan

In 2009, the Organization established a thrift savings plan to replace the terminated multiple-employer plan for the benefit of its employees. The Organization's previous 401(k) plan was converted into the new plan as well as the establishment of a new, non-elective employer contribution plan. In order to participate in the plan, employees must have attained age 20 and have completed one month of service. Employees may contribute up to the IRS limitations for their elective deferral, with a 50% matching contribution from the Organization. For employees to receive the non-elective or employer contribution, they must have worked 1,000 hours during the plan year. The Organization matched $241,044 and $202,250 of employee deferrals as of December 31, 2013 and 2012, respectively. In addition, the Organization elected to make an employer contribution in the amount of $370,263 and $352,412 for the years ended December 31, 2013 and 2012, respectively.

The Organization also established a 457B plan in 2010. Eligible employees may contribute an elective deferral, with a discretionary matching contribution from the Organization. Employee contributions were $16,226 and $14,200, for the years ended December 31, 2013 and 2012, respectively. The Organization matched $6,675 and $7,400, of employee deferrals for the years ended December 31, 2013 and 2012, respectively.

The Organization also established a 457F plan in 2011. Employer contribution amounts for employees in excess of IRS contribution limits are deposited to the 457F. The Organization contributed in the amounts of $20,950 and $11,579, for the years ended December 31, 2013 and 2012, respectively.

Attention: Mr. Michael Walker

Subject: NPCC 2013 True Up Actual vs. Budget Variance Analysis
True Up Filing Based on Audited 2013 Financial Statements

Dear Michael:

Enclosed is the Northeast Power Coordinating Council, Inc. (NPCC) submittal regarding the 2013 NPCC actual vs. budget variances. NPCC's independent audit performed by Pricewaterhouse Coopers LLP was concluded on March 27, 2014 and forwarded to NERC for its information and provision to FERC.

As you know, NPCC is a Cross-border Regional Entity which provides Regional Entity functions and services through its regional entity (RE) division. The establishment of Regionally-specific criteria, and monitoring and enforcement of compliance with such criteria are provided through the criteria services (CS) division of NPCC. The CS division is funded by assessments to the Independent System Operators/Balancing Authority Areas within the Region based on their respective Net Energy for Load.

No Regional Entity division assessments were used to fund CS division activities. Allocation between the RE division and CS division represents a 94/6 split for 2013 based upon total corporate FTEs of 35.22 in the RE division and 2.14 in the CS division for the full year. No indirect costs were allocated from the CS division to the RE division and no cross subsidies exist. In addition, NPCC does not budget for interest income and reports such income apportioned based upon its Regional Entity (RE) and Criteria Services (CS) division full time equivalent (FTE) ratio.

Actual total expenses for NPCC's RE division for 2013 were $13,533,519 (excluding non-operating expenses which represent change in pension liability based upon actuarial review) which is $538,216 or 4% under the 2013 operating budget of $14,071,735. Actual total expenses for NPCC's CS division for 2013 were $863,318 (excluding non-operating expenses) which is $173,344 or 17% under the 2013 operating budget of $1,036,662. In the aggregate, actual total expenses for the NPCC RE and CS divisions were $14,396,839 which is $711,558 or nearly 5% under the 2013 total corporate budget of $15,108,397. Indirect expenses are allocated to the direct statutory programs based on FTE ratio. NPCC did not use operating cash reserves to fund any activities or services in 2013.

Significant aggregate expense variations for the Regional Entity division are explained on the following page:

Personnel Expenses

(Actual variance of $346k or 4% under budget at year end)

In 2013 NPCC experienced several partial year vacancies but ended the year fully staffed. Despite not being at a full staff complement at times during the year, NPCC performed all of its 2013 delegated responsibilities as well as its goals and objectives, including:

- Conducted 22 off-site Operations & Planning (O&P) audits, four on-site O&P audits, 39 off-site CIP audits, 11 on-site CIP audits and 483 individual spot checks involving 79 entities;
- Processed 153 Technical Feasibility Exceptions (TFE) from 23 entities, completed TFE Part B review of 135;
- Closed 180 violations;
- Accepted mitigation plans for 152 violations;
- Examined 87 events of which eight were category two or higher;
- Processed 35 new entity registrations, 19 entity removals, 17 entity name changes and three certifications.

WECC CEA Revenue and Expenses

(Actual variance of $75k or 218% over budget at year end)

WECC CEA related expenses and offsetting revenue were greater than budget in 2013 due to ongoing audit follow up and enforcement work resulting from the O&P and CIP audits conducted during 2012. The total actual expenses related to the WECC audits were trued up with WECC, as per the CEA Agreement.

Meeting Expenses

(Actual variance of $157k or 12% under budget at year end)

Continued efforts to hold more meetings onsite and at member facilities or via webinars have kept meeting expenses under budget. Additionally, in 2013 NPCC contracted with a more cost effective teleconference/webinar provider.

No funds were budgeted in association with NPCC conducting compliance hearings and no hearings have been initiated to date in NPCC.

Significant variances by program area are provided on a line-item basis using the template provided by NERC which presents actual and budgeted costs on program-by-program format. A single consolidated budget versus actual cost comparison is presented for Administrative Services in order to be consistent with the presentation in NPCC's 2013 Business Plan and Budget. Should you have any questions please do not hesitate to contact me via email at jhala@npcc.org or via telephone at (212) 840-1070.

Sincerely,

Jessica Hala

Independent Auditor's Report

To the Board of Directors and the Members of
Northeast Power Coordinating Council, Inc.

We have audited the accompanying financial statements of Northeast Power Coordinating Council, Inc., which comprise the balance sheets as of December 31, 2013 and December 31, 2012, and the related change in net assets and cash flows for the years then ended.

Management's Responsibility for the Financial Statements

Management is responsible for the preparation and fair presentation of the financial statements in accordance with accounting principles generally accepted in the United States of America; this includes the design, implementation, and maintenance of internal control relevant to the preparation and fair presentation of financial statements that are free from material misstatement, whether due to fraud or error.

Auditor's Responsibility

Our responsibility is to express an opinion on the financial statements based on our audits. We conducted our audits in accordance with auditing standards generally accepted in the United States of America. Those standards require that we plan and perform the audit to obtain reasonable assurance about whether the financial statements are free from material misstatement.

An audit involves performing procedures to obtain audit evidence about the amounts and disclosures in the financial statements. The procedures selected depend on our judgment, including the assessment of the risks of material misstatement of the financial statements, whether due to fraud or error. In making those risk assessments, we consider internal control relevant to the Company's preparation and fair presentation of the financial statements in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the Company's internal control. Accordingly, we express no such opinion. An audit also includes evaluating the appropriateness of accounting policies used and the reasonableness of significant accounting estimates made by management, as well as evaluating the overall presentation of the financial statements. We believe that the audit evidence we have obtained is sufficient and appropriate to provide a basis for our audit opinion.

Opinion

In our opinion, the financial statements referred to above present fairly, in all material respects, the financial position of Northeast Power Coordinating Council, Inc. at December 31, 2013 and December 31, 2012, and the results of its operations and its cash flows for the years then ended in accordance with accounting principles generally accepted in the United States of America.

1. Background

Northeast Power Coordinating Council, Inc. ("NPCC" or the "Company") is a New York State not-for-profit corporation whose purpose is to promote and enhance the reliable and efficient operation of the international, interconnected bulk power system in Northeastern North America through its regional entity and criteria services divisions. The Company's regional entity division is responsible for the development of regional reliability standards and compliance assessment and enforcement of continent-wide and regional reliability standards, coordination of system planning, design and operations, and assessment of reliability. These responsibilities are pursuant to an agreement with the North American Electric Reliability Corporation ("NERC"), an Electric Reliability Organization ("ERO"), under authority of the U.S. Federal Energy Regulatory Commission ("FERC"), and by Memoranda of Understanding with applicable Canadian Provincial regulatory and/or governmental authorities. The Company's criteria services division establishes regionally-specific criteria, and monitors and enforces compliance with such criteria. In the development of regionally-specific reliability criteria, the Company, to the extent possible, facilitates attainment of fair, effective and efficient competitive electric markets.

The Company is primarily funded through the NERC based on the regional entity division annual business plan and budget submitted to and approved by the FERC and Canadian provincial regulatory and/or governmental authorities. The Company's criteria services division is funded by regional independent system operators or balancing authorities acting as the Load Serving Entities' designees with regard to funding and the criteria services division operates on assessments to and funded from these entities based upon a "Net Energy for Load" formula.

2. Summary of Significant Accounting Policies

Basis of Accounting

For the years ended December 31, 2013 and 2012, the Company used the accrual basis of accounting in conformity with accounting principles generally accepted in the United States of America.

Cash

The Company's cash balance consists of its operating checking account, as well as a savings account. At times, cash balances may be in excess of depository insurance limits.

Restricted Cash

Restricted cash represents amounts in deposit accounts funded with penalties levied and received for noncompliance within NPCC U.S., which are required to be used for statutory activities in years subsequent to which the penalty was received, and amounts in deposit accounts for collateralizing a letter of credit as security for NPCC's office lease. At times, cash balances may be in excess of depository insurance limits.

Equipment and Leasehold Improvements

Equipment and leasehold improvements are stated at cost. Depreciation of furniture and computer equipment is computed on the straight-line basis over the estimated useful lives of the applicable assets. Amortization of leasehold improvements is computed on the straight-line basis over the estimated useful lives of the applicable assets, or over the term of the related lease, whichever is less.

Revenue Recognition
For the criteria services division, membership in the Company is on a calendar year basis. There are no fees assessed to full members other than those members that are Independent System Operators or Balancing Authorities. Assessments received are recorded as income in the year to which the membership applies irrespective of when billed or collected. For the regional entity division, membership in the Company is on a calendar year basis. There are no fees assessed to general members. Funding mechanisms provided through U.S. regulatory and Canadian Provincial governmental and/or regulatory agreements provide for quarterly remittances through the North American Electric Reliability Corporation. Assessments received are recorded as income in the year to which the Business Plan and Budget applies irrespective of when billed or collected. Penalty sanctions are recorded as income when levied and the appeals process has been waived or is concluded.

Rent Expense
The Company's office lease which commenced in 2009 contains predetermined increases and decreases in the rentals payable during the lease term. Rent expense is recognized on a straight-line basis over the lease term. The difference between the rent expense charged to operations during the year and the amount payable under the lease during that year is recorded as "Deferred rent" on the Statements of Financial Position. Deferred rent also includes the landlord's contribution toward the cost of leasehold improvements, which is being amortized over the lease term. The unamortized balance of the landlord's contribution at December 31, 2013 is approximately $372,000.

Income Taxes
The Company has been classified as exempt from federal income taxes under Section 501(c) (6) of the Internal Revenue Code.

Use of Estimates
The Company uses estimates and assumptions in preparing these financial statements in accordance with accounting principles generally accepted in the United States of America. Those estimates and assumptions affect the reported amounts of assets, liabilities, revenues and expenses. Actual results could vary from the estimates that are used.

3. Investments

The Company's primary banking relationship is with JP Morgan Chase. Prior to 2009, both regional entity (ERO funded) and criteria services (Regional Independent System Operators/Balancing Authorities – ISO/BAs) revenues were invested in a JPMorgan 100% U.S. Treasury Security Money Market Fund (the "Fund"). The Fund aims to provide the highest possible level of current income while still maintaining liquidity and providing maximum safety of principal. The Fund is a money market fund managed to meet the requirements of Rule 2a-7 under the Investment Company Act of 1940. The Fund is not insured or guaranteed by the FDIC or any other government agency. In late 2008, the Fund was closed to additional investments. Subsequent excess cash is being deposited into a savings account with JP Morgan Chase.

The Fund invests solely in debt securities of the U.S. Treasury, including Treasury bills, bonds and notes. These investments carry different interest rates, maturities and issue dates. The National Association of Insurance Commissioner ("NAIC"), Moody's, Fitch IBCA and S&P ratings signify that the Fund has historically had a superior capacity to maintain a net asset value of $1.00 per share. The ratings do not eliminate the risks associated with investing in the Fund. The NAIC "approved" status indicates that the Fund meets certain pricing and quality guidelines. Management has determined that the likelihood of sustaining losses from money market funds to be remote based on the marketability of the underlying investment of the funds.

At December 31, 2013 and 2012, the Company owned 2,210,944 and 2,210,894 units of $1 par value per unit, respectively. In 2013 and 2012, the funds earned average yields of less than 1%. Investment income earned on the Fund is reinvested into units of the Fund on a monthly basis.

4. Equipment and Leasehold Improvements

Equipment and leasehold improvements at December 31, 2013 and 2012 consists of the following:

	Depreciable Life	2013	2012
Furniture	10 years	$ 202,906	$ 201,518
Computer equipment	3 years	435,769	435,769
Website	3 years	232,000	232,000
Software	3 years	397,701	230,470
Leasehold improvements	15 years (See note 2)	974,691	974,691
		2,243,067	2,074,448
Less: Accumulated depreciation and amortization		(1,100,649)	(800,389)
		$ 1,142,418	$ 1,274,059

In 2013 and 2012, depreciation and amortization expense totaled $300,260 and $236,647, respectively.

5. Pension Plan

The Company has a trusteed, noncontributory defined benefit pension plan (the "Plan") covering employees hired prior to February 6, 2007. The Company's plan contributions were $700,000 and $600,000 for the years 2013 and 2012, respectively.

The following tables provide information with respect to the defined benefit plan as of and for the years ended December 31, 2013 and 2012:

	2013	2012
Components of net periodic benefit cost		
Service cost	$ 298,867	$ 276,757
Interest cost	477,051	461,524
Expected return on plan assets	(599,893)	(492,785)
Amortization of prior service cost	20,532	20,532
Recognized actuarial loss	310,000	272,690
Net periodic benefit cost	$ 506,557	$ 538,718
Change in benefit obligation		
Benefit obligation at beginning of year	$ 11,279,973	$ 8,957,466
Service cost	298,867	276,757
Interest cost	477,051	461,524
Actuarial (gain) loss	(1,660,662)	1,686,218
Benefits paid	(101,992)	(101,992)
Benefit obligation at end of year	10,293,237	11,279,973
Change in fair value of plan assets		
Fair value of plan assets at beginning of year	7,603,820	6,300,716
Actual return on plan assets	956,292	805,096
Company contribution	700,000	600,000
Benefits paid	(101,992)	(101,992)
Fair value of plan assets at end of year	9,158,120	7,603,820
Funded status at end of year	$ (1,135,117)	$ (3,676,153)
Amounts recognized in unrestricted net assets consist of		
Loss	$ (1,745,933)	$ (4,072,994)
Prior service cost	(160,151)	(180,683)
	$ (1,906,084)	$ (4,253,677)
Changes in unrestricted assets recognized in nonoperating expenses		
Net (gain) loss	$ (2,017,061)	$ 1,373,907
Amortization of prior service cost	(20,532)	(20,532)
Amortization of net gain (loss)	(310,000)	(272,690)
	$ (2,347,593)	$ 1,080,685
Amounts of unrestricted net assets expected to be recognized in net periodic benefit cost in 2014		
Amortization of loss	$ 200,000	

Weighted-average assumptions as of December 31 used for obligation		
Discount rate	5.00 %	4.25 %
Expected return on plan assets	7.50 %	7.50 %
Rate of compensation increase	3.00 %	3.00 %
Weighted-average assumptions as of December 31 used for net periodic benefit cost		
Discount rate	5.00 %	4.25 %
Expected return on plan assets	7.50 %	7.50 %
Rate of compensation increase	3.00 %	3.00 %

The accumulated benefit obligation at December 31, 2013 and 2012 was $9,371,706 and $8,487,636, respectively.

The Company determines its expected return on plan assets assumption by evaluating both historical returns of major asset classes and current market factors. Current market factors include inflation and interest rates, as well as asset diversification.

The Company's defined benefit plan weighted average asset allocation at December 31, 2013 and 2012 by asset category is as follows:

	Allocation Percentage	
	2013	**2012**
Equity securities	70.6%	71.1%
Debt securities	28.0%	28.2%
Cash	1.4%	0.7%
	100.0%	100.0%

The Company's defined benefit plan invests primarily in equity and debt securities that are based upon levels of risk and provide for necessary liquidity requirements. The long-term objective is to limit the variability of its pension funding. The Company's plan assets are measured against benchmarks established by the Pension Committee, which has the authority to recommend changes as deemed appropriate.

Investments in actively traded equity and debt securities are valued using market prices in active markets. Their valuations are obtained from real-time quotes for transactions in active exchange markets involving identical assets. There were no securities for which the fair value was based on other observable or unobservable inputs. At December 31, 2013, the plan assets consisted of $127,177 of cash and cash equivalents, $3,310,439 of domestic equities, $1,346,311 of international equities, $2,563,932 of corporate bonds, $1,126,052 of specific strategy funds, $263,378 of commodity funds and $420,831 of public real estate investment trust investments.

At December 31, 2013, the Company's target allocation percentages for plan assets were approximately 46% equity securities, 29% debt securities and 25% other securities. The targets may be adjusted periodically to reflect current market conditions and trends as well as inflation levels, interest rates and trends thereof.

Expected employer contribution for the year ended December 31, 2014 is $650,000.

Benefits expected to be paid in cash in subsequent years ending December 31 are as follows:

2014	$ 110,150
2015	386,154
2016	377,739
2017	369,074
2018	360,326
2019–2023	3,274,211

6. Savings and Supplemental Plans

The Company maintains a 401(k) plan for which all employees are immediately eligible upon hire. Within this plan, an employee can contribute 2% or greater of his or her compensation up to the IRS limit set for this plan. The Company's policy is to contribute on the employee's behalf 100% of the employee's contribution of the first 3% of his or her compensation, and 50% of his or her contribution for the next 2% of compensation. Additionally, for those employees joining the Company after February 6, 2007, and upon completion of a full calendar year of service, such employees become eligible for a discretionary contribution to be considered annually by the Board of Directors. The discretionary contribution for 2013 and 2012 was 8% of base compensation and totaled $189,215 for 2013 and $189,956 for 2012. Company contributions to the 401(k) plan were $185,546 and $174,392 for 2013 and 2012, respectively. During 2010, the Company adopted a supplemental plan for employees who were not eligible to receive the same percentage level of retirement benefits as other employees under the 401(k) plan due to IRS compensation limits. The Company contributed $26,500 and $23,000 to this supplemental plan for 2013 and 2012, respectively. During 2013, the Company adopted a 457(f) plan for the President and CEO to provide benefits not provided under the Pension Plan as a result of the IRS code limitations. The Company contributed $30,000 to this plan in 2013.

7. Leases

The Company is obligated under long-term operating leases for the rental of office facilities and certain equipment. NPCC executed office and equipment leases with effective rental dates starting in 2009 coordinated with its relocation of offices within New York City. NPCC's office lease provides for additional rent based on increases in real estate taxes and operating expenses over base amounts. The office lease expires on April 30, 2024 and includes an option to renew for five years. The office lease provides for security in the form of a collateralized letter of credit in the amount of $500,000 at lease inception and reduced to $300,000 at December 31, 2012, and reduced amounts in future years. NPCC executed various computer and equipment leases with expiration dates through March, 2016. In addition, the Company rents certain other equipment on a month-to-month basis. Rental expense for office facilities and equipment totaled $775,320 and $761,588 for 2013 and 2012, respectively.

Future minimum rental payments required under the Company's long-term operating leases as of December 31, 2013 are as follows:

	Office Space	Other Leases	Total
Year Ending December 31			
2014	$ 652,380	$ 129,064	$ 781,444
2015	672,392	88,637	761,029
2016	672,392	20,142	692,534
2017	672,392		672,392
2018	672,392		672,392
Thereafter	3,826,091		3,826,091
	$ 7,168,039	$ 237,843	$ 7,405,882

8. Functional Expenses

During 2013 and 2012 salaries and employee benefits consist of the following:

	2013	2012
President, COO and technical staff	$ 5,510,411	$ 5,128,701
Administrative support	175,493	169,254
Payroll taxes, insurance, pension and educational assistance	2,680,048	2,425,028
Total salaries and employee benefits	$ 8,365,952	$ 7,722,983

9. Other Expenses

The Company incurs various costs for administrative, consultant and professional services. Such costs amounted to $2,970,235 and $2,472,132 in 2013 and 2012, respectively, and consist of the following:

	2013	2012
Consultants	$ 1,734,733	$ 1,485,916
Accounting, legal and other services	1,197,113	964,903
Pension administration	38,389	21,313
Total administrative, consultant and professional fees	$ 2,970,235	$ 2,472,132

These costs are reflected in "Administrative and consultant fees" and "Professional fees" in the Statements of Activities.

10. Related Party Transactions

The NERC, through agreements with the FERC in the U.S. and Canadian Provincial regulatory and/or governmental agreements within Canada, delegates enforcement authority to eight Regional Entities. NPCC is the cross-border Regional Entity for Northeastern North America. NERC was certified as the "Electric Reliability Organization" by the FERC on July 20, 2006. As of June 18, 2007, the U.S. FERC granted NERC the legal authority to enforce reliability standards with all U.S. users, owners, and operators of the bulk power system, and made compliance with those standards mandatory and enforceable. NERC relies on the diverse and collective expertise of industry participants to improve the reliability of the bulk power system. These entities account for virtually all the electricity supplied in the United States, Canada, and a portion of Baja California Norte, Mexico. NERC is subject to audit by the U.S. FERC and governmental and/or regulatory authorities in Canada. NERC funded the Regional Entities based upon Business Plans and Budgets submitted to and approved by FERC in the U.S. and Canadian Provincial regulatory and/or governmental authorities.

NPCC's criteria services division was fully funded by regional independent system operator or balancing authorities acting as the Load Serving Entities' designees and operated on assessments to and funded from these six entities. Dues were based upon a "Net Energy for Load" funding formula. During 2013 and 2012, total assessments billed amounted to $1,139,688 and $956,900, respectively.

	2013		2012	
Description	**Percent**	**Total Share**	**Percent**	**Total Share**
Hydro-Quebec TransEnergie	28.56 %	$ 325,481	28.27 %	$ 270,543
Independent Electricity System Operator	21.94 %	250,013	22.11 %	211,520
ISO-New England, Inc.	20.65 %	235,313	20.52 %	196,362
New Brunswick System Operator	2.12 %	24,185	2.12 %	20,242
New York Independent System Operator	24.91 %	283,927	25.08 %	240,034
Nova Scotia Power Inc.	1.82 %	20,769	1.90 %	18,199
Total assessments	100.00 %	$ 1,139,688	100.00 %	$ 956,900

11. Line of Credit

On March 18, 2013, pursuant to an agreement with a lender, the Company obtained a line of credit in the amount of $1,000,000. There were no borrowings against the line of credit as of December 31, 2013.

12. Subsequent Events

Management has evaluated, for potential recognition and disclosure, events subsequent to the date of the Statement of Financial Position through March 27, 2014, the date the financial statements were available to be issued.

AND

2013 AUDITED FINANCIAL REPORT

FOR

RELIABILITYFIRST CORPORATION

RELIABILITY FIRST
3 Summit Park Drive, Suite 600
Cleveland, OH 44131

May 5, 2014

Mr. Michael Walker
North American Electric Reliability Corporation
3353 Peachtree Road, N.E.
Suite 600, North Tower
Atlanta, Georgia 30326

Subject: **ReliabilityFirst's 2013 True-up Filing**

Mr. Michael Walker:

As requested, ReliabilityFirst Corporation (ReliabilityFirst) is providing NERC the end of year audited 2013 True-up Filing. Significant variances are explained below, while more detailed variances are provided in the attached Statement of Activities, Fixed Assets and Change in Working Capital document presented by program area.

The explanations of variances are provided based on the following criteria:

1. Variances equal to or greater than +/- 10% of budget, and
2. Variances greater than $10,000, or
3. Variances that are considered significant.

Summary

For the year ending December 31, 2013, Reliability*F*irst was $119K (.68%) over budget. This year end variance included $551K of Leasehold Improvement capital expenditures that related to the 2014 office and data center relocation, which were not included in the 2013 budget. If these capital expenditures were not recorded in 2013, the year-end variance would have been $432K (2.48%) under budget. In addition to completing all statutory objectives, ReliabilityFirst completed these major accomplishments:

- Developed the audit section of the MKInsight Audit Management Software to organize, manage, and improve efficiency of our monitoring processes.
- ReliabilityFirst Staff presented entity training on our Risk-Harm determination tool during the Spring Reliability Workshop. The series included detail on how risk and harm is quantified, the concepts of estimating the likelihood and magnitude of harm occurring, and how to mitigate the risk to reduce the likelihood of the harm occurring.
- Delivered one full day of training to more than 200 representatives from Registered Entities on Reliability Assurance Initiative (RAI) which included the identification of key critical process areas that contribute to reliability and how a systems thinking approach can lead to building a robust set of management practices that can reduce the risk to reliability.
- Supported RAI by conducting a pilot appraisal of key management practice areas with a registered entity.
- To improve ReliabilityFirst's resource assessments, reviewed demand forecast method(s) and data, the weather normalization calculations, and the NERC demand bandwidth analysis used in our footprint. After reviewing this information, researched a method of including load forecast uncertainty (i.e., bandwidth) in future resource assessments.

- Reviewed the September 8, 2011 *Arizona-Southern California Outage* report findings and recommendations and performed a gap analysis to determine what could be missing in existing standards, guidelines, processes, or audit procedures and assessment studies. A report was produced that included suggestions for improvement.
- Examined existing methods to determine reliability of systems and proposed a definition and a method to measure grid reliability for the bulk power system. Existing methods and data considered included misoperations analysis, TADs, GADs, CIP Influence, outages/100 miles/year, etc. A sample report was produced on an entity basis to show the effect of that entity's performance on the overall ReliabilityFirst footprint.
- Quantitatively assessed the effectiveness of two Reliability Standards in achieving the desired reliability outcome including whether, if appropriate to the standard, less than zero-tolerance compliance would achieve essentially the same reliability result as full compliance. The two Standards assessed were PRC-005 and VAR-002. Reports were produced that discussed the benefits and any detriments of the standards and any recommendations for any changes to the standard or other proposals for improvement.
- Provided guidance and education to registered entities to meet compliance obligations through a better understanding of the NERC Reliability Standards by conducting 12 assist visits. Entity issues ranging from compliance concerns associated with their reading of the FERC approved standards, to preparing for new standards, and providing additional guidance and education.
- ReliabilityFirst conducted several successful outreach efforts, including two workshops that were attended by 200 plus registered entities and a Monthly Open Compliance Call that was attended by, on average, 75 registered entities.

Funding

- **Investment Income:** $127K (211%) under budget
  The variance in Investment Income is due to the unrealized change in value of the company's investment portfolio offset by the dividends that were received.

Expenses

- **Personnel Expenses**
  - **Salaries, Payroll Taxes, Employee Benefits and Savings & Retirement Costs:** $651K (5%) under budget
    These personnel expenses were under budget due to the difficulties in hiring qualified personnel.
- **Operating Expenses**
  - **Rent & Utilities:** $98K (21%) over budget
    Rent was over budget due to the early termination penalty for the prior office lease, offset by the board decision not to pursue an offsite disaster recovery site in 2013.
  - **Office Costs:** $213K (31%) over budget
    Office Costs were over budget as a result of variances in Telephone and Internet. Telephone expenses were over budget due to the large capacity phone line that was procured in preparation to support an in house conferencing system. Internet expenses were over budget due to the continued use of the contracted high bandwidth data line.

Fixed Assets

- **Computer Hardware & Software:** $37K (47%) under budget
  Computer Hardware & Software was under budget due to planned hardware purchases being delayed or reassessed in consideration of the planned 2014 office move.
- **Furniture & Fixtures:** $8K over budget
  The variance in Furniture & Fixtures was a result of the purchases of office furniture to accommodate new hires and appliances for the new office.

- **Leasehold Improvements:** $551K over budget
  The variance in Leasehold Improvements was a result of the planned 2014 office and data center relocation. All of these expenditures have been reimbursed from our Tenant Improvement Allowance in 2014.

Cash Reserves

ReliabilityFirst's Operating Reserve of $1,000,000 was never utilized.

Statutory Programs

ReliabilityFirst performed only statutory activities in 2013.

Cost Allocation

ReliabilityFirst records all direct costs to the appropriate program areas. Costs related to the Administrative Services programs are allocated proportionately based on FTE count to the direct programs.

- Direct Programs include:
  - Standards
  - Compliance
  - Reliability Assessment
  - Training & Education
  - Situation Awareness
- Administrative Services Programs include:
  - General & Administrative
  - Legal & Regulatory Affairs
  - Information Technology
  - Human Resources
  - Finance & Accounting

Personnel Expenses					
Salaries	$ 592,533	$ 618,029	$ (25,496)	-4%	
Payroll Taxes	41,223	41,356	(133)	0%	
Employee Benefits	101,658	85,791	15,867	18%	Employee Benefits were over budget as a result of a variance in Individual Training. Individual Training was over budget due to vulnerability remediation training that was not budgeted for.
Savings & Retirement	87,574	97,312	(9,738)	-10%	
Total Personnel Expenses	$ 822,988	$ 842,488	$ (19,500)	-2%	
Meeting Expenses					
Meetings	$ 1,223	$ 600	$ 623	104%	
Travel	11,866	11,000	866	8%	
Conference Calls	38,097	43,092	(4,995)	-12%	
Total Meeting Expenses	$ 51,186	$ 54,692	$ (3,506)	-6%	
Operating Expenses					
Consultants & Contracts	$ 9,031	$ 36,000	$ (26,969)	-75%	Consultants & Contracts were under budget due to the postponement of several projects
Office Rent	-	60,000	(60,000)	-100%	Rent was under budget as a result of the delay in securing an offsite disaster recovery site.
Office Costs	468,239	253,085	215,154	85%	Office Costs were over budget as a result of variances in Telephone and Internet. Telephone expenses were over budget due to the large capacity phone line that was procured in preparation to support an in house conferencing system. Internet expenses were over budget due to the continued use of the contracted high bandwidth data line.
Professional Services	-	-	-		
Miscellaneous	1,639	-	1,639		
(Gain)/Loss on Disposal of Assets	(255)	-	(255)		The variance in Proceeds/Loss on Disposal of Assets was due to the gain on disposal of computer equipment that was returned.
Depreciation	153,419	177,658	(24,239)	-14%	Depreciation expense directly correlates to current and prior year fixed asset activities. As a result of the current year fixed asset purchases being under budget, there was less depreciation expense recorded this year.
Total Operating Expenses	$ 632,073	$ 526,743	$ 105,330	20%

Independent Auditor's Report

To the Board of Directors
Reliability*First* Corporation
Akron, Ohio

Report on the Financial Statements

We have audited the accompanying financial statements of Reliability*First* Corporation which comprise the statements of financial position as of December 31, 2013 and 2012, and the related statements of activities and cash flows for the years then ended and the related notes to the financial statements.

Management's Responsibility for the Financial Statements

Management is responsible for the preparation and fair presentation of these financial statements in accordance with accounting principles generally accepted in the United States of America; this includes the design, implementation, and maintenance of internal control relevant to the preparation and fair presentation of financial statements that are free from material misstatement, whether due to fraud or error.

Auditor's Responsibility

Our responsibility is to express an opinion on these financial statements based on our audits. We conducted our audits in accordance with auditing standards generally accepted in the United States of America. Those standards require that we plan and perform the audits to obtain reasonable assurance about whether the financial statements are free of material misstatement.

An audit involves performing procedures to obtain audit evidence about the amounts and disclosures in the financial statements. The procedures selected depend on the auditor's judgment, including the assessment of the risks of material misstatement of the financial statements, whether due to fraud or error. In making those risk assessments, the auditor considers internal control relevant to the entity's preparation and fair presentation of the financial statements in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the entity's internal control. Accordingly, we express no such opinion. An audit also includes evaluating the appropriateness of accounting policies used and the reasonableness of significant accounting estimates made by management, as well as evaluating the overall presentation of the financial statements.

We believe that the audit evidence we have obtained is sufficient and appropriate to provide a reasonable basis for our audit opinion.

Opinion

In our opinion, the financial statements referred to above present fairly, in all material respects, the financial position of Reliability*First* Corporation as of December 31, 2013 and 2012, and the changes in its net assets and its cash flows for the years then ended in accordance with accounting principles generally accepted in the United States of America.

Member of the RSM International network of independent accounting, tax and consulting firms.

Other Matter

Our audits were conducted for the purpose of forming an opinion on the financial statements as a whole. The accompanying supplementary information is presented for purposes of additional analysis and is not a required part of the financial statements. Such information is the responsibility of management and was derived from and relates directly to the underlying accounting and other records used to prepare the financial statements. The information has been subjected to the auditing procedures applied in the audits of the financial statements and certain additional procedures, including comparing and reconciling such information directly to the underlying accounting and other records used to prepare the financial statements or to the financial statements themselves, and other additional procedures in accordance with auditing standards generally accepted in the United States of America. In our opinion, the information is fairly stated in all material respects in relation to the financial statements as a whole.

See Notes to Financial Statements.

Note 1. Organization and Significant Accounting Policies

Organization: ReliabilityFirst Corporation (the Corporation) is a not-for-profit corporation whose mission is to preserve and enhance electric service reliability and security for the interconnected electric systems within its territory. The Corporation was approved by the North American Electric Reliability Corporation (NERC) to become one of eight Regional Entities of NERC. The Corporation conducts its activities from leased offices in Akron, Ohio.

The Corporation receives its quarterly assessments from NERC. A significant reduction in the level of this support, if this were to occur, may have a significant effect on the Corporation's operations.

The following is a summary of the Corporation's significant accounting policies which conform to accounting principles generally accepted in the United States of America (U.S. GAAP).

Use of estimates: The preparation of financial statements in conformity with U.S. GAAP requires management to make estimates and assumptions that affect the reported amounts of assets and liabilities and disclosure of contingent assets and liabilities at the date of the financial statements and the reported amounts of revenue and expenses during the reporting period. Actual results could differ from those estimates.

Revenue recognition: The Corporation currently derives its revenues primarily from quarterly assessments. Revenues from such assessments are recognized as unrestricted revenues at the time services are performed and the cost of these services is recognized when incurred. Penalty sanctions are recognized after the entire appeals process has been exhausted and a Federal Electric Regulatory Commission (FERC) order has been issued and are non-appealable. Penalty sanctions received on or prior to June 30 of each year shall be applied as a general offset to budget requirements for the subsequent fiscal year. Penalty sanctions received after June 30 of each year shall be applied as a general offset to budget requirements for the next subsequent fiscal year.

Cash: The Corporation maintains its cash in non-interest-bearing bank deposit accounts. Management believes it is not exposed to any significant credit risk on cash.

Receivables: Accounts receivable are carried at actual billed amounts relating to penalty sanctions and subcontractor receivables. There was no allowance for doubtful accounts recorded in 2013 or 2012. During 2013, the Corporation recorded a receivable of $855,301 from its new landlord relating to lease incentives provided to reimburse leasehold improvements and a termination penalty on an existing lease, which related to 2013.

Investments: Investments are carried at fair value. The fair values of marketable debt securities are based on quoted market prices. Realized investment gains and losses represent the difference between the proceeds on sales of investments and their carrying value. Investment income includes interest, dividends and both realized and unrealized gains and losses. All realized and unrealized gains and losses on investments are reported as increases or decreases, respectively, to unrestricted net assets.

The Corporation invests in fixed income mutual funds. Such investments are exposed to various risks such as interest rate, market and credit. Due to the level of risk associated with such investments and the level of uncertainty related to changes in the value of such investments, it is at least reasonably possible that changes in risks in the near term would materially affect investment balances and the amounts reported in the financial statements.

Prepaid expenses: Prepaid expenses consist of expenses paid for in advance that will be recognized within a future operating cycle.

Note 1. Organization and Significant Accounting Policies (Continued)

Fixed assets: Fixed assets are stated at cost. Depreciation is computed on the straight-line method over the estimated useful lives (generally 3 to 7 years) of the depreciable assets. Amortization for the leasehold improvements is computed on the lesser of the useful life or the lease term.

Income taxes: The Corporation is exempt from federal income taxes under Section 501(c)(6) of the Internal Revenue Code and applicable state law, except for taxes pertaining to unrelated business income, if any.

In accordance with the accounting standard on accounting for uncertainty in income taxes, the Corporation addresses the determination of whether tax benefits claimed or expected to be claimed on a tax return should be recorded in the financial statements. Under this guidance, the Corporation may recognize the tax benefit from an uncertain tax position only if it is more likely than not that the tax position will be sustained on examination by taxing authorities, based on the technical merits of the position. Examples of tax positions include the tax-exempt status of the Corporation and various positions related to the potential sources of unrelated business taxable income (UBIT). The tax benefits recognized in the financial statements from such a position are measured based on the largest benefit that has a greater than 50 percent likelihood of being realized upon ultimate settlement. There were no unrecognized tax benefits identified or recorded as liabilities during the periods covered by these financial statements.

The Corporation files forms 990 in the U.S. federal jurisdiction and the State of Ohio. The Corporation is generally no longer subject to examination by the Internal Revenue Service for years before 2010.

Net assets: Of the unrestricted net asset balance, $1,000,000 has been designated by the Board of Directors for its operating reserve fund at December 31, 2013 and 2012.

Temporarily restricted net assets result from the receipt of penalty sanctions which are restricted based on timing conditions as described in the Corporation's revenue recognition policy. Penalty monies are governed by a restriction by NERC as to when the funds can be used. Temporary restricted net assets at December 31, 2013 and 2012, were $1,843,133 and $3,962,933, respectively.

Subsequent events: The Corporation has evaluated subsequent events for potential recognition and/or disclosure through the date these financial statements were available to be issued.

Note 2. Investments

The Corporation maintains an investment portfolio which consists of fixed income securities. The fair values of the investments at December 31, 2013 and 2012, were $3,604,721 and $5,171,574, respectively. The composition of investment income (loss) is as follows at December 31:

	2013	2012
Interest/dividends	$ 81,345	$ 102,937
Realized loss	(6,309)	(11,061)
Unrealized loss	(141,889)	(39,996)
	$ (66,853)	$ 51,880

Note 3. Fair Value

As described in Note 1, the Corporation records its investments at fair value. Fair value is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. The Financial Accounting Standards Board's (FASB) authoritative guidance on fair value measurements establishes a framework for measuring fair value, and expands disclosure about fair value measurements. This guidance enables the reader of the financial statements to assess the inputs used to develop those measurements by establishing a hierarchy for ranking the quality and reliability of the information used to determine fair values. Under this guidance, assets and liabilities carried at fair value must be classified and disclosed in one of the following three categories:

- Level 1: Valuations for assets and liabilities traded in active exchange markets, such as the New York Stock Exchange. Level 1 also includes U.S. Treasury and federal agency securities and federal agency mortgage-backed securities, which are traded by dealers or brokers in active markets. Valuations are obtained from readily available pricing sources for market transactions involving identical assets or liabilities.
- Level 2: Valuations for assets and liabilities traded in less active dealer or broker markets. Valuations are obtained from third-party pricing services for identical or similar assets or liabilities.
- Level 3: Valuations for assets and liabilities that are derived from other valuation methodologies, including option pricing models, discounted cash flow models and similar techniques, and not based on market exchange, dealer, or broker-traded transactions. Level 3 valuations incorporate certain assumptions and projections in determining the fair value assigned to such assets or liabilities.

In determining the appropriate levels, the Corporation performs a detailed analysis of the assets and liabilities that are measured and reported on a fair value basis. At each reporting period, all assets and liabilities for which the fair value measurement is based on significant unobservable inputs would be classified as Level 3.

The Corporation assesses the levels at each measurement date, and transfers between levels are recognized on the date of the actual event or change in the circumstances that caused the transfer in accordance with the Corporation's accounting policy regarding the recognition of the transfer between levels of the fair value hierarchy. For the years ended December 31, 2013 and 2012, there were no such transfers.

As of December 31, 2013 and 2012, the Corporation's investments are fixed income class A mutual funds, which are classified as Level 1.

Note 4. Line of Credit

The Corporation has a $1,000,000 line of credit due on September 24, 2014. The line is collateralized by substantially all assets of the Corporation and interest is charged at LIBOR plus 2.75 percent. The Corporation did not make any drawdowns on the line during the year and had no outstanding balance as of December 31, 2013 or 2012. The Corporation intends to renew the line when it becomes due on September 24, 2014.

Note 5. Operating Leases

The Corporation leases its office and additional storage space from unrelated third parties. On July 16, 2013, the Corporation provided written notice exercising its early termination right for its existing lease with Bath Springside, Ltd. As a result, the Corporation's lease with Bath Springside, Ltd. will terminate on December 31, 2014 and the Corporation will incur a lease termination penalty of $200,000, which will be reimbursed by its new landlord, Investors Warranty of America, Inc. The penalty was recorded in accounts payable at December 31, 2013.

On June 14, 2013, the Corporation signed a 13 year lease with Investors Warranty of America, Inc. (Landlord), with an estimated commencement date of March 1, 2014. According to the lease, the Landlord will provide the Corporation with a $1,854,956 tenant improvement allowance for leasehold improvements and other soft costs. In 2013, the Corporation capitalized $550,734 in leasehold improvements and $104,567 in soft costs.

The above reimbursement of the lease termination penalty and the leasehold improvements were recorded in lease incentives receivable and deferred rent at December 31, 2013. This liability will be amortized over the life of the lease against rent expense, starting on the commencement date of the new lease.

Rental expense for operating leases amounted to $508,704 and $346,873 for the years ended December 31, 2013 and 2012, respectively. The 2013 rent expense includes $32,114 in accelerated straight-line amortization of the previous deferred rent liability due to the early termination of the lease. The remaining deferred rent liability of $72,537 will be recognized against the 2014 straight-line rent expense of $346,873.

The future minimum lease payments relating to the new lease on a straight-line basis are as follows:

2014	$ 496,336
2015	595,603
2016	595,603
2017	595,603
2018	595,603
Thereafter	4,864,089
	$ 7,742,837

Note 6. Employee Retirement Plan

The Corporation has a salary deferral plan under Section 401(k) of the Internal Revenue Code. All employees are eligible for 100 percent match of their first 6 percent of voluntary salary deferral savings and the 3 percent Safe Harbor provision of the plan. Employees who have at least 1,000 hours during the year are eligible for a certain percentage discretionary provision of the plan (7 percent in 2013 and 2012). Therefore, under this plan, the Corporation provided for a potential maximum contribution of up to 16 percent of employees' eligible compensation in 2013 and 2012. The Corporation's contributions to the plan for 2013 and 2012 were approximately $1,469,000 and $1,213,000, respectively.

Chief Financial Officer
North American Electric Reliability Corporation

SERC 2013 Budget vs. Actual Variance Analysis

Enclosed is SERC's response to your request for information on variances between the 2013 SERC budget and year-end financials.

Overall, SERC over ran 2013 budgeted revenues by $93,264 and under spent its 2013 budgeted expenses of $16,094,659 by $551,358. The net impact was a $644,622 positive variance on SERC's cash position for the year.

During 2013, SERC conducted 55 audits and spot checks including 16 on-site and 9 off-site operations and planning audits, 4 operations and planning audits of multi-regional Registered Entities, and 9 on-site and 21 off-site CIP audits. SERC adjusted the planned audits and spot checks pursuant to supplemental guidance provided by NERC and FERC. SERC identified 363 new potential violations and closed 323 enforcement actions addressing possible violations identified during the period from 2008 through 2012. In addition, SERC completed all budgeted reliability assessments for the year.

There are several mitigating circumstances, as explained below:

- During 2013, total personnel costs were lower than budget due to several factors. SERC was not fully staffed during 2013 by 7.56 FTEs. Additionally, when preparing the budget, SERC budgeted retirement costs based on historical data. The actual employee contribution for 2013 was lower than budgeted, causing the corresponding company match to be lower than budgeted.
- Due to the strains on the economy, SERC has emphasized the use of conference calls and Webex capabilities to reduce the number of face to face meetings, which reduced travel and meeting costs. Additionally, SERC continues to work with the same hotels, which provides cost savings on larger meetings, and SERC is now hosting more meetings in the Charlotte office at a significantly reduced cost.
- SERC used contractors to support audit and enforcement activities; engaged a management consulting firm to support SERC's corporate initiative for management training; and a project manager and architecture firm to assist with the design, construction, and coordination of the relocation of SERC's offices in 2014, causing an unplanned overrun in Consultants and Contractors.

- In a coordinated effort with the other regional entities on the preparation of the Five Year Assessment, SERC managed the contract with the consultant, subject to reimbursement from the other regional entities. The offsetting revenue is recorded in Miscellaneous income.
- SERC purchased office furniture and equipment to furnish the new office space, causing the over run in Office Costs.

SERC has no non-statutory activity, and therefore no statutory funding was used for non-statutory activities.

All personnel costs for the other administrative functions, including Information Technology, Legal, Finance, and Human Resources, are recorded within General and Administrative to protect the confidentiality of individual compensation information of employees in these programs.

SERC allocates indirect or administrative expenses and capital expenditures to the statutory programs based upon the ratio of FTEs in those program areas to total statutory program FTEs. The variances associated with this allocation are the result of the differences in the actual versus budgeted ratio of FTEs and the actual versus budgeted spend in the administrative cost centers.

SERC performs the Compliance Enforcement Activities for FRCC and SPP. The regional entity reimburses SERC for the actual costs incurred, including an overhead calculation. These costs have been recorded separately on the Compliance Enforcement Activity Statement of Activities.

Detailed descriptions of budget to actual variances are provided in the attached file. If you have any questions, please feel free to call or email me.

Yours truly,

Jennifer Kelly

Services & Software	-	-	-		
Workshop Fees	173,997	246,000	(72,003)	-29.27%	In 2013, SERC began holding most meetings in house, resulting in a savings in costs, and therefore an offsetting decrease in revenue allowing SERC to charge a reduced attendance fee, from when the budget was developed
Interest	-	-	-		
Miscellaneous	87	-	87		
Total Funding (A)	877,621	949,537	(71,916)	-7.57%	
Expenses					
Personnel Expenses					
Salaries	300,729	334,005	(33,276)	-9.96%	SERC budgeted 7.20 FTE's in the Standards program during 2013. SERC finished 2013 with 6.69 FTEs, a difference of 0.51 FTEs, causing SERC to be under budget.
Payroll Taxes	20,837	20,040	797	3.98%	
Employee Benefits	27,231	26,612	619	2.33%	
Savings & Retirement	35,589	41,864	(6,275)	-14.99%	SERC budgeted based on historical employee contributions. The actual employee contribution for 2013 was lower than budgeted, causing the corresponding company match to be lower than budgeted.
Total Personnel Expenses	384,386	422,521	(38,135)	-9.03%	
Meeting Expenses					
Meetings	142,043	192,975	(50,932)	-26.39%	SERC continues to work with the same hotels, which provides cost savings on larger meetings. Additionally, as noted in the workshop fee revenue, SERC is now hosting more meetings in the Charlotte office at a significantly reduced cost. Finally, a greater emphasis on the use of technology by hosting WebEx meetings has lowered meeting costs.
Travel	13,986	22,781	(8,795)	-38.61%	SERC continues to emphasize the use of technology by hosting meetings using WebEx. Additionally, SERC is now hosting more meetings in the Charlotte office, which does not require staff to travel. By doing this, travel costs have decreased.

Miscellaneous	61,329	-	61,329		SERC is working in a coordinated effort with the other regional entities on the preparation of the Regional Five Year Assessment. SERC is managing the contract with the consultant, subject to reimbursement from the other regional entities. This reimbursement is included in Miscellaneous Income, as an offset to the expense recorded in Contracts and Consultants.
Total Funding (A)	(1,644,396)	(1,705,725)	61,329	-3.60%	
Expenses					
Personnel Expenses					
Salaries	2,347,800	2,131,386	216,414	10.15%	While SERC is under budget by .56 FTEs in General & Administrative, the positions within G&A were filled at a higher than budgeted salary, causing an over run.
Payroll Taxes	138,803	127,883	10,920	8.54%	
Employee Benefits	189,130	164,124	25,006	15.24%	There was higher usage of SERC's medical benefits in 2013, causing an over run.
Savings & Retirement	262,591	298,875	(36,284)	-12.14%	SERC budgeted based on historical employee contributions. The actual employee contribution for 2013 was lower than budgeted, causing the corresponding company match to be lower than budgeted.
Total Personnel Expenses	2,938,324	2,722,268	216,056	7.94%	
Meeting Expenses					
Meetings	64,500	23,290	41,210	176.94%	The over run in meetings expenses is due to actual meeting spaces charged more than anticipated in the budget, as well as additional in-house meetings.
Travel	65,429	61,487	3,942	6.41%	
Conference Calls	49,760	60,000	(10,240)	-17.07%	SERC renegotiated lower rates for the telecommunications component of SERC's web based conferencing platform, causing the under run.
Total Meeting Expenses	179,689	144,777	34,912	24.11%	
Operating Expenses					
Consultants & Contracts	211,984	-	211,984		SERC engaged a management consulting firm to support SERC's corporate initiative for management training; a project manager and architecture firm to assist with the design, construction, and coordination of the relocation of SERC's offices in 2014. Both were unbudgeted, but deemed necessary. Additionally, in a coordinated effort with the other regional entities on the preparation of the Five Year Assessment, SERC managed the contract with the consultant, subject to reimbursement from the other regional entities. This was an unbudgeted project, causing an overrun. The offsetting revenue is recorded in Miscellaneous income, as noted above.
Rent & Improvements	403,731	405,407	(1,676)	-0.41%	
Office Costs	481,725	189,061	292,664	154.80%	The over run in office costs includes one time costs for the purchase of office furniture and equipment to furnish the new office space. Individually, all items were below SERC's capitalization policy and were therefore expensed.
Professional Services	37,366	20,000	17,366	86.83%	The variance is comprised of various unbudgeted items, including a property tax bill, and an increase in our general liability insurances.
Miscellaneous	1,038	-	1,038		
Depreciation	137,147	300,389	(163,242)	-54.34%	Due to the actual cost of the assets and the timing of when the assets were placed into service, depreciation expense and capital expenditures were lower than the budget, causing the under run.
Total Operating Expenses	1,272,991	914,857	358,134	39.15%	
Indirect Expenses	(4,391,004)	(3,781,902)	(609,102)	16.11%	Expenses related to indirect programs have been allocated proportionately to the direct programs for 2013 based on the number of FTEs in those programs
Other Non-Operating Expenses	-	-	-		
Total Expenses (B)	-	-	-

Consultants & Contracts	424,779	632,780	(208,001)	-32.87%	Participation in the OATI schedule checkout tool was lower than planned in 2013, resulting in an under run from the budgeted cost. However, a change was made to the tool to accommodate the users' need for intra-hour scheduling. The net effect caused an overrun . Additionally, actual costs for hosting and maintaining SERC's servers are lower than budgeted. Finally, SERC did not incur significant costs related to various IT projects, causing an under run.
Rent & Improvements	-	-	-		
Office Costs	107,609	144,916	(37,307)	-25.74%	The budget included funds the purchase of computers and equipment for existing staff replacements and for the budgeted new positions. The majority of these items were purchased in 2012, causing an under run in 2013. Additionally, SERC negotiated better rates on the telephone and internet service, causing an under run.

Report on the Financial Statements

We have audited the accompanying financial statements of SERC Reliability Corporation (the "Corporation"), which comprise the statements of financial position as of December 31, 2013 and 2012, and the related statements of activities and cash flows for the years then ended, and the related notes to the financial statements.

Management's Responsibility for the Financial Statements

Management is responsible for the preparation and fair presentation of these financial statements in accordance with accounting principles generally accepted in the United States of America; this includes the design, implementation, and maintenance of internal control relevant to the preparation and fair presentation of financial statements that are free from material misstatement, whether due to fraud or error.

Auditor's Responsibility

Our responsibility is to express an opinion on these financial statements based on our audits. We conducted our audits in accordance with auditing standards generally accepted in the United States of America. Those standards require that we plan and perform the audits to obtain reasonable assurance about whether the financial statements are free from material misstatement.

An audit involves performing procedures to obtain audit evidence about the amounts and disclosures in the financial statements. The procedures selected depend on the auditor's judgment, including the assessment of the risks of material misstatement of the financial statements, whether due to fraud or error. In making those risk assessments, the auditor considers internal control relevant to the entity's preparation and fair presentation of the financial statements in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the entity's internal control. Accordingly, we express no such opinion. An audit also includes evaluating the appropriateness of accounting policies used and the reasonableness of significant accounting estimates made by management, as well as evaluating the overall presentation of the financial statements.

We believe the audit evidence we have obtained is sufficient and appropriate to provide a basis for our audit opinion.

Opinion

In our opinion, the financial statements referred to above present fairly, in all material respects, the financial position of SERC Reliability Corporation as of December 31, 2013 and 2012, and the changes in net assets and its cash flows for the years then ended in conformity with accounting principles generally accepted in the United States of America.

Supplemental Schedules

Our audits were conducted for the purpose of forming an opinion on the financial statements as a whole. The supplemental schedules on pages 10 through 13 are presented for purposes of additional analysis and are not a required part of the financial statements. Such information is the responsibility of management and was derived from and relates directly to the underlying accounting and other records used to prepare the financial statements. The information has been subjected to the auditing procedures applied in the audits of the financial statements and certain additional procedures, including comparing and reconciling such information directly to the underlying accounting and other records used to prepare the financial statements or to the financial statements themselves, and other additional procedures in accordance with auditing standards generally accepted in the United States of America. In our opinion, the information is fairly stated in all material respects in relation to the financial statements as a whole.

Beginning of year	7,192,908	3,847,805
End of year	$ 7,685,935	$ 7,192,908

The accompanying notes to the financial statements are an integral part of these statements.

Note 1—Organization and nature of operations

SERC Reliability Corporation (the "Corporation") is a non-profit corporation which qualifies as a Regional Reliability Organization under the Energy Policy Act of 2005. The Corporation's mission is to promote the reliability of the electricity supply for the southeastern United States. The activities of the Corporation are directed by its Board of Directors. The Corporation's members are electricity suppliers, brokers and consumers from various ownership segments of the electricity supply industry, investor-owned utilities rural electric cooperatives, municipal utilities, independent power producers, power marketers and customers. These entities account for virtually all the electricity supplied in the southeastern United States.

Note 2—Summary of significant accounting policies

Accounting Principles - The financial statements of the Corporation have been prepared on the accrual basis of accounting in accordance with accounting principles generally accepted in the United States of America ("GAAP"). The Corporation is required to report information regarding its financial position and activities according to three classes of net assets - unrestricted net assets, temporarily restricted net assets and permanently restricted net assets. The Corporation had only unrestricted net assets as of December 31, 2013 and 2012, including unrestricted net assets that have been designated by the Board of Directors as an operating reserve.

Management Estimates - The preparation of financial statements in conformity with GAAP requires management to make estimates, including estimates relating to assumptions that affect the reported amounts of assets and liabilities and disclosure of contingent assets and liabilities at the date of financial statements and the reported amounts of revenues and expenses during the reporting period. Actual results could differ from these estimates.

Cash and Cash Equivalents - The Corporation considers all cash investments with an original maturity of three months or less to be cash equivalents.

Accounts Receivable - Accounts receivable arise primarily from amounts billed to members. Management's determination of the need for an allowance for doubtful accounts is based on evaluation of the accounts receivable, past experience, current economic conditions and other risks inherent in the accounts receivable portfolio. Any amounts considered to be uncollectible are written off at the time of such determination. At December 31, 2013 and 2012, management has determined that an allowance for doubtful accounts is not necessary.

Property and Equipment - Property and equipment are stated at cost. Depreciation is computed using the straight-line method over the estimated economic useful lives of the assets ranging from 5-7 years for leasehold improvements and 3 years for computer equipment and software. The costs of major improvements are capitalized, while the costs of maintenance and repairs, which do not improve or extend the lives of the respective assets, are expensed currently. The cost and accumulated depreciation of property and equipment are eliminated from the accounts upon disposal, and any resulting gain or loss is included in the change in net assets of the Corporation. Long-lived assets held and used by the Corporation are reviewed for impairment whenever changes in circumstances indicate the carrying value of an asset may not be recoverable.

Deferred Revenue - Deferred revenue represents amounts billed or collected from members in advance of the periods in which such amounts are earned.

Note 2—Summary of significant accounting policies (continued)

Revenue Recognition - All income is recognized in the period when earned. The Corporation receives a significant portion of its funding directly from the North American Electric Reliability Corporation ("NERC") based on the budget submitted by the Corporation and approved by NERC and the Federal Energy Regulatory Commission ("FERC"). The revenue is received in four equal quarterly installments received at the beginning of each quarter. Based on past history with NERC, the Corporation believes that its revenue risk exposure is limited.

Income Taxes - The Corporation is exempt from federal and state income taxes under Section 501(c)(6) of the Internal Revenue Code ("IRC") and the applicable state statutes. Management believes that the Corporation continues to satisfy the requirements of a tax exempt organization and is not subject to tax. Accordingly, no provision for income taxes has been recorded in the accompanying financial statements.

Management has evaluated the effect of the Financial Accounting Standards Board ("FASB") guidance on accounting for uncertainty in income taxes. The guidance clarifies the accounting for uncertainty in income taxes recognized in an entity's financial statements by prescribing a recognition threshold and measurement attribute for the financial statement recognition and measurement of a tax position taken or expected to be taken in a tax return. The Corporation's policy is to record a liability for any tax position taken that is beneficial to the Corporation, including any related interest and penalties, when it is more likely than not the position taken by management with respect to a transaction or class of transactions will be overturned by a taxing authority upon examination. Management believes there are no such positions at December 31, 2013 or 2012 and, accordingly, no liability has been accrued. The Corporation is no longer subject to tax examinations for years prior to 2010.

Note 3—Property and equipment

Property and equipment includes the following at December 31:

	2013	2012
Leasehold improvements	$ 53,099	$ 53,099
Computer equipment	202,048	177,411
Software	918,535	468,360
	1,173,682	698,870
Less: Accumulated depreciation	(511,204)	(374,058)
Property and equipment, net	$ 662,478	$ 324,812

Depreciation expense was $137,147 and $129,449 for the years ended December 2013 and 2012, respectively.

Note 4—Leases

The Corporation leases office facilities under three operating leases which continue through January 2015. The leases call for monthly payments ranging from $32,000 to $35,000.

Subsequent to year end, the Corporation entered into a new operating lease for office space which commences on April 1, 2014 and continues through March 31, 2025. The lease will provide free rent for the first 10 months of the lease period and annual rent payments ranging from $460,000 to $612,000 thereafter. In connection with the future office space, the Corporation entered into a construction agreement providing for an upfit allowance, whereby the Corporation will be reimbursed for upfit costs up to $814,710.

Note 4—Leases (continued)

Total rent expense for the years ended December 31, 2013 and 2012, was $403,731 and $404,835, respectively.

Future minimum payments on all operating leases are as follows:

Year ending December 31,		
2014	$	410,667
2015		495,442
2016		512,767
2017		524,304
2018		536,101
Thereafter		3,530,777
Total	$	6,010,058

Note 5—Line of credit

The Corporation has a $1,000,000 bank line of credit at an interest rate of prime plus 0.9%, limited to a 5.0% floor, (5.0% at December 31, 2013) for which all outstanding borrowings shall be payable in full at maturity on August 30, 2014. The line is secured by the assets of the Corporation. The line of credit had no outstanding balance at December 31, 2013 and 2012.

Note 6—Benefit plans

401(k) plan - The Corporation sponsors a 401(k) retirement plan covering all eligible employees, as defined. The Corporation makes an annual contribution to the plan equal to 3% of each eligible employee's compensation. In addition, the plan provides that the Corporation may make additional discretionary matching and profit-sharing contributions. During the years ended December 31, 2013 and 2012, contribution expense related to the plan totaled $1,131,588 and $1,029,192, respectively.

Deferred compensation plan - The Corporation established a deferred compensation plan in accordance with Internal Revenue Code Section 457 for certain employees, as defined. The plan provides that eligible employees may make elective salary reduction contributions in accordance with limitations established by the Internal Revenue Code. In addition, the Corporation may make discretionary contributions as provided in the plan. During the years ended December 31, 2013 and 2012, contribution expense related to the plan totaled $21,036 and $21,876, respectively. The asset and liability for deferred compensation of $82,204 and $61,063 at December 31, 2013 and 2012, respectively, is included in prepaid expenses and other current assets and accrued salaries and related benefits in the accompanying statements of financial position.

Note 7—Concentrations of credit risk and uncertainties

The Corporation places its cash and cash equivalents on deposit with a North Carolina financial institution. The Federal Deposit Insurance Company ("FDIC") covers $250,000 for substantially all depository accounts. The Corporation from time to time may have balances in excess of the FDIC insured limits. The Corporation had funds in banks in excess of the federally insured limited of $7,343,667 and $6,960,203 at December 31, 2013 and 2012, respectively.

Note 8—Functional expenses

The following is an allocation of expenses by functional category for the years ended December 31:

	2013	2012
Program expenses:		
Reliability standards	$ 291,074	$ 356,196
Compliance enforcement	6,928,256	5,643,977
Reliability assessment	1,265,510	957,662
Training and education	635,463	643,381
Situtation awareness	557,238	999,826
	9,677,541	8,601,042
Committee and member forums	853,769	544,597
General and administrative expenses:		
General and administrative	4,391,004	3,480,171
Legal and regulatory	27,362	49,805
Information technology	532,388	526,603
Human resources	17,674	50
Accounting and finance	43,563	40,962
	5,011,991	4,097,591
Total	$ 15,543,301	$ 13,243,230

Note 9—Subsequent events

Management has evaluated subsequent events through April 11, 2014, the date the financial statements were issued.

Subject: Southwest Power Pool Regional Entity 2013 Actual Cost-to-Budget Comparison

Dear Mr. Walker and Ms. Turpen,

Attached is the Southwest Power Pool, Inc.'s (SPP, Inc.) submission of the SPP Regional Entity's (SPP RE) 2013 Actual Cost-to-Budget Comparison (2013 True Up Filing). For 2013, the SPP RE received approximately $9.5 million in statutory funds and incurred approximately $9.7 million in statutory expense (compared to $11.5 million budget).

The $2.8 thousand funding variance results from interest earned on the cash balance. The SPP RE performs only statutory activities, and therefore no statutory funding was used for non-statutory activities. The net impact on SPP RE's cash position for the year was a $153 thousand negative variance (compared to the budgeted $1.9 million negative variance).

The significant expense variances at the aggregate statutory level are explained below, while the explanations for the expense variances by statutory program area are provided in Attachment 1.

Aggregate Expense Variances

- **Personnel Expenses** (Actual - $4,087K or 16% below budget) – Personnel expenses were less than budget primarily due to four positions (Director of Compliance and Events, two Lead Engineers and a CIP Compliance Specialist) being unfilled as of December 31, 2013. There was also less than expected activity required by shared staff in the Reliability Standards program area due to the completion of the SPP UFLS regional standard.[1]

- **Travel and Meeting Expenses** (Actual - $447K or 24% under budget) –Travel expenses were less than expected primarily due to the unfilled budgeted staff positions.

[1] NERC filed a petition to FERC for approval of SPP's UFLS Regional Standard (PRC-006-01) on April 23, 2013. SPP RE's Board of Trustee's approved the recall of PRC-006-01 on August 8, 2013 and NERC filed a petition with FERC to withdraw the standard on December 11, 2013. By operation of law, the standard was withdrawn as of December 27, 2013.

- **Other Operating Expenses** (Actual - $961K or 44% under budget) – Other operating expenses trailed budget primarily due to the delayed implementation of the BES exception process.

- **SPP, Inc. Indirect Expense** (Actual - $4,187K or 4% under budget) – SPP, Inc. Indirect Expenses were less than budget due to actual FTEs being lower than budgeted and a slight decrease in the actual 2013 Indirect Expenses. Indirect Expenses are discussed in greater detail in the discussion that follows.

- **Total Expenses** (Actual $9.7 million or 16% under budget) – Although SPP RE ended the year under budget, SPP RE completed its intended activities for 2013. Although SPP RE is under budget, SPP RE has completed its required activities principally as a result of the increased experience of the RE direct staff, a higher level of Registered Entity compliance, particularly in the Operations and Planning area, resulting in a declining number of incoming violations, and enhanced efficiencies in internal SPP RE processes.

  Specifically, SPP RE performed 42 audits, performed 3 spot checks, processed 271 technical feasibility exceptions, identified 189 possible violations, processed 175 violations, reviewed 180 mitigation plans, and examined 22 reportable events. In addition, SPP RE conducted various outreach activities, participated in the facility ratings alert program, and published winter, summer, and long-term reliability assessments.

SPP, Inc. Shared Staff and Indirect Support Staff

The SPP governing documents, approved by NERC and FERC, allow for the use of SPP, Inc. staff not directly assigned to the SPP RE in the performance or support of some of the responsibilities that are performed by the SPP RE. There are two groups of SPP, Inc. staff that support the SPP RE. First, there is a group that performs some of the primary duties delegated to the SPP RE referred to as "shared staff." Shared staff consists of a portion of the SPP RTO engineering staff that performs the technical studies that form the basis for the SPP Regional Assessments published by NERC. Second, there is another group that supplies administrative services to the SPP RE such as accounting, computer support, human resources support, building services support, etc. referred to as "indirect support staff." In general, indirect support staff does not directly charge time and expenses to the SPP RE but are billed through an administrative charge referred to as "SPP, Inc. Indirect Overhead Expense Rate." Neither group participates in compliance or enforcement decisions of the SPP RE.

Shared staff members charge time and expenses directly to the SPP RE accounts and their hours are included in the official total full time equivalent headcount of the SPP RE for the purposes of reporting to NERC and FERC. Shared staff members record specific hours worked in the performance or support of the SPP RE's statutory functions in SPP, Inc's time tracking system. These hours are posted by the shared staff members and reviewed and approved by their specific manager or supervisor. The SPP RE Manager of Finance and Process Improvement as well as the SPP RE General Manager review the hours posted by the shared staff members. This procedure results in actual hours spent by shared staff on SPP RE statutory functions being charged directly to the particular SPP RE direct function at the shared staff member's compensation rate. These direct charges are included in the SPP RE's Business Plan and

Budget. For 2013, shared staff charged 4,739 hours, or 2.52 FTEs based on SPP's standard assumption that total number of hours in a year is 1,880, to the SPP RE. 2013 budgeted shared staff FTEs were 4.0.

With respect to the costs of indirect support staff (SPP, Inc. Indirect Expenses), these costs are assessed to the SPP RE based on a fixed rate per hour per FTE. The fixed rate is calculated by dividing the total costs for SPP, Inc. support services by the total hours worked by non-overhead personnel. The fixed rate is then multiplied by the hours charged by the shared staff and SPP RE direct staff to determine the total amount of SPP, Inc. Indirect Expenses that are assessed to the SPP RE. The SPP, Inc. Indirect Expenses assessed to the SPP RE are included in the SPP RE's Business Plan and Budget. The SPP, Inc. support costs included in the calculations are reviewed in detail to help ensure that SPP RTO specific costs are excluded from the calculation.

Due to the timing of the budget schedule, the estimated overhead rate used to develop the 2013 budget was the actual Indirect Overhead Rate for 2011, which was $67.35/hour. The actual 2013 Indirect Overhead Rate was $74.26/hour. The development of the $67.35/hour rate that was used in the development of the 2013 budget and the $74.26/hour rate embedded in the actual 2013 costs are shown in Attachments 2 and 3, respectively.

If you have any questions related to the submitted materials please feel free to call me at 501.688.8228 or email me at dcurrie.re@spp.org.

Sincerely,

Deborah K. Currie

Independent Auditor's Report

Board of Directors
Southwest Power Pool, Inc.
Little Rock, Arkansas

We have audited the accompanying financial statements of Southwest Power Pool, Inc., which comprise the balance sheets as of December 31, 2013 and 2012, and the related statements of operations, changes in members' deficit and cash flows for the years then ended, and the related notes to the financial statements.

Management's Responsibility for the Financial Statements

Management is responsible for the preparation and fair presentation of these financial statements in accordance with accounting principles generally accepted in the United States of America; this includes the design, implementation and maintenance of internal control relevant to the preparation and fair presentation of financial statements that are free from material misstatement, whether due to fraud or error.

Auditor's Responsibility

Our responsibility is to express an opinion on these financial statements based on our audits. We conducted our audits in accordance with auditing standards generally accepted in the United States of America. Those standards require that we plan and perform the audit to obtain reasonable assurance about whether the financial statements are free from material misstatement.

An audit involves performing procedures to obtain audit evidence about the amounts and disclosures in the financial statements. The procedures selected depend on the auditor's judgment, including the assessment of the risks of material misstatement of the financial statements, whether due to fraud or error. In making those risk assessments, the auditor considers internal control relevant to the entity's preparation and fair presentation of the financial statements in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the entity's internal control. Accordingly, we express no such opinion. An audit also includes evaluating the appropriateness of accounting policies used and the reasonableness of significant accounting estimates made by management, as well as evaluating the overall presentation of the financial statements.

We believe that the audit evidence we have obtained is sufficient and appropriate to provide a basis for our audit opinion.

Praxity
MEMBER
GLOBAL ALLIANCE OF INDEPENDENT FIRMS

Opinion

In our opinion, the financial statements referred to above present fairly, in all material respects, the financial position of Southwest Power Pool, Inc. as of December 31, 2013 and 2012, and the results of its operations and its cash flows for the years then ended in accordance with accounting principles generally accepted in the United States of America.

Southwest Power Pool, Inc.
Notes to Financial Statements
December 31, 2013 and 2012

Note 1: Nature of Operations and Summary of Significant Accounting Policies

Nature of Operations

Southwest Power Pool, Inc. (the Company) is a not-for-profit entity formed in 1941 and incorporated in 1994. The Company is a Federal Energy Regulatory Commission (FERC)-approved regional transmission organization (RTO) serving more than six million ultimate customers across all or parts of nine states. The Company's membership consists of investor-owned utilities, municipal systems, generation and transmission cooperatives, state authorities, independent power producers, contract participants, power marketers and independent transmission companies.

Major services provided by the Company to its members and customers include tariff administration, electric reliability coordination, regional transmission scheduling, energy imbalance service (EIS) market operations and regional transmission expansion planning.

The Company also serves as the Regional Entity (RE) for its region. The primary responsibility of the RE is the enforcement of North American Electric Reliability Corporation (NERC)-approved reliability standards for users, owners and operators of the bulk power system within the region.

Use of Estimates

The preparation of financial statements in conformity with accounting principles generally accepted in the United States of America requires management to make estimates and assumptions that affect the reported amounts of assets and liabilities and disclosure of contingent assets and liabilities at the date of the financial statements and the reported amounts of revenues and expenses during the reporting period. Actual results could differ from those estimates.

Cash and Cash Equivalents and Deposits (in Thousands)

The Company considers all highly liquid interest-earning investments with stated maturities and coupon rate reset dates of no more than three months to be cash equivalents. At December 31, 2013 and 2012, the Company's cash and cash equivalents, including restricted deposits, are invested primarily in money market funds, mutual funds and repurchase agreements. These investments are typically revalued to the market each day and, in the case of repurchase agreements, are collateralized by U.S. government and federal agency securities. The Company's cash and cash equivalents consist primarily of funds accumulated for general operating purposes. Restricted cash deposits consist primarily of customer security deposits, amounts deposited for engineering studies and funds held in escrow for disputed invoices.

Income Taxes

The Company is exempt from income taxes under Section 501c(6) of the Internal Revenue Code and a similar provision of state law. However, the Company is subject to federal income tax on any unrelated business taxable income.

The Company files tax returns in the U.S. federal jurisdiction. With a few exceptions, the Company is no longer subject to U.S. federal examinations by tax authorities for years before 2010.

Accounts Receivable

Accounts receivable are stated at the amount billed to members, customers and others plus any accrued and unpaid interest. The Company provides an allowance for doubtful accounts, when necessary, which is based upon a review of outstanding receivables, historical collection information and existing economic conditions. Accounts that are unpaid after the due date bear interest at a rate set by FERC. Interest continues to accrue until the account is paid or deemed uncollectible.

Property and Equipment (in Thousands)

Property and equipment are recorded at cost and depreciated on a straight-line basis over the estimated useful life of each asset. The estimated useful lives are as follows:

Building	20 years
Building improvements	Shorter of useful life or remaining life of building
Furniture and fixtures	5 years
Vehicles	5 years
Equipment and machinery	3 years
Software	3 years
Leasehold improvements	Shorter of useful life or lease term

The Company capitalizes interest cost incurred on funds used to construct property, plant and equipment. The capitalized interest is recorded as part of the asset to which it relates and is amortized over the asset's estimated useful life. Interest cost capitalized was $2,777 and $2,723 in 2013 and 2012, respectively.

The Company capitalizes development costs, including interest, for internal use software costs. These costs are included in software in development. Management of the Company is of the opinion that all costs capitalized in association with the software in development are fully recoverable over the anticipated life of the asset.

Long-lived Asset Impairment (in Thousands)

The Company evaluates the recoverability of the carrying value of long-lived assets whenever events or circumstances indicate the carrying amount may not be recoverable. If a long-lived asset is tested for recoverability and the undiscounted estimated future cash flows expected to result from the use and eventual disposition of the asset is less than the carrying amount of the asset, the asset cost is adjusted to fair value and an impairment loss is recognized as the amount by which the carrying amount of a long-lived asset exceeds it fair value.

No asset impairment was recognized during the years ended December 31, 2013 and 2012.

Revenue Recognition

Revenues, consisting of member assessments, tariff administrative fees, contract services and miscellaneous revenues are recognized when earned, and expenses are recognized when incurred.

Customer Deposits

Customers may be required to make deposits with the Company prior to the performance of transmission services and engineering studies. These amounts are typically held for the duration of the service and applied to the customer's final invoice. An offsetting liability equal to the deposit balance is recorded in current liabilities. Funds held in escrow related to disputed invoices are also recorded as a customer deposit under current liabilities.

Tariff Fees and Member Assessments (in Thousands)

An administrative charge is applied to all transmission service under the Company's tariff to cover the expenses related to the administration of the tariff. The charge is calculated in accordance with the terms of the Company's Open Access Transmission Tariff. The administrative rate used for the calculation is established by the board of directors.

Members are assessed monthly based on their prior year average 12-month peak demand multiplied by the total hours in a month and by the monthly assessment rate as established by the board. A member's monthly assessment is offset dollar for dollar for qualifying tariff administrative fees collected from a member in any given assessment period.

The Company collects a membership fee from each member annually. The amount of the membership fee is established by the board of directors of the Company. For 2013 and 2012, all members paid a $6 membership fee.

The Company also bills transmission customers and transmission owners a charge under Schedule 12 on all energy delivered under point-to-point transmission service and network integration transmission service. This provides a mechanism for recovering from transmission customers and transmission owners the annual charges the Company pays to FERC. The rate is developed by FERC in the prior calendar year and applied to energy transmitted in the second prior calendar year.

Deferred Revenue

Revenues for contract services received in advance are recognized over the periods to which the revenues relate.

Other Member Services

The Company provides reliability, tariff administration and scheduling for non-members on a contract basis. The Company also provides engineering study services for long-term transmission service and generation interconnection studies.

Withdrawing Members

Members wishing to withdraw their membership from the Company must provide 24 months written notice and are responsible for their portion of the Company's existing obligations as defined in the bylaws, which include unpaid membership fees, any assessments imposed prior to the effective withdrawal date, any costs or expenses imposed upon the Company as a direct consequence of the member's withdrawal, and the member's share of long-term obligations and related interest.

Concentration of Credit Risk

The Company is exposed to credit risk primarily through accounts receivable and uninsured cash balances. During 2013 and 2012, the Company maintained cash balances, including transaction accounts and short-term investment accounts that are not insured by the Federal Deposit Insurance Corporation. The Company's transaction accounts exceeded federal insurance limits by $9,758 at December 31, 2013. The Company's investment accounts were primarily invested in highly liquid short-term investments such as money market funds, mutual funds and repurchase agreements. The Company also requires the financial institutions holding its cash balances to be rated A or better by nationally recognized rating agencies.

Because the Company considers all accounts receivable to be highly probable of collection, an allowance for doubtful accounts is currently not maintained. The Company requires its customers to meet certain minimum standards of financial condition and creditworthiness to receive unsecured credit from the Company. If these standards cannot be met by a counterparty, the Company requires the posting of defined financial security instruments to cover potential liabilities.

Note 2: Line of Credit (In Thousands)

The Company has a $30,000 revolving line of credit expiring in 2016. At December 31, 2013 and 2012, no amounts were borrowed against this line. The agreement has a variable interest rate equal to the London Interbank Offered Rate (LIBOR) plus a credit margin. The Company's line of credit requires compliance with certain financial and non-financial covenants as well as periodic reporting requirements. The Company was in compliance with the covenant and reporting requirements throughout and at December 31, 2013.

Note 3: Long-term Debt and Interest Rate Swaps (in Thousands)

Long-term Debt

	2013	2012
Variable Rate Term Note due 2027 (A)	$ 3,752	$ 3,958
Variable Rate Term Note due 2014 (B)	5,500	11,000
5.45% Senior Notes due 2016 (C)	15,000	21,000
4.82% Series 2010-A Senior Notes due 2042 (D)	29,541	30,000
4.82% Series 2010-B Senior Notes due 2042 (E)	34,465	35,000
3.55% Series 2010-C Senior Notes due 2024 (F)	70,000	70,000
3.00% Series 2012-D-1 Senior Notes due 2024 (G)	50,000	50,000
3.25% Series 2012-D-2 Senior Notes due 2024 (H)	50,000	50,000
	258,258	270,958
Less current maturities	22,998	12,700
	$ 235,260	$ 258,258

(A) Due February 1, 2027; principal and interest are payable quarterly based on a 25-year amortization. Payments commenced on May 1, 2007. The interest rate adjusts monthly based on the London Interbank Offered Rate (LIBOR) plus 0.85%. The note is secured by a first mortgage on the Company's operation facility.

(B) Due December 25, 2014; interest is payable monthly and principal is payable quarterly based on a seven-year amortization. Payments commenced on March 25, 2008. The interest rate adjusts monthly based on the London Interbank Offered Rate (LIBOR) plus 0.30%. The note is unsecured.

(C) Due July 23, 2016; principal and interest are payable quarterly based on a seven-year amortization. Payments commenced on September 30, 2011. The interest rate is fixed at 5.45%. The note is unsecured.

(D) Due December 30, 2042; principal and interest are payable quarterly based on a 32-year amortization. Principal payments commenced on March 30, 2013. The interest rate is fixed at 4.82%. The note is unsecured.

(E) Due December 30, 2042; principal and interest are payable quarterly based on a 32-year amortization. Principal payments commenced on March 30, 2013. The interest rate is fixed at 4.82%. The note is unsecured.

(F) Due March 30, 2024; principal and interest are payable quarterly based on 13-year amortization. Principal payments commence on June 30, 2014. The interest rate is fixed at 3.55%. The note is unsecured.

(G) Due March 30, 2024; principal and interest are payable quarterly based on 10-year amortization. Principal payments commence on June 30, 2014. The interest rate is fixed at 3.00%. The note is unsecured.

(H) Due September 30, 2024; principal and interest are payable quarterly based on 10-year amortization. Principal payments commence on December 30, 2014. The interest rate is fixed at 3.25%. The note is unsecured.

Aggregate annual maturities of long term debt at December 31, 2013, are:

2014	$ 22,998
2015	24,299
2016	21,353
2017	18,410
2018	18,469
Thereafter	152,729
	$ 258,258

Certain of the Company's term notes require compliance with financial and non-financial covenants, as well as periodic reporting requirements. The Company was in compliance with the covenant and reporting requirements throughout and at December 31, 2013.

Variable-to-Fixed Interest Rate Swap

As a strategy to maintain acceptable levels of exposure to the risk of changes in future cash flows due to interest rate fluctuations, the Company entered into an interest rate swap agreement on September 15, 2006, with U.S. Bank National Association. The agreement provides for the Company to receive interest from the counterparty at LIBOR and to pay interest to the counterparty at a fixed rate of 5.51% on notional amounts of $3,723 and $3,927 at December 31, 2013 and 2012, respectively. Under the agreement, the Company pays or receives the net interest amount quarterly, with the quarterly settlements included in interest expense. The swap was established to hedge interest rate risk on its floating rate debt obligation (Loan A).

The Company entered into another interest rate swap agreement on August 23, 2007, with U.S. Bank National Association. The agreement provides for the Company to receive interest from the counterparty at LIBOR and to pay interest to the counterparty at a fixed rate of 5.31% on notional amounts of $5,500 and $11,000 at December 31, 2013 and 2012, respectively. Under the agreement, the Company pays or receives the net interest amount monthly, with the monthly settlements included in interest expense. The swap was established to hedge interest rate risk on its floating rate debt obligation (Loan B).

The table below presents certain information regarding the Company's interest rate swap agreements.

	2013	2012
Fair value of interest rate swap agreements	$ 934	$ 1,857
Balance sheet location of fair value amounts	Other Long-term Liabilities	Other Long-term Liabilities
Gain recognized in statement of operations	$ 923	$ 674
Location of gain recognized in statement of operations	Change in Fair Market Value of Interest Rate Swaps	Change in Fair Market Value of Interest Rate Swaps

Note 4: Operating Leases (In Thousands)

The Company has noncancellable operating leases for certain office equipment which expire at various times through 2015. The lease for office space expired in early 2013. The Company incurred lease expense related to these operating leases of $432 and $1,690 in 2013 and 2012, respectively.

Future minimum lease payments at December 31, 2013, were:

2014	$ 139
2015	69
	$ 208

Note 5: Employee Benefit Plans (in Thousands)

Pension and Other Postretirement Benefit Plans

The Company has a noncontributory defined benefit pension plan covering all employees meeting eligibility requirements. The Company's funding policy is to make the minimum annual contribution that is required by applicable regulations, plus such amounts as the Company may determine to be appropriate from time to time. The Company expects to contribute approximately $3,660 to the plan in 2014.

The Company has a noncontributory defined benefit postretirement health care plan covering eligible retirees, including those retiring between the ages of 55–65 and hired prior to January 1, 1996. Employees hired after June 1, 2006, are not eligible to participate in the defined postretirement health care plan. The Company's funding policy is to make the minimum annual contribution that is required by applicable regulations, plus such amounts as the Company may determine to be appropriate from time to time. The Company expects to contribute approximately $410 to the plan in 2014.

The Company uses a December 31 measurement date for the plans. Information about the plans' funded status is as follows:

	Pension Benefits		Postretirement Health Care Benefits	
	2013	2012	2013	2012
Benefit obligation	$ 44,090	$ 38,014	$ 7,995	$ 7,353
Fair value of plan assets	41,157	31,295	9,657	7,963
Funded status	$ (2,933)	$ (6,719)	$ 1,662	$ 610

Amounts recognized in the balance sheets:

	Pension Benefits		Postretirement Health Care Benefits	
	2013	2012	2013	2012
Noncurrent assets	$ -	$ -	$ 1,662	$ 610
Noncurrent liabilities	(2,933)	(6,719)	-	-
	$ (2,933)	$ (6,719)	$ 1,662	$ 610

Amounts recognized in members' equity not yet recognized as components of net periodic benefit cost as of December 31, 2013, consist of:

	Pension Benefits	Postretirement Health Care Benefits
Net (gain)/loss	$ 5,401	$ (1,664)
Prior service credit	(21)	-
Transition obligation	115	31
	$ 5,495	$ (1,633)

The accumulated benefit obligation for the defined benefit pension plan was $34,673 and $29,577 at December 31, 2013 and 2012, respectively.

Other significant balances and costs are:

	Pension Benefits		Postretirement Health Care Benefits	
	2013	2012	2013	2012
Employer contributions	$ 4,010	$ 3,892	$ 540	$ 469
Benefits paid	256	177	35	26
Benefit costs	4,625	3,643	542	469

The following amounts have been recognized in the statements of operations for the year ended December 31, 2013:

	Pension Benefits	Postretirement Health Care Benefits
Amounts arising during the period		
Net gain	$ 4,031	$ 1,049
Amounts recognized as components of net periodic benefit cost of the period		
Net loss	352	-
Net prior service credit	1	-
Net transition obligation	16	4

The estimated net loss, prior service cost and transition obligation for the defined benefit pension plan that will be amortized from members' equity into net period benefit cost over the next fiscal year are $58, $1 and $16, respectively. The estimated net gain, prior service cost, and net obligation for the defined benefit postretirement health care plan that will be amortized from members' equity into net periodic benefit cost over the next fiscal year are $37, $0, and $4, respectively.

Weighted-average assumptions used to determine benefit obligations and costs:

	Pension Benefits		Postretirement Health Care Benefits	
	2013	2012	2013	2012
Discount rate benefit obligation	5.5%	5.5%	5.5%	5.5%
Expected return on plan assets	7.0%	7.0%	7.0%	7.0%
Rate of compensation increase	4.0%	4.0%	-	-

The Company has estimated the long-term rate of return on plan assets based primarily on historical returns on plan assets, adjusted for changes in target portfolio allocations and recent changes in long-term interest rates based on publicly available information.

For measurement purposes, a 10% annual rate of increase in the per capita cost of covered health care benefits was assumed for 2013 and 2012. The rate was assumed to decrease gradually to 5% by the year 2019 and remain at that level thereafter.

On December 8, 2003, the *Medicare Prescription Drug, Improvement and Modernization Act of 2003* (the Act) was signed into law. The Act introduces a prescription drug benefit under Medicare Part D, as well as a federal subsidy to sponsors of retiree health care benefit plans that provide benefits at least actuarially equivalent to Medicare Part D. The Company has not determined whether its plan provides benefits that are actuarially equivalent to Medicare Part D.

Financial Accounting Standards Board Staff Position 106-2, *Accounting and Disclosure Requirements Related to the Medicare Prescription Drug, Improvement and Modernization Act of 2003*, subsequently incorporated into FASB Accounting Standards Codification (ASC) 715-60, requires federal subsidies, if any, attributable to past service to be accounted for as an actuarial gain and federal subsidies, if any, attributable to current service to be accounted for as a reduction of net periodic benefit cost. The measures of projected benefit obligation and periodic benefit costs do not reflect any amounts associated with the subsidy because the Company has been unable to conclude whether the benefits provided by the plan are actuarially equivalent to Medicare Part D. The effect of adopting the provisions of ASC 715-60, if and when the Company makes such a determination, is not expected to be material.

The following benefit payments, which reflect expected future service, as appropriate, are expected to be paid as of December 31:

	Pension Benefits	Postretirement Health Care Benefits
2014	$ 452	$ 78
2015	612	128
2016	712	159
2017	841	197
2018	1,045	249
2019–2023	8,380	1,801

The Company's investment strategy is based on an expectation that equity securities will outperform fixed income securities over the long-term. Accordingly, the composition of the Company's plan assets is broadly characterized as a 70/30 allocation between equity and fixed income securities. The strategy utilizes indexed and actively managed mutual fund instruments as well as direct investment in individual equity and fixed income securities. Investments in the plans must adhere to the Investment Policy Statement developed by the Company. The Investment Policy Statement limits investments in foreign securities to 20% of the total fair value of plan assets. The Investment Policy Statement is reviewed annually. At December 31, 2013 and 2012, plan assets by category are as follows:

	Pension Plan Assets		Postretirement Health Care Plan Assets	
	2013	2012	2013	2012
Fixed income securities	17%	14%	24%	29%
Equity securities	76	72	72	65
Cash and equivalents	7	14	4	6
	100%	100%	100%	100%

Pension and Other Postretirement Plan Assets

Following is a description of the valuation methodologies used for the pension and postretirement plan assets measured at fair value on a recurring basis and recognized in the accompanying balance sheets, as well as the general classification of the assets pursuant to the valuation hierarchy.

Where quoted market prices are available in an active market, plan assets are classified within Level 1 of the valuation hierarchy. Level 1 plan assets include cash, money market accounts, mutual funds and common stock. If quoted market prices are not available, then fair values are estimated by using pricing models, quoted prices of plan assets with similar characteristics or discounted cash flows. Level 2 plan assets include foreign company stock, corporate debt obligations, foreign corporate debt obligations, government securities and foreign government securities. In certain cases where Level 1 or Level 2 inputs are not available, plan assets are classified within Level 3 of the hierarchy. At December 31, 2013 and 2012, the Company does not hold any plan assets valued using Level 3 inputs.

The fair values of the Company's pension plan assets at December 31, 2013, by asset category are as follows:

		Fair Value Measurements Using		
Asset Category	Total Fair Value	Quoted Prices in Active Markets for Identical Assets (Level 1)	Significant Other Observable Inputs (Level 2)	Significant Unobservable Inputs (Level 3)
Cash	$ 5	$ 5	$ -	$ -
Money market mutual funds	874	874	-	-
Mutual funds				
Foreign large blend	996	996	-	-

Defined Contribution Plans

The Company has a 401(k) defined contribution plan covering substantially all employees. The Company contributes funds to the plan on behalf of plan participants equal to 75% of the participants' elective deferrals up to 6% of deferred compensation. Contributions to the plan were $2,334 and $2,157 for 2013 and 2012, respectively.

The Company has a 457(b) non-qualified tax-deferred compensation plan. This plan is an unfunded plan maintained for the purpose of providing deferred compensation for a select group of management or highly-compensated employees and, therefore, is intended to be exempt from the participation, vesting, funding and fiduciary requirements of Title I of ERISA. Accumulated contributions and earnings of $1,305 and $968 are recorded in other long-term liabilities at December 31, 2013 and 2012, respectively. The Company also offers a 457(f) non-qualified tax-deferred compensation plan to a select group of executive management. The 457(f) plan is intended to be exempt from the participation, vesting, funding and fiduciary requirements of Title I of ERISA and serves to further supplement benefits lost due to IRS limits on compensation and benefits. Accrued benefits of $1,253 and $975 are recorded in other long-term liabilities for the 457(f) plan participants at December 31, 2013 and 2012, respectively.

Note 6: Related Party Transactions (in Thousands)

General disbursements of the Company are apportioned to members based on the formula described in the bylaws of the Company (see *Note 1*). The Company's receivables from members totaled $17,571 and $9,587 as of December 31, 2013 and 2012, respectively. The Company recognized revenues of $128,486 and $110,707, including assessments and tariff administrative fees, from members for the years ended December 31, 2013 and 2012, respectively.

The Southwest Power Pool Regional State Committee (RSC) was incorporated on April 7, 2004, in the State of Arkansas. The RSC is comprised of commissioners from public service commissions or equivalent, having regulatory authority over Company members. FERC, in its February 20, 2004, order regarding the Company's RTO application, stated, "the RSC should have primary responsibility for determining regional proposals and the transition process for funding of regional transmission enhancements, rate structure for a regional access charge and allocation of transmission rights." The RSC prepares budgets annually for the expected costs of its operations. This budget is submitted to the Company's board of directors for approval. The Company includes in its annual budget funds sufficient to cover 100% of the operating costs of the RSC. During 2013 and 2012, the Company incurred $226 and $455, respectively, in expenses attributable to RSC operations. Management of the Company expects such expenditures for 2014 to be approximately $328.

Note 7: Open Access Transmission and EIS Market Operations (In Thousands)

The Company provides short- and long-term firm and non-firm point-to-point transmission services and network integration transmission service across 15 providers in nine states. The Company is responsible for the billing of the transmission customers for the respective services and the remittance of the subsequent collections to the transmission owner on a monthly basis. Billings for these transmission services are not included in the statements of operations. The Company receives a fee for facilitating the transmission process, which is recorded as tariff fees in the Company's statements of operations. For the years ended December 31, 2013 and 2012, the Company billed transmission customers $1,290,757 and $1,118,542, respectively. For the years ended December 31, 2013 and 2012, the Company remitted to transmission owners $1,171,133 and $1,016,886, respectively. At December 31, 2013 and 2012, the Company was due to collect from customers and remit to owners transmission service charges of $101,106 and $85,613, respectively.

The Company's EIS market is a wholesale market that operates under a tariff approved by FERC and is consistent with the mandate of the FERC Order No. 2000, which requires RTOs to provide real-time energy imbalance services and market monitoring functions. Weekly settlements of market participants' energy transactions are not reflected in the Company's statements of operations since they do not represent revenues or expenses of the Company, as the Company merely acts as an intermediary in the settlement process. In this role, the Company receives and disburses funds to/from market participants on a weekly basis.

Note 8: Commitments and Contingencies (in Thousands)

Litigation and Regulatory Matters

In 2011, a suit was filed against the Company claiming a violation of the Arkansas Minimum Wage Act for overtime hours. While the Company believes it has meritorious defenses against the suit, the ultimate resolution of the matter could result in a loss to the Company. An estimate of loss cannot be made at this time.

The Company is engaged in various regulatory proceedings at both the federal and state levels. The Company is also subject to claims and lawsuits that arise primarily in the ordinary course of business. It is the opinion of management that the disposition or ultimate resolution of such proceedings, claims and lawsuits will not have a material adverse effect on the financial position, results of operations and cash flows of the Company.

Note 9: Disclosures About Fair Value of Financial Instruments (in Thousands)

ASC Topic 820, *Fair Value Measurements*, defines fair value as the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. Topic 820 also specifies a fair value hierarchy, which requires an entity to maximize the use of observable inputs and minimize the use of unobservable inputs when measuring fair value. The standard describes three levels of inputs that may be used to measure fair value:

Level 1 Quoted prices in active markets for identical assets or liabilities

Level 2 Observable inputs other than Level 1 prices, such as quoted prices for similar assets or liabilities; quoted prices in markets that are not active; or other inputs that are observable or can be corroborated by observable market data for substantially the full term of the assets or liabilities

Level 3 Unobservable inputs that are supported by little or no market activity and are significant to the fair value of the assets or liabilities

Following is a description of the valuation methodologies used for assets and liabilities measured at fair value on a recurring basis and recognized in the accompanying balance sheets, as well as the general classification of such assets and liabilities pursuant to the valuation hierarchy.

Interest Rate Swap Agreements

The fair value is estimated using forward-looking interest rate curves and discounted cash flows that are observable or that can be corroborated by observable market data and, therefore, are classified within Level 2 of the valuation hierarchy. At December 31, 2013 and 2012, the fair value measurement of the interest rate swaps as recognized in the accompanying balance sheets was a liability of $934 and $1,857, respectively.

Cash Equivalents

The fair value of money market mutual funds included in cash equivalents are estimated using quoted prices in active markets for identical assets or liabilities. At December 31, 2013 and 2012, the fair value measurement of the cash equivalents as recognized in the accompanying balance sheets was $13,856 and $13,413, respectively.

The Company has no assets or liabilities measured and recognized in the accompanying balance sheets on a nonrecurring basis.

The following methods were used to estimate the fair value of all other financial instruments recognized in the accompanying balance sheets at amounts other than fair value.

Restricted Cash Deposits

For these short-term instruments, the carrying amount is a reasonable estimate of fair value.

Customer Deposits

The carrying amount is a reasonable estimate of fair value.

Long-term Debt

Fair value is estimated based on the borrowing rates currently available to the Company for bank loans with similar terms and maturities.

The following table presents estimated fair values of the Company's financial instruments at December 31, 2013 and 2012.

	2013		2012	
	Carrying Amount	Fair Value	Carrying Amount	Fair Value
Financial assets				
Cash and cash equivalents	$ 34,874	$ 34,874	$ 95,693	$ 95,693
Restricted cash deposits	$ 76,713	$ 76,713	$ 43,743	$ 43,743
Financial liabilities				
Customer deposits	$ 76,713	$ 76,713	$ 43,913	$ 43,913
Long-term debt	$ 258,258	$ 264,200	$ 270,958	$ 274,518
Swap agreements	$ 934	$ 934	$ 1,857	$ 1,857

Note 10: Subsequent Events (in Thousands)

On March 10, 2014, the Company obtained a $33,000 senior unsecured term note facility. This facility will initially be undrawn but will allow the Company to obtain advances as needed during a two year draw period, after which it will convert into an amortizing term loan with escalating principal payments through 2023. Interest will be payable monthly at a floating rate.

Additionally, on March 21, 2014, the Company issued $37,000 in funding related to the 2014 Series E Senior Note due December 30, 2025. This note bears a 3.80% fixed rate interest with quarterly interest payments commencing on June 30, 2014 and principal payments commencing on March 30, 2024. This note is unsecured.

Subsequent events have been evaluated through the date of the Independent Auditor's Report, which is the date the financial statements were available to be issued.

2013 ACTUAL COST-TO-BUDGET COMPARISON

AND

2013 AUDITED FINANCIAL REPORT

FOR

TEXAS RELIABILITY ENTITY, INC.

April 29, 2014

Michael Walker, CFO
Susan Turpen, Controller
North American Electric Reliability Corporation
3343 Peachtree Road, NE Floor East Tower – Suite 400
Atlanta, GA 30326

Subject: Texas Reliability Entity (Texas RE) 2013 Actual Cost-to-Budget Comparison

Dear Mr. Walker and Ms. Turpen,

Texas Reliability Entity (Texas RE) has completed the 2013 True Up Analysis. The budget comparisons are compared to the 2013 Texas RE budget, formally approved by FERC.

Texas RE did not use Statutory funds for Non-statutory purposes. Texas RE's policy is to allocate indirect expenses to programs based on the pro-rata share of FTEs to total program FTEs.

Texas RE maintains a $2,000,000 cash reserve balance according to the policy approved by the Texas RE Board of Directors.

The significant expense variances at the aggregate statutory level are explained below. The explanations for the expense variances by statutory program area are provided in the attached spreadsheet.

INCOME

Total Statutory Income was under budget by $40k or 0.4%.

Membership Fees decreased $2,000 or 9%. Fewer registered entities paid membership dues than budgeted.

No Workshop Fees were collected in 2013 causing a 100% budget variance. Registered Entities hosted the workshops; therefore, no fees were charged to attend.

EXPENSES

Personnel Expenses ($553,797 or 7% below budget)

Salary expense was $145k or 2% less than budget due to FTE vacancies. The vacancies were the result of employee turnover and the timing of hiring replacement employees. Employee benefits is 23% less than budget due to fewer employees participating in offered benefits than anticipated.

Travel and Meeting Expenses ($46k or 11.4% less than budget)

Meeting expenses were 16% less than budget due to the workshops being hosted by registered entities with no costs to Texas RE.

Travel expenses were $44k or 12.5% less than budget. Standards attended fewer meetings than budgeted that required travel while the RAPA program required more travel. Less travel was required in the Compliance audit area.

Conference expenses increased $3,784 or 20% offsetting the reduction in the travel expense.

Other Operating Expenses ($818k or 26.5% less than budget)

Consultants and Contract costs were 16.8% less than budget because the IT staff performed some of the task originally planned for consultants in the Sharepoint project implementation.

The Rent budget did not consider the deferred rent adjustment to make the rent expense straight line over the life of the lease causing the favorable 19.5% budget variance.

Reconfiguring the cubicle space and adding front office signage caused the cost to be 18.4% greater than budget for office cost.

Professional Services are $354,177 less than budget because professional insurance policies were less than anticipated since Texas RE has reached an excellent experience rating. The Enforcement department did not utilize the legal fees budgeted for a potential contested case.

Laptops and computer equipment fully depreciated in 2013 and replacements were not purchased causing the 40% favorable variance in depreciation.

Indirect Expenses ($59K or 26.5% less than budget)

Indirect expense are allocated to functional departments based on FTE count.

Texas RE indirect expenses were less than budget because Non-Statutory costs were charged directly to the Non-Statutory department rather than being charged indirectly.

FIXED ASSETS

Budgeted assets were not acquired in 2013 causing budget to be 19.5% less than anticipated.

Total Budgeted Statutory expenses are under budget $1.4 million or 12.8%.

Although Texas RE ended the year $1.4 million under budget, Texas RE completed its intended activities for 2013.

Texas RE completed 33 Non-CIP audits, 10 CIP audits with CCA's, 21 CIP audits without CCA's, and 12 spot checks.

Texas RE indentified 170 non-compliance matters and completely resolved 322 violations to reduce violation caseload from 255 to 103.

86 category zero events, 7 category one, 2 category 2 and 3 category 1 events were examined.

123 technical feasibility exceptions were processed in 2013.

Texas RE verified mitigation plans or mitigation activities for 62 possible violations.

In 2013, Texas RE processed 18 new entity registrations, 23 entity removals and 9 entity name changes. Also, 2 TOP certifications and 2 reviews associated with a control center relocation was conducted.

If you have any questions on the report or the attached spreadsheet, please call me at the number below.

Thank you.

Independent Auditor's Report

Board of Directors
Texas Reliability Entity, Inc.
Austin, Texas

We have audited the accompanying financial statements of Texas Reliability Entity, Inc. (Texas RE), which comprise the statements of financial position as of December 31, 2013 and 2012, and the related statements of activities and cash flows for the years then ended, and the related notes to the financial statements.

Management's Responsibility for the Financial Statements

Management is responsible for the preparation and fair presentation of these financial statements in accordance with accounting principles generally accepted in the United States of America; this includes the design, implementation and maintenance of internal control relevant to the preparation and fair presentation of financial statements that are free from material misstatement, whether due to fraud or error.

Auditor's Responsibility

Our responsibility is to express an opinion on these financial statements based on our audits. We conducted our audits in accordance with auditing standards generally accepted in the United States of America. Those standards require that we plan and perform the audit to obtain reasonable assurance about whether the financial statements are free from material misstatement.

An audit involves performing procedures to obtain audit evidence about the amounts and disclosures in the financial statements. The procedures selected depend on the auditor's judgment, including the assessment of the risks of material misstatement of the financial statements, whether due to fraud or error. In making those risk assessments, the auditor considers internal control relevant to the entity's preparation and fair presentation of the financial statements in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the entity's internal control. Accordingly, we express no such opinion. An audit also includes evaluating the appropriateness of accounting policies used and the reasonableness of significant accounting estimates made by management, as well as evaluating the overall presentation of the financial statements.

We believe that the audit evidence we have obtained is sufficient and appropriate to provide a basis for our audit opinion.

Praxity MEMBER GLOBAL ALLIANCE OF INDEPENDENT FIRMS

Opinion

In our opinion, the financial statements referred to above present fairly, in all material respects, the financial position of Texas Reliability Entity, Inc. as of December 31, 2013 and 2012, and the changes in its net assets and its cash flows for the years then ended in accordance with accounting principles generally accepted in the United States of America.

Emphasis of Matter

As discussed in *Note 8* to the financial statements in 2013, the entity has elected to change its method of accounting of fines and penalties in 2013. Our opinion is not modified with respect to this matter.

Other Information

Our audit was conducted for the purpose of forming an opinion on the financial statements as a whole. The Schedule of Statutory and Nonstatutory Operating Activities is presented for purposes of additional analysis and is not a required part of the financial statements. Such information has not been subjected to the auditing procedures applied in the audit of the financial statements, and accordingly, we do not express an opinion or provide any assurance on it.

Texas Reliability Entity, Inc.

Notes to Financial Statements

December 31, 2013 and 2012

Note 1: Organization and Operations

Texas Reliability Entity, Inc. (Texas RE) is a Texas nonprofit corporation that is tax exempt under Section 501(c)(3) of the Internal Revenue Code. Texas RE was formed January 1, 2010, to be the Regional Entity for the Electric Reliability Council of Texas, Inc. (ERCOT) region and to preserve and enhance reliability across the ERCOT region by encouraging a culture of compliance among all users, owners and operators of the bulk-power system (BPS). Texas RE, took assignment of all rights, contracts, obligations, assets and liabilities of Texas Regional Entity (which was an independent division of ERCOT, the predecessor Regional Entity), effective midnight on June 30, 2010. Texas RE became the Regional Entity for the ERCOT region on July 1, 2010, pursuant to its Amended and Restated Delegation Agreement with North American Electric Reliability Corporation (NERC), which was approved by the Federal Energy Regulatory Commission (FERC) on May 6, 2010. The Delegation Agreement with NERC was further amended effective January 1, 2011 and October 7, 2011. Texas Regional Entity was the authorized Regional Entity for the ERCOT region from May 2007 through June 30, 2010.

As Regional Entity, Texas RE proposes and facilitates development of new and modified NERC Reliability Standards and Regional Standards (Standards); monitors, assesses, investigates and enforces compliance by registered entities with Standards in the ERCOT region, and oversees the mitigation of any violations. Texas RE is authorized to impose penalties and sanctions for violations, but NERC and FERC must approve determination of all violations and the imposition of all penalties and sanctions. These Regional Entity activities are referred to herein as "statutory" activities.

The ERCOT region is the geographic area located within the state of Texas that operates under the jurisdiction of the Public Utility Commission of Texas (PUCT) and is not synchronously interconnected with any electric utilities operating outside of Texas. The ERCOT region includes approximately 200,000 square miles and 85% of Texas load.

In addition to Texas RE's statutory activities as Regional Entity, Texas RE has a contract with the PUCT and ERCOT to be the Reliability Monitor for the ERCOT region. As Reliability Monitor, Texas RE monitors, investigates and reports to the PUCT regarding compliance with state reliability rules (the reliability-based ERCOT Protocols and Operating Guides), and coordinates and assists PUCT staff with related reliability-related matters. The PUCT is responsible for the enforcement of violations of the state reliability rules. Texas RE's activities under this contract are permitted by NERC and FERC, by Exhibit E to the Delegation Agreement, and these activities are referred to herein as "nonstatutory" activities.

Texas Reliability Entity, Inc.
Notes to Financial Statements
December 31, 2013 and 2012

Membership and Governance

Texas RE has the following six membership sectors under its Bylaws:

- System Coordination and Planning: An entity that is registered with NERC as a Reliability Coordinator (RC), Balancing Authority (BA), Planning Authority (PA), Resource Planner (RP) or Interchange Authority (IA).
- Transmission and Distribution: An entity that is registered with NERC as a Transmission Owner (TO), Transmission Planner (TP), Transmission Service Provider (TSP), Distribution Provider (DP), and/or Transmission Operator (TOP) and is not a Cooperative or Municipal Utility.
- Cooperative Utility: An entity that is (a) a corporation organized under Chapter 161 of the Texas Utilities Code or a predecessor statute to Chapter 161 and operating under that chapter; (b) a corporation organized as an electric cooperative in a state other than Texas that has obtained a certificate of authority to conduct affairs in the state of Texas or (c) a cooperative association organized under Tex. Rev. Civ. Stat. 1396-50.01 or a predecessor to that statute and operating under that statute that is registered with NERC for at least one reliability function.
- Municipal Utility: An entity that owns or controls transmission or distribution facilities, owns or controls dispatchable generating facilities or provides retail electric service and is a municipally owned utility as defined in PURA §11.003 and is registered with NERC for at least one reliability function.
- Generation: An entity that is registered with NERC as a Generator Owner (GO) or Generator Operator (GOP).
- Load-Serving and Marketing: An entity that is registered with NERC as a Load-Serving Entity (LSE), a Purchasing-Selling Entity (PSE) or any newly defined NERC reliability function for demand response.

Membership in Texas RE is voluntary and open to any entity that is a user, owner or operator of the ERCOT region BPS and registered with NERC for at least one reliability function. Eligible registered entities must complete and submit a membership application, pay a nominal annual fee, which may be waived for good cause shown and comply with the Texas RE Bylaws. Any person or entity that has a direct and material interest in the BPS has a right to participate in the Texas RE Standards development process, even if not a Texas RE member.

Texas RE is governed by a hybrid board of directors (the Board), comprised of the following nine directors:

- Texas RE President and Chief Executive Officer
- Four Independent Directors

- Two Member Directors (the Chair and Vice-Chair of the Member Representatives Committee)
- Chair of the PUCT, or another PUCT Commissioner designated by the Chairman, as an ex officio nonvoting member
- Texas Public Counsel, from the Texas Office of Public Utility Counsel, as an ex officio nonvoting member

The Board's primary role is to oversee management of Texas RE, including assuring that Texas RE meets its requirements under the Bylaws and Delegation Agreement, and to elect a Chief Executive Officer to manage and be responsible for the day-to-day ongoing activities of Texas RE. The Board has one subcommittee, the Audit and Governance Committee, which is comprised of the Independent Directors.

Texas RE has two stakeholder committees, the Member Representatives Committee (MRC) and the Reliability Standards Committee (RSC). The MRC includes representatives from members in each of the six membership sectors and provides advice and recommendations to the Board on administrative, financial, reliability-related or any other matters, except for standards development issues, through its elected Chair and Vice-Chair, who serve as directors. The RSC includes representatives from the six industry sectors described above, whether or not members of Texas RE and including any entity with a direct and material interest in the ERCOT region BPS. The RSC facilitates the Regional Standards development process, coordinates the development of Regional Standards and variances with the development of national NERC Standards, and monitors, reviews, and comments on Standards under development and Standards interpretation requests.

Note 2: Summary of Significant Accounting Policies

Use of Estimates

The preparation of financial statements in conformity with accounting principles generally accepted in the United States of America requires management to make estimates and assumptions that affect the reported amounts of assets and liabilities and disclosure of contingent assets and liabilities at the date of the financial statements and the reported amounts of revenues, expenses gains, losses and other changes in net assets during the reporting period. Actual results could differ from those estimates.

Cash

At December 31, 2013, Texas RE's cash accounts exceeded federally insured limits by approximately $5,400,000. Texas RE places its cash with a high quality financial institution, and management believes no significant risks exist with respect to uninsured balances.

Assets Limited to Use

As stipulated by NERC policies, Texas RE records fines and penalties that are required to be used in future operations as assets limited to use. Assets limited to use (maintained in a financial institution) was $887,078 and $1,083,012 at December 31, 2013 and 2012, respectively.

Revenue Recognition

Texas RE funds its statutory operations primarily from assessments NERC collects from load serving entities and pays to Texas RE in four quarterly payments, pursuant to the Delegation Agreement. Four quarterly payments were received by Texas RE, which totaled $8,152,520 and $9,503,866 from NERC during 2013 and 2012, respectively. NERC pays Texas RE at or near the beginning of each quarter. Additionally, Texas RE recognized $19,250 and $21,020 for membership dues and other miscellaneous revenue, and $635,000 and $447,832 from fines and penalties, during 2013 and 2012, respectively. Texas RE did not recognize any revenue from providing workshops in 2013; however, Texas RE recognized $3,330 from providing workshops in 2012. All statutory budgeted expenditures for Texas RE are approved by the Texas RE Board when it approves Texas RE's annual business plan and budget.

Texas RE funds its nonstatutory operations from revenues paid by ERCOT from its PUCT approved system administration fee, pursuant to the Reliability Monitor Agreement. Texas RE received revenue of $1,029,100 and $999,100 from the Reliability Monitor Agreement in 2013 and 2012, respectively, to cover operating expenses incurred by Texas RE. All nonstatutory budgeted expenditures for Texas RE are approved by the Texas RE Board when it approves Texas RE's annual business plan and budget.

Texas RE recognized revenue related to fines and penalties in the period in which they are earned (all appeals have been exhausted).

Related Party Transactions

Texas RE compensates its independent board directors, which is a common practice in the industry in which Texas RE operates. The authority to compensate its Independent Directors is specified in the Bylaws, which were approved by the Texas RE membership. Texas RE Independent Director compensation (totaling approximately $225,000 during 2013 and $190,000 during 2012) is paid monthly. In addition to their compensation, Texas RE independent board members are reimbursed for their actual expenses incurred related to their duties as a Texas RE board member.

Property and Equipment

Property and equipment are stated at cost less accumulated depreciation. Depreciation is charged to expense using the straight-line method over the estimated useful life of each asset. Assets under capital lease obligations and leasehold improvements are depreciated over the shorter of the lease term or their respective estimated useful lives. Repairs and maintenance costs are expensed when incurred.

The estimated useful lives for each major depreciable classification of property and equipment are as follows:

Equipment	5 years
Computer hardware	3 years
Computer software	5 years
Furniture and fixtures	7 years
Leasehold improvements	7.5 years

Long-lived Asset Impairment

Texas RE evaluates the recoverability of the carrying value of long-lived assets whenever events or circumstances indicate the carrying amount may not be recoverable. If a long-lived asset is tested for recoverability and the undiscounted estimated future cash flows expected to result from the use and eventual disposition of the asset is less than the carrying amount of the asset, the asset cost is adjusted to fair value and an impairment loss is recognized as the amount by which the carrying amount of a long-lived asset exceeds it fair value. No asset impairment was recognized during the years ended December 31, 2013 and 2012.

Deferred Rent

In 2010, Texas RE entered into an operating lease agreement, which contains provisions for future increases in rent payments. In accordance with accounting principles generally accepted in the United States of America, Texas RE records monthly rent expense equal to the total of payments due over the lease term divided by the number of months of the lease term. The difference between rent expense recorded and the amount paid is credited or charged to deferred rent.

Income Taxes

Texas RE is exempt from income taxes under Section 501 of the Internal Revenue Code and a similar provision of state law. However, Texas RE is subject to federal income tax on any unrelated business taxable income.

Texas RE files tax returns in the U.S. federal jurisdiction. With a few exceptions, Texas RE is no longer subject to U.S. federal examinations by tax authorities for years before 2010.

Note 3: Expenses by Functional Classification

While the statements of activities presents expenses by natural classification, Texas RE's expenses by functional classification for the years ended December 31 were as follows:

	2013	2012
Program	$ 6,942,188	$ 6,602,467
General and administrative	4,116,015	3,914,595
Total	$ 11,058,203	$ 10,517,062

Certain costs have been allocated among the program and general and management categories based on actual use or estimates made by management.

Note 4: Property and Equipment

Property and equipment at December 31 consists of:

	2013	2012
Equipment	$ 410,886	$ 408,364
Computer hardware	701,980	701,980
Computer software	1,376,992	1,168,815
Furniture	309,512	309,512
Leasehold improvement	206,521	206,521
Work in process	15,000	142,288
Total property and equipment	3,020,891	2,937,480
Less accumulated depreciation	2,417,988	1,745,703
Total property and equipment, net	$ 602,903	$ 1,191,777

Note 5: Line of Credit

On January 29, 2013, Texas RE obtained a $500,000 bank line of credit that expires in 2014. The line is not collateralized by any of Texas RE's assets and is unsecured. Interest rate varies with LIBOR plus 4.265%. At December 31, 2013, there was $0 borrowed against the line.

Note 6: Operating Leases

Texas RE leases office space, datacenter space and equipment under noncancellable agreements recorded as operating leases. Operating lease expenditures for the year ended December 31, 2013, were $395,698. The future rental payments due under operating leases are as follows through December 31, 2013:

2014	$ 547,627
2015	424,652
2016	424,652
2017	424,652
2018	270,000
	$ 2,091,583

Note 7: Employee Benefit Plans

Texas RE employees are sponsored under the Texas Reliability Entity, Inc. 401(k) Savings Plan (Plan) which is subject to the provisions of the Employee Retirement Income Security Act of 1974. The Plan utilizes a third-party administrator to assist in the administration. Employees must be 21 years of age to be eligible to participate. Texas RE matches 75% of the employee's contribution up to 6% of eligible compensation as defined in the plan document. Employees are fully vested for the Texas RE match of 75% after five years. In addition, Texas RE contributes 10% of a participant's eligible compensation as defined in the plan document. Employees are fully vested for the Texas RE contributions of 10% after three years. Employer contributions to the 401(k) plans were $813,224 and $705,777, respectively, in 2013 and 2012.

Note 8: Change in Accounting Principle

During 2013, Texas RE changed its method of recognizing fines and penalties revenue from the period they were available to be used in operations to the period in which they were earned (all appeals have been exhausted). This recognition methodology is the preferred method of NERC. As a result of this retrospective change, the 2012 financial statements have been restated as follows:

Statement of Financial Position

	2013			2012		
	As Computed Previously	As Adjusted	Effect of Change	As Originally Reported	As Adjusted	Effect of Change
Cash	$ 5,584,176	$ 4,697,098	$ (887,078)	$ 6,483,137	$ 5,400,125	$ (1,083,012)
Assets limited to use – cash	-	887,078	887,078	-	1,083,012	1,083,012
Deferred revenue	955,837	-	(955,837)	1,080,833	-	(1,080,833)

May 9, 2014

Mr. Michael Walker
Senior Vice President, Chief Financial and Administrative Officer
North American Electric Reliability Corporation
3353 Peachtree Road, N.E.
Suite 600, North Tower
Atlanta, Georgia 30326

RE: 2013 Statement of Activities and Variance Explanations Based on Audited Financials

Summary

The Western Electricity Coordinating Council's (WECC) audited Statutory total change in working capital for the year ended December 31, 2013 is over budget by $8.46 million with grant activity and $4.50 million over budget without grant activity. The major drivers of WECC's 2013 overrun are related to the bifurcation of the organization, the recommendations of the Reliability Coordination Task Force (RCTF), and timing variances related to the Department of Energy (DOE) grants.

A summary of significant overall variances (greater than $10,000 and 10 percent) is described in this document. For significant program area line-item variances, see the detailed statements of activities.

WECC substantially completed all of its goals and key deliverables as contained in the 2013 Business Plan and Budget.

Allocation of Indirect Costs

Administrative Services costs are allocated to program activities based on a full-time equivalent (FTE) ratio that is consistent with NERC's accounting methodology for allocation of overhead.

Federal Grants

In WECC's 2010 Amended Business Plan and Budget, WECC included revenue and associated costs related to three U.S. Department of Energy grants. FERC determined that the activities performed under the three grants received by WECC qualify as Section 215 activities.

The Western Interconnection Synchrophasor Program (WISP) (budgeted in the Situation Awareness program area) increases reliability by, among other things, enhancing the situation awareness of WECC's Reliability Coordinator Offices.

This Interconnection-wide Synchrophasor system also enables smart grid functionality such as:

- Improved integrated system operations.

- Enhanced, knowledge-based, real-time, advanced-warning systems.
- Reduced energy losses.
- Increased efficiency of asset use.
- Improved market efficiency.
- Increased reliability and efficient integration of intermittent renewable resources.

The Regional Transmission Expansion Planning (RTEP) project, which encompasses all activities funded under this U.S. DOE grant, produces Interconnection-level transmission plans for the Western Interconnection. The RTEP project is a natural expansion of the depth, breadth, and coordination of existing regional and sub-regional planning processes. The plan accomplishes the following:

- Evaluates the long-term regional transmission capacity needs under a comprehensive set of load, resource, and policy scenarios.
- Incorporates the results of a comprehensive examination of reliability impacts, technology costs, and emissions conducted during the project.
- Provides guidance for decision-makers at all levels (project developers, siting authorities, utility regulators, and others).
- Facilitates and accelerates the development of needed transmission infrastructure.

WECC uses a fund-accounting system to ensure that federal grant activities are segregated in accordance with federal cost-accounting standards.

Non-Statutory

WECC has one non-statutory activity, the Western Renewable Energy Generation Information System (WREGIS). WECC uses a fund-accounting system that allows costs to be segregated between statutory and non-statutory activities to ensure that no statutory funding is used for non-statutory activities.

In 2013, WECC allocated indirect costs to its non-statutory activity based on FTEs. Indirect costs include the Board of Directors and its Standing Committees, General and Administrative, Legal, Information Technology, Human Resources, and Finance programs. These costs are allocated to WREGIS based on the ratio of total WREGIS FTEs to total operating program FTEs. This allocation is consistent with the FTE method of allocating overhead costs used by NERC and the other Regional Entities.

Reserves

WECC used working capital reserves to fund its budget overrun.

Variance Explanations (Statutory Activities)

FUNDING

- **Penalty Sanctions** ($1.40 million over budget)
  - Some penalty sanction payments received from Registered Entities between July 1, 2013 and December 31,2013 were recorded as 2013 penalty revenues rather than being held to offset 2015 assessments to offset accrued estimates for potential penalty expenses.
- **Grant Funding** ($6.07 million over budget)
  - Grant expenditures were delayed from 2012, the year in which they were budgeted, to 2013.
  - The variances are timing differences only; total project cost has not changed.
- **Interest Income** ($88,000 under budget)
  - Lower-than-anticipated rates of return on WECC's cash balances.
- **Miscellaneous Income** ($279,000 under budget)
  - Unrealized losses arising from fair market valuation of WECC's investment portfolio.

EXPENSES

- **Salaries** ($2.98 million over budget)
  - Additional Reliability Coordinator personnel were hired as recommended by the RCTF.
  - Additional administrative personnel were hired in preparation for the bifurcation of the Reliability Coordinator function into a separate company.
- **Savings and Retirement** ($210,000 over budget)
  - Savings and Retirement fluctuates with Salaries.
- **Meetings** ($311,000 under budget)
  - Lower-than-anticipated attendance at workshops and training classes.
  - Company-wide cost-saving effort to reduce expenses.
  - Increased use of WebEx services.
- **Travel** ($178,000 under budget)
  - WECC staff attended fewer off-site meetings.
  - More efficient audits requiring fewer days on site.
  - Increased use of webinars.
- **Conference Calls** ($74,000 under budget)
  - Conference call usage was less than expected.
- **Consultants & Contracts** ($8.16 million over budget)
  - Contracts associated with the grants were delayed from 2012, the year in which they were budgeted, to 2013.
  - Unbudgeted search fees for independent directors.
  - The development of reliability enhancement measures.
  - The creation of a Reliability Coordinator trainee program.

- **Office Costs** ($885,000 over budget)
  - WISP software licensing and maintenance expenditures were delayed from 2012, the year in which they were budgeted, to 2013.
- **Professional Services** ($820,000 over budget)
  - Unbudgeted legal fees and independent director compensation related to the bifurcation of the Reliability Coordinator function into a separate company.
- **Miscellaneous** ($1.40 million over budget)
  - Accrued estimates for penalty expenses.
- **Indirect Expenses** ($148,000 under budget)
  - Administrative Services program area expenses were less than budgeted due to efficiency gains.

FIXED ASSETS

- **Computer & Software CapEx** ($824,000 over budget)
  - WISP asset expenditures were delayed from 2012, the year in which they were budgeted.
- **Furniture & Fixtures CapEx** ($28,000 under budget)
  - Furniture & Fixtures expenditures were eliminated.
- **Equipment CapEx** ($87,000 under budget)
  - Equipment CapEx expenditures were eliminated in Administrative Services
- **Leasehold Improvements** ($406,000 over budget)
  - Control Room modifications related to WISP.

Please feel free to contact me if you have any questions.

Thank you,

Jillian Lessner

REPORT OF INDEPENDENT CERTIFIED PUBLIC ACCOUNTANTS

Board of Directors
Western Electricity Coordinating Council

We have audited the accompanying financial statements of Western Electricity Coordinating Council, which comprise the statements of financial position as of December 31, 2013 and 2012, the related statements of activities and cash flows for the years then ended, and the related notes to the financial statements.

Management's responsibility for the financial statements

Management is responsible for the preparation and fair presentation of these financial statements in accordance with accounting principles generally accepted in the United States of America; this includes the design, implementation, and maintenance of internal control relevant to the preparation and fair presentation of financial statements that are free from material misstatement, whether due to fraud or error.

Auditor's responsibility

Our responsibility is to express an opinion on these financial statements based on our audits. We conducted our audits in accordance with auditing standards generally accepted in the United States of America. Those standards require that we plan and perform the audit to obtain reasonable assurance about whether the financial statements are free from material misstatement.

An audit involves performing procedures to obtain audit evidence about the amounts and disclosures in the financial statements. The procedures selected depend on the auditor's judgment, including the assessment of the risks of material misstatement of the financial statements, whether due to fraud or error. In making those risk assessments, the auditor considers internal control relevant to the entity's preparation and fair presentation of the financial statements in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the entity's internal control. Accordingly, we express no such opinion. An audit also includes evaluating the appropriateness of accounting policies used and the reasonableness of significant accounting estimates made by management, as well as evaluating the overall presentation of the financial statements.

We believe that the audit evidence we have obtained is sufficient and appropriate to provide a basis for our audit opinion.

Opinion

In our opinion, the financial statements referred to above present fairly, in all material respects, the financial position of Western Electricity Coordinating Council as of December 31, 2013 and 2012, and the results of its operations and its cash flows for the years then ended in accordance with accounting principles generally accepted in the United States of America.

Western Electricity Coordinating Council

NOTES TO FINANCIAL STATEMENTS

December 31, 2013 and 2012

NOTE A – SUMMARY OF SIGNIFICANT ACCOUNTING POLICIES

1. Nature of activities

Western Electricity Coordinating Council (WECC) is a not-for-profit organization whose primary mission is to assure a reliable bulk electric power system in the Western Interconnection. WECC's revenues are generated through performance of statutory and non-statutory activities.

WECC performs statutory activities pursuant to the Delegation Agreement effective October 2007 and Amended and Restated Delegation Agreement effective January 2011 with North American Electric Reliability Corporation (NERC). NERC is the Electric Reliability Organization (ERO) certified by the Federal Energy Regulatory Commission (FERC) to establish and enforce reliability standards for the bulk electric system. Statutory activities authorize WECC to develop, monitor, assess, and enforce compliance with NERC reliability standards and regional standards within the United States portion of the geographic boundaries of the Western Interconnection. Statutory revenues are derived from WECC's statutory funding from NERC, which NERC has delegated WECC to collect through assessments to load-servicing entities (LSEs) within the Western Interconnection.

Non-statutory activities include oversight of the operations of a component of WECC "doing business as" Western Renewable Energy Generation Information System (WREGIS). WREGIS is an independent, renewable energy tracking system within WECC's region. WECC funds its non-statutory activities though annual and other activity fees.

2. Financial statement presentation

WECC's financial statements have been prepared on the accrual basis of accounting, in accordance with accounting principles generally accepted in the United States of America (U.S. GAAP). The information regarding its financial position and activities is reported based on the existence or absence of donor-imposed restrictions in three classes of net assets, as applicable: unrestricted net assets, temporarily restricted net assets, and permanently restricted net assets. As of December 31, 2013 and 2012, WECC had only unrestricted net assets.

3. Use of estimates

The preparation of financial statements in conformity with U.S. GAAP requires management to make estimates and assumptions that affect certain reported amounts of assets and liabilities and disclosure of contingent assets and liabilities as of the date of the financial statements and the reported amounts of revenue and expenses during the reporting period. Accordingly, actual results could differ from those estimates.

NOTE A – SUMMARY OF SIGNIFICANT ACCOUNTING POLICIES – CONTINUED

4. Revenue recognition

WECC recognizes revenue from the statutory funding provided by NERC for performing the statutory activities that have been delegated to WECC. The annual assessments are collected by WECC, remitted first to NERC and then are returned to WECC within a few days. WECC generally receives assessment payments in advance of the assessment period, and records it as assessment payable or as deferred revenue after it has been remitted to NERC and returned to WECC. Assessments are recognized as revenue in the year they are intended to fund. Federal grant revenue is generated through WECC's and WECC sub-recipient's performance of services in accordance with federal award agreements on a cost reimbursement basis.

Other types of revenues, such as non-statutory revenue, are recognized when the services or products have been provided.

WECC can incur penalties assessed by its regulators. When the amounts of such penalties become known or reasonably estimable, WECC recognizes penalty revenue (collected from U.S. LSEs) earmarked for a future year to offset the penalty expense. This results in WECC recording an expense and offsetting revenue. Depending on when the amount of the penalty becomes known (whether it is before or after NERC has approved the budget for the subsequent year), WECC's assessments revenue for the subsequent budget year or the year following will be offset by the amount of the penalty. Such penalties are recorded in the income statement as Electric Reliability Organization Funding and Other operating expenses.

5. Cash and cash equivalents

WECC considers all highly liquid financial instruments with an original maturity of three months or less when purchased to be cash equivalents. Cash and cash equivalents consist of bank demand accounts, money market investment accounts, and other investments. WECC's cash deposits are held with financial institutions in the United States that are insured by the Federal Deposit Insurance Corporation (FDIC). Deposits may exceed the federally insured limits at times.

Pursuant to the Delegation Agreement with NERC, cash equivalents contractually restricted as of December 31, 2013 and 2012 were $4,004,026 and $4,720,916, respectively.

6. Certificates of deposit

Certificates of deposits held by WECC that are not classified as debt securities have original maturities greater than three months.

7. Investments

Investments in marketable securities with readily determinable fair values and all investments in debt securities are reported at their fair values in the statements of financial position. Investment income or loss (including realized gains and losses on investments, interest, and dividends) and unrealized gains and losses on investments are included in the change in net assets.

NOTE A – SUMMARY OF SIGNIFICANT ACCOUNTING POLICIES – CONTINUED

8. Accounts receivable

Accounts receivable consists of statutory funding, grants and other fees receivables that have not been collected. Accounts receivable are carried at original invoice amount less an estimate made for doubtful receivables based on a review of all outstanding amounts on an annual basis. Management determines the allowance for doubtful accounts by identifying troubled accounts and by using historical experience applied to an aging of accounts. Accounts receivable are written off when deemed uncollectible. Recoveries of accounts receivable previously written off are recorded when received.

9. Property, equipment, and software

Expenditures for property, equipment, and software that exceed $5,000 on and individual basis are capitalized at cost and are depreciated using the straight-line method over the estimated useful lives of the assets as follows:

Equipment and software	3 years
Furniture and fixtures	5 years

Leasehold improvements are depreciated over the shorter of the lease term or their estimated useful life of 10 years. Minor replacements, maintenance, and repairs which do not increase the useful lives of the property, equipment, and software to which they are related are expensed as incurred.

10. Impairment of long-lived assets

WECC reviews its long-lived assets for impairment whenever events or changes in circumstances indicate that the carrying amount of the assets may be impaired. If it is determined that the estimated undiscounted future cash flows are not sufficient to recover the carrying value of an asset, an impairment loss is recognized in the statement of activities for the difference between the carrying value and the fair value of the asset.

11. Income taxes

WECC has been recognized by the Internal Revenue Service as a not-for-profit corporation as described in Section 501(c)(6) of the Internal Revenue Code and, as such, is not subject to federal or state income taxes on exempt purpose income. WECC recognized no unrelated business income tax benefit in the years ended December 31, 2013 and 2012.

WECC has identified and evaluated its significant tax positions for which the statute of limitations remain open. The open tax years are the years ended December 31, 2009 through December 31, 2013 for federal tax purposes and Utah tax purposes. WECC applied the more likely than not criteria to all tax positions and determined that no material unrecognized tax benefits or liability should be recognized. In addition, there have been no material changes in unrecognized benefits as of December 31, 2013, and it is not expected that there will be a material change in the 12 months following December 31, 2013. WECC did not incur any tax penalties or tax-related interest expenses during the years ended December 31, 2013 and 2012.

NOTE A – SUMMARY OF SIGNIFICANT ACCOUNTING POLICIES – CONTINUED

12. Functional allocation of expenses

The costs of programs and supporting services have been summarized on a functional basis. WECC's expenses are classified as *Statutory Expenses* or *Non-statutory Expenses* as the majority of expenses incurred fulfill the purposes or mission for which WECC exists. Furthermore, the statutory expenses are classified according to the statutory functions WECC performs pursuant to the Delegation Agreement with NERC. All direct costs are charged to the functional area to which they pertain. Indirect costs are charged to programs and supporting services based on estimates made by management, taking into account the nature of the expense and how it relates to the functional area.

NOTE B – FAIR VALUE MEASUREMENTS

WECC's financial instruments, including cash equivalents, accounts receivable, accounts payable, and accrued liabilities, are carried at cost which approximates their fair value due to the short-term nature of these instruments.

Fair value is defined as the amount that would be received for the sale of an asset or be paid to transfer a liability in an orderly transaction between market participants at the measurement date. In determining fair value, WECC uses various valuation approaches within a hierarchy for inputs used in measuring fair value that maximizes the use of observable inputs and minimizes the use of unobservable inputs by requiring that the most observable inputs be used when available. Observable inputs are inputs that market participants would use in pricing the asset or liability developed based on market data obtained from sources independent of WECC. Unobservable inputs are inputs that reflect WECC's estimates about the assumptions market participants would use in pricing the asset or liability developed based on the best information available in the circumstances. The following hierarchy prioritizes the inputs according to valuation methodologies used to measure fair value:

Level 1: Inputs are quoted prices (unadjusted) in active markets that are accessible for identical assets or liabilities as of the measurement date. Valuation of these products does not entail a significant degree of judgment since it is based on quote prices readily available in an active market. The types of instruments generally included in this category include listed equity securities.

Level 2: Inputs are observable for the asset or liability (either directly or indirectly) as of the measurement date, but are other than quoted prices in active markets as in Level 1. The types of instruments generally included in this category include unlisted derivative financial instruments and fixed income investments.

Level 3: Inputs are unobservable for the instrument and include situations where there is little, if any, market activity for the instrument. The inputs into the determination of fair value require significant judgment or estimation by the reporting entity. The types of instruments generally included in this category include privately held investments, partnership interests and similar interests, and beneficial interests in trusts held by others.

NOTE B – FAIR VALUE MEASUREMENTS – CONTINUED

In certain cases, the inputs used to measure fair value may fall into different levels of the fair value hierarchy. In such cases, for disclosure purposes the level in the fair value hierarchy within which the fair value measurement falls in its entirety is determined based on the lowest level input that is significant to the fair value measurement in its entirety. Fair value is a market-based measure considered from the perspective of a market participant rather than an entity-specific measure. Therefore, even when market assumptions are not readily available, WECC's own assumptions are set to reflect those that WECC believes a market participant would use in pricing the asset or liability at the measurement date.

Assets and liabilities measured at fair value on a recurring basis are summarized as follows:

	Fair Value Measurements as of December 31, 2013			
Description	Level 1	Level 2	Level 3	Total
Cash equivalents:				
Money market funds	$ 12,690,456	$ -	$ -	$ 12,690,456
Investments:				
Corporate bonds	-	502,754	-	502,754
Government agency bonds	-	2,440,179	-	2,440,179
	-	2,942,933	-	2,942,933
	$ 12,690,456	$ 2,942,933	$ -	$ 15,633,389

	Fair Value Measurements as of December 31, 2012			
Description	Level 1	Level 2	Level 3	Total
Cash equivalents:				
Money market funds	$ 35,340,465	$ -	$ -	$ 35,340,465
Commercial paper	-	89,941	-	89,941
	35,340,465	89,941	-	35,430,406
Investments:				
Commercial paper	-	2,138,625	-	2,138,625
Corporate bonds	-	1,128,748	-	1,128,748
Government agency bonds	-	2,501,506	-	2,501,506
Foreign bonds	-	161,234	-	161,234
	-	5,930,113	-	5,930,113
	$ 35,340,465	$ 6,020,054	$ -	$ 41,360,519

Money market funds are valued using observable prices in the active market. Commercial paper, corporate bonds, government agency bonds, and foreign bonds are valued using observable quoted prices of similar securities.

NOTE C – INVESTMENTS

Investments stated at fair value consisted of the following as of December 31:

	2013	2012
Government agency bonds	$ 2,440,179	$ 2,501,506
Corporate bonds	502,754	1,128,748
Commercial paper	-	2,138,625
Foreign bonds	-	161,234
	$ 2,942,933	$ 5,930,113

NOTE D – PROPERTY, EQUIPMENT, AND SOFTWARE

Property, equipment, and software consisted of the following as of December 31:

	2013	2012
Equipment	$ 12,284,835	$ 10,787,879
Software	9,542,253	6,774,760
Leasehold improvements	6,145,304	5,632,787
Furniture and fixtures	695,513	689,655
	28,667,905	23,885,081
Less accumulated depreciation and amortization	(18,972,742)	(14,562,013)
Construction in progress	1,347,519	2,641,399
Property, equipment and software - net	$ 11,042,682	$ 11,964,467

Depreciation and amortization expense for the years ended December 31, 2013 and 2012 was $4,541,466 and $3,766,592, respectively.

Assets purchased with grant funds are secured by a lien on the assets. For the years ended December 31, 2013 and 2012 such assets totaled $7,196,746 and $7,215,063, respectively, net of accumulated depreciation.

NOTE E – ACCOUNTS PAYABLE

Accounts payable consisted of the following as of December 31:

	2013	2012
Assessment payables	$ 4,296,396	$ 4,469,827
Trade payables	1,082,204	2,986,287
Other payables	1,799	101,273
	$ 5,380,399	$ 7,557,387

NOTE F – ACCRUED EXPENSES AND OTHER LIABILITIES

Accrued expenses consisted of the following as of December 31:

	2013	2012
Accrued wages and paid time off	$ 2,279,629	$ 1,672,000
Other accrued expenses	1,654,242	220,947
Accrued employee benefits expense	211,622	140,352
	$ 4,145,493	$ 1,892,947

Other liabilities consisted of the following as of December 31:

	2013	2012
Deferred rents	$ 1,665,866	$ 1,793,598
Subrecipient payable	-	5,257,558
	$ 1,665,866	$ 7,051,156

NOTE G – UNRESTRICTED NET ASSETS

WECC reports information regarding statutory and non-statutory related earnings to the Federal Energy Regulatory Commission in accordance with its Delegation Agreement with NERC dated October 16, 2007 as amended and restated January 1, 2011. As of December 31, the breakdown of such earnings included in unrestricted net assets consisted of the following:

	2013	2012
Non-statutory earnings	$ 8,642,963	$ 7,811,415
Statutory earnings	14,808,559	24,320,472
	$ 23,451,522	$ 32,131,887

NOTE H – COMMITMENTS AND CONTINGENCIES

1. Operating lease commitments

WECC has entered into non-cancelable operating leases for office space and office equipment. Future minimum lease payments under non-cancelable operating leases with terms of one year or more are as follows:

Year Ending December 31:		Amount
2014	$	2,092,821
2015		2,116,135
2016		2,156,515
2017		2,213,848
2018		2,185,758
Thereafter		2,277,703
	$	13,042,781

Total rent expense under non-cancelable operating leases was $2,034,309 and $1,828,431 for the years ended December 31, 2013 and 2012, respectively.

2. Sub-recipient grant

WECC committed up to a total of $22 million in federal grant awards to a sub-recipient. WECC records a payable in sub-recipient payable for payments due for the sub-recipient's performance of services in accordance with federal award agreements on a cost reimbursement basis. As of December 31, 2013 there was no remaining commitment related to this grant.

3. Other matters

WECC may incur a future loss from a monetary penalty assessed by its regulators. The amount of the potential monetary penalty associated with this action is uncertain. During 2013, WECC accrued its reasonable estimate of the expected penalty. Ultimate resolution of this matter could result in a loss that is less than or in excess of the amount accrued.

NOTE I – RETIREMENT PLAN

Employee benefit plan

WECC has a 401(k) Retirement Savings Plan (Plan) for eligible employees. The Plan requires WECC to make matching contributions equal to 50% of the first 6% of eligible compensation of the participating employees' contributions to the Plan. WECC may also make, at its discretion, supplemental contributions for eligible employees. Plan expense reflected in the accompanying statements of activities was $1,802,545 and $1,427,114 for the years ended December 31, 2013 and 2012, respectively.

NOTE J – FUNCTIONAL EXPENSES

The detail of functional expenses for the years ended December 31, are as follows:

Program services	2013	2012
Statutory services	$ 56,316,225	$ 51,997,258
Non-statutory services	927,738	936,470
	57,243,963	52,933,728
Support Services		
Management and general	11,440,990	8,432,074
	$ 68,684,953	$ 61,365,802

NOTE K – SUBSEQUENT EVENTS

WECC has evaluated events occurring between the end of its most recent fiscal year and May 27, 2014, the date the financial statements were available to be issued.

On October 10, 2013, WECC incorporated Peak Reliability (Peak), a not-for-profit organization headquartered in Vancouver, Washington, in preparation for the legal separation of its regional entity function from its reliability coordinator function. On January 1, 2014, Peak began operating as a wholly-owned subsidiary of WECC and assumed WECC's reliability coordinator function. On February 12, 2014, WECC received formal FERC approval of the sub-delegation of WECC's reliability coordinator function to Peak. Subsequent to this date, Peak began to operate independently of WECC (as an unconsolidated entity). Additionally, WECC subsequently transferred to Peak WECC's right, title and interest in all assets directly related to the reliability coordinator function, as well as related liabilities. The assets transferred consisted primarily of fixed assets with a total net book value of approximately $9.4 million and cash and other assets totaling approximately $6.7 million. The liabilities transferred consisted primarily of deferred rent and accrued employee compensation costs and totaled approximately $1.1 million.

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

North American Electric Reliability Corporation	**)** **)**	**Docket No. _____**

MOTION TO DISCONTINUE COMPLIANCE OBLIGATION OF THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION IN RESPONSE TO PARAGRAPH 629 OF ORDER NO. 693

In its March 16, 2007 Order,[1] the Federal Energy Regulatory Commission ("FERC" or the "Commission") directed the North American Electric Reliability Corporation ("NERC" or "ERO") to provide a quarterly informational filing regarding the timeframe to restore power to the auxiliary power systems of U.S. nuclear power plants following a blackout as determined during simulations and drills of system restoration plans. Pursuant to Rule 212 of the Commission's Rules of Practice and Procedure, 18 C.F. R. § 385.212 (2012), NERC hereby submits this motion requesting that the Commission discontinue NERC's obligations to (i) collect data and (ii) provide quarterly informational filings pursuant to the Commission's directive in Paragraph 629 of Order No. 693.

The purpose of conducting the data collection has been superseded by the development of Reliability Standard NUC-001-2 (Nuclear Plant Interface Coordination) and Reliability Standard EOP-005-2 (System Restoration from Blackstart Resources),

[1] *Mandatory Reliability Standards for the Bulk-Power System*, 118 FERC ¶ 61,218, FERC Stats. & Regs. ¶ 31,242, P 629 (Order No. 693), *Order on reh'g, Mandatory Reliability Standards for the Bulk-Power System*, 120 FERC ¶ 61,053 (Order No. 693-A) (2007).

which were approved by the Commission on January 21, 2010[2] and March 17, 2011[3], respectively. Further, after twenty-five quarters of data collection and reporting, NERC and the Commission now have a set of data points for each U.S. nuclear power plant.[4]

Finally, because the development of quarterly reports requires the outlay of substantial resources by Transmission Operators who collect and forward the information to the Regional Entity, by the Regional Entity which accumulates and assembles the data, and by NERC which combines the information into the filings and generate reports, NERC is seeking to redirect these industry, regional, and NERC resources to other reliability-related activities that impact the Bulk-Power System.

I. NOTICES AND COMMUNICATIONS

Notices and communications with respect to this filing may be addressed to the following:[5]

[2] *North American Electric Reliability Corporation*, 130 FERC ¶ 61,051 (2010).

[3] *System Restoration Reliability Standards*, Order No. 749, 134 FERC ¶ 61,215 (2011).

[4] Upon Board of Trustees approval, NERC began to collect nuclear data from U.S. Transmission Operators during the fourth quarter of 2007 and has continued to collect and report the data to the Commission on a quarterly basis.

[5] Persons to be included on the Commission's service list are indicated with an asterisk. NERC requests waiver of 18 C.F.R. § 385.203(b) to permit the inclusion of more than two people on the service list.

II. BACKGROUND

In Order No. 693, in response to comments offered by the U.S. Nuclear Regulatory Commission ("NRC") during the Notice of Proposed Rulemaking process, the Commission expressed its concern regarding the role and priority that nuclear power plants should have in Bulk-Power System restoration plans.[6] The NRC comments suggested that Reliability Standard EOP-005-1 include: (1) a requirement to record the amount of time required to restore power to the auxiliary power systems of nuclear power plants; (2) a provision requiring the affected transmission operators give high priority to restoration of off-site power to nuclear power plants even if a nuclear power plant is being powered from the nuclear power plant's onsite power supply, and (3) a provision stating that restoration shall not violate nuclear power plant minimum voltage and frequency requirements.[7] The Commission addressed the concern in its discussion of

[6] Order No. 693 at P 629.
[7] *See* NRC Dec. 28, 2006 Comments, Docket No. RM06-16-000 at 3-4.

Reliability Standard EOP-005-1 (System Restoration Plans). In Paragraph 629 of Order No. 693, the Commission issued the following directive:

> [t]he Commission directs the ERO to gather data, pursuant to § 39.5(f) of the Commission's regulations, from simulations and drills of system restoration on the time it takes to restore power to the auxiliary power systems of nuclear power plants under its data gathering authority and report that information to the Commission on a quarterly basis.

NERC, in its role as the ERO and in accordance with 18 C.F.R. § 39.2(d) (2012), is required to provide information as necessary to the Commission in order to implement section 215 of the Federal Power Act. That same regulation obligates users, owners, and operators of the Bulk-Power System to provide the ERO with information in support of this same objective. As noted above, NERC began collecting data in the fourth quarter of 2007 pursuant to the directive in Order No. 693 and has done so for twenty-five consecutive quarters.

III. MOTION TO DISCONTINUE PARAGRAPH 629 COMPLIANCE OBLIGATION

NERC respectfully requests the discontinuance of the compliance obligation under Paragraph 629 for three reasons, each of which is addressed below. First, since the issuance of Order No. 693 in March 2007, NERC has addressed the issues raised by the NRC in Order No. 693 through the development and approval of Reliability Standards NUC-001-2 and EOP-005-2. These Reliability Standards create a broader approach, and specifically address the off-site power capability concerns of the NRC. Second, the Commission and NERC have collected extensive sets of data on each of the nuclear plants in response to the directive in Paragraph 629. Lastly, because the purpose behind the data collection is now being accomplished by the much broader Reliability Standards

mentioned above, NERC can more efficiently utilize the time and resources of NERC, Regional Entities, and Transmission Operators to accomplish other reliability efforts.

A. Development of Two Reliability Standards with Broader Approach

1. Reliability Standard NUC-001-2

Since the issuance of Order No. 693 in March 2007, Reliability Standard NUC-001-2.1 (Nuclear Plant Interface Coordination) has been approved by the Commission, and contains explicit Requirements that address the off-site power concerns expressed by the NRC. Specifically, Reliability Standard NUC-001-2 requires a Nuclear Plant Generator Operator to coordinate operations and planning with Transmission Entities providing services relating to nuclear plant operating and off-site power delivery requirements. Reliability Standard NUC-001-2 also requires Nuclear Plant Generator Operators and Transmission Entities to implement interface agreements setting forth expectations and procedures for coordinating operations to meet the nuclear plant licensing requirements and System Operating Limits affecting nuclear plant operations.

As an example of how Reliability Standard NUC-001-2.1 provides a broader approach to the Commission directive in Order No. 693, currently-effective Requirement R9.2.2 of Reliability Standard NUC-001-2 requires Nuclear Plant Generator Operators to identify facilities, components, and configuration restrictions that are essential for meeting the Nuclear Interface Plant Requirements ("NPIRs"). Requirement R9.3.4 includes provisions to address mitigating actions needed to avoid violating NPIRs and to address periods when responsible Transmission Entities lose the ability to assess the capability of the electric system to meet the NPIRs. These provisions also include the obligation to notify the Nuclear Plant Generator Operator of this information within a specified time frame.

Additionally, Requirement R9.3.5 of Reliability Standard NUC-001-2 includes provisions for considering, during the restoration process, the requirements and urgency of a nuclear plant that has lost all off-site and on-site AC power. Requirement R4 provides that the applicable Transmission Entities shall incorporate the NPIRs into their operating analyses of the Bulk-Electric System, operate the Bulk-Electric System to meet the NPIRs, and inform the Nuclear Plant Generator Operator when the ability to assess the operation of the Bulk-Electric System is lost.

2. Reliability Standard EOP-005-2

In addition to the approval of Reliability Standard NUC-001-2, the Commission stated in its approval of Reliability Standard EOP-005-2 in Order No. 749 that Reliability Standard EOP-005-2 effectively addresses the Commission's directive in Order No. 693 to develop timeframes for training and review of restoration plan requirements to simulate contingencies and prepare operators for anticipated and unforeseen events.[8] The purpose of Reliability Standard EOP-005-2 is to ensure plans, facilities, and personnel are prepared to enable system restoration from Blackstart Resources, and to ensure that reliability is maintained during restoration and priority is placed on restoring the Interconnection. Requirement R1.2 of Reliability Standard EOP-005-2 provides that the Transmission Operator shall have a Reliability Coordinator-approved restoration plan that includes "[a] description of how all Agreements or mutually agreed upon procedures or protocols for off-site power requirements of nuclear power plants, including priority of restoration, will be fulfilled during System restoration."

[8] *See System Restoration Reliability Standards*, Order No. 749, 134 FERC ¶ 61,215 at P 17. *See also System Restoration Reliability Standards*, Notice of Proposed Rulemaking, 133 FERC ¶ 61,161 at P 19 (2010).

Requirements R3 and R4 set forth time frames for review of restoration plans. Frequency of testing Blackstart Resources is addressed in Requirement R9, and Requirement R6 requires each transmission operator to verify every five years through analysis of actual events, testing, or steady state and dynamic simulations that the restoration plan accomplishes its intended function. Requirements R10, R11 and R17 address training requirements.

B. Existing Nuclear Data Points

NERC has collected data from U.S. Transmission Operators pursuant to its obligation under Paragraph 629 of Order No. 693 since the fourth quarter of 2007. This information, which is collected by U.S. Transmission Operators, submitted to Regional Entities, then delivered to NERC for submission the Commission, includes a comprehensive collection of nuclear data including the following: identification of the reporting entity; name of the exercise, drill or simulation; date of the exercise, drill or simulation; name of the nuclear plant; unit designation; identification of the off-site power source; time duration measured from the time off-site power sources are lost to the time of restoration of the first off-site power source; and discussion of scenario assumptions or constraints impacting the restoration of the first off-site power source to the nuclear power plant. Because the information collected by NERC and reported to the Commission over the previous twenty-five quarters has been thorough and complete, NERC and the Commission have an extensive collection of accurate data points with regard to nuclear plants in the Commission's jurisdiction.

C. Unnecessary Utilization of Resources

The quarterly reports submitted to the Commission require a substantial expenditure of time, effort, and other valuable resources by Transmission Operators,

Regional Entities, NERC, and the industry as a whole. These are resources that could be utilized to accomplish more important reliability-related activities designed to improve the resiliency of the Bulk Power System. As described above, Transmission Operators, Regional Entities, and NERC have independent responsibilities related to the reporting requirements prescribed by Order No. 693. For example, Transmission Operators conduct a series of drills and exercises to collect information regarding the service restoration times for auxiliary power systems of nuclear power plants, and forward that information to their respective Regional Entities. Upon receipt of this information, the Regional Entities coordinate the collection of the requested data from its members and prepare a composite presentation. This is data which must then be validated by the Transmission Operators prior to submittal to NERC. Once NERC has received these data sets, NERC officials combine the information into cognizable filings and generate reports for final submission to the Commission.

As explained above, these filings and reports submitted to the Commission by NERC contain redundant and, in many cases, less robust, data than is provided to the Commission through Reliability Standards NUC-001-2.1 and EOP-005-2. Because the information provided to NERC and the Commission by these Reliability Standards is more than enough to satisfy the Commission's directive in Paragraph 629 of Order No. 693 and because NERC and the Commission already have extensive data related to U.S. nuclear power plants, NERC requests the ability to utilize these valuable resources in a more effective manner.

IV. CONCLUSION

In summary, on the basis that the more explicit Requirements contained in Reliability Standards NUC-001-2 and EOP-005-2 specifically address the off-site power

capability concerns of the NRC and establish timeframes for training and review of restoration plan requirements, and because NERC and the Commission have collected a series of data points regarding existing nuclear plants over the course of the last twenty-five quarters, NERC requests that the Commission discontinue NERC's obligation to collect and report this data, a Commission directive contained in Paragraph 629 of Order No. 693, and allow NERC to redirect the resources required by these obligations to other reliability-related matters.

Respectfully submitted,

development history (Exhibit F) and a demonstration that the proposed Reliability Standard meets the criteria identified by the Commission in Order No. 672[7] (Exhibit C). The NERC Board of Trustees adopted proposed Reliability Standard CIP-014-1 and the associated Implementation Plan on May 13, 2014.

I. EXECUTIVE SUMMARY

The Bulk-Power System is one of North America's most critical infrastructures and is uniquely critical as other infrastructure sectors depend on electric power. The reliability and security of the Bulk-Power System is fundamental to national security, economic development, and public health and safety. A major disruption in electric service due to extreme weather, equipment failure, a cybersecurity incident, or a physical attack could have far-reaching effects. Owners and operators of the Bulk-Power System must therefore institute measures to protect against and mitigate the impact of both conventional risks (e.g., extreme weather and equipment failures) and emerging security risks, such as physical attacks intended to damage or disable critical elements of the Bulk-Power System. As the Commission recognized in the Physical Security Order, "[p]hysical attacks to critical Bulk-Power System facilities can adversely impact the reliable operation of the Bulk-Power System, resulting in instability, uncontrolled separation, or cascading failures."[8] The purpose of the proposed Reliability Standard is to enhance physical security measures for the most critical Bulk-Power System facilities and thereby lessen the overall vulnerability of the Bulk-Power System to physical attacks.[9]

---

[7] *Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval, and Enforcement of Electric Reliability Standards*, Order No. 672, FERC Stats. & Regs. ¶ 31,204, at P 262, 321-37, *order on reh'g*, Order No. 672-A, FERC Stats. & Regs. ¶ 31,212 (2006).

[8] Physical Security Order at P 5.

[9] NERC's Reliability Standards already includes numerous Reliability Standards addressing both conventional risks and cybersecurity risks. Consistent with the Physical Security Order, the proposed Reliability Standard focuses on bolstering mandatory requirements addressing physical security risks.

The Commission's Physical Security Order provides a framework for a mandatory Reliability Standard that will represent a significant step forward in securing North America's most critical Bulk-Power System facilities. Proposed Reliability Standard CIP-014-1 requires Transmission Owners and Transmission Operators to protect those critical Transmission stations and Transmission substations, and their associated primary control centers that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. Consistent with the Physical Security Order, the proposed Reliability Standard requires Transmission Owners to take the following steps to address the risks that physical attacks pose to the reliable operation of the Bulk-Power System:

1) Perform a risk assessment of their systems to identify (i) their critical Transmission stations and Transmission substations, and (ii) the primary control centers that operationally (i.e., physically) control the identified Transmission stations and Transmission substations.

2) Evaluate the potential threats and vulnerabilities of a physical attack to the facilities identified in the risk assessment.

3) Develop and implement a security plan, based on the evaluation of threats and vulnerabilities, designed to protect against and mitigate the impact of physical attacks that may compromise the operability or recovery of the identified critical facilities.

Further, the proposed Reliability Standard requires Transmission Operators that operate primary control centers that operationally control any of the Transmission stations or substations identified by the Transmission Owner to also:

1) evaluate the potential threats and vulnerabilities of a physical attack to such primary control centers; and

2) develop and implement a security plan, based on the evaluation of threats and vulnerabilities, designed to protect against and mitigate the impact of physical attacks that may compromise the operability or recovery of such primary control centers.

Additionally, proposed Reliability Standard CIP-014-1 includes requirements for: (i) the protection of sensitive or confidential information from public disclosure; (ii) third party

verification of the identification of critical facilities as well as third party review of the evaluation of threats and vulnerabilities and the security plans; and (iii) the periodic reevaluation and revision of the identification of critical facilities, the evaluation of threats and vulnerabilities, and the security plans to help ensure their continued effectiveness.

The proposed Reliability Standard continues NERC's longstanding efforts to provide for the reliability and security of the Bulk-Power System. Even before the advent of mandatory Reliability Standards, NERC made grid security a priority, working with industry participants to address both physical and cyber security threats to critical assets. NERC currently addresses physical security through a combination of reliability tools, including security guidelines, training exercises, alerts, and mandatory standards. NERC's ongoing activities to addresses physical security issues include the following:

- NERC's Electricity Sector Information Sharing and Analysis Center ("ES-ISAC") monitors and analyzes Bulk-Power System events. The ES-ISAC then issues alerts through a secure portal to inform industry of physical and cyber threats, and to advise mitigation actions.
- NERC has security guidelines covering physical security response, best practices, and substation security.[10]
- Mandatory Reliability Standards that address certain aspects of physical security, including Reliability Standard EOP-004-2, which requires registered entities to report to NERC and law enforcement any physical damage to or destruction of a facility or threats to damage or destroy a facility, and Reliability Standard CIP-006-5, which includes requirements for the management of physical access to BES Cyber Systems.[11]
- NERC's Critical Infrastructure Protection Committee ("CIPC") was formed to advance the physical and cyber security of the critical electricity infrastructure of North America. Among other things, CIPC issues security guidelines and coordinates and communicates

[10] These guidelines address the following topics: (1) potential risks, (2) best practices that can help mitigate risks, (3) determination of organizational risks and practices appropriate to manage those risks, (4) identification of actions that industry should consider when responding to threat alerts received from the ES-ISAC and other organizations, (5) the scope of actions each organization may implement for its specific response plan, and (6) assessing and categorizing vulnerabilities and risks to critical facilities and functions.

[11] FERC approved Reliability Standard CIP-006-5 and it will becomes effective on April 1, 2016. CIP-006-5 replaces CIP-006-3c, which requires a physical security program for the protection of Critical Cyber Assets.

with organizations responsible for physical and cyber security in all electric industry segments, as well as other critical infrastructure sectors as appropriate.[12]

- NERC hosts grid security exercises, most recently GRIDEX II, to provide training and education opportunities for industry and government participants across North America.
- NERC hosts an annual Grid Security Conference ("GridSecCon") where experts discuss in detail a range of physical security issues.[13]
- NERC regularly participates in energy sector classified briefings both in the United States and Canada.
- NERC regularly works with industry and government partners on security matters through both formal and informal structures.[14]

This multi-pronged approach provides a framework for addressing the dynamic issues of physical and cyber security and helps to ensure a secure and reliable Bulk-Power System for North America. NERC's actions following a physical security incident at a California substation in April 2013 illustrate how NERC uses its multi-pronged approach to inform industry of security incidents and provide guidance on steps to mitigate and protect against future attacks.[15] Immediately after the incident, NERC's ES-ISAC issued an alert to industry to raise awareness of the seriousness and sophistication of the incident. Following this initial alert, NERC continued to work with the owner of the transmission substation to learn about the incident and communicate lessons learned to the industry. Additionally, NERC planned and participated in a 13-city outreach effort across the U.S. and Canada to raise awareness of the incident, inform industry of tactics and tools to

[12] The CIPC has a Physical Security Subcommittee that regularly discusses and analyzes physical security issues for education and awareness among the industry.

[13] NERC provides free physical security training in association with GridSecCon.

[14] For instance, NERC participates in the Electricity Sub-sector Coordinating Council, which provides a forum for communication between public and private sector partners in the Electricity Sub-sector

[15] The April 2013 incident did not result in a power outage. The owner of the substation worked diligently to maintain reliable operations and share lessons learned with government authorities and industry.

mitigate similar security risks, and provide a forum for industry participants to meet with state, local, and federal authorities to discuss physical security concerns in their regions.[16]

Although physical threats to the Bulk-Power System are not new, they are evolving and, as the incident in California illustrates, continue to demand NERC's and the industry's attention. The proposed Reliability Standard will enhance NERC's foundational physical security efforts and help ensure that owners and operators of the Bulk-Power System take the necessary steps to protect the Bulk-Power System from physical attacks. Additionally, as discussed further below, in approving proposed Reliability Standard CIP-014-1, the NERC Board of Trustees instructed NERC management to monitor and assess the implementation of the proposed Reliability Standard and provide regular updates to the Board of Trustees to measure the effectiveness of industry's implementation of the proposed Reliability Standard.

For the reasons discussed herein, NERC respectfully requests that the Commission approve the proposed Reliability Standard as just, reasonable, not unduly discriminatory, or preferential and in the public interest.

[16] This outreach effort involved, among others, NERC's ES-ISAC, the Department of Energy, FERC, the Department of Homeland Security, and the Federal Bureau of Investigation.

III. BACKGROUND

A. Regulatory Framework

By enacting the Energy Policy Act of 2005,[18] Congress entrusted the Commission with the duties of approving and enforcing rules to ensure the reliability of the Nation's Bulk-Power System, and with the duty of certifying an ERO that would be charged with developing and enforcing mandatory Reliability Standards, subject to Commission approval. Section 215(b)(1)[19] of the FPA states that all users, owners, and operators of the Bulk-Power System in the United States will be subject to Commission-approved Reliability Standards. Section 215(d)(5)[20] of the FPA authorizes the Commission to order the ERO to submit a new or modified Reliability

[17] Persons to be included on the Commission's service list are identified by an asterisk. NERC respectfully requests a waiver of Rule 203 of the Commission's regulations, 18 C.F.R. § 385.203 (2013), to allow the inclusion of more than two persons on the service list in this proceeding.

[19] *Id.* § 824(b)(1).

[20] *Id.* § 824o(d)(5).

Standard. Section 39.5(a)[21] of the Commission's regulations requires the ERO to file for Commission approval each Reliability Standard that the ERO proposes should become mandatory and enforceable in the United States, and each modification to a Reliability Standard that the ERO proposes to make effective.

The Commission has the regulatory responsibility to approve Reliability Standards that protect the reliability of the Bulk-Power System and to ensure that such Reliability Standards are just, reasonable, not unduly discriminatory or preferential, and in the public interest. Pursuant to Section 215(d)(2) of the FPA[22] and Section 39.5(c)[23] of the Commission's regulations, the Commission will give due weight to the technical expertise of the ERO with respect to the content of a Reliability Standard.

B. NERC Reliability Standards Development Procedure

The proposed Reliability Standard was developed in an open and fair manner and in accordance with the Commission-approved Reliability Standard development process.[24] NERC develops Reliability Standards in accordance with Section 300 (Reliability Standards Development) of its Rules of Procedure and the NERC Standard Processes Manual.[25] In its ERO Certification Order, the Commission found that NERC's proposed rules provide for reasonable notice and opportunity for public comment, due process, openness, and a balance of interests in developing Reliability Standards and thus satisfies certain of the criteria for approving Reliability

24 *Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval, and Enforcement of Electric Reliability Standards*, Order No. 672 at P 334, FERC Stats. & Regs. ¶ 31,204, *order on reh'g*, Order No. 672-A, FERC Stats. & Regs. ¶ 31,212 (2006).

25 The NERC Rules of Procedure are available at http://www.nerc.com/AboutNERC/Pages/Rules-of-Procedure.aspx. The NERC Standard Processes Manual is available at http://www.nerc.com/comm/SC/Documents/Appendix_3A_StandardsProcessesManual.pdf.

Standards. The development process is open to any person or entity with a legitimate interest in the reliability of the Bulk-Power System. NERC considers the comments of all stakeholders, and a vote of stakeholders and the NERC Board of Trustees is required to approve a Reliability Standard before NERC submits the Reliability Standard to the Commission for approval.

C. The Physical Security Order

On March 7, 2014, the Commission issued the Physical Security Order directing NERC to submit for approval, within 90 days of the order, one or more Reliability Standards to address physical security risks and vulnerabilities of critical facilities on the Bulk-Power System. Although the Commission recognized that NERC and the industry have "engaged in longstanding efforts to address the physical security of its critical facilities,"[26] the Commission maintained that "to carry out section 215 of the FPA and to provide for the reliable operation of the Bulk-Power System," it was necessary to develop a mandatory Reliability Standard to "specifically require entities to take steps to reasonably protect against physical security attacks on the Bulk-Power System."[27]

The Commission stated that the Reliability Standard(s) should require owners and operators of the Bulk-Power System to take a least three steps:

- First, they should be required to "perform a risk assessment of their systems to identify their 'critical facilities.'"[28]
- Second, they should be required to "evaluate the potential threats and vulnerabilities to those identified critical facilities."[29]

---

[26] Physical Security Order at P 12.

[27] *Id*. at P 5.

[28] *Id*. at P 6.

[29] *Id*. at P 8.

- Third and finally, they should be required to "develop and implement a security plan designed to protect against attacks to their critical facilities based on the assessment of the potential threats and vulnerabilities to their physical security."[30]

Additionally, the Commission stated that the proposed Reliability Standard(s) should also include: (1) procedures to ensure confidential treatment of sensitive or confidential information; (2) procedures for a third party to verify the list of identified facilities and allow the verifying entity, as well as the Commission, to add or remove facilities from the list of critical facilities; (3) procedures for a third party to review of the evaluation of threats and vulnerabilities and the security plan; and (4) a requirement that the identification of the critical facilities, the evaluation of the potential threats and vulnerabilities, and the security plans be periodically reevaluated and revised to ensure their continued effectiveness.

The following is a brief discussion of each of the elements that the Commission stated should be included in any proposed Reliability Standard.

Identification of Critical Facilities: The Commission explained that the purpose of the risk assessment to identify critical facilities is to "ensure that owners or operators of the Bulk-Power System identify those facilities that are critical to the reliable operation of the Bulk-Power System such that if those facilities are rendered inoperable or damaged, instability, uncontrolled separation or cascading failures could result on the Bulk-Power System."[31] As such, the Commission explained, a "critical facility" for purposes of the Physical Security Order "is one that, if rendered inoperable or damaged, could have a critical impact on the operation of the interconnection through instability, uncontrolled separation or cascading failures on the Bulk Power System."[32] The

---

30 Physical Security Order at P 9.

31 *Id*. at P 6.

32 *Id*. at P 6. The Commission recognized that "owners and operators may also take steps to protect facilities necessary to serve critical load on their systems, even if the inoperability or damage to those facilities would not result in instability, uncontrolled separation or cascading failures on the Bulk-Power System." *Id*. at n. 5. However, the Commission continued, the Reliability Standards should have a narrower purpose and apply only to

Commission explained that critical facilities will generally include critical substations and control centers.[33]

The Commission specified that "methodologies to determine these facilities should be based on objective analysis, technical expertise, and experienced judgment," but did not require NERC to adopt a specific type of risk assessment, nor did the Commission require that a mandatory number of facilities be identified as critical facilities under the Reliability Standard(s).[34] The Commission stated, however, that it did not expect there to be a large number of critical facilities identified under the any proposed Reliability Standard:

> Under the Reliability Standards, we anticipate that the number of facilities identified as critical will be relatively small compared to the number of facilities that comprise the Bulk-Power System. For example, of the many substations on the Bulk-Power System, our preliminary view is that most of these would not be "critical" as the term is used in this order. We do not expect that every owner and operator of the Bulk-Power System will have critical facilities under the Reliability Standard.[35]

Evaluation of Threats and Vulnerabilities: The Commission recognized that "threats and vulnerabilities may vary from facility to facility based on factors such as the facility's location, size, function, existing protections and attractiveness as a target."[36] Thus, the Commission stated, "the Reliability Standards should require the owners or operators to tailor their evaluation to the unique characteristics of the identified critical facilities and the type of attacks that can be realistically contemplated."[37] The Commission also stated that NERC should consider whether to

---

critical facilities that, if rendered inoperable or damaged, could have a critical impact on the operation of the interconnection through instability, uncontrolled separation or cascading failures on the Bulk-Power System. *Id*.

35 *Id*. at P 12.

36 *Id*. at P 8.

37 *Id*. at P 8.

require owners and operators to consult with entities with appropriate expertise as part of the evaluation process.[38]

Development and Implementation of a Security Plan: For the third step, the Commission recognized that there is not a "one size fits all" response to protect against physical security threats.[39] The Commission stated, however, that while the proposed Reliability Standard(s) need not "dictate specific steps an entity must take to protect against attacks on the identified facilities," it must "require that owners or operators of identified critical facilities have a plan that results in an adequate level of protection against the potential physical threats and vulnerabilities they face at the identified critical facilities."[40]

The Commission also stated that the Reliability Standard should allow applicable entities to consider elements of resiliency in carrying out these three steps, including system design, operation, and maintenance, and the sophistication of recovery plans and inventory management.[41]

Third Party Verification and Review: The Commission stated that the Reliability Standard should require that "the risk assessment used by an owner or operator to identify critical facilities [] be verified by an entity other than the owner or operator."[42] Additionally, the Physical Security Order provides that any proposed Reliability Standard "should include a procedure for the verifying entity, as well as the Commission, to add or remove facilities from an owner's or operator's list of critical facilities."[43] Similarly, the Commission stated that under the Reliability Standard the "determination of threats and vulnerability and the security plan should also be

42 *Id*. at P 11.

43 *Id*. at P 11.

reviewed by NERC, the relevant Regional Entity, the Reliability Coordinator, or another entity with appropriate expertise."[44]

Reevaluation and Revision: Given the dynamic nature of the Bulk-Power System and physical security threats, the Physical Security Order provides that any proposed Reliability Standard "should require that the identification of the critical facilities, the assessment of the potential risks and vulnerabilities, and the security plans be periodically reevaluated and revised to ensure their continued effectiveness."[45]

Confidentiality: Lastly, the Commission stated that the proposed Standard(s) should also include procedures that will ensure confidential treatment of sensitive or confidential information.[46] The Commission noted that compliance with a Reliability Standard including the three steps outlined in the order "could [lead to the development of] sensitive or confidential information that, if released to the public, could jeopardize the reliable operation of the Bulk-Power System. Guarding sensitive or confidential information is essential to protecting the public by discouraging attacks on critical infrastructure."[47]

D. Procedural History of Proposed Reliability Standard CIP-014-1

As further described in Exhibit F hereto, following the issuance of the Physical Security Order, the NERC Standards Committee, working with NERC staff, initiated Project 2014-04 Physical Security to develop a proposed Reliability Standard to satisfy FERC's directive to submit one or more physical security Reliability Standards by June 5, 2014 (i.e., within 90 days of the Physical Security Order). To facilitate meeting the 90-day timeline, the NERC Standards

46 *Id*. at P 10.

47 *Id*. at P 10.

Committee approved waivers to the Standard Processes Manual to shorten the comment and ballot periods for the Standards Authorization Request ("SAR") and draft Reliability Standard.[48] In accordance with a Standard Committee-approved waiver of the Standard Processes Manual, NERC posted the SAR for a seven-day informal comment period from March 21-28, 2014. A NERC-led industry Technical Conference on April 1, 2014 provided an opportunity for the standards drafting team, NERC, and industry participants to discuss issues related to applicability, identification of critical facilities, evaluation of threats and vulnerabilities, development and implementation of physical security plans, and a proposed implementation plan for the proposed Reliability Standard.

On April 10, 2014, following standard drafting team meetings, NERC posted the proposed Reliability Standard for an initial 15-day comment period and 5-day ballot in accordance with the Standard Committee-approved waiver.[49] The initial ballot received a quorum of 88.60% and an approval of 82.07%. After addressing industry comments on the initial draft of the proposed Reliability Standard, NERC posted the proposed Reliability Standard for a final ballot, which received a quorum of 95.53% and approval of 85.61%.

The NERC Board of Trustees adopted proposed Reliability Standard CIP-014-1 and the associated Implementation Plan on May 13, 2014. In approving the proposed Reliability Standard, the NERC Board of Trustees articulated its expectation that NERC management monitor and assess implementation of the proposed Reliability Standard on an ongoing basis, including:

- the number of assets identified as critical under the proposed Reliability Standard;

[48] The Standards Committee approved the waivers in accordance with Section 16 of the Standard Processes Manual.

[49] On April 9, 2014, the Standards Committee authorized the posting of the proposed Reliability Standard for comment and ballot.

- the defining characteristics of the assets identified as critical;
- the scope of security plans (i.e., the types of security and resiliency measures contemplated under the various security plans);
- the timeliness included in the security plans for implementing the security and resiliency measures; and
- industry's progress in implementing the proposed Reliability Standard.

As directed by the NERC Board of Trustees, NERC staff could use this information to provide regular updates to the NERC Board of Trustees, FERC staff, and other applicable regulatory authorities on industry's progress in securing critical Bulk-Power System facilities. NERC staff would monitor implementation in a manner that protects against the public disclosure of any sensitive or confidential information by, among other things, collecting and presenting aggregated information that cannot be attributed to any particular entity or transmission system.

IV. JUSTIFICATION FOR APPROVAL

As discussed below and in Exhibit C, proposed Reliability Standard CIP-014-1 satisfies the Commission's criteria in Order No. 672 and is just, reasonable, not unduly discriminatory or preferential, and in the public interest. The following section provides an explanation of: (1) the purpose of the proposed Reliability Standard; (2) the scope and applicability of the proposed Reliability Standard; (3) each of the requirements in the proposed Reliability Standard, including a discussion of how the requirements fulfil each element of the Physical Security Order and enhance Bulk-Power System security; (4) the protection of sensitive or confidential information under the proposed Reliability Standard; and (5) the enforceability of the proposed Reliability Standard.

A. Purpose and Overview of the Proposed Reliability Standard

The proposed Reliability Standard serves the vital reliability goal of enhancing physical security measures for the most critical Bulk-Power System facilities and lessening the overall

vulnerability of the Bulk-Power System to physical attacks. As the Commission noted, physical attacks on critical elements of the Bulk-Power System could have a significant impact on the reliable operation of the Bulk-Power System, potentially resulting in instability, uncontrolled separation, or Cascading.[50] Although the April 2013 attack on a California substation did not result in a power outage and reliability was maintained throughout the incident,[51] it emphasizes the evolving nature of physical security risks and the need to bolster physical security measures through a combination of NERC's reliability tools, including mandatory Reliability Standards, to provide for a secure and reliable Bulk-Power System for North America.

Proposed Reliability Standard CIP-014-1 will reinforce NERC's and the industry's longstanding efforts to protect the Bulk-Power System from physical attacks. Consistent with the Physical Security Order, the proposed Reliability Standard requires Transmission Owners and Transmission Operators to take steps to address threats and vulnerabilities to the physical security of those Bulk-Power System facilities that present the greatest risk to reliability if damaged or otherwise rendered inoperable. As explained further below, the proposed Reliability Standard contains six requirements designed to protect against and mitigate the impact of physical attacks on certain Transmission stations and Transmission substations, and their associated primary control centers, as follows:

- *Requirement R1* requires applicable Transmission Owners to perform risk assessments on a periodic basis to identify their Transmission stations and Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. The Transmission Owner must then identify the primary control center that operationally controls each of the identified Transmission stations or Transmission substations.

- *Requirement R2* provides that each applicable Transmission Owner shall have an unaffiliated third party with appropriate experience verify the risk assessment performed

[50] Physical Security Order at P 5.

[51] No customers lost service during the incident.

under Requirement R1. The Transmission Owner must either modify its identification of facilities consistent with the verifier's recommendation or document the technical basis for not doing so.

- *Requirement R3* requires the Transmission Owner to notify a Transmission Operator that operationally controls a primary control center identified under Requirement R1 of such identification. This requirement helps ensure that such a Transmission Operator has notice of the identification so that it may timely fulfill its resulting obligations under Requirements R4 and R5 to protect that primary control center.

- *Requirement R4* requires each applicable Transmission Owner and Transmission Operator to conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of its respective Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1, as verified under Requirement R2.

- *Requirement R5* requires each Transmission Owner and Transmission Operator to develop and implement documented physical security plan that covers each of its respective Transmission stations, Transmission substations, and primary control centers identified in Requirement R1, as verified under Requirement R2.

- *Requirement R6* provides that each Transmission Owner and Transmission Operator subject to Requirements R4 and R5 have an unaffiliated third party with appropriate experience review its Requirement R4 evaluation and Requirement R5 security plan. The Transmission Owner and Transmission Operator must either modify its evaluation and security plan consistent with the recommendation of the reviewer or document its reasons for not doing so.

B. Scope and Applicability of the Proposed Reliability Standard

As outlined above, the objective of proposed Reliability Standard CIP-014-1 is to identify and protect those critical Transmission stations and Transmission substations, and their primary control centers that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. This scope is consistent with the Commission's directive in the Physical Security Order that the mandatory Reliability Standard focus industry resources on protecting the highest priority facilities on the Bulk-Power System. As discussed above, while the Commission recognized that owners and operators of the Bulk-Power System may also take steps to protect other types of facilities (i.e., "facilities necessary to serve critical load"), the Commission directed NERC to develop one

or more mandatory Reliability Standards that apply to facilities that would have significant or widespread impact on the Bulk-Power System if damaged or rendered inoperable as a result of a physical attack, namely, those "facilities that…could have a critical impact on the operation of the interconnection through instability, uncontrolled separation or cascading failures on the Bulk-Power System."[52]

Provided this direction, NERC and the standard drafting team determined that the appropriate focus of the proposed Reliability Standard is Transmission stations and Transmission substations, which are uniquely essential elements of the Bulk-Power System. They make it possible for electricity to move long distances, connect generation to the grid, serve as critical links or hubs for intersecting power lines, and are vital to the delivery of power to major load centers. Because of this functionality, Transmission stations and Transmission substations are the types of facilities that could meet the criteria for critical facilities set forth in the Physical Security Order. Damage to or the inoperability of certain large Transmission stations or Transmission substations has the potential to result in widespread instability, uncontrolled separation, or Cascading within an Interconnection.

The use of the phrase "Transmission stations or Transmission substations" in the applicability section and the requirements of the proposed Reliability Standard clarifies that the Reliability Standard applies to both "Transmission stations" and "Transmission substations," as industry uses those terms. Although these terms are sometimes used interchangeably, some entities consider the term "Transmission substation" to refer specifically to a facility contained within a physical border (e.g., a fence or a wall) that contains one or more autotransformers. In contrast, some entities use the term "Transmission station" to refer specifically to a facility that

[52] Physical Security Order at P 6 and n. 5.

functions as a switching station or switchyard but does not contain autotransformers. The proposed Reliability Standard uses both "Transmission station" and "Transmission substation" to make clear that both types of facilities are subject to the proposed Reliability Standard.

Following its determination that Transmission stations or Transmission substations are the appropriate focus of the proposed Reliability Standard, the standard drafting team recognized that it was also necessary to identify and protect the primary control centers that operationally control any critical Transmission stations or Transmission substations. A primary control center is a control center that the Transmission Owner or Transmission Operator uses as the principal, permanently-manned site to operate a Bulk-Power System facility. A primary control center operationally controls a Transmission station or Transmission substation when the electronic actions from the control center can cause direct physical actions at the identified Transmission station or Transmission substation, such as opening a breaker. If a physical attack damages or otherwise renders such a primary control center inoperable, it could jeopardize the reliable operation of the critical Transmission station and Transmission substation in Real-time because it could remove or severely limit the ability to operate that critical facility remotely to respond to events on the system or otherwise ensure the reliable operation of a critical Bulk-Power System facility. Similarly, if perpetrators of a physical attack seize a primary control center that operationally controls a critical Transmission station or Transmission substation, the attackers could directly operate the critical Transmission station and Transmission substation to cause significant adverse reliability impacts.

Control centers that provide back-up capability and control centers that cannot operationally control a critical Transmission station or Transmission substation do not present similar direct risks to Real-time operations if they are the target of a physical attack. If a physical

attack damages or renders inoperable a backup control center for a critical Transmission station or Transmission substation, it would have no direct reliability impact in Real-time as the entity can continue operating the Transmission station or Transmission substation from its primary control center. Backup control centers are maintained in a dormant, stand-by state. A backup control center is a form of resiliency built into the system and is therefore intentionally redundant. So long as the proposed Reliability Standard requires the Transmission Owner or Transmission Operator to adequately protect its primary control center(s), it need not also require the Transmission Owner or Transmission Operator to protect its backup control center(s). Nothing in the proposed Reliability Standard, however, prohibits a Transmission Owner or Transmission Operator from considering whether to implement security measures at its backup control centers to strengthen the resiliency of its system and the ability to recover from a physical attack.

Similarly, the standard drafting team concluded that a physical attack at a control center of a Reliability Coordinator, for instance, that only has monitoring or oversight capabilities of a critical Transmission station or Transmission substation[53] would not have the direct reliability impact in Real-time contemplated in the Physical Security Order because operators at such control centers do not have the ability to physically operate critical Bulk-Power System facilities. Although certain monitoring and oversight capabilities might be lost as a result of a physical attack on such controls centers, the Transmission Owner or Transmission Operator that operationally controls the critical Transmission station or Transmission substation would be able to continue

[53] Certain Independent System Operators ("ISO") and Regional Transmission Organizations ("RTO"), for instance, operate control centers that monitor the transmission system within their footprint. These control centers, however, have no capability to physically operate those facilities. Rather, the ISO/RTO, in their role as Reliability Coordinator or Transmission Operator, only has the authority to coordinate or direct the action of the entity that actually physically operates the facility at local control centers.

operating its transmission system to prevent widespread instability, uncontrolled separation, or Cascading within an Interconnection.

Importantly, while the proposed Reliability Standard only covers primary control centers that operationally control a critical Transmission station or Transmission substation, the physical security protections required under Reliability Standard CIP-006-5 are applicable to primary and backup control centers of Reliability Coordinators, Balancing Authorities, Transmission Operators and Generation Operators irrespective of their ability to operationally control Bulk-Power System facilities. Reliability Standard CIP-006-5 requires entities to implement physical security measures designed to restrict physical access to locations containing High and Medium Impact BES Cyber Systems. Such locations include primary and backup control centers that perform the functional obligations of Reliability Coordinators, Balancing Authorities, Transmission Operators, and Generation Operators.[54] While the measures implemented under Reliability CIP-006-5 are primarily designed to protect against a cyber attack, these measures also help protect such control centers from physical attack. Additionally, NERC understands that Reliability Coordinators, Balancing Authorities, Transmission Operators, and Generation Operators typically include physical intrusion controls for their control centers, such as barriers and fences, card key access restrictions, and manned-security, and have done so for many years outside the scope of mandatory Reliability Standards. For the reasons stated above, however, the standard drafting team concluded that the scope of the proposed Reliability Standard should only provide additional physical security

[54] Specifically, Reliability Standard CIP-002-5.1 provides that BES Cyber System located at primary and backup control centers that perform the functional obligations of Reliability Coordinators, Balancing Authorities, Transmission Operators and Generation Operators are "High Impact" or "Medium Impact" BES Cyber Systems.

protections to those primary control centers that can physically operate critical Transmission stations and Transmission substations.[55]

The standard drafting team also considered whether the scope of the proposed Reliability Standard should include other types of facilities, such as generation facilities (e.g., a generation plant or a generator collector bus). The standard drafting team concluded that while the loss of a generation facility due to a physical attack may have local reliability effects, the loss of the facility is unlikely to have the widespread, uncontrollable impact that the Commission was concerned about in the Physical Security Order. A generation facility does not have the same critical functionality as certain Transmission stations and Transmission substations due to the limited size of generating plants, the availability of other generation capacity connected to the grid, and planned resilience of the transmission system to react to the loss of a generation facility. For example, as required by NERC's Transmission Planning (TPL) group of Reliability Standards, planning models must account for the loss of a generation facility, and entities must build resiliency into their systems to withstand an N-1 contingency (e.g., the loss of a generator or a generation switchyard). Accordingly, a physical attack that damages a generation facility is highly unlikely to destabilize the system, or cause uncontrolled separation or Cascading within an Interconnection. By limiting the scope of proposed Reliability Standard CIP-014-1 to Transmission stations,

[55] NERC recognizes that certain control centers categorized as "High Impact" or "Medium Impact" under Reliability Standard CIP-002-5.1 would not be subject to the proposed Reliability Standard. This reflects the different nature of cyber security risks and physical security risks at control centers. An asset that presents a heightened risk to the Bulk-Power System from a cyber security perspective may not present the same risk from a physical security perspective and vice versa. A primary cyber security concern for control centers is the corruption of data or information and the potential for operators to take action based on corrupted data or information. This concerns exists at control centers that operationally control Bulk-Power System facilities and those that do not. As such, there is no distinction in CIP-002-5.1 between these controls centers. As discussed above, however, such a distinction is appropriate in the physical security context. As such, the standard drafting team concluded that each type of control centers categorized as "High Impact" or "Medium Impact" under CIP-002-5.1 does not necessarily need the additional protections provided by the proposed Reliability Standard.

Transmission substations and their associated primary control centers, industry will be able to focus resources where it is most essential for maintaining reliable operations.

Furthermore, Transmission Owners must consider the loss of generation in determining which Transmission stations or Transmission substations are critical for purposes of the proposed Reliability Standard. Specifically, any determination of whether a Transmission station or Transmission substation is critical under the proposed Reliability Standard would account for the loss of generation facilities connected to that Transmission station or Transmission substation. As stated in the technical guidance attached to proposed Reliability Standard CIP-014-1, in performing its risk assessment to identify critical Transmission stations and Transmission substations, "[a]n entity could remove all lines, without regard to the voltage level, to a single Transmission station or Transmission substation and review the simulation results to assess system behavior to determine if Cascading of Transmission Facilities, uncontrolled separation, or voltage or frequency instability is likely to occur over a significant area of the Interconnection." By doing so, a Transmission Owner would account for the loss of any generation connected to that Transmission station or Transmission substation.

As also explained and illustrated via a one-line diagram in the technical guidance attached to the proposed Reliability Standard, a Transmission station or Transmission substation that interconnects generation on the high side of a Generator Step-up transformer is subject to the Requirement R1 risk assessment, provided that the Transmission station or Transmission substation meets the criteria listed in Applicability Section 4.1.1, discussed below. The Requirement R1 risk assessment would then take into account the impact of the loss of a Transmission station or Transmission substation on the high-side of a Generator Step-up transformer that serves as an interconnection point for one or multiple generation resources.

Importantly, nothing in the proposed Reliability Standard precludes an entity from taking steps to protect against and mitigate the impact of physical attacks to generation facilities and control centers outside the scope of the proposed Reliability Standard, or any other Bulk-Power System element that does not meet the criteria of the proposed Reliability Standard. Many Reliability Coordinators, Balancing Authorities, Transmission Operators, Generation Owners, and Generation Operators are already taking steps to protect the physical security of their Bulk-Power System facilities, such as control centers and large generation facilities. NERC will continue to use its various reliability tools (e.g., security guidelines, training exercises, reliability assessments, and alerts) to inform industry of security threats and vulnerabilities and to provide guidance on steps industry participants should take to improve the security of all of their facilities to provide for a secure and reliable Bulk-Power System. Further, as noted above, Reliability Standards EOP-004-2 and CIP-006-5 address certain aspects of physical security.

Given the standard drafting team's determination on the appropriate scope of facilities subject to the proposed Reliability Standard, the proposed Reliability Standard provides requirements applicable to Transmission Owners and Transmission Operators, which are the functional entities that own and/or physically operate Transmission stations, Transmission substations and associated primary controls centers. Applying the proposed Reliability Standard to every registered Transmission Owner, however, would be overly broad, requiring many Transmission Owners to perform a risk assessment under Requirement R1 even though their systems do not include any Transmission stations or Transmission substations that would meet the Commission's criteria for critical facilities specified in the Physical Security Order. As the Commission recognized, "the number of facilities identified as critical will be relatively small compared to the number of facilities that comprise the Bulk-Power System" and many owners and

operators of the Bulk-Power System will not have critical facilities under the Reliability Standard.[56] NERC and the standard drafting team thus sought to establish a bright-line applicability threshold that would be broad enough to capture all Transmission Owners that could potentially have "critical facilities" while excluding Transmission Owners who do not own such facilities.

To that end, Applicability Section 4.1.1 of the proposed Reliability Standard provides that the proposed Reliability Standard applies only to those Transmission Owners that own a Transmission station or Transmission substation that meets the description of Transmission Facilities described in Applicability Section 4.1.1.1 through 4.1.1.4. The Transmission Facilities included in Applicability Section 4.1.1.1 through 4.1.1.4 match the "Medium Impact" Transmission Facilities listed in Attachment 1 of Reliability Standard CIP-002-5.1.[57] The standard drafting team determined that using the criteria for "Medium Impact" Transmission Facilities set forth in Reliability Standard CIP-002-5.1 is an appropriate applicability threshold as the Commission has acknowledged that it is as a technically sound basis for identifying Transmission Facilities, which, if compromised, would present an elevated risk to the Bulk-Power System.[58]

Applicability Section 4.1.1 establishes an overinclusive threshold for defining which Transmission Owners are subject to the proposed Reliability Standard and must perform a risk assessment in accordance with Requirement R1. NERC expects that a number of Transmission Owners required to perform risk assessments under Requirement R1 will not identify any

---

[56] Physical Security Order at P 12.

[57] Specifically, the "Medium Impact" facilities described in Sections 2.4, 2.5, 2.6, and 2.7 of Attachment 1 of CIP-002-5.1.

[58] *Version 5 Critical Infrastructure Protection Reliability Standards*, Order No. 791, 78 Fed. Reg. 72,755 (Dec. 3, 2013), 145 FERC ¶ 61,160, Order No. 791-A, 146 FERC ¶ 61,188 (2013). As described in CIP-002-5.1, the failure of a Transmission station or Transmission substation that meets the Medium Impact criteria could have the capability to result in exceeding one or more Interconnection Reliability Operating Limits.

Transmission stations or Transmission substations that, if damaged or rendered inoperable as a result of physical attack, pose a risk of widespread instability, uncontrolled separation, or Cascading within an Interconnection. Nevertheless, NERC and the standard drafting team concluded that using the "Medium Impact" criteria was a prudent approach to balancing the need for a Reliability Standard that is broad enough to capture all critical Transmission stations and Transmission substations while narrowing the scope of the Reliability Standard so as not to unnecessarily include entities that do not own or operate such critical facilities. During the development of the proposed Reliability Standard, the standard drafting team considered several other options for bright-line criteria but could not technically justify any higher threshold that would ensure the necessary Transmission stations and Transmission substations would be subject to the proposed Reliability Standard. Further, entities are already identifying whether they have "Medium Impact" facilities for purposes of transitioning to compliance with Reliability Standard CIP-002-5.1. As such, using the "Medium Impact" criteria in the applicability section of the proposed Reliability Standard does not create an additional burden on entities and complements the efforts already underway to comply with the CIP Reliability Standards approved in Order No. 791.

Transmission Operators are also subject to the proposed Reliability Standard (Applicability Section 4.1.2) to ensure that where the Transmission Owner does not operate the primary control center that operationally controls an identified Transmission station or Transmission substation, the Transmission Operator of that control center takes the steps required to protect that control center from physical attack. As discussed below, however, a Transmission Operator only has performance obligations under the proposed Reliability Standard if an applicable Transmission Owner notifies the Transmission Operator under Requirement R3 that the Transmission Operator

operates a primary control center that operationally controls a Transmission station or Transmission substation identified according to Requirement R1 (and verified under Requirement R2).

Finally, the standard drafting team considered whether it was necessary to include functional entities such as Reliability Coordinators or Balancing Authorities that have wide-area view of the Bulk-Power System as applicable entities under the proposed Reliability Standard. Specifically, whether such entities should be obligated to participate in the identification of critical facilities or have any responsibilities with respect to preventing or responding to physical attacks. Ultimately, for the reasons discussed below, the standard drafting team determined that expanding the scope beyond Transmission Owners and Transmission Operators would not provide any additional security benefits.

First, the standard drafting team concluded that the framework established in the proposed Reliability Standard accounts for a wide-area view and makes it unnecessary to include additional functional entities for purposes of identifying critical facilities. As explained further below, Transmission Owners are obligated to study in their risk assessments all of the categories of Transmission Facilities listed in Applicability section 4.1.1, including:

> Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Coordinator, or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

Accordingly, Transmission Owners are required to analyze Transmission stations and Transmission substations previously identified by Reliability Coordinators, Planning Coordinators, or Transmission Planners as potentially having a critical impact on the Bulk-Power

System.[59] Further, as noted above, the Commission already has acknowledged that the types of facilities listed in the applicability section reflect the subset of Transmission facilities that present an elevated risk to the Bulk-Power System.

Second, as further explained below, Requirement R2 obligates Transmission Owners to select an unaffiliated third party to verify their Requirement R1 risk assessment to help ensure that the identification of critical facilities captured the appropriate facilities. Requirement R2, Part 2.1 requires the verifying entity to be either a registered Planning Coordinator, Transmission Planner, or Reliability Coordinator, or an entity that has transmission planning or analysis experience. Through this verification process, Transmission Owners can work with a third party with a wide-area view of the Bulk-Power System to help identify critical facilities that would have widespread impacts if compromised as a result of a physical attack.

Lastly, the standard drafting team concluded that it was not necessary to extend the applicability of the proposed Reliability Standard to Reliability Coordinators or Balancing Authorities for purposes of imposing responsibilities on such entities with respect to preventing or responding to physical attacks. The standard drafting team determined that any security measures to protect against or mitigate the impact of physical attacks on a particular facility most appropriately fall on the owner or operator of that facility, not another functional entity. Reliability Coordinators and Balancing Authorities, however, continue to have an important role, outside of the proposed Reliability Standard, in helping the system respond to or recover from a physical attack. Other Reliability Standards set forth the duties of functional entities in responding to events on the Bulk-Power System. The Emergency Preparedness and Operations (EOP) group of

[59] Interconnection Reliability Operating Limit are defined in the NERC Glossary as "[a] System Operating Limit that, if violated, could lead to instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Bulk Electric System."

Reliability Standards, for instance, include requirements for, among other things, emergency operations planning and coordination between the Reliability Coordinators, Balancing Authorities and Transmission Operators.[60] Proposed Reliability Standard CIP-014-1 will complement these Reliability Standards.

C. Requirements in the Proposed Reliability Standard

The following is an explanation of each of the requirements in the proposed Reliability Standard, including a discussion of how each requirement satisfies the elements of the Physical Security Order and enhances the reliability and security of the Bulk-Power System.

Requirement R1 addresses the directive in the Physical Security Order that entities should be required to perform a risk assessment of their systems to identify their critical facilities.[61] It also satisfies the directive for the periodic reevaluation and revision of the identification of critical facilities.[62] Requirement R1 requires Transmission Owners to conduct periodic risk assessment to identify their critical Transmission stations and Transmission substations. Requirement R1 provides:

> **R1.** Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria

---

60 For example, EOP-001-2.1b, Requirements R2 requires each Balancing Authority and Transmission Operator to develop, maintain, and implement a set of plans (i) to mitigate operating emergencies for insufficient generating capacity, (ii) to mitigate operating emergencies on the transmission system, (iii) for load shedding, and (iv) to mitigate operating emergencies. Under EOP-001-2.1b, Requirement R6 each Balancing Authority and Transmission Operator is also required to coordinate its operating plans with other Balancing Authorities and Transmission Operators. Further, Reliability Standard EOP-005-2, Requirement R1 requires the Transmission Operator to have a Reliability Coordinator approve its system restoration plan. Requirement R13 of that standard requires the Transmission Operator to have written agreements or mutually agreed to procedures with Generator Operators with blackstart resources, including testing requirements for those resources. Reliability Standard EOP-006-2 requires the Reliability Coordinator to have a Reliability Coordinator Area restoration plan and to coordinate restoration plans with other Reliability Coordinators and review the restoration plans of Transmission Operators within its Reliability Coordinator Area. The Reliability Coordinator is also required to work with Transmission Operators s, Generation Operators and adjacent Reliability Coordinators to monitor restoration and provide assistance if necessary.

61 Physical Security Order at P 6.

62 *Id*. at P 11.

specified in Applicability Section 4.1.1. The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify the Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection.

1.1 Subsequent risk assessments shall be performed:

- At least once every 30 calendar months for a Transmission Owner that has identified in its previous risk assessment (as verified according to Requirement R2) one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection; or

- At least once every 60 calendar months for a Transmission Owner that has not identified in its previous risk assessment (as verified according to Requirement R2) any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection.

1.2 The Transmission Owner shall identify the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment.

The applicability section and Requirement R1 effectively establish a two-step process for identifying critical facilities under the proposed Reliability Standard. First, a Transmission Owner must determine whether it has any Transmission stations or Transmission substations that meet the criteria in Applicability Section 4.1.1. If it does not, the Transmission Owner is not an applicable entity and has no performance obligations under the proposed Reliability Standard. If it does own Transmission stations or Transmission substations described in the applicability section, the Transmission Owner must then assess, in accordance with Requirement R1, whether any of those Transmission stations or Transmission substations, if rendered inoperable or damaged as a result of a physical attack, could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection.

Requirement R1 mandates that the risk assessment "consist of a transmission analysis or transmission analyses" to help ensure that the methods used to identify critical facilities are based on objective analysis, technical expertise, and experienced judgment, consistent with the Commission's directive. The proposed Reliability Standard, however, does not require that a Transmission Owner use a specific method to perform its analysis. Transmission Owners have the ability to use the method that best suits their needs and the characteristics of their system. For example, an entity may perform a power flow analysis, which, depending on the characteristics of its system, could include a stability analysis at a variety of load levels as well as steady state or short circuit analyses under various system conditions and configurations.[63] The standard drafting team concluded that mandating a specific method would not adequately consider regional, topological, and system circumstances. Regardless of the method used to perform the risk assessment, however, Transmission Owners must be able to demonstrate to the verifier under Requirement R2 and the ERO during its compliance monitoring activities that it used an appropriate method to meet its affirmative obligation to identify all critical Transmission stations and Transmission substations under Requirement R1.[64]

As set forth in the Implementation Plan for proposed Reliability Standard CIP-014-1, Transmission Owners must complete their initial risk assessments on or before the effective date of the proposed Reliability Standard. Consistent with the Commission's directive, Requirement R1 also requires the periodic reevaluation and revision of the identification of critical facilities to

---

[63] The guidance section of the proposed Reliability Standard provides entities guidance on ways to perform the transmission analysis to meet the requirements of the standard.

[64] If a Transmission Owner patently fails to develop a method reasonably designed to identify its critical facilities (e.g., the assumptions underlying the study are patently deficient), the ERO could find that the Transmission Owner is non-compliant with Requirement R1 and exercise its enforcement authority against that Transmission Owner, as appropriate. As discussed below, in cases where the Transmission Owner demonstrates that the verifying entity is qualified, unaffiliated with the Transmission Owner, and the scope of their verification is clear, auditors are encouraged to rely on the verifications.

help ensure that the risk assessments remain current with projected conditions and configurations of the Transmission Owner's system. As provided in Requirement R1, Part 1.1, however, the timing of subsequent risk assessments depends on whether the Transmission Owner has previously identified any critical facilities. Specifically, if a Transmission Owner identified in its previous risk assessment (as verified according to Requirement R2) one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection, it must conduct its next risk assessment within 30 calendar months of its previous risk assessment. The standard drafting team concluded that a 30-month period was appropriate given the long lead times required for a Transmission Owner to change its system, whether through construction of new facilities or otherwise, in a manner that would result in additional Transmission stations or Transmission substations meeting the criteria of a critical facility for purposes of the proposed Reliability Standard. Additionally, the 30-month period aligns with the requirement to consider both existing Transmission stations and Transmission substations and those planned to be in service within 24 months.

For a Transmission Owner that did not identify any critical facilities in its previous risk assessment (as verified according to Requirement R2), Requirement R1 requires the Transmission Owner to conduct its next risk assessment within 60 calendar months of its previous risk assessment. The standard drafting team concluded that because such entities are unlikely to see material changes to their systems in the Near-Term Planning Horizon that would result in a new or existing Transmission station or substation becoming critical, a 60-month period for completing subsequent risk assessments was appropriate.

Following the identification of any critical Transmission stations and Transmission substations, Part 1.2 requires the Transmission Owner to identify the primary control center that operationally controls each identified Transmission station and Transmission substation. As noted above, it is important to protect such primary control centers from a physical attack to help ensure that they are not damaged, rendered inoperable or misoperated in a way that could cause significant adverse reliability impacts.

Requirement R2 addresses the Commission directive that the Reliability Standard should (i) require that an entity other than the owner or operator verify the risk assessment, and (ii) include a procedure for the verifying entity to add or remove facilities from an owner's or operator's list of critical facilities.[65] Requirement R2 provides:

> **R2.** Each Transmission Owner shall have an unaffiliated third party verify the risk assessment performed under Requirement R1. The verification may occur concurrent with or after the risk assessment performed under Requirement R1.
>
> **2.1.** Each Transmission Owner shall select an unaffiliated verifying entity that is either:
>
> - A registered Planning Coordinator, Transmission Planner, or Reliability Coordinator; or
>
> - An entity that has transmission planning or analysis experience.
>
> **2.2.** The unaffiliated third party verification shall verify the Transmission Owner's risk assessment performed under Requirement R1, which may include recommendations for the addition or deletion of a Transmission station(s) or Transmission substation(s). The Transmission Owner shall ensure the verification is completed within 90 calendar days following the completion of the Requirement R1 risk assessment.
>
> **2.3.** If the unaffiliated verifying entity recommends that the Transmission Owner add a Transmission station(s) or Transmission substation(s) to, or remove a Transmission station(s) or Transmission substation(s) from, its identification under Requirement R1, the Transmission Owner shall either, within 60 calendar days of completion of the verification, for each

[65] Physical Security Order at P 11.

recommended addition or removal of a Transmission station or Transmission substation:

- Modify its identification under Requirement R1 consistent with the recommendation; or

- Document the technical basis for not modifying the identification in accordance with the recommendation.

2.4. Each Transmission Owner shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third party verifier and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

The purpose of the verification requirement is to have a third party with requisite expertise provide an independent assessment of the Transmission Owner's identification of critical facilities. As noted above, physical attacks on certain Transmission stations and Transmission substations could have a significant adverse impact on the reliable operation of the Bulk-Power System. Requirement R2 therefore builds in a layer of independence to help ensure that the Transmission Owner identifies and protects all critical Transmission stations and Transmission substations on its system. The third-party verification will also help provide additional assurance, consistent with the Physical Security Order, that the "methodologies to determine these facilities [are] based on objective analysis, technical expertise, and experienced judgment."[66]

To meet the intent of this element of the Physical Security Order, Requirement R2 requires that the verifying entity meet certain criteria. First, the verifying entity must be an "unaffiliated third party." For purposes of this Reliability Standard, the term "unaffiliated" means that the selected verifying entity cannot be a corporate affiliate (i.e., the verifying entity cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission

[66] *See* Physical Security Order at P 6.

Owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit.[67]

Additionally, the verifying entity must be a registered Planning Coordinator, Transmission Planner, or Reliability Coordinator, or another entity that has transmission planning or analysis experience. In all cases, but particularly if the Transmission Owner does not select a registered Planning Coordinator, Transmission Planner, or Reliability Coordinator, the Transmission Owner must demonstrate that the selected verifier has the requisite expertise to perform the verification. The guidance section of the proposed Reliability Standard includes a discussion of characteristics that Transmission Owners should consider when selecting a verifying entity, including: (1) experience in power system studies and planning; (2) understanding of the NERC MOD standards, TPL standards, and facility ratings as they pertain to planning studies; and (3) familiarity with the Interconnection within which the Transmission Owner is located. In cases where the Transmission Owner shows that the verifying entity is qualified, unaffiliated with the Transmission Owner, and the scope of their verification is clear, auditors are encouraged to rely on the verifications. In cases where the verifying entity lacks the qualifications specified in Requirement R2, the verifier is not sufficiently independent, or where the scope of the verification is unclear, it is expected that auditors will apply increased audit testing of Requirements R1.

Requirement R2 also provides that the "verification may occur concurrent with or after the risk assessment performed under Requirement R1." This provision is designed to provide the Transmission Owner the flexibility to work with the verifying entity throughout the risk

[67] The prohibition on Transmission Owners using a corporate affiliate to conduct the verification, however, does not prohibit a governmental entity (e.g., a city, a municipality, a U.S. federal power marketing agency, or any other political subdivision of U.S. or Canadian federal, state, or provincial governments) from selecting as the verifying entity another governmental entity within the same political subdivision. The verifying entity, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could collaborate with their unaffiliated verifying entity to perform the risk assessment under Requirement R1 such that both Requirement R1 and Requirement R2 are satisfied concurrently. The intent of Requirement R2 is to have an entity other than the owner or operator of the facility be involved in the risk assessment process and have an opportunity to provide input, rather than to simply have an after-the-fact verification. Accordingly, Requirement R2 allows entities to have a two-step process, where the Transmission Owner performs the risk assessment and subsequently has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the risk assessment.

Consistent with the Commission's directive, Requirement R2 includes a process for the verifying entity to recommend the addition or removal of facilities from a Transmission Owner's list of identified facilities. Part 2.2 specifies that the verification "may include recommendations for the addition or deletion of a Transmission station or Transmission substation." Part 2.3 then requires the Transmission Owner to address those recommendations in one of two ways. The Transmission Owner must either: (i) modify its identification under Requirement R1 consistent with the verifier's recommendation(s); or (ii) document the technical basis for not modifying the identification in accordance with the recommendation. Requiring documentation of the technical basis for not modifying the identification in accordance with the recommendation will help ensure that a Transmission Owner meaningfully considers the verifier's recommendations and follows those recommendations unless it can technically justify its reasons for not doing so. To comply with Part 2.3, the technical justification must be sound and based on acceptable approaches to conducting transmission analyses. During its compliance monitoring activities, the ERO will

review that documentation in assessing the Transmission Owner's compliance with the proposed Reliability Standard.

Because the Commission has existing authority to enforce NERC Reliability Standards, the proposed Reliability Standard does not also include a procedure for the Commission to add or remove a facility from a Transmission Owner's list of identified facilities.[68] As provided in Section 215(e)(3) of the FPA and Section 39.7(f) of the Commission's regulations, the Commission has the authority, on its own motion, to enforce NERC Reliability Standards. In exercising that authority, the Commission, like NERC and the Regional Entities, can effectively require Transmission Owners to add or remove facilities if its finds that the Transmission Owner did not comply with its duty under Requirement R1 to identify critical Transmission stations or Transmission substations. As stated above, a Transmission Owner must be able to demonstrate that its method for performing its risk assessment was technically sound and reasonably designed to identify its critical Transmission stations and Transmission substations. If, in the course of assessing an entity's compliance with the proposed Reliability Standard, NERC, a Regional Entity, or FERC finds that the entity's transmission analysis was patently deficient and that the Requirement R2 verification process did not cure those deficiencies, they could use their enforcement authority to compel Transmission Owners to re-perform the risk assessment using assumptions designed to identify the appropriate critical facilities.

Requirement R2 also addresses the timing of the verifications. As provided in Part 2.2, the Transmission Owner is responsible for ensuring that the verifier completes the verification within 90 calendar days of the completion of each Requirement R1 risk assessment. The Transmission Owner then has 60 calendar days to modify its identification consistent with any recommendations

[68] *See* Physical Security Order at 11.

or document the technical basis for not doing so. The standard drafting team concluded that such timeframes appropriately balance the need to accomplish these tasks quickly while providing sufficient time for the Transmission Owner to complete the verification.

Lastly, consistent with the Commission's directive to protect confidential or sensitive information from public disclosure,[69] Part 2.4 creates an affirmative obligation on the Transmission Owner to guard against the release of any sensitive or confidential information, such as the list or location of critical Transmission Stations and Substations, to the public. As the Commission stated, if this information is disclosed to the public, it could jeopardize the reliable operation of the Bulk-Power System. Part 2.4 requires Transmission Owners to implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third party verifier or otherwise developed pursuant to this Reliability Standard from public disclosure. Below is an additional discussion of confidentiality issues under the proposed Reliability Standard.

Requirement R3 provides:

> **R3.** For a primary control center(s) identified by the Transmission Owner according to Requirement R1, Part 1.2 that a) operationally controls an identified Transmission station or Transmission substation verified according to Requirement R2, and b) is not under the operational control of the Transmission Owner: the Transmission Owner shall, within seven calendar days following completion of Requirement R2, notify the Transmission Operator that has operational control of the primary control center of such identification and the date of completion of Requirement R2.
>
> **3.1.** If a Transmission station or Transmission substation previously identified under Requirement R1 and verified according to Requirement R2 is removed from the identification during a subsequent risk assessment performed according to Requirement R1 or a verification according to Requirement R2, then the Transmission Owner shall, within seven calendar days following the verification or the subsequent risk assessment,

[69] Physical Security Order at 10.

notify the Transmission Operator that has operational control of the primary control center of the removal.

Requirement R3 requires the Transmission Owner to notify a Transmission Operator that operationally controls a primary control center identified under Requirement R1 (as verified under Requirement R2) of such identification. Part 3.1 requires a Transmission Owner to notify the Transmission Operator of any removals from identification. This requirement helps ensure that such Transmission Operators have notice as to whether they have any obligations under the proposed Reliability Standard to protect any of their control centers.

Requirement R4 addresses the Commission's directive to require owners and operators evaluate the potential threats and vulnerabilities to their critical facilities.[70] It also satisfies the directive for the periodic reevaluation and revision of the evaluation of critical facilities.[71] Requirement R4 provides:

> R4. Each Transmission Owner that identified a Transmission station, Transmission substation, or a primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2. The evaluation shall consider the following:
>
> **4.1.** Unique characteristics of the identified and verified Transmission station(s), Transmission substation(s), and primary control center(s);
>
> **4.2.** Prior history of attack on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and
>
> **4.3.** Intelligence or threat warnings received from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), U.S. federal and/or Canadian governmental agencies, or their successors.

---

[70] Physical Security Order at P 8.

[71] *Id*. at P 11.

Although Requirement R4 does not mandate a specific, one-size-fits-all method for evaluating potential threats and vulnerabilities, it obligates applicable entities to consider elements that form the foundation of an effective evaluation of security threats and vulnerabilities. First, consistent with the Commission's acknowledgement that threats and vulnerabilities may vary from facility to facility, Part 4.1 requires that the Transmission Owner or Transmission Operator tailor their evaluations to the unique characteristics of the facility in question so as to consider factors such as the facility's location, size, function, existing protections, and attractiveness as a target. Second, entities must consider prior history of attack on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events (Part 4.2). Lastly, entities must consider intelligence or threat warnings (Part 4.3). Collectively, Parts 4.1-4.3 help to ensure that the Transmission Owner and Transmission Operator tailor their evaluations to "the types of attacks that can be realistically contemplated," as the Commission directed.[72] The guidance section of the proposed Reliability Standard provides a list of resources that entities may consult for information on conducting effective threat and vulnerability evaluations.

Consistent with the directive in the Physical Security Order that the Reliability Standard require periodic evaluations, Transmission Owners and Transmission Operators must conduct an evaluation following each Requirement R1 risk assessment. Although Requirement R4 does not explicitly state when the evaluation of threats and vulnerabilities must occur, Requirement R5, requires that entities develop their security plan(s) within 120 calendar days following completion of the Requirement R2 verifications. Because the development of the Requirement R5 security plan(s) is dependent on the completion of the Requirement R4 evaluation, Transmission Owners

[72] Physical Security Order at P 8.

and Transmission Operators must simply complete the Requirement R4 evaluation in time to comply with the 120-day period for completing the Requirement R5 security plan(s).

Requirement R5 addresses the Commission's directive to require owners and operators to develop and implement a security plan designed to protect against physical attacks to their critical facilities based on the assessment of the potential threats and vulnerabilities to those facilities.[73] It also satisfies the directive for the periodic reevaluation and revision of the security plans.[74] Requirement R5 provides:

> **R5.** Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s). The physical security plan(s) shall be developed within 120 calendar days following the completion of Requirement R2 and executed according to the timeline specified in the physical security plan(s). The physical security plan(s) shall include the following attributes:
>
> **5.1.** Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.
>
> **5.2.** Law enforcement contact and coordination information.
>
> **5.3.** A timeline for executing the physical security enhancements and modifications specified in the physical security plan.
>
> **5.4.** Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).

Requirement R5 creates an affirmative obligation on Transmission Owners and Transmission Operators to develop and implement security plans to protect their critical

---

[73] Physical Security Order at P 9.

[74] *Id*. at P 11.

Transmission stations, Transmission substations, and primary control centers. Rather than dictate the specific steps entities must take to protect their critical facilities, however, Requirement R5 obligates entities to develop security plan(s) that include elements that will help ensure that the security plans will result in an adequate level of protection against the potential physical threats and vulnerabilities identified pursuant to Requirement R4. These elements are set forth in Parts 5.1-5.4, each of which is discussed below.

Part 5.1 requires entities to include in their security plan(s) "[re]siliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4." Security measures refer to those steps an entity takes to strengthen the physical security of the site, such as security guards, video cameras, fences, or ballistic protections. Based on the Requirement R4 evaluation, entities should consider the need to implement security measures applicable to the entire site (e.g., the construction of a fence or wall around an entire facility, or the hiring security guards to guard the entire facility) as well as security measures that target specific critical components at the site (e.g., ballistic protections for some or all transformers at a Transmission substation).

Resiliency measures refer to those steps an entity may take that, while not specifically targeted as hardening the physical security of the site, help to decrease the potential adverse impact of a physical attack at an identified critical facility. These measures could include modifications to system topology or the construction of a new Transmission station or Transmission substation that would lessen the criticality of the facility. Entities may choose to focus their resources on redesigning their systems to limit the number of critical facilities, which will ultimately make it more difficult for the perpetrators of a physical attack to cause significant harm to the Bulk-Power

System.[75] Additionally, resiliency measures include providing for access to spare or replacement equipment. Many components of Transmission stations, Transmission substations, and primary control centers are expensive and difficult to replace quickly. Having spare equipment available will enable entities to limit the length of outages caused by a physical attacks. Entities should not necessarily be limited to implementing conventional security measures but should also seek to build resiliency into their system to enhance their ability to mitigate the risk and impact of a physical attack. The flexibility provided in Part 5.1 is thus consistent with the Commission's directive to allow applicable entities to consider elements of resiliency in identifying and protecting their critical facilities.

Part 5.2 requires entities to include in their security plan(s) provisions for "law enforcement contact and coordination information." Such provisions may include, among other things, providing substation safety and familiarization training for local and federal law enforcement, fire department, and Emergency Medical Services. Working with law enforcement is essential to both preventing and responding to physical attacks.

Part 5.3 requires entities to include in their security plan(s) a "timeline for executing the physical security enhancements and modifications specified in their physical security plan." Entities must have the flexibility to prioritize the implementation of the various resiliency or security enhancements and modifications in their security plan according to risk, resources, or other factors, such as the lead times necessary to implement certain security or resiliency measures. Entities must design these timelines, however, to protect their critical facilities from the threats and vulnerabilities identified pursuant to Requirement R4. For measures that have long lead times,

[75] The implementation of certain resiliency measures, such as the construction of a new Transmission station or Transmission substation, could affect the results of an entity's next Requirement R1 risk assessment such that a facility previously identified as critical would no longer meet that criteria.

entities must consider whether interim protections are necessary to address the identified threats and vulnerabilities. As part of the third party review of the security plans required by Requirement R6, as well as any ERO compliance monitoring activity, entities must be able to justify their implementation timelines and demonstrate that they are implementing their security plan in a manner that will provide an adequate level of protection as soon as reasonably practicable.[76]

Lastly, Part 5.4 requires entities to include in their security plans "[p]rovisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s)." These provisions will help ensure that a Transmission Owner's and Transmission Operator's physical security protections evolve to meet a dynamic and changing risk environment. An entity's physical security plan should include processes and responsibilities for obtaining and handling alerts, intelligence, and threat warnings from various sources. Such sources include the ERO, ES-ISAC, and US and/or Canadian federal agencies. Transmission Owners and Transmission Operators should then use that information to reevaluate or consider changes in the security plan and the corresponding security measures of the security plan.

The approach to specify the fundamental attributes that an entity must include in its security plan(s), as opposed to specifying the steps the entity must take, is consistent with the directives in the Physical Security Order[77] and preferable from a security perspective. As noted, the threat environment is dynamic and continually evolving. As such, Reliability Standards addressing security issues must allow entities to adapt to changing threats and encourage entities to develop

---

[76] If, in the course of assessing an entity's compliance with the proposed Reliability Standard, NERC, a Regional Entity, or FERC finds that the timelines were patently deficient in their ability to adequately deter, detect, delay, assess, communicate, and respond to the identified physical threats and vulnerabilities, they could use their enforcement authority to compel the Transmission Owners or Transmission Operator to modify those timelines.

[77] Physical Security Order at PP 2, 9.

and implement new and innovative measures to deter, detect, delay, assess, communicate, and respond to emerging security threats. As the Commission noted, there is not a one-size-fits all approach to protecting against physical security threats.[78] A specific measure that would be effective at one facility may not be appropriate for a different facility. Listing specific steps in the proposed Reliability Standard could also potentially stunt the types of security measures that entities would ultimately implement. Entities must have the flexibility to develop security measures that are unique to the threats and vulnerabilities of their facilities.

As described above, however, the plan must include measures designed "to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4." Accordingly, as part of the third party review of the security plans required by Requirement R6, as well as any ERO compliance monitoring activity, entities must demonstrate that their security plans are designed to result in an adequate level of protection against the potential physical threats and vulnerabilities identified pursuant to Requirement R4.

As to timing, Requirement R5 obligates Transmission Owners and Transmission Operators to develop (or revise) their security plans within 120 calendar days of the date the Transmission Owner completes Requirement R2.[79] This 120-day period is for the development of the plan, not implementation of the measures included with the security plan(s). Requirement R5 specifically states that entities must execute their security plans according to the timelines specified therein. As noted above, to comply with Requirement R5 Transmission Owners and Transmission

---

[78] See Physical Security Order at P 2.

[79] Requirement R2 is complete when there is nothing left to do under the requirement. If the verifier does not make any recommendations, then the Transmission Owner completes Requirement R2 once the verifier completes its verification. If the verifier makes one or more recommendations, the Transmission Owner only completes Requirement R2 when it has modified its identification of critical facilities consistent with the recommendations or documented its reasons for not doing so.

Operators must establish timelines reasonably designed to address the identified security threats and vulnerabilities to the critical facility in a timely manner.

Finally, Requirement R6 addresses the Commission directive that the Reliability Standard require that an entity other than the owner or operator of the critical facility review the Requirement R4 evaluation of threats and vulnerabilities and the Requirement R5 security plan(s). Requirement R6 provides:

> **R6.** Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall have an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5. The review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5.
>
> **6.1.** Each Transmission Owner and Transmission Operator shall select an unaffiliated third party reviewer from the following:
>
> - An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.
> - An entity or organization approved by the ERO.
> - A governmental agency with physical security expertise.
> - An entity or organization with demonstrated law enforcement, government, or military physical security expertise.
>
> **6.2.** The Transmission Owner or Transmission Operator, respectively, shall ensure that the unaffiliated third party review is completed within 90 calendar days of completing the security plan(s) developed in Requirement R5. The unaffiliated third party review may, but is not required to, include recommended changes to the evaluation performed under Requirement R4 or the security plan(s) developed under Requirement R5.
>
> **6.3.** If the unaffiliated third party reviewer recommends changes to the evaluation performed under Requirement R4 or security plan(s) developed under Requirement R5, the Transmission Owner or Transmission Operator

shall, within 60 calendar days of the completion of the unaffiliated third party review, for each recommendation:

- Modify its evaluation or security plan(s) consistent with the recommendation; or

- Document the reason(s) for not modifying the evaluation or security plan(s) consistent with the recommendation.

6.4. Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third party reviewer and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

Similar to Requirement R2, the purpose of Requirement R6 is to have a third party with the appropriate expertise provide an independent review of a Transmission Owner's and Transmission Operator's Requirement R4 evaluation or Requirement R5 security plans(s). The third party review will provide an additional layer of expertise and assurance that the Transmission Owner and Transmission Operator (1) properly evaluated potential threats and vulnerabilities, and (2) developed a security plan that results in an adequate level of protection against the potential physical threats and vulnerabilities it faces at the identified facilities.[80]

To meet the intent of this element of the Physical Security Order, Requirement R6 requires that the reviewing entity meet certain criteria. First, the reviewing entity must be an "unaffiliated third party." As in Requirement R2, the term "unaffiliated" means that the selected entity cannot be a corporate affiliate (i.e., the verifying entity cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Owner or Transmission

[80] The third party review thus addresses the Commission directive that NERC should consider whether to require owners and operators to consult with entities with appropriate expertise as part of the evaluation process. *See* Physical Security Order at P 8.

Operator). The reviewing entity also cannot be a division of the Transmission Owner or Transmission Operator that operates as a functional unit.[81]

Additionally, Requirement R6 states that Each Transmission Owner and Transmission Operator shall select an unaffiliated third party reviewer that meets one of the following criteria: (1) an entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional ("CPP") or Physical Security Professional ("PSP") certification; (2) an entity or organization approved by the ERO; (3) a governmental agency with physical security expertise;[82] and (4) an entity or organization with demonstrated law enforcement, government, or military physical security expertise. NERC and the standard drafting team determined that unaffiliated entities or organizations that meet these qualifications will have the expertise necessary to provide an effective and independent review. Applicable Transmission Owners and Transmission Operators have the flexibility to have one reviewer review both the Requirement R4 evaluation and the Requirement R5 security plan or have separate reviewers for each step.

Under either scenario, the Transmission Owner and Transmission Operator must show that the selected entity has the appropriate expertise to conduct the review. As noted for Requirement R2, in cases where the Transmission Owner or Transmission Operator shows that the reviewing entity is qualified, sufficiently independent, and the scope of their review is clear, auditors are encouraged to rely on the reviews. In cases where the reviewing entity lacks the qualifications

---

[81] The prohibition on Transmission Owners using a corporate affiliate to conduct the verification, however, does not prohibit a governmental entity (e.g., a city, a municipality, a U.S. federal power marketing agency, or any other political subdivision of U.S. or Canadian federal, state, or provincial governments) from selecting as the verifying entity another governmental entity within the same political subdivision. The verifying entity, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

[82] CPP and PSP certifications are widely-recognized in the physical security industry to demonstrate expertise in the physical security domain.

specified in Requirement R6, the reviewer is not sufficiently independent, or where the scope of the review is unclear, it is expected that auditors will apply increased audit testing of Requirements R4 and R5.

As with the verification under Requirement R2, Requirement R6 provides that the "review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5." This provision provides applicable Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5. In other words, a Transmission Owner or Transmission Operator could collaborate with its unaffiliated third party reviewer to perform the Requirement R4 evaluation or develop the Requirement R5 security plan. This collaboration may allow entities to create efficiencies in their processes for complying with the proposed Reliability Standard. The intent of Requirement R6 is to have an entity other than the owner or operator of the facility be involved with and provide input on the Requirement R4 evaluation and the development of the Requirement R5 security plans, rather than simply have an after-the-fact review. Accordingly, Requirement R6 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the evaluation and develops the security plan itself and then has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the evaluation and develop the security plan.

Requirement R6, Part 6.2 provides that applicable Transmission Owners and Transmission Operators are responsible for ensuring that the reviewer(s) complete the review within 90 calendar days of the completion of the development of the security plan under Requirement R5. Part 6.2 also specifies that the review may "include recommended changes to the evaluation performed

under Requirement R4 or the security plan(s) developed under Requirement R5." Part 6.3 then specifies that the Transmission Owner or Transmission Operator must address those recommendations, within 60 calendar days, in one of two ways. The Transmission Owner or Transmission Operator must either: (i) modify its evaluation or security plan consistent with the reviewer's recommendation(s); or (ii) document the reason for not modifying the evaluation or security plan in accordance with the recommendation. Requiring documentation of these reasons will help ensure that the Transmission Owner or Transmission Operator properly considers the reviewer's recommendations and follows those recommendations unless it can justify not doing so. The ERO or the Commission can then review that documentation when evaluating the entity's compliance with the proposed Reliability Standard. Although Part 6.3 allows the Transmission Owner or Transmission Operator to consider a variety of factors for not following the reviewer's recommendations, to satisfy Part 6.3, the Transmission Owner or Transmission Operator must provide a reasonable justification for not doing so.

Lastly, consistent with the Commission's directive to protect confidential or sensitive information from public disclosure,[83] Part 6.4 creates an affirmative obligation on the Transmission Owner and Transmission Operator to guard against the release of any sensitive or confidential information, such as site vulnerabilities or the security protection established for a particular site. Release of such information could provide a roadmap to those individuals or groups intent on physically attacking critical Bulk-Power System facilities. As the Commission stated, if this information is disclosed to the public, it could jeopardize the reliable operation of the Bulk-Power System.[84] Part 6.4 thus requires Transmission Owners to implement procedures, such as

---

83 Physical Security Order at 10.

84 *Id.*

the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third party reviewer and or otherwise developed pursuant to this Reliability Standard from public disclosure. Below is an additional discussion of confidentiality issues under the proposed Reliability Standard.

D. Protection of Sensitive or Confidential Information

As discussed above, the Commission sought to ensure that any sensitive or confidential information that entities develop in the course of complying with the proposed Reliability Standard remains confidential to decrease the possibility that such information could become available to individuals or groups that may use such information to perpetrate physical attacks on the Bulk-Power System.[85] To that end, the proposed Reliability Standard affirmatively obligates entities to protect their sensitive and confidential information from public disclosure (Requirement R2, Part 2.4 and Requirement R6, Part 6.4). Procedures for protecting confidential information may include, among other things, the following elements: (1) the control and retention of information at the applicable entity's facility for third party verifiers/reviewers; (2) restricting information to only those employees that need to know such information for purposes of carrying out their job functions; (3) marking all relevant documents as confidential; (4) securely storing and destroying information, both physical and electronically; and (5) requiring senior manager sign-off prior to releasing any sensitive or confidential information to an outside entity.

Additionally, the compliance monitoring section of the proposed Reliability Standard provides that all evidence for demonstrating compliance with this standard will be retained at the Transmission Owner's and Transmission Operator's facilities.[86] Requiring that evidence remain

---

[85] *Id.*

[86] Specifically, Compliance Monitoring Section 1.4 provides:

on site will reduce the possibility of releasing sensitive or confidential information to individuals who should not have access to such information. NERC and the Regional Entities will develop policies to ensure that sensitive or confidential information reviewed during compliance monitoring activities will remain on site and confidential.

During the standard development process, certain registered entities raised issues as to the relationship between the confidentiality provisions of the proposed Reliability Standard and public disclosure laws, such as the U.S. Freedom of Information Act, and similar state, provincial, or local laws. Registered entities were concerned that public disclosure laws would require them to publicly disclose certain sensitive or confidential information, thereby jeopardizing the reliability of the Bulk-Power System. NERC notes that the confidentiality provisions in proposed Reliability Standard CIP-014-1 may provide registered entities subject to public disclosure laws the authority to limit public disclosure of sensitive or confidential information developed pursuant to the proposed Reliability Standard. NERC understands that many public disclosure laws in various jurisdictions in the United States and Canada include provisions that exempt from public disclosure information that entities must keep confidential pursuant to another federal, state, provincial, or local law.[87] Such exemptions may apply to the sensitive or confidential information developed in the course of complying with the Reliability Standard given the affirmative obligation in the proposed Reliability Standard (Parts 2.4 and 6.4) that applicable entities protect such information from public disclosure. Additionally, certain public disclosure laws already exempt from disclosure certain confidential information specifically related to critical infrastructures, such as

> Confidentiality: To protect the confidentiality and sensitive nature of the evidence for demonstrating compliance with this standard, all evidence will be retained at the Transmission Owner's and Transmission Operator's facilities.

[87] *See*, *e.g.*, Colorado Open Records Act, C.R.S. § 24-72-204; Washington Public Records Act, Wash. Rev. Code § 42.56.070.

energy, water, or telecommunications infrastructure,[88] or information that is vital to governmental interests.[89] Such provisions may exempt some, if not all, of the sensitive or confidential information developed under the standard from disclosure.

Nevertheless, NERC understands that public disclosure laws are different across the various jurisdictions in North America and there may be some laws that do not have existing provisions to exempt from public disclosure the sensitive or confidential information developed under the proposed Reliability Standard. The purpose of NERC Reliability Standards is to establish and impose mandatory requirements that owners, operators and users of the Bulk-Power System must follow to help protect the reliability of the Bulk-Power System. NERC Reliability Standards do not stipulate whether certain information is exempt from public disclosure laws. The applicability of such laws to the information developed under proposed Reliability Standard CIP-014-1 may be addressed in other forums at the federal, state, provincial, or local levels. NERC understands that certain registered entities may ask the Commission for a statement indicating that the proposed Reliability Standard will govern any contrary state or local public disclosure law. Such a statement could help to clarify the applicability of public disclosure laws and further the intent of the Physical Security Order to protect sensitive or confidential information.

E. Enforceability of the Proposed Reliability Standards

The proposed Reliability Standard includes VRFs and VSLs. The VRFs and VSLs provide guidance on the way that NERC will enforce the requirements of the proposed Reliability Standard. The VRFs and VSLs for the proposed Reliability Standard comport with NERC and

---

[88] *See, e.g.*, Arizona Public Records Act, A.R.S. §39-126 (stating "[n]othing in this chapter requires the disclosure of a risk assessment that is performed by or on behalf of a federal agency to evaluate critical energy, water or telecommunications infrastructure to determine its vulnerability to sabotage or attack.")

[89] *See, e.g.*, Wash. Rev. Code § 42.56.210.

Commission guidelines related to their assignment. Exhibit E provides a detailed review of the VRFs and VSLs, and the analysis of how the VRFs and VSLs were determined using these guidelines.

The proposed Reliability Standard also includes measures that support each requirement by clearly identifying what is required and how the ERO will enforce the requirement. These measures help ensure that the requirements will be enforced in a clear, consistent, and non-preferential manner and without prejudice to any party.[90]

V. EFFECTIVE DATE

In the Physical Security Order, the Commission stated that "NERC should develop an implementation plan that requires owners or operators of the Bulk-Power System to implement the Reliability Standards in a timely fashion, balancing the importance of protecting the Bulk-Power System from harm while giving the owners or operators adequate time to meaningfully implement the requirements."[91] The Commission also specified that the implementation plan should include timeframes for completion of the risk assessment, threat and vulnerability evaluations, and development and implementation of the security plan.

Consistent with the Commission's directive, NERC respectfully requests that the Commission approve the proposed Reliability Standard to become effective on the first day of the first calendar quarter that is six months after Commission approval. The Implementation Plan for proposed Reliability Standard CIP-014-1, attached hereto as Exhibit B, provides a timeline for initial performance under the proposed Reliability Standard following the proposed effective date.

---

[90] Order No. 672 at P 327 ("There should be a clear criterion or measure of whether an entity is in compliance with a proposed Reliability Standard. It should contain or be accompanied by an objective measure of compliance so that it can be enforced and so that enforcement can be applied in a consistent and non-preferential manner.").

[91] Physical Security Order at P 12.

As described in the Implementation Plan, applicable Transmission Owners must conduct their initial Requirement R1 risk assessment on or before the effective date of the proposed Reliability Standard. Transmission Owners and Transmission Operators must then complete initial performance of Requirements R2 through R6, as applicable, according to the timelines specified in those requirements, as follows:

- *Requirement R2* - The Transmission Owner must (i) complete the third party verification of the risk assessment (Parts 2.1, 2.2, and 2.4) within 90 calendar days of the effective date of the proposed Reliability Standard, and (ii) make any modifications to the list of identified facilities or documentation as to why no modifications were required (Part 2.3) within 60 days of completing the third party verification.

- *Requirement R3* – The Transmission Owner must make the required notification to the Transmission Operator within 7 calendar days of completion of performance under Requirement R2.[92]

- *Requirements R4 and R5* – Applicable Transmission Owners and Transmission Operators must complete the evaluation of threats and vulnerabilities and develop the security plan within 120 calendar days of completion of performance under Requirement R2.

- *Requirement R6* – Transmission Owners and Transmission Operators must (i) complete the third party review of the Requirement R4 evaluation and the Requirement R5 security plan (Parts 6.1 and 6.2) within 90 calendar days of completion of developing the Requirement R5 security plans, and (ii) make any modifications to the evaluation or security, or documentation as to why no modifications were required (Part 6.3) within 60 days of completing the third party review.

The standard drafting team concluded that the timeframes set forth in the Implementation Plan appropriately balances the urgency of implementing the requirements of the proposed Reliability Standard to protect the Bulk-Power System with providing entities sufficient time for effective implementation. While many entities are already taking steps to implement security measures, others may require time to develop internal processes, procedures, and budget

[92] Requirement R2 is complete when there is nothing left to do under the requirement. Specifically, if the verifier does not make any recommendations, then the Transmission Owner completes Requirement R2 once the verifier completes its verification. If the verifier makes one or more recommendations, the Transmission Owner only completes Requirement R2 when it has modified its identification of critical facilities consistent with the recommendations or documented its reasons for not doing so.

allocations to comply with proposed Reliability Standard CIP-014-1. In the interim, NERC will continue to use its existing reliability tools to work with industry to protect the security of the Bulk-Power System

VI. CONCLUSION

For the reasons set forth above, NERC respectfully requests that the Commission approve:

- the proposed Reliability Standard and associated elements included in Exhibit A, effective as proposed herein; and
- the proposed implementation plan included in Exhibit B;

Respectfully submitted,

/s/ Shamai Elstein

Date: May 23, 2014

Exhibit A

Proposed Reliability Standard

A. Introduction

1. Title: Physical Security

2. Number: CIP-014-1

3. Purpose: To identify and protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection.

4. Applicability:

4.1. Functional Entities:

4.1.1 Transmission Owner that owns a Transmission station or Transmission substation that meets any of the following criteria:

4.1.1.1 Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

4.1.1.2 Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

Voltage Value of a Line	Weight Value per Line
less than 200 kV (not applicable)	(not applicable)
200 kV to 299 kV	700
300 kV to 499 kV	1300
500 kV and above	0

4.1.1.3 Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Coordinator, or

Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

4.1.1.4 Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements.

4.1.2 Transmission Operator.

Exemption: Facilities in a "protected area," as defined in 10 C.F.R. § 73.2, within the scope of a security plan approved or accepted by the Nuclear Regulatory Commission are not subject to this Standard; or, Facilities within the scope of a security plan approved or accepted by the Canadian Nuclear Safety Commission are not subject to this Standard.

5. Effective Dates:

CIP-014-1 is effective the first day of the first calendar quarter that is six months beyond the date that this standard is approved by applicable regulatory authorities, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. In those jurisdictions where regulatory approval is not required, CIP-014-1 shall become effective on the first day of the first calendar quarter that is six months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

6. Background:

This Reliability Standard addresses the directives from the FERC order issued March 7, 2014, *Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (2014), which required NERC to develop a physical security reliability standard(s) to identify and protect facilities that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection.

B. Requirements and Measures

R1. Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria specified in Applicability Section 4.1.1. The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify the Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. *[VRF: High; Time-Horizon: Long-term Planning]*

1.1. Subsequent risk assessments shall be performed:

- At least once every 30 calendar months for a Transmission Owner that has identified in its previous risk assessment (as verified according to Requirement R2) one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection; or

- At least once every 60 calendar months for a Transmission Owner that has not identified in its previous risk assessment (as verified according to Requirement R2) any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection.

1.2. The Transmission Owner shall identify the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment.

M1. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the risk assessment of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria in Applicability Section 4.1.1 as specified in Requirement R1. Additionally, examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the identification of the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment as specified in Requirement R1, Part 1.2.

R2. Each Transmission Owner shall have an unaffiliated third party verify the risk assessment performed under Requirement R1. The verification may occur concurrent with or after the risk assessment performed under Requirement R1. *[VRF: Medium; Time-Horizon: Long-term Planning]*

2.1. Each Transmission Owner shall select an unaffiliated verifying entity that is either:

- A registered Planning Coordinator, Transmission Planner, or Reliability Coordinator; or
- An entity that has transmission planning or analysis experience.

2.2. The unaffiliated third party verification shall verify the Transmission Owner's risk assessment performed under Requirement R1, which may include recommendations for the addition or deletion of a Transmission station(s) or Transmission substation(s). The Transmission Owner shall ensure the verification is completed within 90 calendar days following the completion of the Requirement R1 risk assessment.

2.3. If the unaffiliated verifying entity recommends that the Transmission Owner add a Transmission station(s) or Transmission substation(s) to, or remove a Transmission station(s) or Transmission substation(s) from, its identification under Requirement R1, the Transmission Owner shall either, within 60 calendar days of completion of the verification, for each recommended addition or removal of a Transmission station or Transmission substation:

- Modify its identification under Requirement R1 consistent with the recommendation; or
- Document the technical basis for not modifying the identification in accordance with the recommendation.

2.4. Each Transmission Owner shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third party verifier and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M2. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner completed an unaffiliated third party verification of the Requirement R1 risk assessment and satisfied all of the applicable provisions of Requirement R2, including, if applicable, documenting the technical basis for not modifying the Requirement R1 identification as specified under Part 2.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 2.4.

R3. For a primary control center(s) identified by the Transmission Owner according to Requirement R1, Part 1.2 that a) operationally controls an identified Transmission station or Transmission substation verified according to Requirement R2, and b) is not under the operational control of the Transmission Owner: the Transmission Owner

shall, within seven calendar days following completion of Requirement R2, notify the Transmission Operator that has operational control of the primary control center of such identification and the date of completion of Requirement R2. *[VRF: Lower; Time-Horizon: Long-term Planning]*

3.1. If a Transmission station or Transmission substation previously identified under Requirement R1 and verified according to Requirement R2 is removed from the identification during a subsequent risk assessment performed according to Requirement R1 or a verification according to Requirement R2, then the Transmission Owner shall, within seven calendar days following the verification or the subsequent risk assessment, notify the Transmission Operator that has operational control of the primary control center of the removal.

M3. Examples of acceptable evidence may include, but are not limited to, dated written or electronic notifications or communications that the Transmission Owner notified each Transmission Operator, as applicable, according to Requirement R3.

R4. Each Transmission Owner that identified a Transmission station, Transmission substation, or a primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2. The evaluation shall consider the following: *[VRF: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

4.1. Unique characteristics of the identified and verified Transmission station(s), Transmission substation(s), and primary control center(s);

4.2. Prior history of attack on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and

4.3. Intelligence or threat warnings received from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), U.S. federal and/or Canadian governmental agencies, or their successors.

M4. Examples of evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner or Transmission Operator conducted an evaluation of the potential threats and vulnerabilities of a physical attack to their respective Transmission station(s), Transmission substation(s) and primary control center(s) as specified in Requirement R4.

R5. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s). The physical security plan(s) shall be developed within 120 calendar days following the completion of Requirement R2 and executed according to the timeline specified in the physical security plan(s). The physical security plan(s) shall include the following attributes: *[VRF: High; Time-Horizon: Long-term Planning]*

5.1. Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.

5.2. Law enforcement contact and coordination information.

5.3. A timeline for executing the physical security enhancements and modifications specified in the physical security plan.

5.4. Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).

M5. Examples of evidence may include, but are not limited to, dated written or electronic documentation of its physical security plan(s) that covers their respective identified and verified Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R5, and additional evidence demonstrating execution of the physical security plan according to the timeline specified in the physical security plan.

R6. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall have an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5. The review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5. *[VRF: Medium; Time-Horizon: Long-term Planning]*

6.1. Each Transmission Owner and Transmission Operator shall select an unaffiliated third party reviewer from the following:

- An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified

Protection Professional (CPP) or Physical Security Professional (PSP) certification.

- An entity or organization approved by the ERO.
- A governmental agency with physical security expertise.
- An entity or organization with demonstrated law enforcement, government, or military physical security expertise.

6.2. The Transmission Owner or Transmission Operator, respectively, shall ensure that the unaffiliated third party review is completed within 90 calendar days of completing the security plan(s) developed in Requirement R5. The unaffiliated third party review may, but is not required to, include recommended changes to the evaluation performed under Requirement R4 or the security plan(s) developed under Requirement R5.

6.3. If the unaffiliated third party reviewer recommends changes to the evaluation performed under Requirement R4 or security plan(s) developed under Requirement R5, the Transmission Owner or Transmission Operator shall, within 60 calendar days of the completion of the unaffiliated third party review, for each recommendation:

- Modify its evaluation or security plan(s) consistent with the recommendation; or
- Document the reason(s) for not modifying the evaluation or security plan(s) consistent with the recommendation.

6.4. Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third party reviewer and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M6. Examples of evidence may include, but are not limited to, written or electronic documentation that the Transmission Owner or Transmission Operator had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 as specified in Requirement R6 including, if applicable, documenting the reasons for not modifying the evaluation or security plan(s) in accordance with a recommendation under Part 6.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 6.4.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence during an on-site visit to show that it was compliant for the full time period since the last audit.

The Transmission Owner and Transmission Operator shall keep data or evidence to show compliance, as identified below, unless directed by its Compliance Enforcement Authority (CEA) to retain specific evidence for a longer period of time as part of an investigation.

The responsible entities shall retain documentation as evidence for three years.

If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records, subject to the confidentiality provisions of Section 1500 of the Rules of Procedure and the provisions of Section 1.4 below.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints Text

1.4. Additional Compliance Information

Confidentiality: To protect the confidentiality and sensitive nature of the evidence for demonstrating compliance with this standard, all evidence will be retained at the Transmission Owner's and Transmission Operator's facilities.

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-014-1)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Long-term Planning**	**High**	The Transmission Owner performed an initial risk assessment but did so after the date specified in the implementation plan for performing the initial risk assessment but less than or equal to two calendar months after that date; OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread	The Transmission Owner performed an initial risk assessment but did so more than two calendar months after the date specified in the implementation plan for performing the initial risk assessment but less than or equal to four calendar months after that date; OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could	The Transmission Owner performed an initial risk assessment but did so more than four calendar months after the date specified in the implementation plan for performing the initial risk assessment but less than or equal to six calendar months after that date; OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread	The Transmission Owner performed an initial risk assessment but did so more than six calendar months after the date specified in the implementation plan for performing the initial risk assessment; OR The Transmission Owner failed to perform an initial risk assessment; OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or

Guidelines and Technical Basis

Section 4 Applicability

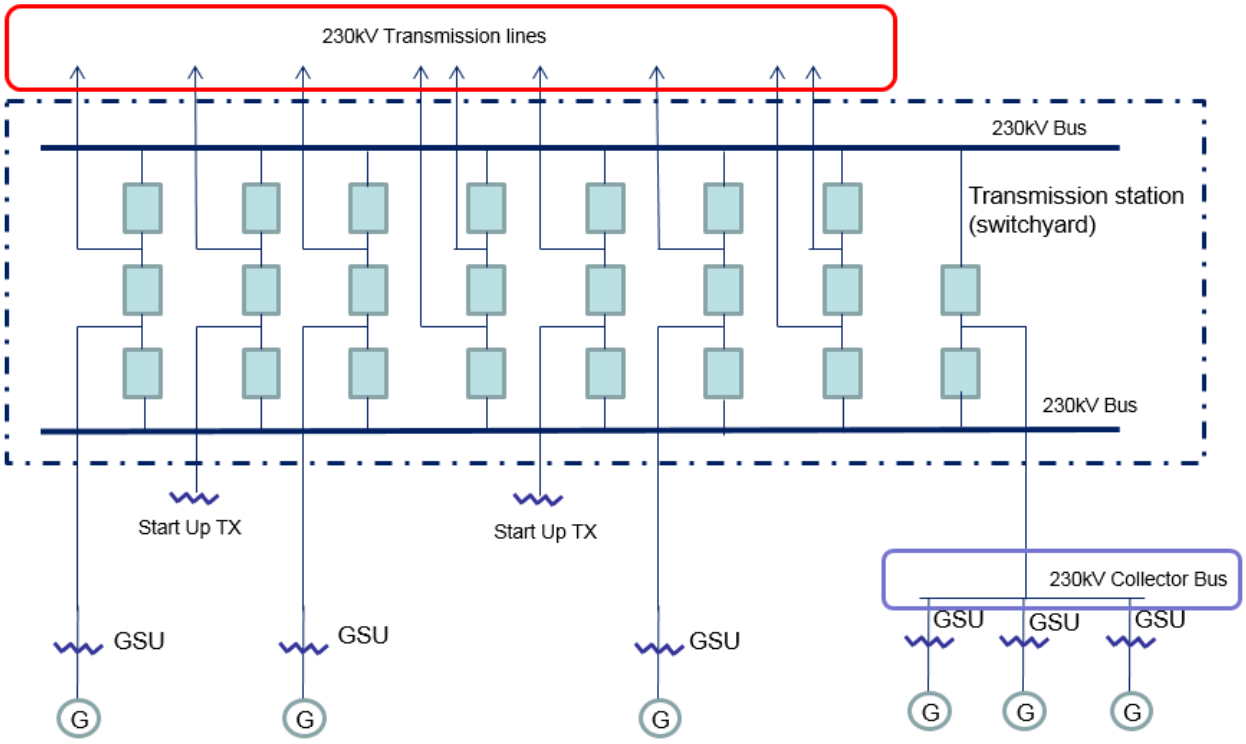
The purpose of Reliability Standard CIP-014-1 is to protect Transmission stations and Transmission substations, and their associated primary control centers that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. To properly include those entities that own or operate such Facilities, the Reliability Standard CIP-014-1 first applies to Transmission Owners that own Transmission Facilities that meet the specific criteria in Applicability Section 4.1.1.1 through 4.1.1.4. The Facilities described in Applicability Section 4.1.1.1 through 4.1.1.4 mirror those Transmission Facilities that meet the bright line criteria for "Medium Impact" Transmission Facilities under Attachment 1 of Reliability Standard CIP-002-5.1. Each Transmission Owner that owns Transmission Facilities that meet the criteria in Section 4.1.1.1 through 4.1.1.4 is required to perform a risk assessment as specified in Requirement R1 to identify its Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. The Standard Drafting Team (SDT) expects this population will be small and that many Transmission Owners that meet the applicability of this standard will not actually identify any such Facilities. Only those Transmission Owners with Transmission stations or Transmission substations identified in the risk assessment (and verified under Requirement R2) have performance obligations under Requirements R3 through R6.

This standard also applies to Transmission Operators. A Transmission Operator's obligations under the standard, however, are only triggered if the Transmission Operator is notified by an applicable Transmission Owner under Requirement R3 that the Transmission Operator operates a primary control center that operationally controls a Transmission station(s) or Transmission substation(s) identified in the Requirement R1 risk assessment. A primary control center operationally controls a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical action at the identified Transmission station or Transmission substation, such as opening a breaker, as opposed to a control center that only has information from the Transmission station or Transmission substation and must coordinate direct action through another entity. Only Transmission Operators who are notified that they have primary control centers under this standard have performance obligations under Requirements R4 through R6. In other words, primary control center for purposes of this Standard is the control center that the Transmission Owner or Transmission Operator, respectively, uses as its primary, permanently-manned site to physically operate a Transmission station or Transmission substation that is identified in Requirement R1 and verified in Requirement R2. Control centers that provide back-up capability are not applicable, as they are a form of resiliency and intentionally redundant.

The SDT considered several options for bright line criteria that could be used to determine applicability and provide an initial threshold that defines the set of Transmission stations and Transmission substations that would meet the directives of the FERC order on physical security (*i.e.*, those that could cause widespread instability, uncontrolled separation, or Cascading within

an Interconnection). The SDT determined that using the criteria for Medium Impact Transmission Facilities in Attachment 1 of CIP-002-5.1 would provide a conservative threshold for defining which Transmission stations and Transmission substations must be included in the risk assessment in Requirement R1 of CIP-014-1. Additionally, the SDT concluded that using the CIP-002-5.1 Medium Impact criteria was appropriate because it has been approved by stakeholders, NERC, and FERC, and its use provides a technically sound basis to determine which Transmission Owners should conduct the risk assessment. As described in CIP-002-5.1, the failure of a Transmission station or Transmission substation that meets the Medium Impact criteria could have the capability to result in exceeding one or more Interconnection Reliability Operating Limits (IROLs). The SDT understands that using this bright line criteria to determine applicability may require some Transmission Owners to perform risk assessments under Requirement R1 that will result in a finding that none of their Transmission stations or Transmission substations would pose a risk of widespread instability, uncontrolled separation, or Cascading within an Interconnection. However, the SDT determined that higher bright lines could not be technically justified to ensure inclusion of all Transmission stations and Transmission substations, and their associated primary control centers that, if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. Further guidance and technical basis for the bright line criteria for Medium Impact Facilities can be found in the Guidelines and Technical Basis section of CIP-002-5.1.

Additionally, the SDT determined that it was not necessary to include Generator Operators and Generator Owners in the Reliability Standard. First, Transmission stations or Transmission substations interconnecting generation facilities are considered when determining applicability. Transmission Owners will consider those Transmission stations and Transmission substations that include a Transmission station on the high side of the Generator Step-up transformer (GSU) using Applicability Section 4.1.1.1 and 4.1.1.2. As an example, a Transmission station or Transmission substation identified as a Transmission Owner facility that interconnects generation will be subject to the Requirement R1 risk assessment if it operates at 500kV or greater or if it is connected at 200 kV – 499kV to three or more other Transmission stations or Transmission substations and has an "aggregate weighted value" exceeding 3000 according to the table in Applicability Section 4.1.1.2. Second, the Transmission analysis or analyses conducted under Requirement R1 should take into account the impact of the loss of generation connected to applicable Transmission stations or Transmission substations. Additionally, the FERC order does not explicitly mention generation assets and is reasonably understood to focus on the most critical Transmission Facilities. The diagram below shows an example of a station.



Also, the SDT uses the phrase "Transmission stations or Transmission substations" to recognize the existence of both stations and substations. Many entities in industry consider a substation to be a location with physical borders (i.e. fence, wall, etc.) that contains at least an autotransformer. Locations also exist that do not contain autotransformers, and many entities in industry refer to those locations as stations (switching stations or switchyards). Therefore, the SDT chose to use both "station" and "substation" to refer to the locations where groups of Transmission Facilities exist.

On the issue of joint ownership, the SDT recognizes that this issue is not unique to CIP-014-1, and expects that the applicable Transmission Owners and Transmission Operators will develop memorandums of understanding, agreements, Coordinated Functional Registrations, or procedures, etc., to designate responsibilities under CIP-014-1 when joint ownership is at issue, which is similar to what many entities have completed for other Reliability Standards.

The language contained in the applicability section regarding the collector bus is directly copied from CIP-002-5.1, Attachment 1, and has no additional meaning within the CIP-014-1 standard.

Requirement R1

The initial risk assessment required under Requirement R1 must be completed on or before the effective date of the standard. Subsequent risk assessments are to be performed at least once every 30 or 60 months depending on the results of the previous risk assessment per Requirement R1, Part 1.1. In performing the risk assessment under Requirement R1, the

Transmission Owner should first identify their population of Transmission stations and Transmission substations that meet the criteria contained in Applicability Section 4.1.1. Requirement R1 then requires the Transmission Owner to perform a risk assessment, consisting of a transmission analysis, to determine which of those Transmission stations and Transmission Substations if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. The standard does not mandate the specific analytical method for performing the risk assessment. The Transmission Owner has the discretion to choose the specific method that best suites its needs. As an example, an entity may perform a Power Flow analysis and stability analysis at a variety of load levels.

Performing Risk Assessments

The Transmission Owner has the discretion to select a transmission analysis method that fits its facts and system circumstances. To mandate a specific approach is not technically desirable and may lead to results that fail to adequately consider regional, topological, and system circumstances. The following guidance is only an example on how a Transmission Owner may perform a power flow and/or stability analysis to identify those Transmission stations and Transmission substations that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. An entity could remove all lines, without regard to the voltage level, to a single Transmission station or Transmission substation and review the simulation results to assess system behavior to determine if Cascading of Transmission Facilities, uncontrolled separation, or voltage or frequency instability is likely to occur over a significant area of the Interconnection. Using engineering judgment, the Transmission Owner (possibly in consultation with regional planning or operation committees and/or ISO/RTO committee input) should develop criteria (e.g. imposing a fault near the removed Transmission station or Transmission substation) to identify a contingency or parameters that result in potential widespread instability, uncontrolled separation, or Cascading within an Interconnection. Regional consultation on these matters is likely to be helpful and informative, given that the inputs for the risk assessment and the attributes of what constitutes widespread instability, uncontrolled separation, or Cascading within an Interconnection will likely vary from region-to-region or from ISO-to-ISO based on topology, system characteristics, and system configurations. Criteria could also include post-contingency facilities loadings above a certain emergency rating or failure of a power flow case to converge. Available special protection systems (SPS), if any, could be applied to determine if the system experiences any additional instability which may result in uncontrolled separation. Example criteria may include:

(a) Thermal overloads beyond facility emergency ratings;

(b) Voltage deviation exceeding ± 10%; or

(c) Cascading outage/voltage collapse; or

(d) Frequency below under-frequency load shed points

Periodicity

A Transmission Owner who identifies one or more Transmission stations or Transmission substations (as verified under Requirement R2) that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection is required to conduct a risk assessment at least once every 30 months. This period ensures that the risk assessment remains current with projected conditions and configurations in the planned system. This risk assessment, as the initial assessment, must consider applicable planned Transmission stations and Transmission substations to be in service within 24 months. The 30 month timeframe aligns with the 24 month planned to be in service date because the Transmission Owner is provided the flexibility, depending on its planning cycle and the frequency in which it may plan to construct a new Transmission station or Transmission substation to more closely align these dates. The requirement is to conduct the risk assessment at least once every 30 months, so for a Transmission Owner that believes it is better to conduct a risk assessment once every 24 months, because of its planning cycle, it has the flexibility to do so.

Transmission Owners that have not identified any Transmission stations or Transmission substations (as verified under Requirement R2) that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection are unlikely to see changes to their risk assessment in the Near-Term Planning Horizon. Consequently, a 60 month periodicity for completing a subsequent risk assessment is specified.

Identification of Primary Control Centers

After completing the risk assessment specified in Requirement R1, it is important to additionally identify the primary control center that operationally controls each Transmission station or Transmission substation that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. A primary control center “operationally controls” a Transmission station or Transmission substation when the control center’s electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker.

Requirement R2

This requirement specifies verification of the risk assessment performed under Requirement R1 by an entity other than the owner or operator of the Requirement R1 risk assessment.

A verification of the risk assessment by an unaffiliated third party, as specified in Requirement R2, could consist of:

1. Certifying that the Requirement R1 risk assessment considers the Transmission stations and Transmission substations identified in Applicability Section 4.1.1.

2. Review of the model used to conduct the risk assessment to ensure it contains sufficient system topology to identify Transmission stations and Transmission substations that if rendered inoperable or damaged could cause widespread instability, uncontrolled separation, or Cascading within an Interconnection.
3. Review of the Requirement R1 risk assessment methodology.

This requirement provides the flexibility for a Transmission Owner to select from unaffiliated registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term unaffiliated means that the selected verifying entity cannot be a corporate affiliate (*i.e.,* the verifying or third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit.

The prohibition on registered entities using a corporate affiliate to conduct the verification, however, does not prohibit a governmental entity (e.g., a city, a municipality, a U.S. federal power marketing agency, or any other political subdivision of U.S. or Canadian federal, state, or provincial governments) from selecting as the verifying entity another governmental entity within the same political subdivision. For instance, a U.S. federal power marketing agency may select as its verifier another U.S. federal agency to conduct its verification so long as the selected entity has transmission planning or analysis experience. Similarly, a Transmission Owner owned by a Canadian province can use a separate agency of that province to perform the verification. The verifying entity, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

Requirement R2 also provides that the "verification may occur concurrent with or after the risk assessment performed under Requirement R1." This provision is designed to provide the Transmission Owner the flexibility to work with the verifying entity throughout (*i.e.,* concurrent with) the risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could collaborate with their unaffiliated verifying entity to perform the risk assessment under Requirement R1 such that both Requirement R1 and Requirement R2 are satisfied concurrently. The intent of Requirement R2 is to have an entity other than the owner or operator of the facility to be involved in the risk assessment process and have an opportunity to provide input. Accordingly, Requirement R2 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the risk assessment and subsequently has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the risk assessment.

Characteristics to consider in selecting a third party reviewer could include:

- Registered Entity with applicable planning and reliability functions.
- Experience in power system studies and planning.
- The entity's understanding of the MOD standards, TPL standards, and facility ratings as they pertain to planning studies.

- The entity's familiarity with the Interconnection within which the Transmission Owner is located.

With respect to the requirement that Transmission owners develop and implement procedures for protecting confidential and sensitive information, the Transmission Owner could have a method for identifying documents that require confidential treatment. One mechanism for protecting confidential or sensitive information is to prohibit removal of sensitive or confidential information from the Transmission Owner's site. Transmission Owners could include such a prohibition in a non-disclosure agreement with the verifying entity.

A Technical feasibility study is not required in the Requirement R2 documentation of the technical basis for not modifying the identification in accordance with the recommendation.

On the issue of the difference between a verifier in Requirement R2 and a reviewer in Requirement R6, the SDT indicates that the verifier will confirm that the risk assessment was completed in accordance with Requirement R1, including the number of Transmission stations and substations identified, while the reviewer in Requirement R6 is providing expertise on the manner in which the evaluation of threats was conducted in accordance with Requirement R4, and the physical security plan in accordance with Requirement R5. In the latter situation there is no verification of a technical analysis, rather an application of experience and expertise to provide guidance or recommendations, if needed.

Parts 2.4 and 6.4 require the entities to have procedures to protect the confidentiality of sensitive or confidential information. Those procedures may include the following elements:

1. Control and retention of information on site for third party verifiers/reviewers.
2. Only "need to know" employees, etc., get the information.
3. Marking documents as confidential
4. Securely storing and destroying information when no longer needed.
5. Not releasing information outside the entity without, for example, General Counsel sign-off.

Requirement R3

Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first completing the risk assessment specified by Requirement R1 and the verification specified by Requirement R2. Requirement R3 is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1 receive notice so that the Transmission Operator may fulfill the rest of the obligations required in Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include within the notice the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk

assessment under Requirement R1 or as a result of the verification process under Requirement R2.

Requirement R4

This requirement requires owners and operators of facilities identified by the Requirement R1 risk assessment and that are verified under Requirement R2 to conduct an assessment of potential threats and vulnerabilities to those Transmission stations, Transmission substations, and primary control centers using a tailored evaluation process. Threats and vulnerabilities may vary from facility to facility based on any number of factors that include, but are not limited to, location, size, function, existing physical security protections, and attractiveness as a target.

In order to effectively conduct a threat and vulnerability assessment, the asset owner may be the best source to determine specific site vulnerabilities, but current and evolving threats may best be determined by others in the intelligence or law enforcement communities. A number of resources have been identified in the standard, but many others exist and asset owners are not limited to where they may turn for assistance. Additional resources may include state or local fusion centers, U.S. Department of Homeland Security, Federal Bureau of Investigations (FBI), Public Safety Canada, Royal Canadian Mounted Police, and InfraGard chapters coordinated by the FBI.

The Responsible Entity is required to take a number of factors into account in Parts 4.1 to 4.3 in order to make a risk-based evaluation under Requirement R4.

To assist in determining the current threat for a facility, the prior history of attacks on similarly protected facilities should be considered when assessing probability and likelihood of occurrence at the facility in question.

Resources that may be useful in conducting threat and vulnerability assessments include:

- NERC Security Guideline for the Electricity Sector: Physical Security.
- NERC Security Guideline: Physical Security Response.
- ASIS International General Risk Assessment Guidelines.
- ASIS International Facilities Physical Security Measure Guideline.
- ASIS International Security Management Standard: Physical Asset Protection.
- Whole Building Design Guide - Threat/Vulnerability Assessments.

Requirement R5

This requirement specifies development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Requirement R5 specifies the following attributes for the physical security plan:

- *Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.*

  Resiliency may include, among other things:

  a. System topology changes,

  b. Spare equipment,

  c. Construction of a new Transmission station or Transmission substation.

  While most security measures will work together to collectively harden the entire site, some may be allocated to protect specific critical components. For example, if protection from gunfire is considered necessary, the entity may only install ballistic protection for critical components, not the entire site.

- *Law enforcement contact and coordination information.*

  Examples of such information may be posting 9-1-1 for emergency calls and providing substation safety and familiarization training for local and federal law enforcement, fire department, and Emergency Medical Services.

- *A timeline for executing the physical security enhancements and modifications specified in the physical security plan.*

  Entities have the flexibility to prioritize the implementation of the various resiliency or security enhancements and modifications in their security plan according to risk, resources, or other factors. The requirement to include a timeline in the physical security plan for executing the actual physical security enhancements and modifications does not also require that the enhancements and modifications be completed within 120 days. The actual timeline may extend beyond the 120 days, depending on the amount of work to be completed.

- *Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).*

  A registered entity's physical security plan should include processes and responsibilities for obtaining and handling alerts, intelligence, and threat warnings from various sources. Some of these sources could include the ERO, ES-ISAC, and US and/or Canadian federal agencies. This information should be used to reevaluate or consider changes in the security plan and corresponding security measures of the security plan found in R5.

  Incremental changes made to the physical security plan prior to the next required third party review do not require additional third party reviews.

Requirement R6

This requirement specifies review by an entity other than the Transmission Owner or Transmission Operator with appropriate expertise for the evaluation performed according to

Requirement R4 and the security plan(s) developed according to Requirement R5. As with Requirement R2, the term unaffiliated means that the selected third party reviewer cannot be a corporate affiliate (*i.e.,* the third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Operator). A third party reviewer also cannot be a division of the Transmission Operator that operates as a functional unit.

As noted in the guidance for Requirement R2, the prohibition on registered entities using a corporate affiliate to conduct the review, however, does not prohibit a governmental entity from selecting as the third party reviewer another governmental entity within the same political subdivision. For instance, a city or municipality may use its local enforcement agency, so long as the local law enforcement agency satisfies the criteria in Requirement R6. The third party reviewer, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

The Responsible Entity can select from several possible entities to perform the review:

- *An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.*

  In selecting CPP and PSP for use in this standard, the SDT believed it was important that if a private entity such as a consulting or security firm was engaged to conduct the third party review, they must tangibly demonstrate competence to conduct the review. This includes electric industry physical security experience and either of the premier security industry certifications sponsored by ASIS International. The ASIS certification program was initiated in 1977, and those that hold the CPP certification are board certified in security management. Those that hold the PSP certification are board certified in physical security.

- *An entity or organization approved by the ERO.*

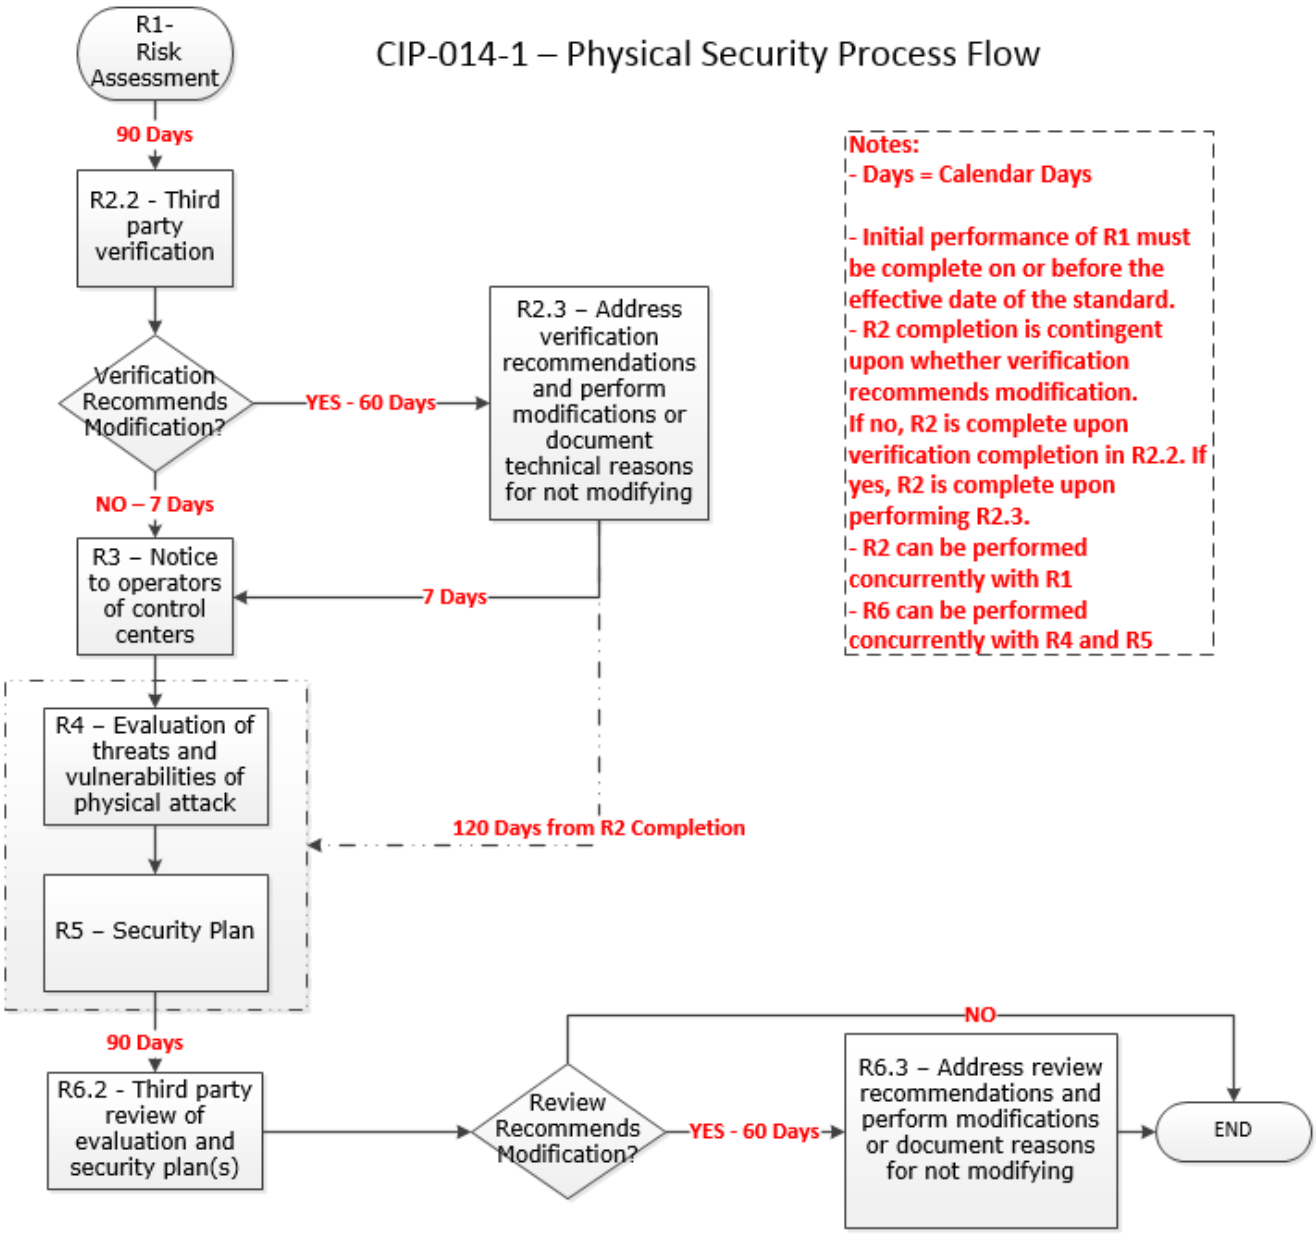
- *A governmental agency with physical security expertise.*

- *An entity or organization with demonstrated law enforcement, government, or military physical security expertise.*

As with the verification under Requirement R2, Requirement R6 provides that the "review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5." This provision is designed to provide applicable Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout (*i.e.,* concurrent with) the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5, which for some Responsible Entities may be more efficient and effective. In other words, a Transmission Owner or Transmission Operator could collaborate with their unaffiliated third party reviewer to perform an evaluation of potential threats and vulnerabilities (Requirement R4) and develop a security plan (Requirement R5) to satisfy Requirements R4 through R6 simultaneously. The

intent of Requirement R6 is to have an entity other than the owner or operator of the facility to be involved in the Requirement R4 evaluation and the development of the Requirement R5 security plans and have an opportunity to provide input on the evaluation and the security plan. Accordingly, Requirement R6 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the evaluation and develops the security plan itself and then has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the evaluation and develop the security plan.

Timeline



CIP-014-1 – Physical Security Process Flow
R1- Risk Assessment
90 Days
R2.2 - Third party verification
Verification Recommends Modification?
YES - 60 Days
R2.3 – Address verification recommendations and perform modifications or document technical reasons for not modifying
NO – 7 Days
R3 – Notice to operators of control centers
7 Days
R4 – Evaluation of threats and vulnerabilities of physical attack
120 Days from R2 Completion
R5 – Security Plan
90 Days
R6.2 - Third party review of evaluation and security plan(s)
Review Recommends Modification?
YES - 60 Days
R6.3 – Address review recommendations and perform modifications or document reasons for not modifying
NO
END
Notes:
- Days = Calendar Days
- Initial performance of R1 must be complete on or before the effective date of the standard.
- R2 completion is contingent upon whether verification recommends modification. If no, R2 is complete upon verification completion in R2.2. If yes, R2 is complete upon performing R2.3.
- R2 can be performed concurrently with R1
- R6 can be performed concurrently with R4 and R5

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1:

This requirement meets the FERC directive from paragraph 6 in the order on physical security to perform a risk assessment to identify which facilities if rendered inoperable or damaged could impact an Interconnection through widespread instability, uncontrolled separation, or cascading failures. It also meets the portion of the directive from paragraph 11 for periodic reevaluation by requiring the risk assessment to be performed every 30 months (or 60 months for an entity that has not identified in a previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection).

After identifying each Transmission station and Transmission substation that meets the criteria in Requirement R1, it is important to additionally identify the primary control center that operationally controls that Transmission station or Transmission substation (*i.e.,* the control center whose electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker, compared to a control center that only has the ability to monitor the Transmission station and Transmission substation and, therefore, must coordinate direct physical action through another entity).

Rationale for Requirement R2:

This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring verification by an entity other than the owner or operator of the risk assessment performed under Requirement R1.

This requirement provides the flexibility for a Transmission Owner to select registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term “unaffiliated” means that the selected verifying entity cannot be a corporate affiliate (*i.e.*, the verifying entity cannot be an entity that controls, is controlled by, or is under common control with, the Transmission owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit. The term “unaffiliated” is not intended to prohibit a governmental entity from using another government entity to be a verifier under Requirement R2.

Requirement R2 also provides the Transmission Owner the flexibility to work with the verifying entity throughout the Requirement R1 risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could coordinate with their unaffiliated verifying entity to perform a Requirement R1 risk assessment to satisfy both Requirement R1 and Requirement R2 concurrently.

Planning Coordinator is a functional entity listed in Part 2.1. The Planning Coordinator and Planning Authority are the same entity as shown in the NERC Glossary of Terms Used in NERC Reliability Standards.

Rationale for Requirement R3:

Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first identifying which Transmission stations and Transmission substations meet the criteria specified by Requirement R1, as verified according to Requirement R2. This requirement is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1, Part 1.2 of a Transmission station or Transmission substation verified according to Requirement R2 receives notice of such identification so that the Transmission Operator may timely fulfill its resulting obligations under Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include notice of the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or the verification process under Requirement R2.

Rationale for Requirement R4:

This requirement meets the FERC directive from paragraph 8 in the order on physical security that the reliability standard must require tailored evaluation of potential threats and vulnerabilities to facilities identified in Requirement R1 and verified according to Requirement R2. Threats and vulnerabilities may vary from facility to facility based on factors such as the facility's location, size, function, existing protections, and attractiveness of the target. As such, the requirement does not mandate a one-size-fits-all approach but requires entities to account for the unique characteristics of their facilities.

Requirement R4 does not explicitly state when the evaluation of threats and vulnerabilities must occur or be completed. However, Requirement R5 requires that the entity's security plan(s), which is dependent on the Requirement R4 evaluation, must be completed within 120 calendar days following completion of Requirement R2. Thus, an entity has the flexibility when to complete the Requirement R4 evaluation, provided that it is completed in time to comply with the requirement in Requirement R5 to develop a physical security plan 120 calendar days following completion of Requirement R2.

Rationale for Requirement R5:

This requirement meets the FERC directive from paragraph 9 in the order on physical security requiring the development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Rationale for Requirement R6:

This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring review by an entity other than the owner or operator with appropriate expertise of the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5.

As with the verification required by Requirement R2, Requirement R6 provides Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout the Requirement R4 evaluation and the development of the Requirement R5 security plan(s). This would allow entities to satisfy their obligations under Requirement R6 concurrent with the satisfaction of their obligations under Requirements R4 and R5.

Exhibit B

Implementation Plan

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan for Project 2014-04

Approvals Requested
CIP-014-1 Physical Security

Prerequisite Approvals
None

Effective Date

New or Revised Standards
CIP-014-1 is effective the first day of the first calendar quarter that is six months beyond the date that this standard is approved by applicable regulatory authorities or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. In those jurisdictions where regulatory approval is not required, CIP-014-1 shall become effective on the first day of the first calendar quarter that is six months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

Standards for Retirement
None

Initial Performance of Periodic Requirements
The initial risk assessment required by CIP-014-1, Requirement R1, must be completed on or before the effective date of the standard. Subsequent risk assessments shall be performed according to the timelines specified in CIP-014-1, Requirement R1.

The initial performance of CIP-014-1, Requirements R2 through R6, must be completed according to the timelines specified in those requirements after the effective date of the proposed Reliability Standard, as follows:

- Requirement R2 shall be completed as follows:
    - Parts 2.1, 2.2, and 2.4 shall be completed within 90 calendar days of the effective date of the proposed Reliability Standard.
    - Part 2.3 shall be completed within 60 calendar days of the completion of performance under Requirement R2 part 2.2.

- Requirement R3 shall be completed within 7 calendar days of completion of performance under Requirement R2.
- Requirements R4 and R5 shall be completed within 120 calendar days of completion of performance under Requirement R2.
- Requirement R6 shall be completed as follows:
    - Parts 6.1, 6.2, and 6.4 shall be completed within 90 calendar days of completion of performance under Requirement R5.
    - Part 6.3 shall be completed within 60 calendar days of Requirement R6 part 6.2.

Exhibit C

Order No. 672 Criteria

EXHIBIT C

Order No. 672 Criteria

In Order No. 672,[1] the Commission identified a number of criteria it will use to analyze Reliability Standards proposed for approval to ensure they are just, reasonable, not unduly discriminatory or preferential, and in the public interest. The discussion below identifies these factors and explains how the proposed Reliability Standard has met or exceeded the criteria.

1. **Proposed Reliability Standards must be designed to achieve a specified reliability goal and must contain a technically sound means to achieve that goal.[2]**

Proposed Reliability Standard CIP-014-1 achieves the specific reliability goal of enhancing physical security measures for the most critical Bulk-Power System facilities and thereby lessening the overall vulnerability of the Bulk-Power System to physical attacks. The proposed Reliability Standard requires Transmission Owners and Transmission Operators to protect those critical Transmission stations and Transmission substations, and their associated primary control centers that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. Consistent with the Physical Security Order, the proposed Reliability Standard requires Transmission Owners to take the following steps to address the risks that physical attacks pose to the reliable operation of the Bulk-Power System:

1) Perform a risk assessment of their systems to identify (i) their critical Transmission stations and Transmission substations, and (ii) the primary control centers that operationally (i.e., physically) control the identified Transmission stations and Transmission substations.

---

[1] *Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval, and Enforcement of Electric Reliability Standards*, Order No. 672, FERC Stats. & Regs. ¶ 31,204, *order on reh'g*, Order No. 672-A, FERC Stats. & Regs. ¶ 31,212 (2006).

[2] Order No. 672 at PP 321, 324.

2) Evaluate the potential threats and vulnerabilities of a physical attack to the facilities identified in the risk assessment.

3) Develop and implement a security plan, based on the evaluation of threats and vulnerabilities, designed to protect against and mitigate the impact of physical attacks that may compromise the operability or recovery of the identified critical facilities.

Further, the proposed Reliability Standard requires Transmission Operators that operate primary control centers that operationally control any of the Transmission stations or substations identified by the Transmission Owner to also:

1) evaluate the potential threats and vulnerabilities of a physical attack to such primary control centers; and

2) develop and implement a security plan, based on the evaluation of threats and vulnerabilities, designed to protect against and mitigate the impact of physical attacks that may compromise the operability or recovery of such primary control centers.

Additionally, proposed Reliability Standard CIP-014-1 includes requirements for: (i) the protection of sensitive or confidential information from public disclosure; (ii) third party verification of the identification of critical facilities as well as third party review of the evaluation of threats and vulnerabilities and the security plans; and (iii) the periodic reevaluation and revision of the identification of critical facilities, the evaluation of threats and vulnerabilities, and the security plans to help ensure their continued effectiveness.

2. Proposed Reliability Standards must be applicable only to users, owners and operators of the bulk power system, and must be clear and unambiguous as to what is required and who is required to comply.[3]

The proposed Reliability Standard is clear and unambiguous as to what is required and who is required to comply, in accordance with Order No. 672. The proposed Reliability Standard applies to Transmission Owners and Transmission Operators. The proposed Reliability Standard clearly articulates the actions that such entities must take to comply with the standard.

---

[3] Order No. 672 at PP 322, 325.

3. A proposed Reliability Standard must include clear and understandable consequences and a range of penalties (monetary and/or non-monetary) for a violation.[4]

The Violation Risk Factors ("VRFs") and Violation Severity Levels ("VSLs") for the proposed Reliability Standard comport with NERC and Commission guidelines related to their assignment, as discussed further in Exhibit E. The assignment of the severity level for each VSL is consistent with the corresponding requirement and the VSLs should ensure uniformity and consistency in the determination of penalties. The VSLs do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations. For these reasons, the proposed Reliability Standard includes clear and understandable consequences in accordance with Order No. 672.

4. A proposed Reliability Standard must identify clear and objective criterion or measure for compliance, so that it can be enforced in a consistent and non-preferential manner. [5]

The proposed Reliability Standard contains measures that support each requirement by clearly identifying what is required to demonstrate compliance. These measures help provide clarity regarding the manner in which the requirements will be enforced, and help ensure that the requirements will be enforced in a clear, consistent, and non-preferential manner and without prejudice to any party.

---

4 Order No. 672 at P 326.

5 Order No. 672 at P 327.

5. **Proposed Reliability Standards should achieve a reliability goal effectively and efficiently — but do not necessarily have to reflect "best practices" without regard to implementation cost or historical regional infrastructure design.[6]**

The proposed Reliability Standard achieves the reliability goal effectively and efficiently in accordance with Order No. 672. The proposed Reliability Standard clearly enumerates the responsibilities of applicable entities with respect to the identification and protection of critical Bulk-Power System facilities and provides entities the flexibility to tailor their processes and plans required under the standard to best suit the needs of their organization.

6. **Proposed Reliability Standards cannot be "lowest common denominator," *i.e.*, cannot reflect a compromise that does not adequately protect Bulk-Power System reliability. Proposed Reliability Standards can consider costs to implement for smaller entities, but not at consequences of less than excellence in operating system reliability.[7]**

The proposed Reliability Standard does not reflect a "lowest common denominator" approach. To the contrary, the proposed Reliability Standard contains significant benefits for the Bulk-Power System. The requirements of the proposed Reliability Standard help ensure that entities provide an adequate level of protection against physical attacks to critical facilities.

7. **Proposed Reliability Standards must be designed to apply throughout North America to the maximum extent achievable with a single Reliability Standard while not favoring one geographic area or regional model. It should take into account regional variations in the organization and corporate structures of transmission owners and operators, variations in generation fuel type and ownership patterns, and regional variations in market design if these affect the proposed Reliability Standard.[8]**

The proposed Reliability Standard applies throughout North America and does not favor one geographic area or regional model.

---

6 Order No. 672 at P 328.

7 Order No. 672 at P 329-30.

8 Order No. 672 at P 331.

8. Proposed Reliability Standards should cause no undue negative effect on competition or restriction of the grid beyond any restriction necessary for reliability.[9]

The proposed Reliability Standard has no undue negative impact on competition. The proposed Reliability Standard requires the same performance by each applicable entity. The standard does not unreasonably restrict the available transmission capability or limit use of the Bulk-Power System in a preferential manner.

9. The implementation time for the proposed Reliability Standard is reasonable.[10]

The proposed effective date for the standard is just and reasonable and appropriately balances the urgency in the need to implement the standard against the reasonableness of the time allowed for those who must comply to develop and implement the necessary procedures and policies. The proposed implementation period will allow applicable entities adequate time to meaningfully implement the requirements. The proposed effective date is explained in the proposed Implementation Plan, attached as Exhibit B.

10. The Reliability Standard was developed in an open and fair manner and in accordance with the Commission-approved Reliability Standard development process.[11]

The proposed Reliability Standard was developed in accordance with NERC's Commission-approved, ANSI- accredited processes for developing and approving Reliability Standards. Exhibit F includes a summary of the Reliability Standard development proceedings, and details the processes followed to develop the Reliability Standards. These processes included, among other things, comment and balloting periods. Additionally, all meetings of the

---

9 Order No. 672 at P 332.

10 Order No. 672 at P 333.

11 Order No. 672 at P 334.

drafting team were properly noticed and open to the public. The initial and additional ballots achieved a quorum and exceeded the required ballot pool approval levels.

11. NERC must explain any balancing of vital public interests in the development of proposed Reliability Standards.[12]

NERC has identified no competing public interests regarding the request for approval of the proposed Reliability Standard. No comments were received that indicated the proposed Reliability Standard conflicts with other vital public interests.

12. Proposed Reliability Standards must consider any other appropriate factors.[13]

No other negative factors relevant to whether the proposed Reliability Standard is just and reasonable were identified.

Exhibit D

Consideration of Directives

Consideration of Issues and Directives

Project 2014-04 - Physical Security

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
P.6. The Reliability Standards should require owners or operators of the Bulk-Power System to take at least three steps to address the risks that physical security attacks pose to the reliable operation of the Bulk-Power System. First, the Reliability Standards should require owners or operators of the Bulk-Power System to perform a risk assessment of their systems to identify their "critical facilities." A critical facility is one that, if rendered inoperable or damaged, could have a critical impact on the operation of the interconnection through instability, uncontrolled separation or cascading failures on the Bulk-Power System. Methodologies to determine these facilities should be based on objective analysis, technical expertise, and experienced judgment. The Commission is not requiring NERC to adopt a specific type of risk assessment, nor is the Commission requiring that a mandatory number of facilities be identified as critical facilities under the Reliability Standards. Instead, the Commission is directing NERC to develop Reliability	*Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (Mar. 7, 2014).	Requirement R1 of proposed Reliability Standard CIP-014-1 responds to this directive by requiring Transmission Owners to perform a risk assessment of its Transmission stations and substations that meet the criteria in Attachment 1 of CIP-002-5.1 for a Medium Impact rating to identify which of those Transmission stations and substations, if rendered inoperable or damaged as a result of a physical attack, could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. The Transmission Owner must also identify the primary control centers that operationally controls each identified Transmission station or Transmission substation. The standard drafting team (SDT) determined that the CIP-002-5 bright line would provide a conservative threshold for defining which Transmission stations and Transmission substations must be included in the risk assessment in Requirement R1 of CIP-014-1. If the Transmission Owner does not have any Transmission stations or Transmission substations that meet the Medium

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Standards that will ensure that owners or operators of the Bulk-Power System identify those facilities that are critical to the reliable operation of the Bulk-Power System such that if those facilities are rendered inoperable or damaged, instability, uncontrolled separation or cascading failures could result on the Bulk-Power System and thereby warrant the directive imposed here.		Impact rating, it is not subject to the proposed Reliability Standard and, in turn, would not have to conduct the risk assessment. Consistent with the Commission's directive, Requirement R1 does not require a specific methodology for identifying facilities that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection; rather, the requirement mandates that the risk assessment shall consist of a transmission analysis or transmission analyses to ensure that the risk assessment is based on objective analysis, technical expertise, and experienced judgment. Lastly, Requirement R1 identifies the periodicity for conducting the risk assessments.
7. Issuance of this directive will help provide for the resiliency and reliable operation of the Bulk-Power System. To that end, the proposed Reliability Standards should allow owners or operators to consider resilience of the grid in the risk assessment when identifying critical facilities, and the elements that make up those facilities, such as transformers that typically require significant time to repair or replace. As part of this process, owners or operators may consider elements of resiliency such as how the system is designed,	*Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (Mar. 7, 2014).	Requirement R1 provides Transmission Owners the flexibility to consider the resilience of their system when conducting their risk assessments. As noted above, Requirement R1 does not require a specific methodology for identifying their critical facilities and, in turn, allows an entity to use a methodology that considers how their system is designed, operated, and maintained, and the sophistication of recovery plans and inventory management.

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
operated, and maintained, and the sophistication of recovery plans and inventory management.		
8. In the second step, the Reliability Standards should require owners or operators of the identified critical facilities to evaluate the potential threats and vulnerabilities to those identified facilities. The threats and vulnerabilities may vary from facility to facility based on factors such as the facility's location, size, function, existing protections and attractiveness as a target. Thus, the Reliability Standards should require the owners or operators to tailor their evaluation to the unique characteristics of the identified critical facilities and the type of attacks that can be realistically contemplated. NERC should also consider in the standards development process requiring owners and operators to consult with entities with appropriate expertise as part of this evaluation process.	*Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (Mar. 7, 2014).	Requirement R4 of proposed Reliability Standard CIP-014-1 responds to this directive by requiring that the applicable Transmission Owner or Transmission Operator of facilities identified in accordance with Requirement R1 and verified in accordance with Requirement R2 conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s). Consistent with the Commission's directive to "tailor their evaluation to the unique characteristics of the identified critical facilities and the type of attacks that can be realistically contemplated," Requirement R4 states that the evaluation must consider: (1) the unique characteristics of the identified facilities; (2) prior history of attack on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and (3) intelligence or threat warnings received from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), U. S. federal and/or Canadian governmental agencies, or their successors.

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		Consistent with the Commission's statement that NERC should consider requiring owners and operators of identified facilities to consult with entities with appropriate expertise, Requirement R6 requires applicable Transmission Owners and Transmission Operators to select a third party to review their evaluation. This review may occur concurrently with or after the evaluation.
9. Third and finally, the Reliability Standards should require those owners or operators of critical facilities to develop and implement a security plan designed to protect against attacks to those identified critical facilities based on the assessment of the potential threats and vulnerabilities to their physical security. The Reliability Standards themselves need not dictate specific steps an entity must take to protect against attacks on the identified facilities. However, the Reliability Standards need to require that owners or operators of identified critical facilities have a plan that results in an adequate level of protection against the potential physical threats and vulnerabilities they face at the identified critical facilities.	*Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (Mar. 7, 2014).	Requirement R5 of proposed Reliability Standard CIP-014-1 responds to this directive by requiring the applicable Transmission Owner or Transmission Operator of facilities identified in accordance with Requirement R1 and verified in accordance with Requirement R2 to develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s). Consistent with the Commission's directive, Requirement R5 does not dictate specific steps an entity must take to protect against attacks on the identified facilities but requires applicable entities to develop a security plan that includes the following attributes to help ensure an adequate level of protection: (1) resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4; (2) law enforcement

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		contact and coordination information; (3) a timeline for executing the physical security enhancements and modifications specified in the physical security plan; and (4) provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).
10. All three steps of compliance with the Reliability Standard described above could contain sensitive or confidential information that, if released to the public, could jeopardize the reliable operation of the Bulk-Power System. Guarding sensitive or confidential information is essential to protecting the public by discouraging attacks on critical infrastructure. Therefore, NERC should include in the Reliability Standards a procedure that will ensure confidential treatment of sensitive or confidential information but still allow for the Commission, NERC and the Regional Entities to review and inspect any information that is needed to ensure compliance with the Reliability Standards.	*Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (Mar. 7, 2014).	To protect confidential or sensitive information, the Compliance Monitoring section of the standard provides that evidence demonstrating compliance with the standard must be retained at the applicable entities' facilities. Additionally, Requirements R2 and R6 require applicable entities to implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to third party verifiers and reviewers and to protect or exempt sensitive or confidential information developed pursuant to the standard from public disclosure.
11. In addition, the risk assessment used by an owner or operator to identify critical facilities should be verified by an entity other than the owner or operator. Such verification could be performed by NERC, the relevant Regional Entity, a	*Reliability Standards for Physical Security*	Requirements R2 and R6 respond to this directive. Under Requirement R3 Transmission Owners must have an unaffiliated third party verify the risk assessment performed under Requirement R1. The third party verifier must be either (1) a

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Reliability Coordinator, or another entity. The Reliability Standards should include a procedure for the verifying entity, as well as the Commission, to add or remove facilities from an owner's or operator's list of critical facilities. Similarly, the determination of threats and vulnerabilities and the security plan should also be reviewed by NERC, the relevant Regional Entity, the Reliability Coordinator, or another entity with appropriate expertise. Finally, the Reliability Standards should require that the identification of the critical facilities, the assessment of the potential risks and vulnerabilities, and the security plans be periodically reevaluated and revised to ensure their continued effectiveness. NERC should establish a timeline for when such reevaluations should occur.	*Measures*, 146 FERC ¶ 61,166 (Mar. 7, 2014).	registered Planning Coordinator, Transmission Planner, or Reliability Coordinator; or (2) an entity that has transmission planning or analysis experience. The requirement provides that the verification shall either verify the Transmission Owner's risk assessment or include recommendations for the addition or deletion of a Transmission station(s) or Transmission substation(s). The verification may occur concurrently with the Requirement R1 risk assessment but must be completed within 90 calendar days of the risk assessment. The Transmission Owner is required to either modify its identification based on the verifier's recommendation or, if it disagrees with the verifier's recommendations, document the technical basis for not modifying its identification. Similarly, under Requirement R6, applicable Transmission Owners and Operators must have an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5. The reviewing entity must be (1) an entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification; (2) an entity or organization approved by the ERO; (3) a governmental agency with physical security expertise; or (4) an entity or organization with demonstrated law

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		enforcement, government, or military physical security expertise. The third party review must be completed within 90 calendar days of completing the security plan(s) developed in Requirement R5. The applicable Transmission Owners and Transmission Operators are required to either modify their evaluation or security plan(s) consistent with the reviewer's recommendations or, if they disagree with the recommendations, document the reasons for not modifying. Consistent with the directive to establish a timeline for periodic reevaluation of the identification of facilities that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection, the assessment of the potential risks and vulnerabilities, and the security plans, the standard provides that Requirement R1 risk assessment should be performed at least once every 30 calendar months for those Transmission Owners that identified facilities in their previous risk assessment and once every 60 calendar months for those Transmission Owners that did not identify facilities in their previous risk assessment. Upon completion of each subsequent risk assessment, the applicable entities must satisfy the obligations under the remaining requirements.

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
12. Under the Reliability Standards, we anticipate that the number of facilities identified as critical will be relatively small compared to the number of facilities that comprise the Bulk-Power System. For example, of the many substations on the Bulk-Power System, our preliminary view is that most of these would not be "critical" as the term is used in this order. We do not expect that every owner and operator of the Bulk-Power System will have critical facilities under the Reliability Standard. We also recognize that the industry has engaged in longstanding efforts to address the physical security of its critical facilities. Thus, NERC should develop an implementation plan that requires owners or operators of the Bulk-Power System to implement the Reliability Standards in a timely fashion, balancing the importance of protecting the Bulk-Power System from harm while giving the owners or operators adequate time to meaningfully implement the requirements. NERC should file the plan with the Reliability Standards for Commission review.	*Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (Mar. 7, 2014).	The proposed Implementation Plan addresses this directive. As provided in the Implementation Plan, the standard becomes effective the first day of the first calendar quarter that is six months beyond the date that this standard is approved by applicable regulatory authorities or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. This means that the initial risk assessment required by Requirement R1, must be completed on or before the effective date of the standard. The initial performance of Requirements R2 through R6 must be completed according to the timelines specified in those requirements after the effective date of the proposed Reliability Standard, as follows: - Requirement R2, Parts 2.1, 2.2, and 2.4 shall be completed within 90 calendar days of the effective date of the proposed Reliability Standard. Requirement R2, Part 2.3 shall be completed within 60 calendar days of the completion of performance under Requirement R2 part 2.2. - Requirement R3 shall be completed within 7 calendar days of completion of performance under Requirement R2.

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		- Requirements R4 and R5 shall be completed within 120 calendar days of completion of performance under Requirement R2. - Requirement R6, Parts 6.1, 6.2, and 6.4 shall be completed within 90 calendar days of completion of performance under Requirement R5. Requirement R6, Part 6.3 shall be completed within 60 calendar days of Requirement R6 Part 6.2.

Project 2014-04: Physical Security

VRF and VSL Justifications for CIP-014-1

VRF and VSL Justifications – CIP-014-1, R1	
Proposed VRF	High
NERC VRF Discussion	Initial and subsequent risk assessments identify Transmission stations or Transmission substations that need to be assessed for threats and vulnerabilities and potential physical security measures. Since this is a Requirement in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition. This justifies a High VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the risk assessment periodicity and the identification of the primary control center that has operational control of Transmission stations and/or Transmission substations.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable CIP-002-5.1 R1, which deals with categorizing cyber systems, is assigned a High VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Transmission Owner performed an initial risk assessment but did so after the date specified in the implementation plan for performing the initial risk assessment but less than or equal to two calendar months after that date;

VRF and VSL Justifications – CIP-014-1, R1	
	OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 30 calendar months but less than or equal to 32 calendar months; OR The Transmission Owner that has not identified in its previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 60 calendar months but less than or equal to 62 calendar months.
Proposed Moderate VSL	The Transmission Owner performed an initial risk assessment but did so more than two calendar months after the date specified in the implementation plan for performing the initial risk assessment but less than or equal to four calendar months after that date; OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 32 calendar months but less than or equal to 34 calendar months; OR The Transmission Owner that has not identified in its previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 62 calendar months but less than or equal to 64 calendar months.
Proposed High VSL	The Transmission Owner performed an initial risk assessment but did so more than four calendar months after the date specified in

VRF and VSL Justifications – CIP-014-1, R1	
	the implementation plan for performing the initial risk assessment but less than or equal to six calendar months after that date; OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 34 calendar months but less than or equal to 36 calendar months; OR The Transmission Owner that has not identified in its previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 64 calendar months but less than or equal to 66 calendar months; OR The Transmission Owner performed a risk assessment but failed to include Part 1.2.
Proposed Severe VSL	The Transmission Owner performed an initial risk assessment but did so more than six calendar months after the date specified in the implementation plan for performing the initial risk assessment; OR The Transmission Owner failed to perform an initial risk assessment; OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after more than 36 calendar months; OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within

VRF and VSL Justifications – CIP-014-1, R1	
	an Interconnection failed to perform a risk assessment; OR The Transmission Owner that has not identified in its previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after more than 66 calendar months; OR The Transmission Owner that has not identified in its previous risk assessment any Transmission station and Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection failed to perform a subsequent risk assessment.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if the risk assessment is not performed or if the risk assessment is not performed within required intervals.
FERC VSL G3 Violation Severity Level	The language of the VSL directly mirrors the language in the corresponding requirement.

VRF and VSL Justifications – CIP-014-1, R1	
Assignment Should Be Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is assigned for a single instance of failing to submit perform a risk assessment.

VRF and VSL Justifications – CIP-014-1, R2	
Proposed VRF	Medium
NERC VRF Discussion	Unaffiliated third party verification of initial and subsequent risk assessments provides reinforcement that the risk assessment was performed with due consideration to risk to the bulk power system. Since this Requirement is in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. This justifies a Medium VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the unaffiliated third party verification including entities that may perform the verification, provisions for adding or removing Transmission stations and/or Transmission substations, and provisions for confidentiality of sensitive information.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable EOP-005-2 R6, which deals with verifying that its restoration plan accomplishes its intended function is assigned a medium VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but did so in more than 90 calendar days but less than or equal to 100 calendar days following completion of Requirement R1;

VRF and VSL Justifications – CIP-014-1, R2	
	OR The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 and modified or documented the technical basis for not modifying its identification under Requirement R1 as required by part 2.3 but did so more than 60 calendar days and less than or equal to 70 calendar days from completion of the third party verification.
Proposed Moderate VSL	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but did so more than 100 calendar days but less than or equal to 110 calendar days following completion of Requirement R1; Or The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 and modified or documented the technical basis for not modifying its identification under Requirement R1 as required by part 2.3 but did so more than 70 calendar days and less than or equal to 80 calendar days from completion of the third party verification.
Proposed High VSL	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but did so more than 110 calendar days but less than or equal to 120 calendar days following completion of Requirement R1; OR The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 and modified or documented the technical basis for not modifying its identification under Requirement R1 as required by part 2.3 but did so more than 80 calendar days from completion of the third party verification; OR The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but failed to modify or document the technical basis for not modifying its identification under R1 as required by part 2.3.
Proposed Severe VSL	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but did so more than 120 calendar days following completion of Requirement R1; OR The Transmission Owner failed to have an unaffiliated third party

VRF and VSL Justifications – CIP-014-1, R2	
	verify the risk assessment performed under Requirement R1; OR The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but failed to implement procedures for protecting information per Part 2.4.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if an unaffiliated third party verification is not performed or if the verification is not performed within prescribe timelines. The VSLs are also written indicating violation of the Requirement Part regarding protection of information.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The language of the VSL directly mirrors the language in the corresponding requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based	The VSL is assigned for a single instance of failing to have an unaffiliated third party verification performed; or failing to perform the verification within prescribe timelines; or failing to implement procedures to protect information.

VRF and VSL Justifications – CIP-014-1, R2	
on A Single Violation, Not on A Cumulative Number of Violations	

VRF and VSL Justifications – CIP-014-1, R3	
Proposed VRF	Lower
NERC VRF Discussion	Notifying the Transmission Operator that it has operational control of a Transmission station or Transmission substation identified in Requirement R1 and verified in Requirement R2 is necessary so that the Transmission Operator may begin performance of subsequent physical security requirements for the primary control center. This is a requirement that is administrative in nature and in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. This justifies a Lower VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the notification of the Transmission Operator regarding the removal of a Transmission station or Transmission substation.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable INT-006-4 R6, which deals with notifying other entities so that Confirmed Interchange may be implemented, is assigned a Lower VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Transmission Owner notified the Transmission Operator that operates the primary control center as specified in Requirement R3 but did so more than seven calendar days and less than or equal to nine calendar days following the completion of Requirement R2; OR The Transmission Owner notified the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R1 but did so more than seven calendar

VRF and VSL Justifications – CIP-014-1, R3	
	days and less than or equal to nine calendar days following the verification or the subsequent risk assessment.
Proposed Moderate VSL	The Transmission Owner notified the Transmission Operator that operates the primary control center as specified in Requirement R3 but did so more than nine calendar days and less than or equal to 11 calendar days following the completion of Requirement R2; OR The Transmission Owner notified the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R1 but did so more than nine calendar days and less than or equal to 11 calendar days following the verification or the subsequent risk assessment.
Proposed High VSL	The Transmission Owner notified the Transmission Operator that operates the primary control center as specified in Requirement R3 but did so more than 11 calendar days and less than or equal to 13 calendar days following the completion of Requirement R2; OR The Transmission Owner notified the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R1 but did so more than 11 calendar days and less than or equal to 13 calendar days following the verification or the subsequent risk assessment.
Proposed Severe VSL	The Transmission Owner notified the Transmission Operator that operates the primary control center as specified in Requirement R3 but did so more than 13 calendar days following the completion of Requirement R2; OR The Transmission Owner failed to notify the Transmission Operator that it operates a control center identified in Requirement R1; OR The Transmission Owner notified the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R1 but did so more than 13 calendar days following the verification or the subsequent risk assessment. OR The Transmission Owner failed to notify the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R1.

VRF and VSL Justifications – CIP-014-1, R3	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if notification is not made subject to the conditions of the requirement.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The language of the VSL directly mirrors the language in the corresponding requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is assigned for a single instance of failing to make the appropriate notification.

VRF and VSL Justifications – CIP-014-1, R4	
Proposed VRF	Medium
NERC VRF Discussion	Performing an evaluation of potential threats and vulnerabilities of a physical attack to each of respective Transmission station(s), Transmission substation(s), and primary control center(s) is necessary to ensure the physical security of those assets as well as the reliability of the bulk power system. Since this Requirement is in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. This justifies a Medium VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the evaluation of potential threats and vulnerabilities of a physical attack to Transmission stations and/or Transmission substations.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable CIP-007-5 R2, which deals with a patch management process for tracking, evaluating, and installing cyber security patches for applicable Cyber Assets, is assigned a Medium VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	N/A

VRF and VSL Justifications – CIP-014-1, R4	
Proposed Moderate VSL	The Responsible Entity conducted an evaluation of the potential physical threats and vulnerabilities to each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but failed to consider one of Parts 4.1 through 4.3 in the evaluation.
Proposed High VSL	The Responsible Entity conducted an evaluation of the potential physical threats and vulnerabilities to each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but failed to consider two of Parts 4.1 through 4.3 in the evaluation.
Proposed Severe VSL	The Responsible Entity failed to conduct an evaluation of the potential physical threats and vulnerabilities to each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1; OR The Responsible Entity conducted an evaluation of the potential physical threats and vulnerabilities to each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but failed to consider Parts 4.1 through 4.3.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if a responsible entity fails to conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) or failed to consider any of the Requirement Parts 4.1-4.3.

VRF and VSL Justifications – CIP-014-1, R4	
Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The language of the VSL directly mirrors the language in the corresponding requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is assigned for a single instance of failing to conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) or failing to consider any of the Requirement Parts 4.1-4.3.

VRF and VSL Justifications – CIP-014-1, R5	
Proposed VRF	High
NERC VRF Discussion	Development, implementation and execution of a documented physical security plan(s) that covers applicable Transmission station(s), Transmission substation(s), and primary control center(s) is necessary to ensure the physical security of those assets as well as the reliability of the bulk power system. Since this Requirement is in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition. This justifies a High VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the physical security plan for applicable Transmission stations, Transmission substations, or primary control centers.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable CIP-003-3 R4, which deals with implementing and documenting a program to identify, classify, and protect information associated with Critical Cyber Assets, is assigned a High VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Responsible Entity developed and implemented a documented physical security plan(s) that covers each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but did so more than 120 calendar days but less than or equal to 130 calendar days after completing Requirement R2;

VRF and VSL Justifications – CIP-014-1, R5	
	OR The Responsible Entity developed and implemented a documented physical security plan(s) that covers its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2 but failed to include one of Parts 5.1 through 5.4 in the plan.
Proposed Moderate VSL	The Responsible Entity developed and implemented a documented physical security plan(s) that covers each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but did so more than 130 calendar days but less than or equal to 140 calendar days after completing Requirement R2; OR The Responsible Entity developed and implemented a documented physical security plan(s) that covers its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2 but failed to include two of Parts 5.1 through 5.4 in the plan.
Proposed High VSL	The Responsible Entity developed and implemented a documented physical security plan(s) that covers each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but did so more than 140 calendar days but less than or equal to 150 calendar days after completing Requirement R2; OR The Responsible Entity developed and implemented a documented physical security plan(s) that covers its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2 but failed to include three of Parts 5.1 through 5.4 in the plan.
Proposed Severe VSL	The Responsible Entity developed and implemented a documented physical security plan(s) that covers each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but did so more than 150 calendar days after completing the verification in Requirement R2; OR The Responsible Entity failed to develop and implement a documented physical security plan(s) that covers its Transmission

VRF and VSL Justifications – CIP-014-1, R5	
	station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1. OR The Responsible Entity developed and implemented a documented physical security plan(s) that covers its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2 but failed to include Parts 5.1 through 5.4 in the plan.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if a responsible entity fails to develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s) or if the responsible entity failed to include any of the Requirement Parts 5.1-5.4.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The language of the VSL directly mirrors the language in the corresponding requirement.
FERC VSL G4 Violation Severity Level	The VSL is assigned for a single instance of failing to develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and

VRF and VSL Justifications – CIP-014-1, R5	
Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	primary control center(s) or failing to include any of the Requirement Parts 5.1-5.4.

VRF and VSL Justifications – CIP-014-1, R6	
Proposed VRF	Medium
NERC VRF Discussion	Unaffiliated third party review of the threat evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 provides reinforcement that these requirements were performed with due consideration to risk to the bulk power system. Since this Requirement is in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. This justifies a Medium VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the unaffiliated third party review including entities that may perform the review, timelines for completing the review and provisions for confidentiality of sensitive information.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable EOP-005-2 R6, which deals with verifying that its restoration plan accomplishes its intended function is assigned a medium VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but did so in more than 90 calendar days but less than or equal to 100 calendar days;

VRF and VSL Justifications – CIP-014-1, R6	
	OR The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 and modified or documented the reason for not modifying the security plan(s) as specified in Part 6.3 but did so more than 60 calendar days and less than or equal to 70 calendar days following completion of the third party review.
Proposed Moderate VSL	The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but did so in more than 100 calendar days but less than or equal to 110 calendar days; OR The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 and modified or documented the reason for not modifying the security plan(s) as specified in Part 6.3 but did so more than 70 calendar days and less than or equal to 80 calendar days following completion of the third party review.
Proposed High VSL	The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but did so more than 110 calendar days but less than or equal to 120 calendar days; OR The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 and modified or documented the reason for not modifying the security plan(s) as specified in Part 6.3 but did so more than 80 calendar days following completion of the third party review; OR The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but did not and modify or document the reason for not modifying the security plan(s) as specified in Part 6.3.
Proposed Severe VSL	The Responsible Entity failed to have an unaffiliated third party

VRF and VSL Justifications – CIP-014-1, R6	
	review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 in more than 120 calendar days; OR The Responsible Entity failed to have an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5; OR The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but failed to implement procedures for protecting information per Part 6.3.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if an unaffiliated third party review is not performed or if the review is not performed within prescribe timelines. The VSLs are also written indicating violation of the Requirement Part regarding protection of information.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the	The language of the VSL directly mirrors the language in the corresponding requirement.

VRF and VSL Justifications – CIP-014-1, R6	
Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is assigned for a single instance of failing to have an unaffiliated third party review performed; or failing to perform the review within prescribe timelines; or failing to implement procedures to protect information.

Exhibit F

Summary of Development History and Record of Development

Summary of Development History

Summary of Development History

The development record for proposed Reliability Standard CIP-014-1 is summarized below.

I. Overview of the Standard Drafting Team

When evaluating a proposed Reliability Standard, the Commission is expected to give "due weight" to the technical expertise of the ERO.[1] The technical expertise of the ERO is derived, in part, from the standard drafting team. For this project, the standard drafting team consisted of industry experts, all a diverse set of experiences. A roster of the standard drafting team members is included in Exhibit G.

II. Standard Development History

Following the issuance of the Physical Security Order, the NERC Standards Committee ("SC"), working with NERC staff, initiated Project 2014-04 Physical Security to develop a proposed Reliability Standard to satisfy FERC's directive to submit one or more physical security Reliability Standards by June 5, 2014 (i.e., within 90 days of the Physical Security Order).

A. Standard Processes Manual Waivers and Formation of Standards Drafting Team

To facilitate meeting the 90-day timeline, the NERC Standards Committee approved waivers to the Standard Processes Manual to shorten the comment and ballot periods for the Standards Authorization Request ("SAR") and draft Reliability Standard. The Standards Committee, working with NERC staff, also moved expeditiously to form a standard drafting team.

---

[1] Section 215(d) (2) of the Federal Power Act; 16 U.S.C. §824(d) (2) (2006).

Specifically, on March 12, 2014, the following actions were taken: (1) Standards Committee authorized solicitation of a drafting team; (2) the SC chair presented to the SC a proposal for waiver of certain provisions in the Standard Processes Manual to shorten the comment and ballot periods for the Standards Authorization Request ("SAR") and draft Reliability Standard; and (3) NERC posted solicitation of standard drafting team announcement, with nominations due Tuesday, March 18. On March 14, 2014 NERC posted notice of request for waiver of certain Standards Processes Manual provisions in accordance with Section 16 of the Standard Processes Manual. On March 21, 2014, the Standards Committee approved the requested waivers and appointed the standards drafting team.

B. Standard Authorization Request Development

NERC submitted a SAR to the SC on March 12, 2014. On March 21, 2014, the SC accepted the SAR and NERC posted the SAR for a seven-day informal comment period from March 21-28, 2014 in accordance with the SC-approved waiver of the Standard Processes Manual.

C. Technical Conference

On April 1, 2014, NERC held a technical conference to provide an opportunity for the standards drafting team, NERC, and industry participants to discuss issues related to applicability, identification of critical facilities, evaluation of threats and vulnerabilities, development and implementation of physical security plans, and a proposed implementation plan for the proposed Reliability Standard.

D. First Posting

Following standard drafting team meetings, NERC posted proposed Reliability Standard CIP-014-1 for a 15-day formal comment period from April 10, 2014 through April 24, 2014 in

accordance with the SC-approved waiver. On April 9, 2014, the Standards Committee authorized the posting of the proposed Reliability Standard for comment and ballot.

There were 136 sets of responses to the posting, including comments from approximately 240 different people from approximately 165 companies representing all 10 of the industry segments. The proposed Reliability Standard received a quorum of 88.60% and an approval of 82.07%.

The standard drafting team considered all comments and made the following non-substantive changes, among others, to the standard to incorporate stakeholder recommendations:

- Part 4.1.1 of the applicability section was changed to clarify that applicable Transmission Owners are those that own transmission stations or transmission substations meeting the criteria in 4.1.1.4 through 4.1.1.4.
- The exemption for covered by a security plans under Nuclear Regulatory Commission or Canadian Nuclear Safety Commission jurisdiction was changed to provide clarity on the scope of the exemption.
- Several additions were made to the guidance section of the standard to address stakeholder concerns.
- The standard drafting team drafted language in Requirement R2, Part 2.4, Requirement R6, Part 6.4 and Section 1.4 of the Compliance section of the standard to address confidentiality.
- The standard drafting team added language to the Guidelines and Technical Basis section to clarify the use of the term collector bus.
- Requirement R2, Part 2.2 was reworded to align with the intended applicable entity.
- A change was made to Requirement R3 to accurately state which primary control centers are included in the requirement.
- Changes were made to clarify factors to be considered by the responsible entity in Requirements R4 Parts 4.2 and 4.3.
- Requirement R5 was reworded to clarify the standard drafting team's intent for security plans to be developed within 120 days of completing Requirement R2 and executed according to the timeline specified in the security plan.

- Requirement R6, Part 6.1 was changed to clearly indicate that one or more of the criteria must be met.

- The standard drafting team added commentary in the Guidelines and Technical Basis section to address joint ownership.

E. Final Ballot

Proposed Reliability Standard CIP-014-1 was posted for a 5-day final ballot period from May 1, 2014 through May 5, 2014 in accordance with the SC-approved waiver. The proposed Reliability Standard received a quorum of 92.53% and an approval of 85.61%.

F. Board of Trustees Approval

Proposed Reliability Standard CIP-014-1 was approved by NERC Board of Trustees on May 13, 2014.

Record of Development

Project 2014-04 Physical Security

Related Files

Status:

The NERC Board of Trustees adopted the CIP-014-1 standard at their May 13, 2014 meeting and NERC staff is preparing the FERC filing.

Background:

This project will address the directives issued in the FERC Order on Reliability Standards for Physical Security Measures under Docket No. RD14-6-000 issued March 7, 2014. The Commission directed "The North American Electric Reliability Corporation (NERC), as the Commission-certified Electric Reliability Organization (ERO), to submit for approval one or more Reliability Standards that will require certain registered entities to take steps or demonstrate that they have taken steps to address physical security risks and vulnerabilities related to the reliable operation of the Bulk-Power System. The proposed Reliability Standards should require owners or operators of the Bulk-Power System, as appropriate, to identify facilities on the Bulk-Power System that are critical to the reliable operation of the Bulk-Power System. Then, owners or operators of those identified critical facilities should develop, validate and implement plans to protect against physical attacks that may compromise the operability or recovery of such facilities. The Commission directs NERC to submit the proposed Reliability Standards to the Commission within 90 days of the date of this order."

Purpose/Industry Need:

From the Order: "Physical attacks to the Bulk-Power System can adversely impact the reliable operation of the Bulk-Power System, resulting in instability, uncontrolled separation, or cascading failures. However, the current Reliability Standards do not specifically require entities to take steps to reasonably protect against physical security attacks on the Bulk-Power System. Therefore, to carry out section 215 of the FPA and to provide for the reliable operation of the Bulk-Power System, the Commission directs the ERO to develop and file for approval proposed Reliability Standards that address threats and vulnerabilities to the physical security of critical facilities on the Bulk-Power System. Such Reliability Standards will enhance the Commission's ability to assure the public that critical facilities are reasonably protected against physical attacks."

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Unofficial Nomination Form

Project 2014-04 Physical Security Standard Drafting Team

Please complete the electronic nomination form as soon as possible, but no later than **March 18, 2014.** This unofficial version is provided to assist nominees in compiling the information necessary to submit the electronic form. If you have any questions, please contact Stephen Crutchfield.

By submitting a nomination form, you are indicating your willingness and agreement to actively participate in the drafting team meetings (see dates of technical conference and first drafting team meeting below) if appointed by the Standards Committee. If appointed, you are expected to attend most of the face-to-face drafting team meetings as well as participate in all the team meetings held via conference calls. Failure to do so may result in your removal from the drafting team.

Background Information

Nominations are being sought for the Project 2014-04 Physical Security Standard Drafting Team (SDT). On March 7, 2014, FERC issued an Order, directing NERC to develop a new Reliability Standard to address concerns about the physical security of the Bulk-Power System. From the order:

> "The Commission directs the North American Electric Reliability Corporation (NERC), as the Commission-certified Electric Reliability Organization (ERO), to submit for approval one or more Reliability Standards that will require certain registered entities to take steps or demonstrate that they have taken steps to address physical security risks and vulnerabilities related to the reliable operation of the Bulk-Power System. The proposed Reliability Standards should require owners or operators of the Bulk-Power System, as appropriate, to identify facilities on the Bulk-Power System that are critical to the reliable operation of the Bulk-Power System. Then, owners or operators of those identified critical facilities should develop, validate and implement plans to protect against physical attacks that may compromise the operability or recovery of such facilities. The Commission directs NERC to submit the proposed Reliability Standards to the Commission within 90 days of the date of this order."

Potential SDT members should have experience in physical security programmatic design, risk assessments, evaluations, management, and identification of critical transmission substations and control centers, rather than the execution of physical security plan mitigation measures. In addition, compliance, legal, regulatory, and technical writing are desired. Previous drafting team experience and/or experience with development of standards is beneficial, but not required.

The expected time commitment for this team is aggressive because of directives with a deadline associated with them. The SDT is expected to meet in person for up to three full three-day meetings

during the project which is anticipated to last 90 days, with additional conference calls between face-to-face meetings as necessary to meet the aggressive project schedule. The first technical conference will be held in Atlanta on April 1, 2014 and the new drafting team will meet immediately following, April 2-4, 2014. SDT members are expected to attend both events.

Please provide the following information for the nominee:	
Name:	
Title:	
Organization:	
Address:	
Telephone:	
Email:	

Please briefly describe the nominee's experience and qualifications to serve on the selected project:

If you are currently a member of any NERC SAR or standard drafting team(s), please list each team here:

☐ Not currently on any active SAR or standard drafting team.

☐ Currently a member of the following SAR or standard drafting team(s):

If you previously worked on any NERC SAR or standard drafting team(s)s, please identify the team(s):

☐ No prior NERC SAR or standard drafting team.

☐ Prior experience on the following SAR or standard drafting team(s):

Select each NERC Region in which you have experience relevant to Project 2014-04:

☐ ERCOT	☐ NPCC	☐ SPP
☐ FRCC	☐ RFC	☐ WECC
☐ MRO	☐ SERC	☐ NA – Not Applicable

Select each Industry Segment that you represent:	
☐	1 — Transmission Owners
☐	2 — RTOs, ISOs
☐	3 — Load-serving Entities
☐	4 — Transmission-dependent Utilities
☐	5 — Electric Generators
☐	6 — Electricity Brokers, Aggregators, and Marketers
☐	7 — Large Electricity End Users
☐	8 — Small Electricity End Users
☐	9 — Federal, State, and Provincial Regulatory or other Government Entities
☐	10 — Regional Reliability Organizations and Regional Entities
☐	NA – Not Applicable

Select each Function[1] in which you have current or prior expertise:	
☐ Balancing Authority	☐ Transmission Operator
☐ Compliance Enforcement Authority	☐ Transmission Owner
☐ Distribution Provider	☐ Transmission Planner
☐ Generator Operator	☐ Transmission Service Provider
☐ Generator Owner	☐ Purchasing-selling Entity
☐ Interchange Authority	☐ Reliability Coordinator
☐ Load-serving Entity	☐ Reliability Assurer
☐ Market Operator	☐ Resource Planner
☐ Planning Coordinator	

Provide the names and contact information for two references who could attest to your technical qualifications and your ability to work well in a group:			
Name:		Telephone:	
Organization:		Email:	

[1] These functions are defined in the NERC Functional Model, which is available on the NERC web site.

Nominations are being sought for the Project 2014-04 Physical Security Standard Drafting Team (SDT). On March 7, 2014, FERC issued an Order, directing NERC to develop a new Reliability Standard to address concerns about the physical security of the Bulk-Power System. From the order:

> "The Commission directs the North American Electric Reliability Corporation (NERC), as the Commission-certified Electric Reliability Organization (ERO), to submit for approval one or more Reliability Standards that will require certain registered entities to take steps or demonstrate that they have taken steps to address physical security risks and vulnerabilities related to the reliable operation of the Bulk-Power System. The proposed Reliability Standards should require owners or operators of the Bulk-Power System, as appropriate, to identify facilities on the Bulk-Power System that are critical to the reliable operation of the Bulk-Power System. Then, owners or operators of those identified critical facilities should develop, validate and implement plans to protect against physical attacks that may compromise the operability or recovery of such facilities. The Commission directs NERC to submit the proposed Reliability Standards to the Commission within 90 days of the date of this order."

Potential SDT members should have experience in physical security programmatic design, risk assessments, evaluations, management, and identification of critical transmission substations and control centers, rather than the execution of physical security plan mitigation measures. In addition, compliance, legal, regulatory, and technical writing are desired. Previous drafting team experience and/or experience with development of standards is beneficial, but not required.

The expected time commitment for this team is aggressive because of directives with a deadline associated with them. The SDT is expected to meet in person for up to three full three-day meetings during the project which is anticipated to last 90 days, with additional conference calls between face-to-face meetings as necessary to meet the aggressive project schedule. The first technical conference will be held in Atlanta on April 1, 2014 and the new drafting team will meet immediately following, April 2-4, 2014. SDT members are expected to attend both events.

Submitting a Nomination

If you are interested in serving on the SDT, please complete the official nomination form by **March 18, 2013**. The nomination form should be submitted describing the individual's experience or qualifications related to the project.

An unofficial Word version of the nomination form is also posted on the Standard Drafting Team Vacancies page.

For information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Wendy Muller, Standards Development Administrator, or at 404-446-2560.

SAR Type (Check as many as applicable)			
☒ New Standard		☐ Withdrawal of existing Standard	
☐ Revision to existing Standard		☐ Urgent Action	

SAR Information
Industry Need (What is the industry problem this request is trying to solve?):
On March 7, 2014, FERC issued an order directing the ERO to develop a standard to address the physical security of critical facilities on the Bulk-Power System. In the order, FERC stated: "The Commission directs the North American Electric Reliability Corporation (NERC), as the Commission-certified Electric Reliability Organization (ERO), to submit for approval one or more Reliability Standards that will require certain registered entities to take steps or demonstrate that they have taken steps to address physical security risks and vulnerabilities related to the reliable operation of the Bulk-Power System. The proposed Reliability Standards should require owners or operators of the Bulk-Power System, as appropriate, to identify facilities on the Bulk-Power System that are critical to the reliable operation of the Bulk-Power System. Then, owners or operators of those identified critical facilities should develop, validate and implement plans to protect against physical attacks that may compromise the operability or recovery of such facilities. The Commission directs NERC to submit the proposed Reliability Standards to the Commission within 90 days of the date of this order." *Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 at P 1 (2014) ("FERC Order").
SAR Information
Purpose or Goal (How does this request propose to address the problem described above?):
The primary goal of this SAR is to allow the Standard Drafting Team (SDT) for Project 2014-04, Physical Security to develop a standard(s) to address the directives of the March 7, 2014 FERC Order and to ensure consistency within the NERC body of Reliability Standards.
Identify the Objectives of the proposed standard's requirements (What specific reliability deliverables are required to achieve the goal?):
Provide clear, unambiguous requirements and standard(s) to address the directives in the March 7, 2014 FERC Order regarding the physical security of critical facilities on the Bulk-Power System.
Brief Description (Provide a paragraph that describes the scope of this standard action.)
The SDT shall develop standard requirements, Violation Risk Factors, Violation Severity Levels, and implementation plan and shall work with compliance on an accompanying RSAW to address each of the directives in the March 7, 2014 FERC Order.

SAR Information
Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR. Also provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)
The SDTs execution of this SAR requires the SDT to address each of the FERC directives in the deadline required by the Order. The reliability assessment and justification is also set forth in the March 7, 2014 FERC Order. The March 7, 2014 FERC Order is incorporated in its entirety into this SAR, so as not to unnecessarily repeat or paraphrase the substance of the Order. There are no market interface impacts resulting from the standard action on physical security.

Reliability Functions	
The Standard will Apply to the Following Functions (Check each one that applies.)	
☐ Regional Reliability Organization	Conducts the regional activities related to planning and operations, and coordinates activities of Responsible Entities to secure the reliability of the Bulk Electric System within the region and adjacent regions.
☐ Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☐ Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☐ Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☐ Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐ Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.

Reliability Functions		
☐	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☐	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☒	Transmission Owner	Owns and maintains transmission facilities.
☒	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☐	Distribution Provider	Delivers electrical energy to the End-use customer.
☐	Generator Owner	Owns and maintains generation facilities.
☐	Generator Operator	Operates generation unit(s) to provide real and reactive power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.
☐	Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles	
Applicable Reliability Principles (Check all that apply).	
☐	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☐	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☐	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.

Reliability and Market Interface Principles	
☒	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☒	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	Yes

Background Information

On March 7, 2014, FERC issued an order directing the ERO to develop a standard to address the physical security of critical facilities on the Bulk-Power System. In the order, FERC stated:

"The Commission directs the North American Electric Reliability Corporation (NERC), as the Commission-certified Electric Reliability Organization (ERO), to submit for approval one or more Reliability Standards that will require certain registered entities to take steps or demonstrate that they have taken steps to address physical security risks and vulnerabilities related to the reliable operation of the Bulk-Power System. The proposed Reliability Standards should require owners or operators of the Bulk-Power System, as appropriate, to identify facilities on the Bulk-Power System that are critical to the reliable operation of the Bulk-Power System. Then, owners or operators of those identified critical facilities should develop, validate and implement plans to protect against physical attacks that may compromise the operability or recovery of such facilities. The Commission directs NERC to submit the proposed Reliability Standards to the Commission within 90 days of the date of this order."

You do not have to answer all questions. Enter comments in simple text format. Bullets, numbers, and special formatting will not be retained.

Questions

1. Do you agree with the scope and contents of the SAR? If not, please provide specific comments and suggestions for SDT consideration.

   ☐ Yes
   ☐ No
   Comments:

2. Are you aware of any regional variances associated with approved NERC Reliability Standards that will be needed as a result of this project? If yes, please identify the Regional Variance.

   ☐ Yes
   ☐ No
   Comments:

3. Are you aware of any Canadian provincial or other regulatory requirements that may need to be considered during this project in order to develop a continent-wide approach to the standard(s)? If yes, please identify the jurisdiction and specific regulatory requirements.

   ☐ Yes
   ☐ No
   Comments:

4. Are there any other concerns with this SAR?

   ☐ Yes
   ☐ No

Please use the electronic form to submit comments on the revised definition. If you experience any difficulties in using the electronic form, please contact Wendy Muller. An off-line, unofficial copy of the comment form is posted on the project page.

Instructions for Joining Ballot Pool

Ballots pools are being formed for Project 2014-04 – Physical Security and the associated non-binding poll on this project. Registered Ballot Body members must join the ballot pools to be eligible to vote in the balloting and submittal of an opinion for the non-binding poll of the associated VRFs and VSLs. Registered Ballot Body members may join the ballot pools at the following page: Join Ballot Pool

During the pre-ballot window, members of the ballot pool may communicate with one another by using their "ballot pool list server." (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list servers.) The list servers for this project are:

Initial Ballot: bp-2014-04_CIP-014-1_in@nerc.com
Non-Binding poll: bp-2014-04_CIP-014-1_NB_in@nerc.com

For information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Wendy Muller, Standards Development Administrator, or at 404-446-2560.

Comment Summary

Project 2014-04 Physical Security

The Project 2014-04 Physical Security Standard Authorization Request (SAR) was posted for a 7-day public comment period from March 21, 2014 through March 28, 2014. Stakeholders were asked to provide feedback on the standards and associated documents through a special electronic comment form.

Index to Questions, Comments, and Responses

1. **Do you agree with the scope and contents of the SAR? If not, please provide specific comments and suggestions for SDT consideration.** 10
2. **Are you aware of any regional variances associated with approved NERC Reliability Standards that will be needed as a result of this project? If yes, please identify the Regional Variance** 30
3. **Are you aware of any Canadian provincial or other regulatory requirements that may need to be considered during this project in order to develop a continent-wide approach to the standard(s)? If yes, please identify the jurisdiction and specific regulatory requirements.**.....35
4. **Are there any other concerns with this SAR?** 40

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 — Regional Reliability Organizations, Regional Entities

1. Do you agree with the scope and contents of the SAR? If not, please provide specific comments and suggestions for SDT consideration.

Organization	Yes or No	Question 1 Comment
Tennessee Valley Authority	No	The SDT should consider expanding the applicable entities identified in the SAR. For instance, the type of system risk assessment that FERC suggests in the March 7 order is likely to be conducted by the Transmission Planner / Planning Authority. The Reliability Coordinator might also have information that is pertinent to such a risk assessment from a wide area operations viewpoint. In the event that a generating plant or associated transmission switchyard is identified as a critical facility, the Generator Owner / Generator Operator should be involved in the process of evaluating potential threats and vulnerabilities to those facilities and the development and implementation of the security plan.The following standards should be added to the list of relavent standards to be reviewed by the SDT: CIP-002-3 (R1, R1.2);CIP-002-5.1 (R1 and Attachment 1, Impact Rating Criteria for BES Cyber Systems);FAC-010-2.1 (addresses the Planning Authority(Coordinator) methodology for identifying IROLs);FAC-011-2 (addresses the Reliability Coordinator methodology for identifying IROLs;FAC-014-2 (R5.1.1, use of “critical” in reference to Facility(ies) used to derive an IROL);IRO-002-2 (R5, use of “critical” in reference to BES elements);IRO-003-2 (R2, use of “critical facilities”);IRO-008-1 / IRO-009-1 / IRO-010-1a / TOP-001-2 / TOP-004-2 (the purpose statement for these standards includes “to prevent instability, uncontrolled separation, or cascading outages”, which is language used in the FERC order for identifying critical facilities);TPL-001-4 (R6, addresses the criteria or methodology used by the TP and PC to identify System instability)The SDT should also consider the definition of Interconnection Reliability Operating Limit (IROL) in

Organization	Yes or No	Question 1 Comment
		development of the physical security standard. This definition includes language used in the FERC order to describe a "critical facility".
SPP Standards Review Group	No	The FERC order references facilities which we assume are then tied to the existing definition of Critical Assets as defined in the Glossary of Terms. This definition is scheduled to be retired on March 31, 2016. How does one then determine the list of 'critical' facilities if that definition no longer exists? The distinction between critical facility and critical asset needs to be figured out. Also, FERC's interpretation of 'facility' isn't consistent with the NERC definition of Facility since FERC implies a control center is a facility in Footnote 6 on Page 3 of the order. We need to come to some resolution of terms in order to determine where the playing field lies.The SAR refers only to TOs and TOPs with no reference to GOs and GOPs who also own and operate facilities on the BES. Why were they left out? Also, BAs and RCs are not listed as applicable entities. Shouldn't they be included also? Will FERC accept a standard without these entities being included?While the SAR refers to the entire order being incorporated into the SAR we suggest that the SDT specifically list each of the directives in bullet fashion in the SAR such that the stakeholders can be assured that they have all been included and will then be addressed by the SDT.
Bonneville Power Administration	No	BPA believes that generally, this type of standard would be useful to the electric industry. The biggest issue for the SAR is the scope is loosely defined. As described, the objective of protecting critical facilities of the BES is stated too broadly and it is not apparent what countermeasures would be considered adequate or sufficient. ..."Then, owners or operators of those identified critical facilities should develop, validate and implement plans to protect against physical attacks that may compromise the operability or recovery of such facilities." BPA believes that there are also many questions and issues to resolve to get to an acceptable level of risk that is lower than what may be in place today, and the 90 day drafting

Organization	Yes or No	Question 1 Comment
		period may not be long enough to define adequate expectations. A phased development approach may be more conducive to obtaining the benefits desired - - for example, assessment and ranking standard(s) first followed by mitigation options and requirements standard(s) to address gaps identified by the assessment.
Foundation for Resilient Societies	No	SAR Only includes Transmission Owners and Operators. This does not include all critical facilities.
Self	No	After reviewing the SAR, where in the Reliability and Market Interface Principles the box 5 for facilities for communication monitoring and control are referenced, I believe that the Reliability Coordinator Function should have been checked also. Is this an oversight in the draft SAR?
Consumers Energy	No	The information contained in the attached PDF files seems very vague and open ended. I would specifically point ot page 2, under the Industry Need section 2nd paragraph, line 3:"will require certain registered entities" I believe the term certain should be changed to a term of greater focus such as "entities that meet a predetermined set of criteria used to determine local, regional, and national criticality."2nd paragraph, line 8:"may compromise", again I think there needs to be some "degree" of compromise contained in this section. Example a chunk of stolen copper, to some degree can compromise a system, just as a VBIED can compromise a system. In areas where a "compromise" could cause a consequence at a local level, and the primary identified risk is trespass and copper theft this SAR as written suggests we 'Mitigate" the risk of compromise, not the cause of compromise coupled with the identified consequence of the compromise. An owner should have the ability to identify the risk, the consequence, and the mitigations to "prevent" that type of compromise in areas or sections of the system that would impact local, and perhaps to some degree regional consequences. If in fact an owner has assets that

Organization	Yes or No	Question 1 Comment
		could, if compromised cause cascading events that impact areas outside of their system operational area, those assets would show a greater consequence area and would require a greater level of protection.
City of Tallahassee - Electric Utility	No	TAL has concerns with the expedited nature of the timeline. The issue of physical security has been known for quite some time. The timeline of this directive appears to be solely in reaction to the publishing of the Metcalf incident. This directive and expedited time line precludes the dialog from occurring that needs to take place to truly understand what is expected to satisfy the Commission's desires. TAL believes this directive will yield a standard that is difficult to enforce with little benefit to the large majority of the BES. Additionally, the publicizing of certain "known" studies indicating that as little as nine substations will cause a large blackout is problematic.
David Kiguel	No	1. The SAR should include other entities in the applicability section such as Generator Owners (GO) and Generator Operators (GOP). The FERC Directive indicates that the proposed Reliability Standards should require owners or operators of the Bulk-Power System, as appropriate, to identify facilities on the Bulk-Power System that are critical to the reliable operation of theBulk-Power System. It is clear that GOs and GOPs also own and operate Bulk-Power System facilities. 2. The FERC Directive requires that a risk assessment of the systems to identify their "critical facilities" be performed. In many cases, the entity that would be in the best position to perform such assessment would be the RC or the PC. It is suggested one of these be added in the SAR so the SDT can assign this responsibility to one of these functional entities. 3. The FERC Directive contains a requirement that NERC includes in the Reliability Standards a procedure that will ensure confidential treatment of sensitive or confidential informationbut still allow for the Commission, NERC and the Regional Entities to review and inspect any information that is needed to ensure compliance with the Reliability

Organization	Yes or No	Question 1 Comment
		Standards. Review and inspect such information on the part of the Commission should be limited to entities that are under FERC's jurisdiction. Canadian and/or Mexican data should be provided to regulators in the respective jurisdiction only, unless aggregated in a manner that will not allow to identify individual entities.
The Empire District Electric Company	No	The FERC order references facilities which we assume are then tied to the existing definition of Critical Assets as defined in the Glossary of Terms. This definition is scheduled to be retired on March 31, 2016. How does one then determine the list of 'critical' facilities if that definition no longer exists? The distinction between critical facility and critical asset needs to be addressed so that the expectation of a critical facility is clear to entities. Also, FERC's interpretation of 'facility' isn't consistent with the NERC definition of Facility since FERC implies a control center is a facility in Footnote 6 on Page 3 of the order. There needs to be some resolution of terms in order to determine where FERC's concern is focused so that a proper solution can be devloped.The SAR refers only to TOs and TOPs with no reference to GOs and GOPs who also own and operate facilities on the BES. These may be considered? Also, BAs and RCs are not listed as applicable entities-shouldn't they be included also as they have the overall ability to direct and control the BES? Will FERC accept a standard without these entities being included?While the SAR refers to the entire order being incorporated into the SAR we suggest that the SDT specifically list each of the directives in bullet fashion in the SAR such that the stakeholders can be assured that they have all been included and will then be addressed by the SDT.
the empire district electric company	No	The FERC order references facilities which we assume are then tied to the existing definition of Critical Assets as defined in the Glossary of Terms. Organization	Yes or No	Question 1 Comment
Westar Energy	No	The SAR refers only to TOs and TOPs with no reference to other registered functions. Should the applicability be expanded to include all registered functions who own and operate facilities on the BES and would be involved in the assessment process?
Colorado Springs Utilities	No	The SAR refers to the entire order being incorporated into the SAR we suggest that the SDT specifically list each of the directives in bullet fashion in the SAR such that the stakeholders can be assured that they have all been included and will then be addressed by the SDT. We would recommend Brightline Criteria For the identification of critical Bulk Electric System Facilities, based on either the Transmission Planning Standard TPL-004a or identification of the largest single contingency for each interconnection. If we need a single number, including only Facilities that provide or control over 3000 MW of generation or transmission or transmission operating at 300 kV and above. Case-specific analysis and consideration of exceptions will be needed, but we need to start with a high lower limit.
City of Tallahassee	No	TAL has concerns with the expedited nature of the timeline. The issue of physical security has been known for quite some time. The timeline of this directive appears to be solely in reaction to the publishing of the Metcalf incident. This directive and expedited time line precludes the dialog from occurring that needs to take place to truly understand what is expected to satisfy the Commission's desires. TAL believes this directive will yield a standard that is difficult to enforce with little benefit to the large majority of the BES. Additionally, the publicizing of certain "known" studies indicating that as little as nine substations will cause a large blackout is problematic.

Organization	Yes or No	Question 1 Comment

TAL believes this directive will yield a standard that is difficult to enforce with little benefit to the large majority of the BES. Additionally, the publicizing of certain "known" studies indicating that as little as nine substations will cause a large blackout is problematic.
Independent Electricity System Operator	No	We generally agree with the purpose and scope of the SAR, but we disagree with the applicability.The purpose of this project is develop a standard that will require owners and/or operators of the Bulkâ€Power System, as appropriate, to identify facilities on the Bulkâ€Power System that are critical to the reliable operation of the Bulkâ€Power System. Then, owners or operators of those identified critical facilities should develop, validate and implement plans to protect against physical attacks that may compromise the operability or recovery of such facilities. We interpret the "identify facilities" part in the first sentence to mean assessing the reliability impacts of the facilities which, if deemed inoperable, can result in instability, uncontrolled separation or cascading failures on the Bulk-Power System. Such tasks will thus require power system analysis not unlike the type required for transmission planning assessment, with a focus on losing the all the facilities at a location (e.g. a transmission substation, a large power plant, a right of way, etc.). These tasks will likely involve the Planning Coordinator and/or the Reliability Coordinator.This interpretation is also inferred from Para. 6 and Footnote #6 of the Order. Below is an excerpt of Para. 6 and FN#6:6. First, the Reliability Standards should require owners or operators of the Bulk-Power System to perform a risk assessment of their

Organization	Yes or No	Question 1 Comment
		systems to identify their “critical facilities.” A critical facility is one that, if rendered inoperable or damaged, could have a critical impact on the operation of the interconnection through instability, uncontrolled separation or cascading failures on the Bulk-Power System. Methodologies to determine these facilities should be based on objective analysis, technical expertise, and experienced judgment. The Commission is not requiring NERC to adopt a specific type of risk assessment, nor is the Commission requiring that a mandatory number of facilities be identified as critical facilities under the Reliability Standards. (FN#6) Instead, the Commission is directing NERC to develop Reliability Standards that will ensure that owners or operators of the Bulk-Power System identify those facilities that are critical to the reliable operation of the Bulk-Power System.FN#6 says: However, the Commission expects that critical facilities generally will include, but not be limited to, critical substations and critical control centers.Two key points:a. FN#6 clearly indicates that it is the Commission’s expectation that control centres are critical facilities. The most critical control centres are those of the RCs. Hence, the RC’s inclusion in the standard appears to be very likely.b. Para 6 suggests that critical facilities are necessary those that if rendered not operable, they have wide-area reliability impact associated with instability, uncontrolled separation or cascading failures. We fully expect the standard to require responsible entities to have a process and criteria in place with which to identify the critical facilities from a wide-area reliability impact point of view. Such tasks will involve reliability assessments that are normally performed by the Planning Coordinator and Reliability Coordinator, depending on the time frame. In the Applicability Section, however, neither the PC’s nor the RC’s box is checked. We suggest the SAR be revised to include at least these two entities as potential applicable entities so that the drafting team does not foreclose the possibility that reliability assessments need to be conducted to aid the identification of critical facilities. Further, we believe Generator

Organization	Yes or No	Question 1 Comment
		Owners and Generator Operators may also be involved since critical facilities may not be just limited to transmission facilities of control centres. Large power plants, if deemed inoperable, can also result in wide-area reliability concerns. We suggest the SAR be revised to include these two entities as potential applicable entities.
American Electric Power	No	Please see comments provided in response to Question 4.
Hydro One	No	The SAR does not ask the SDT to identify timelines by which the third-party verification, following the completion of the risk assessment, would be required. The FERC Order also does not specify timelines for how soon the third-party verification must be completed after the completion of the risk assessment. The scope of the standard should be limited to protection against physical attacks.Identifying which physical facilities are critical facilities should be determined through a BPS assessment of risk and the methodology by which this assessment is conducted should be identified in the standard. The assessment of risk or vulnerabilities should consider other standards including CIP and the new GMD Stage 2 project which will be a new TPL standard.
American Transmission Company, LLC	No	Currently, only Transmission Owners (TOs) and Transmission Operators (TOPs) are applicable Reliability Functions checked on the SAR on page 4. ATC believes those having experience in performing risk assessments and identifying critical facilities should also be included, which would be Planning Coordinators(PCs), Reliability Coordinators(RCs), and Transmission Planners(TPs). (and checked as applicable in the SAR for Reliability Functions on pp. 3 and 4) The basis for making PCs, RCs, and TPs applicable to the SAR and new Standard is also implied by one of the FERC Directives below addressing the need for a risk assessment: The following is an excerpt from the FERC Order:..... the Reliability Standards should require owners or operators of the Bulk-Power System to perform a risk

Organization	Yes or No	Question 1 Comment
		assessment of their systems to identify their "critical facilities." A critical facility is one that, if rendered inoperable or damaged, could have a critical impact on the operation of the interconnection through instability, uncontrolled separation or cascading failures on the Bulk-Power System.5 Methodologies to determine these facilities should be based on objective analysis, technical expertise, and experienced judgment. The Commission is not requiring NERC to adopt a specific type of risk assessment, nor is the Commission requiring that a mandatory number of facilities be identified as critical facilities under the Reliability Standards.6 Instead, the Commission is directing NERC to develop Reliability Standards that will ensure that owners or operators of the Bulk-Power System identify those facilities that are critical to the reliable operation of the Bulk-Power System such that if those facilities are rendered inoperable or damaged, instability, uncontrolled separation or cascading failures could result on the Bulk-Power System and thereby warrant the directive imposed here.In addition, ATC believes that Generator Owners (GOs) and Generator Operators (GOPs) should be added to the Reliability Functions of the SAR. The FERC Order states that "The proposed Reliability Standards should require owners or operators of the Bulk-Power System, as appropriate, to identify facilities on the Bulk-Power System that are critical to the reliable operation of the Bulk-Power System. Then, owners or operators of those identified critical facilities should develop, validate and implement plans to protect against physical attacks that may compromise the operability or recovery of such facilities." To address owners and operators of generation facilities that are part of the Bulk-Power System, GOs and GOPs should be included in the Reliability Functions of the SAR. With the above justification, ATC is recommending that the GOs, GOPs, PCs, RCs and TPs be checked on the SAR as applicable Reliability Functions.
Utility Services, Inc	No	The SAR attempts to address the Commission's directive by requiring only Transmission Owners and Transmission Operators to protect certain types

Organization	Yes or No	Question 1 Comment
		of facilities , however this may not fully address the directives. The Commission is seeking to physically protect BPS facilities that will impact to the reliable operation of the BPS. Generation is recognized to be a part of maintaining the reliability and resiliency of the BPS. Based on several factors, including but not limited to location and operating profile, a significant generation facility could have a huge effect on the reliable operation of the BPS. The SAR should, at a minimum, examine whether generating stations consisting of 3000 MW or more need to be included in the applicability of this project. This matches up to the treatment of the other types of assets being contemplated herein.
Nebraska Public Power District	No	If a list of the most critical substations exists, why are we trying to develop a new process to determine the list without first getting to see the list? The draft standard is due to FERC within 90 days, but we are being asked to develop a process to match their list, when we don't even know what is on the list. Shouldn't Congress get involved and pass a law within 90 days to require the military to protect the substations? No, just as we shouldn't have to draft a new standard within 90 days. Our NERC standard development process, similar to the process Congress uses to pass new federal requirements is intentionally designed with checks and balances, plus adequate time for review to prevent knee-jerk reactions to events. We need to spend time to get this right and not rush something through.This expedited standard development has the potential to derail our entire NERC standard development process. I feel like we have been blind folded and put into a room and told to hit a small target with a dart and we don't even know which wall or direction to throw the dart. We work in a very complex industry with very talented staff across North America. FERC's staff is more appropriately aligned toward oversight, without the technical expertise to understand the full impact of implementation of new rules and regulations. Why are we jeopardizing our entire process for this standard? Is there an imminent threat? If so, our leaders should find a more

Organization	Yes or No	Question 1 Comment
		appropriate path for a solution (i.e., deploy our military). We already have multiple NERC requirements to identify and designate our facilities as critical. Introducing a new requirement to identify critical facilities will create confusion and unintended consequences. The CIP standards have been through several iterations of identifying critical facilities and continue to evolve. This has been a moving target, so why introduce yet another process to determine critical facilities. Our planning standards require us to study our systems and methodically improve the infrastructure to prevent cascading outages. Do those planning standards need to be modified to consider physical attacks? Would that be a more appropriate path to a solution for this issue?
Ameren	No	1) The related standards section of the SAR should include CIP-002-5 so that the criteria to determine which facilities are critical as a preliminary list for the new physical security standard will not conflict with the bright-line criteria in CIP-002-5.
Tri-State Generation and Transmission Association, Inc.	No	TSGT does not agree that Transmission Operators should be included in the Reliability Functions. The March 7, 2014 FERC Order, paragraph 1, states "...owners or operators of the Bulk-Power System, as appropriate...". Transmission Owners have the legal and/or contractual ability to dictate how physical environments within a facility are addressed. There is nothing within the TOP function that formally allows the entity to dictate or ensure that any physical security concerns are met under this standard, unless otherwise dictated by contracts and/or agreements. If Transmission Operators are kept as a Reliability Function under this standard, the standard should clearly define which TOPS versus TOs should be included to ensure the "appropriate" entity is included and that the same facilities are not repeatedly reported by multiple entities.

Organization	Yes or No	Question 1 Comment
Salt River Project	No	The SAR, under the section "Related Standards" lists only CIP-006-5, CIP-008-5 and CIP-009-5. It should also consider additional related standards CIP-002-5, CIP-002-3, CIP-006-3, CIP-008-3, CIP-009-3, EOP-004-1, and the TPL family of standards. The SAR should work both to avoid inconsistencies between any new standard and the existing standards and also avoid redundancies as well.
Kansas City Power & Light	No	The FERC order references facilities and it is assumed this is linked to the existing definition of Critical Assets as defined in the Glossary of Terms. This definition is scheduled to be retired on March 31, 2016. There are many references to critical in the standards. Clarity as well as consistency is needed in the definition of critical and expressly for what purpose (reliability, security, relisiency, etc.). If the definition of critical facilities will be retired, common understanding of this term should be defined somewhere for consistent language between ERO staff and registered entities. The distinction between critical facility and critical asset should also be defined. Also, FERC's interpretation of facility is inconsistent with the NERC definition of Facility as FERC implies a control center is a facility in Footnote 6 on Page 3 of the order. Before this would become mandatory and enforceable, resolution of definition of terms is required to ensure consistency in application.The SAR reference determines applicability only to the TO and TOP functions. Whether based on the registry criteria or functional model activities, the determination of critical can be impacted or influenced by Transmission Planners, Generator Owners and Generator Operators who also model, plan, own and operate facilities on the BES. Applicability should be considered for Balancing Authorities, Planning Coordinators, and Reliability Coordinators depending on criticality for the purpose of reliability, security and resiliency. While the SAR refers to the entire order being incorporated into the SAR, KCP&L recommends that the SDT specifically list each of the directives in the SAR such that the

Organization	Yes or No	Question 1 Comment
		stakeholders can be assured that they have all been included and will then be addressed by the SDT.
Northeast Power Coordinting Council	Yes	Agree generally with the scope. Care must be taken that the requirements developed are consistent with the applicable reliability functions as noted in the SAR. The scope of the standard should be limited to protection against physical attacks. The determination of which physical facilities to protect (identified to be "critical") should come through a BPS assessment of risk that will need to be defined in the Standard, and depending on how that is done, might involve other types of registered entities or work done under other standards (e.g., CIP or even the GMD Stage 2 effort in which a new TPL Standard is under development, for similar reasons of determining what system risks to address).Regarding the Applicability, the purpose of this project is develop a standard that will require owners and/or operators of the Bulk Power System, as appropriate, to identify facilities on the Bulk Power System that are critical to the reliable operation of the Bulk Power System. Then, owners or operators of those identified critical facilities should develop, validate and implement plans to protect against physical attacks that may compromise the operability or recovery of such facilities. Such tasks might require power system impact analyses not unlike the type required for system impact assessments, with a focus on losing all the facilities at a location (e.g. a transmission substation, a large power plant, a right of way, etc.). We do not disagree with the applicable entities as specified in the proposed SAR, but are looking for clarification on how the assessments are obtained, and whether other functional entities might be asked for input from owners/operators. Put another way, depending on the types of impacts the Standard will seek to protect against, entities within the entire Interconnection, or maybe even specific regions within the Interconnection, might need to be included in the Standard. Can NERC or the SDT provide guidance on whether the loss of generating facilities might have interconnection or area wide impacts that the Standard needs to

Organization	Yes or No	Question 1 Comment
		protect against happening?To avoid compromising operations as stated in the SAR, we believe that consideration should be given to entities focusing more on the resiliency and the redundancy of the network rather than on additional physical security measures. Attacks may not be able to be prevented, but the consequences of an attack can be mitigated. This is the type of assessment that is best performed using the techniques in the TPL standards.Furthermore, according to the SAR, the SDT is to develop a standard that addresses risk factors, levels of acceptable security and the implementation of a protection plan. We believe that these elements can not be standardized as threat assessments are not the same from one entity to another. Consequently, the acceptable levels of safety cannot be identical. All of these factors lead us to believe that the development of fixed criteria regarding levels of acceptable risk and security cannot be identical from one entity to another. The SDT also has to consider and address the standard with respect to Canadian differences.
Duke Energy	Yes	(1)Duke Energy agrees with the scope and contents of the SAR.
ISO RTO standards Review Committee	Yes	We generally agree with the purpose and scope of the SAR, but we ask for clarification on how the SAR will address certain aspects of the FERC Order. Based upon the FERC Order for Physical Security Standards, we understand the task for NERC and the industry is to develop a standard that will require owners and/or operators of the Bulkâ€Power System, as appropriate, to identify facilities on the Bulkâ€Power System that are critical to the reliable operation of the Bulkâ€Power System. Then, owners or operators of those identified critical facilities should develop, validate and implement plans to protect against physical attacks that may compromise the operability or recovery of such facilities. Such tasks may require power system analysis not unlike the type required for transmission planning assessment, with a focus on loss of all the facilities at a physical location (e.g. a transmission substation, a large power plant, a right of way, etc.). We

Organization	Yes or No	Question 1 Comment
		do not disagree with the applicable entities as denoted in the proposed SAR snd are not seeking to expand the SAR to apply to Planning Authority (PA) and Reliability Coordinator (RC). However, we ask for clarification of how the assessments are obtained. Depending on the nature of the type of risk assessment developed under this Standard, certain tasks may need to involve the PA and/or the RC. Moreover, while the identification of "critical facilities" might not be the same as what may be identified under CIP-002-5 effective April 1, 2016 for High and Medium impact systems), CIP-002-5 (or PRC-023) might provide a model to use for RC/PA providing information to asset owners. We ask if these requirements can and will be relied upon.
ACES Standards Collaborators	Yes	ACES supports Project 2014-04 Physical Security SAR and NERC's efforts to protect the BES from either a cyber or physical security attack. NERC guidance should be developed to provide industry with examples of acceptable protections against various threat vectors and what level of resiliency should be in place. We support the drafting team in its development of a consistent and effective physical security standard for impacted registered entities across the regions. We also caution the drafting team to consider and minimize unintended consequences of these standards. For example, if the standards require visual impairments to prevent a Metcalf style attack could such visual impairments become projectiles during a storm. If so, would such visual impairments improve reliability in areas prone to many storms and tornadoes?
Exelon	Yes	Yes, Exelon agrees the primary goal is to develop a standard with clear unambiguous requirements that address the FERC directives.
Occidental Energy Ventures Corp.	Yes	Occidental Energy Ventures Corp. ("OEVC") agrees that the SAR properly captures the language and intent of FERC's order to address physical attacks on the BES. In addition, it is appropriate to limit the scope to high priority transmission assets - which we believe pose the most difficult

Organization	Yes or No	Question 1 Comment
		logistical challenges based upon their sheer number and wide geographic distribution.Having said that, there is a concern that the 90 day turn around interval mandated by the Commission could introduce flaws that would normally be caught in the vetting process. We realize that FERC has the legal authority to compel an expedited time frame, but would prefer that the SAR clearly indicate a commitment to risk-based principles that will allow flexibility to the industry and CEA community alike. For example, it may be appropriate at this time to require entities to develop strategies that engage law enforcement and the FBI when a threat appears - whereas a requirement to fortify substations and/or control rooms would not be. As the industry gains experience with protective techniques through exercises and actual experience, the best-in-class strategies can be encoded in a standard - but not before.
Madison Gas and Electric Company	Yes	The SAR seems to directly reflect the FERC Order but to assure system reliability and perform adequate studies the PC and TP may need to be added to the applicability section, since they have the ability to perform reliability studies. Plus studies could be used within the TPL Standards.
OPG	Yes	The reliability functions identified in the SAR are TO (Transmission Owner) and TOP (Transmission Operator). GO (Generator Owner) and GOP (Generator Operator) are not identified and this makes good sense. BPS impacted equipment that may be owned by a GO is contained within a plant environment and are already protected by existing Physical Security Measures in place to protect the plant.
City of Austin dba Austin Energy	Yes	City of Austin dba Austin Energy (AE) agrees with the scope and contents of the SAR; however, we think it is appropriate to include #7 in the list of Applicable Reliability Principles. #7 states “The security of the

Organization	Yes or No	Question 1 Comment
		interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis."
Northeast Utilities	Yes	NU agrees with scope and applicability. NU urges the SDT to take care that the requirements developed are consistent with the applicable reliability functions (TO & TOP) as noted in the SAR.

Northeast Power Coordinting Council	Yes	At this time, it is uncertain whether or not there are any jurisdictional issues that need to be considered by the Standard Drafting Team and addressed in the standard. It depends on the proposed requirements as they relate to detection, protection and reporting of potential physical risks to safeguard physical security. In addition, if the standard should involve protection of nuclear power plants, then there are differences in nuclear power plant regulations between the United States and Canada that may require recognition by the proposed standard.
Duke Energy	Yes	(1)The SDT should ensure that facilities regulated by the Nuclear Regulatory Commission or Canadian Nuclear Safety Commission are considered for exemption in the drafting of a Physical Security standard.
David Kiguel	Yes	Please see my comment with respect to confidential information above (Question 1).
Hydro One	Yes	As well, there may be provincial regulations in Ontario that require government-owned entities such as utilities to follow procurement rules and if the new standard included timelines by which assessments must be verified by third-party, these utilities may not be able to go through procurement processes for normal work (i.e.

Organization	Yes or No	Question 3 Comment
		not emergency or restoration work) quickly enough if the timelines are insufficient. (I am looking into this to confirm).

Northeast Power Coordinting Council	Yes	The Standard Drafting Team is urged to not be too prescriptive in the development of these requirements. Operators should be able to conduct a vulnerability assessment and implement any mitigation actions that were deemed appropriate by the entity. The Standard Drafting team should carefully consider the cost impact that the standard will have on entities to implement and therefore limit the site selection.Minimum vulnerabilities should be defined to be included in vulnerability assessments.Critical facilities determination are recommended to be carried out via a TPL standard based assessment.Timing should be provided for the effective date of standard versus the time required to conduct assessments and implement the mitigation actions identified.It has to be considered that electrical analysis and physical analysis are related, but are not one in the same. For example, using an electrical criteria, e.g., >3,000MVA, does not take into account that multiple voltages can reside on a single site, within a single footprint and fence. “Substations” is not a stand alone term. The SAR needs to recognize that there is not a total correlation between Cyber Security (CIPâ€002â€5.1) and Physical Security (CIPâ€014â€1). They are related, but different, and may need to use identical and as well as some different criteria. The current proposal for CIPâ€014 is to use the same criteria as those specifying a Medium Asset in CIPâ€002â€5.1. This may represent an over simplification. Physical Security is different. You do not need access in order to violate physical security. A TPL standards based assessment is a better approach.The SDT

Organization	Yes or No	Question 4 Comment
		must ensure that the scope of this standard and applicability of facilities subject to the standard is consistent with existing CIP standards.Furthermore, consider the impact of this standard on the existing standard EOP-004-2 and ensure the coordination with the EOP-004-2 standard.We believe that the SDT should consider network redundancy in the case of an attack, the potential consequences associated with a physical attack and threats specific to each entity before imposing a standard level of acceptance for all.The SDT should define how the verification of the risk assessment used by the owner or operator of critical facilities will be completed. The standard should identify the methodology by which critical facilities were identified. Once the methodology is determined, then the SAR should also define the methodology for doing this verification. The definition of the methodology for review should be applied to the review of all three of the identification of critical facilities, determination of threats and vulnerabilities, and mitigation plans, and that the standard should clarify whether the mitigation plans also have to be reviewed by a third party.The SDT should ensure that the new standard does not call for requirements that will impact or impede the normal operational capacity, access for maintenance or restoration, or the safety of people or equipment.The standard should clearly define the timelines for conducting assessments and implementing the mitigation actions identified with respect to when the standard becomes effective. Timelines for assessment of risk or vulnerabilities in this new standard should coincide with the timelines for which assessment of risk or vulnerabilities for other standards including the CIP and the new GMD Stage 2 project which will be a new TPL standard.
Duke Energy	Yes	(1)Duke Energy would like to reiterate to the SDT that any set of physical security standards need to provide the specific deliverables and that the requirements developed are clear and concise. We ask that the SDT proceed with caution and focus its attention on all potential physical threats and vulnerabilities to transmission substations, and not solely focus its attention on the recent activities in California and elsewhere. Also, stakeholders should have the flexibility to implement a staged level approach of security measures that are appropriate for the criticality of the facility

Organization	Yes or No	Question 4 Comment
		and the assessment of the vulnerabilities at a facility.(2)In addition to the CIP standards identified in the SAR for review of consistency in language and terminology, Duke Energy recommends the SDT review CIP-002-5 and EOP-004-2 as well.
Tennessee Valley Authority	Yes	While not stated in the SAR, it appears the SDT is preparing to develop an initial draft physical security standard as CIP-014-1 based on the ballot pool title. We agree that physical security of critical power system facilities can be considered a critical infrastructure protection issue; however we are concerned that development and implementation of a physical security standard (as outlined in the FERC order) under the CIP family of standards during the transition period from CIP version 3 to CIP version 5 will create an unnecessary distraction from the ongoing industry efforts to protect Cyber Assets under a changing regulatory framework. We respectfully request the SDT to consider developing the physical security standard for critical facilities (as outlined in the FERC order) under the FAC standards group to maintain a distinction from the CIP version 5 standards that are more focused on BES Cyber Assets and the associated protection of those Cyber Assets.
ISO RTO standards Review Committee	Yes	The IRC SRC is committed to working under this extremely expedited standards process timeline to provide our resources and technical expertise to help develop a standard that satisfies the FERC directive and above all, is effective and adds value to the numerous in effect reliability standards and practices that are designed to protect the Bulk-Power System from instability, uncontrolled separation and cascading failures. We do ask the standards drafting team to be aware that many facility owners already have physical protections in place for facilities they have determined to be critical. A NERC standard for physical security needs to be flexible so that it not only increases protections where they may be deficient - but also does not hinder or disincents the continued use of any protections already in place which have been effective.

Organization	Yes or No	Question 4 Comment
ACES Standards Collaborators	Yes	(1) FERC has stated in their order that they want grid owners and operators to "consider resilience of the grid" when identifying critical facilities. We recommend that the drafting team provide additional guidance to what level of resilience is needed, how will this be measured for each type of facility, and the level of resilience based upon risk to the BES. (2) FERC is requiring that an applicable entity must have "NERC, the relevant Regional Entity, a Reliability Coordinator, or another entity" review the process for identifying a critical facility. Given that only a TO and TOP have been identified as potential applicable functions, we question if this directive has been considered appropriately in the SAR.(3) Given that third parties may evaluate critical facility information, further guidance is needed and controls are required to address this highly sensitive level information. Is this information subject to the Freedom of Information Act? This will need to be clear as to how information, data, and protection plans are to be reviewed, secured and monitored.Thank you for your time and consideration.
SPP Standards Review Group	Yes	The 90-day response requested by FERC is well short of the normal standard development time at NERC. This process is an established, ANSI accredited and transparent process which is intended to consider all technical considerations and to establish a broad stakeholder consensus. To drastically reduce the process to a 90-day turnaround will present a challenge to developing a broad industry consensus and achieving the best technical solution.If the apparent driver behind this effort, the Metcalf event referenced in the WSJ article, truly raises a credible threat to the reliability of the Bulk Electric System(BES), it should be addressed logically in a well, thought-out process to reach the right conclusion and not be done in haste. The credibility of the analysis referred to in the WSJ article, pointing to a limited set of substations in North America causing a widespread outage, must be vetted by industry experts to first determine if there is a reliability gap in existing NERC standards. This is an appropriate scientific and logical approach to establishing a benchmark for developing any additional standards to further protect the North American electric grid from harm.We request that in order to give this project the

Organization	Yes or No	Question 4 Comment
		proper thought and effort that it deserves, NERC should reconsider seeking an extension from FERC in order to allow more time for a broader cross section of industry and as many technical experts as possible to participate in developing a product which will be more effective at maintaining the reliability of the BES.What does RISC say about the need for this standard? Have they been consulted? Also, what about the Independent Expert Review Panel? Have these parties voiced an opinion?Do the studies referenced in Table 1 of the TPL standards point to the list of the limited set of substations which this project is intended to address? Are the substations tied to these studies in any manner?The order mentions facilities being inoperable or not available but there was no reference to misuse as there is in the CIPs standards. Can we assume that cyber-type attacks on substations are already adequately accounted for in the CIPs standards and therefore do not need to be factored into the Physical Security standard?
Bonneville Power Administration	Yes	BPA believes it is virtually impossible to fully protect all critical BES facilities from attack by a determined foe. The means to damage BES facilities is readily available, constructible, and implementable regardless of what level of physical hardening is implemented. There are many question and issues to resolve, and the 90 day drafting period may not be long enough to address them all. The biggest general question to answer is what will be considered adequate protection.Will we need a 24 hour on site armed security force because the location is too remote to augment detection technology with fast response that will minimize the scale of impact to an acceptable level of loss? Will we need security walls constructed to be as impervious as those of a maximum security prison? The list of potential risk mitigation barriers is endless, as is the cost of building and maintaining elaborate barriers for facilities that cover acres of ground. It will be interesting to see what a standard of this type will prescribe as required to obtain a level of risk that is significantly lower than the current state potential for experiencing another Metcalf type event.BPA has concerns that the compressed time frame will impact quality and thoroughness of the dialog needed to develop “unambiguous” standards.

Organization	Yes or No	Question 4 Comment
Foundation for Resilient Societies	Yes	Detectors for Intentional Electromagnetic Interference (IEMI) and Electromagnetic Pulse as a Physical Security MeasureBecause an IEMI attack would take place in the physical proximity of critical facilities of the bulk electric system, it should be considered a physical security vulnerability for standard-setting for FERC Order RD14-6-000, just as a kinetic attack or physical intrusion would be covered in a physical security standard. Electronic upsets and failures occur under normal operating circumstances, even in high-reliability equipment such as that supporting critical infrastructure. Intentional Electromagnetic Interference (IEMI) and other electromagnetic pulse (EMP) induced upsets and failures, however, are different from those encountered in the normal operation of infrastructure systems, and in fact have unique aspects not encountered under any other circumstances. A coordinated physical attack using IEMI could produce nearly simultaneous upset and damage of electronic equipment over wide geographic areas. Since such non-random upset and damage is not encountered in other circumstances, the normal experience of otherwise skilled system operators and others in positions of responsibility and authority will not prepare them to identify what has happened to the system, what actions to take to minimize further adverse consequences, and what actions must be carried out to restore the impacted systems as swiftly and effectively as possible.Special system capabilities and operator awareness, planning, training, and testing will be required to deal with IEMI/EMP-induced system impacts. The first requirement is for the operators of critical infrastructure systems to be able to determine that a IEMI/EMP attack has occurred.It will be necessary to distinguish high altitude nuclear EMP (HEMP) effects from localized IEMI effects that could be generated by a cruise missile or ground based vehicle employing non-nuclear intentional electronic interference devices. IEMI attacks have fast rise times measured in nanoseconds but limited geographic range; detectors can be designed to distinguish between nuclear EMP and IEMI.Indications of IEMI or EMP attack should be transmitted to electric grid control rooms so operators can gain a comprehensive picture and adjust operational response. Without electromagnetic sensors and

Organization	Yes or No	Question 4 Comment
		associated telemetry and alarm systems, operators would be flying blind in case of IEMI/EMP attack.
Minnkota Power Cooperative	Yes	a) On page 5 of the SAR, under the Related Standards section, there lists 3 CIP Reliability Standards (CIP-006-5, CIP008-5, and CIP-009-5), with an explanation to review them to ensure no language and terminology inconsistency with requirements developed under this project. CIP-011-1 - Cyber Security Information Protection should also be added to the list. Paragraph (10) of the FERC order describes the importance of guarding sensitive or confidential information. While CIP-011-1 is focused towards BES Cyber System Information, the information protection program entities may adopt could be hindered if CIP-011-1 was not considered when developing new standard(s) to address the directives in the March 7, 2014 FERC Order regarding the physical security of critical facilities on the Bulk-Power System.b) On page 3 of the SAR, under the Reliability Functions section, lists the Functions the Standard(s) would be applicable to (TO and TOP are checked). Shouldn't GO and GOP also be checked. The FERC order states the "proposed Reliability Standards should require owners or operators of the Bulk-Power System, as appropriate, to identify facilities on the Bulk-Power System that are critical to the reliable operation of the Bulk-Power System". The key words to note are "owners or operators". A generation plant, under the BES definition enforceable July 1, 2014, could be considered critical to the reliable operation of the Bulk-Power System.
Entergy Services, Inc.	Yes	Compressed timeline will limit NERC's ability to acquire input from owners or operators of the Bulk-Power System.
Encari	Yes	If the proposed standard under this project takes effect and is implemented prior to 3/31/2016, then the proposed standard should take into account CIP-002-3 which has a process for identifying Critical Assets. After 3/31/2016, CIP-002-3 and the term "Critical Asset" become inactive.

Organization	Yes or No	Question 4 Comment
Idaho Power Co.	Yes	Related Standards. CIP-002-5 is not mentioned and as one of the instructions is 'to identify facilities on the Bulk-Power System that are critical to the reliable operation of the Bulk-Power System' unless we are going with another set of criteria and labelling the facilities differently, this seems to be what CIP-002-5 does.
The Empire District Electric Company	Yes	The 90-day response requested by FERC is well outside the normal standard development process at NERC. This process is an established, transparent process which incorporates stakeholder consensus. How will the industry be able to adequately respond to the directive when the process we use isn't designed for such a quick development time? Trying to respond within a 90-day period while maintaining some resemblance of our existing process will be difficult indeed. The apparent driver behind this effort, the WSJ article, seems a bit misdirected. The Metcalf event occurred over a year ago, yet the standard has been mandated to be issued within 90 days. If the issue was that critical, why hasn't something been done sooner? And if this is a truly critical situation, we need to be sure to move logically in a well, thought-out process to reach the right conclusion rather than respond with a "knee-jerk" reaction to a newspaper article. How was the list of 9 substations in the WSJ article determined? What studies were ran to make this determination? What process was used to validate the study? What were the credentials of those conducting the study? Numerous questions like these come to mind regarding the credibility of the analysis behind the study upon which the article is founded. The WSJ article referred to entire interconnections going down due to the loss of 9 substations across 3 interconnections. Four substations are credited with being able to bring down the entire EI. This is doubtful. This study must be vetted by industry experts to first establish if a reliability gap exists.

Organization	Yes or No	Question 4 Comment
		substations are already adequately accounted for in the CIPs standards and therefore do not need to be factored into the Physical Security standard?
Westar Energy	Yes	The FERC imposed development timeframe of 90 days is inadequate. The normal Standard Development Process allows for a transparent process which incorporates stakeholder consensus.The quality of the regulation will be adversely impacted by such an accelerated schedule.Westar requests that in order to give this project the proper thought and effort that it deserves, NERC seek an extension from FERC which will allow more time to complete the project. Allowing more time and consideration will result in a better product which will be more effective at maintaining the reliability of the BES.
Occidental Energy Ventures Corp.	Yes	This project is one of several which FERC has clearly established their expectation of urgent action. The CIP Version 5 Cyber Security, Geomagnetic Disturbance, and Gas/Electricity Industry Interoperability standards come immediately to mind. In OEVC's view, this means that NERC's standards development prioritization must be updated to take on the new work load - even if other project activity needs to be suspended in favor of Project 2014-04.Furthermore, there are a large number of new and/or modified standards which are scheduled to take effect this year and next - Generator Validations, and Protection System maintenance are among the most pressing. As a result, OEVC believes it is time for a second iteration of the Paragraph 81 process to aggressively retire those requirements that do little to support BES reliability. We understand that the obvious candidates have been addressed, but the industry's efforts must be continually re-focused on higher-priority activities. As long as less urgent requirements remain on the books, we all must set aside resources to capture evidence of compliance to routine tasks; leaving fewer available to address far more important threats to the BES.
Colorado Springs Utilities	Yes	The 90-day response requested by FERC is well outside the normal standard development process at NERC. This process is an established, transparent process which incorporates stakeholder consensus. The result of this accelerated process will

Organization	Yes or No	Question 4 Comment
		be an inferior standard.We request that in order to give this project the proper thought and effort that it deserves, NERC seek an extension from FERC which will allow more time to complete the project. Allowing more time and consideration will result in a better product which will be more effective at maintaining the reliability of the BES.We feel the focus should be on recovery from an attack, not solely prevention. We believe this has a larger impact on the reliability of the BES. Include something in the new standard that BES information should be protected, especially for public entities subject to Open Records Acts.
Manitoba Hydro	Yes	(1) Related Standards to avoid inconsistencies should include CIP-004-5 which addresses physical access management, a component of overall physical security. (2) "Applicability" should include an RC or PA/PC, as these would be the most appropriate Reliability Functions to determine if the loss of a facility would result in instability etc.
American Electric Power	Yes	While American Electric Power (AEP) appreciates the need for expediency in this FERC docket and relevant NERC SARs/Standards, we caution against an assumption that because a specific category of threat may be perceived as new, no efforts are yet underway to protect against that threat. In reality, AEP already has in place significant protections to secure the reliability of the grid - as does most of the electric utility industry. Many of these protections are in system configuration and design, inherently minimizing the criticality of any particular transformer, transmission circuit or station. These system configuration and design protections are incorporated to foster transmission system reliability in the event of weather and/or normal equipment failures. But they also answer the need for protection from other physical threats. In many cases our existing safeguards will protect the grid against new threats, including intentionally created damage.AEP agrees with FERC Commissioner John Norris' concurring comments filed with RD14-6-000 on March 7: "The owners and operators of our Bulk-Power System have already taken significant steps to protect critical facilities from physical attack. NERC's standards development process will benefit from the lessons learned from the owners and operators of the Bulk-

Organization	Yes or No	Question 4 Comment
		Power System and the communication that will take place across the stakeholder community regarding physical security. However, I am concerned that the procedural approach chosen by the Commission will inappropriately preclude an open and transparent process in which all interested parties would be able to engage with the Commission as the standards development process gets underway."AEP does not fully understand NERC's SAR which describes this effort as a New Standard, but not an Urgent Action. Certainly, the uniquely short timeframes allowed first by FERC and then by NERC for stakeholder participation imply an element of urgency. With no provision for comment to FERC and reduced input ability at NERC, the industry and our customers run the risk of unnecessary costs resulting from rushed decisions made with inadequate data. Likewise, addressing only Transmission Owners and Transmission Operators will provide less than a complete picture. Reliability Coordinators and Balancing Authorities also have a role to play and excluding that role from consideration will yield sub-par results. Additionally, some of the issues covered in the SAR and the FERC docket seem to overlap with existing Standards. Violations of a Standard that could stem from this effort might also be violations of CIP-002, CIP-006, CIP-008 and/or CIP-009. Care must be taken to ensure that the Standards dovetail, rather than duplicate each other, which would create a double-jeopardy situation for grid owners.In addition to our concerns about the process, AEP has reservations about the substance of the proposed SAR as well. First, AEP questions how the SAR proposes to define critical facilities. FERC and NERC have implied that the number of critical facilities identified in this process will be relatively small - fewer than 100 of the 55,000 transmission stations dispersed throughout the country. However, for previous "critical asset" determinations requested by NERC, AEP has already identified almost that many just on our own system. This would indicate we are starting over with the definition of critical facilities, which is counter-intuitive if not counter-productive. CIP-V5 switches the focus from protecting discrete cyber assets to protecting systems. Shouldn't we consider this same approach for physical security? AEP suggests that we begin by determining how critical facilities will be defined: 1) Will it be a bright-line test or a triage approach? 2) What will

Organization	Yes or No	Question 4 Comment
		distinguish critical cyber facilities from physical, and will one facility category be deemed more critical than the other? 3) Is there a distinction between a “critical facility” and “critical assets” defined in previous initiatives?4) Will there be distinctions between staffed and unstaffed stations, control centers or shared facilities?AEP believes that critical physical facilities will largely be a subset of the critical cyber asset list, tempered by:1) Availability of equipment spares, 2) Equipment redundancy located at the same vs. adjacent stations, 3) Level of interconnection to other stations at a particular voltage level,4) Proximity to a nuclear station, 5) Availability of alternative black start paths, 6) A sundry list of similar considerations. This analysis suggests that determination of a particular station as a critical physical facility is not a yes/no question, but rather a tiered approach to physical criticality is required. Considering the above, two stations similarly configured but in different parts of the system may not have the same physical criticality. Therefore, AEP is pleased with the nod to regional differences and the flexibility indicated in RD14-6-000. However, the changes NERC and FERC are proposing could result in massive changes, bringing excessive additional costs with no guarantee of desired outcomes. The question then becomes whether the cost to the nation’s electric customers far outweighs the benefits from additional protections layered on top of existing protocols. Are we being overly reactive to the isolated case of the Metcalf Station attack in San Jose a year ago? Are we painting targets on our critical infrastructure? Even with increased physical security, there will always be some potential for an attack on a critical facility. Larger fences and armed guards will make attacks marginally more difficult. They will not make the facilities immune to attack. A second primary concern is cost recovery - an issue that neither FERC nor NERC has addressed. Should NERC determine that a bright-line definition of critical facilities is the best way to go, cost recovery would be easier for grid owners, but costlier for customers. If NERC gives grid owners discretion to identify their critical facilities through risk-based assessments and determine their own protection strategies, state regulatory commissions will question every decision made, creating regulatory lag. That said, a risk-based assessment resulting in tiered levels of

Organization	Yes or No	Question 4 Comment
		criticality would yield the strongest results from a grid protection standpoint. While grid protection is paramount, we must weigh options. Poorly executed, these Standards could carry astronomical real costs as well as opportunity costs. Meanwhile, many customers are about to bear significant cost increases based on changes required by the EPA's Mercury and Toxics Standards. While we need to make whatever investment is necessary to adequately protect the grid, we also need to be responsible stewards of the grid and our ratepayers' pocket books. We must make sure we have taken necessary steps as cost-effectively as possible and that we are not simply being reactionary.In summary, AEP supports:1) Risk-based assessments conducted by transmission owners to define their own critical facilities2) Triage protocols based on those risk-based assessments3) Acknowledgement and inclusion of existing protections4) Adoption of a CIP-V5 approach of protecting critical systems rather than discrete facilities5) Cost-based assessments that include opportunity costs and factor in cost recovery.
Hydro One	Yes	The SAR should ask the SDT to define how the verification of the risk assessment used by the owner or operator of critical facilities will be completed. The standard should identify the methodology by which critical facilities were identified? If it is the methodology, then the SAR should also define the methodology for doing this verification. The FERC Order states "the Reliability Standards should require that the identification of the criticalfacilities, the assessment of the potential risks and vulnerabilities, and the security plans be periodically reevaluated and revised to ensure their continued effectiveness." The definition of the methodology for review should be applied to the review of all 3 of identification of critical facilities, determination of threats and vulnerabilities, and mitigation plans, and that the standard should clarify whether the mitigation plans also have to be reviewed by a third party.There is risk that significant investments may be needed as a result of the new standard.There SDT should ensure that the new standard does not call for requirements that will impact or impede the normal operational capacity, access for maintenance or restoration, or the safety of people or equipment.Minimum vulnerabilities should be defined in the standard to be included in vulnerability

Organization	Yes or No	Question 4 Comment
		assessments.The assessment of critical facilities should be defined in a TPL standard based assessment.The standard should clearly define the timelines for conducting assessments and implementing the mitigation actions identified with respect to when the standard becomes effective.Timelines for assessment of risk or vulnerabilities in this new standard should coincide with the timelines for which assessment of risk or vulnerabilities for other standards including the CIP and the new GMD Stage 2 project which will be a new TPL standard.
Northeast Utilities	Yes	NU urges that the SDT not be too prescriptive in the development of these requirements. Entities should be able to conduct a vulnerability assessment and implement any mitigation actions that they deem appropriate. SDT should carefully consider the cost impact that the standard will have on entities to implement and therefore limit the site selection.SDT should define minimum vulnerabilities to be included in vulnerability assessments.SDT to provide for timing of the effective date of standard versus the time required to conduct assessments and implement mitigation actions identified.SDT should clearly limit the scope of the standard to protection against physical attacks.
Xcel Energy Inc.	Yes	A review of the CIP standards (Version 5) is required by the SAR. However, considering that many, if not all of the facilities in scope of this new standard will also likely be considered Critical Assets, as defined by CIP-002-5, this has the possibility of creating double jeopardy situations and added Regulatory oversight. Instead, please consider addressing physical security through an existing standard like CIP-006-5 or EOP-004-2 (Event Reporting).
Utility Services, Inc	Yes	The identification method that will be used to determine applicability to the standard is a concern. The drafting team should take care to respect the work already crafted by the previous CIP drafting teams in creating a format and brightline thresholds to identify those facilities that require protection. From historical experience we have seen that “Risk Assessment” style applicability is not consistently and uniformly

Organization	Yes or No	Question 4 Comment
		applied and should therefore be avoided. We have seen this causes major issues and we should not repeat past mistakes.
Nebraska Public Power District	Yes	If we truly have a small subset of nine key substations that are as critical as was quoted in the Wall Street Journal, why isn't the military protecting these substations? We use our military to protect our Air Force bases, Army forts, Naval yards, etc. Is this threat real or is it political sensationalism? Is the number of substations nine, or is it 30 or is it less than 100 as the Wall Street Journal quoted former FERC chairperson Wellinghoff. Shouldn't the electric industry experts be allowed to review the modeling for this analysis? Was the modeling in sufficient detail or were many networks equivalized? Was it a steady-state model or were dynamics evaluated? What was the experience level of the engineers doing the analysis (have they performed similar analysis at large utilities)? Should we revoke this SAR and replace it with another new standard that would restrict utilities from building any new substations above a certain level? Should the standard require planned additions/expansions to provide for redundancy and resiliency as the Department of Homeland Security and Department of Energy recently recommended in their Physical Security of Substations Briefing? Do we have to build 500 kV and 765 kV systems? Does the market save us any money to transfer power between regions, if we have to add these systems that open up vulnerabilities to physical attacks?Should Congress fund a US based manufacturing plant for transformers?Should North America (those within NERC) standardize voltage levels, so replacement transformers are more readily available?The list of philosophical questions can continue, but we are not ready to draft a standard on this issue without first debating the problem we are trying to solve. What is the problem we are trying to solve?The Wall Street Journal article implied we need to protect our substations from automatic weapons. Is this the problem we are trying to solve? Will we be required to build walls around our substations? What do we do about a substation that is located in a valley with unlimited firing angles from surrounding higher ground? How do we protect the miles and miles of transmission structures leading to these substations? Do we have to protect one substation away, two substations away, etc.By installing additional

Organization	Yes or No	Question 4 Comment
		security on these facilities, aren't we painting those assets as targets by clearly identifying them?
Ameren	Yes	1) The time frame that is outlined in this SAR to create a new physical security standard is very short and we are concerned that a cost effective, reasonable, workable standard cannot be drafted in this short amount of time. We understand the need for a new physical security standard but creating a standard this quick could result in an incorrectly written standard which will not be understood by industry. We are concerned that this does not solve the problem but will end up making a new one.
New Brunswick Power Corporation	Yes	It is our desire to ensure the SDT consider the impacts of physical security threats that can arise between entities (wide area view) rather than a strict focus on the effects of physical security risks on elements within a given entity's footprint. Taking this approach and allowing the entity to determine the specific impact criteria for their footprint, should align the violation risk factors and severity levels to account for higher level threats rather than burden the entities with lower impact concerns.
Tri-State Generation and Transmission Association, Inc.	Yes	In agreement with the Commissioner, John Norris's, concurrence, the uniquely expedited nature of this standard development procedural approach will preclude an open and transparent process, limit the engagement of the industry, and, without the time to properly vet the security risks and measures, will negatively impact reliability and consumer costs.Co-owned facilities are not addressed in the standard. Co-owned facilities will have multiple assessments by different entities. This will lead to different threat assessments and different physical security plans. Conflicts may and most likely will occur on co-owned facilities. This is something that must to be taken into consideration.There is no requirement for 3rd party verification for CIP-002-5.1 R2 which requires assessment and categorization of assets. 3rd party verification is not required there and should not be required here. Senior approval should be all that's necessary. Some possibilities to address the FERC order for verification of entities' plans include a submittal to the RC/RE upon their request as currently

Organization	Yes or No	Question 4 Comment
		required by many of the emergency operations plans or an annual submittal to the RC/RE.Something else to consider is that audits for TO/TOPs are on a 3 year cycle. The RE could review the assessments and plans during audits removing the requirement for 3rd party verification.Physical threats run the gamut of simple to highly complex. What will limit this review? Addressing ALL potential threats will be cost prohibitiveThe value necessary for a facility to qualify should be raised. The criteria from CIP-002 v5 is meant to include a larger portion of the grid. This criteria will include too many facilities which was not the intent of FERC.
Salt River Project	Yes	The SAR should closely follow the FERC Order that owners and operators are to develop their specific plans to protect against physical attacks that may compromise their facilities. The FERC Order provides for flexibility for owners and operators to determine the methodology they will use in identifying their critical facilities. The standard should direct the entities to focus on station facilities and not 'outside the fence' assets. Critical facilities vary widely both in the type and extent of potential vulnerabilities to physical attacks. Customized defenses and protections are esstential and the owners and operators are correctly given flexibility both in identifying which assets are critical and then developing the most appropriate plans for protection. That plan should not be primarily directed at physical deterrence of the threats, there are two other important facets of a security plan: operational security, and recovery after an event. The flexibility will help avoid potential conflicts between any new standards and existing ones. The objectives of the SAR are to provide clear, unambiguous requirements and standard(s) to address the FERC Order. This should not mean development of requirements with highly prescriptive, detailed and specific physical protection structures, activities and programs but instead should mean the SAR will develop clear direction on identification of critical facilities and credible physical threats to such facilities followed by prudent plans for protection that are appropriate for each such facility.
Kansas City Power & Light	Yes	The 90-day response requested by FERC is well outside the normal standard development process at NERC. This process is an established, transparent process

Organization	Yes or No	Question 4 Comment
		which incorporates stakeholder consensus. Trying to respond within a 90-day period while giving the appropriate diligence and consideration to the topic of protection of BES assets will be difficult. We recommend taking appropriate time to give this project the proper thought and effort that it deserves for diligent actions to be taken to protect the grid. We respectfully ask NERC to remain open to the potential need to seek an extension from FERC to allow more time to complete the project if deemed necessary. The order mentions facilities being inoperable or not available but there was no reference to misuse or a resiliency concept. We believe the SDT should consider these options including the concept of a capability / maturity model and on a continuum for improvements in the hardening of our BES facilities. Ultimately the goal is to focus on protection and security of assets.

END OF REPORT

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. Nominations for the Standard Drafting Team (SDT) for Project 2014-04 Physical Security were solicited March 13-18, 2014, and the SDT was appointed by the Standards Committee on March 21, 2014.
2. Technical Conference was held April 1, 2014.

Description of Current Draft

This is the first draft of the proposed Reliability Standard, and it is being posted for stakeholder comment and initial ballot. This draft includes proposed requirements to meet the directives issued in the FERC order issued March 7, 2014, in Docket No. RD14-6-000, *Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (2014).

Anticipated Actions	Anticipated Date
15-day Formal Comment Period with a 5-day Initial Ballot, pursuant to a Standards Committee authorized waiver.	April 10, 2014
10-day Formal Comment Period with a 5-day Additional Ballot (if necessary), pursuant to a Standards Committee authorized waiver.	May 2014
5-day Final Ballot, pursuant to a Standards Committee authorized waiver.	May 2014
BOT Adoption.	May 2014
File with applicable Regulatory Authorities.	No later than June 5, 2014

Version History

Version	Date	Action	Change Tracking
1.0	TBD	Effective Date	New

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the NERC Glossary of Terms used in Reliability Standards (Glossary) are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

A. Introduction

1. Title: Physical Security

2. Number: CIP-014-1

3. Purpose: To identify and protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection.

4. Applicability:

4.1. Functional Entities:

4.1.1 Transmission Owner that owns any of the following:

4.1.1.1 Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

4.1.1.2 Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

Voltage Value of a Line	Weight Value per Line
less than 200 kV (not applicable)	(not applicable)
200 kV to 299 kV	700
300 kV to 499 kV	1300
500 kV and above	0

4.1.1.3 Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Coordinator, or Transmission Planner as critical to the derivation of Interconnection

Reliability Operating Limits (IROLs) and their associated contingencies.

4.1.1.4 Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements.

4.1.2 Transmission Operator.

Exemption: Facilities within the scope of a security plan approved by the Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission are not subject to this Standard.

5. Effective Dates:

CIP-014-1 is effective the first day of the first calendar quarter that is six months beyond the date that this standard is approved by applicable regulatory authorities, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. In those jurisdictions where regulatory approval is not required, CIP-014-1 shall become effective on the first day of the first calendar quarter that is six months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

6. Background:

This Reliability Standard addresses the directives from the FERC order issued March 7, 2014, *Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (2014), which required NERC to develop a physical security reliability standard(s) to identify and protect facilities that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection.

B. Requirements and Measures

R1. Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria specified in Applicability Section 4.1.1. The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify any Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. *[VRF: High; Time-Horizon: Long-term Planning]*

1.1. Subsequent risk assessments shall be performed:

- At least once every 30 calendar months for a Transmission Owner that has identified in its previous risk assessment (as verified according to Requirement R2) one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection; or

- At least once every 60 calendar months for a Transmission Owner that has not identified in its previous risk assessment (as verified according to Requirement R2) any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection.

1.2. The Transmission Owner shall identify the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment.

M1. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the risk assessment of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria in Applicability Section 4.1.1 as specified in Requirement R1.

Rationale for Requirement R1:

This requirement meets the FERC directive from paragraph 6 in the order on physical security to perform a risk assessment to identify which facilities if rendered inoperable or damaged could impact an Interconnection through widespread instability, uncontrolled separation, or cascading failures. It also meets the portion of the directive from paragraph 11 for periodic reevaluation by requiring the risk assessment to be performed every 30 months (or 60 months for an entity that has not identified in a previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in

widespread instability, uncontrolled separation, or Cascading within an Interconnection).

After identifying each Transmission station and Transmission substation that meets the criteria in Requirement R1, it is important to additionally identify the primary control center that operationally controls that Transmission station or Transmission substation (*i.e.,* the control center whose electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker, compared to a control center that only has the ability to monitor the Transmission station and Transmission substation and, therefore, must coordinate direct physical action through another entity).

R2. Each Transmission Owner shall have an unaffiliated third party verify the risk assessment performed under Requirement R1. The verification may occur concurrent with or after the risk assessment performed under Requirement R1. *[VRF: Medium; Time-Horizon: Long-term Planning]*

2.1. Each Transmission Owner shall select an unaffiliated verifying entity that is either:

- A registered Planning Coordinator, Transmission Planner, or Reliability Coordinator; or
- An entity that has transmission planning or analysis experience.

2.2. The unaffiliated verifying entity shall either verify the Transmission Owner's risk assessment performed under Requirement R1 or recommend the addition or deletion of a Transmission station(s) or Transmission substation(s). The Transmission Owner shall ensure the verification is completed within 90 calendar days following the completion of the Requirement R1 risk assessment.

2.3. If the unaffiliated verifying entity recommends that the Transmission Owner add a Transmission station(s) or Transmission substation(s) to, or remove a Transmission station(s) or Transmission substation(s) from, its identification under Requirement R1, the Transmission Owner shall either, within 60 calendar days of completion of the verification, for each recommended addition or removal of a Transmission station or Transmission substation:

- Modify its identification under Requirement R1 consistent with the recommendation; or
- Document the technical basis for not modifying the identification in accordance with the recommendation.

2.4. Each Transmission Owner shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information exchanged with the unaffiliated verifying entity.

M2. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner completed an unaffiliated third party verification of the Requirement R1 risk assessment and satisfied all of the applicable provisions of Requirement R2, including, if applicable, documenting the technical basis for not modifying the Requirement R1 identification as specified under Part 2.3.

Rationale for Requirement R2:

This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring verification by an entity other than the owner or operator of the risk assessment performed under Requirement R1.

This requirement provides the flexibility for a Transmission Owner to select registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term "unaffiliated" means that the selected verifying entity cannot be a corporate affiliate (*i.e.*, the verifying entity cannot be an entity that controls, is controlled by, or is under common control with, the Transmission owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit.

Requirement R2 also provides the Transmission Owner the flexibility to work with the verifying entity throughout the Requirement R1 risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could coordinate with their unaffiliated verifying entity to perform a Requirement R1 risk assessment to satisfy both Requirement R1 and Requirement R2 concurrently.

R3. For a primary control center(s) identified by the Transmission Owner according to Requirement R1 and verified according to Requirement R2 that is not under the operational control of the Transmission Owner, the Transmission Owner shall, within seven calendar days following completion of Requirement R2, notify the Transmission Operator that has operational control of the primary control center of such identification and the date of completion of Requirement R2. *[VRF: Lower; Time-Horizon: Long-term Planning]*

3.1. If a Transmission station or Transmission substation previously identified under Requirement R1 and verified according to Requirement R2 is removed from the identification during a subsequent risk assessment performed according to Requirement R1 or a verification according to Requirement R2, then the Transmission Owner shall, within seven calendar days following the verification or the subsequent risk assessment, notify the Transmission Operator that has operational control of the primary control center of the removal.

M3. Examples of acceptable evidence may include, but are not limited to, dated written or electronic communications that the Transmission Owner notified each Transmission Operator, as applicable, according to Requirement R3.

Rationale for Requirement R3:

Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first identifying which Transmission stations and Transmission substations meet the criteria specified by Requirement R1, as verified according to Requirement R2. This requirement is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1 and verified according to Requirement R2 receives notice of such identification so that the Transmission Operator may timely fulfill its resulting obligations under Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include notice of the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or the verification process under Requirement R2.

R4. Each Transmission Owner that owns or operates a Transmission station, Transmission substation, or primary control center identified in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3 that the Transmission Operator's primary control center has operational control of an identified Transmission station or Transmission substation, shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2. The evaluation shall consider the following: *[VRF: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

4.1. Unique characteristics of the identified and verified Transmission station(s), Transmission substation(s), and primary control center(s);

4.2. Prior history or attack on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and

4.3. Intelligence or threat warnings from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), U.S. federal and/or Canadian governmental agencies, or their successors.

M4. Examples of evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner or Transmission Operator conducted an evaluation of the potential threats and vulnerabilities of a physical attack to their respective Transmission station(s), Transmission substation(s) and primary control center(s) as specified in Requirement R4.

Rationale for Requirement R4:

This requirement meets the FERC directive from paragraph 8 in the order on physical security that the reliability standard must require tailored evaluation of potential threats and vulnerabilities to facilities identified in Requirement R1 and verified according to Requirement R2. Threats and vulnerabilities may vary from facility to facility based on factors such as the facility's location, size, function, existing protections, and attractiveness of the target. As such, the requirement does not mandate a one-size-fits-all approach but requires entities to account for the unique characteristics of their facilities.

Requirement R4 does not explicitly state when the evaluation of threats and vulnerabilities must occur or be completed. However, Requirement R5 requires that the entity's security plan(s), which is dependent on the Requirement R4 evaluation, must be completed within 120 calendar days following completion of Requirement R2. Thus, an entity has the flexibility when to complete the Requirement R4 evaluation, provided that it is completed in time to comply with the requirement in Requirement R5 to develop a physical security plan 120 calendar days following completion of Requirement R2.

R5. Each Transmission Owner that owns or has operational control of a Transmission station, Transmission substation, or primary control center identified in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3 that the Transmission Operator's primary control center has operational control of an identified Transmission station or Transmission substation, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s) within 120 calendar days following the completion of Requirement R2. The physical security plan(s) shall include the following attributes: *[VRF: High; Time-Horizon: Long-term Planning]*

5.1. Resiliency or security measures designed to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities based on the results of the evaluation conducted in Requirement R4.

5.2. Law enforcement contact and coordination information.

5.3. A timeline for implementing the physical security enhancements and modifications specified in the physical security plan.

5.4. Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).

M5. Examples of evidence may include, but are not limited to, dated written or electronic documentation of its physical security plan(s) that covers their respective identified and verified Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R5, and additional evidence demonstrating implementation of the physical security plan.

Rationale for Requirement R5:

This requirement meets the FERC directive from paragraph 9 in the order on physical security requiring the development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

R6. Each Transmission Owner that owns or operates a Transmission station, Transmission substation, or primary control center identified in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3 that the Transmission Operator's primary control center has operational control of an identified Transmission station or Transmission substation, shall have an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5. The review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5. *[VRF: Medium; Time-Horizon: Long-term Planning]*

6.1. Each Transmission Owner and Transmission Operator shall select an unaffiliated third party reviewer from the following:

6.1.1. An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.

6.1.2. An entity or organization approved by the ERO.

6.1.3. A governmental agency with physical security expertise.

6.1.4. An entity or organization with demonstrated law enforcement, government, or military physical security expertise.

6.2. The Transmission Owner or Transmission Operator, respectively, shall ensure that the unaffiliated third party review is completed within 90 calendar days of completing the security plan(s) developed in Requirement R5. The unaffiliated third party review may, but is not required to, include recommended changes to the evaluation performed under Requirement R4 or the security plan(s) developed under Requirement R5.

6.3. If the unaffiliated reviewing entity recommends changes to the evaluation performed under Requirement R4 or security plan(s) developed under Requirement R5, the Transmission Owner or Transmission Operator shall, within 60 calendar days of the completion of the unaffiliated third party review, for each recommendation:

- Modify its evaluation or security plan(s) consistent with the recommendation; or
- Document the reason(s) for not modifying the evaluation or security plan(s) consistent with the recommendation.

6.4. Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information exchanged with the unaffiliated reviewing entity.

M6. Examples of evidence may include, but are not limited to, written or electronic documentation that the Transmission Owner or Transmission Operator had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 as specified in Requirement R6 including, if applicable, documenting the reasons for not modifying the evaluation or security plan(s) in accordance with a recommendation under Part 6.3.

Rationale for Requirement R6:

This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring review by an entity other than the owner or operator with appropriate expertise of the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5.

As with the verification required by Requirement R2, Requirement R6 provides Transmission Owners and Transmission Operators the flexibility to work with the reviewing entity throughout the Requirement R4 evaluation and the development of the Requirement R5 security plan(s). This would allow entities to satisfy their obligations under Requirement R6 concurrent with the satisfaction of their obligations under Requirements R4 and R5.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence during an on-site visit to show that it was compliant for the full time period since the last audit.

The Transmission Owner and Transmission Operator shall keep data or evidence to show compliance, as identified below, unless directed by its Compliance Enforcement Authority (CEA) to retain specific evidence for a longer period of time as part of an investigation.

The responsible entities shall retain documentation as evidence for three years.

If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records, subject to the confidentiality provisions of Section 1500 of the Rules of Procedure and the provisions of Section 1.4 below.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints Text

1.4. Additional Compliance Information

Confidentiality: To protect the confidentiality and sensitive nature of the evidence for demonstrating compliance with this standard, all evidence will be retained at the Transmission Owner's and Transmission Operator's facilities.

Guidelines and Technical Basis

Section 4 Applicability

The purpose of Reliability Standard CIP-014-1 is to protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. To properly include those entities that own or operate such Facilities, the Reliability Standard CIP-014-1 first applies to Transmission Owners (TO) that own Transmission Facilities that meet the specific criteria in Applicability Section 4.1.1.1 through 4.1.1.4. The Facilities described in Applicability Section 4.1.1.1 through 4.1.1.4 mirror those Transmission Facilities that meet the bright line criteria for "Medium Impact" Transmission Facilities under Attachment 1 of Reliability Standard CIP-002-5.1. Each TO that owns Transmission Facilities that meet the criteria in Section 4.1.1.1 through 4.1.1.4 is required to perform a risk assessment as specified in Requirement R1 to identify its Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. The Standard Drafting Team (SDT) expects this population will be small and that many TOs that meet the applicability of this standard will not actually identify any such Facilities. Only those TOs with Transmission stations or Transmission substations identified in the risk assessment (and verified under Requirement R2) have performance obligations under Requirements R3 through R6.

This standard also applies to Transmission Operators (TOP). A TOP's obligations under the standard, however, are only triggered if the TOP is notified by an applicable TO under Requirement R3 that the TOP operates a primary control center that operationally controls a Transmission station(s) or Transmission substation(s) identified in the Requirement R1 risk assessment. A primary control center operationally controls a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical action at the identified Transmission station or Transmission substation, such as opening a breaker, as opposed to a control center that only has information from the Transmission station or Transmission substation and must coordinate direct action through another entity. Only TOPs who are notified that they have primary control centers under this standard have performance obligations under Requirements R4 through R6.

The drafting team considered several options for bright line criteria that could be used to determine applicability and provide an initial threshold that defines the set of Transmission stations and Transmission substations that would meet the directives of the FERC order on physical security (*i.e.*, those that could cause widespread instability, uncontrolled separation, or Cascading within an Interconnection). The SDT determined that using the criteria for Medium Impact Transmission Facilities in Attachment 1 of CIP-002-5.1 would provide a conservative threshold for defining which Transmission stations and Transmission substations must be included in the risk assessment in Requirement R1 of CIP-014-1. Additionally, the SDT concluded that using the CIP-002-5.1 Medium Impact criteria was appropriate because it has been approved by stakeholders, NERC, and FERC, and its use provides a technically sound basis

to determine which Transmission Owners should conduct the risk assessment. As described in CIP-002-5.1, the failure of a Transmission station or Transmission substation that meets the Medium Impact criteria could have the capability to result in exceeding one or more Interconnection Reliability Operating Limits (IROLs). The SDT understands that using this bright line criteria to determine applicability may require some Transmission Owners to perform risk assessments under Requirement R1 that will result in a finding that none of their Transmission stations or Transmission substations would pose a risk of widespread instability, uncontrolled separation, or Cascading within an Interconnection. However, the SDT determined that higher bright lines could not be technically justified to ensure inclusion of all Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. Further guidance and technical basis for the bright line criteria for Medium Impact Facilities can be found in the Guidelines and Technical Basis section of CIP-002-5.1.

Additionally, the SDT determined that it was not necessary to include Generator Operators and Generator Owners in the Reliability Standard. First, the transmission analysis or analyses conducted under Requirement R1 will take into account the impact of the loss of generation connected to applicable Transmission stations or Transmission substations. Additionally, the FERC order does not explicitly mention generation assets and is reasonably understood to focus on the most critical Transmission Facilities.

Requirement R1

In performing the risk assessment under Requirement R1, the Transmission Owner should first identify their population of Transmission stations and Transmission substations that meet the criteria contained in Applicability Section 4.1.1. Requirement R1 then requires the Transmission Owner to perform a risk assessment, consisting of a transmission analysis, to determine which of those Transmission stations and Transmission Substations if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. The standard does not mandate the specific analytical method for performing the risk assessment. The Transmission Owner has the discretion to choose the specific method that best suites its needs. As an example, an entity may perform a Power Flow analysis and stability analysis at a variety of load levels.

Performing Risk Assessments

The following is guidance on how a Transmission Owner may perform a traditional power flow and stability analysis to identify those Transmission stations and Transmission substations that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. An entity could remove all lines to a single Transmission station or Transmission substation and review the simulation results to assess system behavior to determine if Cascading of Transmission Facilities, uncontrolled separation, or voltage or frequency instability is likely to occur over a wide area. Using engineering judgment, the Transmission Owner should develop criteria to identify a contingency resulting in potential widespread instability, uncontrolled separation or Cascading within an Interconnection. For example, the criteria could include post-contingency

facilities loadings above a certain emergency rating or failure of a power flow case to converge. Available remedial action schemes (RAS) or special protection systems (SPS), if any, could be applied to determine if the system experiences any additional instability which may result in uncontrolled separation.

Periodicity

A TO who identifies one or more Transmission stations or Transmission substations (as verified under Requirement R2) that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection is required to conduct a risk assessment at least once every 30 months. This period ensures that the risk assessment remains current with projected conditions and configurations in the planned system.

TOs who have not identified any Transmission stations or Transmission substations (as verified under Requirement R2) that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection are unlikely to see changes to their risk assessment in the Near-Term Planning Horizon. Consequently, a 60 month periodicity for completing a subsequent risk assessment is specified.

Identification of Primary Control Centers

After completing the risk assessment specified in Requirement R1, it is important to additionally identify the primary control center that operationally controls each Transmission station or Transmission substation that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. A primary control center "operationally controls" a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker.

Requirement R2

This requirement specifies verification of the risk assessment performed under Requirement R1 by an entity other than the owner or operator of the Requirement R1 risk assessment.

A verification of the risk assessment by an unaffiliated third party, as specified in Requirement R2, could consist of:

1. Certifying that the Requirement R1 risk assessment considers the Transmission stations and Transmission substations identified in Applicability Section 4.1.1.
2. Review of the model used to conduct the risk assessment to ensure it contains sufficient system topology to identify Transmission stations and Transmission substations that if rendered inoperable or damaged could cause widespread instability, uncontrolled separation, or Cascading within an Interconnection.
3. Review of the Requirement R1 risk assessment method, which may include, for example, consideration of factors such as the following system performance criteria:
    a. Thermal overloads beyond facility emergency ratings;
    b. Voltage deviation exceeding ± 10%,

c. Cascading outage/Voltage collapse,

d. Frequency below under-frequency load shed points.

This requirement provides the flexibility for a Transmission Owner to select from unaffiliated registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term unaffiliated means that the selected verifying entity cannot be a corporate affiliate (*i.e.,* the verifying or reviewing entity cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit.

Requirement R2 also provides the Transmission Owner the flexibility to work with the verifying entity throughout (*i.e.,* concurrent with) the risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could coordinate with their unaffiliated verifying entity to perform the risk assessment under Requirement R1 such that both Requirement R1 and Requirement R2 are satisfied concurrently.

Characteristics to consider in selecting a reviewing entity could include:

- Registered Entity with applicable planning and reliability functions.
- Experience in power system studies and planning.
- The entity's understanding of the MOD standards, TPL standards, and facility ratings as they pertain to planning studies.
- The entity's familiarity with the Interconnection within which the transmission owner is located.

With respect to the requirement that Transmission owners develop and implement procedures for protecting confidential and sensitive information, the Transmission Owner could have a method for identifying documents that require confidential treatment. One mechanism for protecting confidential or sensitive information is to prohibit removal of sensitive or confidential information from the TO's site. Transmission Owners could include such a prohibition in a non-disclosure agreement with the verifying entity.

Requirement R3

Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first completing the risk assessment specified by Requirement R1 and the verification specified by Requirement R2. Requirement R3 is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1 receive notice so that the Transmission Operator may fulfill the rest of the obligations required in Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include within the notice the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk

assessment under Requirement R1 or as a result of the verification process under Requirement R2.

Requirement R4

This requirement requires owners and operators of facilities identified by the Requirement R1 risk assessment and that are verified under Requirement R2 to conduct an assessment of potential threats and vulnerabilities to those Transmission stations, Transmission substations, and primary control centers using a tailored evaluation process. Threats and vulnerabilities may vary from facility to facility based on any number of factors that include, but are not limited to, location, size, function, existing physical security protections, and attractiveness as a target.

In order to effectively conduct a threat and vulnerability assessment, the asset owner may be the best source to determine specific site vulnerabilities, but current and evolving threats may best be determined by others in the intelligence or law enforcement communities. A number of resources have been identified in the standard, but many others exist and asset owners are not limited to where they may turn for assistance. Additional resources may include state or local fusion centers, U.S. Department of Homeland Security, Federal Bureau of Investigations (FBI), Public Safety Canada, Royal Canadian Mounted Police, and InfraGard chapters coordinated by the FBI.

The Responsible Entity is required to take a number of factors into account in Parts 4.1 to 4.3 in order to make a risk-based evaluation under Requirement R4.

To assist in determining the current threat for a facility, the prior history of attacks on similarly protected facilities should be considered when assessing probability and likelihood of occurrence at the facility in question.

Resources that may be useful in conducting threat and vulnerability assessments include:

- NERC Security Guideline for the Electricity Sector: Physical Security.
- NERC Security Guideline: Physical Security Response.
- ASIS International General Risk Assessment Guidelines.
- ASIS International Facilities Physical Security Measure Guideline.
- ASIS International Security Management Standard: Physical Asset Protection.
- Whole Building Design Guide - Threat/Vulnerability Assessments.

Requirement R5

This requirement specifies development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Requirement R5 specifies the following attributes for the physical security plan:

- *Resiliency or security measures designed to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities based on the results of the assessment conducted in Requirement R4.*

While most security measures will work together to collectively harden the entire site, some may be allocated to protect specific critical components. For example, if protection from gunfire is considered necessary, the entity may only install ballistic protection for critical components, not the entire site.

- *Law enforcement contact and coordination information.*

  Examples of such information may be posting 9-1-1 for emergency calls and providing substation safety and familiarization training for local and federal law enforcement, fire department, and EMS.

- *A timeline for implementing physical security resiliency or security measures specified in the physical security plan.*

  Entities have the flexibility to prioritize the implementation of the various resiliency or security measures in their security plan according to risk, resources, or other factors.

- *Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).*

  A registered entity's physical security plan should include processes and responsibilities for obtaining and handling alerts, intelligence, and threat warnings from various sources. Some of these sources could include the ERO, ES-ISAC, and US and/or Canadian federal agencies. This information should be used to reevaluate or consider changes in the security plan and corresponding security measures of the security plan found in R5.

Requirement R6

This requirement specifies review by an entity other than the TO or TOP with appropriate expertise for the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5. As with Requirement R2, the term unaffiliated means that the selected reviewing entity cannot be a corporate affiliate (*i.e.,* the reviewing entity cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Operator). A reviewing entity also cannot be a division of the Transmission Operator that operates as a functional unit.

The Responsible Entity can select from several possible entities to perform the review:

- *An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.*

  In selecting CPP and PSP for use in this standard, the drafting team believed it was important that if a private entity such as a consulting or security firm was engaged to conduct the third party review, they must tangibly demonstrate competence to conduct the review. This includes electric industry physical security experience and either of the premier security industry certifications sponsored by ASIS International. The ASIS certification program was initiated in 1977, and those that hold the CPP

certification are board certified in security management. Those that hold the PSP certification are board certified in physical security.

- *An entity or organization approved by the ERO.*
- *A governmental agency with physical security expertise.*
- *An entity or organization with demonstrated law enforcement, government, or military physical security expertise.*

A third party that contributes to the threat assessment and development of the security plan may also serve as the reviewer. As with Requirement R2, the Responsible Entity has the flexibility to work with the reviewing entity throughout (*i.e.,* concurrent with) the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5, which for some Responsible Entities may be more efficient and effective. In other words, a TO or TOP could coordinate with their unaffiliated reviewing entity to perform an evaluation of potential threats and vulnerabilities (Requirement R4) and develop a security plan (Requirement R5) concurrently with review to satisfy Requirements R4 through R6 simultaneously.

Implementation Plan for Project 2014-04

April 9, 2014

Approvals Requested
CIP-014-1 Physical Security

Prerequisite Approvals
None

Effective Date

New or Revised Standards
CIP-014-1 is effective the first day of the first calendar quarter that is six months beyond the date that this standard is approved by applicable regulatory authorities or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. In those jurisdictions where regulatory approval is not required, CIP-014-1 shall become effective on the first day of the first calendar quarter that is six months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

Standards for Retirement
None

Initial Performance of Periodic Requirements
The initial risk assessment required by CIP-014-1, Requirement R1, must be completed on or before the effective date of the standard. Subsequent risk assessments shall be performed according to the timelines specified in CIP-014-1, Requirement R1.

The initial performance of CIP-014-1, Requirements R2 through R6, must be completed according to the timelines specified in those requirements after the effective date of the proposed Reliability Standard, as follows:

- Requirement R2 shall be completed as follows:
    - Parts 2.1, 2.2, and 2.4 shall be completed within 90 calendar days of the effective date of the proposed Reliability Standard.
    - Part 2.3 shall be completed within 60 calendar days of the completion of performance under Requirement R2 part 2.2.

- Requirement R3 shall be completed within 7 calendar days of completion of performance under Requirement R2.
- Requirements R4 and R5 shall be completed within 120 calendar days of completion of performance under Requirement R2.
- Requirement R6 shall be completed as follows:
    - Parts 6.1, 6.2, and 6.4 shall be completed within 90 calendar days of completion of performance under Requirement R5.
    - Part 6.3 shall be completed within 60 calendar days of Requirement R6 part 6.2.

Project Overview for Project 2014-04 Physical Security

April 9, 2014

At a Glance: The Top Items to Know about Proposed Reliability Standard CIP-014-1

- Proposed CIP-014-1 Physical Security is drafted pursuant to the framework directed by the March 7, 2014, FERC order[1] directing a Physical Security Standard be filed by June 5, 2014. Consistent with the order, proposed CIP-014-1 includes a risk assessment (transmission analysis) for identification of critical facilities (as describe by FERC), evaluation of physical threats, and development of a physical security plan – with the assessment verified by a third party and the evaluation/plan reviewed by a third party.
    - The framework includes only those Transmission stations and Transmission substations (and associated primary control centers) that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection.
    - NERC will not request an extension of time to file the Standard, which is supported by the leadership of the Standards Committee (SC) and the Standards Drafting Team (SDT).
- Only a relatively small number of Transmission Owners and Transmission Operators will need to comply with the entire Standard.
    - Generator Operators and Generator Owners are not included as applicable entities.
    - Loss of generation connected to an applicable Transmission station or Transmission substation is considered in the risk assessment conducted by the Transmission Owners.
- The draft Standard was vetted at the April 1, 2014, NERC-sponsored technical conference and during the SDT meetings later that same week.
- The SC has approved a waiver to shorten the initial comment period to 15 days and the ballot period to the last five days of the comment period.
- There will be webinars to explain the Physical Security Standard on April 15 and April 17, 2014.
- **Your vote counts!** If you have registered in the ballot body, we need you to vote, and you must vote by the close of business on April 24, 2014. If you do not vote and quorum is not met on April 24, 2014, this will negatively impact the ability of the SDT to expeditiously move forward.
- Please review the FERC order, the draft Standard and associated guidance, the FAQ, and the RSAW posted on the 2014-04 project page. If you have any questions, please contact Stephen Crutchfield via email or by telephone at stephen.crutchfield@nerc.net or 609-651-9455 as soon as possible.

Frequently Asked Questions
Project 2014-04 Physical Security and Draft Standard CIP-014-1

April 9, 2014

1. Why are NERC and the Standards Committee pursuing a Physical Security Reliability Standard?

On March 7, 2014, the Federal Energy Regulatory Commission (FERC or Commission) issued an order directing NERC to file one or more Reliability Standards addressing physical security of certain critical facilities by June 5, 2014.[1] The Commission stated that the physical security Reliability Standard(s) should require entities to take a least the following three steps: (1) perform a risk assessment of their systems to identify their facilities that, if rendered inoperable or damaged, could have a critical impact on the operation of the interconnection through instability, uncontrolled separation or cascading failures on the Bulk-Power System; (2) evaluate the potential threats and vulnerabilities to those identified facilities; and (3) develop and implement a security plan designed to protect against physical attacks to those identified critical facilities based on the assessment of the potential threats and vulnerabilities to their physical security. The Commission stated the Reliability standard(s) should also: (i) include a procedure that will ensure confidential treatment of sensitive or confidential information; (ii) include a procedure for a third party to verify the list of identified facilities and review the threat evaluation and security plan(s); and (iii) require that the identification of the critical facilities, the assessment of the potential risks and vulnerabilities, and the security plans be periodically reevaluated and revised to ensure their continued effectiveness.

In terms of the scope of the standard, FERC stated:

> . . . we anticipate that the number of facilities identified as critical will be relatively small compared to the number of facilities that comprise the Bulk-Power System. For example, of the many substations on the Bulk-Power System, our preliminary view is that most of these would not be "critical" as the term is used in this order. We do not expect that every owner and operator of the Bulk-Power System will have critical facilities under the Reliability Standard.

[1] *Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (2014).

NERC, the NERC Standards Committee (SC), and the Project 2014-04 Physical Security Standard Drafting Team (SDT) have been working diligently, with the assistance of stakeholders through an April 1, 2014, technical conference and SDT meetings, to draft a Reliability Standard that addresses all of the directives issued by FERC in the March 7, 2014, order. Proposed Reliability Standard CIP-014-1 is consistent with the scope of the Commission order and satisfies each directive described above.

NERC does not intend to request an extension of time for filing the proposed Reliability Standard and is committed to meeting the June 5, 2014, filing deadline. The SC and SDT leadership support this decision because they believe the framework in the FERC order is sufficiently clear to develop and file a Reliability Standard by the June 5, 2014, deadline.

2. Why does the proposed Reliability Standard's applicability section start with Transmission stations and Transmission substations identified under the medium impact criteria in CIP-002-5.1?

The SDT developed a technical guidance document appended to the end of CIP-014-1 that explains the applicability section and the requirements of the Reliability Standard in more detail.

In brief, the SDT concluded that FERC's March 7 order is reasonably understood to focus on the most critical Transmission facilities and determined that the CIP-002-5.1 bright line medium impact criteria for Transmission stations and Transmission substations was the appropriate place to start. The CIP-002-5.1 bright line medium impact criteria has been vetted with stakeholders, NERC, and FERC, and provides a technically sound basis to determine which Transmission Owners should conduct the risk assessment under proposed Reliability Standard CIP-014-1. The SDT considered and rejected higher bright line thresholds because the SDT determined that higher bright lines could not be technically justified and may inadvertently exclude Transmission Owners that could have Transmission stations and Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection.

The SDT understands that many of the Transmission Owners that have Transmission stations and Transmission substations that meet CIP-002-5.1's medium impact criteria are unlikely to have a Transmission station or Transmission substation that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. To that end, if a Transmission Owner's risk assessment does not identify any such Transmission stations or Transmission substations and that risk assessment has been verified by a third party, the Transmission Owner has no further obligations under the proposed Reliability Standard, except to conduct subsequent risk assessments every five years to confirm that it continues to have no such facilities.

The SDT estimates that relatively few Transmission Owners (perhaps 30 or less) will have Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. In turn, only a small number of Transmission Owners will actually have performance obligations under the entire proposed Reliability Standard. While the applicability section may include additional Transmission Owners subject to Requirements R1 and R2 only, the SDT found that the slightly broader applicability is necessary given the FERC directives, the inability to technically justify a higher bright line, and the importance of being conservative on applicability given the nature of the Reliability Standard's important topic.

The SDT also does not believe more study or time will justify another or higher bright line, given the diversity of Transmission Owners and the highly confidential nature of information related to the applicable Transmission stations and Transmission substations.

3. Why were Generator Operators and Generator Owners not included?

The SDT considered whether to include Generator Operators and Generator Owners in the proposed Reliability Standard and decided not to include them as applicable entities. First, the FERC order does not explicitly mention generation assets, and the order is reasonably understood to focus on the most critical Transmission Facilities. Second, the proposed Reliability Standard accounts for the loss of generation resources. A determination of whether a Transmission station or Transmission substation that meets CIP-002-5.1's medium impact criteria could, if rendered inoperable or damaged, result in widespread instability, uncontrolled separation, or Cascading within an Interconnection must consider the impact of the loss of generation. Specifically, the transmission analysis or analyses conducted under Requirement R1 will take into account the impact of the loss of generation. As such it is not necessary to include Generator Operators and Generator Owners to ensure that the impact of loss of generation is considered.

4. Why are only those primary control centers that have operational control of a Transmission station or Transmission substation that is identified in Requirement R1 and verified in Requirement R2 included in the proposed Reliability Standard? And what does "has operational control" mean?

The FERC order in footnote 6 specifically mentions control centers as a type of critical facility to be subject to the physical security Reliability Standard. Consistent with the order, the SDT found that it is important to include in the proposed Reliability Standard those primary control centers that have operational control over Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. Specifically, the SDT concluded that in order to fully protect the Transmission stations and Transmission substations from causing

widespread instability, uncontrolled separation, or Cascading within an Interconnection as a result of a physical attack, it was imperative that these primary control centers be subject to the threat evaluation and development/implementation of physical security plans similar to the Transmission station(s) and Transmission substation(s) they operationally control.

There are two scenarios that the Standard recognizes related to identified primary control centers. In the first scenario, the registered Transmission Owner of the identified and verified Transmission station or Transmission substation is also the entity that operates the primary control center. In scenario two, the registered Transmission Owner is not the same registered entity that operates the primary control center. In this latter instance, the Transmission Operator would be the entity that operates the primary control center that has operational control of the Transmission Owner's identified and verified Transmission station or Transmission substation. Under scenario two, formal notice is required to the Transmission Operator, and that is covered in Requirement R3.

The phrase "has operational control" is specifically used to exclude from the Standard control centers that have no physical control over Transmission stations and Transmission substations, but only have the capability to monitor Transmission stations and Transmission substations, such as is the case with many, if not all, Regional Transmission Organizations and Independent System Operators. In other words, to have a primary control center in the scope of this Reliability Standard, the primary control center must have the ability to take electronic actions that can cause direct physical actions at the identified and verified Transmission station and Transmission substation, such as opening a breaker.

5. Why are unaffiliated third party verifications (of Transmission station and Transmission substation identification under Requirement R1) and unaffiliated third party reviews (of the evaluations under Requirement R4 and the security plans under Requirement R5) required in the proposed Reliability Standard?

The FERC order requires that the risk assessment be verified by an entity other than the owner or operator, and, similarly that the evaluation of threats and physical security plan be reviewed by someone other than the owner or operator. The order used the term "verify" in the context of identification of facilities and the term "review" in the context of physical threat evaluations and security plans. Therefore, the SDT decided to also use those terms in similar contexts in the proposed Reliability Standard.

a. What does unaffiliated mean?

The term unaffiliated means that the selected verifying and reviewing entities cannot be a corporate affiliate (*i.e.,* the verifying or reviewing entity cannot be an entity that corporately controls, is controlled by, or is under common control with, the Transmission Owner or

Transmission Operator). The verifying and reviewing entities also cannot be a division of the Transmission Owner or Transmission Operator (only applicable for the reviewer) that operates as a functional unit.

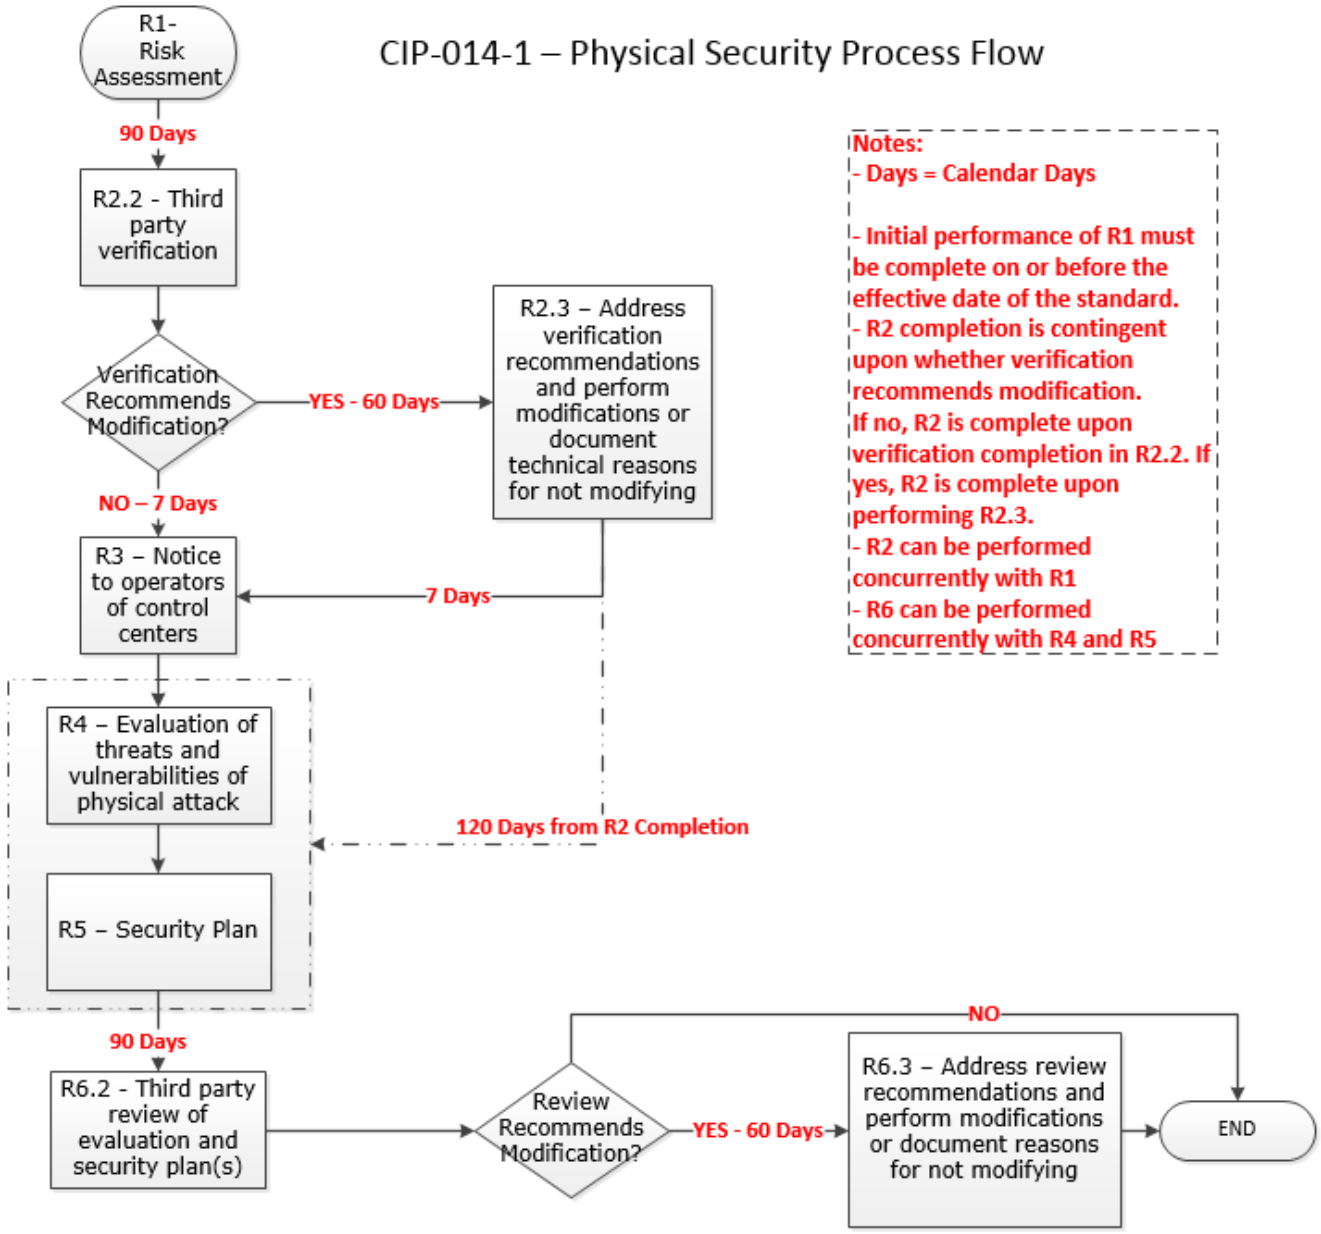
b. Why not "require" unaffiliated Reliability Coordinators, Transmission Planners, and Planning Coordinators to be the verifier of the Requirement R1 risk assessment?

The SDT considered whether to require Reliability Coordinators, Transmission Planners, and Planning Coordinators to be the verifier and decided against such a requirement. The SDT does not believe it is appropriate to require Reliability Coordinators, Transmission Planners, and Planning Coordinators to be the verifier. This conclusion is based the following: (i) unless necessary for reliability there should not be a requirement that requires one functional entity to require another functional entity to perform a task; (ii) there are sufficient entities qualified to verify the risk assessment without mandating additional tasks on Reliability Coordinators, Transmission Planners, and Planning Coordinators, and (iii) Requirement R2 provides Transmission Owners the flexibility to consider from many qualified entities.

c. Why is NERC or the Regional Entities not included as a verifier or reviewer?

Similar to reasons provided above for not mandating Reliability Coordinators, Transmission Planners, and Planning Coordinators to be the verifier, the SDT decided against a requirement that would specify NERC or Regional Entities to be the verifier or reviewer. The proposed Reliability Standard, however, does not preclude an entity from requesting NERC or its Regional Entity to be the verifying or reviewing entity under Requirements R2 and R6, respectively.

6. There are several deadlines in the proposed Reliability Standard to complete the risk assessment, third party verification, security plan(s), and third party review of the evaluation of threats and the security plan – can you illustrate this timeline?



7. Why does the proposed Reliability Standard state that the Transmission Owner can work concurrently with the verifier of the risk assessment or reviewer (and the Transmission Operator of the review) of the evaluation of threats and the security plan(s)?

The SDT recognized the value, effectiveness, and efficiency that may result in the Transmission Owner working side-by-side with its verifier, and the Transmission Owner and Transmission Operator, respectively, working side-by-side with its reviewer. Thus, for example, the Transmission Owner may first perform its Requirement R1 risk assessment for identification of Transmission stations and Transmission substations on its own, and then, in a second step, have the verifier conduct its verification of the risk assessment. If more efficient, the Transmission Owner may combine those steps by working side-by-side with the verifying entity to complete the risk assessment and the verification at the same time. It is expected that the selection of this concurrent approach will lessen misunderstandings, and likely be more effective and efficient. This side-by-side approach is equally applicable for conducting the risk assessment and verification under Requirements R1 and R2 and the evaluation of threats, development and implementation of physical security plan(s), and review under Requirements R4 through R6.

8. Given that the TO and TOP will be subject to unaffiliated third party review, does that change how compliance and enforcement will be conducted for this proposed Reliability Standard?

The SDT expects auditors will use their professional judgment to assess the third party reviews and rely on them to avoid duplication of efforts as is permitted by auditing standards. However, some degree of auditor due diligence related to the third party review is necessary to provide a sufficient basis for reliance on the work of others. Documentation regarding the qualification of third parties and the scope and nature of their reviews will help facilitate reliance for compliance auditors. The Notes to Auditor sections of the draft RSAW associated with proposed CIP-014-1 supports the concept of considering the effect of third party verifications and reviews on audit risk and related rigor of compliance procedures.

Background Information

On March 7, 2014, the Federal Energy Regulatory Commission (FERC) issued an order directing NERC to submit for approval, within 90 days of the order, one or more Reliability Standards to address physical security risks and vulnerabilities of critical facilities on the Bulk Power System (BPS).[1]

In the order, FERC stated that the proposed Reliability Standard(s) should require entities to take a least the following three steps:

- Perform a risk assessment to identify facilities that, if rendered inoperable or damaged, could result in instability, uncontrolled separation, or cascading failures on the BPS.
- Evaluate the potential threats and vulnerabilities to those identified facilities.
- Develop and implement a security plan designed to protect against physical attacks to those identified facilities based on the assessment of the potential threats and vulnerabilities to their physical security.

Additionally, FERC directed that the proposed Standard(s) should also: (1) include a procedure that will ensure confidential treatment of sensitive or confidential information; (2) include a procedure for a third party to verify the list of identified facilities and allow the verifying entity, as well as FERC, to add or remove facilities from the list of critical facilities; (3) include a procedure for a third party to review the evaluation of threats and vulnerabilities and the security plan; and (4) require that the identification of the facilities, the assessment of the potential risks and vulnerabilities, and the security plans be periodically reevaluated and revised to ensure their continued effectiveness. The proposed Physical Security Reliability Standard(s) must be filed with FERC by June 5, 2014.

In response to the order, NERC staff and the Standards Committee (SC) worked together in order to develop an action plan for meeting the June 5, 2014 filing deadline. The SC approved several waivers to facilitate meeting the required timelines and seated the Standard Drafting Team (SDT) on March 21, 2014.

[1] *Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (2014).

This posting solicits comment on proposed Reliability Standard CIP-014-1 Physical Security. The proposed standard responds to the directives from the FERC order, and a summary of those directives with explanation of how the approach addresses them is available in the "Consideration of Issues and Directives" document on the project page.

You do not have to answer all questions below. Enter comments in simple text format. Bullets, numbers, and special formatting will not be retained. Due to the expected volume of comments, the SDT asks that commenters consider consolidating responses and endorsing comments provided by another.

Questions

1. **Applicability**: The applicability of proposed CIP-014-1 starts with those Transmission Owners that own Transmission facilities that meet the bright line criteria in Reliability Standard CIP-002-5.1 for a "medium impact" rating. The drafting team did not modify these criteria in their use under CIP-014-1, as they have been previously approved by stakeholders, NERC, and FERC. The SDT sought to ensure that entities could apply the same set of criteria to assist with identification of facilities under CIP Version 5 and proposed CIP-014-1. The team determined that slightly modified criteria could possibly result in confusion in application. The drafting team considered several other alternatives to refine the scoping in the applicability section, such as a particular kV threshold in addition to the other criteria; however, after significant discussion, the team found no technical or reliability basis for providing such limitiation. Importantly, by virtue of application of Requirement R1, the scope of the standard only applies to Transmission Owners that have Transmission stations and Transmission substations that meet the "medium impact" criteria from CIP-002-5.1, and their associated primary control centers. Furthermore, the standard drafting team expects many who are "applicable" to the standard will not identify facilities through their Requirement R1 risk assessment and Requirement R2 verification that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. In those cases, the entity only performs Requirements R1 through R2. When that results in a null set, Requirement R1 additionally provides that subsequent risk assessments may occur less frequently. Similarly, while Transmission Operators are also listed in the applicability section, by virtue of application of the requirements, only certain Transmission Operators that are notified under the standard's Requirement R3 have obligations under the standard. Do you agree with the applicability section? If not, please provide specific recommendations, ensuring to articulate how your suggested approach would not limit the applicability in such a manner as to inadvertently miss a facility that should be covered under the standard as specified in the FERC order on physical security.

☐ Yes
☐ No

Comments:

2. **Requirements R1 through R3**: The first three requirements of CIP-014-1 require Transmission Owners to: (1) perform risk assessments to identify through transmission planning analysis those Transmission stations and Transmission substations that meet the "medium impact" criteria from CIP-002-5.1, and their associated primary control centers, that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection; (2) arrange for a third party verification (as directed in the order) of the identifications; and (3) notify certain Transmission Operators of identified primary control centers that operationally control the identified and verified Transmission stations and Transmission substations. The requirements provide the periodicity for satisfying these obligations. Only an entity that owns or operates one or more of the identified facilities has further obligations in Requirements R4 through R6. If an entity identifies a null set after applying Requirements R1 through R2, the rest of the standard does not apply. Do you agree with this approach? If not, please articulate how an alternative approach addresses the directives specified in the order on physical security.

☐ Yes
☐ No

Comments:

3. **Requirements R4 through R6**: The final three requirements of CIP-014-1 require (1) the evaluation of potential threats and vulnerabilities of a physical attack to the facilities identified and verified according to the earlier requirements, (2) the development and implementation of a security plan(s) designed in response to the evaluation, and (3) a third party review of the evaluation and security plan(s) (as directed in the order). Do you agree with this approach? If not, please articulate how an alternative approach addresses the directives specified in the order on physical security.

☐ Yes
☐ No

Comments:

4. Do you have input on other areas of the standard or implementation plan not discussed in the questions above? If so, please provide them here, recognizing that you do not have to provide a response to all questions. Please limit your response to 300 words or less.

☐ Yes
☐ No

Comments:

Consideration of Issues and Directives

Project 2014-04 - Physical Security

April 9, 2014

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
6. The Reliability Standards should require owners or operators of the Bulk-Power System to take at least three steps to address the risks that physical security attacks pose to the reliable operation of the Bulk-Power System. First, the Reliability Standards should require owners or operators of the Bulk-Power System to perform a risk assessment of their systems to identify their "critical facilities." A critical facility is one that, if rendered inoperable or damaged, could have a critical impact on the operation of the interconnection through instability, uncontrolled separation or cascading failures on the Bulk-Power System. Methodologies to determine these facilities should be based on objective analysis, technical expertise, and experienced judgment. The Commission is not requiring NERC to adopt a specific type of risk assessment, nor is the Commission requiring that a mandatory number of facilities be identified as critical facilities under the Reliability Standards. Instead, the Commission is directing NERC to develop Reliability	*Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (Mar. 7, 2014).	Requirement R1 of proposed Reliability Standard CIP-014-1 responds to this directive by requiring that each Transmission Owner perform a risk assessment of its Transmission stations and substations that meet the criteria in Attachment 1 of CIP-002-5.1 for a Medium Impact rating to identify which of those Transmission stations and substations, if rendered inoperable or damaged as a result of a physical attack, could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. The Transmission Owner must also identify the primary control centers that operationally controls each identified Transmission station or Transmission substation. The standard drafting team (SDT) determined that the CIP-002-5 bright line was appropriate because it has been vetted with stakeholders, and approved by NERC and FERC. The SDT concluded it was a technically sound basis to determine which Transmission Owners should conduct the risk assessment. If the Transmission Owner does not have any Transmission stations or substations that meet the Medium Impact rating, it is not subject

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Standards that will ensure that owners or operators of the Bulk-Power System identify those facilities that are critical to the reliable operation of the Bulk-Power System such that if those facilities are rendered inoperable or damaged, instability, uncontrolled separation or cascading failures could result on the Bulk-Power System and thereby warrant the directive imposed here.		to the proposed Reliability Standard and, in turn, would not have to conduct the risk assessment. Consistent with the Commission's directive, Requirement R1 does not require a specific methodology for identifying facilities that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection; rather, the requirement mandates that the risk assessment shall consist of a transmission analysis or transmission analyses to ensure that the methodology is based on objective analysis, technical expertise, and experienced judgment. Lastly, Requirement R1 identifies the periodicity for conducting the risk assessments.
7. Issuance of this directive will help provide for the resiliency and reliable operation of the Bulk-Power System. To that end, the proposed Reliability Standards should allow owners or operators to consider resilience of the grid in the risk assessment when identifying critical facilities, and the elements that make up those facilities, such as transformers that typically require significant time to repair or replace. As part of this process, owners or operators may consider elements of resiliency such as how the system is designed,	*Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (Mar. 7, 2014).	Requirement R1 provides Transmission Owners the flexibility to consider the resilience of their system when conducting their risk assessments. As noted above, Requirement R1 does not require a specific methodology for identifying their critical facilities and, in turn, allows an entity to use a methodology that considers how their system is designed, operated, and maintained, and the sophistication of recovery plans and inventory management.

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
operated, and maintained, and the sophistication of recovery plans and inventory management.		
8. In the second step, the Reliability Standards should require owners or operators of the identified critical facilities to evaluate the potential threats and vulnerabilities to those identified facilities. The threats and vulnerabilities may vary from facility to facility based on factors such as the facility's location, size, function, existing protections and attractiveness as a target. Thus, the Reliability Standards should require the owners or operators to tailor their evaluation to the unique characteristics of the identified critical facilities and the type of attacks that can be realistically contemplated. NERC should also consider in the standards development process requiring owners and operators to consult with entities with appropriate expertise as part of this evaluation process.	*Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (Mar. 7, 2014).	Requirement R4 of proposed Reliability Standard CIP-014-1 responds to this directive by requiring that each Transmission Owner and Transmission Operator that owns or operates facilities identified in accordance with Requirement R1 (and verified under Requirement R2) conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s). Consistent with the Commission's directive to "tailor their evaluation to the unique characteristics of the identified critical facilities and the type of attacks that can be realistically contemplated," Requirement R4 states that the evaluation must consider: (1) the unique characteristics of the identified facilities; (2) prior history or attack on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and (3) intelligence or threat warnings from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), U. S. federal and/or Canadian governmental agencies, or their successors.

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		Consistent with the Commission's statement that NERC should consider requiring owners and operators of identified facilities to consult with entities with appropriate expertise, Requirement R6 requires applicable Transmission Owners and Transmission Operators to select a third party to review their evaluation. This review may occur concurrently with or after the evaluation.
9. Third and finally, the Reliability Standards should require those owners or operators of critical facilities to develop and implement a security plan designed to protect against attacks to those identified critical facilities based on the assessment of the potential threats and vulnerabilities to their physical security. The Reliability Standards themselves need not dictate specific steps an entity must take to protect against attacks on the identified facilities. However, the Reliability Standards need to require that owners or operators of identified critical facilities have a plan that results in an adequate level of protection against the potential physical threats and vulnerabilities they face at the identified critical facilities.	*Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (Mar. 7, 2014).	Requirement R5 of proposed Reliability Standard CIP-014-1 responds to this directive by requiring that each Transmission Owner and Transmission Operator that owns or operates facilities identified in accordance with Requirement R1 (and verified under Requirement R2) develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s). Consistent with the Commission's directive, Requirement R5 does not dictate specific steps an entity must take to protect against attacks on the identified facilities but requires applicable entities to develop a security plan that includes the following attributes to help ensure an adequate level of protection: (1) resiliency or security measures designed to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities based on the results of the evaluation conducted in Requirement R4; (2) law enforcement contact and

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		coordination information; (3) a timeline for implementing the physical security enhancements and modifications specified in the physical security plan; and (4) provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).
10. All three steps of compliance with the Reliability Standard described above could contain sensitive or confidential information that, if released to the public, could jeopardize the reliable operation of the Bulk-Power System. Guarding sensitive or confidential information is essential to protecting the public by discouraging attacks on critical infrastructure. Therefore, NERC should include in the Reliability Standards a procedure that will ensure confidential treatment of sensitive or confidential information but still allow for the Commission, NERC and the Regional Entities to review and inspect any information that is needed to ensure compliance with the Reliability Standards.	*Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (Mar. 7, 2014).	To protect confidential or sensitive information, the Compliance Monitoring section of the standard provides that evidence demonstrating compliance with the standard must be retained at the applicable entities' facilities. Additionally, Requirements R2 and R6 require applicable entities to implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information exchanged with the third party verifier under Requirement R2 or the reviewing entity under Requirement R6. These steps will help ensure that lists of critical facilities or other sensitive documents remain confidential.
11. In addition, the risk assessment used by an owner or operator to identify critical facilities should be verified by an entity other than the owner or operator. Such verification could be performed by NERC, the relevant Regional Entity, a	*Reliability Standards for Physical Security*	Requirements R2 and R6 respond to this directive. Under Requirement R3 Transmission Owners must have an unaffiliated entity verify the risk assessment performed under Requirement R1. The third party verifier must be either (1) a registered

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Reliability Coordinator, or another entity. The Reliability Standards should include a procedure for the verifying entity, as well as the Commission, to add or remove facilities from an owner's or operator's list of critical facilities. Similarly, the determination of threats and vulnerabilities and the security plan should also be reviewed by NERC, the relevant Regional Entity, the Reliability Coordinator, or another entity with appropriate expertise. Finally, the Reliability Standards should require that the identification of the critical facilities, the assessment of the potential risks and vulnerabilities, and the security plans be periodically reevaluated and revised to ensure their continued effectiveness. NERC should establish a timeline for when such reevaluations should occur.	*Measures*, 146 FERC ¶ 61,166 (Mar. 7, 2014).	Planning Coordinator, Transmission Planner, or Reliability Coordinator; or (2) an entity that has transmission planning or analysis experience. The requirement provides that the verifying entity shall either verify the Transmission Owner's risk assessment or recommend the addition or deletion of a Transmission station(s) or Transmission substation(s). The verification may occur concurrently with the Requirement R1 risk assessment but must be completed within 90 calendar days of the risk assessment. The Transmission Owner is required to either modify its identification based on the verifier's recommendation or, if it disagrees with the verifier's recommendations, document the technical basis for not modifying its identification. Similarly, under Requirement R6, applicable Transmission Owners and Operators must have an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5. The reviewing entity must be either (1) an entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification; (2) an entity or organization approved by the ERO; (3) a governmental agency with physical security expertise; or (4) an entity or organization with demonstrated law

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		enforcement, government, or military physical security expertise. The third party review must be completed within 90 calendar days of completing the security plan(s) developed in Requirement R5. The applicable Transmission Owners and Transmission Operators are required to either modify their evaluation or security plan(s) consistent with the reviewer's recommendations or, if they disagree with the recommendations, document the reasons for not modifying. Consistent with the directive to establish a timeline for periodic reevaluation of the identification of facilities that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection, the assessment of the potential risks and vulnerabilities, and the security plans, the standard provides that Requirement R1 risk assessment should be performed at least once every 30 calendar months for those Transmission Owners that identified facilities in their previous risk assessment and once every 60 calendar months for those Transmission Owners that did not identify facilities in their previous risk assessment. Upon completion of each subsequent risk assessment, the applicable entities must satisfy the obligations under the remaining requirements.

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
12. Under the Reliability Standards, we anticipate that the number of facilities identified as critical will be relatively small compared to the number of facilities that comprise the Bulk-Power System. For example, of the many substations on the Bulk-Power System, our preliminary view is that most of these would not be "critical" as the term is used in this order. We do not expect that every owner and operator of the Bulk-Power System will have critical facilities under the Reliability Standard. We also recognize that the industry has engaged in longstanding efforts to address the physical security of its critical facilities. Thus, NERC should develop an implementation plan that requires owners or operators of the Bulk-Power System to implement the Reliability Standards in a timely fashion, balancing the importance of protecting the Bulk-Power System from harm while giving the owners or operators adequate time to meaningfully implement the requirements. NERC should file the plan with the Reliability Standards for Commission review.	*Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (Mar. 7, 2014).	The proposed Implementation Plan addresses this directive. As provided in the Implementation Plan, the standard becomes effective the first day of the first calendar quarter that is six months beyond the date that this standard is approved by applicable regulatory authorities or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. This means that the initial risk assessment required by Requirement R1, must be completed on or before the effective date of the standard. The initial performance of Requirements R2 through R6 must be completed according to the timelines specified in those requirements after the effective date of the proposed Reliability Standard, as follows: - Requirement R2, Parts 2.1, 2.2, and 2.4 shall be completed within 90 calendar days of the effective date of the proposed Reliability Standard. Requirement R2, Part 2.3 shall be completed within 60 calendar days of the completion of performance under Requirement R2 part 2.2. - Requirement R3 shall be completed within 7 calendar days of completion of performance under Requirement R2.

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		- Requirements R4 and R5 shall be completed within 120 calendar days of completion of performance under Requirement R2. - Requirement R6, Parts 6.1, 6.2, and 6.4 shall be completed within 90 calendar days of completion of performance under Requirement R5. Requirement R6, Part 6.3 shall be completed within 60 calendar days of Requirement R6 part 6.2.

R6												X[3,4]	X[4]		

[1] NERC developed this Reliability Standard Audit Worksheet (RSAW) language in order to facilitate NERC's and the Regional Entities' assessment of a registered entity's compliance with this Reliability Standard. The NERC RSAW language is written to specific versions of each NERC Reliability Standard. Entities using this RSAW should choose the version of the RSAW applicable to the Reliability Standard being assessed. While the information included in this RSAW provides some of the methodology that NERC has elected to use to assess compliance with the requirements of the Reliability Standard, this document should not be treated as a substitute for the Reliability Standard or viewed as additional Reliability Standard requirements. In all cases, the Regional Entity should rely on the language contained in the Reliability Standard itself, and not on the language contained in this RSAW, to determine compliance with the Reliability Standard. NERC's Reliability Standards can be found on NERC's website. Additionally, NERC Reliability Standards are updated frequently, and this RSAW may not necessarily be updated with the same frequency. Therefore, it is imperative that entities treat this RSAW as a reference document only, and not as a substitute or replacement for the Reliability Standard. It is the responsibility of the registered entity to verify its compliance with the latest approved version of the Reliability Standards, by the applicable governmental authority, relevant to its registration status.

The NERC RSAW language contained within this document provides a non-exclusive list, for informational purposes only, of examples of the types of evidence a registered entity may produce or may be asked to produce to demonstrate compliance with the Reliability Standard. A registered entity's adherence to the examples contained within this RSAW does not necessarily constitute compliance with the applicable Reliability Standard, and NERC and the Regional Entity using this RSAW reserves the right to request additional evidence from the registered entity that is not included in this RSAW. Additionally, this RSAW includes excerpts from FERC Orders and other regulatory references. The FERC order cites are provided for ease of reference only, and this document does not necessarily include all applicable Order provisions. In the event of a discrepancy between FERC orders, and the language included in this document, FERC orders shall prevail.

[2] Compliance Assessment Date(s): The date(s) the actual compliance assessment (on-site audit, off-site spot check, etc.) occurs.

[3] Applicability is further defined to owners of transmission Facilities operated at 500 kV or higher (see section 4.1.1.1 of the Standard) and owners of certain transmission Facilities operating between 200 kV and 499 kV where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations, per section 4.1.1.2 of the Standard. In addition, sections 4.1.1.3 and 4.1.1.4 bring additional transmission Facilities identified as either critical to the derivation of Interconnection Reliability Operating Limits and Nuclear Plant Interface, respectively, within the purview of the standard. Please see the referenced sections of the Standard for additional details regarding applicability of the Requirements to Transmission Owners.

[4] Facilities regulated by the Nuclear Regulatory Commission or Canadian Nuclear Safety Commission are not subject to this Standard.

Note to Auditors Concerning Third Party Verifications and Reviews

Requirements R2 and R6 prescribe, respectively, unaffiliated third party verifications for Requirement R1 and unaffiliated third party reviews for Requirements R4 and R5. Auditors are encouraged to rely on the verifications and reviews performed in cases where the verifying or reviewing entities are qualified, unaffiliated with the audited entity, and the scope of their verification or review is clear. The concept of reliance means using the work of others to avoid duplication of efforts and is consistent with recognized professional auditing standards, which are required for Compliance Audits per NERC's Rules of Procedure. Reliance in the context of this Reliability Standard means using the Requirement R2 verifications and Requirement R6 reviews to reduce audit risk and the related rigor of audit testing for Requirements R1, R4, and R5. However, in cases where the verifying or reviewing entity lacks the qualifications specified in Requirement R2 for verifications or Requirement R6 for reviewers, the required unaffiliation from the audited entity, or where the scope of the third party entity's verification or review is unclear, auditors may need to apply audit testing of Requirements R1, R4, or R5. For this reason, the Evidence Requested and Compliance Assessment Approach Sections are still present in this RSAW for Requirements R1, R4, and R5. We anticipate those sections will also facilitate expectations for entities and their unaffiliated third party verifiers and reviewers, assist Electric Reliability Organization (ERO) auditors to understand the audit procedures applied by unaffiliated third party verifiers and reviewers, and provide transparency between ERO auditors and Industry, should circumstances require audit testing of Requirements R1, R4, or R5. Further, it is an objective of the ERO to have transparent Evidence Requests and Compliance Assessment Approaches for every enforceable standard, whether they are in audit scope or not.

DRAFT

R1 Supporting Evidence and Documentation

R1. Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria specified in Applicability Section 4.1.1.The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify any Transmission station(s) and Transmission substation(s) that, if rendered inoperable or damaged, could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection.

1.1. Subsequent risk assessments shall be performed:

- At least once every 30 calendar months for a Transmission Owner that has identified in its previous risk assessment (as verified according to Requirement R2)one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection; or
- At least once every 60 calendar months for a Transmission Owner that has not identified in its previous risk assessment (as verified according to Requirement R2) any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection.

1.2. The Transmission Owner shall identify the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment.

M1. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the risk assessment of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria in Applicability Section 4.1.1 as specified in Requirement R1.

Registered Entity Response (Required):

Question: As a result of your risk assessment, do you own any Transmission stations/substations, either existing or planned in the next 24 months, meeting the applicability requirements of 4.1.1? ☐ Yes ☐ No

☐ This entity does not have any applicable Transmission stations/substations.

☐ Other: [Provide explanation below]

[Include additional information regarding the question here, including the type of response and format of the response requested, as appropriate.]

[Note: A separate spreadsheet or other document may be used. If so, provide the document reference below.]

Compliance Narrative:

Provide a brief explanation of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
(R1) Provide the current and the immediately preceding risk assessments conducted after the enforceable date of this Standard (i.e. any risk assessments conducted prior to the effective date of this standard are not relevant).
(R1) List of existing Transmission stations/substations that meet the criteria specified in Section 4.1.1.
(R1) List of Transmission stations/substations planned in the next 24 months that meet criteria specified in Section 4.1.1.
(R1 Part 1.2) List of primary control centers that operationally control each identified Transmission station/substation.

Registered Entity Evidence (Required):

The following information is required for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location of the evidence.					
File Name	**Document Title**	**Revision or Version**	**Document Date**	**Relevant Page(s) or Section(s)**	**Description of Applicability of Document**

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to CIP-014-1, R1

This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	(R1) Review entity's process for determining Transmission stations/substations subject to identification in accordance with Requirement R1, including weighting described in Section 4.1.1.2.
	(R1) Review entity's risk assessment process to determine the Transmission stations/substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an interconnection.
	(R1) Ensure entity's risk assessment process includes Transmission stations/substations planned in the next 24 months.
	(R1) Ensure a risk assessment was performed for each Transmission station/substation meeting applicability described in Section 4.1.

	(R1 Part 1.1) If applicable, review any prior risk assessments and verify whether or not Transmission stations/substations were identified.
	(R1 Part 1.1) Review evidence that risk assessment was performed and verify that it occurred within the past 30 months where items were identified in the previous risk assessment and 60 months where no items were identified in the previous risk assessment.

Note to Auditor: Review entity's answer to the above Question and if the auditor can verify the answer is 'no,' Requirements R3-R6 do not apply and no further audit testing of Requirements R3-R6 is necessary.

See above Note Concerning Third Party Verifications for important details regarding audit risk assessment and related rigor of audit procedures to be applied for this Requirement.

Auditor Notes:

DRAFT

R2 Supporting Evidence and Documentation

R2. Each Transmission Owner shall have an unaffiliated third party verify the risk assessment performed under Requirement R1. The verification may occur concurrent with or after the risk assessment performed under Requirement R1.

2.1. Each Transmission Owner shall select an unaffiliated verifying entity that is either:

- A registered Planning Coordinator, Transmission Planner, or Reliability Coordinator;
- An entity that has transmission planning or analysis experience.

2.2. The unaffiliated verifying entity shall either verify the Transmission Owner's risk assessment performed under Requirement R1 or recommend the addition or deletion of a Transmission station(s) or Transmission substation(s). The Transmission Owner shall ensure the verification is completed within 90 calendar days following the completion of the Requirement R1 risk assessment.

2.3. If the unaffiliated verifying entity recommends that the Transmission Owner add a Transmission station(s) or Transmission substation(s) to, or remove a Transmission station(s) or Transmission substation(s) from, its identification under Requirement R1, the Transmission Owner shall either, within 60 calendar days of completion of the verification, for each recommended addition or removal of a s Transmission station or Transmission substation::

- Modify its identification under Requirement R1 consistent with the recommendation; or
- Document the technical basis for not modifying the identification in accordance with the recommendation.

2.4. Each Transmission Owner shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information exchanged with the unaffiliated verifying entity.

M2. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner completed an unaffiliated third verification of the Requirement R1 risk assessment and satisfied all of the applicable provisions of Requirement R2, including, if applicable, documenting the technical basis for not modifying the Requirement R1 identification as specified under Part 2.3.

Registered Entity Response (Required):

Compliance Narrative:

Provide a brief explanation of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
(R2) Dated evidence of third party verification of the entity's risk assessment performed under Requirement

R1.
(R2 Part 2.1) Documented qualifications of the verifying party.
(R2 Part 2.3) Recommendations, if any, of the verifying party related to Requirement R1 risk assessments.
(R2 Part 2.3) Documentation of modifications and implementation of recommendations or technical basis for not implementing recommendations of the verifying party.
(R2 Part 2.4) Evidence that procedures were implemented to protect sensitive and confidential information.

Registered Entity Evidence (Required):

The following information is required for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location of the evidence.					
File Name	**Document Title**	**Revision or Version**	**Document Date**	**Relevant Page(s) or Section(s)**	**Description of Applicability of Document**

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to CIP-014-1, R2

This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	(R2) Review evidence of third party verification of the entity's risk assessment and verify the following:
	(R2 Part 2.1) The reviewing entity is registered in accordance with Part 2.1 or has transmission planning or analysis experience.
	(R2 Part 2.2) Verification was completed with 90 calendar days of risk assessment.
	(R2 Part 2.3) Verifying entity's recommendations, if any, were used to modify the entity's Requirement R1 identification or the technical basis for not modifying the Requirement R1 identification is documented within 60 calendar days of completion of the verification.
	(R2 Part 2.4) Review non-disclosure agreement (or other evidence) to verify procedures for protecting sensitive or confidential information between the entity and third party were implemented.
Note to Auditor See Guidelines and Technical Basis section of the standard and Rationale for Requirement R2 associated with the Standard for additional details regarding the term 'unaffiliated.' The third party verification may occur concurrent with or after the risk assessment performed under Requirement R1.	

Auditor Notes:

DRAFT

R3 Supporting Evidence and Documentation

R3. For the primary control center(s) identified by the Transmission Owner according to Requirement R1 and verified according to Requirement R2 that is not under the operational control of the Transmission Owner, the Transmission Owner shall, within seven calendar days following completion of Requirement R2, notify the Transmission Operator that has operational control of the primary control center of such identification and the date of completion of Requirement R2.

3.1. If a Transmission station or Transmission substation previously identified under Requirement R1 and verified according to Requirement R2 is removed from the identification during a subsequent risk assessment performed according to Requirement R1 or a verification according to Requirement R2, then the Transmission Owner shall, within seven calendar days following the verification or the subsequent risk assessment, notify the Transmission Operator that has operational control of the primary control center of the removal.

M3. Examples of acceptable evidence may include, but are not limited to, dated written or electronic communications that the Transmission Owner notified each Transmission Operator, as applicable, according to Requirement R3.

Registered Entity Response (Required):

Question: Are any primary control centers identified in Requirement R1, Part 1.2 not under operational control of your NERC registration? ☐ Yes ☐ No

[Note: A separate spreadsheet or other document may be used. If so, provide the document reference below.]

Compliance Narrative:

Provide a brief explanation of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
(R3) If applicable, dated communications with Transmission Operators demonstrating notification and the date of completion of Requirement R2.

Registered Entity Evidence (Required):

The following information is required for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location of the evidence.					
File Name	**Document Title**	**Revision or Version**	**Document Date**	**Relevant Page(s) or Section(s)**	**Description of Applicability of Document**

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to CIP-014-1, R3

This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	(R3) For each applicable primary control center identified in Requirement R1 Part 1.2 not under the control of the entity's registration, verify notification exists and contains the date of completion of Requirement R2.
	(R3 Part 3.1) For each Transmission station/substation removed under Part 3.1, ensure the responsible Transmission Operator was notified of the removal within seven calendar days of removal from identification.
Note to Auditor: Note the entity's response to the above Question. If auditor can verify the entity's answer of 'No,' then Requirement R3 is not applicable and no further audit testing is required.	

Auditor Notes:

.

R4 Supporting Evidence and Documentation

R4. Each Transmission Owner that owns or operates a Transmission station, Transmission substation, or primary control center identified in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3 that the Transmission Operator's primary control center has operational control of an identified Transmission station or Transmission substation, shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2. The evaluation shall consider the following:

4.1. Unique characteristics of the identified and verified Transmission station(s), Transmission substation(s), and primary control center(s);

4.2. Prior history or attack on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and

4.3. Intelligence or threat warnings from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), U.S. federal and/or Canadian governmental agencies, or their successors.

M4. Examples of evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner or Transmission Operator conducted an evaluation of the potential threats and vulnerabilities of a physical attack to their respective Transmission station(s), Transmission substation(s) and primary control center(s) as specified in Requirement R4.

Registered Entity Response (Required):

Compliance Narrative:

Provide a brief explanation of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
(R4) A description of the entity's process for executing the evaluation prescribed in Requirement R4.
(R4) Dated evidence of the evaluation prescribed in Requirement R4.

Registered Entity Evidence (Required):

The following information is required for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location of the evidence.					
File Name	**Document Title**	**Revision or Version**	**Document Date**	**Relevant Page(s) or Section(s)**	**Description of Applicability of Document**

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to CIP-014-1, R4

This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	(R4) Review evidence of evaluation and verify it considers the following:
	(R4) Potential threats as described in Requirement R4.
	(R4 Part 4.1) Unique characteristics as described in Requirement R4 Part 4.1.
	(R4 Part 4.2) Prior history or attack on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events.
	(R4 Part 4.3) Intelligence or warnings as described in Part 4.3.
Note to Auditor: See above Note Concerning Third Party Verifications for important details regarding audit risk assessment and related rigor of audit procedures to be applied for this Requirement. Auditor should cross reference the Transmission stations/substations and primary Control Centers identified in the risk assessment performed under Requirement R1 to the evaluation prescribed in Requirement R4 to ensure it is complete.	

Auditor Notes:

R5 Supporting Evidence and Documentation

R5. Each Transmission Owner that owns or has operational control of a Transmission station, Transmission substation, or primary control center identified in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3 that the Transmission Operator's primary control center has operational control of an identified Transmission station or Transmission substation, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s) within 120 calendar days following the completion of Requirement R2. The physical security plan(s) shall include the following attributes:

5.1. Resiliency or security measures designed to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities based on the results of the evaluation conducted in Requirement R4.

5.2. Law enforcement contact and coordination information.

5.3. A timeline for implementing the physical security enhancements and modifications specified in the physical security plan.

5.4. Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).

M5. Examples of evidence may include, but are not limited to, dated written or electronic documentation of its physical security plan(s) that covers their respective identified and verified Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R5, and additional evidence demonstrating implementation of the physical security plan.

Registered Entity Response (Required):

Compliance Narrative:

Provide a brief explanation of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
(R5) Dated physical security plan(s).

Registered Entity Evidence (Required):

The following information is required for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location of the evidence.					
File Name	**Document Title**	**Revision or Version**	**Document Date**	**Relevant Page(s) or Section(s)**	**Description of Applicability of Document**

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to CIP-014-1, R5

This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	(R5) Review evidence and verify the physical security plan(s) covers the Transmission stations/substations and primary controls identified in Requirements R1 and/or R2, and verify plan was implemented within 120 calendar days following the completion of Requirement R2. In addition, verify the plan includes the following attributes:
	(R5 Part 5.1) Resiliency or security measures designed to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities based on the results of Requirement R4.
	(R5 Part 5.2) Law enforcement contact and coordination information.
	(R5 Part 5.3) A timeline for implementing physical security enhancements and modifications specified in the physical security plan.
	(R5 Part 5.4) Provisions to evaluate evolving physical threats, and their corresponding security measures in accordance with R5 Part 5.4
	(R5) Verify implementation of physical security plan(s). See 'Note to Auditor' for details.

Note to Auditor: See above Note Concerning Third Party Verifications for important details regarding audit risk assessment and related rigor of audit procedures to be applied for this Requirement.

Auditor should cross reference the Transmission stations/substations and primary Control Centers identified in the risk assessment performed under Requirement R1 to the evaluation prescribed in Requirement R4 and the security plan(s) prescribed in Requirement R5 to ensure the plan addresses vulnerabilities that would facilitate physical attacks that have a high probability or likelihood of occurrence.

Requirement R5 includes implementation of the security plan(s), which is not within the scope of the third party review described in Requirement R6. Auditors can gain reasonable assurance security plan(s) was/were implemented by determining if specific actions prescribed by the plan(s) have taken place within the timelines established by the plan(s). For example, if the plan calls for certain procedures to occur, then auditors could ask for evidence demonstrating the procedure has been implemented within the timeline established in the security plan. Also, if the plan calls for construction of a barrier, an auditor could verify evidence that such a barrier was constructed in accordance with the entity's timeline. As auditors should obtain reasonable, not absolute, assurance the plan(s) was/were implemented, testing implementation on a sample basis may be appropriate.

Auditor Notes:

DRAFT

R6 Supporting Evidence and Documentation

R6. Each Transmission Owner that owns or operates a Transmission station, Transmission substation, or primary control center identified in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3 that the Transmission Operator's primary control center has operational control of an identified Transmission station or Transmission substation, shall have an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5. The review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5

6.1. Each Transmission Owner and Transmission Operator shall select an unaffiliated third party reviewer from the following:

6.1..1. An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.

6.1..2. An entity or organization approved by the ERO.

6.1..3. A governmental agency with physical security expertise.

6.1..4. An entity or organization with demonstrated law enforcement, government, or military physical security expertise.

6.2. The Transmission Owner or Transmission Operator, respectively, shall ensure that the unaffiliated third party review is completed within 90 calendar days of completing the security plan(s) developed in Requirement R5. The unaffiliated third party review may, but is not required to, include recommended changes to the evaluation performed under Requirement R4 or the security plan(s) developed under Requirement R5.

6.3. If the unaffiliated reviewing entity recommends changes to the evaluation performed under Requirement R4 or security plan(s) developed under Requirement R5, the Transmission Owner or Transmission Operator shall, within 60 calendar days of the completion of the unaffiliated third party review, for each recommendation:

- Modify its security plan(s) consistent with the recommendation; or
- Document the reason for not modifying the security plan(s) consistent with the recommendation

6.4. Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information exchanged with the unaffiliated reviewing entity.

M6. Examples of evidence may include, but are not limited to, written or electronic documentation that the Transmission Owner or Transmission Operator had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 as specified in Requirement R6 including, if applicable, documenting the reasons for not modifying the evaluation or security plan(s) in accordance with a recommendation under Part 6.3..

Registered Entity Response (Required):

Compliance Narrative:

Provide a brief explanation of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
(R6) Dated Evidence of unaffiliated third party review of entity's Requirement R4 evaluation and Requirement R5 security plan(s).
(R6 Part 6.1) Evidence that reviewing entity staff meets qualifications identified in Part 6.1.
(R6 Part 6.3) Recommendations of reviewing party related to Requirement R4 evaluation and Requirement R5 security plan.
(R6 Part 6.3) Dated documentation of modifications and implementation of recommendations or reasons and compensating mitigating measures for not implementing recommendations of the reviewing party.
(R6 Part 6.4) Evidence that procedures were implemented to protect sensitive and confidential information.

Registered Entity Evidence (Required):

The following information is required for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location of the evidence.					
File Name	**Document Title**	**Revision or Version**	**Document Date**	**Relevant Page(s) or Section(s)**	**Description of Applicability of Document**

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to CIP-014-1, R6

This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	(R6) Review evidence and verify the physical security plan(s) and the Requirement R4 evaluation have been reviewed by an unaffiliated third party. Also, review evidence and verify the following:
	(R6 Part 6.1) Reviewing party has the qualifications identified in Part 6.1.
	(R6 Part 6.2) Review is dated within 90 calendar days of completion of the Requirement R5 security plan.
	(R6 Part 6.3) Reviewing entity recommended changes to security plan(s) were made by entity or the reason(s) for not making the change(s) was/were documented within 60 calendar days of the completion of the unaffiliated third party review.
	(R6 Part 6.4) Review non-disclosure agreement (or other evidence) to verify procedures for protecting sensitive or confidential information between entity and third party were implemented.
Note to Auditor: The third party review may occur concurrent with or after the evaluation performed under Requirement R4 or the security plan develop under Requirement R5. See Guidelines and Technical Basis associated with the Standard for additional details related to qualifications of reviewing entities that may inform audited entities selection of a reviewing entity.	

Auditor Notes:

Additional Information:

Reliability Standard

The RSAW developer should provide the following information without hyperlinks. Update the information below as appropriate.

The full text of CIP-014-1 may be found on the NERC Web Site (www.nerc.com) under "Program Areas & Departments", "Reliability Standards."

In addition to the Reliability Standard, there is an applicable Implementation Plan available on the NERC Web Site.

In addition to the Reliability Standard, there is background information available on the NERC Web Site.

Capitalized terms in the Reliability Standard refer to terms in the NERC Glossary, which may be found on the NERC Web Site.

Sampling Methodology [If developer deems reference applicable]

Sampling is essential for auditing compliance with NERC Reliability Standards since it is not always possible or practical to test 100% of either the equipment, documentation, or both, associated with the full suite of enforceable standards. The Sampling Methodology Guidelines and Criteria (see NERC website), or sample guidelines, provided by the Electric Reliability Organization help to establish a minimum sample set for monitoring and enforcement uses in audits of NERC Reliability Standards.

Regulatory Language [Developer to ensure RSAW has been provided to NERC Legal for links to appropriate Regulatory Language – See example below]

E.g. FERC Order No. 742 paragraph 34: "Based on NERC's…….

E.g. FERC Order No. 742 Paragraph 55, Commission Determination: "We affirm NERC's…….

Selected Glossary Terms [If developer deems applicable]

The following Glossary terms are provided for convenience only. Please refer to the NERC web site for the current enforceable terms.

Revision History for RSAW

Version	Date	Reviewers	Revision Description
1	04/09/2014	Physical Security RSAW Task Force	New Document

[i] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

Standards Announcement

Project 2014-04 Physical Security
CIP-014-1

Formal Comment Period Now Open through April 24, 2014
Ballot Pools Forming Now through April 19, 2014

This email distribution list may include individuals subject to ex parte communication restrictions pursuant to Rule 2201 of the Federal Energy Regulatory Commission's regulations governing off-the-record communications (18 C.F.R. § 385.2201 (2014)). Please refrain from using this distribution list for any substantive communications related to Project 2014-04, Physical Security.

In an order issued March 7, 2014, the Federal Energy Regulatory Commission directed NERC to file a physical security standard within 90 days of the order (*i.e.*, by June 5, 2014). On March 21, 2014, the NERC Standards Committee (SC) authorized a waiver of the standard development process, in accordance with Section 16 of the Standard Processes Manual, to meet this pending regulatory deadline. The SC approved to shorten this comment period from 45 days to 15 calendar days, with a concurrent ballot conducted during the last 5 days of the comment period. The waiver also provided for ballot pool formation to begin immediately upon approval of the waiver, with closure of the ballot pool 10 days after the initial formal comment and ballot period begins. (Sections 4.7-4.9)

Now Available

A 15-day formal comment period for **CIP-014-1 – Physical Security** is open through **8 p.m. Eastern on Thursday, April 24, 2014.**

If you have questions please contact Stephen Crutchfield via email or by telephone at (609) 651-9455.

Background information for this project can be found on the project page. Please refer to the 1-page Project Overview to learn more about the Physical Security standard and project at a glance.

Instructions for Commenting

Please use the electronic form to submit comments on the standard. If you experience any difficulties in using the electronic form, please contact Wendy Muller. An off-line, unofficial copy of the comment form is posted on the project page.

Instructions for Joining Ballot Pool

Ballots pools are being formed for Project 2014-04 – Physical Security and the associated non-binding poll on this project. Registered Ballot Body members must join the ballot pools to be eligible to vote in the balloting and submittal of an opinion for the non-binding poll of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs). Registered Ballot Body members may join the ballot pools at the following page: Join Ballot Pool

During the pre-ballot window, members of the ballot pool may communicate with one another by using their "ballot pool list server." (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list servers.) The list servers for this project are:

Initial Ballot: bp-2014-04_CIP-014-1_in@nerc.com
Non-Binding poll: bp-2014-04_CIP-014-1_NB_in@nerc.com

Next Steps

An initial ballot for the standard and non-binding poll of the associated VRFs and VSLs will be conducted **April 20-24, 2014.**

For more information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Wendy Muller, Standards Development Administrator, or at 404-446-2560.

Standards Announcement

Project 2014-04 Physical Security
CIP-014-1

Initial Ballot and Non-Binding Poll Results

Now Available

An initial ballot for **CIP-014-1 – Physical Security** and non-binding poll of the associated Violation Risk Factors and Violation Severity Levels concluded at **8 p.m. Eastern on Thursday, April 24, 2014.**

The standard achieved a quorum and sufficient affirmative votes for approval. Voting statistics are listed below, and the Ballot Results page provides a link to the detailed results for the ballot.

Approval	Non-Binding Poll Results
Quorum: 88.60%	Quorum: 84.62%
Approval: 82.07%	Supportive Opinions: 83.83%

Background information for this project can be found on the project page.

Next Steps

The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standard. If the standard does not show the need for significant revisions, it will proceed to a final ballot

For information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Wendy Muller (via email), Standards Development Administrator, or at 404-446-2560.

Jennifer Wright
San Diego Gas & Electric
Yes
San Diego Gas & Electric (SDG&E) agrees that it is appropriate to start with those Transmission Owners that own Transmission facilities that meet the bright line criteria in Reliability Standard CIP-002-5.1 for a “medium impact” rating. However, SDG&E believes that it would be prudent to simply refer to the CIP-002-5.1 Impact Rating Criteria rather than restating it in CIP-014 Standard. Being more specific that this Standard is applicable to Transmission Owners that have any facilities identified as “medium impact” facilities under CIP-002-5.1 Attachment 1, Inpact Rating Criteria 2.4, 2.5, 2.6 and 2.7, would be clearer and more consistent with the general way that CIP-003-5 through CIP-011-5 are built upon the identification of “critical” facilities made in CIP-002-5.1. Linking the two explicitly, rather than simply restating the same language, would prevent the possibility that differences could creep into the rules over time as each Standard is modified.
Yes
SDG&E agrees with this approach. A facility’s identification as “medium impact” does not necessarily mean that the facility, if rendered inoperable or damaged could result in widespread instability, uncontrolled separation or Cascading within an Interconnection. Application of a risk assessment will ensure that CIP-014-1 is focused on the facilities that are most critical to the system.
Yes

SDG&E agrees that an evaluation of potential threats and vulnerabilities of a physical attack to the facilities identified in R1 through R3 of the Standard is appropriate. Security threats and vulnerabilities can, and will vary from location to location and such differences must be accounted for in a robust security plan. It is appropriate and necessary that the Standard not mandate a one-size-fits-all approach, but requires entities to take into account the unique characteristics of each facility. SDG&E understands the Federal Energy Regulatory Commission's concern addressed by its Paragraph 11 directive that the Standard must have the analysis verified by an independent third party. While SDG&E believes it has in-house experts capable of performing such an analysis (as required by R4) and developing a Physical Security plan (as required by R5) adequately, SDG&E appreciates that verification by a third party, essentially a "second opinion," can serve to ensure a robust analysis of the physical security threats and vulnerabilities of facilities identified in Requirements R1 through R3. SDG&E appreciates the broad definition under R6.1 of what qualifies as a "unaffiliated third party reviewer." A list that unnecessarily limits possible reviewers could: 1) result in a bottleneck as too few potential reviewers are available for the industry to use; and 2) result in increased costs and a tight market for reviewers results in higher prices for their services.

The following comments relate to suggested modifications for Requirements 1-3 – PGE believes the 90-day period to ensure verification of the risk assessment is too short. It will be difficult for every Transmission Owner to establish a contract with an unaffiliated verifying entity during the implementation time period. In addition, the current wording of the standard puts the obligation on the Transmission Owner to make sure that the assessment is done within 90 days, even though by definition they cannot have control over that timeline. Therefore, PGE proposes replacing the R2.2 language, "[t]he Transmission Owner shall ensure the verification is completed within 90 calendar days following the completion of the Requirement R1 risk assessment," with the language, "[t]he Transmission Owner shall ensure that any agreement executed with the unaffiliated verifying entity stipulate that the verification be completed by a date that is not later than 90 calendar days from the completion of the Requirement R1 risk assessment." In addition, Requirement R3 provides no mechanism for the Transmission Operator who operates a primary control center identified by a different Transmission Owner to disagree with that identification. PGE proposes including similar language to that in R2.3 to allow for the Transmission Operator to document the technical basis for not identifying its primary control center as an asset to be protected.
Yes

In Requirement R4 the phrase “owns or operates” is used for the first time. If Transmission Owner Entity A is also a Transmission Operator of a line it does not own, and that line was identified by Transmission Owner Entity B in Requirement R1 and verified according to Requirement R2, Entity A could be responsible for evaluating and protecting that line under this wording. However, there is no mechanism built into the standard to communicate this information or to allow the Transmission Operator to dispute the decision. In addition, Requirement R4.2 should be changed to “[p]rior history of attack.” In addition, in Requirement R4.3, the current wording places an unrealistic and unclear burden on every Transmission Owner to monitor intelligence or threat warnings from an open-ended list of sources. We recommend changing the wording from “[i]intelligence or threat warnings from sources” to “[i]intelligence or threat warnings received from sources” to narrow the obligation to information that the Transmission Owner actually received from its monitoring activities. In addition, in Requirement R5, the phrase “owns or has operational control over” is used for the first time. It’s not clear why this needs to be different from the “owns or operates” in Requirement R4. Consistent terms should be used to decrease potential confusion. In addition, as above, PGE believes that the 90-day period to review each entity’s evaluation and security plan is too short. Again, we propose replacing the R6.2 language, “[t]he Transmission Owner or Transmission Operator, respectively, shall ensure that the unaffiliated third party review is completed within 90 calendar days of completing the security plan(s) developed in Requirement R5,” with the language, “[t]he Transmission Owner or Transmission Operator, respectively, shall ensure that any agreement executed with the unaffiliated verifying entity stipulate that the verification be completed by a date that is not later than 90 calendar days from completing the security plan(s) developed in Requirement R5.”

Comment: Proposed language to be added to the end on Requirement 6: This Requirement shall not apply to any Federal corporation or agency that meets any of the criteria in Requirement 6.1 and that has an Inspector General, pursuant to the Inspector General Act Amendments of 1988, appointed by the President of the United States and charged with oversight responsibility for such Federal corporation or agency. Comment: Recommend adding “with electric utility experience” as a reviewer qualification to 6.1.3 and 6.1.4.

Rationale: There should be a common standardizing qualification such as PSP, CPP, or electric utility experience that applies across the sub requirements of R6 that entities and the ERO can use as criteria to qualify unaffiliated third party reviewers.

The applicability of the draft standard should be expanded to incude Planning Coordinators in addition to Transmission Owners and Transmission Operators. While NPCC agrees that TOs and TOPs simple application of the screening criteria to determine which facilities need analysis, they may not be able to conduct a complete analysis. The SDT should consider that Transmission Owners in some cases do not have the ability to conduct an analysis with a "wide area" view of consequences. Smaller TOs or TOPs only have an outside equivalent representation of the BES and could need help conducting their analyses. Consideration should be given to allow them to conduct the studies in conjunction with PCs.
No
The Rationale Box for Requirement R2 stipulates that "'unaffiliated' means that the selected verifying entity cannot be a corporate affiliate (i.e., the verifying entity cannot be an entity that controls, is controlled by, or is under common control with, the Transmission o(O)wner)." This conflicts with Requirement R2 Part 2.1 which lists "A registered Planning Coordinator, Transmission Planner, or Reliability Coordinator; or An entity that has transmission planning or analysis experience" as those qualifications for an unaffiliated verifying entity. Clarification is needed that an Independent System Operator that has operating authority over an entity is eligible to be the unaffiliated verifying entity.
No
Regarding Part 5.1, the requirement states that the security measures should be designed to deter, detect, delay, assess, communicate and respond to potential physical threats. NPCC suggests removing the obligation to 'deter' from this Part and establish a separate Part that addresses deterrence and very basic specifics regarding what constitutes deterrence. The new Part could describe how an entity should implement deterrence and consider some minimum auditable criteria; for example, Consider and Implement measures designed to deter potential physical threats including 1) perimeter control 2) motion detection 3) lighting 4) access control. In this manner the ambiguity surrounding the term 'deter' is eliminated. Part 5.3 should allow flexibility to modify the time line. Suggest that Entities should 1) have a master Physical Security Plan; 2) have the flexibility to accomplish mitigation activities associated with the results of the vulnerability assessment, and 3) capture those mitigation plans under a separate mitigation plan (similar to the action plans for Cyber Assets vulnerability assessments) or include "associated modifications to the time line".

Yes
It is NPCC's expectation that RAI concepts will be applied to the operating and enforcement of this standard.

Overall comment is this is too complicated of a draft standard for a 90 day consensus! Keep it simple. I agree with the functional entitiy that is identified however, I would add GO to address any "critical" switchyards that may exist that are not owned by a TO. I also agree with the scoping of the facilities similar to the CIP V5 criteria with the following exception, apparently a list already exists for the substations that should be considered "high" do they deserve an alternative approach to what is within this standard? Altering the existing basic approach as follows: Since the FERC order allowed for "One or More Reliability Standards", it would be appropriate to address the "High " facilities separate from the "Medium Facilities". This approach would make it an easier task to file the "high standard" within the 90 days then follow with the "medium later". Thus giving more time, latitude and maneuverability to address issues that arise specific to those facilities.
No
I agree with the risk assessment in concept, the standard has far too many requirements and sub requirements to accomplish the task. Since initial analysis apparently this has already been done for the "High Risk" stations, a more efficient approach would be for the RC to perform the analysis based on the criteria mentioned to validate findings and find any second contingency facilities that may not have been identified. Since the RC is the "Reliability Coordinator", this is your third party identifying facilities without bias… Determinations will be based on an engineering basis utilizing standard uniform criteria across North America. The same analysis occurs for all entities within all regions, no variations this would yield consistency! Then the RC notify the entities that they have facilities that have been identified. (much like other NERC standards) Thus the information on which facilities have been identified would disseminated and controlled in a much more secure and better controlled environment while still maintaining the quality and consistency of the study needed.
No
Once the in scope facilities have been identified, it would be best for the entites to use the same resources for the evaluation of "Potential Threats" since this language has endless possibilities. i.e. Aerial attack, induced seismic events to name a few to illustrate "Potential". I favor the wording of "reasonable risks" The FBI, DOE or DHS should be involved in the discussion with the entities in lieu of a third party who is only subject to confidentiality agreements and also has interests beyond mitigating the true risks.
Yes

I think the standard IF broken up into 2 standards (High, Med) should provide clearer guidance as to the expectations of the plans content. Similar to the issues that arose with the Low assets in CIP V5 . Give basic structure and content to be addressed to give FERC the assurance the specific concerns have been met.

Yes
Yes
There does not seem to be any timeframe within which the initial assessment is to be completed under R1, nor when the 30 and 60 month periods for subsequent reassessments under R1.1 are to begin and conclude.
No
R4.2 requires each Transmission Owner of an identified facility to "consider" and "Prior history or attack on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events." Is such consideration to be given to other "similar facilities" of the specific Transmission Owner or of any Transmission Owner anywhere in North America? How will such "consideration" be possible if the scope of such consideration is intended to be the latter? R5 is fine, but R6 suffers from the same ambiguity as R4.

Terry Volkmann
Yes
No
The SDT has not factored in the resiliency concerns stated in the FERC order. Many of the facilities selected by the initial screening process will have long lead time equipment that if damaged will be out of service for several months. The assessment process needs to consider the operational risks during the time that the TO is waiting for replacement equipment. R1 should be amended to include the following sub-requirement. If the facility being studied has long lead time items, i.e. 4 months or greater, the study must include an N-1 analysis for the widespread instability, uncontrolled separation, or Cascading within an Interconnection test. In addition, the premise for this standard is a physical attack resulting in faulted equipment. There is no mention of the assessment being conducted for the Facilities under fault

conditions and in many cases under delayed clearing. R1 should be amended to include the following sub-requirement. The analysis of the subject Facility must include dynamic simulation of faulted conditions with delay cleared for the most severe contingency within the Facility. The phrase "instability, uncontrolled separation, or Cascading" is core to the definition of Interconnected Reliability Operating Limit (IROL). Every RC and PC has an IROL methodology under the FAC standards. R1 should be amended to include the following sub-requirement. The test for instability, uncontrolled separation, or Cascading must be consistent with the IROL methodology established by PCs and RCs under FAC-010 and FAC-011.
No
It is recognized that a one–size–fits all approach is not practical. However the proposed directives as to what should be included in physical security plans are so general that little is likely to change from current practices that are insufficient to protect very critical high risk substations. The only language directive in CIP-01401 is listed on Pg. 10, R5 para 5.1. More definitive guidelines must be outlined if improvements are to really be achieved. The utility industry has used real-time remote monitoring of substation equipment for reliability purposes for decades. Similar technology is available for the very important physical security function. The following sentence needs to be added at the end of paragraph 5.1. “Security measures must include isolation zones of sufficient size covering approaches to substations, in addition to monitoring inside substation fenced areas, to detect both attempted and actual penetration of critical sites and the surrounding buffer areas. The areas must be patrolled with real time monitoring & assessment equipment designed to provide live and playback/recorded video that must be automatically presented to alarm station operators. Detection equipment must include gunshot detectors. Sufficient real-time surveillance must be provided to allow sufficient time to implement a tactical response plan to minimize and interrupt threats.”

Historically, FERC and NERC have taken the position that redundancy is not an acceptable criterion to exempt a Critical Cyber Asset from mandated physical or cyber controls. Redundancy is not supposed to be a factor in the determination of the criticality; instead redundancy is used to improve reliability and availability. This principle should be extended to the protective measures applicable to control centers under CIP-014-1. So long as both the primary control center and backup control centers meet the bright line criteria for a medium impact rating under CIP-002-5.1, the protections under CIP-014-1 should apply equally to both the primary and backup control centers.
No

There should be a strong, rebuttable presumption that an applicable Transmission Facility requires physical protection owing to its classification under the bright-line "medium impact" rating criteria under CIP-002-5.1 (which is repeated in the Applicability section of CIP-014-1 for Transmission Facilities). The utility of a risk assessment could be recognized, however, as justification for rebutting the presumed need for a set of mandated physical security measures.
No
The approach taken by the Nuclear Regulatory Commission, which prescribes specific physical protections for nuclear plants and materials in 10 CFR Part 73, is instructive. Applicable Transmission Facilities, which are subject to common potential threats and vulnerabilities, warrant minimum physical security protective measures. Physical security plans should incorporate those prescribed protective measures unless a responsible entity can establish that its validated security plan provides a comparable level of protection required by the Standard.
Yes
CIP-014-1 should expressly permit one well-coordinated physical security plan for a Transmission Facility. As proposed, there could be a separate physical security plan under CIP-006-5 for BES Cyber Systems within an applicable Transmission Facility and potentially another physical security plan for the Transmission Facility as whole under CIP-014-1.
Individual
David Ramkalawan
OPG
No
In the applicability section of the proposed standard, does the exemption refer to the Nuclear Generation Facility or the Transmission facility to which the Nuclear Generation Facility is connected? In Canada the Canadian Nuclear Safety Commission has no jurisdiction over the Transmission Owner/Operator; therefore the intent of the standard has to be made clear on this point.

Clarification - R6.2: Need to clarify that “completing the security plan(s)” does not include completing the tasks outlined in the time line developed in R5.3 – the time line is required to be complete as part of the plan but not the tasks in the time line.
Yes
Recommendation # 1 – Include the timeline diagram located in the FAQ document titled “CIP-014 Physical Security Process Flow” in the Guideline and Technical Basis section of the standard. This diagram clearly demonstrates the timing between the different requirements. Because of the subsequent risk analysis’s in R1, verifications in R2, and potentially the processes outlined in R3, R4, R5, & R6, questions on timing (answered by the diagram) potentially will arise throughout the life of the standard. Recommendation # 2 – Add the words “catastrophic failure” to the Purpose statement. On a webinar, there was discussion concerning the Purpose statement and it was stated a number of times that “widespread instability, uncontrolled separation” meant to convey the concept of “catastrophic” – there will be a lot of folks involved in the implementation of the standard who did not hear the webinar comments. Recommendation # 3 – Rather than the term “primary control center” used in all the proposed requirements, use a different term or phrase such as the “facility that has direct Supervisory Control”. The word “direct” in the recommendation of “direct Supervisory Control” should replace the need for the word “primary” - primary makes one think of primary and backup (which is not addressed in the standard). The concern with using primary control center, even though “control center” is not capitalized, brings up a mental picture of primary (and backup) Control Centers as defined in the NERC glossary. The standard should be straight forward, not using terms that can be confused.

R2 – A concern to consider is whether there is an adequate pool of unaffiliated third party verifiers to meet the 90 day timeframe. Possible solutions would include (1) increase the 90 day requirement to six months; or (2) Revise the requirement to allow the NERC Registered Entity to notify the appropriate Regional Entity of the verifier pool constraint and request the Regional Entity act as the verifier or specify an acceptable alternative.

Yes
Yes
The SDT should be applauded for the diligent work performed in short order to meet the requirements of the FERC order RD14-6-000 while allowing flexibility in the manner the Registered Entity may be compliant.

EEI supports the draft standard CIP-014-1 as fully responsive to the FERC March 7 order. The project has moved along a very aggressive timeline and naturally raises a broad range of practical and implementation issues. Based on extensive discussions with member companies, EEI recommends that the standard drafting team (SDT) consider additions or changes to the implementation guidance that will clarify for companies several questions on the timing of the various implementation stages of the standard, including especially that security plans are subject to change over time for a broad range of reasons. In addition, EEI asks the SDT to consider clarifications in implementation guidance that, in many cases, the completion of all mitigation work may take place on longer timelines, and that implementation of a security plan does not require the completion of all mitigation work. Observing the many meetings and webinars that have taken place recently, EEI also recommends that the SDT consider adding language in the implementation guidance around the application of the terms 'control center,' 'primary control center,' and 'transmission station' in the draft standard. Obviously, there are a wide variety of understandings on these terms and additional clarity will help companies' ability to perform under the requirements. Considering that these terms have generic application to bulk power system reliability, the project timeline does not afford time for careful consideration of various facts and circumstances that might inform content of formal NERC defined terms.

SPPRE does not agree with the applicability because it excludes certain facilities that could pose a significant risk to the BPS reliability if rendered inoperable or damaged as a result of a physical attack. Other facilities that should be applicable are those where high impact BES Cyber Systems are found. Additionally, any Special Protection System and automatic load shedding system capable of shedding 300 Mw or more should be included. Reference CIP-002-5 Attachment 1 (Impact Rating Criteria 1.1, 1.2, 1.4,2.9, and 2.10). SPPRE also disagrees with the decision to limit applicability to only the primary control center.
No
SPPRE believes that greater clarity is required with respect to the risk assessment to be performed. At a minimum an extreme contingency study needs to be performed that takes out the entire facility, all voltages present. The study should also not consider any operating guides or other mitigation when evaluating the impact of the outage. In Section 2.3 technical basis should be changed to engineering basis. Additionally, the unaffliated verifying entity should not be the party performing the original study, under the principle that an auditor cannot audit ones own work; to do so would not be consistent with the expectation of verification by an unaffiliated entity.
No
SPPRE disagrees with the inclusion of Requirement 4.2. Prior history is not a predictor of future events and could result in critical facilities not being protected until after a sucessful first damaging attack with adverse BES reliability impact. Requirement 5.3 should be a project plan with measurable milestones for implementing the physical security enhancements and modifications.
Yes
SPPRE recommends that subsequent risk assessments should be peformed at least every 36 calendar months regardless of whether previous risk assessments had identified critical facilities. It is more important to identify facilities that should be on the list than those that might not need to be on the list anymore.

Overall Minnesota Power agrees with the approach laid out by the Standard Drafting Team in Requirements 4-6, but requests that the SDT consider modifying the wording of R5.1 as follows. Resiliency or security measures designed to deter, detect, delay, assess, communicate, or respond to potential physical threats and vulnerabilities based on the results of the evaluation conducted in Requirement R4. An auditor could interpret the use of “and” in

"…deter, detect, delay, assess, communicate, and respond…" to mean that each resiliency or security measure be designed to meet all of these, where we believe and hope that the intent of the sub-Requirement is that the resiliency or security measure identified in the physical security plan be designed to "…deter, detect, delay, assess, communicate, or respond…", while recognizing that it may meet more than one.

In regards to R2.2 as currently drafted, the unaffiliated verifying entity should have to ensure verification within 90 days and not the TO, since it is that entity performing the verification. In regards to R2.3 as currently drafted, there appears to be a lack of an appeals process in cases

of disagreement between the unaffiliated verifying entity and the TO concerning the recommendations formulated by the unaffiliated verifying entity.

the applicability section table should be modified by either removing the 500kV line or making it a 3000 value. By giving it a 0 value in the table it send a different message than the text indicating all 500kV facilities are in. Also, in the draft RSAW Compliance Assessment approach for R1, it would appear that a Transmission Owner needs to comply with R1 and R2 in order to determine if the standard applies to them. If an entity is required to have a process for determining applicability then it needs to be a requirement. The applicability section should produce a yes or no answer. I spoke with Nick Webber of WECC and his response back was "Much like the requirement of all entities to apply CIP-002, all entities registered as for the TO function must complete CIP-014-1 R1 and R2. Each TO must complete R1 to determine if R3-R6 apply. The TO then must subsequently have that R1 assessment reviewed as required in R2." An entity should not have to comply with 2 of the requirements in order to determine if the standard applies to them. If all TOs are expected to comply with R1 and R2, then move the criteria into the requirement, if that is not the intent, clarify that once an entity reviews the applicability section and determines the standard does not apply they are finished. The rationale for requirement R1 indicates the criteria is in R1 when it is actually in the Applicability section.
Yes
This standard has the perceived importance of protecting national security and being so critical as to expedite its development through modification of nearly all associated controls. I agree physical security of critical facilities is of paramount concern but not at the expense of producing a sound standard. After listening to two of the webinars it is clear to me that the majority of the entities responsible for ultimately complying with this standard and those that will enforce the requirements are unclear as to what is required. I would suggest running it past the "Experts" for their review prior to the first vote.

Tampa Electric Company
Ronald L Donahey

Yes
Yes
Yes
Comments to R5 Tampa Electric Company appreciates the excellent work of the standard drafting team (SDT). They and their support staffs have evidently worked very hard to produce in a very short time a family of documents that create a workable framework for improving the physical security of Transmission substations and primary Control Centers. We also commend NERC and the SDT for reaching out to the industry through a live a technical conference and by conducting a series Webinars in local and national venues. Moreover, we fully support the intent of the SDT as it has been articulated so well in the technical conference, in NERC and FRCC Webinars and in EEI and NATF conference calls. Unfortunately, there is a critical ambiguity in the text of requirement R5 that is problematic and needs to be addressed by the SDT. Our main concern is that requirement R5 literally reads that all provisions of the security plans for our primary control center and for all our substations and switchyards, including the installation and construction of any physical security upgrades, must be completed "within 120 calendar days following the completion of Requirement R2." Such a requirement may well be impossible to meet depending on the extent of the upgrades, the need for facility outages, and the number of locations that are affected. Members of the SDT have made it very clear in the Webinars and conference calls that they did not intend this result. Instead, the SDT intended to require registered entities, "within 120 calendar days following the completion of Requirement R2," to develop and document plans that include definite timelines for completing any security upgrades that are necessary to protect against the vulnerabilities and threats that are identified under requirement R4. Given that the text of R5 is contrary to the intent of the SDT, Tampa Electric urges the SDT to clarify that, in many cases, the completion of all mitigation work may take place on longer timelines, and that implementation of a security plan does not require the completion of all mitigation work. This clarification can be accomplished in the guidance document to the standard or by our preference, editing the text of the standard and issue a revised standard for a second ballot. Removing "and implement" from the text of requirement R5 should remove the ambiguity and conform the text to the intent of the SDT. This edit, combined with R5.3 expresses the SDT's intent on this issue: R5. Each Transmission Owner that owns or has operational control of a Transmission station, Transmission substation, or primary control center identified in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3 that the Transmission Operator's primary control center has operational control of an identified Transmission station or Transmission substation, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s) within 120 calendar days following the completion of Requirement R2. The physical security plan(s) shall include the following

attributes: [VRF: High; Time-Horizon: Long-term Planning] 5.3. A timeline for implementing the physical security enhancements and modifications specified in the physical security plan.

Yes

Comments: Comments to Definitions Tampa Electric also urges the SDT to define certain terms that appear in the standard: 1) “Transmission substation” and “Transmission station,” 2) “collector bus,” and 3)“primary control center. There terms are not defined in the NERC Glossary and may not have definitions that are universally accepted by the industry. “Transmission substation” and “Transmission station” Many industry practitioners use the term “Transmission substation” generally, whether or not any transformers are installed in the facility they are describing. Other practitioners apply the term “Transmission substation” only to facilities that include transformers. The standard implicitly uses the term “Transmission station” in reference to transmission switching arrangements that do not involve transformers. However, the more commonly used term for a transmission switching arrangement that does not include transformers is “Transmission switchyard.” NERC addressed this issue in the Guidelines and Technical Basis section of CIP-002-5. The SDT could easily carry that text over to the Guidelines and Technical Basis section of CIP-014-1. However, it would be better to add definitions for “Transmission substation” and “Transmission station” to the Glossary of Terms Used in NERC Reliability Standards. The relevant text in CIP-002-5 is copied below for the convenience of the SDT. CIP-002-5 Guidelines and Technical Basis clarifications of “Transmission stations” and “Transmission substations” The SDT uses the phrases “Transmission Facilities at a single station or substation” and “Transmission stations or substations” to recognize the existence of both stations and substations. Many entities in industry consider a substation to be a location with physical borders (i.e. fence, wall, etc.) that contains at least an autotransformer. Locations also exist that do not contain autotransformers, and many entities in industry refer to those locations as stations (or switchyards). Therefore, the SDT chose to use both “station” and “substation” to refer to the locations where groups of Transmission Facilities exist. “Collector bus” “Collector bus” is another term that is not defined in the NERC Glossary and that may not have a definition that is universally accepted by the industry. “Collector bus” appears in 4.1.1.1 and in 4.1.1.2. of CIP-014-1 in text that was carried over from CIP-002-5. 4.1.1 Transmission Owner that owns any of the following: 4.1.1.1 Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility. [Underlines added] 4.1.1.2 Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility. [Underlines added] If “Collector bus” is not defined or clarified, some TOs may conclude that some part of

every transmission substation or switchyard that receives the output of a generator(s) is excluded from the scope of the standard. However, that is not the case nor the intent of the SDT. Therefore, the drafting team should consider whether it should define or clarify in the guidance document, the term “collector bus” “Primary control center” The NERC Glossary defines “Control Center” in this manner: One or more facilities hosting operating personnel that monitor and control the Bulk Electric System (BES) in real-time to perform the reliability tasks, including their associated data centers, of: 1) a Reliability Coordinator, 2) a Balancing Authority, 3) a Transmission Operator for transmission Facilities at two or more locations, or 4) a Generator Operator for generation Facilities at two or more locations. What might not be clear for the purposes of CIP-014-1 is what exactly distinguishes a “primary control center” from other alternate “Control Centers.” Some registered entities can operate substations from multiple locations. Often, there is one self-designated “main control center” or “primary control center” for which there might be multiple alternate or “backup control centers.” Given that alternate or backup control centers have capabilities that are comparable to so-called main control centers, it might not be clear in some systems whether “primary control center” in CIP-014-1 applies to more than one Control Center. The SDT can solve this problem by adding a definition of “primary control center” to the NERC Glossary or by adding text to CIP-014 that for each critical substation the TO or TOP can designate any Control Center as the “primary control center.”

Black Hills Corporation Entities

Bob Case - NERC Compliance Manager , Bob.Case@blackhillscorp.com

No

Black Hills Corporation (referred to as BHC hereafter) believes that Section 4.1.1 has appropriate applicability specifics, but Section 4.1.2 only says “Transmission Operator”, which initially implies a much greater scope. Request that similar to Section 4.1.1 styling, Section 4.1.2 alternatively state “Transmission Operators notified by a Transmission Owner according to Requirement R3.”

No

Although BHC agrees with the overall approach, it has significant concerns regarding the use of the term “risk assessment” without a clear definition of intent. CIP-002 regulatory expectations in the Western interconnect for RBAM have consistently referred to the classic risk definition as “risk” times “probability”. However, the further expectation is that the probability of an event is assumed to be 100%, such that the “risk” them becomes equal to the “impact”. CIP-014 does not currently lay out the same expectations, which could allow Transmission Owners and other affected (or unaffiliated) parties to disagree over the role of “proabability” in defining risk. This problem can be resolved in the CIP-014 draft by: 1. leaving the risk assessment language as is, but adding the above statements about “probability” of occurrence being 100%, or 2. changing all references of ‘risk assessment’ in the standard, to ‘impact assessment’, or 3. leave the risk assessment language as is, but make it clear that CIP-014 is deviating from the historical CIP-002 RBAM definition of risk, such that the probability

of the event can change the perceived risk (and that such an interpretation is congruent with the FERC order. This last option seems to be closest to the intent of Paragraph 8 in the FERC directive, but represents a significant departure from past NERC CIP guidance, and needs to be highlighted as such. As written, the TO has exclusive determination say in identifying applicable Transmission stations, substations and primary control centers. R2 speaks to a third party verification of that assessment, but Black Hills believes that coordination of the BES would be better served by having the TO & TOP reach a consensus on the assessment, prior to having the assessment validated by a third party. Requirement 2.1 directs the Transmission Owner to select an unaffiliated Planning Coordinator, Transmission Planner, or Reliability Coordinator to conduct the third-party assessment. Firstly, Planning Coordinator does not appear in the NERC functional registry and should not be casually equated with the TP and RC functions; without first equating the Planning Coordinator to the PA function per the NERC glossary. Secondly, none of these NERC functional entity designations appear in the applicability section of the standard. Therefore, it can be assumed that the unaffiliated PC, TP, or RC are not obligated to conduct the assessment themselves, but rather the assessment is conducted by mutual agreement of the TO and unaffiliated PC, TP, or RC acting as third-party assessor. If this is not the correct assumption, then the PC, TP, and RC functions should be noted in the applicability section. If the Transmission Owner is affiliated with the Transmission Planner and Planning Coordinator, then the third-party review should be performed by the entity's Reliability Coordinator. The reference to "primary control center" is adequately explained in the rationale section of R1, but confusion between it and "back-up control centers", "emergency dispatch center", and those control centers that can only monitor status seem to justify an up-front definition in the standard. Recommend that a special definitions section be added, or the term be clearly defined at its first instance in Section 3. R2.4 could benefit from some added guidance regarding the protection of sensitive or confidential information. Is the intent to employ the entity's baseline confidentiality banner, or something more robust such as that required by CIP-003-3 R4 or CIP-011-1. The latter seems more appropriate for this CIP standard.

No

BHC has the same concern with R4 as expressed in the opening comment of the previous section regarding the definition risk assessment. The tailored evaluation required by FERC directive paragraph 8 introduces a probability of less than 100%, which is in conflict with prior NERC guidance on risk definition. As previously noted, if the unique probability of a threat is to be taken into consideration along with the impact, this change from CIP-002-3 expectation should be clearly highlighted. In addition, the inclusion of probability in the risk assessment will increase disagreements between unaffiliated entities, which will require a mechanism for resolution. BHC questions R4.2: The current language states "Prior history or attack". BHC believes this opening should state "Prior history of attack" because the current language does not provide an indication of what 'prior history' is being referred to. BHC agrees with the AZPS suggestion that a sector specific threat source be utilized to aggregate and disseminate threat information to ensure that relevant and timely data is analyzed consistently across the regions, which would also improve the auditability of the standard as well by removing the subjectivity associated with an unbounded number of threat sources. BHC believes that the

120 day requirement for R5 should be limited to the development of the security plan, and that full implementation should be dependent on the complexity of the plan. Implementation timing of the entity's plan should be approved by the applicable RC. Provisions could be added for temporarily derating the facility, if the implementation timing were considered by the RC to be excessively long. By mandating a 120 day implementation, entity's security plans may be down-sized to meet the 120 day implementation window, rather than to meet the potential threats and vulnerabilities at the facility. If "implementing" only means the specific deliverables of R5.1, R5.2, R5.3, and R5.4 (i.e. the timeline required by R5.3 is created, but not executed), then "implementation" needs to be more clearly defined. BHC has a further concern that R5.1 language reads too close to the "Identify, Assess, Correct" language already remanded by FERC in the CIP v5 standards. Alternative language for R5.1 might be "Resiliency or security measures designed to prevent potential physical threats and vulnerabilities based on the results of the evaluation conducted in Requirement R4." This simplification is not expected to change entities efforts, but could be more appealing to FERC. BHC agrees with the reasoning of AZPS to simplify R6.1 to read: "Each Transmission Owner and Transmission Operator shall select an unaffiliated third-party reviewer with electric industry physical security expertise." If this language consolidation is not acceptable, then alternatively recommend that Section 6.1.1 be expanded to include other similar certification providers, e.g. the National Sheriffs' Association Institute for Homeland Security offers a Certified homeland protection Professional (CHPP) designation (https://ndpci.us/certification/CHPP_Certifications.php), so as not to appear preferential.

Yes
We agree with the Applicablity. R1 has provided flexibility in the assessment method.
Yes
Subsequent risk assessments should be performed every 36 months (to align with CIP requirements) instead of every 30 months. The FERC Order allows for the verification to be completed by NERC, the Regional Entity, an RC or another entity. The standard only identifies that the verification can be completed by a registered Planning Coordinator, Transmission Planner, or Reliabity Coordinator, or an entity with transmission planning and analysis experience; it does not mention NERC or the regional entity.
Yes
The Standard allows the TO and TOP sufficient flexibility to complete R4, R5 and R6.
Yes
Will FERC accept R2.3 and R6.3, which allows the TO or TOP to document why they are not following the recommendations from the verification? The FERC Order did not suggest this. It

is extremely important that all jurisdictions follow the same standard, so that the mitigation of risk to physical security is consistent. Having some jurisdictions who follow a more stringent standard will increase costs to ratepayers in those jurisdictions. The standard should provide a definition for “unaffiliated”.
Group
ERTF
Joe Tarantino
Agree
The following comments are in agreement with LPPC and ERTF as well as comment from our own entity LCRA: • Use of “primary control center” is ambiguous (R1.2 and others); • Unaffiliated third party review needs to be longer than 90-days, suggestion to be 180-days (R2.2); • Issue with non-disclosure agreement vs. Public Power’s obligation to disclose information (R2.4); • Expansion of the Security Plan third-party reviewer to include those functions that are identified in Requirement 2.1 (R6.1). • The standard does not address substations/stations that are owned by multiple Transmission Owners. LCRA TSC recommends adding language describing NERC’s expectations associated with jointly-owned substations/stations or substation/stations with multiple asset owners.

1. For clarity suggest that the word “verify” be changed to “confirm” in sub-requirement 2.2 so that it reads: “The unaffiliated verifying entity shall either confirm the Transmission Owner’s risk assessment performed under Requirement R1 or recommend the addition or deletion of a Transmission station(s) or Transmission substation(s). 2. Sub-requirement 3.1 should cover both, addition and removal of elements from the identified facilities list. Suggest changing to: “In the case of addition(s) to, or removal(s) from the identified Transmission stations or Transmission substations list developed under Requirement R1 and verified/modified according to Requirement R2, the Transmission Owner shall, within seven calendar days following the verification or the subsequent risk assessment, notify the Transmission Operator that has operational control of the primary control center of the change(s).”
No

Sub-requirement 6.1.1: While Certified Protection Professional (CPP) or Physical Security Professional (PSP) might be recognized certifications in the U.S.A., that is not necessarily the case across the Canadian Provinces. Recommend to add: “or equivalent in those jurisdictions where such certifications are not recognized.” Sub-requirement 6.4: In addition to the non-disclosure agreements referred to in this sub-requirement, the standard should specify that the reviewing individuals having access to the confidential information must have security clearance and training, similar to the requirement in other CIP standards. Also, the security clearance must be obtained according to the established procedures in the respective jurisdiction.
Yes
The Implementation Plan obligates applicable entities to complete the initial risk assessment in Requirement R1, on or before the effective date of the standard. While performing and completing the vulnerability assessment before the effective date of the standard may constitute a recommended good practice, from a statutory perspective, compliance with the standard before its effective date may not be enforceable in all jurisdictions. An entity cannot be found in violation of the standard at a time when the standard is not yet effective. Recommend changing the implementation plan to require completion of the assessment after the effective date of the standard.

Seminole Electric Cooperative, Inc.
National Rural Electric Cooperative Association (NRECA)
Yes
Seminole supports the comments by NRECA. Additionally, Seminole supports the use of CIP-002-5 medium impact criteria for use in CIP-014. CIP-002-5 has at least one issue that will apply to CIP-014 as well. There are multiple ways to interpret the phrase Transmission Facility. One example is clarifying what is in the scope of a Transmission Facility. The definition or other documentation should state that the substation is exclusive of the criticality of any connected substation and clarify that a Transmission Facility as used here does not include Transmission Lines.
Yes
Seminole supports the comments by NRECA. Additionally, Seminole agrees with this approach. As this standard is based on the same standards as the impact ratings in CIP-002, it would be cleaner to identify any facility that is determined critical under the Assessment with a separate (non-exclusive) impact rating such high physical impact and use this term for applicability for R3-R6. If an entity has a qualified third party perform the R1 assessment on

behalf of or in cooperation with the registered entity, does this also meet the requirement R2? Note that the draft RSAW, not under review here, states that R1 and R2 may occur concurrently. R2.4 is redundant with the information protection requirements in CIP-011-1. It would be appropriate to note that this information is included in the materials subject to enforcement under CIP-011-1 R1.
Yes
Seminole supports the comments by NRECA. Additionally, Seminole agrees with this approach. Requirements R4.1, 4.2, and 4.3 should be moved to the guidelines and technical basis as there is excessive flexibility provided to the auditor for concluding whether the evaluation is adequate and potential that an auditor may choose to determine that identification of events was inadequate. R5.2 requiring law enforcement contact information is redundant with EOP-004-2 R1. If an entity has a qualified third party perform the R5 security planning on behalf of or in cooperation with the registered entity, does this also meet the requirement R5? R6.4 is redundant with the information protection requirements in CIP-011-1. It would be appropriate to note that this information is included in the materials subject to enforcement under CIP-011-1 R

Yes

See related comments under Requirement 2 below.
Yes
AZPS generally agrees with the approach of the standard as drafted. The following comments relate to suggested modifications for Requirements 1-3. AZPS suggests that the drafting team modify the term “risk assessment” to “BES impact assessment” in Requirements 1-3. The term risk assessment is not a defined term in the NERC Glossary of Terms. It is used in other CIP standards (CIP-002, and CIP-004) each with a different context. Changing the term to “BES impact assessment” ensures that the risks will be categorized and evaluated correctly. Requirement 2.1 directs the Transmission Owner to select a Planning Coordinator, Transmission Planner, or Reliability Coordinator to conduct the third-party assessment. However, none of these NERC functional entity designations appear in the applicability section of the standard. Thus it is assumed that the entities listed above are not obligated to conduct the assessment once selected but rather the assessment is conducted by mutual agreement. AZPS suggests that the drafting team provide clarifying language in the requirement to indicate that the assessment is conducted by mutual agreement between the Transmission Owner and the third-party assessor. AZPS is concerned that the term “primary control center” will be confused with the NERC Glossary Term “Control Center.” The definition of Control Center is partially defined as “monitor and control the BES…”. The rationale for Requirement 1 introduces the term “operationally control” in its definition of primary control center which is further defined to mean “causing direct physical action”. The concept of monitoring is explicitly excluded from this definition. To avoid confusion, AZPS suggests that the drafting team define the term primary control center or adopt a new term that clearly differentiates itself from the common term “control center”.
Yes
AZPS generally agrees with the approach of the standard as drafted. The following comments relate to suggested modifications or clarifications for Requirements 4-6. AZPS is concerned that Requirement 4.3, which requires the Transmission Owner to evaluate threat warnings from a myriad of sources, will result in inconsistent application by entities. The threat sources need to be consistent, and the threats evaluated must be relevant. AZPS suggests that a sector specific threat source be utilized to aggregate and disseminate threat information to ensure that relevant and timely data is analyzed consistently across the regions. This would also improve the auditability of the standard as well by removing the subjectivity associated with an unbounded number of threat sources. Requirement 6 requires Transmission Owners to secure a third-party review of the security plan developed under Requirements 4 and 5. AZPS strongly supports the development of security measures to protect critical substations. However, AZPS believes that requirements 6.1.1 through 6.1.4 add a level of specificity that does not provide an improved reliability benefit and has the potential to create a bottleneck that would make compliance within the short 90-day timeframe very difficult. AZPS contends that the most important quality of the third party reviewer is electric industry physical security expertise. Further, AZPS does not believe that the CPP or PSP certifications provide additional value from a realiability standpoint since neither certification has a sector specific focus. For these reasons AZPS would suggest that 6.1 be simplified to read: “Each

Transmission Owner and Transmission Operator shall select an unaffiliated third-party reviewer with electric industry physical security expertise.”

(1) Regarding R3 and R3.1, we believe that the 7 day requirement is too short and 30 days would be more appropriate to notify other utilities. (2) R4 should have wording added to the requirement that the R4 evaluation is to be completed 120 days after the completion of R2. Then, the R5 wording should be changed so that the R5 physical security plans should be completed 120 days after the R4 evaluation is completed.
Yes
No
We recommend adding language in the implementation guidance around the application of the terms ‘control center’, ‘primary control center’, and ‘transmission station’ in the draft standard. Obviously, there are a wide variety of understandings on these terms and additional clarity will help companies’ ability to perform under the requirements. Considering that these terms have generic application to bulk power system reliability, the project timeline does not afford time for careful consideration of various facts and circumstances that might inform content of formal NERC defined terms. Also, we recommend that the standard drafting team (SDT) consider additions or changes to the implementation guidance that will clarify several questions on the timing of the various implementation stages of the standard, including particularly that security plans are subject to change over time for a broad range of reasons. In addition, we ask the SDT to consider clarifications in implementation guidance that, in many cases, the completion of all mitigation work may take place on longer timelines, and that implementation of a security plan does not require the completion of all mitigation work.

R1 - It appears the intent of R1 is for a TO (which meets the applicability section 4.1.1) to perform a risk assessment (as defined in the standard) on only those substations that meet the applicability section 4.1.1, not all substations owned by a TO which meets the applicability section 4.1.1 description; however this is not 100% clear. The verbiage of the second sentence in R1 states “The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify any Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection.” The use of the word “any” in this sentence has led some to believe that a TO (which meets the applicability section 4.1.1 description) will have to assess all of their substations, even those that do not meet the section 4.1.1 description. To address this possible issue, LES recommends replacing the word “any” in R1 with “applicable”. R2 - Smaller TOs may not have the in-house resources to perform the risks assessments required in R1, and may need to contract with a third party to perform these assessments. If the performing third party is not affiliated with the TO, is a second unaffiliated third party verification required as stated in R2? Please revise the requirement to address this situation.

MidAmerican Energy Holding Company
Yes
MidAmerican Energy Holdings Company (MEHC) agrees with the applicability section.
Yes
MEHC agrees with the R1 through R3 approach. However, MEHC suggests the following changes to improve the standards as written: The term “unafilliated third party” is used in R2 and in R6, but in parts 2.1, 2.3 and 2.3. “unaffiliated verifying entity” and in part 6.3 “unaffiliated reviewing entity” is used. Unless the intent was that the terms have different meanins, it is suggested that “unafilliated third party” be used throughout the standard.
Yes
MEHC agrees with the R4 through R6 approach. However, MEHC suggests the following changes to improve the standards as written: The following rewording of R5 is recommended to clarify that the “build out” of security enhancement schedule. R5 Each Transmission Owner that owns or has operational control of a Transmission station, Transmission substation, or primary control center identified in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3 that the Transmission Operator’s primary control center has operational control of an identified Transmission station or Transmission substation, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s). The plan shall be completed within 120 calendar days following the completion of Requirement R2. Implementation of the plan shall be as documented in the plan.
Yes

1. The standard anticipates the potential for joint responsibility in involving transmission operator control centers for substations identified by transmission owners. It is suggested that additional guidance be provided regarding joint ownership of substations The following addition to the first paragraph under the Requirement R1 heading which is similar to an aswer to this questions in the webinars is suggested: For substations that are jointly owned the owners may jointly designate one of the joint owners to perform the risk assessment for that substation. 2. It is suggested that a clarification be made to the RSAW with regard to the following question: " As a result of your risk assessment, do you own any Transmission stations/substations, either existing or planned in the next 24 months, meeting the applicability requirements of 4.1.1?" By referring to risk assessment this seems to imply the stations/substations identified after the completion of the requirement R1 risk assessment rather than just the applicability requirements. It is suggested that the words "as a result of your risk assessment" be deleted from this question. 3. Item 3. in the guidance for Requirement R2 seems to actually be guidance for Requirement R1. However, it does not provide useful guidance for Requirement R1; therefore, it should be removed. The guidance for Requirement R1 that gives the TO discretion to choose its own methods and criteria is preferred. 4. The following modification to one of the sentences in the "Performing Risk Assessment" section of the guidance document is suggested: "Using engineering judgment, the Transmission Owner should develop criteria (e.g. imposing a fault near the removed substation) to identify a contingency resulting in potential widespread instability, uncontrolled separation or Cascading within an Interconnection."

No
WECC questions why generation assets are exempt from analysis and verification required by Requirements R1 and R2. It is possible that some generation assets, if rendered inoperable, could result in widespread instability, uncontrolled separation, or Cascading. WECC recommends removing the 500 kV line in the Weighted Value table. All 500 kV facilities are to be assessed per Applicability Section 4.1.1.1 and including 500 kV lines in the table in applicability section 4.1.1.2 with a zero value seems more likely to add confusion than to provide clarifying information. Applicability section 4.1.2 makes it look like the standard is applicable to all Transmission Operators. WECC suggests adding some clarifying language to indicate that the standard is only applicable to Transmission Operators notified per Requirement R3. This may serve to make the standard more acceptable to Transmission Operators in general.

No
The periodicity for risk assessments and the forward looking time frame for including planned substations do not match. Entities are only required to consider stations planned in the next 24 months, while the risk assessment is applied on a 30 month cycle, or a 60 month cycle if the entity previously identified a null list of applicable stations. This potentially leaves a 6 to 36 month gap. We would encourage the SDT to match the periodicity of the application to the planned implementation window or include language requiring any new asset be evaluated under R1. WECC notes that the time frame for completion of the initial risk assessment required in Requirement R1 is not identified in the standard, only in the implementation plan. This may be a point of confusion for entities that fail to fully read and understand the implementation plan. WECC suggests that at a minimum NERC and the Regions engage in extensive outreach to ensure that the Transmission Owners are aware of this and that if possible the drafting team revise the language of Requirement R1 to make this clear. Requirement R2, part 2.2 appears to be assigning responsibilities to the unaffiliated verifying entity (registered Planning Coordinator, Transmission Planner, or Reliability Coordinator) yet these entities are not included in the applicability section. If these entities are to be held accountable in the standard for actions, why are they not included in the applicability section?
No
From a compliance perspective, WECC notes that the criterion identified in R4 is too vague to enable a consistent approach across regions or even entities. Identifying a basic set of attack vectors that must be considered (ie: direct fire ballistic attack, indirect fire attack, explosive device attack, vehicle-borne attack, arson/incendiary attack) fosters a far more consistent approach while allowing the entity the flexibility to tailor their assessment and security plan to the unique characteristics and threat landscape of their asset(s). WECC is concerned that the language of Requirement R5 is confusing or contratictory. Requirement R5 requires the applicable entity to “develop and implement” a documented physical security plan…within 120 calendar days following the completion of Requirement R2. However, part 5.3 requires a timeline for “implementing” the physical security enhancements and modifications specified in the physical security plan. WECC questions whether Requirement R5 requires the physical security plan to be “developed” or “developed and implemented” within 120 calendar days following the completion of Requirement R2. If Requirement R5 requires “development and implementation” within 120 calendar days following the completion of Requirement R2, what is the purpose of the timeline for implementing the physical security enhancements and modifications specified in the physical security plan required by part 5.3?
Yes
WECC believes that the proposed standard addresses the FERC Order and has voted affirmative to approve CIP-014-1. However, as noted in our comments above we believe there is opportunity for enhancements and clarification that if implemented would improve the standard and still meet the FERC Order. WECC encourages the drafting team to consider implementation of these suggestions prior to the final ballot or NERC to submit a SAR for consideration of these suggestions immediately after approval of the standard.
Group

NCPA Compliance Management Operating Committee
Steve Hill
No
The Standard Drafting Team (SDT) estimates that relatively few Transmission Owners (perhaps 30 or less) will have Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability or uncontrolled separation. The Applicability section creates a lot of work for many TOs an TOPS to identity those 30 or less transmission stations out of the 55,000 substations. The SDT might consider a higher level of applicability as was done for EOP-010-1, Geomagnetic Disturbance Operations i.e. apply the standard to Reliability Coordinators (RC) and only the Transmission Operators the RCs deem critical.This would be a more efficeint filtering process. Benefits of such an approach would be (1)Simplification and tighter security of critical information and informaton sharing (2) streamling and simplicaton of requirements for unaffiliated third party review, for example one reviewer could handle the risk assessment, vulnerability and threat assessment and review of security plans (combines requirements R2 & R6 together) (3)Time and resources of the entity could be more efficiently and economically managed as all reviews could be handled by a single Reviewer in a continuous manner rather than starting a stopping for different phases. (4) Saves many entities who would fall out of the process after going through the first three requirements. I expect RCs, ISOs and Regional Entities already know this
No
Applicability is a key issue here. Comments to question 1 apply here as well. Why subject all Transmission Owners who may meet the "medium impact under CIP-002-5.1 to a third pary review for all medium impact stations and substations when only 30 stations will be affected (please define the difference between a Transmission station and Transmission substation. A third party review is appropriate for the 30 or so stations involved, but seems excessive for all owners to obtain third party review when the expectation is that 30 out of 55,000 are te ones of real concern. NCPA elected to have an independent third party risk asssessment and vulnerability assessment performed at its 5 generation facilities and control center. The assessment cost is approximately $150K and takes about 9 months to complete. NCPA'a assets are also low impact. The risk assessment, vulnerability and threat assessments and development of the security plans are able to performed by the same third party reviewer that flows together without interruption. The way in which the requirements are structured creates alot of consultants or third party reviewers running around, with 99% of them stopping work after R3. How much money will be spend for that and for what purpose? There has to be a better way segregate the 99% from the 1% where the real concern is.
No
Same line of reasoning as given in the response to the question 2. If the Applicability Section were changed R1, R3, R4,and R5 could be combined together and R2 and R6 could be combined together. This simplifies the standard and gets to the heart of the Reliability

Concern without creating a Consulting industry to perform third party reviews. (If you don't like the suggestion, maybe I found a new business opportunity)
Yes
The Implementation Plan is too agressive. I cite NCPA experience as described in our response to question 2. I find it interesting the the CIP-version 5 standards have essentially a two year implementation plan for medium and high assets and yet this proposed standard has a 6 month implementation plan.
Individual
Joe O'Brien
NIPSCO
In R2 we are not sure who would do the verification. On one of the webinars a member of PJM suggested that another PJM member could be a candidate. However it is likely that a PJM member is not a PC, TP or RC as prescribed in the requirement; that role is performed by PJM itself. Any further guidance would be welcome; we do not consider this a "show stopper". The hard work that went into putting this project together in such a short time frame is appreciated, thanks.

No
The Standard intentionally does not provide specific methodologies regarding the type of analyses needed to be conducted for the assessments in R1. This leaves the door open to very different interpretations across the industry. We suggest the drafting team consider specifying analyses such as those contained in the TPL standards. This would eliminate confusion within the industry and provide clear direction for those conducting the analyses. We suggest adding the following sentence at the end of R1. “These analyses will include consideration of the entire loss of the Transmission stations and Transmission substations specified in Applicability Section 4.1.1 taken individually, one at a time.” While not specifically

referencing the TPL standards (currently enforceable TPL-004-0a, R1 and TPL-001-4, R3 to be enforced in 2016) which cover the loss of switching stations and substations, this language provides guidance regarding the type of analyses to be conducted in the assessments.
Yes
Yes
Effective Date: The use of the term 'implement' needs clarification . To some implement means installed and in-service. To others it could mean a work in progress. The SDT recognized this confusion in the webinars on April 17 and we encourage them to modify the language to more clearly indicate the intent of the drafting team. VSLs: Capitalize Part 2.3 in the Lower, Moderate and High VSLs for R2. Insert 'and verified according to Requirement 2' following the reference to Requirement R1 in all the VSLs for R5. Delete 'and modify or' in the last High VSL for R6. Guidelines and Technical Basis: Replace 'drafting team' with 'SDT' in the last paragraph under Section 4 Applicability on Page 27. Make the same change in the last paragraph on Page 32 under Requirment R6. Capitalize Remedial Action Schemes (RAS) and Special Protection Systems (SPS) in the paragraph at the top of Page 29. These are defined terms in the Glossary. Insert 'Transmission', capitalize 'Owner' and delete 'or operator' in the 1st paragraph under Requirement R2 on Page 29. Make 'outage' plural in Bullet c. at the top of Page 30. Capitalize 'Transmission Owner' in the 4th bullet in the middle of Page 30. Capitalize 'Owner' in the 1st line of the paragraph immediately preceeding Requirement R3. Insert 'Requirement' in front of R5 in the last line of the paragraph immediately preceeding Requirement R6. Spell out TO and TOP throughout the document. RSAW: The parenthetical statement in the 1st row of the table under Evidence Requested for R1 that states '…any risk assessments conducted prior to the effective date of this standard are not relevant…' is inconsistent with the statement on the Consideration of Issue or Directive in response to paragraph 12 of the FERC order. It states there 'This means that the initial risk assessment required by Requirement R1, must be completed on or before the effective date of the standard.' We believe the latter is consistent with the view expressed by SDT members on the two webinars conducted on April 17. This is also inconsistent with the posted Implementation Plan in which it states "The initial risk assessment required by CIP-014-1, Requirement R1, must be completed on or before the effective date of the standard." Additionally, this is inconsistent with others standards in that action is sometimes taken prior to the effective date of the standard in order to be compliant when the standard becomes effective. Replace 'with' with 'within' in the 3rd row of the table under Compliance Assessment Approach Specific to CIP-014-1, R2. This is the row for R2, Part 2.2. Use lower case control center in the Note to Auditor box at the bottom of the table under Compliance Assessment Approach Specific to CIP-014-1, R4. The phrase 'and compensating mitigating measures' in the 4th row in the table under Evidence Requested for R6 goes beyond the requirement in the standard. The requirement only calls for the reasons for not modifying the security plan according to the reviewer recommendations. It doesn't require the Responsible Entity to specify how it will mitigate the discrepancy.

Amy Casuscelli
Xcel Energy
Yes
Yes
Overall Xcel Energy agrees with the approach, but we offer the following items for consideration of the Standard Drafting Team. R1 requires an assessment of facilities, including those to be in service within the next 24 months, followed by an additional review every 30 or 60 months. If a facility is brought into service, it is unclear when the review should be performed due to the 6 month gap between the in service date and the review. R2 requires a Transmission Owner to have an unaffiliated third party "verify" the risk assessment performed under R1. By contrast, R6 requires each Transmission Owner to have an unaffiliated entity "review" the evaluation performed under R4 and the security plan under R5. Xcel Energy recognizes that use of "verify" and "review" reflects the Commission's wording, but it would be helpful if the standard explained the difference between the two terms, if there is a difference. The 90 days prescribed by R2 to obtain third party verification may be too restrictive due to the availability and/or capacity of applicable resources. The standard requirement which imposes the action/deliverable by a third party, but the accountability to the TO/TOP, is also a cause for concern. It might be better to have the timing of R1 and R2 combined as this would enable flexibility of performing the assessment and completing the third party verification within the overall timeframe desired. We also suggest the Regional Entities or NERC be considered as parties that can provide third party verification and contract out if desired. It would also be helpful to expressly clarify in R2.1 that an "entity with transmission planning or analysis experience" could include a peer TO/TOP or a panel of employees from peer TO/TOPs, for example from the North American Transmission Forum. Allowing peer review would assist in identification and dissemination of best practices, we believe. R2.3 requires documentation of any recommendation to add or remove facilities as recommended by the verifying entity, but does not specify if any actions are required if no recommendations are made. Since the VRFs reference various levels of severity based upon documentation of recommendations, it would seem beneficial to allow a "no recommendations" option. Also, it is unclear if there are specific criteria the third party reviewer should utilize to review/verify and make recommendations if facilities are to be added or removed. While an entity could indicate why recommendations were or were not adopted, it would be useful to have verification criteria defined more clearly. R3 seems to be unclear in whether TOs or TOPs have operational control over facilities. In order to more clearly identify that TOPs have operational control, R3 should indicate that the TO shall notify the TOP of the identified facility.
Yes
Overall Xcel Energy agrees with the approach, but we offer the following items for consideration of the Standard Drafting Team. The rational for R4 and R5.1 indicate that there is no required timeframe to complete the evaluation of the potential threats and

vulnerabilities to identified facilities, but it does indicate the linkage of completing this when the physical security plan developed as part of R5 and within 120 days of completion of R2. We suggest that it might be more efficient to combine R4 and R5 or clearly show the linkage to reduce confusion about the timing of these two activities. Maybe the standard should require entities to develop a physical security plan after the risk assessment is completed, not after a verification of facilities as specified in R2. If R2 returns a null set, this seems ambiguous as we may still be required to have a physical security plan, even if blank. Since R4 would only be considered applicable if the R2 risk assessment process identifies facilities, referencing R4 in R5 would seem more intuitive. R5.2 states that the physical security plan must include law enforcement's contact and coordination information. However, guidance on law enforcement and coordination has already been established with the adoption of EOP-004-2. It is also unclear by what is meant by "coordination". Since reporting a physical threat to a Facility is a requirement of EOP-004-2 and in order to remove ambiguity around the word coordination, we propose changing R5.2 to read "notification of law enforcement consistent with EOP-004-2". This would avoid potential confusion whether the R5.2 requirement is different than the EOP-004-2 requirement. R6.1, While there will be some regional variances, if an entity spans multiple regions or even some governmental agency jurisdictions, what protection does an entity have against reviewer discrepancies or differences? For example, the Xcel Energy registered entities anticipate using a common risk assessment methodology, and similar security plans. It would be efficient to have a single evaluator provide the review for all three Xcel Energy registered entities. It would also be important for Regional Entities to apply consistent criteria when auditing the risk assessments and security plans. R6.1.2, if the ERO does not meet any or some parts of the criteria established in R6.1, it is uncertain how the ERO will be able to determine and approve an organization that does. Our security department, like the departments at other utilities of similar size, consists of a mix of multiple CPP and/or PSP holders, prior law enforcement professionals and several career military experts, including nuclear military asset security. It would seem that resources within the industry are the most knowledgeable resources available to evaluate physical security plans, given the criteria, and would have more utility specific knowledge than outside entities. Similar to our comments regarding R2.1, since the industry has the most knowledge on threats and vulnerabilities, and means to prevent them, we again propose adding an option to allow for industry (but non-affiliated) peer review of the physical security evaluation, either directly or through a group organization such as the North American Transmission Forum. Allowing peer review is likely to assist in identifying and disseminating best practices, thereby improving security. R6.3. Similar to our comments regarding R2.3, if no recommendations are made for changes to the evaluation by the unaffiliated reviewing entity, does this conclusion need be documented? Since some of VRFs are built off this requirement, it would seem to follow that all aspects be included to ensure certainty for the industry.

Yes

Since existing criteria from CIP-002-5.1 is used to identify facilities in scope, Xcel Energy suggests the addition of the proposed requirements be incorporated to CIP-006-5 (rather than in an entirely new standard) to more closely align and standardize the oversight of R3 and R6. In addition, this would centralize all physical security requirements within a single

Standard. Additionally, there is a significant amount of language in the requirements to specify the affected parties. We suggest the Standard Drafting Team seek opportunities to more concisely outline the applicability and the subsequent obligations in the requirements, to improve ease of understanding. We see an opportunity for the audit or risk functions of the Regional Entities to align with the third party review criteria established in the proposed standard. Although the expertise to perform this function may not currently be in place, the Regional Entities could easily develop the knowledge and expertise, and the reviews could naturally integrate within their other review and assessment activities. Overall, the standard is very comprehensive as drafted and it is balanced in a manner that allows for maximum flexibility. Consistent with NERC's evolution to results-based standards, it is appropriate for the standard to focus on the desired results of increased security of critical facilities, rather than mandating rigid actions that may or may not be suitable for individual facilities and entities. Allowing industry the latitude to design its own mitigating measures ensures those measures will be the most practical and cost effective as appropriate for the particular nature of each facility. The flexibility of this proposed standard is the best opportunity for the industry to execute a comprehensive solution based on assessments and security that relies on the unique design and characteristics of the operating systems of each utility.

Mahmood Safi
Omaha Public Power District
No
The Omaha Public Power District (OPPD), suggests replacing the term "primary control center", using the NERC defined term "Control Center", with "primary Control Center".
No
OPPD, in general, is in agreement with the approach taken in CIP-014-1 for identifying critical Transmssion stations and substations. We agree that risk assessment be conducted using transmission planning analysis, however, we suggest that this standard identifies what applicable planning analysis is used. We think the TPL standards provide the ability for the Transmission Owners to determine the worst case extreme event for identifying critical transmission stations and substations. OPPD believes that leaving R1 open and vague would encourage various interpretations of the term 'transmission planning analysis' as it applies to a 'risk assessment'. This may place the industry and the ERO in the same position as they were with the ealier versions of CIP-002 and the associated RBAM. Referencing the applicable TPL standards attemptes to remove some of this ambiguity by providing a more concise framework to evaluate those worst case extreme events. Furthermore, since TPL standards associated transmission planning analyses are performed in coordination with the PCs, risk assessment verification by PCs/RCs will not require a re-assessment of a study that has already been performed. We suggest that the SDT consider specifically defining 'transmission planning analysis' to avoid repeat of the uncertainty and vagueness associated with the CIP-002 RBAM. OPPD asks the SDT to consider revising requirement R1 as following: R1. Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments

of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria specified in Applicability Section 4.1.1. The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify any Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. The transmission planning analysis shall be based on the applicable portion(s) of the TPL standards and specifically referenced. [VRF: High; Time-Horizon: Long-term Planning] 1.1. Subsequent risk assessments shall be performed: • At least once every 30 calendar months for a Transmission Owner that has identified in its previous risk assessment (as verified according to Requirement R2) one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection; or • At least once every 60 calendar months for a Transmission Owner that has not identified in its previous risk assessment (as verified according to Requirement R2) any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. 1.2. The Transmission Owner shall identify the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment.
Yes
Yes
OPPD believes that the third-party verifications in requirements R2 and R6, to be performed once every 60 calendar months, not each time when a risk assessment analysis or security plan is changed that does not significantly change the facilities identified or the associated security plan. The transmission entity can still perform analysis and update security plan accordingly as required by this standard, however, the third-party verification should be reserved for major changes to the assessment or the plan or otherwise be done every 60 calender months.

We strongly disagree with applicability statements being outlined in the requirement. We support APPA's recommendation to further define TOP applicability in section 4.1.2 to avoid nuisance compliance certifications.
Yes
However, the TOP does not receive any relief from R1-R2 null set(s) and will be required to provide attestations to auditors and yearly certification of the absence of any notice from Transmission Owners.
No
We are very concerned with the preferential endorsement this Standard affords to ASIS International. We know of at least one other security organization that offers a security certification: the Certified Homeland Protection Professional (CHPP) designation form the National Sheriffs' Association Institute for Homeland Security. If this requirement is left unchanged, FERC's statutory obligation in determining a proposed reliability standard is "not unduly discriminatory or preferential" may trigger the standard to be remanded back to NERC. It is for this concern, and only this concern Cowlitz votes negative. However, Cowlitz plans to vote affirmative in the final Ballot, regardless of any concerns to allow NERC to meet FERC requirements.
Yes
Cowlitz commends the SDT's effort in a very difficult situation.

• Stations and substations should be clearly understood within the standard, not just through a guidance document or rationale. It is FKEC’s understanding that a “station” equates to a switchyard that does not include transformers; and a “substation” is a facility that does include transformers. This should be addressed at the beginning of the standard document to ensure clear understanding throughout the standard. • Do stations and substations focus only on certain key assets or all assets within the facility? Some assets could be those used for local distribution and/or be below 100kV. Clarity on this is required in order to understand the full scope and appropriateness of the standard.
No
• Comments: R1.1 – FKEC recommends that the 30 months timeframe be revised to 36 months as an annual focus is more straight forward than a 2.5 year focus and it’s easier to track for internal programs and controls. 60 months should also be increased to 72 months to maintain the double timeframe that currently exists in the draft requirement. • R2 – The March 7 FERC order does not require an owner or operator to select an entity to verify its critical facilities assessment. The order uses the word “should,” not “shall” or “require.” The rationale for R2 is not accurate in this sense and should be revised to match the language in the order. Additional clarity is needed regarding what “verify” means in the standard.

Guidance and rationale is helpful, but does not carry to legal weight of the standard language. • R2.1 – This section should explicitly include NERC and the Regional Entity (RE) as a potential verifying entity. NERC and the RE should be obligated to perform this role if the owner or operator requests them to do so under this standard. There should not be a direct or indirect requirement to mandate the registered entity to hire a third party to verify the assessment portion of the standard. If a registered entity wants to hire a third party, that should be a decision the registered entity makes, but is not required for standard compliance. If a third party, other than NERC or the RE, verification of the assessment is required by the standard, then this is effectively two audits on the same requirement. Additionally, it does not seem appropriate (or potentially even legal) for a third party (other than NERC or RE) to be able to add or remove facilities from a critical facilities list as the standard is currently drafted. o Are there enough non-NERC/RE third parties available for what is likely to be a high demand for services, especially if there's a short time period as currently drafted? This is similar to the shortage of vendors that industry faced in theNERC facility ratings alert responses. o How is "transmission planning or analysis experience" judged by NERC compliance and enforcement? This language could be very difficult to comply with depending on the purview of the auditor. o If a registered entity hires a third party to develop and complete an assessement as required in the standard, can that third party also verify the registered entity's assessment? As drafted, the current standard could be read to require two third party entities to be hired – this would be unreasonable and the standard should be revised to clarify that only one third party would be needed to comply with the standard. • R2.2 – This requirement appears to require the third party entity to comply with language in the requirement. This does not seem to be appropriate or legal. The drafting team should revise the language to redirect the compliance burden to the NERC registered entity. In addition, the 90 day requirement could be difficult to comply with if there is a shortage of third party entities to contract with. Consideration should be given to revising this requirement to prevent a registered entity being found in violation of a requirement due to circumstances not under its control. • R2.4 – The words "exchanged with" should be changed to "made available to" in order to clarify that information may not be exchanged, but rather presented for viewing only, to a third party entity • R3.1 – The 7 day requirement appears to be unnecessarily short and not immediately necessary for BES reliability. FKEC believes 30 days is more appropriate timeframe for this requirement.

No

• It's unclear how an auditor will judge compliance with R4 and its subrequirementsas it will be uncertain what an owner or operation is aware of regarding prior history, intelligence information, etc. The language should be revised to clarify the compliance expectations and also taking into consideration that each TO and TOP may have a varied exposure to the items identified in the requirements. • R5.1 – FKEC strongly recommends the removal of "Resiliency or security" as this is not needed for the requirement and resiliency will be next to impossible to audit. • 5.3 – After the word "modifications " add ",if any," as this is a possibile outcome. • R6 – Same as comments on R2 in Question 2 above. and R2.1. • R6.1.1 – NERC standards should not endorse, or appear to endorse, ASIS or its certifications in a requirement. This should be removed. There could be other certifications that an entity may have that provides

for the necessary skills under this standard. • R6.1.2 – It is highly unlikely that the ERO is not going to approve consultants for industry use. This should be removed. • R6.1.3 – All government agencies have physical security expertise for their own facilities; that doesn't mean they can be an adequate reviewer under this standard. This should be removed. • R6.1.4 – It is unclear and not auditable whether an entity has demonstrated expertise. This language should be removed.
Yes
Under the implementation plan for R1, how can compliance with a standard be required prior to the effective date of the standard? The drafting team should reconsider this element of the implementation plan. If included in future drafts, a legal opinion from the NERC General Counsel should accompany this issue for stakeholder consideration.

R2.1 Drafting Team could consider adding a note to R2 Guidance section similar to that which is included in the recently approved MOD-032 standard. "Planning Authority and Planning Coordinator" (hereafter collectively referred to as "Planning Coordinator")combines "Planning Authority" with "Planning Coordinator" in the list of applicable functional entities. The NERC Functional Model lists "Planning Coordinator" while the registration criteria lists "Planning Authority" and they are not yet synchronized. Until that occurs, the proposed standard applies to both Planning Authority and Planning Coordinator."

Reliability Coordinator, Planning Coordinator and Transmission Planner should be added to the Applicability Section. That will obligate these entities to meet the 90 day review period stipulated in R2.2, if they are identified as a verifying entity by the Transmission Owner.
Yes
Yes
Yes
Section: Purpose Comment: Use of term “primary control center” should be clarified. If an entity has a primary control center and a redundant back up control center, is the back up control center also in scope for CIP-014? Requirement 1: is the intent of the Standard that the R1 risk assessment be applied to transmission stations or substations identified under Applicability 4.1.1.4, as meeting NPIRs? Requirement 4: If under Requirement R4 a Transmission Owner owns or operates a single substation that employs multiple voltage levels, then which portions of that substation would be covered by CIP-014-1 and the Entity’s physical security plan, and which would not be covered? Requirement 5: Consideration of transmission system “resiliency” is more appropriate to be applied during the R1 risk assessment, as opposed to the R5 physical security plan. Recommend moving references to resiliency to R1.

4.1.2. Seems vague in its description lending the reader to believe that TOPs are in scope at all times which is inconsistent with guidance later in the standard which states they are only required to perform actions when informed they are in scope by a TO. Further Clarification is needed in this section.
Yes
Further clarification is needed on several points. There is no specificity to provide consistency with how the "risk assessment" should be performed or what methodology or components to the methodology should be used. Additionally, there is no defined meaning of "widespread instability, uncontrolled separation, or Cascading within an Interconnection." Does this refer to regionally identified IROLs or some other objective criteria or only based on the analysis performed? Additionally, there is no mechanism built into R3 to allow for a dispute between a TO and a TOP if they disagree on a particular station or substation as there is in the third party reviews under R2 and R6 where there is a mechanism to disagree with the reviewer.
Yes

Further clarification is needed on several points. 4.2 & 4.3 leave open much room for interpretation under audit to say you did or didn't consider a particular source or threat. There is also some consternation over the use of "potential threat" in this requirement. There are a great many potential threats many that are so remote and nearly impossible to protect against that the risk does not outweigh the cost. It seems like these sub-requirements are a potential audit findings trap by the way they are worded. There are also no criteria specified for what the unaffiliated third party will be looking for in their review of the entity's evaluation. There is a great deal of concern for how these third parties will be able to handle or be willing to handle the influx of these reviews especially considering the short 90 day timeframe listed in 6.2.
Yes
There is great concern related to information protection related to turning over information concerning vulnerabilities of the grid and related facilities to outside parties. Even with the use of NDAs, these third parties are not subject to the same NERC reliability standards (i.e. CIP standards, information protection, etc) as the entities, will not be audited on their information protection practices, and may have no accountability to the regulators in the event of a disclosure of sensitive information, inadvertent or otherwise. It is a concern that the TO is responsible for 3rd party verification to be completed within a tight 90 day window, especially considering the critical infrastructure information being exchanged. Contractual exchanges and negotiations could impede upon the 90 day window. Also, TO's may need time to review the R2 study results and possibly mitigate study discrepancies. The date R1 needs to be performed is unclear. Does it need to be performed within a certain amount of time after the effective date? The implementation plan states that the initial risk assessment must be performed on or before the effective date of the standard. However, the RSAW for R1 states that "any risk assessments conducted prior to the effective date of this standard are not relevant." Does this mean the initial risk assessment must be performed “on” the actual effective date of the standard? Is there a basis for the short notification window in R3? The seven calendar days window for the TO to notify the TOP seems quite short. Additionally, there is a discrepancy in the review timeframes in R1 in which a look ahead of 24 months is required for stations and substations that are in the planning process but the risk assessments are performed every 30 months leaving a 6 month gap in the analysis. It would also seem more intuitive and consistent with other CIP standards to have the risk assessment requirement performed on an even year rather than a 30 month basis (i.e. 36 months.)

Yes
We support a clear and defined “bright line” criteria that has been industry vetted and FERC approved as the starting point for the risk assessment in R1.
No
(1) Conceptually, we agree with this approach but have identified the following issues and concerns. (2) R1 requires additional clarification. The Guidelines and Technical Basis section states that the “bright line” criteria in applicability section is used to identify an initial set of stations and substations that must be further evaluated in R1. It is our understanding that if a TO owns one 500 kV transmission station and no other transmission facilities, then that 500 kV station would meet the applicability section 4.1.1.1 criteria. The TO would be required to perform a risk assessment to identify if that facility was rendered inoperable, it could result in widespread instability, uncontrolled separation, or Cascading in an Interconnection. In other words, if the applicability section is met, the TO must perform a risk assessment, but the remainder of the standard (R4-R6) would not apply unless loss of the Facility would result in widespread instability, uncontrolled separation or Cascading. Please confirm if our understanding of applying the requirements is the correct approach. (3) We see a significant compliance risk created by Requirement R2 and question why the unafilliated third party verification cannot be integrated into the Regional Entity compliance monitoring and enforcement processes to minimize costs and limit access to highly sensitive information. The third party verification creates a compliance problem outside of the TO’s control because the TO is dependent on a third-party for regulatory compliance and there is no obligation on any of the third parties (i.e. RC, PC) identified in the standard to verify the risk assessment. Thus, the TO will have to rely on consultants to perform the verification. Since all TOs will be working towards the same efffective date, there will be a backlog and the reviews may not be completed by the timelines established in the standard. Review by consultants also will increase the number of people with access to highly sensitive information. While this concern can be partially mitigated through confidentiality agreements, the more people that have the information, the higher the probability the information will be released, whether intentional or unintentional, to persons that should not have the information. All of these issues could be resolved if NERC and Regional Entities conducted the review. The review could be performed as part of a spot check of the standard 90 days after the initial effective date. If NERC or the Regional Entity disagree with the approach or believe additional facilities should be added, RAI would give them the flexibility to treat the issue as not impactful to compliance as long as the TO resolved the issue within a certain time period. This approach would result in a reduced cost impact on industry and minimize the distribution of highly confidential information reducing the likelihood of information leaks. As an alternative, we suggest that a companion requirement that compels either the RC or PC to perform the verification. This would also reduce the costs impacts and distribution of sensitive information since these entities will already be familiar with the TOs they are verifying and will already have access to highly sensitive information. (4) Regarding R3, this requirement does not warrant a 7-day timeline. This is not a near real-time issue. We suggest 30 days as a reasonable notification period.
No

(1) We see a significant risk of the compromise of highly sensitive information created by Requirement R6 and question why the unaffiliated third party review cannot be integrated into the ERO compliance monitoring and enforcement processes. There is no compliance obligation on these third parties to complete the review within the required timelines, which could subject the TO to potential compliance violations. Furthermore, there is a limited set of companies with qualified personnel capable of performing this review. Given that all of the Transmission Owners will be working toward the same effective date of the standard, it is highly likely that a backlog of work would occur. Furthermore, review of the evaluations by consultants will increase the the number of people with access to higly senstivie information. While this concern can be partially mitigated through confidentiality agreements, the more people that have the information, the higher the probability the information will be released, whether intentional or unintentional, to persons that should not have the information. To resolve this inssue, NERC and Regional Entities could hire qualified personnel to perform these reviews. NERC and Regional Entities could perform a spot check of the standard 90 days after the initial effective date. If NERC or the Regional Entity disagree with the approach or believe additional facilities should be added, RAI would give them the flexibility to treat the issue as not impactful to compliance as long as the TO resolve the issue within a certain time period. This approach would result in a reduced cost impact on industry and minimize the distribution of highly confidential information reducing the likelihood of information leaks. (2) How can the 'cost to benefit to risk to the BES' be measured consistently across each facility, region and risk? Does a Registered Entity have to authority to not implement a 'recommendation' from a third party based upon a cost to benefit to risk analysis? (3) Given that third parties are required to evaluate critical facility information, further guidance is needed for the required controls to prevent unintended release of highly sensitive and confidential information. What is the risk to the Registered Entity if the information does get leaked? Is this a violation to the Registered Entity, even if the leaked information was not caused by the Registered Entity? We are concerned that if this information were to be leaked, the Registered Entity could be liable for increased risk of attack, additional time and costs to address the leak and could impact the BES due to changes in operations from shutting down those facilities. (4) Part 4.2 has a potential "prove the negative" issue. How do you prove that you considered similar facilities particularly when similar facilities could includes other company's facilities. To resolve this issue we suggest replacing "similar" with "nearby facilities" or "asset owner's other facilities in the area". (5) Part 4.3 could be interpreted as requiring consideration of all threat and intelligence information including information that is not relevant to a given area. To remedy this issue, we recommend using the term "current and local" to describe the types of intelligence and threats that must be considered. (6) We believe that Part 5.2 is redundant to the EOP-004-2 – Event Reporting, especially Attachment 2 Event Reporting Form line 4. Please consider removing and comparing the standard in its entirety to EOP-004-2 to avoid unnecessary duplication. (7) For Part 5.4, please modify the language to clarify that it only applies to facilities identified as a result of application of Requirements R1 and R2. (8) For Part 6.1 please modify "… from the following" to "… from one of the following". This will make it perfectly clear that only one entity must be selected.

There seems to be a conflict between the RSAW, Consideration of Issues or Directives and the Timeline included in the FAQ. To meet the overall timeline for the entire standard, the risk assessment must be started prior to the Effective date of the standard. There should be no prohibition for completion of the Risk Assessment prior to the Effective date of the standard. The FAQ Timeline states: “Initial performance of R1 must be complete on or before the effective date of the standard…” The Consideration of Issues or Directives #12: “…This means that the initial risk assessment required by Requirement R1, must be completed on or before the effective date of the standard. The initial performance of Requirements R2 through R6 must be completed according to the timelines specified in those requirements after the effective date of the proposed Reliability Standard…” The RSAW under R1 Evidence Requested states: “Provide the current and the immediately preceding risk assessments conducted after the enforceable date of this Standard (i.e. any risk assessments conducted prior to the effective date of this standard are not relevant).”

Yes
APPA supports approval of the proposed physical security standard, subject to the technical clarifications and corrections shown below. These comments were developed by APPA staff based on extensive input from a diverse group of members utilities that will be subject to the proposed standard once it is approved. Please see also the individual comments of APPA members. CONTROL CENTER - Use the defined term “Control Center” by capitalizing as “primary Control Center” or explain why lower case “primary control center” is different and needs to be used in the standard. Consider inserting “with operational control” after primary Control Center, to express the intent of the text box Rationale for Requirement R1 that the control center must be capable of taking electronic actions that can cause direct physical actions at the identified station or substation. Please also clarify whether the periodic use of a

backup control center as the entity's primary control center would make R4 and R5 applicable to both the primary and backup control centers. UNAFFILIATED - needs to be either defined or a footnote needs to be added to the standard to explain that "unaffiliated means that the selected verifying or reviewing entity cannot be a corporate affiliate," as stated in the guidance section. CONFIDENTIALITY Publicly Owned Utilities subject to state Open Records Acts are concerned that records produced, gathered, used and maintained as evidence of compliance with this standard may be subject to disclosure under applicable state laws. To protect this critical information from disclosure, we suggest adding a provision to the Introduction section of the proposed standard that designates the produced, gathered, used and maintained records related to compliance with this standard as exempt from disclosure. Alternatively, we suggest the addition of Requirements to protect the records and information from disclosure. Proposed language for a new #7 in the A. Introduction section, after 6. Background: 7. Critical Facilities Information Records and related information concerning critical facilities physical infrastructure, including risk assessments and evaluation of physical threats and vulnerabilities, as produced, gathered, used or maintained for compliance with mandatory Reliability Standards, are intended to be kept confidential by the owner of the records and information, those entities with authorized access, and any organization or agency charged with examination of such records and information pursuant to Section 215 of the Federal Power Act. All such identified records and information are also intended to be exempt from public disclosure. Consistent with that premise, the purpose of the cyber and physical security Reliability Standards are to identify and protect facilities that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or cascading within an interconnection. Consequently, records and information detailing the physical infrastructure, including records and information related to the risk assessments and evaluation of physical threats and vulnerabilities conducted under this Reliability Standard and all records and information produced, gathered, used and maintained for compliance with this Reliability Standard shall be considered critical facilities information and are intended to be exempt from disclosure under public records laws. Nothing in this section or the Reliability Standards is intended to eliminate other lawful methods of access to such records and information. ALTERNATIVE PROPOSED REQUIREMENT LANGUAGE ADDITIONS: R1.3 The Transmission Owner will keep confidential all records and information related to the risk assessments conducted under this standard. R3.2 The Transmission Owner will keep confidential all records and information related to the notifications conducted under Requirement R3 and R3.1 of this standard. R4.4 The Transmission Owner and each applicable Transmission Operator will keep confidential all records and information related to the evaluation of physical threats and vulnerabilities to each of its transmission substation(s) and primary Control Center(s) identified in Requirement R1. APPA suggests technical edits to Requirements R2.4 and R6.4 to insert "or made available to" after "exchanged with." This change would clarify that sensitive or confidential information does not have to be actively "exchanged" between entities to be subject to the protections directed under Requirements R2.4 and R6.4. APPLICABILITY 4.1.2 - The applicability section for Transmission Operators under section 4.1.2 should be explicitly limited to each TOP that operates a primary Control Center and receives a verified notification under Requirement R3. As written each TOP would

be required to certify on each compliance contact that it has not been notified that it operates an applicable primary control center. The following edited text would accomplish that objective: 4.1.2 Transmission Operator that operates a primary Control Center and receives notice from a Transmission Owner under Requirement R3. Please also confirm that the Transmission Operator of a primary control center is not responsible for conducting a risk assessment under R1 or arranging for third party verification of the risk assessment under R2.
Yes
APPA supports approval of the proposed physical security standard, subject to the technical clarifications and corrections shown below. These comments were developed by APPA staff based on extensive input from a diverse group of members utilities that will be subject to the proposed standard once it is approved. Please see also the individual comments of APPA members. TIMELINES to complete third party verification under R2 and third part review under R6 are both too short. Increase 90 days to 120 days or 180 days. Verifying entities may recommend that the Transmission Owner conduct additional planning studies to confirm asset identifications such as interactions between BES Elements in adjacent Transmission Owner footprints. A short 90-day time limit may not be sufficient time to conduct and verify a revised or supplemental BES assessment. For security reviews, conducting a meaningful review with sound recommendations applicable to a specific TO's or TOP's facts and circumstances may also take time along with necessary discussions with the TO. A short review window is more likely to lead to disagreements with the TO which in turn would lead to discrepancies that would need to be justified – which in turn might cause the reviewer to avoid making proposals that should be considered by the TO or pressure on the TO to accept recommendations that could be improved upon. R1 GUIDANCE - TRANSMISSION PLANNING BASE CASES: Please revise the Guidance for R1 to clarify that TOs should start their initial and subsequent risk assessments with a common regional or area transmission planning base case used for transmission planning purposes. The base case should include existing BES stations and substations and those planned to be in service within 24 months within the region or area, to ensure forward-looking risk assessments and security planning. R2 VERIFICATION - Third party verification of third party risk assessments conducted under R1: some medium sized TOs with applicable transmission stations and substations may contract with a third party consultant to conduct necessary BES risk assessments, to ensure accurate and comprehensive consideration of the risk of widespread cascading, instability and uncontrolled separation. Such entities seek clarification that a single expert risk assessment study, in conjunction with a verification by an unaffiliated PC, TP or RC would suffice.
Yes
APPA supports approval of the proposed physical security standard, subject to the technical clarifications and corrections shown below. These comments were developed by APPA staff based on extensive input from a diverse group of members utilities that will be subject to the proposed standard once it is approved. Please see also the individual comments of APPA members. R4 CLARITY - Under R4, combining the applicability of this requirement to both TOs and TOPs with applicable control centers within a single sentence is confusing and could be read to imply that a TOP that is affiliated with a TO must arrange for a separate third party review. We recommend revising R4 to read as follows: R4 Each Transmission Owner that

owns a Transmission station or Transmission substation identified in Requirement R1 and verified according to Requirement R2, shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s) and Transmission substation(s), identified in Requirement R1 and verified according to Requirement R2. Each Transmission Operator notified by a Transmission Owner according to Requirement R3 that the Transmission Operator's primary control center has operational control of an identified Transmission station or Transmission substation, shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to their primary control center identified in Requirement R1 and verified according to Requirement R2. The evaluation shall consider the following: [VRF: Medium; Time-Horizon: Operations Planning, Long-term Planning] R4.2 TYPO – Please change: "Prior history or attack..." to "Prior history OF attack..." Make conforming edits to the RSAW. 30-MONTH CYCLE - Identification of new threats and vulnerabilities in R5.4 does not change the 30-month cycle for conducting reliability studies and security evaluations: The standard needs to make clear that the security plan needs to take into account threats and vulnerabilities that are known at the time the plan is developed and the approved plan is capable of addressing new threats and vulnerabilities as they emerge, but that there is no NERC requirement to revise the plan between 30 month cycles and for the NERC CEA to audit such revisions. The TO should apply its existing security plans and procedures to evaluate and mitigate evolving security threats. The TO may also revise the security plan in mid-cycle if it so chooses without arranging for a third party review, but that action does not obviate its obligation to conduct the "subsequent" risk assessment and threat evaluation and security plan on the 30 month cycle. The CEA will audit the processes the TO uses to develop its plans, rather than the content of the plans. REQUIREMENT R5 CLARITY – R5 states in part that each TO and TOP "shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s) within 120 calendar days following the completion of Requirement R2." Please change "implement" to "complete." The use of implement can easily be read to require the actual implementation of physical security measures within 120 days, rather than the completion of the security plan, starting the 90 day clock for unaffiliated third party review under R6. In contrast, R6 states that: "The review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5."

Yes

APPA supports approval of the proposed physical security standard, subject to the technical clarifications and corrections shown below. These comments were developed by APPA staff based on extensive input from a diverse group of members utilities that will be subject to the proposed standard once it is approved. Please see also the individual comments of APPA members. See comments on definitions under Question 1. RSAW for R1 poses the following question: "As a result of your risk assessment, do you own any Transmission stations/substations, either existing or planned in the next 24 months, meeting the applicability requirements of 4.1.1?" This question combines a multi-step process into a single question that cannot be answered as yes or no by many TOs. Please break the RSAW for R1

into three discrete questions: 1…Do you own any Transmission stations/substations, either existing or planned in the next 24 months, meeting the applicability requirements of 4.1.1? 2…Have you conducted a risk assessment of each applicable station or substation identified under Applicability section 4.1.1.? 3…Did the risk assessment identify one or more Transmission station(s) and/or Transmission substation(s) that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection? RSAW R1 evidence request text from near the top of page 6: (R1) Provide the current and the immediately preceding risk assessments conducted after the enforceable date of this Standard (i.e. any risk assessments conducted prior to the effective date of this standard are not relevant). The draft Implementation Plan states that the risk assessment required by R1 "must be completed on or before the effective date of the standard," yet the RSAW language provided above seems to exclude such an assessment. RSAW R1 "Note to Auditor" on page 7: “Review entity’s answer to the above Question and if the auditor can verify the answer is ‘no,’ Requirements R3-R6 do not apply and no further audit testing of Requirements R3-R6 is necessary.” The text appears to reference the following question from page 6: “As a result of your risk assessment, do you own any Transmission stations/substations, either existing or planned in the next 24 months, meeting the applicability requirements of 4.1.1?” This question is poorly worded, because TOs not meeting the applicability requirements of 4.1.1 are effectively exempt from this standard and do not need to perform a risk assessment. RSAW R3 "Question" on page 11: Please reword to add the following all caps text: “Are THERE any primary control centers identified in Requirement R1, Part 1.2 THAT ARE not under operational control of your NERC registration? RSAW R4 "Compliance Assessment Approach" on page 14: Change “or” to “OF” (R4 Part 4.2) “Prior history OF attack...” See the language used in the Guidelines and Technical Basis on page 31 of the standard. RSAW R5 "Note to Auditor" on page 16 states: “Auditor should cross reference the Transmission stations/substations and primary Control Centers identified in the risk assessment performed under Requirement R1 to the evaluation prescribed in Requirement R4 and the security plan(s) prescribed in Requirement R5 to ensure the plan addresses vulnerabilities that would facilitate physical attacks that have a high probability or likelihood of occurrence.” The requirements of the standard do not address "probability" or "likelihood" of occurrence, so these factors should not be in scope of the compliance audit. Rather, auditors should address whether the security plan is complete and the TO or TOP addresses the issues raised by the third-party reviewer.

Manitoba Hydro

Yes
Yes
No
(1) Manitoba Hydro has concerns about the need to have a third party to review or verify risk assessments and physical security plans. It is unclear at this point what measures or counter measures are being alluded to here as far as protecting critical assets such as lines and towers. This may potentially be financially burdensome as well as questionably effective. (2) Also missing in the standard is conflict resolution between a TO and this third party reviewer. Clarification should be provided on who weighs in on this and how NERC audits a system that has been verified by a third party. As currently drafted it appears that the third party reviewer/verifier would have no liability under the standard.
Yes
(1) R6.1 – It is not clear whether only one or all of the qualifications in Section 6.1.1 through 6.1.4 must be met. Accordingly, R6.1 should be rephrased to refer to “one of the following”.

FirstEnergy supports the proposed requirements R1 through R3.
Yes
FirstEnergy supports the proposed requirements R4 through R6 but offers two comments: 1) In regard to the inclusion of “primary control centers,” we suggest the team add language within the Guidelines and Technical Basis section for requirement R4 and potentially the inclusion of an additional FAQ item to document some of the team’s feedback provided

during the webinar sessions. During the webinar the team provided a good explanation of how CIP-014 is uniquely different than physical protections provided under CIP-006 and that CIP-014 provides perimeter protection of the primary control center location or site and not just the subset of the control center that may house cyber assets protected under CIP-006. 2) Regarding requirement R5, during the industry webinars it became evident that there is some confusion associated with the word “implement” as used in the statement “shall develop and implement a documented security plan(s)” and that some industry stakeholders questioned if implement intended completion of all identified tasks stated within the plan(s). While FirstEnergy understood the requirement as described by the team during the webinars, to alleviate any confusion and better clarify the intended application, FirstEnergy suggests changing “implement” to “initiate” or “issue” so that it reads “shall develop and initiate a documented security plan(s)”. This wording may better align with part 5.3 and the guidance provided in the Guidelines and Technical Basis section that states “Entities have the flexibility to prioritize the implementation of the various resiliency or security measures in their security plan according to risk, resources, or other factors.”
No
FirstEnergy supports the proposed standard and appreciates the teams consideration of our comments intended to help clarify a few areas of the standard. FirstEnergy appreciates the team’s efforts in producing a quality standard within an expeditious schedule and believes the team has provided a product that meets the core expectations described by the FERC Order.

Seattle City Light supports the Question 1 comments of APPA, with one exception in the area of Confidentiality. Seattle's comments about Confidentiality, in place of APPA's comments on this topic, follow. CONFIDENTIALITY The stated purpose of draft CIP-014-1 Physical Security is: To identify and protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. Public Utilities subject to state Open Records Acts are concerned that records produced, gathered, used and maintained as evidence of compliance with this standard may be subject to disclosure under applicable state laws. To protect this critical information from disclosure, we suggest adding a provision to the Introduction section of the proposed standard that designates the produced, gathered, used and maintained records related to compliance with this standard as exempt from disclosure. Alternatively, we suggest the addition of Requirements to protect the records and information from disclosure. Proposed language for a new #7 in the Introduction Section: 7. Critical Facilities Information Records and related information concerning critical facilities physical infrastructure, including risk assessments and evaluation of physical threats and vulnerabilities, as produced, gathered, used or maintained for compliance with mandatory Reliability Standards, are intended to be

kept confidential by the owner of the records and information, those entities with authorized access to the records and information, and any agency charged with examination of such records and information pursuant to Section 215 of the Federal Power Act. All such identified records and information are also intended to be exempt from public disclosure. Consistent with that premise, the purpose of the cyber and physical security Reliability Standards are to identify and protect facilities that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or cascading within an interconnection. Consequently, records and information detailing the physical infrastructure, including records and information related to the risk assessments and evaluation of physical threats and vulnerabilities conducted under this Reliability Standard and all records and information produced, gathered, used and maintained for compliance with this Reliability Standard shall be considered critical facilities information and are intended to be exempt from disclosure under public records laws. Nothing in this section or the Reliability Standards is intended to eliminate other lawful methods of access to such records and information. Proposed Requirement Language: R1.3 Records and information related to the risk assessments conducted under this standard that are designated confidential by the Transmission Owner are [intended to be] exempt from public disclosure. R3.2 Records and information related to the risk assessments conducted under Requirement R1 of this standard that are designated confidential by the Transmission Owner are [intended to be] exempt from public disclosure. R4.4 Records and information related to the evaluation of physical threats and vulnerabilities to each of its Transmission station(s), Transmission substation(s), and/or Control Center(s) identified in Requirement R1 conducted under this standard that are designated confidential by the Transmission Owner or Transmission Operator are [intended to be] exempt from public disclosure.

Yes

Seattle City Light supports the Question 2 comments of APPA as well as the additional comments of Salt River Project (SRP) regarding 3rd party verification. Third Party Verifiers (SRP): SRP recommends removal of the concept of third party verifiers and adherence to the existing, and well-functioning, audit program of FERC, NERC and the Regional Entities. If, at any time, modification to the compliance and audit program in regards to any or all of the standards are deemed necessary, such modification can be proposed, evaluated and implemented with due process to ensure no unintended adverse impacts. SRP is concerned that use of third party verifiers to verify, or opine on compliance, both undermines the foundational structure of the FERC/NERC/Regional Entity audit program and introduces additional risk for the safeguarding of critical facility information on physical threats and vulnerabilities. The national audit program for the mandatory Reliability Standards is founded on compliance, self-reporting and a range of audit types, including spot checks and regularly-scheduled audits by NERC and Regional Entities. There are no facts to support abandonment of this foundation in favor of the introduction of a non-authoritative mid-layer of inspection by third parties. Third party verifiers are not authorized to verify compliance. As such, a Registered Entity derives no concrete benefit from a third party verifier's expressions of agreement or disagreement with the Registered Entity's compliance activities. Notwithstanding the theoretical value of another's opinions on whether one has properly or

fully complied with the requirements of CIP-014, there are sound and compelling reasons to forego requiring such opinions at the expense of owners. On the other hand, as demonstrated with other standards, Registered Entities readily retain expert consultants as needed to help them evaluate and resolve all manner of compliance challenges. This standard is no different in the sense that outside subject matter experts already are being retained as needed by the party bearing compliance responsibilities. Introducing third parties does not guarantee value-added subject matter experts versed in the nuanced and individualistic profiles on critical facilities. The Transmission Owner already is required both by law and sound business practices to be versed in physical security risks and potential vulnerabilities of critical facilities. The owner both knows which are its critical facilities and is best suited to identify the optimal means and methods to protect them. There are overwhelming incentives for Registered Entities to evaluate and take all appropriate steps to ensure continued reliability of the bulk electric system and reliable service to electric customers. Critically, neither the owner nor FERC/NERC/Regional Entities can rely on the findings of third party verifiers: the approved program of compliance audits will continue regardless and without regard to the findings of third party verifiers. Confidentially of the highly sensitive information produced, gathered, used and maintained for compliance with this standard is critical. Wholesale introduction of a new subset of entities who would routinely gain access to such information poses additional challenges to information safekeeping. Absent demonstrable need, granting access to physical risk and vulnerabilities information introduces unnecessary risk. With any access, vulnerabilities for inappropriate use or further unauthorized access occur. Prudent industry practices dictate non-disclosure absent demonstrable need to know or compelling benefits from such disclosure. Here there is no record of need or benefits.

SPP Standards Review Group
Robert Rhodes
No
We have some concern with the undefined term ‘collector bus facility’. Without a definition for collector bus facility some may consider the entire switchyard at a generating station as a collector bus facility. We do not believe the drafting team intended this to be the case. Therefore, some additional clarification may be needed for the term.
No
The Standard intentionally does not provide specific methodologies regarding the type of analyses needed to be conducted for the assessments in R1. This leaves the door open to very different interpretations across the industry. We suggest the drafting team consider specifying analyses such as those contained in the TPL standards. This would eliminate

confusion within the industry and provide clear direction for those conducting the analyses. We suggest adding the following sentence at the end of R1. “These analyses will include consideration of the entire loss of the Transmission stations and Transmission substations specified in Applicability Section 4.1.1 taken individually, one at a time.” While not specifically referencing the TPL standards (currently enforceable TPL-004-0a, R1 and TPL-001-4, R3 to be enforced in 2016) which cover the loss of switching stations and substations, this language provides guidance regarding the type of analyses to be conducted in the assessments. We strongly suggest that the SDT expand on this addition to R1 in the guidance document to provide needed clarification to the industry.
Yes
Yes
Effective Date: The use of the term ‘implement’ needs clarification . To some implement means installed and in-service. To others it could mean a work in progress. The SDT recognized this confusion in the webinars on April 17 and we encourage them to modify the language to more clearly indicate the intent of the drafting team. VSLs: Capitalize Part 2.3 in the Lower, Moderate and High VSLs for R2. Insert ‘and verified according to Requirement 2’ following the reference to Requirement R1 in all the VSLs for R5. Delete ‘and modify or’ in the last High VSL for R6. Guidelines and Technical Basis: Replace ‘drafting team’ with ‘SDT’ in the last paragraph under Section 4 Applicability on Page 27. Make the same change in the last paragraph on Page 32 under Requirment R6. Capitalize Remedial Action Schemes (RAS) and Special Protection Systems (SPS) in the paragraph at the top of Page 29. These are defined terms in the Glossary. Insert ‘Transmission’, capitalize ‘Owner’ and delete ‘or operator’ in the 1st paragraph under Requirement R2 on Page 29. Make ‘outage’ plural in Bullet c. at the top of Page 30. Capitalize ‘Transmission Owner’ in the 4th bullet in the middle of Page 30. Capitalize ‘Owner’ in the 1st line of the paragraph immediately preceeding Requirement R3. Insert ‘Requirement’ in front of R5 in the last line of the paragraph immediately preceeding Requirement R6. Spell out TO and TOP throughout the document. RSAW: The parenthetical statement in the 1st row of the table under Evidence Requested for R1 that states ‘…any risk assessments conducted prior to the effective date of this standard are not relevant…’ is inconsistent with the statement on the Consideration of Issue or Directive in response to paragraph 12 of the FERC order. It states there ‘This means that the initial risk assessment required by Requirement R1, must be completed on or before the effective date of the standard.’ We believe the latter is consistent with the view expressed by SDT members on the two webinars conducted on April 17. This is also inconsistent with the posted Implementation Plan in which it states “The initial risk assessment required by CIP-014-1, Requirement R1, must be completed on or before the effective date of the standard.” Additionally, this is inconsistent with others standards in that action is sometimes taken prior to the effective date of the standard in order to be compliant when the standard becomes effective. Replace ‘with’ with ‘within’ in the 3rd row of the table under Compliance Assessment Approach Specific to CIP-014-1, R2. This is the row for R2, Part 2.2. Use lower case control center in the Note to Auditor box at the bottom of the table under Compliance Assessment Approach Specific to CIP-014-1, R4. The phrase ‘and compensating mitigating measures’ in the 4th row

in the table under Evidence Requested for R6 goes beyond the requirement in the standard. The requirement only calls for the reasons for not modifying the security plan according to the reviewer recommendations. It doesn't require the Responsible Entity to specify how it will mitigate the discrepancy.

Colorado Springs Utilities
Shannon Fair
CSU agrees with APPA comments with exception to the confidentiality section, please see CSU's comments below. CONFIDENTIALITY Publicly Owned Utilities subject to state Open Records Acts are concerned that records produced, gathered, used and maintained as evidence of compliance with this standard may be subject to disclosure under applicable state laws. To protect this critical information from disclosure, we suggest adding a provision to the Introduction section of the proposed standard that designates the produced, gathered, used and maintained records related to compliance with this standard as exempt from disclosure. Alternatively, we suggest the addition of Requirements to protect the records and information from disclosure. Proposed language for a new #7 in the A. Introduction section, after 6. Background: 7. Critical Facilities Information Records and related information concerning critical facilities physical infrastructure, including risk assessments and evaluation of physical threats and vulnerabilities, as produced, gathered, used or maintained for compliance with mandatory Reliability Standards, are intended to be kept confidential by the owner of the records and information, those entities with authorized access, and any organization or agency charged with examination of such records and information pursuant to Section 215 of the Federal Power Act. All such identified records and information are also intended to be exempt from public disclosure. Consistent with that premise, the purpose of the cyber and physical security Reliability Standards are to identify and protect facilities that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or cascading within an interconnection. Consequently, records and information detailing the physical infrastructure, including records and information related to the risk assessments and evaluation of physical threats and vulnerabilities conducted under this Reliability Standard and all records and information produced, gathered, used and maintained for compliance with this Reliability Standard shall be considered critical facilities information and are intended to be exempt from disclosure under public records laws. Nothing in this section or the Reliability Standards is intended to eliminate other lawful methods of access to such records and information. ALTERNATIVE PROPOSED REQUIREMENT LANGUAGE ADDITIONS: R1.3 All records and information related to the risk assessments conducted of this standard are exempt from public disclosure. R3.2 All records and information related to the notifications conducted under Requirement R3 and R3.1 of this standard are exempt from public disclosure. R4.4 All records and information related to the evaluation of physical threats and vulnerabilities to each of its transmission substation(s) and primary Control Center(s) identified in Requirement R1 of this standard are exempt from public disclosure. Adding confidential in the standard would create undo compliance burden and auditing challenges.

Barry Lawson
National Rural Electric Cooperative Association (NRECA)
No
Stations and substations should be clearly understood within the standard, not just through a guidance document or rationale. It is NRECA's understanding that a "station" equates to a switchyard that does not include transformers; and a "substation" is a facility that does include transformers. This should be addressed at the beginning of the standard document to ensure clear understanding throughout the standard. Do stations and substations focus only on certain key assets or all assets within the facility? Some assets could be those used for local distribution and/or be below 100kV. Clarity on this is required in order to understand the full scope and appropriateness of the standard.
No
R1.1 – NRECA recommends that the 30 months timeframe be revised to 36 months as an annual focus is more straightforward than a 2.5 year focus and it's easier to track for internal programs and controls. 60 months should also be increased to 72 months to maintain the double timeframe that currently exists in the draft requirement. R2 – The March 7 FERC order does not require an owner or operator to select an entity to verify its critical facilities assessment. The order uses the word "should," not "shall" or "require." The rationale for R2 is not accurate in this sense and should be revised to match the language in the order. Additional clarity is needed regarding what "verify" means in the standard. Guidance and rationale is helpful, but does not carry to legal weight of the standard language. R2.1 – This section should explicitly include NERC and the Regional Entity (RE) as a potential verifying entity. NERC and the RE should be obligated to perform this role if the owner or operator requests them to do so under this standard. There should not be a direct or indirect requirement to mandate the registered entity to hire a third party to verify the assessment portion of the standard. If a registered entity wants to hire a third party, that should be a decision the registered entity makes, but is not required for standard compliance. If a third party, other than NERC or the RE, verification of the assessment is required by the standard, then this is effectively two audits on the same requirement. Additionally, it does not seem appropriate (or potentially even legal) for a third party (other than NERC or RE) to be able to add or remove facilities from a critical facilities list as the standard is currently drafted. Are

there enough non-NERC/RE third parties available for what is likely to be a high demand for services, especially if there's a short time period as currently drafted? This is similar to the shortage of vendors that industry faced in the NERC facility ratings alert responses. How is "transmission planning or analysis experience" judged by NERC compliance and enforcement? This language could be very difficult to comply with depending on the purview of the auditor. If a registered entity hires a third party to develop and complete an assessement as required in the standard, can that third party also verify the registered entity's assessment? As drafted, the current standard could be read to require two third party entities to be hired – this would be unreasonable and the standard should be revised to clarify that only one third party would be needed to comply with the standard. R2.2 – This requirement appears to require the third party entity to comply with language in the requirement. This does not seem to be appropriate or legal. The drafting team should revise the language to redirect the compliance burden to the NERC registered entity. In addition, the 90 day requirement could be difficult to comply with if there is a shortage of third party entities to contract with. Consideration should be given to revising this requirement to prevent a registered entity being found in violation of a requirement due to circumstances not under its control. R2.4 – The words "exchanged with" should be changed to "made available to" in order to clarify that information may not be exchanged, but rather presented for viewing only, to a third party entity R3.1 – The 7 day requirement appears to be unnecessarily short and not immediately necessary for BES reliability. NRECA believes 30 days is more appropriate timeframe for this requirement.
No
It's unclear how an auditor will judge compliance with R4 and its subrequirements as it will be uncertain what an owner or operation is aware of regarding prior history, intelligence information, etc. The language should be revised to clarify the compliance expectations and also taking into consideration that each TO and TOP may have a varied exposure to the items identified in the requirements. R5.1 – NRECA strongly recommends the removal of "Resiliency or security" as this is not needed for the requirement, and resiliency will be next to impossible to audit. 5.3 – After the word "modifications " add ",if any," as this is a possibile outcome. R6 – Same as comments on R2 in Question 2 above. and R2.1. R6.1.1 – NERC standards should not endorse, or appear to endorse, ASIS or its certifications in a requirement. This should be removed. There could be other certifications that an entity may have that provides for the necessary skills under this standard. R6.1.2 – It is highly unlikely that the ERO is going to approve consultants for industry use. This should be removed. R6.1.3 – All government agencies have physical security expertise for their own facilities; that doesn't mean they can be an adequate reviewer under this standard. This should be removed. R6.1.4 – It is unclear and not auditable whether an entity has demonstrated expertise. This language should be removed.
Yes
Under the implementation plan for R1, how can compliance with a standard be required prior to the effective date of the standard? The drafting team should reconsider this element of the implementation plan. If included in future drafts, a legal opinion from the NERC General Counsel should accompany this issue for stakeholder consideration.

ATC supports the draft standard, with the realization that the aggressive time line has raised a broad range of issues or ambiguities resulting from the use of vague language or generic terms. While ATC understands the necessity for this approach, given the compressed timeframe directed by the FERC Order, the project's condensed timeline may not have afforded for the necessary and careful consideration of these terms. Improved guidance around the application of generic terms would increase clarity and help the industry. ATC also supports a follow up effort commensurate with typical standards drafting processes and timeframes to allow for further consideration, improvement, and cleaner language to assure effective implementation of the standard. An example of language like this is in Requirement R1, which includes the vague terminology of "widespread instability, uncontrolled separation, or Cascading." Risk assessment findings can vary significantly depending on the assumptions, criteria, and methodology used for the assessment, and a more thoughtful use of terms could provide for a more uniform risk assessment basis.

Utility Services
No
We have seen in the previous versions of the CIP standards that "Risk Assessments" are not performed consistently, and create more problems than they solve, and even violation determinations. The solution in CIP-014 to this inherent problem seems to just add another level of review, but there is no guarantee of consistency within these assessments. Additionally, it seems the drafting team is suggesting a single assessment ("Concurrent with R1 study" specified in R2), this this might eliminate the review stage all together. A clear applicability section with a "brightline" approach would be more appropriate and consistent with the progression of the CIP standards overall. Otherwise, what prevents an auditor from making a determination that the assessment performed was not sufficient or incomplete, even with a 3rd party validation? Entities need a clear definition to avoid the problems of the past. If the drafting team wants to limit the scope of Facilities this could be detailed in the "Exemptions" portion of the "Applicability" section of the standard. 1. The "Exemption"

section needs to be clarified. If this applies to the entire section number it 4.2. If it is only applicable to the last bullet it is under give it the appropriate number (4.1.2.1) Suggested re-write 4. Applicability: 4.1. Functional Entities: 4.1.1 Transmission Owner 4.1.2 Transmission Operator 4.2. Applicable Facilities: The following Facilities, systems, and equipment, owned or operated by each Responsible Entity in 4.1 above are those to which these requirements are applicable. 4.2.1 Transmission Facility operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility. 4.2.2 Transmission Facility that operate between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility. ADD TABLE HERE 4.2.3 Transmission Facility at a single station or substation location that is identified by its Reliability Coordinator, Planning Coordinator, or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies. 4.2.4 Transmission Facility at a single station or substation whose unplanned unavailability would result in the loss of at least 3000 MW of generation. 4.2.5 Control Center that controls: 4.2.5.1 Transmission Facilities identified by identification under 4.2.1 through 4.2.4; or 4.2.5.2 Two or more Facilities which contain a Cyber System(s) which have been identified as a High or Medium Impact BES Cyber System. 4.2.6 Exemptions: 4.2.6.1 All facilities regulated by the Nuclear Regulatory Commission or Canadian Nuclear Safety Commission. 4.2.6.2 Transmission station or substation connected to only one other Transmission station or substation. 4.2.6.3 Transmission station or substation that does not operate above 200kV. 4.2.6.4 control centers not designated as a “primary control center”
No
1. What is a Transmission “station”? What is the definition of station and what is it intended to cover that substation does not. Generally in the NERC glossary “station” is associated with Generation, not Transmission. 2. There is a concern between R1 and R5. a. R1 states that substations planned to be in service within 24 months should be identified, which would presumably be for stations under construction. b. R5 will then require a Physical Security plan to be in place within 120 days of identification, regardless of the current status of the station. c. Possibly adjust language to allow sites under construction to have the later of 120 days or the operation date of the station. 3. R1.2 should be reworded: “The TO shall identify the primary Control Center with operational authority of each Facility identified in the R1 risk assessment.” 4. R2, if the assessments are concurrent, could this be a joint effort, with the result being 1 report? 5. R2.1, “unaffiliated” needs some clarification. Is this unaffiliated with the TO in any way? Could the TO use their Planning Coordinator, Transmission Planner or RC for the assessment, or do they need to seek out an entity from another region?
Yes

1. R4, what is the time frame for the evaluations? Is this to be conducted during the 30 or 60 month cycle outlined in R2 or more frequently? 2. R6.1, These are all “or” statements and 6.1.1 through 6.1.4 should be bullets, not numbers (this is outlined in the CIP-002-5 page 6, and should maintain consistency with the CIP standards format). 3. R6, Does the ERO have to approve of the third party reviewer? Is there going to be a criteria to determine “demonstrated physical security expertise”?
Yes
1 “primary control center” is confusing. NERC has a defined term “Control Center” which is intentionally not being used. What is the intent of not using the defined term? If the undefined term remains in use more clarity needs to be given on “primary control center”. 2. what is the definition of “widespread?” Does this mean outside of a Balancing Authority Area, outside of a Region or outside of an interconnection? More clarity is needed in the term. Additionally, TO’s may not have the data required to perform this type of assessment. There needs to be process in place for the TOs to obtain the data required to perform the appropriate assessment. 3. The SDT should review projects such as PRC-006 or MOD C, and define groups within the requirements to reduce the length of requirements. For example R4 could be reduced to the following, making the requirement easier to read and adding much needed clarity: “Each Applicable Entity shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Applicable Facilities as identified in R1 and verified in R2. The evaluation shall consider the following:… “ RSAW Comment: R1 “Evidence Requested” section doesn’t provide a time frame for the first assessment, no assessment prior to effective date will be considered, but there must be an assessment completed before the effective date to be complaint. This is a catch 22.

In the “Draft_RSAW_CIP-014-1_v1_2014_0409.pdf” document, on page 4 of 22, there is a Note to Auditors Concerning Third Party Verifications and Reviews. In this section there is a mention to the “concept of reliance means using the work of others to avoid duplication of efforts”. While the reference to “duplication” was in regards to unaffiliated third party verifications and reviews, we appreciate the SDT be congnitive of “duplication of efforts” as their developing the Standard and the RSAW. With the very restrictive timeframe for which the development of the Standard was required, this concept can get lost. We did see another

area in the Standard CIP-014-1 R5.2, which may be considered “duplication of efforts”. CIP-014-1 R5.2 states, the TO/TOP should have in their physical security plan(s) law enforcement contact and coordination information. On June 20, 2013, FERC approved Reliability Standard EOP-004-2, which identified types of reportable events and thresholds for reporting, requires responsible entities to have an operating plan for reporting applicable events to NERC and other entities (including law enforcement), and requires reporting of threshold events with a 24 hour period (Docket No. RD13-3-000). This Standard covers the need to incorporate law enforcement contacts in the operating plan. Requesting this type of information in both the operating plan required in EOP-004-2 and physical security plan in CIP-014-1 is a “duplication of efforts”. MPC believes the intent for CIP-014-1 was to identify and mitigate physical security risks, while the intent for EOP-004-2 is to improve reliability of the BES by requiring the reporting of events by Responsible Entities. MPC suggests removing Requirement 5.2 in CIP-014-1.

While we do agree with the need for the standard and the importance of it we do have comments on the proposed standard. The intention of this standard is to protect those facilities that are most critical to the bulk electric system. The CIP-002-5.1 criteria brings into play many facilities that while deemed critical to an entity are not likely critical to this standards definition and would not cause wide area impact.
Yes
Specifically the filtering of assets. While starting with CIP-002-5.1 as a starting point, the amount of analysis and assessment to determine if these facilities are critical and applicable to this standard may not be possible in the timeline proposed for this standard if a full transmission planning analysis will be needed. Many planning analysis performed previously by entities were not assessed to the specific defininition included in this requirement and therefore could require considerable work to be performed to analyze. The wording suggests that a full transmission planning assessment should be performed for all CIP-002-5.1 facilities and not to just those an entity feels may cause wide area impact. What if you do not agree with the third parties review of your assessment? what evidence will be required to prove that you do not need to agree with their assessment? If an entity identifies a facility as critical does this require that the control center operating this facility must also have a full physical security plan per the requirements later in the standard?

Yes
how long will and entity have to complete their plans designed due to the evaluation of threats? It appears that the standard is saying that you must develop a plan and a timeline to complete your actions associated with the plan. What if a timeline needs to be adjusted at some point, will an entity have to notify their RRO? Or just track all changes and their need to provide to an auditor during a full audit of the standard?
No
Group
Western Area Power Administration
Lloyd A. Linke
Yes
Western agrees with what we understand as the applicability, based on the CIP-014 Workshops. However, we have some concern with the undefined term 'collector bus facility'. Without a definition for collector bus facility we are concerned that some parties may consider the entire switchyard at a generating station as a collector bus facility. Based on the discussion during the CIP-014 Workshops we do not believe the drafting team intended this to be the case. Therefore, some additional clarification may be needed for the term.
Yes
Western agrees with the approach of using Requirements R1 and R2 to identify whether an entity is subject to Requirements R4-R6. However, we suggest that the drafting team modify the term "risk assessment" to "BES impact assessment." In the physical security community, the term "risk assessment" generally refers to "The process of assessing security-related risks from internal and external threats to an entity, its assets, or personnel." See ASIS International, General Security Risk Assessment Guideline (2002), http://www.scnus.org/local_includes/downloads/9200.pdf. In its filing to FERC, NERC can explain that it adopted the term "BES impact assessment" so it is clear that the initial evaluation is of risk to the BES if the substation is damaged or rendered inoperable. Western recommends revising R1 1.1 to: "Each Transmission Owner shall review their BES Impact Assessments once every 60 months for any transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an interconnection after completion of the initial assessment." This would consolidate the two bulleted actions and make them equally applicable. We believe a 60 month interval would be a more appropriate period for this type of assessment. Western suggest the drafting team clarify requirement 2.1, which directs the Transmission Owner to select a Planning Coordinator, Transmission Planner, or Reliability Coordinator to conduct the third-party assessment; however, these NERC functional entity designations do not appear in the applicability section of the standard. We also suggest reconsidering the short 90-day period to ensure verification of the risk assessment. This may not allow every Transmission Owner to establish a contract with an unaffiliated verifying entity during the standard's implementation time period.

Yes
: We recommend striking the qualifier regarding the ASIS “Certified Protection Professional or Physical Security Professional” from the standard R6-6.1.1 as it is inclusive of only one organization and may not provide the best support for each entity . Simply having these certifications does not guarantee the necessary knowledge to perform this unique work. We believe the language does not support the intent of the FERC Order as identified in paragraph 11. We request the Drafting Team clarify the scope of the third party review process identified in R6 and tie the requirement to a specific and established method as consistent in accepted practices, such as the ISO processes. We recommend the third party review process be clarified as a review of the primary entity’s adherence to their established processes in evaluating threats and vulnerably, as well as their security plan(s). We believe the current audits conducted by the regional entities satisfy the third party review process as identified in the FERC Order, paragraph 11. We do not believe R6-6.4 adequately protects the sensitive information contained in the risk, threat, and vulnerability assessments, or the security plan(s). These reports may contain sensitive and/or classified information, or otherwise information that if released would jeopardize the BES, with little to no penalty for an offending party.
Yes
In the VSL for requirement R5, in all four severity levels, states that the security plans need to be developed for the facilities “identified in requirement R1”. However Requirement R5 only requires the plans to be developed for facilities ‘identified in Requirement R1 and verified according to Requirement R2,”. The VSL should be modified to include the statement ‘and verified according to Requirement R2. The first row in the Table, in the RSAW, describing the evidence required in requirement R1, it states that any risk assessments conducted prior to the effective date of this standard are not relevant. The Implementation Plan states that “The initial risk assessment required by CIP-014-1, Requirement R1, must be completed on or before the effective date of the standard.” There appears to be a conflict between these two statements, unless the intent is that the initial risk assessment needs to be completed on the effective date. Also, normally, unless the implementation plan provides a different time line, you need to be compliant by the effective date. In the RSAW for requirement R6 the fourth row in the Evidence Requested table, it asks for evidence that includes the “reasons or compensating mitigating measures for not implementing the recommendations for the reviewing party.” Requirement R6.3 of the standard only requires the Transmission Owner or Transmission Operator to “Document the reason(s) for not modifying the evaluation or security plan(s) consistent with the recommendation.” These two statements should be clarified in order to ensure consistent enforcement.

Southern Indiana Gas & Electric Company d/b/a Vectren Energy Delivery of Indiana, Inc.
Yes

Vectren supports the use of the CIP-002-5.1 medium impact criteria. This approach focuses on the facilities that could have a true adverse impact to the Bulk Electric System and provides consistency with approved standards.

No

Specifically, Vectren recommends that R2 be removed from the draft standard, for the reasons set out in this Comment. And that an approach similar to that used for evaluation of designations under CIP 002 Version 3 be adopted for review of the required risk assessment. Vectren urges FERC and NERC to designate registered Planning Coordinators, Transmission Planners, or Reliability Coordinators as the approved verifiers for entity risk assessments AND to establish clear criteria for verifiers, so that NERC auditors can apply a uniform set of criteria to their after the fact assessment of verifier qualifications. As written, these provisions lack the specificity necessary to provide clear direction to entities, increasing the risk of later non-compliance. Such a risk is ironic and unacceptable in requirements that purport to provide a review of risk assessments. Under these draft requirements entities have no assurance that any third party verifier they might select will be considered "qualified" by FERC, NERC or NERC auditors who might review the results later – leaving entities at grave risk of compliance violations if FERC, NERC or any other regulatory body later disagrees with the entity's selection of a third party verifier. Vectren strongly urges NERC and FERC to establish criteria for those who might seek to be designated third party verifiers, rather than leave assessment of qualifications to an after the fact review during a NERC audit or spot check. A lack of certainty leads here by necessity to a lack of confidence in the result, which Vectren surmises was not the intent of FERC or the drafters.

Yes

Vectren recognizes that this drafting effort required significant contraction of drafting and approval processes, and Vectren appreciates the work of the drafting team. Vectren is

supportive of the goals of the standard, supports R1, R3, R4 and R5. Vectren urges the drafting team, NERC and FERC to remove entirely or add detail to the requirements R2 and R6, and to add specific audit criteria in the RSAWs, so that entities can have some confidence that their risk assessments performed in good faith, will be considered compliant with this Standard.

The applicability should include the TP, PC, RC, and the unaffiliated entity as they are noted in this standard.
No
1. For R1, the Transmission Owner is not the appropriate entity to conduct the type of transmission analysis that the requirement describes. It seems like a more logical process would be for the Transmission Planner to conduct an analysis of all substations meeting the applicability in 4.1.1.1 thru 4.1.1.4, and then, if the removal of a substation results in Cascading, instability, or uncontrolled separation, the TP will then notify the TO & TOP to conduct the security threat evaluation per R4 at only those substations identified by the TP. 2. R1 - A “risk assessment” pertains to the physical security of Transmission Facilities while a “risk-based assessment” pertains to identification of Critical Assets and Critical Cyber Assets. The two phrases are too similar in meaning to each other, but possess differing meanings and intents. 3. For R2, if the approach described in #1 is accepted, it may also satisfy R2 in those cases where the TP is independent from the TO. The independent verification would also be the responsibility of the TP, utilizing another TP, the PC, the RC, or an unaffiliated entity as described in the current language. 4. For R3, if the approach described in #1 is accepted, the initial notification to the TOP would originate from the TP.
No
1. The sequence and timelines for R5 and R6 need to be reviewed. R5 states the TO “shall develop and implement” the security plan within 120 calendar days of completion of R2. R6 states the 3rd party evaluation can occur concurrently with or after completion of R5. It seems like the 3rd party evaluation should be completed before the plan is implemented in R5, otherwise the entity may be planning for or implementing measures that may not be appropriate for the risk level. 2. R6 also 3. Also, who evaluates the implementation phase of security plan and whether or not it was implemented correctly or if the plan was effective? There should be an entity assigned for this task. There should be an exercise (like GridEx) to

test the plan. 4. The third party reviewer could be the same entity in R2 and R6. This could be a question of independence. It also does not indicate the third party actually verifies the implementation of the security plan(s) in R6. This does not permit the Compliance Enforcement Agency to place reliance upon the work of the third party.
Yes
Several places in the standard refer to notifying the Transmission Operator for stations that meet the higher risk profiles. However, the language is not clear as to what is expected from the Transmission Operators when a physical security incident occurs at one of those substations during real-time operations. Finally, this entire process can exceed four hundred days, which is excessive.

No
FMPA commends the efforts of the SDT to lay out an excellent process for risk assessment in accordance with the FERC Order in such a short time frame. We only have few comments. WHAT DOES “CONTROL CENTER” MEAN Is there a signifance for not using the capitalized term of Control Center throughout the standard? It seems to FMPA that the defined term “Control Center” ought to be used. If the intent is that “control center” and “Control Center” mean two different things, then, what does “control center” mean? If the intent is to include large TOs that may be part of a large TOP, such as a large utility in an RTO, that do not have Control Centers; then, FMPA recommends using a different term such as “the location of the SCADA system that has remote control of breakers associated with the identified substation/station” or similar might avoid confusion. WHAT DOES “UNAFFILIATED” MEAN The term “unaffiliated” may be a source of ambiguity and conflict without further definition. For instance, dictionary.com defines affiliated as: “being in close formal or informal association; related” So, this would imply that peer members of the Transmission Forum are affiliated, which we do not believe is the intent of the SDT. FMAP believes the SDT’s intent is as Black’s Law Dictionary defines affiliate: “1. A corporation that is related to another corporation by shareholdings or other means of control; a subsidiary, parent, or sibling corporation. 2. One who controls, is controlled by, or is under common control with an issuer of a security.”; which would mean that peers within the Transmission Forum are unaffiliated, but subsidiaries of a company are affiliated, or members of a Joint Action Agency are affiliated. It also aligns with FERC’s definitions for Affiliate in their market based rates regulations 18 C.F.R. 35.36(a)(9) and in the Pro Forma OATT. FMPA suggests using a footnote to clarify use of the term unaffiliated, such as “Use of the term unaffiliated is in relation to Black’s Law Disctionary defition for affiliated: ‘1. A corporation that is related to another corporation by shareholdings or other means of control; a subsidiary, parent, or sibling corporation. 2. One who controls, is controlled by, or is under common control with an issuer of a security.’”

PROPER QUALIFICATIONS FOR RISK ASSESSMENT VERIFICATION FMPA appreciates the challenges of defining qualification for independent verifiers while offering registered entities a broad choice for selection. We interpret that requirements R2 and R6 grant the applicable entity sole authority to choose the 3rd party verifier as long as they meet the qualifications contained within those requirements. Is FMPA correct in that interpretation? CHANGE MANAGEMENT OF THE RISK ASSESSMENT The standard is somewhat ambiguous on what happens if the responsible entity chooses to revise it's risk assessment of R1 sooner than the required 30 or 60 calendar months. Does every minor revision to the risk assessment require another 3rd party review? Or would only major system changes (e.g., due to adding a major new investment in the power system like a new 500 kV line) require review? Or regardless of system changes, would the review occur once every 30/60 months? FMPA suggests clarification to R2 to say that minor revisions to the risk assessment due to minor power system changes in between the 30/60 month periods do not need a separate 3rd party verification.

No

Again, FMPA commends the SDT for a job well done. Just a few minor comments. See response to question 1 concerning use of the terms "control center" and "unaffiliated". CHANGE MANAGEMENT OF THE VULNERABILITY ASSESSMENT AND SECURITY PLAN Similar to our comments regarding change management of the risk assessment, it is ambiguous as to how we would implement change management related to the vulnerability assessment and security plans. R4 has no periodicity requirement, but, instead seems to require responsible entities to continuously reevaluate their vulnerability assessments in response to events listed in bullets 4.1, 4.2 and 4.3. If the entity changes their vulnerability assessment to include new threats, does every revision require a new 3rd party review? How do we come to agreement what constitutes a valid "trigger" for a new vulnerability assessment? It seems to imply that each of us would need to have an independent 3rd party on retainer to review our assessment of every intelligence or threat warning from governmental or regulatory agencies, or new attacks that each entity becomes aware of. Is that the intent? If so, what consititues a "warning", e.g., is it an "official" warning through some sort of official channel, such as a NERC Alert? If so, what happens if an entity decided to act on an "unofficial warning", such as a media release, to revise their vulnerability assessment – would that also need a 3rd party review? FMPA suggest clarifying 4.3 with "Official intelligence or threat warnings …". R5 seems overly ambitious. 120 days, or 4 months, is not a lot of time to perform a vulnerability assessment and develop and implement a security plan, especially in response to a newly identified threat vector/warning, and especially considering that a revised security plan may include capital investments in measures like new enclosures, vehice barriers, or the like. Is the intent that a security plan could be a phased approach, e.g., implement an interim security plan within 120 days while future improvements to that plan take longer? If so, then the language of the requirement ought to reflect that intent. FMPA suggest a modification to R5 such as: "… shall develop and implement the first phase of a documented physical security plan(s) … within 120 calendar days …" In addition, R5 does not seem to fit temporally with R2 and R4 well. R2 requires periodic risk assessments every 30/60 months. R4 seems to require changes to vulnerability assessments in response to newly known threat vectors. The timing

of R5 refers to R2: "… within 120 calendar days following the completionof R2" with no reference to a revision to the vulnerability assessment. This causes FMPA to belevie that revisions to the security plan as a result of a new threat vector and a revised vulnerability assessment of R4 would not need to be required until 120 days following the next periodic risk assessment of R2. Is that the intent? If that is the intent, if an entity chooses to revise the security plan earlier, would that then need an 3rd party verification at that time, or at the time of the periodic risk assessment?
Yes
FMPA has concerns for the RSAW and the lack of direction to auditors from the RSAW concerning the scope of their review. The auditor should not have a subjective decision regarding the sufficiency of the risk assessment, vulnerability assessment or security plan of the TO/TOP. The unaffiliated 3rd party is the source of qualified expert subjective opinion on the sufficiency of the risk assessment, vulnerability assessment and security plan. As such, the RSAW ought to clearly define the scope of the auditor's review of the risk assessment, vulnerability assessment and security plan. FMPA suggests rewording the "Compliance Assessment Approach"portions of the RSAW that call for these reviews to read something like the following (specific to R1): Review the entity's risk assessment to answer the following: a. Were all of the entity's assets, existing and planned to be in service within 24 months of the date of the documented risk assessment, and applicable to the standard (Applicability Section 4.1.1), included in the assessment? b. Was a transmission analysis or transmission analyses identified and documented to evaluate whether any applicable Transmission station(s) and Transmission substation(s), if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection? The auditor is not to evaluate the sufficiency of such analyses; but rather whether such analysis was documented. c. Was the assessment conducted within the timeframes identified in bullet 1.1? d. Was the primary control center(s) identified in accordance with bullet 1.2?

It is AEP's understanding that regarding R5, the phrase "develop and implement a documented physical security plan…within 120 calendar days" means that, within 120 days, the physical security plan must be completed and that the entity is working toward implementing the plan and does not mean that the plan must be fully implemented within

120 days. AEP urges the clarification of that expectation within R5 so that the requirement is unambiguous. Regarding R6.4, please clarify whether the procedures for protecting sensitive or confidential information would include suitable terms and conditions within a third party contract.

(1) Duke Energy suggests that language should be incorporated either in the proposed standard or RSAW to allow for the flexibility in modifying the timeline specified in R5.3. We believe there are unforeseen circumstances that could occur which would result in the proposed timeline shifting from the intended completion date. Examples include, but are not limited to: a. Unplanned outage of transmission or generation facilities that results in canceling scheduled work. b. BES reliability concerns should the facility be out of service for a short or extended period of time. c. Third party vendor's availability in implementing recommendations made by an entity or unaffiliated third party verifier. For these reasons, we believe a provision is needed to allow for this type of flexibility in modifying the timeline specified in R5.3.

Anthony Jablonski
ReliabilityFirst
Yes
ReliabilityFirst supplies the following comments for consideration: 1. ReliabilityFirst believes there may be a perceived disconnect between the Applicability Section and Requirements 5 and 6. Requirements 5 and 6 introduce new requirements surrounding the Transmission Owners "primary control center" though the "primary control center" is not listed within the Applicability section as an asset the Transmission Owner owns that is included in the standard. Consideration may be given to adding "primary control center" under section 4.1.1. [Note: Since "Control Center" is a NERC defined term, this term should be capitalized throughout the standard.] 2. Applicability section 4.1.1.4 - ReliabilityFirst believes the term "as essential" is ambiguous and may cause unintended compliance monitoring implications. ReliabilityFirst recommends the following for consideration: "Transmission Facilities identified

[in] Nuclear Plant Interface Requirements [which provide offsite power].” ReliabilityFirst believes the recommended language addresses the intent of the SDT.
Yes
ReliabilityFirst supplies the following comments for consideration: 1.Requirement R1 - ReliabilityFirst believes there may be a gap in the timing of performing the risk assessment for new Transmission stations and Transmission substations which are planned outside the 24 month window as required in Requirement R1. For example, as written, if a new Transmission stations or Transmission substation is planned for month 25, it would not be included within the initial risk assessment. Thus, there is a potential for this new Transmission stations or Transmission substation to not be assessed for 30 calendar months (for a Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable …) or 60 calendar months (for a Transmission Owner that has not identified in its previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability…” With the potential gap in assessing new Transmission stations and Transmission substations being so long, ReliabilityFirst believes reliability may be compromised. For these reasons, ReliabilityFirst recommends the following for consideration: “Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 30 months)…” and including a new bullet under Part 1.1 which states “At least prior to the implementation of all new Transmission stations and Transmission substations (if not assessed within the initial or subsequent risk assessment)” 2. Requirement R3 part 3.1 - From a standards writing perspective, if there is only one sub-part, ReliabilityFirst recommends including it within the Parent requirement R3. Typically sub-parts are only included if there are more than one.
Yes
ReliabilityFirst supplies the following comments for consideration: 1. Requirement R5 - ReliabilityFirst requests clarification on why the term “primary control center” is used throughout the document instead of just “control center”, as it seems both a primary and secondary control center would be of equal importance (and have similar vulnerabilities) to reliability.

With Michigan situated as a peninsula, Michigan infrastructure may be at a lesser risk, based on the limited number of interconnect avenues into and out of our system. Meaning the highest level of criticality likely would be identified as those key interconnect points, and not the entirety of our system. From our experience with the blackout of August 2003, BES implications were centered in southeast Michigan and although affected, we were able to successfully minimize/sustain our base load generation requirements. Any substation targeted in Michigan may not have a cascading effect on the BES.
No
We agree to the approach, however, our concern is around protection of information shared between the entity and the third party. There should be a requirement within the standard that requires the third parties to protect the information and not leave it up to the entities.
No
We agree to the approach, however, our concern is around protection of information shared between the entity and the third party. There should be a requirement within the standard that requires the third parties to protect the information and not leave it up to the entities.
Yes
Develop a requirement to protect information shared between entities and third party organizations. Requirement number 6 should be revised to state “…third party reviewer that is either…” 6.1.1 or 6.1.2 or 6.1.3 or 6.1.4. R6 seems vague and should be revised
Individual
Chantal Mazza
Hydro Québec TransÉnergie
Yes
No
Hydro-Quebec TransEnergie (HQT) agrees with this approach but requests that the SDT remove the term "unaffiliated" from Requirements R2 and R6.1 HQT notes that the term "unaffiliated" is not used in FERC Order 146. Paragraph 11 of the Order states "In addition, the risk assessment used by an owner or operator to identify critical facilities should be verified by an entity other than the owner or operator." Moreover, it appears that it is not FERC's intent to introduce this restriction regarding the choice of a third party. HQT therefore believes that the use of the term “unaffiliated” goes above and beyond what was stipulated in the FERC Order. Furthermore, the term "unaffiliated" is not required because the NERC Reliability Functional model already ensures the independence between the TO/TOP and the verifying entities (RC, PC and TP) that the SDT is seeking in the draft standard. The Reliability Model uses the term "functional entity" to apply to a class of entities without making reference to specific organizations that register as functional entities. For some Canadian jurisdictions, the use of the term "unaffiliated" renders the standard more stringent due to the fact that certain Canadian entities such as Hydro-Québec TransÉnergie are simultaneously

registered as TO, TOP, PC and RC. For integrated modeled entities, the restriction of available options that would otherwise be available (such as selecting a PC, TP or RC for the risk assessment verification under R2), makes it difficult to identify an entity with the required expertise capable of performing the reviews stipulated in the standard. HQT believes that the risk assessment of a TO should only be verified by the RC or the PC that has supervision (real-time or planning) over the said TO's assets because only the RC or the PC can ensure a comprehensive approach to critical facility identification that considers the reliability of an entire area. For these reasons, HQT believes that the expression "third party" alone is sufficient and consistent with the expressed concerns in the FERC Order.
No
The same comments regarding the term "unaffiliated" in Question 2 above apply to R6. HQT believes that the SDT should remain general about the security measures that should be put in place. Requirement R5.1 states "Resiliency or security measures designed to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities based on the results of the evaluation conducted in Requirement R4." We believe that rather than the standard dictate what type of measures are to be implemented, it should be rephrased to remain general and use similar language that is used in paragraph 9 of the FERC order. Suggest rewording the requirement to "Resiliency or security measures designed to protect against potential physical threats and vulnerabilities based on the results of the evaluation conducted in Requirement R4.".
Yes
The following are suggestions to facilitate reading of the standard, as well as its future translation: All requirements: Replace the expression "Transmission stations and Transmission substations" with "Transmission facilities". Otherwise, please explain why such a distinction is necessary. R1: Remove "transmission analysis" from the sentence "The initial and subsequent risk assessments shall consist of transmission analysis or transmission analyses designed to …" We believe this repetition is unnecessary. R2.2: The first part applies to an entity that is not subject to the standard and should be removed from the standard. R2.3: Replace the word "identification" with "assessment". Remove the word "either" Rephrase R4, R5 and R6 (add "a"): " ...a transmission substation, or a primary control center". R4 and R5: Remove the part "…that the Transmission Operator's primary control center has operational control of an identified Transmission station or Transmission substation". It only complicates the reading of the requirement (the TOP is not notified by the TO unless it has operational control over an asset identified in R1). If the first parts of R4, R5 and R6 are intended to identify the functional entities to which the requirement applies, we suggest "… and each Transmission Operator notified by a Transmission Owner under requirement R3, shall …" for the TOP portion (line 3 to 6 of R4, R5 and R6). We believe that it would greatly improve clarity and readability of the requirements. R6.1: rephrase to "from one of the following". Furthermore, the numbers 6.1.1 to 6.1.4 should be replaced with bullets as is the case in R1.1, R2.1, and R2.2. Rephrase R6.1 and R6.1.1 to reflect the language used in the rationale. We believe limiting the reviewer to someone with a CPP or PSP certification goes beyond what the FERC order requesting. Suggest rephrasing to "with appropriate expertise of the evaluation performed". Guidelines and Technical Basis on requirement R1: HQT agrees with the fact that the TO has discretion to

choose the specific method to establish the risk assessment, and that it is relevant that the Guidelines proposes examples. However, the proposed example of "removing all lines to a single Transmission station" seems to present a very stringent impact considering a physical attack on a facility. We ask the SDT to propose others less stringent examples that would be more in line with realistic physical attack, such as loss of a large section according to physical organisation of the facility, or loss of all main transformers, etc.

Connie Lowe
Yes
No
Measure M1 - R1.2 -- Measure M1 does not address sub-requirement R1.2 which requires the Transmission Owner to identify the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment. Dominion recommends the SDT determine whether M1 should include the control center. R2.3 - Relative to R2.3, Dominion does not agree that the TO should have to document the technical basis for retaining assets that have been suggested for removal by the third party. R3 - Dominion suggests R3 be revised to strike the words ‘and verified according to Requirement R2’, and changing R2 to R1.2 in the next two instances where R2 is mentioned. This is due to the reason there is nothing included in R2 that requires verifing primary control centers.
No
R5 and R6 are written for the initial risk assessment and don’t necessarily apply for subsequent risk assessments. Is the expectation that 3rd party reviews be performed for R4 and R5 every time R1/R2 is run, particularly if there are no changes? Dominion recommends that the SDT modify this in the event the R1 list changes (ie: add stations) to require a subsequent R4/R5 reassessment. If stations drop off, or no change to R1 list for subsequent assessments, then subsequent R4/R5 reassessment is not required. R6 - Through continuous improvement processes and lessons learned, there will be expected changes to the security plan(s). What changes are allowed to the security plan(s) without triggering a 3rd party review?
No

Yes

Language contained in R1 does not align the performance of risk assessments of Transmission stations and Transmission substations with the actual commissioning or energization of such facilities. To ensure that risk assessments and subsequent risk assessments address existing and planned Transmission stations and Transmission substations to be in service within a risk assessment window the following edits are recommended to R1: R1. Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 30 months) .. 1.1. Subsequent risk assessments shall be performed at least once every 30 calendar months. (this would apply to all applicable TOs) GCPD also supports comments made by APPA regarding the insertion of the language addressing Confidentiality and treatment of Critical Facilities Information. GCPD's suggested language is as follows: Risk assessments and evaluations of physical threats and vulnerabilities, as produced, gathered, used or maintained for compliance with mandatory Reliability Standards, are intended to be kept confidential by the owner of the records and information, those entities with authorized access, and any organization or agency charged with examination of such records and information pursuant to Section 215 of the Federal Power Act. All such identified records and information are also intended to be exempt from public disclosure.
Yes
R2 references primary control center(s). Since Control Center is a NERC defined term GCPD suggests that all references to the Control Center be capitalized within the Standard and that "primary" be defined within the standard to not include "back-up" Control Center(s).
Yes
GCPD appreciates the flexibility built into the Standard language that allows tailored evaluations of potential threats and vulnerabilities to its own facilities. GCPD supports APPA's suggested edits to the Standard to enhance clarity of requirements under R4, R4.1 & R4.2. In addition, APPA's suggested removal of "and implement" under R5 clarifies that the intent of R5 is to develop the physical security plan, not fully implement the plan within 120 calendar days. This would better align the Standard language contained in R5.3.
Yes
GCPD feels that the implementation schedule is somewhat arbitrary and demonstating compliance with the implementation schedule conflicts with language contained in the proposed RSAW. GCPD supports RSAW edits as proposed by APPA to address these discrepancies. GCPD proposes the following edits to Requirement language addressing implementation timing to allow for enforceable and auditable time lines not dependent upon the unique completion date of the initial risk assessments conducted by the RE. 2.2. ...The Transmission Owner shall ensure the verification of the initial risk assessment performed under Requirement R1 is completed within 90 calendar days following the effective date of this Standard. Subsequent risk assessments shall have verifications completed within 90 calendars days of completion of the risk assessment. R5. ...and primary Control Center(s) within 210 calendar days following the effective date of this Standard. Changes to recognized applicable facilities under this Standard as identified under Requirement R1 and verified according to Requirement R2, shall require review of the physical security plan(s) within 90

calendar days of completion of associated risk assessments. ... General commentary: in October 2012 the Cost Effective Analysis Process (CEAP) was approved for a “pilot”. The NERC CEAP was intended to integrate cost consideration and effectiveness into the development of new and revised standards. The first phase of the CEAP was to be implemented during the SAR stage to determine cost impact and identify “order of magnitude” or potentially egregious costs, to determine if a proposed standard will meet or exceed an adequate level of reliability, and what potential risks are being mitigated. The second phase was to be conducted later in the standard development process and afford the industry the opportunity to offer more cost efficient solutions that may be equally effective to achieving the reliability intent of the draft standard. This report would be posted at the time the standard is balloted. The report was intended to present the data collected in a manner which will provide the industry with representative cost implementation and effectiveness information to allow a more informed choice during balloting. Based upon the urgent nature of this Standard, phase two would need to be applied. The CIP-014 Standard requires costs to be incurred to comply with Requirement R5. In addition, there may be substantial costs incurred to implement the Physicial Security Plan(s). The CIP-014 Standard is an ideal standard upon which to exercise the CEAP. The information resulting from the CEAP would be beneficial not only to government officials, but also the industry as a whole.

No
There is a use of the term "critical" being used in several NERC Standards, which can cause unintended confusion. Since the applicability of this draft Standard is derived from the approved CIP-002-5.1, can this proposed Standard be added as a revision to CIP-002-5.1?
No
In R1, we have concerns about the ambiguity associated with the term "assessments". Can you provide examples of the types of assessments that would be acceptable to meet R1 and that would be CIP audit worthy in the future. We have the same concern in R2 with the term "third-party". Will there be a list of pre-approved third party contractors or will the RE's review and approve a third-party at the request of the registered entity prior to their use in the verification process as described in R2?
No
Same comments about "third-party" from Question 2.

MID agrees that maintaining selection criteria consistent with CIP-002-5 is a prudent approach. However, if a facility is worthy of protection against a cyber attack, why is that same facility not worthy of consideration and evaluation for a potential physical attack? Inclusion of 'widespread instability, uncontrolled separation, or Cascading within an Interconnection' as an additional criteria is also prudent. These criteria focus on the immediate impact of the physical attack. What is missing is the longer term impact - if serious physical damage is the result, can the damaged system perform adequately during subsequent peak loading periods? MID understands that these changes would extent the scope of the standards coverage beyond what was included in the FERC order. MID would like to respectfully suggest that the FERC order is a step in the right direction but did not fully consider all of the potential physical attacks that could cause 'widespread instability, uncontrolled separation, or Cascading within an Interconnection' or impair long term reliability of the system. MID feels that in responding to the FERC order, it would be acceptable to ‘do the right thing’ and step up to the challenge and evaluate all facilities identified in CIP-002-5 as high or medium impact the system against possible physical attacks.

NRG Energy, Inc.
Yes
This standard should not address generation interconnection facilities because the BES is designed to withstand the loss of generation facilities through the use of regional reserves.
Yes
NRG agrees the approach described in Requirements 1 through 3 address the directives specified in FERC Docket No. RD14-6-000. However, NRG does have concerns with the standard as currently composed and offers the following points it believes will improve the standard if implemented: • Primary control centers are referenced in the “purpose” of the standard, but are not included in the “applicability” section. For clarity, NRG suggests the addition of section 4.1.1.5, stating “Control Centers and backup Control Centers associated with the Transmission stations and Transmission substations identified in requirements 4.1.1.1 through 4.1.1.4.” • R1 directs that the Transmission Owner to perform an initial risk assessment with subsequent studies and include an unaffiliated third party to verify the risk assessment performed. NRG is concerned the standard does not indicate how information shared under this Requirement will be protected and held in confidence. NRG believes the information subject to this standard should be treated as Critical Energy Infrastructure Information (CEII). • R1 is vague in providing guidance as to the criteria to be used in developing the risk assessment. NRG appreciates this is intentional to allow flexibility in developing the assessment. However, this results in the potential for a determination of non-compliance during the audit process. NRG suggests reliance on the CIP-002 standard used for defining Critical Assets, which is based on solid metrics. • R2 seems to allow the same third party to perform both the initial risk assessment and the review of the initial risk assessment, potentially negating the need for a separate review. • R2.2 calls for review of the results of the initial risk assessment by an unaffiliated third party. The standard provides no guidance regarding the criteria (assumptions, contingencies, etc.) to be used for this review, which could provide results differing from the initial assessment. More objective measures should be incorporated.
Yes
NRG agrees the approach described in Requirements 4 through 6 addresses the directives specified in FERC Docket No. RD14-6-000. However, NRG does have concerns with the standard as currently composed and offers the following points it believes will improve the standard if implemented: • R5.1 provides no guidelines or examples of how to combat certain threats, or even what threat thresholds require accounting for. NRG appreciates the flexibility built into the requirement. However, NRG is concerned this flexibility could result in “interpretation” issues during future audits of compliance with the standard. • The ability to meet the time horizon commitment for providing the third party assessment of the vulnerabilities and security plan are contingent upon the availability of certified parties that

can adequately perform these assessments. NRG is concerned there may be a lack of qualified resources available to the industry to complete the necessary reviews within the required time frame. • Because the reliability of the bulk power system depends on numerous susbstations all across the nation, it would be more effective to increase the monitoring of the grid to ensure timely, effective re-routing of power when a disruption occurs. • Minimum physical standards should be established within the security plan that include industrial standard chain link fencing with barbed wire topguards; gates secured with chains and locks (not the alloy metal collar around a post); signage that clearly states No Trespassing every 100 ft., or on each perimeter side at small footprints; cameras that are monitored by the appropriate transmission control center, security control center or a contract central monitoring service and capable night viewing to be able to identify intruders.

New Brunswick Power Corporation
Alan MacNaughton
No
New Brusnwick Power (NB Power) agrees with the “applicability section” but not with portions of the preamble above, in question 1, which expands beyond applicability and states that “Furthermore, the standard drafting team expects many who are “applicable” to the standard will not identify facilities through their Requirement R1 risk assessment and

Requirement R2 verification that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection." To our knowledge there is no evidence to support the standards drafting teams statement that they expect that many of the applicable entities will not identify facilities through R1 and R2. FERC's statement that "we anticipate that the number of facilities identified as critical will be relatively small compared to the number of facilities that comprise the Bulk-Power System" is not sufficient evidence. NB Power is concerned that the cost impact of this standard may be underestimated as a result of this view that the number of critical facilities will be small. Please see comments below with respect to R1 and R2.

No

In general, a TO may not have the capability to conduct a risk assessment to determine if an identified facility that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. Such an assessment requires a wide area view of the Interconnection. It is proposed that the risk assessment be conducted by a PC, or RC for the area in which the facility is located. Doing so would satisfy the third party verification requirement as the TO would not be conducting the analysis. It is the opinion of NB Power that the technical details concerning the transmission analysis, in the proposed standard, are overly vague. This could lead to an inconsistent application of the analysis between entities as well as create obstacles with consensus concerning the proposed 3rd party verification. NB Power suggests a clear analysis methodology be drafted to establish a common basis for study criteria with the ability for each entity to apply additional specific requirements for their respective area. For corporate bodies, such as a vertically integrated utilities, that are registered as the RC, TOP, PC, TP and TO for a particular area, it is the opinion of NB Power that the requirement for unaffiliated 3rd party verification is overly stringent and of little value. The verifying party is limited to entities that have transmission planning or analyses experience, or, are registered as a PC, TP, or, RC from an adjacent area. NB Power is of the view that there are no unaffiliated entities with sufficient knowledge of the local transmission system to provide a meaningful verification within a 90 day period. As a government owned utility, NB Power is required to follow procurement processes which will make it difficult to meet the 90 day period for the third party verification. NB Power is also concerned that it could be non-compliant with the requirement if the third party fails to meet its obligation. While NB Power can mitigate the financial risk of that event it would still result in a recorded non-compliance. It is the opinion of NB Power that the proposed standard does not sufficiently address a disagreement resolution process between the TO and the unaffiliated verifying 3rd party in requirement R2.3. NB Power believes that documenting the technical basis for not following the recommendations of the unaffiliated verifying 3rd party without guidance on what constitutes valid technical reasons presents a compliance and enforcement gap where both the entity and an auditor may not be able to come to consensus. NB Power suggests the SDT develop guidance concerning compliance and enforcement of this requirement indicating acceptable technical reasoning for not following the 3rd parties recommendations.

No

NB Power is concerned with the 120 day timeline to implement a physical security plan that would meet the third party verification requirements. Having limited knowledge of physical security issues NB Power will likely rely on the third party verifier to work with NB Power in developing a security plan. NB Power is not aware of any analysis that was done to ensure that there is enough capacity within the “physical security industry” to support the work load increase resulting from the approval of this standard and as such is concerned that 120 days may be insufficient. NB Power is concerned that it could be non-compliant with R6.2 if the third party fails to meet its obligation. While NB Power can mitigate the financial risk of that event it would still result in a recorded non-compliance. It is the opinion of NB Power that the proposed standard does not sufficiently address a disagreement resolution process between the TO and the unaffiliated reviewing 3rd party in requirement. NB Power believes that documenting the technical basis for not following the recommendations of the unaffiliated reviewing 3rd party without guidance on what constitutes valid technical reasons presents a compliance and enforcement gap where both the entity and an auditor may not be able to come to a consensus. NB Power suggests the SDT develop guidance concerning compliance and enforcement of this requirement indicating acceptable technical reasoning for not following the 3rd party’s recommendations.

Yes
We agree with the inclusion of the Transmission Owners and Transmission Operators as they have the obligations to conduct an evaluation of the potential threats and vulnerabilities to a physical attack on each of their respective transmission stations/control centres.
No
While the proposed R1 to R3 collectively meet the FERC requirements for having an entity to identify the critical facilities and having the assessments of such identification verified, we believe it is more appropriate that the 3rd party verification be performed by NERC registered entities only (which could be the Reliability Coordinator, Planning Coordinator or Transmission Planner). An entity that has transmission planning or analysis experience may only have an outside equivalent representation of the BES and their ability to conduct an analysis with a “wide area” view of consequences may not be possible. As such, we suggest to revise Requirement 2.1 by eliminating the second bullet point : “An entity that has transmission planning or analysis experience”.

Applicability: The applicability section for Transmission Operators under section 4.1.2 should be explicitly limited to each TOP that operates a primary Control Center and receives a verified notification under Requirement R3. As written each TOP would be required to certify on each compliance contact that it has not been notified that it operates an applicable primary control center. The following edited text would accomplish that objective: 4.1.2 Transmission Operator that operates a primary Control Center and receives notice from a Transmission Owner under Requirement R3. Please state clearly the Transmission Operator of a primary control center is not responsible for conducting a risk assessment under R1 or arranging for third party verification of the risk assessment under R2.
No
R1 - The auditors should be limited to verifying that a study was completed using the assumptions agreed to by both the TO and the reviewer. The auditor should accept any study and assumptions jointly agreed to by the TO and the reviewer without requiring additional engineering justifications as to why one type of study was used instead of the auditor’s preferred methodology. To summarize and echo FERC Commissioner Norris in his clarifying statement, included with the FERC Order that is the basis of the CIP-014 Standard, that if the Planning Studies indicate a transmission solution that would cause the substation to no longer cause the cascading outage that the transmission project could be initiated in lieu of the security plan. The additional transmission solution would potentially add other operational benefits other than just “security” and therefore may be more practical than the security plan in R4 through R6. In the guidance document, statements should be made that a TO may make additional planning studies at any time prior to the 30 months and if the third party reviewer concurs the updated study no longer shows a cascading event, whether due to changing grid conditions or system improvements, the standard would no longer apply including the continued implementation of the security plan. The TO should also notify the owner of the primary control center the substation no longer causes a cascading event. R2 - Timelines to complete third party verification under R2.2 and third party review under R6.2 are both too short. Increase 90 days to 120 days or 180 days. a. Verifying entities may recommend that the Transmission Owner conduct additional planning studies to confirm asset identifications such as interactions between BES Elements in adjacent Transmission Owner footprints. A 90-day time limit may not provide sufficient time to conduct and verify a revised or supplemental BES assessment. b. For security reviews, conducting an accurate and meaningful review with sound recommendations applicable to a specific TPs facts and circumstances may require

additional time for assessment and discussions with the TO. A short review window is more likely to lead to misunderstandings, or disagreements with the TO which in turn could lead to discrepancies or improper application of the assessment requiring justification. This could cause the reviewer to avoid making recommendations that should be considered by the TO and improve the TO's assessment. c. As currently written, it appears if the TO disagrees with the reviewer's comments and writes a technical reason why he believes the original conclusion were correct, the recommendation(s) by the reviewer may be rejected and the TO's decision is final. Although I agree with this position it may be interpreted differently by the auditors. Please clarify which was the intent of the SDT. R3 - No comments
No
R4 - Sub requirement 4.1 should be modified to include specific language focusing the security study to those elements within the substation that can affect the reliability of the BES. The security plan should protect those elements of the substation as identified in the planning study in R1 that could cause the cascade or other unacceptable event identified in R1. Many substations identified in these studies are very large geographically and potentially very expensive to protect elements that may be located 30 to 50 feet above the ground. If these elements are determined to be critical they should be protected. If not, there is no justifiable reason to expend the resources to protect these devices. The security plans should concentrate on the protection of elements that could actually cause a cascading event, otherwise large expenditures may be made while adding no benefit or improvement to the reliability of the BES. R4.1 should read: 4.1. Unique characteristics of the identified and verified Transmission station(s), Transmission substation(s), and primary control center(s) including the identified elements within the station, substation or control center, that need to be protected that could initiate the cascading collapse identified by the planning study in R1; Under both R4 and R5 clarification should be provided to the auditors affirming that auditors do not need the work papers, or backup information used in preparing the security plan, it is preferable auditors be allowed to only view the plan on site and not be allowed to take a copy of the plan for their files due to the sensitive nature of the security plan. Having copies of the security plans of critical targets consolidated into the files of the auditing entity increases the security risk to the plan and identified assets do to a security beach or accidental release of the file. While having one security plan of a critical location is a security risk in and of itself, having a compilation of security plans by one entity becomes a national security risk. R5 - states in part that each TO and TOP "shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s) within 120 calendar days following the completion of Requirement R2." The "and implement" should be deleted. It should be made clear the facilities, additional employees or other measure identified in the plan are not required to be in place at the end of the 120 days. The requirement should be clearly stated that a timeline needs to be developed as part of the plan and the TO and TOP will implement the plan per the timeline identified in the plan. The implementation may require several years to get through budget cycles, procurement, installation and implementation. R6 - The standard should make clear the auditor is not to audit the security plan for its content or appropriateness, but to confirm a security plan has been developed and that particular

security plan has been reviewed by a qualified entity. It should also be clear that a TO could expand its actual security beyond that identified in the approved/reviewed plan without requiring an additional review of such modification. Example: The original, approved plan had card readers on the doors and cameras within the yard. During the 30 months until the next required review, the TO added motion detectors as additional security measures at the substation even though they were not required in the initial security plan. The installation of additional monitoring or security measures beyond those in the approved plan should not initiate the need for a new security plan or third party review.
Yes
Definitions: primary control center - although not capitalized and therefore not a defined term, it is used in this standard in requirements 1, 3, 4, 5, and 6. The same term "primary control center" (again not capitalized) is used with a completely different meaning in standards EOP-008 in requirements 1.3, 1.5, 1.6, 2, 3, 4 and 7.1. Similarly "primary control room" is used in EOP-005 requirement 5 and in EOP-006 requirement 6 and is defined as the control center from which a TOP normally operates as opposed to the backup center. In CIP-014, it is defined/implied to be the control center that actually controls the circuit breakers at two or more substations. • If the term “primary control center” is used there will be confusion over the different meanings within the NERC Reliability Standards. • A completely different term should be used such as “primary local control center” or “primary transmission operations center”. The SDT apparently meant a "facility that has direct Supervisory Control". The term should be defined completely in the standard and should become a defined term within the Glossary of Terms used in NERC Reliability Standards. Proposed defined term: Primary Transmission Operations Center - One or more Transmission Owner or Transmission Operator facilities hosting operations personnel having primary operational real-time control of the BES elements in one or more remotely located substations using SCADA, EMS or other electronic means.” Please clarify whether these security plans are also required at any backup control center. Many of these control centers are generally not manned on a 24 by basis. unaffiliated - should be either defined or a footnote needs to be added to the Standard to explain that unaffiliated - means the selected verifying or reviewing entity cannot be a corporate affiliate, as stated in the guidance document. • Would two entities that do not have a direct ownership stake in each other but both are parties to an ownership in a third organization be considered to be unaffiliated? Example: Two utilities each have an ownership of a joint power plant but no ownership of each other. • What if they both had no ownership of the third party but both had purchase contracts with a third party? An explanation needs to be in the standard and not in the separate guidance document.
Individual
Michael P Moltane
ITC
Yes
ITC agrees with utilizing, as a starting point, the CIP-002-5.1 “medium impact” rating to determine the facilities needing enhanced physical security. As ITC indicated in its comments

to FERC in Docket No. RD14-6, these new physical security Standards must be developed in a coordinated manner to avoid duplicative, overlapping, or contradictory requirements among the various existing Reliability Standards that cover a similar if not an identical set of assets. By ensuring “that entities could apply the same set of criteria to assist with identification of facilities under CIP Version 5 and proposed CIP-014-1,” the SDT has fully met our expectations with respect to the applicability of the standard.
No
ITC believes that limiting physical security requirements in CIP-014-1 to those substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection does not adequately raise the bar for critical infrastructure protection of valuable and strategic substation assets. Indeed, those substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection certainly warrant additional physical protection. However, so does any other substation asset deemed critical through the cybersecurity initiatives already in place through applicable companion Reliability Standards. If a substation is deemed critical through the CIP-002-5 screening process, it at a minimum, should warrant an “evaluation of potential threats and vulnerabilities of a physical attack to the facilities (CIP-014-1 R4). ITC supports using the brightline test criteria of CIP-002-5, as noted in our comments for Question 1, above, but also feels that all substation assets passing the brightline test criteria should move directly to R4 for an assessment of threats and vulnerabilities, eliminating the need for R1 and R2. This has the benefit of using industry-vetted, bright-line criteria that creates valuable consistency between physical and cybersecurity assessment practices. This does not undermine the Commission’s three-part requirement for addressing physical security, but rather allows the responsible entity to meet the Commission’s first requirement (identification of critical assets) by using the same critical asset identification criteria for physical and cybersecurity. ITC believes if a facility is critical enough to warrant cybersecurity protection, then it should also warrant physical security and that the requirements should not be so narrowly defined to ignore the importance of substations beyond those few whose individual loss causes cascading outages. This simplified approach avoids potential contradictory and duplicative requirements between existing CIP standards, and would allow this standard to focus exclusively on physical security aspects and not on asset identification
Yes
Yes
Transmission systems tend to have facilities for which inoperability, while not causing immediate system failure or separation, would nonetheless leave the system in a degraded state. This degraded state will require system operators to reconfigure the system in a way to mitigate the loss of such facilities, but at that point, a new group of facilities could effectively become “critical” as that term is currently defined in CIP-014-1. For example, the loss of a given substation may cause several transformers to be inoperable, and with the long lead time for replacement components, the transmission owner would realistically need to plan for

the substation to be out of service for an extended period of time. During this time in which the substation is out of service, a second tier of assets may exist for which inoperability would now cause separation or failure of the type that would afford them a “critical” designation as currently defined under CIP-014-1. This condition would persist for as long as the original equipment was out of service. If the SDT were to adopt ITC’s proposed modifications to R1 (see above), this would not be an issue, since all CIP-002-5 substations would already be covered by CIP-014-1. However, if the SDT chooses not to adopt ITC’s proposal, the SDT should consider whether entities should assess the transmission system in this new degraded condition to determine if new critical assets are created due to the degraded condition (i.e., a reapplication of the analysis performed in the current R1 to determine if the loss of a particular substation causes widespread cascading.) The Standard could also trigger additional transmission system studies to determine if the transmission system remains reliable during the extended period in which the critical assets remain out of service.
Group
PPL NERC Registered Affiliates
Brent Ingebrigtson
Yes
These comments are submitted on behalf of the following PPL NERC Registered Affiliates: Louisville Gas and Electric Company and Kentucky Utilities Company; PPL Electric Utilities Corporation, PPL EnergyPlus, LLC; PPL Generation, LLC; PPL Susquehanna, LLC; and PPL Montana, LLC. The PPL NERC Registered Affiliates are registered in six regions (MRO, NPCC, RFC, SERC, SPP, and WECC) for one or more of the following NERC functions: BA, DP, GO, GOP, IA, LSE, PA, PSE, RP, TO, TOP, TP, and TSP. The PPL NERC Registered Affiliates support the draft standard. As members of EEI, we also support the comments being submitted by EEI. In addition, we have provided specific comments that we believe would add clarity to the standards and simplify the requirements. We urge the SDT to consider our comments and incorporate them as appropriate when developing the final standard that will be balloted. Comments: Section 4.1.1.2 includes in the applicability Transmission Owners that own Transmission Facilities that are operating between 200kV and 499 kV at a single station or substation, where the station or substation is connected at 200kV or higher voltages to three or more other Transmission stations or substations and has an “aggregated weighted value” exceeding 3000 according to the table set forth in section 4.1.1.2. Because section 4.1.1.1 covers transmission facilities operated at 500 kV and above and section 4.1.1.2 only references Facilities operating between 200 kV and 499 kV, the fourth row in the table in section 4.1.1.2 referencing voltages of “500kV and above” is unnecessary and should be removed.
Yes
Requirement 1: 1. Requiring completion of an initial risk assessment for Transmission stations and substations planned to be in service within 24 months can lead to audit difficulties. Planned in service dates often change for a variety of internal or external reasons. It is requested that the SDT consider changing this language to a more easily identifiable trigger

such as requiring the risk assessment to be performed before a new Transmission station or substation is energized. 2. Does the R1 risk analysis require consideration of the impact of loss of lines with voltages below 200 kV in an identified Transmission station or substation? 3. It is unclear when the R.1 risk assessment needs to be completed. This should be clarified. 4. The wording in the Rationale for Requirement 1 box identifies the primary control center, but it also notes that control center electronic actions can cause direct physical actions at the Transmission station and substation. This would typically implicate the backup control center as well because the backup control center will have similar functional capabilities. There appears to be a disconnect between the use of the term primary control center and the parenthetical that follows which appears to include any control center that performs the listed functions.
Yes
Requirement 5: In the VSL table, does implemented mean complete execution of the plan including any necessary construction, or does it mean having initiated the plan but not necessarily completed all planned construction? There are only 10 days between VSLs. Requirement 6: 1. Similar to Requirement 2.3, the sub-requirements under Requirement 6.1 should be bullets, not individual sub-requirements. 2. Does R6 require subsequent third-party reviews when the security plan is revised? If so, what are the criteria?
Yes
We recommend that the SDT include a timeline within the standard which includes all required steps.

Due to the imposed time constraints and expedited development of this standard, sufficient time isn't available to develop more realistic criteria for determining applicable substations creating unnecessary work and expense for transmission planners and reviewers.
No

The third party verification is unnecessary and should be deleted from the standard. There is no other unaffiliated third party that has knowledge and expertise comparable with the incumbent Transmission Planner who develops the detailed models, performs the reliability assessments, and develops the required long term plans for the Transmission Owner on an annual basis. If the verification remains in the standard, 90 calendar days is not a sufficient amount of time to complete verification. A Transmission Planner may ask a Planning Authority (PA) to review its risk assessments, but the same PA will likely be asked to review multiple utilities. Recommend at least 180 days to complete the verification.
Yes
Since we are using CIP-002-5 for identifying Transmission stations and substations, the confidential information for these facilities is already protected under CIP-011-1 Information Protection. CIP-014-1, requirements 2.4 and 6.4 are redundant with already approved requirements and are not needed. Adding requirements for protecting sensitive or confidential information in this standard will create confusion and double jeopardy. CIP-006-5 covers physical security and any information pertaining to the substations identified through the CIP-002-5 criteria. CIP-011-1 already protects this information. Due to the expedited development of this standard, sufficient time isn't available to provide clear requirements in the standard to evaluate compliance. The RSAW does contain language that will help, but the RSAW isn't the enforceable document and can be changed without industry approval. We've learned from implementing the other CIP standards that auditors can take a completely different position than what was meant by the drafting team with little recourse for utilities.

GridWise Alliance
Ladeene Freimuth
Yes
Yes
Yes
Yes
GWA includes electric utilities, information and communications technology service and equipment providers, Independent System Operators (ISOs) and Regional Transmission Organizations (RTOs), academic institutions, and energy consulting firms. GWA appreciates the acknowledgment in the Order of the significant efforts that industry already is undertaking to enhance the resilience of the electric grid and thereby protect the grid from a range of threats, including physical, cyber, natural, and other hazards. Industry has been working in close partnership with various levels of government to enhance grid protection, reliability, resilience, and security. This collaboration is ongoing and should be fostered for the

future. As you are aware, the electric grid is dynamic in nature. Electric grid owners and operators are making investments to enhance the reliability and resiliency of the grid, and are actively managing the operation of the grid to prevent outages and to restore power expeditiously, when outages do occur. As this process moves forward, GWA wants to underscore the importance that the result not be overly burdensome or inhibit innovation. It is important that the risk assessment process indeed be limited to truly "critical" infrastructure that is deemed essential to the functioning of the bulk electric system. This will help ensure that protection measures are reasonable and cost-effective, as well as cost-sensitive, to help minimize costs to industry and also to consumers, who ultimately must bear the costs of these investments. Industry is working hard to monitor and stay ahead of the myriad threats that could arise – physical, natural, cyber, and otherwise – recognizing that the types of threats and the motivations of potential actors continue to change over time. NERC should partner with FERC to ensure that an all-hazards approach to addressing risk is undertaken going forward. We appreciate the Order's acknowledgement of the vital need to protect confidential and sensitive information. Yet, we are concerned about the nature of information-sharing under this Order, and what protections and assurances, in fact, would be implemented to prevent the inappropriate sharing of confidential information. While also recognizing the need to protect the confidentiality of such sensitive information, we also note that it is important to ensure that information sharing is facilitated between the government and the private sector, as well as within the private sector. Vendors who supply critical systems and equipment are incorporated into this process, since continued coordination and cooperation among all the stakeholders is essential.

A) The FERC order directs that the risk assessment used by an owner or operator to identify critical facilities should be verified by an entity other than the owner or operator. It does not require verification of the specific or particular facilities identified. Therefore, SCE&G believes this section should be clarified and specifically state that the assessment itself (i.e. the methodology used by the owner or operator) be verified and not the facilities. B) SCE&G would like the drafting team to comment on the liabilities a NERC registered entity may assume as the third party when they are used to verify the risk assessment. Specifically, if in a future audit the owner or operator's assessment is found noncompliant, then would the independent NERC registered third party entity suffer any noncompliance as well? It is important for NERC registered entities to understand their compliance risks as third parties before they agree to perform independent verification of other entities assessments.
Yes

Yes
The requirement for unaffiliated third party verification throughout this standard is not consistent with other NERC Reliability Standard verification requirements. SCE&G is concerned that this standard sets precedence for future standard third party verification which would be very costly, confusing and burdensome.

Yes
Recommend that the drafting team include the Transmission Planner who would be performing the risk assessment in the applicability as discussed in R1.
No
Recommend that the Transmission Planner perform the risk assessment in R1 instead of the Transmission Owner. Need further clarification and examples for the term “unaffiliated”. Would “peer” reviews studies that do not have a single registered entity with controlling interest suffice as an “unaffiliated” third party reviewer? What role does the SDT envision the ERO (including regional entities) playing in the review process?
No
Recommend adding electric utility experience to 6.1.3 and 6.1.4. Consider removing the requirement for CPP and PSP certifications. Rationale: Numerous other mandatory enforceable standards (e.g. MTSA, CFATS, and CT-PATS) that do not require specific certifications nor are we aware of similar certifications in cyber elsewhere in the CIP standards. Suggest clarification of “electric utility experience” and “physical security experience” to allow the ERO and registered entities to justifiably select authorized third party reviewers.
Yes
Until the process of the standards has more fully matured there should not be a presecribed methodology for conducting the Security Vulnerability Assesments (SVAs) as long as generally accepted criteria as well as as stated in the standard in 4.1, 4.2, and 4.3 are followed in the development of the evaluation and plan(s). The comments expressed herein represent a consensus of the views of the above named members of the SERC CIPC only and should not be construed as the position of the SERC Reliability Corporation, or its board or its officers.
Individual
William Temple
Northeast Utilities
Yes
Standard Drafting Team should define the term widespread. NU suggests the following definition: Widespread – An event that causes voltage collapse, Cascading and/or instability

that results in uncontrolled separation across significant portions of the Interconnection. The registered entity shall use regional criteria to evaluate.
Yes
Requirement 1 should match that language in the FERC order and not limit the assessment to Transmission System analysis and allow for an opportunity to apply technical expertise and judgment prior to the Transmission System analysis. We agree to Requirement 2 and Requirement 3.
Yes
Suggest standard allow entities to have a Master Physical Security Plan and that the standard provide for flexibility to accomplish mitigation activities associated with the results of vulnerability assessments and capture those under a separate mitigation plan (similar to the action plans associated to vulnerability assessments being conducted on Cyber Assets).

No
1. Reliability Coordinators (RCs) would be exempted under the draft standard. Not all Reliability Coordinators are Transmission Operators or Owners. Peak Reliability, Midcontinent ISO, and Southwest Power Pool would be exempted because they are not in the NERC Compliance Registry as Transmission Operators or Owners. (MISO is not a Reliability Coordinator under its MRO registration.) The following standards apply to Reliability Coordinators but not Transmission Operators and Owners: Standard EOP-006-2 — "System Restoration Coordination"; Standard EOP-002-3.1 — "Capacity and Energy Emergencies" (Applies to Balancing Authorities, Reliability Coordinators, and Load-Serving Entities); Standard IRO-009-1 — "Reliability Coordinator Actions to Operate Within IROLs"; Standard IRO-015-1 — "Notifications and Information Exchange Between Reliability Coordinators." The Joint U.S.-Canada report on the 2003 Blackout concluded that insufficient wide-area control, such as that provided by Reliability Coordinators, was a contributing factor to the blackout. Yet the Standard Drafting Team has disregarded these findings in exempting Reliability Coordinators. It is a fallacy to believe that only entities with direct control of substations need protection from physical attack. If critical substations and their Reliability Coordinators are attacked in a coordinated manner, what entity will lead system restoration? It is essential that Reliability Coordinators are designated as responsible entities, both to protect their own facilities and to enable their authority to review the adequacy of physical security capabilities for operating utilities in their coordinating areas. Key findings of the joint U.S.- Canada Outage Task Force on the August 2003 blackout demonstrated the need for the Reliability Coordinators to actively supervise operating entities both to meet essential operating needs and to assure adequate regional visibility. See U.S.-Canada Power System Outage Task Force

Report (April 2004). <http://energy.gov/sites/prod/files/oeprod/DocumentsandMedia/BlackoutFinal-Web.pdf> 2. Balancing Authorities would be exempted under the standard. According to the NERC Compliance Registry, there are 19 Balancing Authorities that are not also Transmission Operators or Owners. The following standards apply to Balancing Authorities but not to Transmission Operators or Owners: Standard BAL-001-2 — "Real Power Balancing Control Performance"; Standard BAL-002-1 — "Disturbance Control Performance"; Standard BAL-003-1 — "Frequency Response and Frequency Bias Setting"; Standard BAL-004-0 — "Time Error Correction"; Standard EOP-002-3.1 — "Capacity and Energy Emergencies"; Standard IRO-006-5 — "Reliability Coordination — Transmission Loading Relief". If critical substations and their Balancing Authorities are attacked in a coordinated manner, what entity will balance demand and generation and manage the emergency, especially if the attack causes a regional load imbalance? 3. Generator Operators would be exempted under the proposed standard. Generator Operators have vulnerable and hard-to-replace Generator Step Up (GSU) Transformers, just as Transmission Operators have these transformers. Generation facilities could present contingencies in excess of spinning reserves, especially in congested areas with import of large megawatts of power over long transmission lines. Hence, Generator Operators should be included in mandatory physical security protection standards. 4. The standard does not require modeled contingency planning for scenarios of physical attack. Contingency planning for physical attack should include megawatt capacity of all generators at single generation facility, not just failure of some individual units at the facility. 5. Without explicit modeling for physical attack, some substations may fall through the cracks under "Aggregate Weighted Value" methodology in the standard. Physical attack of multiple transformers is different than the random failures planned for under the standard N-1 criterion. We have already seen attack on multiple transformers and their circuits at the Metcalf substation. The standard's criterion for violation of IROL limits would not be valid if the IROL limits assume random failures rather than coordinated physical attack. 6. Some "High Impact" control centers would be exempt under the standard. Examples include the control centers for Peak Reliability, MISO, and SPP. In all, these control centers manage power for 141 million Americans. Control centers for Reliability Coordinators, Balancing Authorities, and Generator Operators are included in the "High Impact" Criteria for CIP-002-5.1 How can the standard drafting team take the CIP-002-5.1 criteria for substations but not control centers of Reliability Coordinators, Balancing Authorities, and Generator Operators? FERC Directive RD14-6-000 specifically requires protection of critical control centers in Footnote 6: "… the Commission expects that critical facilities generally will include, but not be limited to, critical substations and critical control centers." 7. While FERC Directive RD14-6-000 [146 FERC ¶61,166] did not require specific security measures, it could have been reasonably expected that NERC would have developed specific measures to be applied on an as-needed basis. Nonetheless, the draft standard contains no specific requirements or even suggested guidelines for physical security measures. Such measures might include: Opaque Fencing; Concrete Jersey Barriers; Motion Sensors; License Plate Scanners; Intentional Electromagnetic Interference (IEMI) Detectors; Gunfire Locators; Limiting of Close Public Access, Including Recreational Access; Armed Private Guards; Police Details; Deployment of National Guard

Troops; Better Stocking of Spares—e.g., Transformer Bushings and Radiators; Equipment Monitoring and Redundant Telemetry to Control Centers. Instead, the standard relies upon self-devised security measures without prioritization or other guidance. 8. The Metcalf incident unambiguously showed the value of equipment monitoring in mitigating physical attack on power transformers. Gunfire locators, had they been installed at Metcalf, could have alerted system operators to the attack in real-time, allowing prompt dispatch of law enforcement. Intentional Electromagnetic Interference (IEMI) Detectors could likewise provide real-time warning. If threat sensors with reliable and cyber-protected alerts are not part of a physical security system, it will be impossible to mobilize time-urgent countermeasures and impractical to take precautionary measures at other at-risk facilities vulnerable to coordinated attack. 9. Intentional Electromagnetic Interference should be a physical threat included in the standard, because IEMI attack could occur in the physical proximity of facilities and could cause permanent physical damage in additional to temporary upset. IEMI detectors are a cost-effective measure as these devices cost approximately $15,000 per unit. 10. The Metcalf Incident was both a physical attack and a cyber denial-of-service attack. The need for linkage between physical and cyber is explicitly called for in the RD14-6-000 Order of March 7, 2014, para 5, footnote 3. The implementation plan under this Order must require responsible entities to identify and protect cyber assets that link facilities and control centers that are otherwise identified as critical to the reliability of the BES. Communications and Network entities routinely provide hardened and alternate routing for military, other government and the Defense Industrial Base and their services should be an explicit requirement for Physical Security Standards that apply to any units and control centers that are identified by Responsible Entities as critical to the Reliability of the BES. 11. Review and certification of security plans, as proposed in the draft standard, does not necessarily provide a level of independence that would be prudent or credible to the public. Regional Entities or Reliability Coordinators for any facilities under their jurisdiction should be the primary authorities to review and approve security plans. Governmental authorities should have the ability to audit security plans. 12. Improvements to the standard that we suggest would be marginal additions of facilities and their equipment and therefore would be cost-effective. We propose inclusion of primary and backup control centers for Peak Reliability, MISO, and SPP—an increase of 6 control centers as compared to approximately 200 already included Transmission Operator control centers. We propose inclusion of 19 additional Balancing Authorities as compared to 114 Balancing Authorities in total. There are only 50 non-nuclear generation facilities in the United States with nameplate capacity of 2 GW or more—this number is a rough approximation of the number of generation facilities that modeling might show to be capable of causing cascading outage if successfully attacked. 13. RD14-6-000 directs NERC to submit for approval a physical security standard that would apply to the most critical facilities of the Bulk Electric System. The Standard Drafting Team has narrowly interpreted “critical facilities” to mean transmission facilities and directly linked control centers. We disagree with this narrow interpretation. Given the NERC interpretation and the 90 day deadline for standard development, NERC’s draft standard holds tightly to the most minimal facilities and therefore has significant gaps in protection as we describe in our foregoing comments. Some of these gaps, such as the exemption of Reliability Coordinators

and Balancing Authorities, are so fundamental that they should be addressed immediately. For other gaps, we ask that NERC open a Standard Authorization Request (SAR) for a Phase Two physical security standard. This follow-on Phase Two standard should require modeling of BES operations sufficient to ensure identification of facilities that could cause cascading outage, single points of failure, data connectivity needs, and other processes and technologies essential to grid protection—in short, a standard designated CIP-014 Version 2. An approved SAR for a Phase Two standard should be concurrent with NERC Board of Trustees approval of the current standard in development.
No
Same answer as provided to Question 1.
No
The third party review is not adequately specified. The Joint U.S.-Canada Outage Tasf Force Report (April 2004) determined that lack of Reliability Coordinator oversight, and legal authority, contributed to inadequate supervision of transmission operators, and reduced visibility of regional inadequacies. See our comment to Question 1 for our view that Reliability Coordinators and Balancing Authorities must be involved.
Yes
We recognize that FERC has established a 90-day review process, and that NERC has worked to meet the tight deadline. Hence, the Foundation for Resilient Societies asks NERC to develop a SAR for Physical Security Standards - Phase 2. In this process, analytical modeling should be undertaken to identify and prioritize physical security risks that include cyber vulnerabilities, and that relate to the need for reliable warning and communications via redundant channels to control centers and to law enforcement. It should not be acceptable to exclude Regional Coordinators and Balancing Authorities, both groups needing to review and perhaps upgrade their own physical security, and both groups playing key roles in oversight of the operating entities, both TOs and GOs, whose physical security may be essential to prevent long-term outages through coordinated attacks. For additional materials prepared by the Foundation for Resilient Societies, contact the FERC staff designated to assist NERC with standard setting in FERC Docket RD14-6-000.

Bureau of Reclamation
Erika Doot
No
The Bureau of Reclamation (Reclamation) believes that the Transmission Planner, Planning Coordinator, and Reliability Coordinator should be included in the Applicability section of the standard and should be responsible for reviewing the Transmission Owner’s risk assessment (BES impact assessment).
No
Reclamation agrees with this approach. However, to promote consistent identification of critical facilities within an interconnection, Reclamation believes that the third-party review should be conducted by the Transmission Owner (TO)’s Planning Coordinator or Transmission Planner. If the Transmission Owner is also the Transmission Planner and Planning Coordinator, the third-party review should be performed by the Reliability Coordinator. Reclamation also suggests that the drafting team modify the term “risk assessment” to “BES impact assessment.” In the physical security community, the term “risk assessment” generally refers to “The process of assessing security-related risks from internal and external threats to an entity, its assets, or personnel.” See ASIS International, General Security Risk Assesment Guideline (2002), http://www.scnus.org/local_includes/downloads/9200.pdf. In its filing to FERC, NERC can explain that it adopted the term “BES impact assessment” so it is clear that the initial evaluation is of risk to the BES if the substation is rendered inoperable or damaged. Reclamation also recommends revising R1.1 to require subsequent risk assessments every 60 months for all Transmission Owners. Reclamation believes that periodic risk assessments are necessary, but has not seen evidence that the costs associated with updating risk assessments every 30 months rather than every 60 months would provide commensurate reliability benefits. Reclamation recommends that the drafting team update R1.1 to state, “Each Transmission Owner shall review their BES Impact Assessments once every 60 months for any transmission stations or Transmission substations that if rendered inoperable or damaged

could result in widespread instability, uncontrolled separation, or Cascading within an interconnection after completion of the initial assessment.”
No
Reclamation agrees with the requirements to develop a threat assessment and physical security plan. Reclamation also agrees with the inclusion of governmental agencies with physical security expertise as threat assessment and physical security plan reviewers. However, Reclamation does not believe that the proposed requirements will allow adequate time for a comprehensive review. Reclamation suggests that at least 180 days would be a more appropriate timeframe for a detailed threat analysis and physical security plan review. Reclamation also requests that the drafting team clarify the scope of third party reviews of these threat assesments and physical security plans, perhaps by adding additional detail to the Guidance and Technical Basis section. Reclamation is not convinced that third-party reviews will increase reliability. Reclamation believes that each entity is in the best position to evaultate threats to its facilities and determine appropriate mitigation plans. Reclamation is concerned that the well-intentioned third-party review mandated by the order could result in classified or national security related information falling into the wrong hands. Reclamation does not believe that non-disclosure agreements will adequately protect this sensitive information.Reclamation believes that audits by regional entities in essence provide a “third-party” review of an entity’s threat assessments and physical security plans.
Yes
Reclamation is concerned that the term “primary control center” will become confused with the NERC Glossary term “Control Center.” As indicated by the use of the term “monitor” in the definition of Control Center, Reclamation does not believe that the concept of “operational control” has been equated with “causing direct physical action” to date. To avoid confusion, Reclamation suggests that the drafting team replace the R1 phrase “primary control center that operationally controls eachTransmission station or Transmission substation” with the phrase “primary control center that physically controls each Transmission station or Transmission substation.”
