Yes
The SAR should not be posted with the Standard. The intent of posting a SAR for comment is to seek industry's input on the need and scope of a proposed standard's development or revision. Posting the Standard for comments and ballot means that the SAR is "water under the bridge", and that industry's input on the SAR doesn't mean anything.
Yes
VAR-002 uses footnote (3) on page 6 to clarify the phrase "voltage or Reactive Power schedule." VAR-001 does not use a footnote or otherwise define "voltage or Reactive Power schedule." Intead of using a footnote to clarify/define the phrase, add the phrase "voltage or Reactive Power schedule" to the Definitions of Terms Used in the Standard, making sure it is applicable to both VAR-001 and VAR-002. Suggest adding the following wording to both VAR-001 and VAR-002: Definitions of Terms Used in the Standard: Voltage or Reactive Power Schedule – A target value communicated by the Transmission Operator to the Generator Operator establishing a tolerance band within which the target value is to be maintained during a specified period. If this definition is added to VAR-001 and VAR-002, then VAR-002 footnote (3) should be deleted. For VAR-001-4: Recommend adding "upon request" to this sub-requirement to make it read: "Each Transmission Operator shall provide a copy of these documented policies or procedures to adjacent Transmission Operators, upon request." VAR-001 uses the term "real-time" (no capitalization) throughout, whereas VAR-002 uses the term "Real-time" (capitalized) in R1. The capitalized term is defined in the NERC Glossary of Terms Used. The Glossary definition is the meaning intended for both standards. Please use consistent terminology employing the capitalized Glossary term "Real-time" throughout both Standards. Regarding VAR-001, typically, the voltage and Reactive Power (VAR) output of a generator may be adjusted by one or more of three means: a no-load tap changer (NLTC), a load-tap changer (LTC), or an automatic voltage regulator (AVR). The requirements in the VAR-001 Standards should more fully and clearly address these Real-time and periodic NLTC, LTC and AVR changes or adjustments. The following wording changes are proposed for VAR-001 Requirements R1, R3, R4 and R6: The language of R1 includes key words such as "implemented" and "control voltage," representing Real-time actions taken by a TOP to keep voltages within limits that could be interpreted to include actions such as switching shunt capacitors/reactors, adjusting transformer taps, adjusting transfers, adjusting generation or other dynamic VAR sources (like SVC's). The intent of R1 may simply be to address the RC monitoring issue, as directed by FERC Order 742 (see Rationale for R1). However, the R1 language can also be interpreted to include the Real-time aspects of R4 creating a potential overlap. Depending on the interpretation and intent of the drafting team for R1, might R4 be a candidate for elimination? Regardless, clarity of wording and intent in R1 is needed. If the intent in R1 is to respond to FERC's

Order 742 directive to assure “monitoring,” then the Drafting Team should consider deleting the action verb “implemented.” The revised wording would read: R1. Each Transmission Operator shall have documented policies or procedures that are to establish, monitor, and control voltage levels and Reactive Power flows (Mvar flows) within limits … If “implemented” is not deleted, then it should be replaced by words conveying the intended meaning, e.g., “that are monitored and enforced.” However, there enforcement is inherent in all standards that all “documented policies or procedures” will be enforced. Application is verified by audit. Adding the phrase “that are implemented” is not needed, and can possibly lead to confusion. The TOP should only be required to develop exemption criteria in R3 if there is an established need for generator exemptions. Once the TOP has determined that there is a need for generator exemptions, only then should it be required to develop and implement exemption criteria. We recommend changing to word of R3 to not only conform to the appropriate Requirement format but include the preceding: R3. Each Transmission Operator shall determine the criteria that shall exempt generators from R4. Requirement R4 may already be covered by FAC-001 and Requirement R1 and may be deleted. But if not, it should be clarified recognizing the following: NLTCs are typically mechanically-fixed at time of generator interconnection and are only adjusted, if necessary, during a generator outage. The NLTCs may not be adjusted in Real-time. The TOP typically establishes initial voltage and Reactive Power requirements in the Interconnection Agreement under FAC-001-0, which states: R2. The Transmission Owner’s facility connection requirements shall address … R2.1.9. Voltage, Reactive Power, and power factor control. The interconnection provisions of R4 are covered in FAC standards. Non-Real-time Periodic timeframe changes in the NLTC settings may be addressed under Requirement R6. Requirement R6 does not appear to refer to Real-time operations and may be deleted from the Real-time standard. However, if it is not deleted, the wording should be revised to address NLTCs only. NLTCs are typically mechanically-fixed at time of generator interconnection and are only adjusted, if necessary, during a generator outage. The NLTCs may not be adjusted in Real-time. The initial NLTC settings are typically addressed during the generator interconnection process (see FAC-001). The need for a NLTC change is typically determined by the TOP through periodic (e.g., seasonal, 5-yr.) system studies. NLTCs adjustment are determined by and directed by the TOP. Alternatively, a load tap changer (LTC) may be adjusted by the GOP under load in Real-time. The setting of any LTC and the automatic voltage regulator (AVR) are typically under the control of the GOP. If this Requirement is referring to a LTC operation in Real-time, it is inappropriately assigned to the TOP. The GOP should have the flexibility to follow its voltage and Reactive Power schedule using the LTC and/or AVR. Alternatively, if the requirement is addressing changes applicable only to the NLTC, then it should be reworded accordingly. We assume the intent is to address NLTC tap changes only and recommend a wording/format change as follows: R6. Each Transmission Operator shall determine the need for generator step-up transformer no-load tap changes. 6.1 After consulting the Generator Operator regarding necessary step-up transformer tap changes, the Transmission Operator shall provide documentation to the Generator Operator specifying the required tap changes, a timeframe for making the changes, and technical justification for these changes. R1 can be interpreted to require a TOP to have documented policies or procedures in place that can be implemented to establish, monitor, and control voltage levels and Reactive Power flows (Mvar flows) within limits as defined in Parts 1.1 to 1.3. However, Part 1.1 requires that the policy/procedure shall include criteria used in system assessments. What is “system assessments” intended to mean? What is “criteria for the assessments” intended to mean, especially in relation to “established steady-state limits, voltage stability limits, etc.? If the assessments were meant to yield the “limits”, then there it is confusing as to what limits are intended to be developed in relation to the “established” limits. In Order 693, P. 1868, FERC directs the ERO to modify VAR-001-1 to include more detailed and definitive requirements on “established limits”. Does it mean more detailed and definitive requirements on stipulating voltage and reactive requirements with respect to established limits (SOLs, IROLs, voltage level, etc.), or does it mean more details on limits (boundaries) of the interconnection voltages as implied by Requirement R8 of the existing VAR-001 Standard? Requirement R1 does not provide clarity since Part 1.1. refers to “established steady-state limits, voltage stability limits”, which is different from the “established limits” presented in the R8 of the existing VAR-001 standard. Requirement R1 as presented does not provide any clarity as to what practice a TOP is required to meet. Requirement R1 as presented is unclear on its objective and the exact actions required of the Responsible Entity as there are a number of “criteria” and “limits” in the main requirement and its part 1.1 that are confusing and subject to different interpretations. R1 as presented will leave a Responsible Entity not knowing what it needs to do to meet Requirement and its reliability objectives.

Suggest that R1 and its parts be revised to clarify its intent, especially on the who, the specific actions and expected outcome according to the results-based principle and guideline. With respect to part 1.1, Measure M1 asks for evidence that proves voltage is currently being monitored. “Such evidence may include, but is not limited to: 1) proof that points are telemetered, 2) alarms are functioning, and 3) during events of low or high voltage the policies and procedures are being followed to respond to control voltage levels.” These examples of evidence do not reflect the scope and depth of R1 and Parts 1.1 (the criteria and assessment parts). R2 as presented appears to go beyond the FERC directive that RC be included to be assigned the “monitoring responsibility” as R2 now requires the RC to “….perform assessments on their respective areas in order to ensure sufficient reactive resources are available for scheduling to maintain voltage stability under normal and contingency conditions in order to provide the voltage levels as defined in Requirement R1.” The inclusion of RC in this requirement is also inconsistent with the view presented in the Informal Consideration with respect to parity between TOPs and RCs. Parts 2.1 and 2.2 stipulate a number of tasks for the TOPs with respect to operating or directing the real-time operation of devices necessary to regulate transmission voltage and reactive flow, and to ensure that sufficient reactive resources have been scheduled to meet the acceptable day-ahead voltage limits identified in Requirement R1. These tasks do not involve the RC. It thus raises a question on the need for including RC in the main requirement when it is not required to take further actions to assure its assessment of “sufficient reactive resources are available for scheduling to maintain voltage stability under normal and contingency conditions” can be fulfilled in real-time operations. We believe the inclusion of RC in this requirement is inappropriate, or if there is a compelling reason to include the RC, then Parts 2.1 and 2.2 are insufficient to assure the RC’s assessment can be supported in real-time operations. Requirement R2, Part 2.1 stipulates that the Transmission Operator has two things (operate or direct) that can be done to “…regulate transmission voltage and reactive flow necessary to regulate transmission voltage and reactive flow which may include…”. Part 2.1 should only contain one thing. The order of Requirements R3 and R4 should be reversed since the exemption criteria (R3) should appear after the overarching requirements for GOs to maintain a voltage or Reactive Power schedule and tolerance band. Regarding Requirement R5, suggest replacing “know” with “monitor”. This provides an active approach, which is appropriately reflected by the wording in Measure M5. In the Compliance Section, there is no requirement for the RC to retain evidence for Measure M2. Further, there is no requirement for the TOP to retain evidence for Measures M5 and M6. Regarding the VSL for R1, there is no explicit requirement in R1 for the TOP to provide a copy of the assessment criteria to its RC or neighbor TOPs since the assessment criteria are supposed to be included in the policy or procedure document. The Low VSL thus serves no purpose. Further, from the standpoint of meeting the intent of Requirement R1, there is little to no difference between having documented policies or procedures which do not include any of the elements stipulated in Parts 1.1 to 1.3, and having no documented policies or procedures at all. Suggest to remove the Low VSL and the High VSL, and keep the Moderate VSL and revise the Severe VSL to include the condition presented in the High VSL as an “OR” condition under the Severe VSL. Regarding the VSL for R2, throughout R2 there are no specific requirements for having policies and procedures implemented to have sufficient MVARs. R2 requires the TOP and RC to perform assessments on their respective areas in order to ensure sufficient reactive resources are available for scheduling to maintain voltage stability under normal and contingency conditions. Part 2.2 stipulates the requirements for scheduling reactive resources to meet the reactive requirements resulting from day-ahead assessments. Part 2.1 stipulates the requirement to operate or direct the real-time operation of devices necessary to regulate transmission voltage and reactive flow. While the Moderate VSL, which addresses non-compliance with Part 2.2 and appears to be reasonable, the Severe VSL does not correspond to how Part 2.1 is presented. The condition that “A lack of real-time operations is also severe.” seems irrelevant to Part 2.1 when it comes to operating or directing the real-time operation of devices necessary to regulate transmission voltage and reactive flow. There can be no lack of real-time operations, but a TOP may totally ignore the operations or directing the operations of devices necessary to regulate transmission voltage and reactive flow. There is no VSL for the RC failing to meet R2. Hence, the RC is assigned a responsibility but its compliance is not measured and there is no VSL to determine its non-compliance. Regarding the VSL for R5, the conditions in the Moderate and High VSLs are irrelevant to the requirement. R5 requires a TOP to know (monitor) the status of all transmission Reactive Power resources, automatic voltage regulators, and power system stabilizers in its system. The Moderate VSL makes reference to a “stable area”, which is totally irrelevant and out of context of R5. In the High VSL, the TOP not knowing “the status of important equipment in weaker areas that were identified in assessments as part of R1.” are also irrelevant and

out of context of R5. Finally, there is no Severe VSL. What constitutes a total failure to comply with Requirement R5? Regarding the VSL for R6, the Low VSL should have an “is”, not an “are”. There is no Severe VSL and hence there is no condition to constitute a total failure to comply with Requirement R6. VAR-002-3 Regarding Measure M2, M2 presents the scenarios where a Generator Operator may not be able to meet a voltage schedule or comply with the TOP’s directive, and how a GOP may manage the situations. The description part does not belong in a Measure, and should be moved to the Background Information Section that a Results-based standard template has made provision for. Regarding Measure M3, the latter part of M3 is not presented in a manner to require the evidence to demonstrate compliance. Suggest revising M3 to read: The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of any of the changes identified in Requirement 3, or evidence that the status had been restored within the first 15 minutes of such change. For all Measures, there are no examples of evidence provided. It would be appropriate if after each of the “evidence”, additional wording “such as log, recording, or other documents” so as to be consistent with the way Measures are presented in other standards. Regarding Evidence Retention, it would be appropriate to reference the Measure Number for the GO’s and the GOP’s data retention requirements.
No
NERC’s Reliability Issue Steering Committee (RISC) is charged to address emerging reliability issues and recommend preferred approaches to manage such issues. Whether or not the TOP/GOP voltage coordination issue should rise up to a risk level that warrants special attention by the industry, and whether the appropriate way to address this issue in a standard project will be best evaluated and determined by the RISC. We suggest that the Drafting Team nominate this issue for RISC consideration. The Requirements in both VAR-001-4 and VAR-002-3 should be reviewed to ensure they are in the correct NERC Standard Development format.

VAR-001-4: R1: In addition to controlling voltage, R1 also requires procedure for control of reactive flow. Reactive flows are hard to control and there is no reliability benefits for controlling the reactive flow. Reference to reactive flow should be deleted. R2: This requirement is a duplication of requirements in other standards such as in TPL standards. Reactive assessment should not be part of this standard. R5: This requirement is unnecessary. A GO is already obligated to provide the status of AVR and PSS information to TO (VAR-002-3). This requirement puts unnecessary burden on TO to monitor status of all AVR and PSS. Particularly, TO does not have any value in knowing the PSS status. He cannot do anything with that information. There is no reliability benefit of this requirement. If the drafting team thinks that knowing the status of PSS is necessary for TO, please provide the rational. VAR-002-3: R3: Notifying the status of PSS is unnecessary since TO will not use that information for operating system any differently or do anything with that information. If the drafting team thinks that this information is necessary, please provide the rational.
Yes
There is no need to restrict the time to 15 minutes. It should be at least 30 minutes. For any system changes typically 30 minutes are allowed to readjust the system. A TO not knowing the status of AVR for 60 minutes is not going to cause any reliability issue. GO should be given 30 minutes to fix the problem and then 30 minutes to notify the TO if the problem is not fixed.

Yes
VAR-001-4 R3 establishes the ability for the TOP to exempt a GOP from maintaining a voltage schedule and directing the GOP to perform in automatic and exempts from the report requirements that would be established under R4. VAR-002-3 R1 establishes the GOP requirement to operate in the automatic mode. This requirement is not prefaced with "unless exempted by the TOP". It is unclear that if the TOP has exempted the GOP from maintaining a voltage schedule in automatic and reporting AVR status changes, the GOP still needs to keep the AVR in automatic. If a generator is equipped with an AVR, but exempted by the TOP, one can interpret that the GOP still must maintain a voltage schedule (not TOP established) in automatic. Recommend modifying R1 with the lead in "unless exempted by the TOP,". This would clarify the intended operation of the GOP.

In VAR-001-4 Applicability section 4.3 says “Generator Operators within the Western Interconnection”. But nowhere in the Standard does it discuss what are the responsibilities of the GOPs in the Western Interconnection. It has to do with the WECC variance to VAR-001 issued by FERC on 6-20-13 but VAR-001-4 does not explain it.
No
Yes
VAR-002-2 R2 requires the GOP to notify its associated TO within 15 minutes if both: 1) the GOP operated outside the voltage schedule for 15 minutes and 2) the GOP is no longer able to return to its voltage schedule. Regarding item 2) above, how long does the GOP have to return to its voltage schedule? Most GOPs eventually return to the voltage schedule, e.g., either a sister unit at the plant site returns from a forced outage boosting voltage or the wider area voltage returns to normal due to circumstances beyond the GOP’s control. If the GOP returns to its voltage schedule 24 hrs later, does that require notification? Regarding item 1) above, setting the threshold for operating outside the voltage schedule at 15 minutes seems overly prescriptive. Suppose a generator operates outside the voltage schedule for 14 mintues and then operates inside the schedule for 5 minutes, and the process repeats itself. The hourly average voltage may be outside the schedule, but the 15 minute threshold is never reached, so no notification is required. A simpler alternative to the 15 minute threshold would be to use a one hour clock average before reporting is required and eliminate item 2).

Yes
The Bureau of Reclamation (Reclamation) suggests that VAR-001-4 and VAR-002-3 should be combined into one standard because of the reciprocal requirements in each standard (e.g., VAR-001-4 R6 would require the Transmission Operator (TOP) to consult with the Generator Owner (GO) regarding TAP setting changes, and VAR-002-3 R5 requires the GO to ensure that tap positions are changed when possible). If the drafting team prefers not to combine the two standards, Reclamation requests that the drafting team explain why two standards are more appropriate. The Bureau of Reclamation (Reclamation) notes that VAR-001-4 appears to apply to Generator Operators within the Western Interconnection, and the White Paper on the VAR Standards dated July 18, 2013 explains that this is because the WECC variance in VAR-001-3 is retained in VAR-001-4. If the variance is retained, Reclamation suggests that the entire text of the variance should be included in VAR-001-4 rather than incorporated by reference in order to prevent confusion among registered entities. Reclamation also requests that the drafting team explain why the WECC variance would not be beneficial for reliability continent-wide.

VAR-002-3 R2, I think that this requirement is going to be very hard to document compliance. Monitoring voltage at the POI, tracking the time the voltage exceeds the limits and notification to the TOP all will need to be captured.
Yes
I think that the 30 minute notification after a 15 minute violations is reasonable but it think this requirement will be very hard to prove or disprove compliance. Is the intent for the TOP to monitor the GOP or is the GOP responsible to show compliance when there is a deviation. A GOP may not be monitoring the voltage at the POI and unaware that they are outside the voltage limits. If the GOP is not able to bring the bus voltage to within limits and contacts the TOP is there a length of time that they can be outside the bounds.
Coordination is a problem for the requirements in many standards and I'm not sure of a good way to improve coordination. I do not believe that this Standards Project is the time or place to address the issue.

VAR-001-4: R4 of VAR-001-4 seems to have a potential inconsistency between the parenthetical statement and the balance of the requirement. It is suggested that R4 be rewritten and simplified as follows: “Each Transmission Operator shall specify a voltage or Reactive Power schedule and tolerance band for Generator Operators at either the high side or low side of the Generator Step-Up transformer at the TOP's discretion”.[Note the SDT may want to review the concept of “mutually agreed upon” instead of the TOP’s discretion] Additionally, there needs to be a feedback loop from the GOP to the TOP regarding the voltage schedule. The following allows the GOP to provide feedback regarding the feasability of the schedule. A recommended R4.2 for VAR-001 : R4.2 The Generator Operator shall review the voltage or Reactive Power schedule and tolerance band provided by the Transmission Operator and inform the Transmission Operator of any conditions that would prevent the Generator Operator from complying with the schedule or tolerance band, along with the technical basis for that determination. The question that then comes up is, what does the TOP do if the GOP cannot comply with the schedule as presented? Recommended R4.3 to read: R4.3 If the Generator Operator is unable to comply with the voltage or Reactive Power schedule or tolerance band as provided by the Transmission Operator, the Transmission Operator shall (a) modify the voltage schedule within the parameters established in the documented policies and procedures established in R1, taking into account the Generator Operator’s limitations, or (b) exempt the Generator Operator from following the voltage schedule or tolerance band using the criteria established in R3.To allow for coordination of operations between Transmission Operators and Generator Operators, it is suggest the the words “that is mutually agreed” after the words “timeframe for making the changes” be added in requirement R6 of VAR-001-4. A recommended change to R6 of VAR-001 is as follows: “After consultation with the Generator Owner regarding necessary step-up transformer tap changes, the Transmission Operator shall provide documentation to the Generator Owner specifying the required tap changes, a timeframe for making the changes that is mutually agreed, and technical justification for these changes.” That is, the change should normally wait until it can be rolled into a scheduled downtime event. VAR-002-3 The following change to the rationale for R2 of VAR-002-3 is suggested: Change “…or when the unit is too small to raise voltage” to, “…or when the unit is too small to control voltage within the tolerance band.” The implications of footnote 4 to requirement R2 of VAR-002 is unclear in that it is not identified what stablility limit is being referred to: that of the voltage regulator or a transmission system stablility limit. If it is a transmission system stability limit it is unclear how a generator operator would be aware of it and how the generator operator should change the unit capability accordingly. R2 should read, “Unless exempted by the Transmission Operator, each Generator Operator shall maintain the generator voltage or Reactive Power schedule (within each unit’s capabilities4) as directed by the Transmission Operator.” R2.1 should read, “If the voltage drifts out of schedule, each Generator Operator shall notify its associated Transmission Operator when both of the following conditions are met: 1) the parameter being controlled has been outside the prescribed voltage or Reactive Power schedule tolerance band for 15 minutes; and 2) the GOP is

unable to return the parameter being controlled to within the voltage or Reactive Power schedule tolerance band." What's drifting is the grid, not the generators. R2.2 should read, "When a generator's automatic voltage regulator is out-of-service, the Generator Operator shall use an alternative method to control the generator reactive output to meet the voltage or Reactive Power schedule directed by the Transmission Operator, unless the TOP grants an exemption." The purpose of this change is to reference the process established in R3 of VAR-001.

No

The NSRF request that "within 30 calendar days of a request." (of R4) be modified to "within 30 calendar days or agreed upon schedule of a request." This will allow small GOPss to establish a working rapport with their TOPs, since many small GOPs may only have one subject matter expert that has this technical information. Please break the Standards apart into separate ballots. Since the applicable entities are different and the Standards cover different reliability related requirements. Please clarify within Measure 2, that not every day of "system studies" are required to be on-hand as evidence, if the study has not changed, as stated in the last sentence of measure 2.

TVA appreciates the effort that the ad-hoc group has put into this revision. For VAR-001-4, TVA supports the SERC OC Review Group comments. For VAR-002-3, TVA has the following two comments: In R1, please add language to ensure that the TOp has the authority to exempt a generator unit. M2 reads like another requirement or technical rationale. Timing requirements should be made clear in the requirement itself, and the measurement should only detail the evidence needed for the corresponding requirement.

Yes

For R2, TVA requests that notification be based on voltage readings taken no more often than 60 minutes and no less often than 30 minutes. The degree of signal conditioning allowed should be addressed, expressed as a maximum interval for averaging the variable on which the reading is based. The time that the Generator Operator has to notify the Transmission Operator of a voltage reading outside the published schedule would be no greater than 15 minutes. Paragraph 2.1 would then read: "Each Generator Operator shall take voltage readings no less often than every 60 minutes. Voltage readings shall be averaged over a time interval no greater than 30 minutes. The Generator Operator shall notify its associated Transmission Operator within 15 minutes or a length of time determined and communicated by the Transmission Operator when the following conditions are met: 1) the GOP is operating outside of the prescribed voltage or Reactive Power schedule tolerance band at the time of the latest reading; 2) the GOP is no longer able to return to its voltage or Reactive Power schedule; and 3) no previous notification has been made for the same continuous excursion out of schedule."

VAR-001-4 a. In R4, the standard provides the TOP discretion on whether the voltage schedule provided is on the high or low side of the GSU "at the interconnection point between the generator facilitry and the Transmission Owner's facilities to be maintained by each generator. As written, the

sentence makes no sense. The interconnection point MAY BE on the GSU high side, our it MAY BE at a point where the GO's interconnection facilities connect to the TO's facilities. In other words, the GSU low side, the GSU high side, and the interconnection point may be three different places for a particular generator. To avoid this confusion, we recommend that R4 should be rewritten as the first sentence in R4 in VAR-001-3, with the footnote omitted, as shown below: "R4. Each Transmission Operator shall specify a voltage or Reactive Power schedule at the interconnection between the generator facility and the Transmission Owner's facilities to be maintained by each generator." This change maintains the framework which has existed through three versions of VAR-001. b. With regard to the WECC exception, page 11 under the "Regional Variance" section states: "Regional Variance for the Western Electricity Coordinating Council from VAR-001-3 is retained." We understand it is the intent for VAR-001-3 to be retired, so this reference presents a potential reference problem unless all parts of VAR-001-3 are retired EXCEPT Section E, which contains the WECC Variance. We recommend that Section E in VAR-001-3 in its entirety be brought into VAR-001-4 so that the new standard stands alone. VAR-002-3 With the suggested modifications in VAR-001-4 above, we suggest the following changes to VAR-002-3: c. In R2, subpart 2.1, the phrase "If a GOP drifts out of schedule" should be modified to "If a GOP's generator drifts out of schedule." d. In M2, we have both questions and suggested modifications. i. We do not understand why, in this sentence is in M2 what the phrase "based on existing equipment at its facility" refers to. Is the team referring to the equipment for monitoring the voltage? If not, what is intended? ii. Delete the following: "Therefore, GOPs have the option to operate on a voltage schedule on either the high-side or convert the high-side schedule to a low-side schedule at the GOP's discretion. For units that monitor on the low-side/terminal voltage, Generator Operators shall provide evidence of the method of conversion from the high-side schedule to low-side monitoring." This is not longer needed based upon the changes recommended in VAR-001-4 to NOT provide the TOP with discretion on the reference point for the voltage schedule. iii. For the sentence "Evidence may include, but is not limited to Generator Operator logs, SCADA data, phone logs, and any other alarming notifications that would alert the Transmission Operator that both conditions were met," we suggest that "and" be changed to "or."
No
In M3, the phrase "no call is necessary" should be changed to "no notification is necessary."
The single paragraph in the white paper was not specific enough to warrant a comment. Those that have concerns should express them through suggested modifications of the SAR, which defines the project's scope.

I do not see why there is a need for a fifteen minute cutuoff if the status has been restored. The requirement should allow 30 minutes to provide notification of a stauts change and if at any time during the 30 minutes the status is restored there should be no notification required. Under the current language, if the status is restored at 16 minutes, the GOP then needs to notify its TOP within the next 14 minutes that that generator status changed but returned to normal. How is that improving reliabiilty? It does not improve reliability. The purpose of the 30 minute delay is to allow a GOP to breifly investigate why the status or capabilty has changed and if the solution is at the plant, fix it quickly. I believe 30 minutes is a reasonable amount of time before the GOP needs to notify its TOP that a status or capability change has occured. The GOP will still attempt to fix it but has now notified the TOP. Whether the GOP fixed it in 2 minutes or 25 minutes it still does not need to notify the TOP until 30 minutes. If the problem is fixed before 30 minutes, the event is a non-event as far as the TOP is concerned (except that the TOP knows that it was briefly broken and is now fixed). The TOP is not going to change its operations or invoke some emergency plan for a generator that had a status or capabilty issue for 10 or 20 minutes but is now fine.

We question the need to ask this question when the consolidated standard is already posted for commenting and balloting. The intent of posting a SAR for comment is to seek industry's input on the need and scope of a proposed standard development/revision project. Posting the standard for balloting at the same time suggests that there is already a foregone conclusion on the need and the scope for this project , and that the industry's input on SAR would seem irrelevant. The IESO understands that posting a SAR and the draft standards for comment at the same time can improve standard development efficiency, and we support it to the extent that sufficient technical information has been obtained to facilitate the development of a draft standard at the informal outreach stage. However, we are very concerned about the fact that the industry was asked to ballot the draft standard when the need and scope of the draft standard have not been commented on and supported by the industry, and the standard itself has not been drafted by a formal standard drafting team. Such an approach appears to: a. Deviates from the normal standards development process as presented in the Standards Process Manual (SPM); b. Contradicts and perhaps violates the intent of the established standard development process and ANSI principles to have new and revised standard formally developed through an open and inclusive process before being presented to the RBB for balloting. The industry is being asked to ballot a set of standards that has not been formally developed. This concept appears to be fundamentally flawed. We propose that the SDT convey our concern to the NERC senior management and the Standards Committee. We further suggest that NERC and the SC evaluate alternative approaches or make revisions to the SPM to provide the needed flexibility that can further improve the efficiency in standard development if certain elements in the existing SPM are assessed to restrict such improvements.
Yes
VAR-001-4 a. It is unclear on the main objective and the target reliability outcome of Requirement R1, and the intent of the proposed changes in relation to the directive in P. 1868 in Order 693. We interpret R1 to require a TOP to have documented policies or procedures in place that can be implemented to establish, monitor, and control voltage levels and Reactive Power flows (Mvar flows) within limits as defined in Parts 1.1 to 1.3. However, Part 1.1 requires that the policy/procedure shall include criteria used in system assessments. It is unclear as to what "system assessments" means? Does it mean assessments of the TOP area's reliability performance with respect to the voltage levels and Mvar flows and any limits (SOLs, IROLs, reactive capability)? Or does it mean the system assessment that yields the "limits" (SOLs, IROLs, reactive requirements, etc.) which provide the target and guideline for the establishment, monitoring, and control of voltage levels and Mvar flows? It is also unclear as to what the "criteria of the assessments" means in the second sentence of Part 1.1, especially in relation to "established steady-state limits, voltage stability limits, etc. if the answer to the above question is that the assessments were meant to yield the "limits", then there is a confusion as to what limits are intended to be developed in relation to the "established" limits. In Order 693, P. 1868, FERC directs the ERO to modify VAR-001-1 to include more detailed and definitive requirements on "established limits". However, it is unclear what this directive really means. Does it mean more details and definitive requirement on stipulating voltage and reactive requirements with respect to established limits (SOLs, IROLs, voltage level, etc.) or does it mean more details on limits (boundaries) of the interconnection voltages as implied by Requirement R8 of the existing VAR-001 standard? Requirement R1 does not provide this clarity since Part 1.1. refers to "established steady-state limits, voltage stability limits", which is different than the "established limits" presented in the R8 of the existing VAR-001 standard. It is our understanding that as a general practice, a TOP will assess if there exists any reliability concerns that can be caused by voltage levels and instability to develop operating limits (SOLs or IROLs) to ensure reliable operations. The operating limits may be expressed in voltage level, pre and post-contingency power flow level, reactive support requirements or any combination of the above. The operating limits so established will provide a linkage between the SOL, voltage level and reactive power capability/reserve requirement either explicitly or implicitly. System Operators will monitor the key parameters including

voltage level, power flow level and reactive power flow/reserve/capability to meet the SOL boundary conditions. Requirement R1 as presented does not provide any clarity as to what is it that in the practice that a TOP is required to meet. Requirement R1 as presented is unclear on its objective and the exact actions required of the Responsible Entity as there are a number of "criteria" and "limits" in the main requirement and its Part 1.1 that are confusing and subject to different interpretation. R1 as presented will leave a Responsible Entity not knowing what it needs to do to meet Requirement and its reliability objectives. We suggest the SDT to revise R1 and its parts to clarify its intent, especially on the who, the specific actions and expected outcome according to the results-based principle and guideline. Note that with respect to Part 1.1, Measure M1 asks for evidence that proves voltage is currently being monitored. Such evidence may include, but is not limited to: 1) proof that points are telemetered, 2) alarms are functioning, and 3) during events of low or high voltage the policies and procedures are being followed to respond to control voltage levels. These examples of evidence do not reflect the scope and depth of R1 and Parts 1.1 (the criteria and the assessment parts). b. FERC directive 1855 directs NERC to include Reliability Coordinator as applicable entities and include a new requirement(s) that identifies the reliability coordinator's monitoring responsibilities. In the Informal Consideration specific to this directive presented in the White Paper, it is indicated that: "Although some entities in Texas provided feedback that certain RCs perform functions equivalent to a TOP, the informal development group did not expand VAR-001 to give parity to TOPs and RCs." R2 as presented appears to go beyond the FERC directive that RC be included to be assigned the "monitoring responsibility" as R2 now requires the RC to "….perform assessments on their respective areas in order to ensure sufficient reactive resources are available for scheduling to maintain voltage stability under normal and contingency conditions in order to provide the voltage levels as defined in Requirement R1". The inclusion of RC in this requirement is also inconsistent with the view presented in the Informal Consideration with respect to parity between TOPs and RCs. Parts 2.1 and 2.2 stipulates a number of tasks for the TOPs with respect to operating or directing the real-time operation of devices necessary to regulate transmission voltage and reactive flow, and to ensure that sufficient reactive resources have been scheduled to meet acceptable day-ahead voltage limits identified in Requirement R1. These tasks do not involve the RC. It thus raises a question on the need for including RC in the main requirement when it is not required to take further actions to assure its assessment of "sufficient reactive resources are available for scheduling to maintain voltage stability under normal and contingency conditions" can be fulfilled in real-time operations. We believe the inclusion of RC in this requirement is inappropriate, or if there is a compelling reason to include the RC, then Parts 2.1 and 2.2 are insufficient to assure the RC's assessment can be supported in real-time operations. c. Requirement R2, Part 2.1 stipulates that: "Each Transmission Operator shall operate or direct the real-time operation of devices necessary to regulate transmission voltage and reactive flow necessary to regulate transmission voltage and reactive flow which may include…" We do not understand this requirement as it contains two sets of "necessary to regulate transmission voltage and reactive flow". If this is a typographical error, please correct it. d. We do not have any concerns or comments on R3 and R4 as presented, but suggest that their order be reversed since the exemption criteria (R3) should appear after the overarching requirements for GOs to maintain a voltage or Reactive Power schedule and tolerance band. e. R5: we suggest to change the word "know" to "monitor". This provides an active approach, which is appropriately reflected by the wording in Measure M4. f. In the Compliance Section, there is no requirement for the RC to retain evidence for Measure M2. Further, there is no requirement for the TOP to retain evidence for Measures M5 and M6. g. VSL for R1: There is no explicit requirement in R1 for the TOP to provide a copy of the assessment criteria to its RC or neighbor TOPs since the assessment criteria are supposed to be included in the policy or procedure document. The Low VSL thus serves no purpose whatsoever. Further, from the standpoint of meeting the intent of Requirement R1, there is little to no difference between having documented policies or procedures which do not include any of the elements stipulated in Parts 1.1 to 1.3, and having no documented policies or procedures at all. In the former case, the documented policies or procedures provide absolutely no value, and hence is it a total violation of the intent of R1. We suggest to remove the Low VSL and the High VSL, and keep the Moderate VSL and revise the Severe VSL to include the condition presented in the High VSL as an "OR" condition under the Severe VSL. h. VSL for R2: Throughout R2, there are not specific requirements for having policies and procedures implemented to have sufficient Mvars. R2 requires the TOP and RC to perform assessments on their respective areas in order to ensure sufficient reactive resources are available for scheduling to maintain voltage stability under normal and contingency conditions. Part 2.2 stipulates the requirements for scheduling reactive resources to meet

the reactive requirements resulting from day-ahead assessments. Part 2.1 stipulates the requirement to operate or direct the real-time operation of devices necessary to regulate transmission voltage and reactive flow. While the Moderate VSL which address non-compliance with Part 2.2 and appears to be reasonable, the Severe VSL does not correspond to how Part 2.1 is presented. Further, the condition that “A lack of real-time operations is also severe.” seems irrelevant to Part 2.1 when it comes to operating or directing the real-time operation of devices necessary to regulate transmission voltage and reactive flow. There can be no lack of real-time operations, but a TOP may totally ignore the operations or directing the operations of devices necessary to regulate transmission voltage and reactive flow. Finally, there is no VSL for the RC failing to meet R2. Hence, RC is assigned a responsibility but its compliance is not measured and there is no VSL to determine its non-compliance. i. VSL for R5: The conditions in the Moderate and High VSLs are irrelevant to the requirement. R5 requires a TOP to know (monitor) the status of all transmission Reactive Power resources, automatic voltage regulators, and power system stabilizers in their system. The Moderate VSL makes reference to a “stable area”, which is totally irrelevant and out of context of R5. In the High VSL, the TOP not knowing “the status of important equipment in weaker areas that were identified in assessments as part of R1.” are also irrelevant and out of context of R5. Finally, there is no Severe VSL. It begs the question on: what constitutes a total failure to comply with Requirement R5? j. VSL for R6: The Low VSL should have an “is”, not an “are”. Also, there is no Severe VSL and hence there is no condition to constitute a total failure to comply with Requirement R6. VAR-002-3 k. Measure M2: A good part of M2 presents the scenarios where a Generator Operator may not be able to meet voltage schedule or comply with the TOP’s directive, and how a GOP may mange the situations. The description part does not belong to a Measure, and should be moved to the Background Information Section that a Results-based standard template has made provision for. l. Measure M3: the latter part of M3 is not presented in a manner to require the evidence to demonstrate compliance. We suggest M3 be revised to: The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of any of the changes identified in Requirement 3, or evidence that the status had been restored within the first 15 minutes of such change. m. For all Measures, there are no examples of evidence provided. It will be appropriate if after each of the “evidence”, additional wording “such as log, recording, or other documents” so as to be consistent with the way measures are presented in other standards. n. Evidence Retention: It will be appropriate to reference the Measure Number for the GO’s and the GOP’s data retention requirements.
No
NERC’s Reliability Issue Steering Committee (RISC) is charged to address emerging reliability issues and recommend preferred approaches to manage such issues. Whether or not the TOP/GOP voltage coordination issue should rise up to a risk level that warrants special attention by the industry, and whether the appropriate way to address this issue in a standard project will be best evaluated and determined by the RISC. We suggest that the SDT nominate this issue to the RISC for its deliberation.

No
Yes
The SDT should revisit VAR-002-3 Requirement R2 (including sub-requirements) and Measure M2. Generators should be required to operate in automatic voltage control mode and implement a setpoint consistent with the voltage target (schedule, etc.). The current requirement combined with the measure presents a framework that opens new reliability gaps. For example, in the new framework, if the voltage in a localized area goes low, the generators that notice the drop first are encouraged to deviate from actions that are predictable and take independent action to alter their control systems to provide the system more VARs. This presents three problems: 1) The ideal situation would be for the Transmission Operator to allow sufficient time for all of the generators under its control to automatically respond and then issue specific dispatch instructions to those units that are optimally able to resolve the issue: 2) When numerous generators take independent action, it’s questionable as

to whether the Transmission Operator's real-time evaluations of system contingencies are accurate b/c the assumptions related to how a generator will respond are no longer accurate and are unpredicatable due to the independent actions taken by GOPs; and 3) The generators that are slower to notice the voltage dip will likely not alter their control system parameters; allow for the automatic voltage regulator to respond (at which point adequate voltage will likely be restored); and, potentially, these units will have an economic advantage over similarly sized units because they are supplying less VARs than the units that took independent action (If you generate more VARS you can generate less Watts at maximum MVA on the generator capability curve). Additionally, Measure M2's statement "For units that monitor on the low-side/terminal voltage, Generator Operators shall provide evidence of the method of conversion from the high-side schedule to low-side monitoring" creates a hidden defacto requirement for those units that control their units based on the low-side of the GSUT. It's unclear how possession of a conversion method without any clear criteria for what should be included in the conversion method could 1) improve system reliability and 2) be evaluated by an auditor during a compliance audit. The majority of generators on the grid are controlled on the low-side of the GSUT. Under normal conditions, since generator's operation is validated when the unit is brought on-line and voltage schedules should consider N-1 and credible N-2 contingencies, the voltage drop across and losses through the GSUT should have minimal impact (on an individual generator basis) on the voltage quality of the grid. If the technical concern is based on the aggregated impact of GSUTs' voltage regulation varing with loading, then criteria for a methodology should be developed for those units that do not have the capability to monitor the high side voltage in real-time. However, industry input feedback indicates that only a minority of generation units that control on the low-side of the GSUT do not have high-side monitoring. The majority of units that control their AVR based on the low-side of the GSUT do see the high-side voltage and would notify the Transmission Operator of a deviation from the voltage schedule lasting longer than 15 minutes (VAR-002 R2), which would allow the Transmission Operator to direct the Generator Operators under their control to correct the deviation in a predictable and economic fashion AND would allow the Transmission Operator to calibrate any assumptions / variables necessary in their real-time models so that the real-time evaluations reflect accurate input data. Additionally, we would suggest that the models used by Transmission Operator to satisfy requirements R1 and R2 of the draft VAR-001 standard should account for the GSUT's voltage regulation characteristics under normal system operation in order to accurately reflect that Generators are controlling the low-side bus.
If the Transmission Operator has not reached a pre-defined system operating alarm / limit and the Generator Operator is already operating with its automatic voltage regulatory in voltage control mode, what reliability concern is alleviated by the Generator Operator notifying the Transmission Operator that the voltage on the Generator Operator is monitoring has drifted off of schedule? The majority of units on the grid are unable to move the grid voltage by themselves, which is why VAR-002 requires that the aggregate operate in voltage control mode, and the likely cause of the event is a system contingency that the Transmission Operator has: A) planned for in their development of operating limits and is still within their pre-defined operating limits; B) has not planned for and is still within their pre-defined operating limits; or C) has not planned for and is outside of their pre-defined operating limits AND should be the only one taking independent action so that the system's response to the Transmission Operator's actions is predictable.

Yes
For the most part we agree with the GS Subcommittee comments but we also have included are our specific comments below.
Yes
(1) R2 – We request the SDT to clarify this requirement. As it is written we believe operators may be confused of knowing when the new "15 minute" time period will start. Since it seems (under the draft) to be OK, that we can drift in and out of the Voltage Schedule for several hours if the operator

thinks the machine can get back on the VS later. How will our operators know when the 15 minute report trigger has occurred? (2) R2 – We believe the 15 minute time period is too short for mandatory reporting to the TOS. We ask the SDT to consider that currently there is no specific time period, and therefore we will need to modify our procedures accordingly. (3) Whether in VAR-001 or VAR-002 temporary exemptions are not appropriate. There may be circumstances that a generator should be declared exempt consistent with VAR-001 Requirement 3. These type of exemptions should be declared and documented outside of any particular period of inability to maintain the voltage schedule. Rather than have temporary exemptions if a generator were unable to operate in AVR or if operating in AVR the generator could not operate in the band of the voltage schedule, language should reflect that the notification of the inability is made to the TOP and the TOP will provide further instruction for operation, i.e. a set VAR output, a specific power factor, to the unit D-curve, etc. This would ensure that even if a generator could not meet the voltage schedule they should be as near the voltage schedule as is possible. Being exempted might give the generator the notion, "Since I am unable to get to my voltage schedule and I am therefore exempt, it does not matter how I operate." That should never be the case. (4) Whether in VAR-001 or VAR-002 temporary exemptions are not appropriate. There may be circumstances that a generator should be declared exempt consistent with VAR-001 Requirement 3. These type of exemptions should be declared and documented outside of any particular period of inability to maintain the voltage schedule. Rather than have temporary exemptions if a generator were unable to operate in AVR or if operating in AVR the generator could not operate in the band of the voltage schedule, language should reflect that the notification of the inability is made to the TOP and the TOP will provide further instruction for operation, i.e. a set VAR output, a specific power factor, to the unit D-curve, etc. This would ensure that even if a generator could not meet the voltage schedule they should be as near the voltage schedule as is possible. Being exempted might give the generator the notion, "Since I am unable to get to my voltage schedule and I am therefore exempt, it does not matter how I operate." That should never be the case. (5) M2 – A "30 minute" time period is allowed in M2 that appears to not be included, explained or mentioned in R2, please clarify. (6) We believe the TOP should set the reporting time period and it should not be set in the Standard. Our TOP has told us is the 15 minuet reporting is excessive and not necessary for reliable operation of the transmission system. (7) M2 – The first sentence of M2 requires the GOP to "make all attempts to operate within the tolerance bands provided by the TOP". We ask the SDT to explain from a generator perspective and provide an example for how this can be proven to an auditor?

FE believes that #2 of Part 2.1 of Requirement 2 needs clarity. Since both conditions of Part 2.1 must be met, there should be a time parameter associated with #2. Otherwise, unless something

catastrophic happens, #2 will always be true, ie, we expect to be back on schedule at some time. We propose the folloing for #2 of Part 2.1 of Requirement 2 2) the GOP is unable to return to its voltage or Reactive Power schedule within 30 minutes of operating outside the prescribed schedule.

Michelle R D'Antuono
Ingelside Cogeneration LP (Occidental Chemical Corporation)
Yes
Ingleside Cogeneration LP supports the changes that have been made to both VAR standards. First, we agree that the removal of FERC's two LSE-related directives can be justified using the Paragraph 81 criteria. Directive 1858, which calls for LSEs to take on Reactive Power responsibilities consistent with PSEs, can be retired (as can VAR-001-2 R5) since those actions are already governed by the OATT. Similarly, the directive that LSEs maintain power factors within a given range is a normal part of interconnection agreements. Since both the OATT and pro-forma interconnection agreements are under regulatory control, reliability requirements are an unnecessary redundancy. Secondly, we agree with the need to include precise language in the measures to assure that Compliance Enforcement Authorities are looking for situations that present true risk to the BES. For example, the measure for VAR-002-3 R2 clearly accounts for those configurations where the GOP monitors voltage and reactive power flows at the generator output instead of the interconnection. In these cases, the CEA needs to understand that a conversion mechanism is sufficient – and not insist that high-side voltage and reative power monitoring is specifically required.
Yes
In particular, Ingleside Cogeneration would like to see the changes made to VAR-002-3 R3 take effect. We agree that there needs to be a level of tolerance around the communication of an AVR outages – those that are restored within 15 minutes pose no viable threat to the BES and only serve to distract the Transmission Operator from more pressing tasks. Although it does not change our vote to approve both of the VAR standards, we would like to suggest that a referece could be added under R1 to capture the same 15 minute criteria. Otherwise it seems possible that any uncommunicated AVR outage will violate R1, even if compliant with R3.
No
Ingleside Cogeneration would hesitate to call for more standards development activity related to TOP/GOP voltage and reactive communication. In our view, the issue does not appear during normal and semi-normal operations (i.e.; the generator is able to maintain voltage and reactive power within tolerance without exceeding its Facility Ratings). It may be a different story during an event where transients driven by the external network exceed a generation facility's capabilities. Since the proper action to take relies on the character of the transient – whether it is of long-duration/short-duration – and the topology of the local system, and the availability of other nearby reactive resources, the GOP can only take best-effort steps to maintain output to the TOP's schedule. We rely on guidance from the TOP if there are actions that must be taken beyond that point. For example, if a GOP were to make a change to a voltage setpoint outside of the threshold range without the TOP's guidance, the impact to the local system may actually worsen. Ingleside understands that during an emergency, the TOP may be otherwise engaged with many other operating entities – and may need the GOP to take helpful actions to stabilize the situation without direct supervision. However, there needs to be some pre-developed universal criteria in place before we would be comfortable proceding in this direction. In our view, this is an issue best taken up in a NERC sub-committee or task force – not a SDT.

Yes
We would like to see this project divided into two separate projects/ ballots. We are fine with the proposed VAR-002-3, but have some concerns with VAR-001-4. Ultimately, this means we must vote

negative for both standards instead of just one.
Yes
1. VAR-001 causes concern for the uncertainty of how to come up with a basis of how we plan operations. Is our performance over the last "x" years enough to justify no change, or do we need to study for voltage and VARs for the day(s) ahead and in real time (two extremes)? 2. There are discrepancies or vagueness between interpretations in new VAR standards and other standards like TOP. Which one trumps the other? 3. In general, the individual standards can be made to work. However, the interdependencies and the ability to go off on a tangential path between VAR, TOP and other related standards is troublesome. While each standard may be good as a solo act, they do not make a symphony together. RECOMMENDATIONS: A. All of the standards should be placed on a matrix so that interdependencies are identified and coordinated in application and measurement. B. The standards need to be stable over time as opposed to new ones being voted on before the previous one is implemented. C. A multi-year process where interdependent standards are adjusted and implemented in unison will yield a productive effort by the industry towards being more reliable rather than concentrating on avoidance of violations.

VAR-001-4 Comments Requirement R2 appears to be a mix of planning and operational processes. Since the main section of the requirement only addresses the planning process, part 2.1, which

addresses operational issues, seems out of place. In addition, since part 2.2 goes back to addressing planning processes, part 2.1 also seems out of sequence. This could be addressed by revising the main section of requirement R2 to address how the planning and operational aspects interrelate and then reordering parts 2.1 and 2.2. Alternatively and preferably, part 2.1 could be a stand-alone requirement, since it also addresses complying with the limits under the processes required by requirement R1. The drafting team should consider deleting the language "and direct the Generator Operator to comply with the schedule in automatic voltage control (the AVR is in service and controlling voltage)" from part 4.1 of requirement R4. Since VAR-002 requires the GOPs to operate in AVR mode and to follow the voltage schedule, the quoted language is both redundant and administrative in nature. Minor conforming changes would be necessary in VAR-002 (replacing the phase "as directed" with "provided" where that standard references the schedule should be sufficient to address this change). The last sentence of measure M5 should be deleted since it is redundant with EOP-008-1, which requires TOPs to have backup control center functionality available to address the loss of primary control center functionality. Losing the ability to monitor voltage would be a loss of primary control center functionality that is addressed by EOP-008-1.
Yes
VAR-002-3 Comment R2.1 condition 2 is vague and unclear how this should be interpreted "…no longer able to return…" What if you knew you were going to be able to return to schedule tomorrow? Would you need to report?

VAR-002 footnote (3) on page 6 offers a definition of the phrase "voltage or Reactive Power schedule." VAR-001 does not define "voltage or Reactive Power schedule." The term "voltage or Reactive Power schedule" should be defined for both standards. The voltage and Reactive Power (VAR) output of a generator is adjusted by several methods. The requirements in the VAR-001 Standard should state in terms of an action oriented result, what is expected. In VAR-002 M2 provides situations where a Generator Operator may not be able to meet a voltage schedule or comply with the TOP's directive. The description does not belong in a Measure, and should be moved to the Background Information Section of the Results-based standard. The proposed requirements in both VAR-001 and VAR-002 should be carefully reviewed to ensure they meet the expectations of a results based standard.

Concerned about the significant overlap in these standards vs: their long term accuracy.
Yes

VAR-001: -R3, Concern over the TO setting the criteria for when an AVR may be out of service. Could look to the current exceptions table for guidence. -R4 is poorly written and needs editing. Are we to specify the schedule a the point of interconnection, GSU hi side, GSU lo side, or a combination? Also, R3 allows the TO to exempt when the AVR must be in service, but R4.1 doesn't reference this exemption. VAR-002: -R1 confilcts directly with VAR-001 R4.1. Again, I read VAR-001 R4.1 to state the TO is giving the GO a directive to always be in AVR mode. No room is given for exceptions, (could easily correct this).

Although supportive of the drafting team's efforts, LES is concerned with the removal of the FERC-approved interpretation previously appended to VAR-002-2b. Per the Interpretation, the Transmission Operator is permitted the option of directing the Generator Owner to operate the AVR in the constant Pf or constant Mvar modes rather than the constant voltage mode. In consideration that Requirements R1 and R2 of VAR-002 have not changed significantly, it is difficult to discern whether or not the Interpretation still applies. To ensure clarity going forward, LES recommends the interpretation either be appended to VAR-002-3 as well or else the drafting team further modify the requirements and/or measures to allow the TOP to direct the GO to run in a mode other than constant voltage.

Yes
There is a general concern with this proposed standard that it will create further administrative burden for the TOP/RC as well as the back office staff. Additionally, the opportunity exists that the number of calls between the GOP and TOP will increase without materially enhancing BES reliability. Further, how would these standards be used to evaluate the compliance of a unit which has their AVR taken off auto for testing?
Yes
VAR-001-4 Comments: R1.1.2. Each Transmission Operator shall Delete: "provide a copy of these documented policies or procedures to adjacent Transmission Operators" make plans available with a written request so entities requiring documents have access. R1.1.3. Each Transmission Operator shall Delete:"provide a copy of these documented policies or procedures to its Reliability Coordinator." make plans available with a written request so entities requiring documents have access. R2. Each Transmission Operator and Reliability Coordinator shall perform assessments on their respective areas in order to ensure sufficient reactive resources are available Delete: "for scheduling" to maintain voltage stability under normal and contingency conditions in order to provide the voltage levels as defined in Requirement R1. R2.2.2. As a result of the assessments, each Transmission Operator shall ensure that sufficient reactive resources Delete: " have been scheduled" Add: "are available" to meet acceptable day-ahead voltage limits identified in Requirement R1. Sufficient reactive resources may include, but is not limited to reactive generation scheduling; transmission line and reactive resource switching; and controllable load. M2 (excerpt): During a "real-time event" where voltage must be adjusted, a Transmission Operator shall show evidence to show directions were given to adjust the operation of capacitive and inductive resources. It is requested that the SDT provide additional

clarification what is meant by “real-time event” and whether it refers to normal operations or disturbances. SDT Question: How does the SDT anticipate this measure be used to evaluate the compliance of a unit which has their AVR taken off auto for testing? M3 (excerpt): For temporary exemptions, evidence showing the exemptions were granted must be provided. If the exemptions were given verbally from the Transmission Operator, the phone recordings or emails commemorating the phone call must be provided. For temporary exemptions, the evidence of communication must also include the timeframe for how long the exemption will last. We believe that this measure will increase the administrative burden placed on the TOP/GOP in real-time. R4.4.1. The Transmission Operator shall provide the voltage or Reactive Power schedule and tolerance band to the associated Generator Operator and direct the Generator Operator to comply with the schedule in automatic voltage control mode. Delete:”(the AVR is in service and controlling voltage).“ R5. The Transmission Operator shall know the status of Delete:”all transmission” Add: “ BES” Reactive Power resources, automatic voltage regulators, and power system stabilizers in their system. Request that the SDT review R5 to ensure that it is not a duplicative of a TOP standard. M5. The Transmission Operator shall have evidence to show Reactive Power resources are being monitored. Evidence may include, but is not limited to screen shots of EMS/SCADA data, alarms, and phone logs. In the event the monitoring system does not work, each Transmission Operator should have a protocol in place to show these resources are being monitored. Request the SDT to add further clarification for AVR and PSS. VAR-002-3 Comments: R1. The Generator Operator shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) in service and controlling voltage) unless Delete:”the Generator Operator has notified the Transmission Operator of one of the following: “a generator has been has been exempted from operating in the AVR voltage control mode by the Transmission Operator or the Generator Operator has notified the Transmission Operator of one of the following: M1. Add: "Unless exempted" the Generator Operator shall have evidence to show that it notified its associated Transmission Operator any time it failed to operate a generator in the automatic voltage control mode as specified in Requirement 1. 2.1. If a GOP drifts out of schedule, each Generator Operator shall notify its associated Transmission Operator within 15 minutes when both of the following conditions are met: 1) the GOP is operating outside of the prescribed voltage or Reactive Power schedule tolerance band for Change from 15 to 30: 30 minutes; and 2) the GOP is no longer able to return to its voltage or Reactive Power schedule. M2 excerpt: 1) Communications with the TOP when the Generator Operator was operating outside of the prescribed voltage or Reactive Power schedule tolerance band for 30 minutes Delete: “or less the 30 minutes allow for 15 minutes to call and 15 minutes to be outside of the tolerance band)” AND Generator Operator is no longer able to return to its voltage or Reactive Power schedule; 2) R3. Request a threshold be defined for the term “capability change” M3. The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of any of the changes identified in Requirement 3. If the status has been restored within the first 15 minutes, no call is necessary Delete: "therefore, if a status on Reactive Power resource has changed, and that change lasts greater than 15 minutes, the GOP must notify its associated TOP within 30 minutes of when the change first occurred.”
Yes
We are unclear on how the draft time period was arrived at. Without that information it is difficult to compare time periods. The concern is the potential administrative burden placed on the TOP.
Strong communications between TOPs and GOPs is essential for reliability of the system. The concern that we have centers on the potential administrative burden that is placed on the TOPs and GOPs. The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Review Group only and should not be construed as the position of the SERC Reliability Corporation, or its board or its officers.

Yes
VAR-001-4 • R1.1.2 amd R1.1.3 – Dominion suggests addition of the words ‘if requested”. This will

lessen administrative burden. • R2.1; “necessary to regulate transmission voltage and reactive flow” seems to be listed twice in this requirement, please clarify. • R3.1; Dominion suggests replacing “it” with “the Transmission Operator” • M3; Dominion suggests replacing “its” with “the Transmission Operators” • R6 - To allow for coordination of operations between Transmission Operators and Generator Operators, it is suggest the the words “that is mutually agreed” after the words “timeframe for making the changes” be added in requirement. VAR-002-3 • R1 – Dominion suggests requirement be revised to read “The Generator Operator shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) in service and controlling voltage) unless the Generator Operator has been exempted from operating in the AVR voltage control mode by the Transmission Operator or has notified the Transmission Operator of one of the following: • M1- Dominion suggests measure be revised to read “Unless exempted the Generator Operator shall have evidence to show that it notified its associated Transmission Operator any time it failed to operate a generator in the automatic voltage control mode as specified in Requirement 1” • R2 - We suggest inclusion of a footnote to indicate that GOP is expected to be able to maintain voltage schedule as long as doing so would not violate its reactive capability curve or power factor requirement (as prescribed in other reliability standards such as FAC-001-0,. MOD-025-2 and MOD-026-1 or agreements such as an interconnection agreement). • R2.1 – Dominion suggests deletion of the words “If a GOP drifts out of schedule” because inclusion of these words could give the impression that an intentional deviation nullifies this sub-requirement. We do not believe this is the intent and therefore suggest that the sub-requirement read “Each Generator Operator shall notify its associated Transmission Operator within 30 minutes when both of the following conditions are met: 1) the GOP is operating outside of the prescribed voltage or Reactive Power schedule tolerance band for 30 minutes; and 2) the GOP is no longer able to return to its voltage or Reactive Power schedule. • M2- Dominion does not agree with proposed language . GOP should be required to monitor and maintain voltage (high or low side of GSU) as specified by TOP in VAR-001-4@R4. • R3 & M3 - Dominion does not see value in the changes but do not oppose the revisions. In both VAR-001-4 and VAR-002-3 standards; GOP and TOP acrnomyns are used, Dominion suggests these acronyms be either spelled out or be updated to use GOP and TOP throughout the documents.
Yes
Dominion does not believe the additional granularity (15 minutes to determine and 15 to notify) is necessary or improves reliability. We believe the previous requirement (to inform within 30 minutes) is superior to the prosoed revision.
Dominion appreciates the IVG’s concentrated efforts to meet FERC Directives outlined in FERC Order No. 693 in suport of generator timeframes that ensure appropriate generation operation to maintain network voltage schedules. Dominion believes that the language and timeframe in VAR-002 provides for the generator to have adequate time to correct voltage drift and in the occasion where the cause of the voltage status change needs to be determined and then resolved, the timeframe of 30 minutes provides adequate time for the generator to notify the Transmission Operator.

NorthWestern Energy
Yes
It appears VAR-001-4, R5 is negated by VAR-002-3, R2 and R3. These standards should be coordinated with each other before they are submitted for a vote. Also we believe VAR-001-4, R2, requires additional clarification. Also, there are some overlaps within these new standards when compared to current NERC standards in place. For example FAC-014 and TOP-002. An overlap exists in establishing limits in accordance with the RC SOL methodology and the new RC SOL Methodology includes establishing limits for voltage stability and steady state voltage limits. TOP-002 states that the Transmission Operator shall perform seasonal, next day, and current day BES studies. Because of the overlaps we fear that entities could be subject to Double Jeopardy.

Individual
Scott Berry
Indiana Municipal Power Agency
Yes
Indiana Municipal Power Agency (IMPA) believes that there is some overlapping of requirements when comparing VAR-001-4 R1 to TOP-004-2 R6. IMPA recommends removing the common requirements (such as, monitorind and controlling voltage levels and real and reactive power flows-including additional requirements) from R1 of VAR-001-4. IMPA also believes that VAR-001-4 R5 can be deleted because TOP-006-2 R1 and R2 perform the same function. In addition

The PPL NERC Registered Affiliates are registered in six regions (MRO, NPCC, RFC, SERC, SPP, and WECC) for one or more of the following NERC functions: BA, DP, GO, GOP, IA, LSE, PA, PSE, RP, TO, TOP, TP, and TSP. Comments: VAR-001: 1. The rationale statement for R1 of VAR-001 says that it, “will allow each Transmission Operator (TOP) to establish its own policies and procedures,” regarding voltage schedules and tolerance bands. This wording does nothing to prevent specifying an unreasonably-tight bandwidth (e.g. +/- 0.5%), as some parties are now doing. The PPL NERC-Registered Affiliates suggest that R1.1 end as follows, “…voltage schedules along with associated tolerance bands of not less than 1.5% of the schedule voltage unless technically justified.” There may be some resistance to making the standard prescriptive, but it’s not a burdensome requirement, and it would be unfortunate to update the standard without addressing known abuses of the present version. 2. The statement, “Each Transmission Operator shall specify a voltage or Reactive Power schedule and tolerance band (at either the high side or low side of the Generator Step-Up transformer at the TOP's discretion) at the interconnection point between the generator facility and the Transmission Owner's facilities,” in R4 of VAR-001 has a semantics glitch in that there is just one interconnect point. That is, mandating control at the interconnection eliminates any discretion in making the high vs. low-side selection. PPL suggests saying instead, “Each Transmission Operator shall specify a voltage or Reactive Power schedule and tolerance band, at the agreed upon metering point to which the GOP has access.” This will typically be either the transmission bus or the generator terminals. If the TOP specifies this as the TO’s “transmission bus”, the TO should be required to make the same voltage point used by the TOP available to the GOP to ensure both are seeing the exact same voltage. Additionally, there needs to be a feedback loop from the GOP to the TOP regarding the voltage schedule. This does not mean we want to spark a debate every time a schedule is provided, but simply add a step that allows a GOP to provide feedback regarding the feasibility of the schedule. A recommended R4.2: R4.2 The Generator Operator shall review the voltage or Reactive Power schedule and tolerance band provided by the Transmission Operator and inform the Transmission Operator of any conditions that would prevent the Generator Operator from complying with the

schedule or tolerance band, along with the technical basis for that determination. The question that then comes up is what does the TOP do if the GOP cannot comply with the schedule as presented? Recommended R4.3: R4.3 If the Generator Operator is unable to comply with the voltage or Reactive Power schedule or tolerance band as provided by the Transmission Operator, the Transmission Operator shall (a) modify the voltage schedule within the parameters established in the documented policies and procedures established in R1, taking into account the Generator Operator's limitations, or (b) exempt the Generator Operator from following the voltage schedule or tolerance band using the criteria established in R3. 3. PPL would like to see R6 of VAR-001 changed to, "After consultation with the Generator Owner regarding necessary step-up transformer tap changes, the Transmission Operator shall provide documentation to the Generator Owner specifying the required tap changes, a timeframe for making the changes that is mutually agreed, and technical justification for these changes." That is, the change should normally wait until it can be rolled into a scheduled downtime event. VAR-002: 1. PPL suggests changing, "The Generator Operator shall have evidence to show that it notified its associated Transmission Operator any time it failed to operate a generator in the automatic voltage control mode as specified in Requirement 1," in M1 of VAR-002 to a more semantically neutral, "The Generator Operator shall have evidence to show that it notified its associated Transmission Operator any time it did not operate a generator in the automatic voltage control mode." 2. PPL recommends the following changes to R2, for clarity; R2. Unless exempted by the Transmission Operator, each Generator Operator shall maintain the generator voltage or Reactive Power schedule3 (within each unit's ratings or capabilities4) as directed by the Transmission Operator. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations] 3. PPL suggests corresponding changes to R2.1. Note that the time frames are left blank in our recommendation, as there is still much discussion within the industry as to what an appropriate timeframe would be; If the system bus voltage drifts out of schedule, each Generator Operator shall notify its associated Transmission Operator within __ minutes when both of the following conditions are met: 1) the GOP has been operating outside of the prescribed voltage or Reactive Power schedule tolerance band5 for __ minutes; and 2) the GOP is no longer able to return to its voltage or Reactive Power schedule. Notification to the TOP is not required if the GOP can return to schedule. 4. In line with the recommended changes above, PPL suggests changing M2 to; Generator Operators shall operate the generators to help minimize excursions outside the established tolerance bands for the agreed-upon metering point. It is recognized that excursions may occur outside of the tolerance bands during unit start-up and shut-down, during MW and MVAR loading at a transmission bus where multiple units are connected, during time of relatively sudden transmission system loading changes, during system events and when grid conditions are beyond the capability of a generator to correct. Therefore, when the system bus voltage is out of the tolerance band, the Generator Operator will not be held in non-compliance with this requirement if the sub-requirements 2.1, 2.2, and 2.3 are met. In order to identify when a unit is deviating from its schedule, GOPs will monitor voltage at the agreed upon metering point to which the GOP has access. Therefore, GOPs have the option to operate on a voltage schedule on either the high-side or convert the high-side schedule to a low-side schedule at the GOP's discretion. For units that monitor on the low-side/terminal voltage, Generator Operators shall provide evidence of the method of conversion from the high-side schedule to low-side monitoring. GOP shall have evidence to show compliance with requirement R2 by providing 1) Communications with the TOP when the Generator Operator was operating outside of the prescribed voltage or Reactive Power schedule tolerance band for __ minutes AND Generator Operator was unable to return the generator to operation within its voltage or Reactive Power schedule tolerance bands; 2) Generator Operator implemented an alternative method to control reactive output when the AVR was out-of-service or unavailable; 3) compliance with directive to modify voltage or a notification that the directive could not be met. Evidence may include, but is not limited to Generator Operator logs, SCADA data, phone logs, and any other alarming notifications that would alert the Transmission Operator that both conditions were met. Timing for Requirement R2.1 can be crucial during system events, and Generator Operators are expected to begin timing when notified of an event by the TOP as soon as the unit is operating outside of the tolerance band. Further, voltage documentation during a system event may be requested by an auditor to show measures were taken to bring the unit back into schedule. 5. To harmonize Footnote 4 with our recommended language for R2, PPL suggests Footnote 4 be revised to state; For the operations horizon, the GOP may choose a test-based or real-time method of establishing a unit's reactive power capability. The test-based capability is that determined for compliance with MOD-025. Parameters typically monitored for determining real-time capability may include 1) generator loading (MW, MVAR, amps), temperatures, and terminal voltage; 2) GSU

loading and temperatures; 3) auxiliary bus voltages; 4) plant auxiliary equipment loadings, temperatures, and voltages; 5) Generator and GSU Volts/Hz limits; 6) excitation system and/or AVR limits. 6. If R2.1 sticks, PPL would like to see M2 clearly state that "if the GOP can return to schedule, it does not have to notify the TOP." 7. For the new footnote 6 referenced above; The TOP is to establish an official-for-compliance bus and phase voltage point for monitoring compliance of generators controlling to the high-side voltage. An excursion begins for compliance purposes when the measured voltage exceeds the bandwidth boundary by a recognizable amount (0.5%). Multiple notifications to the TOP need not be made when the system voltage wanders back and forth across the bandwidth boundary. The system voltage must be back within the boundary for one hour before the next excursion counts as a separate event. 8. VAR-002, R2.2 should read, "When a generator's automatic voltage regulator is out-of-service, the Generator Operator shall use an alternative method to control the generator reactive output to meet the voltage or Reactive Power schedule directed by the Transmission Operator, unless the TOP grants an exemption." The purpose of this change is to reference the process established in R3 of VAR-001. 9. VAR-002, R4.1 should be revised to state; "For generator step-up and auxiliary transformers with nominal primary voltages equal to the generator terminal voltage:" This is to clarify that R4 is N/A to startup transformers and other station auxiliary transformers connected to a HV bus at a plant. 10. VAR-002, R5 should read, "after consultation with the Transmission Operator and agreement on a schedule regarding necessary step-up transformer tap changes…'" for the reason stated under comment 3 above. Regarding the Technical Whitepaper; 1. The statement on p.7 that, "the more VARs produced at a generating facility, the fewer MWs produced," would be true only if operating to the generator OEM D-curve limit, and many generation units are instead typically limited by generator voltage limits due to variations in aux bus voltages. Under the latter situation raising and lower reactive power export or import does not affect the MW capability. 2. The statement on p.7 that "the informal development group did not want to place numerical requirements on what the proper operational limits should be for the continent," fails to consider that there are present-day abuses of the system that should be addressed in the VAR-001 update. Self-policing isn't working, hence our comment #1 above. 3. Ref. "unit drifts out of schedule," on p.9 it is the system that is drifting, not generation units. 4. The statement on p.10, "This industry divide is not addressed in the pro forma standard presented today," appears to account for some of the ambiguity discussed in the North American Generator Forum's comments. PPL believes that requirements need to be unambiguous, however, and there must also exist explicit and achievable means of achieving compliance. 5. While there is a sentence in the measure that states it is clearly the generator's discretion as to whether they monitor (presumably control) low side or high side to demonstrate compliance, we believe that there is still a substantial amount of language in the Standard and the Whitepaper that would tend to cloud that by implying that a generator should monitor high side for compliance if you have high side equipment installed; in other words, the monitoring/control point is based on current installed equipment. 6. Additionally, the Whitepaper does nothing to shed light on whether generators should make manual moves to reactive output (by changing the AVR low side set-point) without explicit direction form the TOP which leaves the compliance application open for interpretation.

Yes

1. In order 693 Page 488 the FERC "directive" for VAR-002 stated, "Dynegy has suggested an improvement to Reliability Standard VAR-002-1, and NERC should consider this in its Reliability Standards development process." Dynegy's concern stated, "VAR-002-1 should be modified to require more detailed and definitive requirements when defining the time frame associated with an 'incident' of noncompliance." Dynegy offered two alternatives to address their concern: "…[1] either more detail should be added to the Reliability Standard to cure this omission, Or [2] the Reliability Standard should require the transmission operator to have a technical basis for setting the time frame that takes into account system needs and any limitations of the generator." Their reasoning: "… this approach will eliminate the potential for undue discrimination and the imposition of overly conservative or excessively wide time frame requirements, both of which could be detrimental to grid reliability." Note that voltage tolerance band is not mentioned. 2. Going from NERC "should consider" Dynegy's suggested improvements to a very prescriptive time requirement (embedded in a VSL) in the current version of VAR-002 was a big step from the generation perspective. Also, it appears that Dynegy's second alternative was ignored during this step. 3. In the 2013 FERC Order approving VAR-002-2b (current version which became effective on July 1, 2013): PPL presented valid arguments against the "zero tolerance" time frame deviation introduced in the VSLs from the generator operator perspective (see Paragraphs 15 and 16). Both NERC and FERC rejected PPL's arguments. Paragraph

17 states, “NERC argues that the proposed modification would allow for a deviation in system voltage for up to 30 minutes to allow for time to correct an excursion and that such deviations from a voltage and reactive schedule is inappropriate because a deviation even up to a few minutes can negatively impact reliability.” Paragraph 18 goes on to say, “NERC maintains that significant voltage deviations for extended periods of time may lead to voltage collapse and can increase the potential for a wide-area impact to the reliability of the Bulk-Power System, and as such PPL Companies’ proposed modification to the VSL language should be rejected.” The context of the NERC and FERC discussions and agreement on the rigid time requirement apparently assumes all TOP’s voltage schedule tolerance bands are reasonable and “reliability based”. Also, there seems to be an absence of discussion on Dynegy’s 2nd alternative for the “the transmission operator to have a technical basis for setting the time frame that takes into account system needs and any limitations of the generator.” However, the Pro Forma VAR R1 will require each TOP to have documented policies or procedures used to “establish, monitor, and controls voltage levels and Reactive Power flows within limits as defined below: R1.1 These documented policies or procedures shall include criteria used in system assessments. The criteria for the assessments shall include established steady-state limits, voltage stability limits and associated operating margins, and voltage schedules along with associated tolerance bands.” Thus, a fair question on the Pro Forma standards follows: If VAR-001 R1.1 is met; can GOPs conclude that each TOP’s tolerance bands have a documented technical basis? If not, what mechanism will allow GOPs to question extremely narrow voltage or reactive power schedule tolerance bands that make compliance with VAR-002 R2.1 difficult or impossible? Note the Background discussions in the White Paper (see Pages 7 – 10). The discussion for VAR-001 R4 states, “The informal development group is cognizant of the fact that the nature of reactive power on the network varies depending on local conditions. Thus, the group focused on the process that the requirements would detail, not the proper numbers a TOP should enforce in the standard. For VAR-001, the group would not put operational limits on how a TOP should manage voltage stability for its regions; more specifically, the informal development group did not want to place numerical requirements on what the proper operational limits should be for the continent. Operating margins vary due to specific system characteristics as well as the operating conditions.” This begs the question: Why was this same rationale not applied in addressing the time frame? 4. The published reasons for the changes to VAR-002 include 1) eliminating nuisance calls and mitigating compliance issues for generators (i.e. non-reliability gap reducing violations), and 2) addressing the FERC directive to NERC to "consider a timeframe" for allowing a generator to be out of schedule before having to make a notification to its TOP. It could be argued that imposition of a very prescriptive time frame alone does not fully address the FERC “directive” language and the first Pro Forma objective of reducing nuisance calls (GOP to TOP), especially if the voltage tolerance bands are extremely tight or do not have a technical basis.
See responses to question 2 above.

Anthony Jablonski
ReliabilityFirst
Yes
ReliabilityFirst has a fundamental overarching concern with the two proposed standards and believe the two standards in their draft state have major flaws. The two drafts are completely dependent on each other and when implemented individually do not make sense and actually conflict with each other. This interdependency on each other may cause serious issues and potential issues within compliance space and overall reliability. For example, Requirement R5 in VAR-001-4 requires the Transmission Operator to know the status of all transmission Reactive Power resources, automatic voltage regulators, and power system stabilizers in their system. If the Generator never supplies the status, there is a potential for a potential violation on the Transmission Operator. Another example includes Requirement R3 in VAR-001-4. If the Transmission Operator fails notify the Generator Operator that they are exempted, there is a potential for non-compliance for the Generator Operator not complying with R2 in VAR-002-3. ReliabilityFirst believes the linkage between the two standards is crucial and recommends combining the two standards to address the contradictory aspects of the two standards.
Yes

ReliabilityFirst provides the following comments related to the requirements and VSLs for the draft VAR-001-4 standard: 1. Requirement R1, Part 1.1 - ReliabilityFirst seeks further clarity on what is meant by the term “system assessments” in Requirement R1, Part 1.1. Are these “system assessments” meant to be performed in the near-term or long-term time period and what do encompass? 2. Requirement R1, Part 1.2 and Part 1.2 - There is no periodicity for when the documented policies need to be provided to the relevant entities. There is also no stipulation on whether changes to these polices need to be provided as well. ReliabilityFirst offers the following for consideration for Part 1.2: “Each Transmission Operator shall provide a copy of these documented policies or procedures to adjacent Transmission Operators [within 30 calendar days of request and within 30 calendar days of any changes]”. 3. Requirement R2 - ReliabilityFirst seeks further clarity on what is meant by the term “assessments” in Requirement R2. Are these “assessments” meant to be performed in the near-term or long-term time period and what do encompass? 4. Requirement R2, Part 2.1 and Part 2.2 - The Reliability Coordinator is an applicable entity for the parent Requirement R2 but is not listed within Part 2.1 or Part 2.2. ReliabilityFirst believes the Reliability Coordinator is relevant to both of the sub-parts and should be referenced in both sub-parts. For Part 2.1, the Reliability Coordinator can “…direct the real-time operation of devices…” and for Part 2.2, the Reliability Coordinator can help in ensuring “…that sufficient reactive resources have been scheduled…” ReliabilityFirst recommends referencing the Reliability Coordinator within Part 2.1 and Part 2.2. 5. Time Horizons Q2 - The Time Horizons within a number of the requirements (e.g., “Operations”) do not align with the five NERC defined Time Horizons (i.e., Long-term Planning, Operations Planning, Same-day Operations, Real-time Operations and Operations Assessment). ReliabilityFirst suggests the SDT review the NERC defined Time Horizons and modify the Time Horizons for all the requirements accordingly. The NERC defined Time Horizons are located at: http://www.nerc.com/pa/Stand/Resources/Documents/TimeHorizons.pdf. 6. VSL Requirement R1 - The High VSL should reference “sub-parts” rather than “sub-requirements.” NERC standards no longer include sub-requirements. 7. VSL Requirement R2 - The VSL is inconsistent with the language for Requirement R2. Based on the FERC VSL Guideline 3: “Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement.” The VSLs are missing reference to the Reliability Coordinator which is an applicable entity for Requirement R2. ReliabilityFirst recommends adding the Reliability Coordinator to the VSLs associated with Requirement R2. 8. VSL Requirement R3 - ReliabilityFirst believes there should be an associated VSL referencing sub-part 3.1. ReliabilityFirst recommends the following for consideration: "High VSL – “The TOP failed to notify the associated Generator Operator, In the event a Transmission Operator approves a generator as satisfying the exemption criteria.” 9. VSL Requirement R4 - ReliabilityFirst believes the word “some” in the high VSL is ambiguous and troublesome and ambiguous. ReliabilityFirst recommends the following for consideration: i. High VSL – The Transmission Operator specified a voltage or Reactive Power schedule and tolerance band but failed to provide the voltage or Reactive Power schedule and tolerance band to the associated Generator Operator and direct the Generator Operator to comply with the schedule in automatic voltage control mode.” ii. Severe VSL – “The Transmission Operator failed to specify a voltage or Reactive Power schedule and tolerance band.” 10. VSL Requirement R5 - All Requirements are required to have a Severe VSL designation. Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. In cases where an entity completely failed to meet the intent of the requirement, it falls within the Severe category regardless of the risk to reliability (risk is dealt within the Violation Risk Factors). ReliabilityFirst recommends the following for consideration: i. Severe VSL – “The Transmission Operator failed to know the status of all transmission Reactive Power resources, automatic voltage regulators, and power system stabilizers in their system. 11. VSL Requirement R6 - All Requirements are required to have Severe VSL designation. Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. In cases where an entity completely failed to meet the intent of the requirement, it falls within the Severe category regardless of the risk to reliability (risk is dealt within the Violation Risk Factors). ReliabilityFirst recommends the following for consideration: i. High VSL – “The Transmission Operator failed to provide documentation to the Generator Owner specifying either the required tap changes, a timeframe for making the changes, or technical justification for these changes.” ii. Severe VSL – “The Transmission Operator failed to provide documentation to the Generator Owner specifying the required tap changes, a timeframe for making the changes, and technical justification for these changes.” ReliabilityFirst provides the following comments related to the requirements and VSLs for the draft VAR-002-3 standard: 1. Requirement R2, Part 2.2 - For consistency, spell out Generator Operator rather than listing the acronym “GOP.” 2. Requirement R5 -

The parent Requirement R5 is applicable to the Generator Owner while the sub-part 5.1 specifies the Generator Owner. The same applicable entity listed in the “parent” requirement should be the same as any associated sub-parts. This inconsistency needs to be remedied. 3. VSL Requirement R2 - The VSL is inconsistent with the language for Requirement R2. Based on the FERC VSL Guideline 3: “Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement.” ReliabilityFirst recommends the following for consideration: i. Severe VSL – “The Responsible entity failed to maintain the generator voltage or Reactive Power schedule as directed by the Transmission Operator in accordance with Requirement R2, parts 2.1, 2.2 and 2.3 “ 4. VSL Requirement R3 - The VSL is inconsistent with the language for Requirement R3. Based on the FERC VSL Guideline 3: “Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement.” ReliabilityFirst recommends the following for consideration: i. Severe VSL – “The Responsible entity failed to notify its associated Transmission Operator of a status or capability change on any generator Reactive Power resource within 30 minutes of the change.” 5. VSL Requirement R4 - The VSLs for Requirement R4 are completely inconsistent with the associated Requirement R4. Requirement R4 speaks to the Generator Owner providing data to the Transmission Operator while the VSL speaks to the failure of maintaining the generator voltage or reactive power schedule. ReliabilityFirst recommends reviewing Requirement R4 and developing VSLs consistent with the requirement. 6. VSL Requirement R5 - Requirement R5 is applicable to the Generator Owner while the associated VSL refers to the Generator Operator. This inconsistency needs to be remedied.

No
Yes
We appreciate the language giving GOPs the option to monitor voltage on the low-side of the step-up transformers. This is a positive step, but work is still needed on the proposed standards. One concern is that VAR-001-4 allows the TOP to set voltage/reactive power schedules with tolerance bands. However, setting a tolerance band that is too narrow will require GOPs to frequently call TOPs as required in VAR-002-3 anytime the system causes the generator to move outside the tolerance band. The drafting team should consider whether a minimum tolerance band should be included in the standard that is enough to maintain a reliability voltage, but is large enough to minimize the potential for constant communications between GOPs and TOPs. Another concern is that VAR-002-3 R2 should specifically state that a GOP shall be allowed to convert a high-side schedule and control voltage on the low-side of the step-up transformer. Otherwise, R2 and M2 do not match as M2 is the only place where this language is provided. Further, VAR-002-3 requires the GOP to inform the TOP if the voltage drifts outside the tolerance bands set by the TOP. The problem is that GOPs may frequently find themselves outside the tolerance bands as the system voltage drifts if the TOP does not set appropriate tolerance bands.

David Thompson
Yes
There is a general concern with this proposed standard that it will create further administrative burden for the GOP, TOP, and RC, as well as the back office staff. Additionally, the high probability exists that the number of calls between the GOP and TOP will increase without materially enhancing BES reliability.

Yes
VAR-002-3 Comments: R1. The Generator Operator shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) in service and controlling voltage) unless Delete: "the Generator Operator has notified the Transmission Operator of one of the following:" a generator has been has been exempted from operating in the AVR voltage control mode by the Transmission Operator or the Generator Operator has notified the Transmission Operator of one of the following: M1. Add words “Unless exempted” the Generator Operator shall have evidence to show that it notified its associated Transmission Operator any time it Add words: “did not” operate a generator in the automatic voltage control mode. R2. Add "Unless exempted" by the Transmission Operator, each Generator Operator shall maintain the generator voltage or Reactive Power schedule (within Replace: “applicable Facility Ratings” with Add words: “each unit’s ratings or capabilities4”) (NOTE: Footnote 4 should be associated with R2.2, not R2.1.) as directed by the Transmission Operator. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations] 2.1. When directed to modify voltage, the Generator Operator shall comply or provide an explanation of why the schedule cannot be met. [Delete Pro Forma 2.1 and replace it with Pro Forma 2.3. See our comments below and in our response to Question 3.] 2.2. When a generator’s automatic voltage regulator is out-of-service, the Generator Operator shall use an alternative method to control the generator reactive output to meet the voltage or Reactive Power schedule directed by the Transmission Operator Add words: “unless the TOP grants an exemption.” Comments: We feel that approach and language in VAR-002-2.b R2.2 should be retained. This approach reflects closer alignment with VAR-001-4 and current language in the Functional Model for Generator Operator expectations and current plant design features. The GS recommends NERC vet the White Paper for this standard through formal industry review, get stakeholder input and consensus as required per the Standards Process Manual, section 11. It appears that this standard has been written with the assumption that generators can monitor and directly control transmission bus voltage (only some monitor it and almost none directly control it). With the elimination of (the 18 Jul 2013 proposed) R2.1 this measure (M2) should be rewritten. The revised M2 should not include additional requirements. Comments: The M2 information should be considered during the revision of the White Paper. R3. Each Generator Operator shall notify its associated Transmission Operator of a status or capability change on any generator Reactive Power resource, including the status of each automatic voltage regulator and power system stabilizer and the expected duration of the change in status or capability within 30 minutes of the change. If the status has been restored within the first 15 minutes of such change, then there is no need to call the TOP. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations] Comments: The GS suggests clarifying the term “capability change” in the White Paper revision. There is considerable confusion about the time requirement and it is not clear that these are applicable to the AVR status question or the capability change question. It may make sense to separate these two requirements to allow better clarification. M3. The Generator Operator shall have evidence it notified its associated Transmission Operator Replace: “within 30 minutes of any of the changes identified” with Add words: “as required” in Requirement 3. If the status has been restored within the first 15 minutes, no call is necessary. R4. The Generator Owner shall provide the following to its associated Transmission Operator and Transmission Planner within 30 calendar days of a request. [Violation Risk Factor: Lower] [Time Horizon: Real-time Operations] 4.1. For generator step-up transformers and auxiliary transformers with Add words: “nominal” primary voltages equal to (Delete words “or greater than” the generator terminal voltage: Comments: (This is to clarify that R4 is N/A to startup transformers and other station auxiliary transformers connected to a HV bus at a plant.) R5. After consultation with the Transmission Operator Add words: “and agreement on schedule” regarding necessary step-up transformer tap changes, the Generator Owner shall ensure that transformer tap positions are changed according to the specifications provided by the Transmission Operator, unless such action would violate safety, an equipment rating, a regulatory requirement, or a statutory requirement. [Violation Risk Factor: Lower] [Time Horizon: Real-time Operations]. Regarding the Technical Whitepaper; 1. The statement on p.7 that, “the more VARs produced at a generating facility, the fewer MWs produced,” would be true only if operating to the generator OEM D-curve limit, and many generation units are instead typically limited by generator voltage limits due to variations in aux bus voltages. Under the latter situation raising and lower reactive power export or import does not affect the MW capability. The NATF Model Practices Group has recognized that improvements in the way units are modeled for reactive power capability that respects other plant operating limitations, such as aux system voltage limits need to be investigated and have a project to review this issue. 2. The

statement on p.7 that “the informal development group did not want to place numerical requirements on what the proper operational limits should be for the continent,” fails to consider that there are present-day abuses of the system that should be addressed in the VAR-001 update. Numerical tolerance bands should be based on clear system reliability criteria and not some arbitrary tolerance band. For example, maximum voltage limits should be based on equipment ratings at that point in the system. 3. Ref. “unit drifts out of schedule,” on p.9 it is the system that is drifting, not generation units. 4. The statement on p.10, “This industry divide is not addressed in the pro forma standard presented today,”. The SDT is encouraged to follow through on AVR paragraph under the VAR-002 section by pursuing full industry review of the White Paper as required by the Standards Process Manual, section 11. 5. While there is a sentence in the measure that states it is clearly the generator’s discretion as to whether they monitor (presumably control) low side or high side to demonstrate compliance, we believe that there is still a substantial amount of language in the Standard and the Whitepaper that would tend to cloud that by implying that a generator should monitor high side for compliance if you have high side equipment installed; in other words, the monitoring/control point is based on current installed equipment. 6. Additionally, the Whitepaper does nothing to shed light on whether generators should make manual moves to reactive output (by changing the AVR low side set-point) without explicit direction from the TOP which leaves the compliance application open for interpretation.
Yes
Comments: See question 2 comments above. VAR-001-3 allows the TOP to determine the appropriate voltage schedules and tolerances for that TOP’s area for the reasons stated in the White Paper under the VAR-001 section. Why does VAR-002 not allow the TOP to determine the corresponding time requirement? We believe that the prescriptive time requirement in VAR-002 may cause conflicts with R4 of VAR-001 such that system requirements and different control areas may require different notification and therefore will be problematic for system and plant operators. The TOPs are familiar with their systems and will issue voltage tolerance bands based on their system needs. Therefore, it is appropriate for the TOPs to establish the associated time frame for their tolerance bands based on their system needs. That is, the time frame should be linked to the tolerance band. If the voltage tolerance is reliability based the TOP with the RC should be able to establish a corresponding time tolerance for deviations from the scheduled voltage. No reliability gaps should exist if both voltage tolerance band and corresponding time frame are reliability based rather than arbitrarily established. It is imperative that the TOPs provide realistic voltage tolerances and time frames that are 1) practical for both system operators and generator operators who have many duties related to system and plant reliability and safety, and 2) will not result in administrative burdens due to unnecessary notification and possible violations for deviations in voltage schedule that do not pose a BES reliability concern. Further, it appears that this standard has been written with the assumption that generators can monitor and directly control transmission bus voltage. Generation design standards have been that plant voltage regulators regulate the generator bus and having operators being able to see grid voltage has not been a standard. The responsibility for monitoring transmission class voltage has been a transmission operations function and taking action to makes changes requires a wider system view that the generation plants will ever have. This is what is reflected in version 5 of the Functional Model, which states that the GOPs in Real Time 10. Provides Real-time operating information to the Transmission Operators and the required Balancing Authority. 11. Adjusts real and reactive power as directed by the Balancing Authority and Transmission Operators.
The SDT is encouraged to follow through on AVR paragraph under VAR-002 by pursuing full industry review of the White Paper as required by the Standards Process Manual, section 11. The comments expressed herein represent a consensus of the views of the above named members of the SERC Generation Subcommittee (GS)only and should not be construed as the position of the SERC Reliability Corporation, or its board or its officers.

Yes

FMPA appreciates the efforts of the ad hoc team; but, the ad hoc team missed many opportunities to reduce duplication of the VAR standards with other standards (e.g., TOP standards, FAC-011, FAC-014). Consequently, FMPA is recommending a Negative vote. VAR-001-4, R1 is Duplicative of FAC-011 and the TOP-004 Standards This requirement as drafted is duplicative of existing TOP-004-2: "R6. Transmission Operators, individually and jointly with other Transmission Operators, shall develop, maintain, and implement formal policies and procedures to provide for transmission reliability. These policies and procedures shall address the execution and coordination of activities that impact inter- and intra-Regional reliability, including: R6.1. Monitoring and controlling voltage levels and real and reactive power flows. R6.2. Switching transmission elements. R6.3. Planned outages of transmission elements. R6.4. Responding to IROL and SOL violations." The Project 2007-03 SDT that revised the TOP standards found this requirement administrative in nature and eliminated the need for policies and procedures, mapping much of this requirement to the Purpose statement of the new TOP-001-2 Standard. VAR-001-4 should at least remain consistent with Project 2007-03 SDT's intent and eliminate policies and procedures as administrative in nature. R1 as drafted is also duplicative of FAC-011, System Operating Limit Methodology in the Operating Horizon: Proposed VAR-001-4, R1, 1.1: "These documented policies or procedures shall include criteria used in system assessments. The criteria for the assessments shall include established steady-state limits, voltage stability limits and associated operating margins, and voltage schedules along with associated tolerance bands." (emphases added) Existing FAC-011-2: "R2. The Reliability Coordinator's SOL Methodology shall include a requirement that SOLs provide BES performance consistent with the following: R2.1. In the pre-contingency state, the BES shall demonstrate transient, dynamic and voltage stability; all Facilities shall be within their Facility Ratings and within their thermal, voltage and stability limits … R3. The Reliability Coordinator's methodology for determining SOLs, shall include, as a minimum, a description of the following, along with any reliability margins …" (emphases added) Hence, R1 as drafted essentially requires developing and implementing policies and procedures to: a) Operate within SOLs. b) Operate to voltage schedules The only unique part of R1 that is different than FAC-011 is "voltage schedules along with associated tolerance bands". Therefore, R1 should be boiled down to just the TOP or RC establishing, and the TOP operating to "voltage schedules along with associated tolerances bands" to eliminate duplication with other standards. In addition, FMPA questions whether the RC should establish these voltage schedules instead of the TOP. If neighboring TOPs establish different, uncoordinated voltage schedules, then at the boundaries between TOPs, voltage schedules may be difficult to maintain and there will be significant VAR flow between the TOPs with significant associated losses. Coordinated voltage schedules between TOPS should be required. This can be accomplished in two ways: 1) the RC develops the voltages schedules; or 2) the word "jointly" is reintroduced to R1 (the ad hoc team chose to eliminate the word "jointly" from the existing requirement) so that neighboring TOPs "jointly" develop a coordinated voltage schedule. VAR-001-4, R2 is Duplicative of TOP-002 and TOP-001 and should be Eliminated VAR-001-4, R2 requires the TOP to perform assessments (which is duplicative of TOP-002-3, R2 to develop a plan to operate) to ensure sufficient reactive reserves to maintain voltage stability. Voltage stability is a determinant of SOLs; hence, the standards already require TOPs to develop and to operate within SOLs, including SOLs determined by voltage stability limits (FAC-011, FAC-014, TOP-001-2 R7 through R11, TOP-004-2, TOP-007-0). VAR-001-4 also requires TOPs to direct action if needed; for which they already have responsibility under TOP-001. Hence, R2 as drafted is entirely duplicative of other requirements and should be eliminated. VAR-001-4, R5 is Duplicative of TOP Standards and should be Eliminated TOP-006-2 states: "R1. Each Transmission Operator and Balancing Authority shall know the status of all generation and transmission resources available for use .... R2. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall monitor applicable transmission line status, real and reactive power flows, voltage, load-tap-changer settings, and status of rotating and static reactive resources." So, contrary to the ad hoc team's assertion, R5, which requires the TOP to know the status of all reactive power resources, AVRs and PSSs on their system, is duplicative of TOP-006-2, R1 and R2 which do include Power System Stabilizers and voltage regulators (e.g., "status of rotating … reactive resources"). The Project 2007-03 SDT mapped this to the TOP-003-2 standard, R1, which states: "Each Transmission Operator shall create a documented specification for the data necessary for it to perform its Operational Planning Analyses and Real-time monitoring." Hence, if the ad hoc team disagrees with the action of the Project 2007-03 SDT in generalizing the requirement to a generalized data request as opposed to the specificity of exactly what "data (is) necessary for it to perform its … Real-time monitoring" the ad hoc team seems to desire, then, the newly formed SDT for this VAR project should instead modify TOP-

003-2 to incorporate that specificity and not include this requirement in VAR-001-4. VAR-002-3, R2, 2.3 is Duplicative of TOP-001 and should be Eliminated The requirement is essentially for GOPs to follow a directive of the TOP; which is duplicative of TOP-001-2, R1 which states: “Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall comply with each Reliability Directive issued and identified as such by its Transmission Operator(s), unless such action would violate safety, equipment, regulatory, or statutory requirements.” Hence, VAR-002-3, R2, 2.3 should be eliminated. If “directed” as used in the draft VAR-002-3, 2.3 is not intended to be from a Reliability Directive, then, clarification is required as to what “directed” means. VAR-002-3, R3 is Duplicative of TOP-003 and should be Eliminated VAR-002-3, R3 as drafted requires GOPs to inform the TOP of changes in status or capability from a reactive power perspective. This is very similar in nature to the GOPs’ obligation to inform the TOP of the same from a real power perspective in TOP-002-2, R14. The Project 2007-03 SDT mapped this to TOP-003-2, R5 which states: “Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications for data.” It is expected that the TOP will require such data in TOP-003-2, R1, and the GOPs will need to respond in accordance with TOP-003-2, R5. If the ad hoc team disagrees with the action of the Project 2007-03 SDT in generalizing the requirement as opposed to the specificity of exactly what “data (is) necessary for it to perform its … Real-time monitoring” the ad hoc team seems to desire, then, the newly formed SDT for this VAR project should instead modify TOP-003-2 to incorporate that specificity and not include this requirement in VAR-002-3.

Yes
(1) Manitoba Hydro believes that Power System Stabilizer (PSS) should not be included in the standard (R3) because they are not designed for, nor could they be operated in any way to maintain and/or control Network voltage (schedules). In particular: (a) PSS deals with power swings (oscillations) by adjusting the generator voltages through AVRs to add damping to the generator rotor oscillations. The outcome of this process is to provide more stable real power transfer. (b) PSS does NOT control the generator or network voltages, but instead affects them in a uncontrollable way. Moreover, PSS does not contribute to the voltage stability. (c) If PSS must be included in the scope of this standard, then Manitoba Hydro believes that other functions in the AVR such as overexcitation limit (OEL), under excitation limit (UEL) and voltage per hertz limit should be included as well since they all at some point will affect the generator voltages during periods of “normal” operation. (d) It is our experience that PSSs are sometimes out of service as a result of automatically shutting off based on design and operational criteria which may include below certain gate positions or loading levels. In modern designs, the PSSs are normally part of the excitation control system and there is no physical turn-on/off switch (even though our utility has always asked for switches for easy operation). Manitoba hydro believes that there is a lack of clarity in the standard as it pertaines to the need to/process of reporting this status, i.e. the function of PSS is automatically switched off/on (out-of or back-in-service) during normal operation. Manitoba Hydro believes that if a requirement of the PSS is to remain in the standard, then a formal interpretation on this situation is warented. (2) Please clarify that when Automatic Voltage Regulators (AVR’s) or Power System Stabilizers (PSS) come out of service, the appropriate Reliability Coordinator, Transmission Operator and neighbors are to be

notified should they be impacted. Moreover, this must be documented and posted for other Transmission Operators and RC's to view.
No
(1) Effective Dates, VAR-001-4 and VAR-002-3 - replace the words " Board of Trustees approval " with " Board of Trustees' approval " for consistency with other standards. (2) General Comment - replace " Board of Trustees " with " Board of Trustees' " throughout the applicable documents/standards for consistency with other standards.

The standards already require coordination. If the TOP is not being provided enough "cooperation" from the GOPs in their footprint, then there is a need for stronger internal documents to achieve the necessary level of cooperation. While the standard states they must coordinate, it does not provide to what extent. One solution may be to compensate VAR output as well as MW output for the GOPs. As it pertains to VAR-002-3, the last sentence of R3, should state "…..no need to NOTIFY the TOP", in lieu of "call the TOP." This consistency would be appreciated.

Duke Energy suggests the SDT consider using the NERC defined terms of Operating Plan, Operating Process or Operating Procedure instead of “policies or procedures” in Requirement 1 to provide clarity and consistency. R1.2 and R1.3 should be revised and consolidated to read, “ Upon request, the TOP shall provide a copy of these documented Operating Plans, Operating Processes, or Operating Procedures to adjacent Transmission Operators and its Reliability Coordinator. “ Duke Energy recommends the SDT determine the correct NERC defined Time Horizon necessary for all requirements in VAR-001-4 as “Operations” is not considered a valid NERC defined time horizon. Measure 1 would have to be modified if “Upon request” is accepted by the SDT. Duke Energy suggests the following for Requirement 2 1. R2 should be changed to, “Each Transmission Operator and Reliability Coordinator shall perform assessments on their respective areas in order to ensure sufficient reactive resources are available for scheduling to maintain voltage stability under normal and contingency conditions in order to provide the voltage levels as defined in Requirement R1. 2. R2.2 should be changed to, “As a result of the assessments, each Transmission Operator shall ensure that sufficient reactive resources have been scheduled are available to meet acceptable day-ahead voltage limits identified in Requirement R1. Sufficient reactive resources may include, but is not limited to reactive generation scheduling; transmission line and reactive resource switching; and controllable load. Duke Energy seeks clarification on the term “real-time event” used in M2. What was the criterion considered to constitute a “real-time event”? The concern is that an auditor could consider a 1kV voltage deviation a “real-time event”. This type of voltage deviation has no impact to the reliability of the BES. The SDT should consider using alternative language that is more specific. Duke Energy suggests alternative language for VAR-001-04 R4.1 and VAR-002-3 R.1. Per the NERC Compliance Analysis Report of the VAR-002, it is stated that there are three widely-used AVR modes for generators: AVR- automatic controlling voltage mode, AVR-VAR mode, and AVR-power factor mode. Duke Energy is aware of a number of generating facilities that are not equipped with an automatic voltage regulator, thus the pro-forma standard should be revised to include other known AVR modes. Duke Energy suggests the following language: VAR-001-4 R4.1 should read: 4.1. The Transmission Operator shall provide the voltage or Reactive Power schedule and tolerance band to the associated Generator Operator and direct the Generator Operator to comply with the schedule in one of three AVR modes (AVR-automatic controlling voltage mode, AVR-power factor control mode, or AVR-VAR control mode) as determined to be appropriate by the TOP. R1. The Generator Operator shall operate each generator connected to the interconnected transmission system in one of three AVR control modes specified by the Transmission Operator (AVR-automatic controlling voltage mode, AVR-power factor control mode, or AVR-VAR control mode)unless the Generator Operator has notified the Transmission Operator of one of the following: [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations] • That the generator is being operated in start-up1 or shutdown2 • That the generator is not being operated in the TOP-directed AVR control mode for a reason other than start-up or shutdown. In VAR-002-3 R4, Duke Energy suggests removing auxiliary transformers from the standard. Auxiliary transformers are not used to control MVars for reliability purposes. In VAR-002-3 R5, Duke Energy suggests inserting the phrase “mutual assent” into the language of R5. The standard language should read as follows: R5. “After consultation and mutual assent with the Transmission Operator regarding necessary step-up transformer tap changes, …”

Yes
Duke Energy suggests extending the timeframe a GOP must notify its TOP of schedule drift to 30 minutes to allow time for recognition of the problem, assessing corrective action needed, and contacting the TOP when required. Regarding VAR-002-3 R2.1, the start time that a generator “drifts out of schedule” (i.e. is considered to have drifted out of schedule), is dependent upon the method used for monitoring the voltage. Does the clock start based upon the first scan that the generator is outside the voltage schedule, and stop upon the first scan that the generator is back within the voltage schedule? If not, how long of a period must a generator be back within schedule to reset the clock? Can the Transmission Operator define the criteria for measurement when the voltage schedules are provided? For example, can the TOP indicate that a generator is considered outside its voltage schedule when the clock-minute average voltage is outside the schedule? No matter of the data used for measuring voltage against the voltage schedule (scan-rate, clock-minute, rolling ten-minute average), is a generator considered back within its voltage schedule (clock stops) based on the same measurement to contact the TOP? Duke Energy suggests clarifying the term “capability change” in the White Paper revision. There is considerable confusion about the time requirement and it is not clear that these are applicable to the AVR status question or the capability change question. It may make sense to separate these two requirements to allow better clarification. Duke Energy suggest adding the words “or maintain any documentation” after TOP in the R3 sentence. The rewording should read as follows: “If the status has been restored within the first 15 minutes of such change, then there is no need to call the TOP or maintain any documentation” Duke Energy suggests rewording Measure 3 as follows: “The Generator Operator shall have evidence it notified its associated Transmission Operator as required in Requirement 3. If the status has been restored within the first 15 minutes, no call is necessary.”

Exelon and its' affiliates
Yes
As NERC representatives pointed out in recent webinars, one goal of many of the existing standard development projects is to seek a steady state for applicable standards. In order to avoid iterative development projects, the SARs should accommodate all known issues and/or recommendations. The recently issued Independent Experts Review Project cites some requirements within VAR-001 and VAR-002 for attention. The scope of the SAR should include assessment and resolution of the Independent Expert Review Report recommendations. Additionally, to the extent related, the recently submitted risk assessment by the RISC should be considered when developing the scope of SARs. Question 4 below requests input on specific issues acknowledged are not currently included in this project. More detail is below, but Exelon supports addressing all known issues, not just the FERC directives, at this time. In addition, Exelon supports the concept of developing Compliance Guidance concurrently with the Standard development because it makes sense to develop audit explanations and tools while the intent and information is fresh and under development. In addition, this is very useful for Registered Entities to understand how compliance will be judged. However, it is not clear how development of Compliance Input is to be conducted. The Compliance Input should evolve as the Standard language evolves through the standards development process and must ultimately reflect the actual language in the final, approved standard. Understanding that no ballot is associated with Compliance Input, it would be very useful for NERC to post Compliance Input with a separate comment form for stakeholder input. Some of the project SARs cite development of an RSAW. Stakeholder Review and comment on RSAWs and Compliance Input prior to the final ballot of a proposed standard will be mutually beneficial.
Yes
The VAR white paper discusses VAR-002 Requirement R2 and provides a discussion on notifications regarding adherence to a voltage schedule. Specifically, this paper mentions instances where the unit may not be able to return to schedule when it has encountered an operating limit, or when a system event is pulling the unit out of schedule; however, this project does not address issues where the TOP (as may be delegated to the TO) provides an unrealistic voltage schedule that is difficult if at all possible to maintain by the Generator Operator. The white paper evaluates the need for the TOP and

GOP to agree to a voltage schedule but dismisses that concept as it could create “disputes between the parties as to what the appropriate voltage schedule should be for a unit”. In our opinion, VAR-002 should provide a vehicle for a GOP to challenge what they may perceive as an unrealistic schedule if that schedule is unmanageable or challenges the physical operating capability of the generating unit. Exelon suggests that a formal notification to the TOP/TO with a technical justification be required to ensure that this challenge not be abused by the GOP. We believe it is reasonable to allow the generator to monitor the high side or the low side of the generator step up transformer; however, the TOP should align their voltage schedule to match the GOP chosen monitoring equipment or agree on the conversion factor. There is not a one for one conversion between grid voltage and terminal voltage and both parties should agree on the conversion to avoid any future audit or implementation issues. Further to the the specific language in proposed VAR-002, R2, the statements do not seem to track with the stated intent. It appears that a GOP is to notify a TOP within 15 minutes concurrently with being out of the schedule for 15 minutes. Should the language read: “…each Generator Operator shall notify its associated Transmission Operator within 30 minutes when both of the following conditions are met: …” VAR-002, R2.3. When directed to modify voltage, the Generator Operator shall comply or provide an explanation of why the schedule cannot be met. Suggest that “the schedule” be replaced with “the modified Voltage Level” since a request to move Voltage is not really a new “schedule” it is just a temporary change. The Implementation Plan for VAR-001-4 and VAR-002-3 requires the new Standard revisions to be implemented the first day of the first calendar quarter after applicable regulatory approval. This is not sufficient time to allow generating units to implement training of operators and procedural changes necessary to implement the proposed changes to notification requirements. Suggest at least a 6 month implementation period following regulatory approval. Note that as written in the proposed implementation plan, the “first calendar quarter following approval” does not guarantee even the cited timeframe of 3 months (i.e. if approved in March 2014, it becomes effective April 1, 2014). To accommodate a six month implementation period the language must mark time in months. For example the language should read: “this standard shall become effective on the first day of the seventh month after applicable regulatory approval…” The current draft does not have any tolerance at all and starts a time requirement regardless of the deviation from the voltage band. Why is this Standard requiring a time requirement for notification to the TOP when each voltage schedule, tolerance, and voltage band is different for each generator based on size, location, impact to the system and the TOPs preference for operating its system?. The voltage schedule, tolerance band, and notification requirements should be left to the discretion of the TOP. The revised Standard VSL should include a percentage value associated with an excursion outside of the voltage schedule. If the Standard moves forward without any evaluation of the magnitude of deviation from the voltage schedule, then there should be some consideration of this in the associated VSLs. Finally Exelon suggests that the Compliance Section 1.2 Evidence Retention for VAR-002-3 should read the same as for VAR-001-4.

Yes

If the operator takes the time to trouble shoot, make repairs or makes attempts to get the AVR or If the operator takes the time to trouble shoot, make repairs or makes attempts to get the AVR or PSS back to automatic, the operator limits the time available to notify the TOP that the AVR or PSS is not in auto. Exelon recommends that the time for notification be increased to allow for the operator to trouble shoot and make a determination that the AVR/PSS cannot be put back in auto. Additionally, Exelon would like the standard to specify that AVR/PSS status indication, if installed, via SCADA will satify the notification requirement.

As stated above, this project does not address issues where the TOP (as may be delegated to the TO) provides an unrealistic voltage schedule that is difficult if at all possible to maintain by the Generator Operator. Throughout the white paper and this comment form there is the common theme of addressing a “reliability gap”. In the cases of generator who are given an almost impossible job of attempting to adhere to an unrealistic voltage schedule, there is frustration on the operator’s part or constant attempts to adjust voltage that has little or any impact on the system. In the technical white paper this is classified as a “minority issue” however in our opinion this is an issue that definitely warrants attention therefore Exelon feels that it is appropriate to expand the scope of this project to address this and all known issues relevant to the Standards.

Yes
"The Transmission Operator shall know the status of all transmission Reactive Power resources, automatic voltage regulators, and power system stabilizers in their system. [Violation Risk Factor: Medium] [Time Horizon: Operations]" does not allow for a TOP to specify its own information requirements for ensuring that its portion of the BES is operated reliably.
No
Yes it is appropriate to address the coordination between GOP and TOP in this project
Group
ACES Standards Collaborators
Jason Marshall
Yes
(1) We are concerned that the informal development process that was originally contemplated has gone off course. The original plan that was announced to industry was to have an informal development team create a proposal for a standard, which would then pass the preliminary work to a formal standard drafting team to continue the development process. This is not what has occurred. The informal development process should not circumvent the NERC Rules of Procedure. (2) We question the value in posting the draft standard with the SAR. What good is the SAR posting if a standard has already been developed? This gives the impression that the Standards Committee has already determined the need for the standard and eliminated the opportunity for industry stakeholders to provide feedback. It seems unnecessary to comment on the SAR at this point because it appears that it was drafted in tandem with the pro forma standard. We urge NERC to pay close attention to its Rules of Procedure and the Standard Process Manual to avoid deviations and setting precedent that could be challenged in the future. (3) We are also concerned that the standards process manual was not followed correctly regarding the selection of the drafting team. The nomination period began after the draft standard was posted, which clearly shows the ad hoc team developed the draft standard instead of satisfying the activities it was charged with by vetting the issues of the VAR standards with industry. The initial draft standard should be the work of the appointed standards drafting team. We doubt that there was sufficient time for the new drafting team members to thoroughly review and agree with the language in the initial posting. The method of developing the initial draft should comply with the NERC Rules of Procedure and we are concerned that a bad precedent is being set.
Yes
(1) Requirement VAR-001-4 R1 is redundant with FAC-011-2 and FAC-014-2 and, thus, meets paragraph 81 criteria. FAC-014-2 R2 requires each TOP to establish SOLs for its transmission system that is consistent with the RC SOL methodology. FAC-011-2 R2 compels the RC to develop a SOL methodology that requires SOLs to consider voltage, thermal, and stability limits (including voltage) and demonstrate that the BES remains stable (transient, dynamic and voltage) during pre-contingent (R2.1) and post-contingent (R2.2) conditions. FAC-014-2 R6 compels the Planning Coordinator to identify which Category C (multiple) contingencies from TPL-003 that result in stability limits (including voltage) and to communicate the list of Category C (multiple) contingencies along with the stability limits to the RC. FAC-011-2 further compels the RC to establish a process for identifying which stability limits associated with multiple contingencies identified by the Planning Coordinator are applicable in the operating horizon within its SOL methodology. FAC-014-2 R5.2 compels the TOP to communicate its SOLs to its RC and TSP and FAC-014-2 R5.1 compels the RC to communicate the SOLs to neighboring RCs and other TOPs among a list of other entities. Finally, existing TOP-002-2.1b R10 and proposed TOP-002-3 R2 require the TOP to operate within SOLs. Thus, the combination of FAC-011-2 and FAC-014-2 compel the establishment and communication of SOLs within the TOP footprint that already consider the items such as steady-state voltage limits and voltage stability limits compelled in proposed VAR-001-4 R1 and its subparts and TOP-002 compels the TOP to operate within those SOLs. Please strike R1 in its entirety since it is clearly redundant. If the drafting team

does not strike the requirement, we ask that technical justification be provided to explain why the requirement should remain and why the redundancy is necessary. (2) If the standards development team determines there is a technical distinction that would justify why requirement VAR-001-4 R1 remains in the standard, we suggest combining parts 1.2 and 1.3 for simplicity since they both are about providing documentation. (3) We are concerned with the statement in the rationale box for R1 that this "requirement will allow each Transmission Operator (TOP) to establish its own policies and procedures". This statement implies that the TOP cannot create its own voltage policies and procedures without this requirement. This is simply not the case. All TOPs already have their own policies and procedures for voltage so the requirement is not necessary to "allow". Since there is not a specific requirement to have such policies and procedures, some may not be documented to the level necessary to demonstrate compliance but they do exist. Please modify the rationale box to state that it will "compel" or "require" and not "allow" policies and procedures. (4) While we believe VAR-001-4 R1 is redundant with other standards as stated above, we recommend removing "establish" and "Reactive Power flow (Mvar flows)" in R1 if the requirement persists. Both are redundant and, thus, superfluous. First, you cannot monitor "voltage levels… within limits" without establishing such limits. Furthermore, the requirement to establish limits is clear in Part 1.1. Second, you cannot control voltage levels with controlling Reactive Power flows. Thus, it is redundant in the requirement. (5) If VAR-001-4 R persists, please change "Mvar" to "MVAr" in requirement R1. It is actually the correct way to document megavolt amperes reactive. (6) VAR-001-4 M1: The measure contradicts itself. It states web postings as valid evidence but then states that posting a copy of the policy or procedure on a public website is not sufficient. Is it valid evidence or not? (7) VAR-001-4 R2 is redundant with currently enforceable TOP-002-2.1b R10 and R11. R11 already requires the TOP conduct seasonal, next-day, and current-day studies or assessments to determine SOLs and R10 requires the TOP to operate within those SOLs. Remember from our response in bullet (1) that FAC-011-2 and FAC-014-2 collectively require those SOLs defined by the TOP to consider pre-contingent and post-contingent voltages and voltage stability per the RC SOL methodology. Furthermore, some of the contingencies must include Category C contingencies that cause stability issues. There are similar requirements in the proposed TOP-002-3 to perform an assessment and operate within SOLs. We suggest revising R2 to remove this overlap. (8) We disagree with including the list of reactive devices in VAR-001-4 R2. It is simply not needed and is not complete either. If a TOP is not aware of the types of tools and equipment it has available to control voltage, there are more serious issues surrounding the TOP's certification. Furthermore, it might create the unintended consequence of compelling load shedding to maintain a steady-state voltage limit. If the TOP must follow its plan in R1 to operate within steady-state voltage limits by operating "voltage regulation devices" (which includes load shed) in R2, wouldn't the literal interpretation mean that load would have to be shed because a steady-state 94% voltage was below the typical 95% steady-state limit. Obviously, this would be bad for reliability. A registered entity should never be put in a position of having to choose between compliance and reliability. (9) VAR-001-4 M2 refers to studies while VAR-001-4 R2 refers to assessments. If this requirement should persist contrary to our arguments presented in point (7), we suggest using NERC Glossary Term Operational Planning Analysis (OPA). An assessment is a vague term that has several meanings and no time boundaries associated with it. For example, "assessment" is used in the TPL standards, which mean it could go out 10 years. While we understand there would be no reasonable expectation for a TOP to perform an assessment 10 years out, there could be inconsistent compliance applications because one auditor believes an assessment should cover the next day and another believes it should cover the next week. OPA is specific and bounded by time. Furthermore, use of this term would make the standard consistent with IRO-005-4, IRO-008-1, IRO-010-1a, TOP-001-2, TOP-002-3, and TOP-003-2. (10) VAR-001-4 R3 should be modified to state the TOP shall specify the criteria that will exempt generators from maintaining the voltage schedule. The TOP is not the enforcement authority and cannot exempt another responsible entity from compliance. We are concerned the language used will not be approved by FERC and result in a subsequent directive. (11) Part 3.1 of VAR-001-4 would appear to meet the paragraph 81 criterion on reporting. The criterion states that the requirement should be retired if it "obligates responsible entities to report to a Regional Entity, NERC, or another party or entity". Clearly, the GOP would be "another party or entity". The GOP should be able to simply self-determine from the criteria provided by the GOP that it satisfies the criteria. The TOP will be able to see if the GOP is following the voltage schedule from the telemetry. If there is a question, the TOP would call the GOP. (12) While the language in VAR-001-4 R4 is clear that the TOP must have criteria for granting exemptions, the associated language in VAR-001-4 Measure M4 states that the "temporary exemptions may be

provided". Please modify the language in the measure to be clear that the temporary exemptions will be provided if the criteria are met. Otherwise, the measure sounds like the TOP has discretion in granting the temporary exemptions. (13) VAR-001-4 R4 should be modified to require the TOP to only provide a voltage schedule to generators that are capable of controlling voltage. As it literally reads now, the TOP must provide a voltage schedule "to be maintained by each generator". This would include even small generators that simply do not have the size to control voltage. As an example, a 1 MVA generator connected to a 138 kV bus should not be expected to control to a voltage schedule because it simply will never be able to maintain the voltage schedule. One potential solution to address this problem is to insert BES before generator in the requirement. Once the new definition is in effect, it would be clearer that voltage schedules must be provided only to generating units 20 MVA or greater in size and or aggregate generating plants 75 MVA or greater in size. (14) It is unnecessary to require the TOP to direct the Generator Operator to comply with the voltage schedule with the AVR in voltage control mode in VAR-001-4 Part 4.1. It is redundant with VAR-002-3 R2 which compels the GOP to follow the voltage schedule. If drafting team feels the "directive" language is necessary in VAR-001-4 Part 4.1, then VAR-002-3 R2 should be removed because it would be redundant with TOP-001-1a R3 (existing) and TOP-001-2 R1 (pending regulatory approval). Both require the GOP to follow the directives of its TOP. (15) Contrary to the rationale box for VAR-001-4 R5, this requirement is clearly redundant with TOP-006-2 R1 which requires the TOP to know the status of all generation and transmission resources available for use and VAR-002-3 R3 which requires that GOP to notify the TOP of a change in the status of the automatic voltage regulator (AVR) and power system stabilizer (PSS). Since voltage control is one of the primary responsibilities of the TOP, it can be safely assumed that a transmission resource would have to include reactive power resources. Thus, the VAR-001-4 R5 is at least partially redundant with TOP-006-2 R1. How would a generation resource not include the status of the AVR and PSS? The drafting team appears to be interpreting TOP-006-2 R1 outside of the standards development process since interpretation of TOP-006-2 R1 was not included in the scope. If the drafting team does not believe an AVR or PSS is covered in TOP-006-2 R1, the appropriate course of action would be to submit a request for interpretation of TOP-006-2 R1 to verify the interpretation. If industry would disagree through the ballot process, then the interpretation would clearly obviate the need for the requirement for the remaining parts of the requirement. Finally, we can understand why the drafting team may want to emphasize reporting changes in status of the PSS and AVR but VAR-002-3 R3 compels the GOP to report the changes to the TOP already. Please strike VAR-001-4 R5 since it clearly meets the P81 criteria regarding redundancies. (16) Please clarify VAR-001-4 R6 that the TOP must consider the safety, equipment, statutory, and regulatory requirements on the GOP when specifying GSU transformer tap changes. (17) The compliance section needs significant revision. This section does not look like a final standard and is missing much of the boiler plate language. (18) VAR-001-4 VSLs: Overall the VSLs need significant work and do not look like final VSLs. For example, the Severe VSL for R2 mentions that the TOP does not perform assessments and, therefore, does not have policies and procedures implemented. R2 does not require policies and procedures. R1 does. The same Severe VSL also has a vague statement at the end stating "a lack of real-time operation," which is also classified as Severe. How does this relate to the requirement? The VSLs for R4 are inconsistent. One mentions tolerance bands and the other does not. Furthermore, failure to provide a voltage schedule to a 1000 MVA generator on a 500 kV voltage constrained line has a much greater impact on reliability than failing to provide a voltage schedule to 25 MVA generator on a 138 kV line. The former would miss more of the requirement than the latter. The bottom line is that there is an opportunity to provide more graduated VSLs than two levels. Four should be provided for R4. (19) VAR-002-3 R2 will be problematic for some GOPs because it does not reflect the characteristics of the voltage schedule provided by some TOPs. For example, some TOPs provide an hourly average voltage schedule to avoid the need for notification for every time the GOP drifts out of schedule. How would R2 be applicable in this situation? Would it only apply for the first 15 minutes of each hour looking back at the last hour? Please modify the requirement accordingly to address this issue. (20) The VSLs for VAR-002-3 R2 are too severe. Failure to provide an explanation to the TOP for failure to provide an explanation to modify voltage per Part 2.3 should be a Lower VSL not a Severe VSL. The TOP will have telemetered voltage values and will be able to see that voltage has not been modified. Thus, the TOP will be aware of the issue and will be able to call the GOP to find out what is happening or make other arrangements to modify voltage. (21) We suggest that the VAR-002-3 R2 should use different language than "as directed by the Transmission Operator". Compliance personnel may read this to mean this is a directive. If this is directive, then TOP-001-1a R3 would also apply. In essence, the language creates the opportunity for double jeopardy because failure to follow the voltage schedule

would be a violation of VAR-002-3 R2 and could be viewed as a violation of TOP-001-1a R3 for failure to follow the directive. Similar issues exist in the subparts of the requirement. (22) The VSLs for VAR-002-3 R4 appear to be intended for VAR-002-3 R2. (23) The VSL for VAR-002-3 R5 states that a technical justification must be provided for why the GOP did not implement that tap changes. No such requirement exists in the standard. The GOP could provide a safety or statutory reason for not changing the tap which are not technical justifications. Please revise the VSL accordingly.

Yes

We believe the notification should not be required until one hour after the generator has drifted from the voltage schedule or the PSS or AVR has changed status. This will give ample time for the generator to make adjustments to return to the voltage schedules, return the PSS or AVR to service or determine that it will be unable to return the voltage schedule or return the PSS or AVR to service. Then the GOP can notify the TOP. Furthermore, the TOP will be monitoring voltage and can call the GOP in the interim if they need an update on why the voltage schedule has drifted. This will also allow ample time for the TOP to switch reactive devices should they be needed which will help return the generator to voltage schedule and increase its dynamic reactive reserve.

We have no specific additional recommendations beyond those provided in earlier questions. Thank you for the opportunity to comment.

ATC doesn't have any recommended changes to VAR-001 R1. However, VAR-001-4, M1 states "the policies and procedures must detail how criteria for steady-state and voltage stability limits are used in the [TOP's] assessments …" [emphasis added]. This language should be modified to reflect the wording of the requirement, which only requires that the TOP's policies and procedures specify the criteria, not the manner in which the criteria is used in an assessment. A suggested change is: "the policies and procedures must detail the steady-state and voltage stability limits criteria to be used in the [TOP's] assessments of the system." VAR-001-4, R2 and its sub-requirements are duplicative of approved future standards TOP-001-2 R7 though R11 and TOP-002-3 R1 and R2. TOP-001-2 requires the TOP to identify and operate within SOLs and covers VAR-001-4, R2.1. The NERC definition of SOL includes both voltage stability and steady-state voltage limits. The argument that R2.1 is focused on directing reactive resources misses the point that the requirement is designed to ensure that the system is operated within SOLs. VAR-001-4 R2.1 specifies in detail what the TOP will be doing to ensure compliance with TOP-001-2 R9 through R11. TOPs should not be subjected to potentially violating two standards that cover the same ground. Similarly, TOP-002-3 R1 requires TOPs to have next-day assessments and TOP-002-3 R2 requires the TOP to develop a plan to operate within SOLs. The plan under TOP-002-3 R2 would, by necessity, include scheduling reactive resources, when necessary, to ensure SOLs will not be violated. If the comment above regarding VAR-001-4 R2 is not accepted by the ad-hoc team, the following comments on VAR-001-4 R2 should be considered: VAR-001-4, R2 does not specify "real-time and day-ahead assessments" as noted in the R2 rationale statement. The word "assessments" in R2 is not modified by any accompanying descriptor. R2 should be edited to add "real-time and day-ahead" prior to "assessments". VAR-001-4, R2.2 states that the list of options "is not limited to" the methods mentioned. However, given R2.1 specifically calls out load shedding and R2.2 does not specifically state this, it is likely that a future auditor will note this difference and state that load shedding is not acceptable under R2.2. Therefore, R2.2 should explicitly include load shedding, if necessary, as another acceptable tool in the day-ahead plan. VAR-001-4 R3.1 states that the TOP "shall notify the associated Generator Operator" but M3 states that the TOP is to have evidence showing that it notified "the associated Generator Owner". This discrepancy should be corrected. VAR-001-4 M3 places too high of a burden on the TOP for a GOP AVR issue. Specifically, the TOP is made accountable for tracking temporary exemptions granted to a GOP when the GOP calls to state that their AVR is no longer in automatic mode or is no longer controlling voltage. Since no standing exemption has been granted to the GOP (hence the phone call), the compliance obligation to show that an exemption was granted should rest on the GOP through VAR-002-3 R1 and/or R2. VAR-001-4 R4 seems to have a potential inconsistency between the

parenthetical statement and the balance of the requirement. It is suggested that R4 be rewritten and simplified as follows: “Each Transmission Operator shall specify a voltage or Reactive Power schedule and tolerance band at the interconnection point between the generator facility and the Transmission Owner’s facilities, or at either the high side or low side of the Generator Step-Up transformer at the TOP's discretion, to be maintained by each generator.” Other than our comments on VAR-001-4 R4 noted in the preceding paragraph, we agree with and fully support the current wording of VAR-001-4 R4. VAR-001-4 R5 conflicts with VAR-002-3 R3/M3 because VAR-001-4 obligates the TOP to know the status of all AVRs and PSSs but VAR-002-3 does not obligate the GOP to report status or capability changes of AVRs and PSSs if the duration of change is less than 15 minutes. VAR-001-4 R5 should be clarified to state that the TOP is dependent on the GOP to report status of AVRs and PSSs. Suggested edits are as follows: “R5. The Transmission Operator shall know the status of: 1) all transmission Reactive Power resources in its system, and 2) automatic voltage regulators and power system stabilizers as communicated by the Generator Operators in its system.” VAR-001-4 M5 should read: “The Transmission Operator shall have evidence to show transmission Reactive Power resources are being monitored” since that is the language of the requirement.
Yes
See comment in response to question #2 above where 15 minute window in VAR-002-3 R3 conflicts with VAR-001-4 R5.
ATC believes a standard is not required to address this issue.

It is our opinion that any communication and coordination between the TOPs and GOPs that affects reliability should be included in the standard.

ATC does not believe that placing both VAR Standards on one ballot is a good practice, and in fact, only VAR-001 is applicable to ATC as a TO/TOP. For future postings, please post as two separate balloted Standards. This can also create a conflict such that an entity can support one and not the other, resulting in a dilema as to vote affirmative or negative that would affect one or the other Standard negatively.

PJM Interconnection

No
Yes
Specific to VAR-001-4, PJM questions why the RC is included in the standard since the responsibilities to comply with all the requirements are with the TOPs actions. If there are no actions for the RC, PJM supports the RC being removed from the standard. Included in R1 is use of the term 'establish' specific to policies and procedures that are required to be implemented. PJM supports deletion of that specific word because there are several other standards which specifically address establishing methodologies, in turn, procedures and processes, that define voltage levels, reactive power flow, steady state limits and voltage stability limits. Those standards included TPL-001, 002 (footnote a, Table1), FAC-010-2.1 and FAC-011-2 (R1, R2, R2.2) and FAC-014-2 (R1, R2, R3, R4).

It is premature to be voting at all for the standard at this point in the process. Two major pieces of information are missing. First, the SAR has not been adopted, so we do not know if the proposed standard conforms to an adopted SAR. Second, the proposed standard was drafted by a small team of subject matter experts and has not yet been subject to a NERC wide critical review. Therefore, we do not yet know if there is a fatal flaw in the standard for some system(s) across NERC not represented by the SMEs, or if there is an outstanding idea to improve the draft standard.

CenterPoint Energy Houston Electric LLC.
No
Yes
CenterPoint Energy appreciates the efforts of the informal development team in providing the industry the proposed language changes to the VAR Standards incorporating the remainng FERC Directives. CenterPoint Energy offers the following comments and proposed changes for consideration and discussion to better align the standard language to the functions of Transmission Operator and Reliability Coordinator as described in the NERC Reliability Functional Model Technical Document Version 5 in relation to the coordination and control of voltage. The Transmission Operator has policies to monitor and control static reactive devices under its range of vision and control only. The Transmission Operator also has policies for requesting reactive output from generation units already online for voltage control; however, the redispatching of generation for reliability purposes is the responsibility of the Reliability Coordinator. Since the Transmission Operator cannot control all of the generation, then the Transmission Operator is unable to perform a complete or valid Operational Planning Analysis and modify generation dispatch to maintain operational limits both steady state and dynamic. Furthermore, any maintenance outages on static reactive devices need to be reviewed and approved by the Reliability Coordinator. Also, it is unclear to the industry what kind of action is expected from the Transmission Operator based on the status of the reactive power resources since the Transmission Operator cannot dispatch other units to make up for lack of AVR or frequency control in a generator. It would seem to be crtitical for the Balancing Authority and Reliability

Coordinator to be notified of status or capability change on any generator Reactive Power resource. CenterPoint Energy recommends the requirements be modified as follows: VAR-001-4 R1. Each Transmission Operator shall have documented policies or procedures that are implemented to monitor voltage levels and reactive power flows (MVAR flows) and maintain the voltage within limits by controlling reactive devices under its purview or by directing online generation. R1.3 Each Transmission Operator shall provide a copy of its local documented policies or procedures to its Reliability Coordinator. R2. Each Reliability Coodinator shall perform assessments… R3. The Reliability Coordinator shall specify criteria… R3.1 In the event a Reliability Coordinator approves a generator as satisfying the criteria, it shall notify the associated Transmission and Generator Operator. R4. Each Transmission Operator, in coordination with the Reliability Coordinator, shall specify a voltage or Reactive Power schedule and tolerance band at the interconnection point between the generator facility and the Transmission Owner's facilities to be maintained by each generator. R4.1 The Reliability Coordinator shall provide the voltage or Reactive Power schedule to the associated Generator Operator. The Transmission Operator shall direct the Generator Operator to comply with the schedule in automatic voltage control mode (AVR in service and controlling voltage). R5. The Balancing Authority and the Reliability Coordinator shall know the status of all transmission Reactive Power resources, including the status of voltage regulators and power system stabilizers. R6. After consultation with the Generator Owner regarding necessary step-up transformer tap changes, the Transmission Owner, in coordination with the Reliability Coordinator, shall provide documentation to the Generator Owner specifying the required tap changes, a timeframe for making the changes, and technical justification for these changes. VAR-002 R1. The Generator Operator shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) in service and controlling voltage) unless the Generator Operator has notified the Reliability Coordinator of one of the following…

SCE commends the drafting team on the work that it has done to address the FERC Order 693 Directives to modify VAR-001 and VAR-002. The draft standards are productive starting points for further clarification and refinement. Additional clarification is required before SCE can support the standards, for example, in VAR-001-4, Requirement 1.1, the use of the term "system assessment" is vague and ambiguous. The standards drafting team should provide further precision in explaining the intended meaning of this term.

Yes
We do not think the proposed requirement in VAR-001-4 which now includes RC as a Responsible Entity adequately addresses the directives. Please see our comments (b) under Q2.
Yes
VAR-001-4 a. It is unclear on the main objective and the target reliability outcome of Requirement R1, and the intent of the proposed changes in relation to the directive in P. 1868 in Order 693. We interpret R1 to require a TOP to have documented policies or procedures in place that can be implemented to establish, monitor, and control voltage levels and Reactive Power flows (Mvar flows) within limits as defined in Parts 1.1 to 1.3. However, Part 1.1 requires that the policy/procedure shall include criteria used in system assessments. It is unclear as to what "system assessments" means? Does it mean assessments of the TOP area's reliability performance with respect to the voltage levels and Mvar flows and any limits (SOLs, IROLs, reactive capability)? Or does it mean the system assessment that yields the "limits" (SOLs, IROLs, reactive requirements, etc.) which provide the target and guideline for the establishment, monitoring, and control of voltage levels and Mvar flows? It is also unclear as to what the "criteria of the assessments" means in the second sentence of Part 1.1, especially in relation to "established steady-state limits, voltage stability limits, etc. if the answer to the above question is that the assessments were meant to yield the "limits", then there is a confusion as to what limits are intended to be developed in relation to the "established" limits. In Order 693, P. 1868, FERC directs the ERO to modify VAR-001-1 to include more detailed and definitive requirements on "established limits". However, it is unclear what this directive really means. Does it mean more details and definitive requirement on stipulating voltage and reactive requirements with respect to established limits (SOLs, IROLs, voltage level, etc.) or does it mean more details on limits (boundaries) of the interconnection voltages as implied by Requirement R8 of the existing VAR-001 standard? Requirement R1 does not provide this clarity since Part 1.1. refers to "established steady-state limits, voltage stability limits", which is different than the "established limits" presented in the R8 of the existing VAR-001 standard. It is our understanding that as a general practice, a TOP will assess if there exists any reliability concerns that can be caused by voltage levels and instability to develop operating limits (SOLs or IROLs) to ensure reliable operations. The operating limits may be expressed in voltage level, pre and post-contingency power flow level, reactive support requirements or any combination of the above. The operating limits so established will provide a linkage between the SOL, voltage level and reactive power capability/reserve requirement either explicitly or implicitly. System Operators will monitor the key parameters including voltage level, power flow level and reactive power flow/reserve/capability to meet the SOL boundary conditions. Requirement R1 as presented does not provide any clarity as to what is it that in the practice that a TOP is required to meet. Requirement R1 as presented is unclear on its objective and the exact actions required of the Responsible Entity as there are a number of "criteria" and "limits" in the main requirement and its Part 1.1 that are confusing and subject to different interpretation. R1 as presented will leave a Responsible Entity not knowing what it needs to do to meet Requirement and its reliability objectives. We suggest the SDT to revise R1 and its parts to clarify its intent, especially on the who, the specific actions and expected outcome according to the results-based principle and guideline. Note that with respect to Part 1.1, Measure M1 asks for evidence that proves voltage is currently being monitored. Such evidence may include, but is not limited to: 1) proof that points are telemetered, 2) alarms are functioning, and 3) during events of low or high voltage the policies and procedures are being followed to respond to control voltage levels. These examples of evidence do not reflect the scope and depth of R1 and Parts 1.1 (the criteria and the assessment parts). We also suggest the drafting team review TOP-002 Rquirements R1, R8 and R10 as they relate to voltage limits. R1 obligates us to have plans to meet system conditions, similar to the VAR-001 R1. R8 requires us to meet voltage and reactive limits, R10 requires us to meet all SOL's and IROL's which are inclusive of voltage steady state and stability limits. The drafting team also needs to resolve the use of the term 'establish' as it relates to FAC-014 which requires us to establish SOL/IROL's that include voltage limits. b. FERC directive 1855 directs NERC to include Reliability Coordinator as applicable entities and include a new requirement(s) that identifies the reliability coordinator's monitoring responsibilities. In the Informal Consideration specific to this directive presented in the White Paper, it is indicated that: "Although some entities in Texas provided feedback that certain RCs perform functions equivalent to a TOP, the informal development group did not expand VAR-001 to give parity to TOPs and RCs." R2 as presented appears to go beyond the FERC directive that RC be

included to be assigned the "monitoring responsibility" as R2 now requires the RC to "….perform assessments on their respective areas in order to ensure sufficient reactive resources are available for scheduling to maintain voltage stability under normal and contingency conditions in order to provide the voltage levels as defined in Requirement R1". The inclusion of RC in this requirement is also inconsistent with the view presented in the Informal Consideration with respect to parity between TOPs and RCs. Parts 2.1 and 2.2 stipulates a number of tasks for the TOPs with respect to operating or directing the real-time operation of devices necessary to regulate transmission voltage and reactive flow, and to ensure that sufficient reactive resources have been scheduled to meet acceptable day-ahead voltage limits identified in Requirement R1. These tasks do not involve the RC. It thus raises a question on the need for including RC in the main requirement when it is not required to take further actions to assure its assessment of "sufficient reactive resources are available for scheduling to maintain voltage stability under normal and contingency conditions" can be fulfilled in real-time operations. We believe the inclusion of RC in this requirement is inappropriate, or if there is a compelling reason to include the RC, then Parts 2.1 and 2.2 are insufficient to assure the RC's assessment can be supported in real-time operations. c. Requirement R2, Part 2.1 stipulates that: "Each Transmission Operator shall operate or direct the real-time operation of devices necessary to regulate transmission voltage and reactive flow necessary to regulate transmission voltage and reactive flow which may include…" We do not understand this requirement as it contains two sets of "necessary to regulate transmission voltage and reactive flow". If this is a typographical error, please correct it. d. We do not have any concerns or comments on R3 and R4 as presented, but suggest that their order be reversed since the exemption criteria (R3) should appear after the overarching requirements for GOs to maintain a voltage or Reactive Power schedule and tolerance band. e. R5: we suggest to change the word "know" to "monitor". This provides an active approach, which is appropriately reflected by the wording in Measure M4. f. In the Compliance Section, there is no requirement for the RC to retain evidence for Measure M2. Further, there is no requirement for the TOP to retain evidence for Measures M5 and M6. g. VSL for R1: There is no explicit requirement in R1 for the TOP to provide a copy of the assessment criteria to its RC or neighbor TOPs since the assessment criteria are supposed to be included in the policy or procedure document. The Low VSL thus serves no purpose whatsoever. Further, from the standpoint of meeting the intent of Requirement R1, there is little to no difference between having documented policies or procedures which do not include any of the elements stipulated in Parts 1.1 to 1.3, and having no documented policies or procedures at all. In the former case, the documented policies or procedures provide absolutely no value, and hence is it a total violation of the intent of R1. We suggest to remove the Low VSL and the High VSL, and keep the Moderate VSL and revise the Severe VSL to include the condition presented in the High VSL as an "OR" condition under the Severe VSL. h. VSL for R2: Throughout R2, there are not specific requirements for having policies and procedures implemented to have sufficient Mvars. R2 requires the TOP and RC to perform assessments on their respective areas in order to ensure sufficient reactive resources are available for scheduling to maintain voltage stability under normal and contingency conditions. Part 2.2 stipulates the requirements for scheduling reactive resources to meet the reactive requirements resulting from day-ahead assessments. Part 2.1 stipulates the requirement to operate or direct the real-time operation of devices necessary to regulate transmission voltage and reactive flow. While the Moderate VSL which address non-compliance with Part 2.2 and appears to be reasonable, the Severe VSL does not correspond to how Part 2.1 is presented. Further, the condition that "A lack of real-time operations is also severe." seems irrelevant to Part 2.1 when it comes to operating or directing the real-time operation of devices necessary to regulate transmission voltage and reactive flow. There can be no lack of real-time operations, but a TOP may totally ignore the operations or directing the operations of devices necessary to regulate transmission voltage and reactive flow. Finally, there is no VSL for the RC failing to meet R2. Hence, RC is assigned a responsibility but its compliance is not measured and there is no VSL to determine its non-compliance. i. VSL for R5: The conditions in the Moderate and High VSLs are irrelevant to the requirement. R5 requires a TOP to know (monitor) the status of all transmission Reactive Power resources, automatic voltage regulators, and power system stabilizers in their system. The Moderate VSL makes reference to a "stable area", which is totally irrelevant and out of context of R5. In the High VSL, the TOP not knowing "the status of important equipment in weaker areas that were identified in assessments as part of R1." are also irrelevant and out of context of R5. Finally, there is no Severe VSL. It begs the question on: what constitutes a total failure to comply with Requirement R5? j. VSL for R6: The Low VSL should have an "is", not an "are". Also, there is no Severe VSL and hence there is no condition to constitute a total failure to comply with Requirement

R6. VAR-002-3 k. Measure M2: A good part of M2 presents the scenarios where a Generator Operator may not be able to meet voltage schedule or comply with the TOP's directive, and how a GOP may mange the situations. The description part does not belong to a Measure, and should be moved to the Background Information Section that a Results-based standard template has made provision for. l. Measure M3: the latter part of M3 is not presented in a manner to require the evidence to demonstrate compliance. We suggest M3 be revised to: The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of any of the changes identified in Requirement 3, or evidence that the status had been restored within the first 15 minutes of such change. m. For all Measures, there are no examples of evidence provided. It will be appropriate if after each of the "evidence", additional wording "such as log, recording, or other documents" so as to be consistent with the way measures are presented in other standards. n. Evidence Retention: It will be appropriate to reference the Measure Number for the GO's and the GOP's data retention requirements.
No
NERC's Reliability Issue Steering Committee (RISC) is charged to address emerging reliability issues and recommend preferred approaches to manage such issues. Whether or not the TOP/GOP voltage coordination issue should rise up to a risk level that warrants special attention by the industry, and whether the appropriate way to address this issue in a standard project will be best evaluated and determined by the RISC. We suggest that the SDT nominate this issue to the RISC for its deliberation.

1. There is a general concern with this proposed standard that it will create further administrative burden for the TOP/RC as well as the back office staff. Additionally, the opportunity exists that the number of calls between the GOP and TOP will increase without materially enhancing BES reliability. Further, how would these standards be used to evaluate the compliance of a unit which has their AVR taken off auto for testing? 2. VAR-001-4 Comments: R1.1.2. Each Transmission Operator shall Delete: "provide a copy of these Comment Form-2013-04 VAR-001-4/VAR-002-3 July 2013 Page 2 of 5 https://www.nerc.net/nercsurvey/Survey.aspx?s=c645f86a592f47c9ae532b7c11d92eb1&Re... 9/3/2013 documented policies or procedures to adjacent Transmission Operators" make plans available with a written request so entities requiring documents have access. R1.1.3. Each Transmission Operator shall Delete:"provide a copy of these documented policies or procedures to its Reliability Coordinator." make plans available with a written request so entities requiring documents have access. R2. Each Transmission Operator and Reliability Coordinator shall perform assessments on their respective areas in order to ensure sufficient reactive resources are available Delete: "for scheduling" to maintain voltage stability under normal and contingency conditions in order to provide the voltage levels as defined in Requirement R1. R2.2.2. As a result of the assessments, each Transmission Operator shall ensure that sufficient reactive resources Delete: " have been scheduled" Add: "are available" to meet acceptable day-ahead voltage limits identified in Requirement R1. Sufficient reactive resources may include, but is not limited to reactive generation scheduling; transmission line and reactive resource switching; and controllable load. R5. The Transmission Operator shall know the status of Delete:"all transmission" Add: " BES" Reactive Power resources, automatic voltage regulators, and power system stabilizers in their system. Request that the SDT review R5 to ensure that it is not a duplicative of a TOP standard. M5. The Transmission Operator shall have evidence to show Reactive Power resources are being monitored. Evidence may include, but is not limited to screen shots of EMS/SCADA data, alarms, and phone logs. In the event the monitoring system does not work, each Transmission Operator should have a protocol in place to show these resources are being monitored. Request the SDT to add further clarification for AVR and PSS.

R1.1.2. Each Transmission Operator shall Delete: “provide a copy of these Comment Form-2013-04 VAR-001-4/VAR-002-3 July 2013 Page 2 of 5 https://www.nerc.net/nercsurvey/Survey.aspx?s=c645f86a592f47c9ae532b7c11d92eb1&Re... 9/3/2013 documented policies or procedures to adjacent Transmission Operators” make plans available with a written request so entities requiring documents have access. R1.1.3. Each Transmission Operator shall Delete:“provide a copy of these documented policies or procedures to its Reliability Coordinator.” make plans available with a written request so entities requiring documents have access. R2. Each Transmission Operator and Reliability Coordinator shall perform assessments on their respective areas in order to ensure sufficient reactive resources are available Delete: “for scheduling” to maintain voltage stability under normal and contingency conditions in order to provide the voltage levels as defined in Requirement R1. R2.2.2. As a result of the assessments, each Transmission Operator shall ensure that sufficient reactive resources Delete: “ have been scheduled” Add: “are available” to meet acceptable day-ahead voltage limits identified in Requirement R1. Sufficient reactive resources may include, but is not limited to reactive generation scheduling; transmission line and reactive resource switching; and controllable load. R5. The Transmission Operator shall know the status of Delete:”all transmission” Add: “ BES” Reactive Power resources, automatic voltage regulators, and power system stabilizers in their system. Request that the SDT review R5 to ensure that it is not a duplicative of a TOP standard. M5. The Transmission Operator shall have evidence to show Reactive Power resources are being monitored. Evidence may include, but is not limited to screen shots of EMS/SCADA data, alarms, and phone logs. In the event the monitoring system does not work, each Transmission Operator should have a protocol in place to show these resources are being monitored. Request the SDT to add further clarification for AVR and PSS.

PNM Resources, Inc.

No
Yes
PNM disagrees and cast a negative ballot vote due exclusively with the implementation timeframe of one calendar quater. One calendar quater does not appear to be enough time to prepare a documented policy or procedure for assessments that is required of Transmission Operators nor does it allow sufficient time for the newly applicable RC function to prepare its compliance documentation as well as ensure processes/procedures are established and working well prior to the effective date. Finally, Transmission Operators t which were not previously providing voltage/reactive tolerance bands will need additional time to establish this exchange with Generator Operators. PNMR suggests a minimum of 2 calendar quarters for implementation to ensure registered entities are not forced to self report non-compliance due to the extraordinarily short implementation schedule. PNMR has no issues with the wording in the standards and is otherwise in favor of the new proposed standards.

City of Austin dba Austin Energy
No
Yes
For requirement R1, Austin Energy proposes that the standard include generator “testing mode” in the exemption criteria. Austin Energy proposes the following for R1-first bullet item: ”That the generator is being operated in start-up, shutdown or testing mode pursuant to a Real-Time communication or a …….”
Yes
Austin Energy believes Requirement 2.1 is not focusing on the most useful metric for Transmission voltage stability. In the ERCOT Region, the Transmission Operators (Local Control Centers) monitor voltage on their Facilities and, when necessary, control the voltage by operating or directing the operation of reactive devices including reactive generation scheduling. The Generator Operator responds to requests from the Local Control Center for voltage support and notifies the Local Control Center if it is unable to provide voltage support. Asking the GOP to monitor voltage at the GSU and notify the TOP of certain deviations is somewhat redundant and not useful because the Local Control Center already monitors voltage at the system level and directs the Generator to alter MVAR output. Typically, in the ERCOT Region, the Generator and Generator Operator have no visibility into the larger system voltage and operate in a responsive mode. Generator equipment settings (Tap Settings & MVAR Settings) are set to meet the assigned voltage schedule under normal operating conditions and are adjusted only when a request for voltage support is received. Therefore, Austin Energy recommends altering the requirement to read “If the GOP is unable to meet the reactive support requested by the TOP due to equipment limitations it shall notify the Transmission Operator”, as already required in R2.3.
These comments apply to the VSLs (you did not provide an opportunity to do so elsewhere in this comment form): It looks like the VSLs for R2 show up for R4 and vice versa. R4 is merely a requirement to provide data, yet the VSLs address failing to maintain voltage schedules. On the other hand, the VSL for R2 has only a "severe" entry and penalizes the Registered Entity only if it fails to perform ANY sub-requirement (there are three). That doesn't seem correct. Finally, the VSL for R5 applies only if the Registered Entity does not perform BOTH requirements. That also appears incorrect.

No
Yes
VAR-001-4 Replace ‘real time’ with ‘Real-time’ in the Purpose and throughout the standard. It is a NERC defined term. R1 requires the TOP to have policies and procedures that establish, monitor and control voltage levels and Reactive Power flows in the Operations timeframe. Is the requirement stating that the Transmission Operator must develop the voltage and reactive schedules in Real-time? This function is typically performed behind the scenes by Transmission Planners or other support staff. We suggest that the wording be changed by deleting ‘establish’. Additionally, the white paper states that the Operations timeframe is from Real-time up to one year in the future. Real-time, according to NERC Time Horizons document, is within one hour or less while Operations Planning is from day-ahead to up and including seasonal. We suggest this be revised to state the Real-time Operations thru Operations Planning time horizons. R1.2 and R1.3 are redundant with TOP-004-2, R6 and do not need to be repeated in this standard. We recommend deleting these two sub-requirements. In M1 insert ‘and controlled’ in the 6th line after ‘monitored’ such that the sentence states ‘…is currently being monitored and controlled.’ Also inisert ‘adjacent’ in front of Transmission Operator and add an ‘s’ to Operator in the next to last line. R2 requires voltage stablility assessments to be conducted by the TOP but no direction is given on how often these assessments must be performed. While we’re not asking the drafting team to place specific time limits on when assessments must be performed we would like to know what conditions would drive the need for performing a new voltage assessment. This should then be incorporated into the requirement. Also, are references to online assessments referring to Real-time snapshots for input into steady state voltage analysis or are they referring to dynamic voltage stability assessments? Given that it is stated in the Rationale Box for R2 that online assessments are not being specifically required in this standard, what kind of assurances does a TOP have that an audit team won’t expect the TOP to have such functionality available on the control room floor? The word ‘switching’ is left by itself in the listing of resources in M2. We’re not real sure what it refers to but would suggest that we delete capacitor banks and switching and replace it with transmission line and reactive resource switching. This recognizes that switching out a transmission line or a reactor bank serves the same purpose as switching in a capacitor bank. Also, delete the 2nd ‘provide’ in the next to last line of M2. R3 exempts GOPs from R4 but GOPs are not required to do anything in R4. The exemption should apply to VAR-002-3, R2. This is stated in the white paper on Page 8 in the first line under Requirement 3. In the 4th line of M3 ‘maybe’ should be ‘may be’. R4 requires the TOP to direct the GOP to follow the voltage schedule the TOP provided to the GOP. R2 of VAR-002-3 requires the GOP to maintain its assigned voltage schedule and the TOP does not need to direct the GOP to follow it also. This is redundant and should be removed. For consistency with the Measure, delete last sentence of M3. We recommend retiring R6 because it is simply a mechanism for adhering to the requirements in R4. R4 is more of a results-based requirement – follow the provided schedule. R6 is providing one option to assist in following R4. It should be deleted. The VSLs for R2 do not match the requirement. In fact, they add requirements which are not included in the standard. We recommend deleting the Moderate VSL for R2 and revising the Severe VSL to read The Transmission Operator does not perform assessments of their area. Unless the VSLs for R4 are spread out among all categories; did not provide to one GOP for Low, two GOPs for Moderate, three GOPs for High and four or more GOPs for Severe, we would suggest simply deleting the existing High VSL, leaving only the Severe VSL. The VRF shown in R5 does not match the VRF in the VSL table. One is Medium and the other is Lower. Which is it? The justification for the inclusion of power system stabiliizers in R5 is weak to say the least. Why does this equipment need to be highlighted and other equipment, such as capacitor banks and reactors, not? TOP-006-3 R1 requires the TOP to know the status of all generation and transmission resources within its area. R2 goes on to specifically include static and rotating reactive resources. It would appear that R5 is then duplicative with these requirements and therefore could be retired. If AVRs and PSSs need to be highlighted, they should be highlighted in TOP-006 and not in this standard. VAR-002-3 We have a concern that the use of Generator Operator in this standard appears as an attempt to change the definition of GOP to the operator inside the plant control room. Some of the functionality referred to in the standard specifically points to the plant personnel rather than the NERC defined Generator Operator. For example, controlling the AVR. This is something that a plant operator would do not the Generator Operator consolidating several plants at some remote location. This would be similar to field support personnel in a transmission setting. We suggest changing the responsibility to plant

personnel. We recommend replacing ‘directed’ with ’provided‘ in R2 and R2.2. The way the timing logic is written in R2.1 if a GOP is outside the tolerance band for longer than 15 minutes and the GOP has the capability to return to control, the GOP does not have to notify its TOP. Either the ‘and’ needs to be changed to an ‘or’ or the sub-requirement needs to be totally rewritten. Delete ‘associated’ when referring to TOPs in R3, M3 and R5. We recommend moving the VSLs from R4 to R2 with the following changes: LOW – When unable to maintain voltage or reactive power schedule the Generator Operator notified its TOP in more than 30 minutes but within 45 minutes. MODERATE – When unable to maintain voltage or reactive power schedule the Generator Operator notified its TOP in more than 45 minutes but within 60 minutes. HIGH – When unable to maintain voltage or reactive power schedule the Generator Operator notified its TOP in more than 60 minutes but within 75 minutes. SEVERE – When unable to maintain voltage or reactive power schedule the Generator Operator notified its TOP in more than 75 minutes or did not notify its TOP at all. We recommend changing the Severe VSL in R3 to: The responsible entity did not notify its TOP of a status or capability change as specified in R3. The provided VSLs for R4 probably belong to R2 and could be used there if the drafting team chooses to dispurse the severity of the violations across the VSL spectrum. We recommend the following for the VSLs for R4. LOW – The Generator Operator provided the data requested in R4 in more than 30 days but within 45 days. MODERATE – The Generator Operator provided the data requested in R4 in more than 45 days but within 60 days. HIGH – The Generator Operator provided the data requested in R4 in more than 60 days but within 75 days. SEVERE – The Generator Operator provided the data requested in R4 in more than 75 days or the Generator Operator did not provide the data at all. We recommend changing the Severe VSL in R5 to: The responsible entity did not perform the specified tap change and failed to provide the technical justification to its TOP as to why it did not comply with the request as required in R5.
Yes

BPA considers the impact of large renewable generation projects (asynchronous machines) in our interconnection requirements and recognizes the ability of these machines or their auxiliary devices to support voltage. BPA recommends the drafting team address renewable resource voltage control in VAR-002-3. BPA believes that VAR-001-4, Requirements R1.1 and R2 are redundant as they appear to overlap with existing Mandatory standards. FAC-011-2, Requirements R1, R2 and R3 establish that the RC Methodology includes process and pre/post contingency performance, including margins. FAC-014-2, R2 instruct the TOP to establish SOL’s in accordance with the RC Methodology. Because of this, BPA believes that VAR-001-4, R1.1 is already established in these FAC standard requirements. Additionally TOP-002, R11 requires the TOP to perform seasonal, next day and current day studies to determine SOL’s. Because of this, BPA believes that VAR-001-4, R2 appears to be redundant. BPA recommends the elimination of R1.1 and R2 of VAR-001-4 to remove this redundancy.

PacifiCorp
Kelly Cumiskey
No

Yes
PacifiCorp would like to point out that there is no uniform method with which voltage schedules are established in R1 of VAR-001-4. If there isn't anything specific that a TOP is expected to look at or address when drafting the procedures or policies for establishing voltage schedules, it is not clear to PacifiCorp how the policies and procedures will be measured. Moreover, if the policies and procedures only include a TOP's own criteria for the studies used to establish voltage schedules, how does requiring a documented policy and procedure in the reliability standard (referenced on page 7 of the NERC White Paper) "remove the opportunity for auditors or other parties to scrutinize a TOP's own system studies"? Additionally, PacifiCorp would like more clarity with respect to how real-time reactive deficiencies are expected to be identified in R2 of VAR-001-4. The rationale for R2 states that the informal development team believed the requirement should not require a utility to purchase new online simulation tools but in the absence of such tools, it is not clear to PacifiCorp how real-time reactive deficiencies can be captured.

Tri-State Generation and Transmission Association, Inc.
No
Yes
In the draft of VAR-001-4 R2 the use of the word 'schedule' when referring to all reactive resources is unclear. This is in conjunction with the Compliance response to question 2 part 2, "…provide the documentation for the day ahead scheduling in addition to documentation supporting that it was scheduled…" found in the NERC document Draft Reliability Standard Compliance Guidance for VAR-001 and VAR-002 dated July 8, 2013. Is it the ad hoc group's intent to have a schedule for all reactive resources including capacitors, reactors, Static var Compensators and generators? Is the schedule meant to be similar to that of a generator (i.e. Insert capacitors at 1.0pu and remove at 1.05) or on a time base? Is schedule just supposed to take into account availability of all reactive resources? For VAR-001-4 R4 Tri-State Generation and Transmission Association, Inc. (TSGT) believes it would be beneficial to include a feedback loop from the GOP to the TOP when there are generator capability concerns with regards to the TOP's supplied voltage schedule. Also TSGT believes the statement "(at either the high or low side of the Generator Step-Up transformer at the TOP's discretion)" currently in VAR-001-4 R4 to should be changed to "(at an agreed upon metering point to which the GOP has direct access)." For VAR-001-4 R6 why did the ad hoc group not change the consultation requirement from GO to GOP? Tri-State believes that this information would better serve the GOP function particularly at Co-Owned facilities. This change would not have a negative effect on the reliability of the BES would reduce duplicative notification to be administered by the TOP. TSGT suggests the ad hoc group add the statement "Notification to the TOP is not required if the GOP can return to schedule" to the end of VAR-002-3 R2.1 to provide further clarification when notification is needed. For VAR-002-3 R5 TSGT believes the TOP should consult with the GOP rather than the GO to better align requirement R5 with its subrequirement R5.1.
No
TSGT does think a feedback loop would be beneficial for VAR-001-4 R4 as noted in our comment to question 2.

SCE commends the drafting team on the work that it has done to address the FERC directives in Order 693 to modify VAR-001. The draft standard is an excellent baseline/ starting point to accomplish this endeavor the draft VAR-001-4 standard, currently out for comment and balloting, still needs additional clarity and refinement before it can be moved forward and go into effect. An example of the need for clarity can be found in the Requirement 1.1, and the use of the term "system assessment". The drafting team should better describe this term as it is somewhat ambiguous in nature.

Patrick Brown

Yes

VAR-001: 1. The rationale statement for R1 of VAR-001 says that it, “will allow each Transmission Operator (TOP) to establish its own policies and procedures,” regarding voltage schedules and tolerance bands. This wording does nothing to prevent specifying an unreasonably-tight bandwidth (e.g. +/- 0.5%), as some parties are now doing. We suggest that R1.1 end as follows, “…voltage schedules along with associated tolerance bands of not less than 1.5% of the schedule voltage unless technically justified.” There may be some resistance to making the standard prescriptive, but it’s not a burdensome requirement, and it would be unfortunate to update the standard without addressing known abuses of the present version. 2. The statement, “Each Transmission Operator shall specify a voltage or Reactive Power schedule and tolerance band (at either the high side or low side of the Generator Step-Up transformer at the TOP's discretion) at the interconnection point between the generator facility and the Transmission Owner's facilities,” in R4 of VAR-001 has a semantics glitch in that there is just one interconnect point. That is, mandating control at the interconnection eliminates any discretion in making the high vs. low-side selection. We suggest saying instead, “Each Transmission Operator shall specify a voltage or Reactive Power schedule and tolerance band, at the agreed upon metering point to which the GOP has access.” This will typically be either the transmission bus or the generator terminals. If the TOP specifies this as the TO’s “transmission bus”, the TO should be required to make the same voltage point used by the TOP available to the GOP to ensure both are seeing the exact same voltage. Additionally, there needs to be a feedback loop from the GOP to the TOP regarding the voltage schedule. This does not mean we want to spark a debate every time a schedule is provided, but simply add a step that allows a GOP to provide feedback regarding the feasability of the schedule. A recommended R4.2: R4.2 The Generator Operator shall review the voltage or Reactive Power schedule and tolerance band provided by the Transmission Operator and inform the Transmission Operator of any conditions that would prevent the Generator Operator from complying with the schedule or tolerance band, along with the technical basis for that determination. The question that then comes up is, what does the TOP do if the GOP cannot comply with the schedule as presented? Recommended R4.3: R4.3 If the Generator Operator is unable to comply with the voltage or Reactive Power schedule or tolerance band as provided by the Transmission Operator, the Transmission Operator shall (a) modify the voltage schedule within the parameters established in the documented policies and procedures established in R1, taking into account the Generator Operator’s limitations, or (b) exempt the Generator Operator from following the voltage schedule or tolerance band using the criteria established in R3. 3. We’d like to see R6 of VAR-001 changed to, “After consultation with the Generator Owner regarding necessary step-up transformer tap changes, the Transmission Operator shall provide documentation to the Generator Owner specifying the required tap changes, a timeframe for making the changes that is mutually agreed, and technical justification for these changes.” That is, the change should normally wait until it can be rolled into a scheduled downtime event. We sometimes get people studying things for numerous months, then when finally reaching a decision wanting to know why we can’t make the change in the next day or two. VAR-002: 1. We suggest changing, “The Generator Operator shall have evidence to show that it notified its associated Transmission Operator any time it failed to

operate a generator in the automatic voltage control mode as specified in Requirement 1," in M1 of VAR-002 to a more semantically neutral, "The Generator Operator shall have evidence to show that it notified its associated Transmission Operator any time it did not operate a generator in the automatic voltage control mode." 2. The SRT recommends the following changes to R2, for clarity; R2. Unless exempted by the Transmission Operator, each Generator Operator shall maintain the generator voltage or Reactive Power schedule3 (within each unit's ratings or capabilities4) as directed by the Transmission Operator. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations] 3. We suggest corresponding changes to R2.1. Note that the time frames are left blank in our recommendation, as there is still much discussion within the industry as to what an approporitate timeframe would be; If the system bus voltage drifts out of schedule, each Generator Operator shall notify its associated Transmission Operator within __ minutes when both of the following conditions are met: 1) the GOP has been operating outside of the prescribed voltage or Reactive Power schedule tolerance band5 for __ minutes; and 2) the GOP is no longer able to return to its voltage or Reactive Power schedule. Notification to the TOP is not required if the GOP can return to schedule. 4. In line with the recommended changes above, we suggest changing M2 to; Generator Operators shall operate the generators to help minimize excursions outside the established tolerance bands for the agreed-upon metering point. It is recognized that excursions may occur outside of the tolerance bands during unit start-up and shut-down, during MW and MVAR loading at a transmission bus where multiple units are connected, during time of relatively sudden transmission system loading changes, during system events and when grid conditions are beyond the capability of a generator to correct. Therefore, when the system bus voltage is out of the tolerance band, the Generator Operator will not be held in non-compliance with this requirement if the sub-requirements 2.1, 2.2, and 2.3 are met. In order to identify when a unit is deviating from its schedule, GOPs will monitor voltage at the agreed upon metering point to which the GOP has access. Therefore, GOPs have the option to operate on a voltage schedule on either the high-side or convert the high-side schedule to a low-side schedule at the GOP's discretion. For units that monitor on the low-side/terminal voltage, Generator Operators shall provide evidence of the method of conversion from the high-side schedule to low-side monitoring. GOP shall have evidence to show compliance with requirement R2 by providing 1) Communications with the TOP when the Generator Operator was operating outside of the prescribed voltage or Reactive Power schedule tolerance band for __ minutes AND Generator Operator was unable to return the generator to operation within its voltage or Reactive Power schedule tolerance bands; 2) Generator Operator implemented an alternative method to control reactive output when the AVR was out-of-service or unavailable; 3) compliance with directive to modify voltage or a notification that the directive could not be met. Evidence may include, but is not limited to Generator Operator logs, SCADA data, phone logs, and any other alarming notifications that would alert the Transmission Operator that both conditions were met. Timing for Requirement R2.1 can be crucial during system events, and Generator Operators are expected to begin timing when notified of an event by the TOP as soon as the unit is operating outside of the tolerance band. Further, voltage documentation during a system event may be requested by an auditor to show measures were taken to bring the unit back into schedule. 5. To harmonize Footnote 4 with our recommended language for R2, we suggest Footnote 4 be revised to state; For the operations horizon, the GOP may choose a test-based or real-time method of establishing a unit's reactive power capability. The test-based capability is that determined for compliance with MOD-025. Parameters typically monitored for determining real-time capability may include 1) generator loading (MW, MVAR, amps), temperatures, and terminal voltage; 2) GSU loading and temperatures; 3) auxiliary bus voltages; 4) plant auxiliary equipment loadings, temperatures, and voltages; 5) Generator and GSU Volts/Hz limits; 6) excitation system and/or AVR limits. 6. If R2.1 sticks, we would like to see M2 clearly state that "if the GOP can return to schedule, he does not have to notify the TOP." 7. For the new footnote 6 referenced above; The TOP is to establish an official-for-compliance bus and phase voltage point for monitoring compliance of generators controlling to the high-side voltage. An excursion begins for compliance purposes when the measured voltage exceeds the bandwidth boundary by a recognizable amount (0.5%). Multiple notifications to the TOP need not be made when the system voltage wanders back and forth across the bandwidth boundary. The system voltage must be back within the boundary for one hour before the next excursion counts as a separate event. 8. VAR-002, R2.2 should read, "When a generator's automatic voltage regulator is out-of-service, the Generator Operator shall use an alternative method to control the generator reactive output to meet the voltage or Reactive Power schedule directed by the Transmission Operator, unless the TOP grants an exemption." The purpose of this change is to reference the process established in R3 of VAR-001. 9. VAR-002, R4 should be revised to state; "For

generator step-up and auxiliary transformers with nominal primary voltages equal to the generator terminal voltage:" This is to clarify that R4 is N/A to startup transformers and other station auxiliary transformers connected to a HV bus at a plant. 10. VAR-002, R5 should read, "after consultation with the Transmission Operator and agreement on schedule regarding necessary step-up transformer tap changes…'" for the reason stated under comment 3 above. Regarding the Technical Whitepaper; 1. The statement on p.7 that, "the more VARs produced at a generating facility, the fewer MWs produced," would be true only if operating to the generator OEM D-curve limit, and many generation units are instead typically limited by generator voltage limits due to variations in aux bus voltages. Under the latter situation raising and lower reactive power export or import does not affect the MW capability. 2. The statement on p.7 that "the informal development group did not want to place numerical requirements on what the proper operational limits should be for the continent," fails to consider that there are present-day abuses of the system that should be addressed in the VAR-001 update. Self-policing isn't working, hence our comment #1 above. 3. Ref. "unit drifts out of schedule," on p.9 it is the system that is drifting, not generation units. 4. The statement on p.10, "This industry divide is not addressed in the pro forma standard presented today," appears to account for some of the ambiguity discussed in the NAGF's comments. We believe that requirements need to be unambiguous, however, and there must also exist explicit and achievable means of achieving compliance. 5. While there is a sentence in the measure that states it is clearly the generator's discretion as to whether they monitor (presumably control) low side or high side to demonstrate compliance, we believe that there is still a substantial amount of language in the Standard and the Whitepaper that would tend to cloud that by implying that a generator should monitor high side for compliance if you have high side equipment installed; in other words, the monitoring/control point is based on current installed equipment. 6. Additionally, the Whitepaper does nothing to shed light on whether generators should make manual moves to reactive output (by changing the AVR low side set-point) without explicit direction form the TOP which leaves the compliance application open for interpretation.

Yes

1. In order 693 Page 488 the FERC "directive" for VAR-002 stated, "Dynegy has suggested an improvement to Reliability Standard VAR-002-1, and NERC should consider this in its Reliability Standards development process." Dynegy's concern stated, "VAR-002-1 should be modified to require more detailed and definitive requirements when defining the time frame associated with an 'incident' of non compliance." Dynegy offered two alternatives to address their concern: "…[1] either more detail should be added to the Reliability Standard to cure this omission, Or [2] the Reliability Standard should require the transmission operator to have a technical basis for setting the time frame that takes into account system needs and any limitations of the generator." Their reasoning: "… this approach will eliminate the potential for undue discrimination and the imposition of overly conservative or excessively wide time frame requirements, both of which could be detrimental to grid reliability." Note that voltage tolerance band is not mentioned. 2. Going from NERC "should consider" Dynegy's suggested improvements to a very prescriptive time requirement (embedded in a VSL) in the current version of VAR-002 was a big step from the generation perspective. Also, it appears that Dynegy's second alternative was ignored during this step. 3. In the 2013 FERC Order approving VAR-002-2b (current version which became effective on July 1, 2013): PPL presented valid arguments against the "zero tolerance" time frame deviation introduced in the VSLs from the generator operator perspective (see Paragraphs 15 and 16). Both NERC and FERC rejected PPL's arguments. Paragraph 17 states, "NERC argues that the proposed modification would allow for a deviation in system voltage for up to 30 minutes to allow for time to correct an excursion and that such deviations from a voltage and reactive schedule is inappropriate because a deviation even up to a few minutes can negatively impact reliability." Paragraph 18 goes on to say, "NERC maintains that significant voltage deviations for extended periods of time may lead to voltage collapse and can increase the potential for a wide-area impact to the reliability of the Bulk-Power System, and as such PPL Companies' proposed modification to the VSL language should be rejected." The context of the NERC and FERC discussions and agreement on the rigid time requirement apparently assumes all TOP's voltage schedule tolerance bands are reasonable and "reliability based". Also, there seems to be an absence of discussion on Dynegy's 2nd alternative for the "the transmission operator to have a technical basis for setting the time frame that takes into account system needs and any limitations of the generator." However, the Pro Forma VAR R1 will require each TOP to have documented policies or procedures used to "establish, monitor, and controls voltage levels and Reactive Power flows within limits as defined below: R1.1 These documented policies or procedures shall include criteria used in system

assessments. The criteria for the assessments shall include established steady-state limits, voltage stability limits and associated operating margins, and voltage schedules along with associated tolerance bands." Thus, a fair question on the Pro Forma standards follows: If VAR-001 R1.1 is met, can GOPs conclude that each TOP's tolerance bands have a documented technical basis? If not, what mechanism will allow GOPs to question extremely narrow voltage or reactive power schedule tolerance bands that make compliance with VAR-002 R2.1 difficult or impossible? Note the Background discussions in the White Paper (see Pages 7 – 10). The discussion for VAR-001 R4 states, "The informal development group is cognizant of the fact that the nature of reactive power on the network varies depending on local conditions. Thus, the group focused on the process that the requirements would detail, not the proper numbers a TOP should enforce in the standard. For VAR-001, the group would not put operational limits on how a TOP should manage voltage stability for its regions; more specifically, the informal development group did not want to place numerical requirements on what the proper operational limits should be for the continent. Operating margins vary due to specific system characteristics as well as the operating conditions." This begs the question: Why was this same rationale not applied in addressing the time frame? 4. The published reasons for the changes to VAR-002 include 1) eliminating nuisance calls and mitigating compliance issues for generators (i.e. non-reliability gap reducing violations), and 2) addressing the FERC directive to NERC to "consider a timeframe" for allowing a generator to be out of schedule before having to make a notification to its TOP. It could be argued that imposition of a very prescriptive time frame alone does not fully address the FERC "directive" language and the first Pro Forma objective of reducing nuisance calls (GOP to TOP), especially if the voltage tolerance bands are extremely tight or do not have a technical basis.

Texas Reliability Entity
Texas Reliability Entity
Yes
VAR-001----R1 is too vague and general and nature. It does not establish a time period for compliance, and it does not provide sufficient criteria to allow an entity or an auditor to determine whether the "policies and procedures" are effective and adequate to satisfy the standard.
Yes
***VAR-001---- (1) R2.2 refers to "day-ahead voltage limits identified in Requirement R1," but R1 does not have a timeframe associated with it, and it does not expressly require identification of "day-ahead voltage limits." (2) The Measures include many details that appear to be intended to flesh out the requirements, not just to explain what will be expected to demonstrate compliance with the requirements. For example, most of M3 deals with "temporary exemptions," but there is no mention of "temporary exemptions" in R3. (3) In R4, is the specified voltage and tolerance band at the GSU or at the interconnection point (which in many cases is not the GSU)? In a world with long lead lines, setting a definite unique location for a voltage point and associated tolerance is required. ***VAR-002---- (1) Actions necessary to maintain a voltage or Reactive Power schedule are needed to prevent drift. As written the GOP would only have to be within its voltage or Reactive Power schedule for 2 minutes of a given hour and never notify its TOP. Is that what is intended? (2) Measure M2 contains an enormous amount of information that appears intended to modify the requirement – that is not the purpose of a measure. The requirement should be written to capture all of the elements of and exceptions to the requirement. (3) R3 ignores the requirement for the TOP in VAR-001-4 to know the status of "all transmission Reactive Power resources, automatic voltage regulators, and power system stabilizers in their system" as defined in VAR-001-4 R5. (4) In R5, there is a disconnect between actions by a GO in R5 and actions by a GOP in R5.1. (5) The VSL for R2 should be reconsidered. This does not appear to be a binary requirement, as multiple levels of non-compliance could be identified. Also, does the VSL require ALL sub-requirements to not be met before a non-compliance occurs—the language used is ambiguous. (6) The VSL for R4 does not correspond to the language of R4 (R4-data within 30 days of a request---VSL talks about timeframes of not meeting a schedule). (7) The VSL for R5 fails to recognize the role of a GO as stated in the requirement.
Yes
As written the GOP would only have to be within its voltage or Reactive Power schedule for 2 minutes

Yes
WECC notes that Requirement R3.2 has been deleted from the proposed standard. The proposed R3 in VAR-002-3 still requires the GOP to notify its associated TOP of a status or capbility change on any generator Reactive Power resource, including the status of each automatic voltage regulator and power system stabilizer (old R3.1) but the requirement for the GOP to notify its associated TOP of a status or capbility change on any other Reactive Power resource under the GOP's control (old R3.2) is no longer included in the proposed VAR-002-3. What is the purpose of removing this requirement?

R.1. This requirement is very unclear and the objective is undefined for the Transmission Operator in establishing the criteria for the system assessments that are to be included in the required policy. TOPs establish their operating limits (SOLs and IROLs) based on NERC and WECC RC (in the west) criteria. Would this established criteria (in the west) be the intended 'criteria' that should be used in a TOP's system assessment in the WECC region for this requirement or are there other minimum criteria that are expected to be included to meet compliance with this requirement? When establishing these operating limits, voltage and reactive requirements are captured when the WECC RC criteria is applied as required as part of the compliance with FAC-014-2 R2 for TOP entities in the WECC region. Does the establishment of this requirement create an unintended duplication of the reliability standards? These studies follow a specific methodology and criteria established and used, but requirement 1.1 refers to a criteria that is not entirely clear on what the TOP should be using.

Yes
On VAR-001 and VAR-002 regarding voltage schedule and compliance: The published reasons for the changes to these standards are 1) to eliminate nuisance calls and non-reliability gap reducing violations, and 2) to address the FERC directive to NERC to "consider a timeframe" for allowing a generator to be out of schedule before having to make a notification to its TOP. The changes to the standards do not fully address the first objective of reducing nuisance calls (GOP to TOP) regarding being off schedule. In addition, we have considered the idea of notification timeframes and do not suggest including such GOP notifications in the revised VAR-002. Currently, GOPs are required to maintain generator voltage or Reactive Power Schedules as directed by the TOP. If the GOP experiences problems maintaining voltage schedules, the TOPs, if warranted, will notify the GOP to either maintain or modify their voltage schedule as needed to maintain reliability of the TOP area. This existing construct has proved to work well and a new notification requirement is unnecessary. VAR-001-4 R1 Comments: Regarding R1 Part 1.1, the language addressing the specification for the criteria for the assessments needs refining. Regarding the verbiage specifying the inclusion of “estabilished steady-state limits”, while one would assume that means voltage level steady state limits, this needs to be clarified. Otherwise, it could be mis-interpreted to include steady state Mvar flows or other power system quantities. Also, the inclusion of voltage stability limits and operating margins is not applicable to all TOP footprints. Voltage stability limits manifests as the potential limiting phenomena in systems with high transfers or dense loads served over high nominal voltage kV transmission lines. Transmissions systems that are predominately load serving by local generation over lower nominal kV transmission lines are often shown, through off-line studies, to be limited by thermal and/or voltage level limits far in advance of voltage stability limits. Given that voltage stability analysis is not trival, this verbiage is burdensome and would require subject matter expertise that is not widely available for no reliability gain. Would suggest chaning the verbiage to “…..for systems where voltage stability limits are potentially the limiting phenomiena, the criteria for the assessment should also inlcude voltage stability limits and associated …….” Finally, need to include that voltage stability limits can be identified in off-line studies. VAR-001-4 R2 Comments: Modify R2 from…..”….are available for scheduling to maintain voltage stability under normal and contingency conditions conditions in order to provide the voltage levels as defined in Requirement R1” to ….”….are available to provide the voltage levels as defined in Requirement R1”. If the voltage limits found in R1 are honored, inheritently, any voltage stability limit will also be honored. Note for voltage stability limits associated with high transfer over EHV corridors, the corresponding pre-contingency voltage level limit may be near levels which are normally considered acceptable. In addition, VAR-001-4 R2 is redundant with several existing and future enforceable standards: TOP Requirements TOP-002 R10 and R11 & TOP-003 R1 and 2: The proposed VAR-001-4 R2 is redundant with the existing TOP-002 Requirements 10 and 11 that require operational assessments so that TOPs can plan to meet all SOLs and IROLs which include voltage limits. TOP-002 R10 and R11 will be replaced with TOP-003 Requirements 1 and 2 when the “Real Time Operations” project is approved by FERC. TOP-003 R1 and R2 require operational assessments to be able to operate within SOLs and IROLs as well. TOP-004-2 R6: VAR-001-4 R2 is also redundant with TOP-004-2 R6. The Real Time Operations SDT recognized that TOP-004-2 R6 was covered by TOP-001-2 which requires TOPs to operate within SOLs and IROLs. TOPs must perform assessments to be able to operate within such limits; therefore, the proposed VAR-001-4 R2 is redundant with TOP-004-2 R6 and TOP-001-2 when approved by FERC. RC Requirements FAC-011-2: The purpose of FAC-011-2 states, “To ensure that System Operating Limits (SOLs) used in the reliable operation of the Bulk Electric System (BES) are determined based on an established methodology or methodologies.” Since this requires documented methodology for SOLs, which includes voltage and stability limits, VAR-001-4 R2 is redundant with FAC-011-2. FAC-014-2: The purpose of FAC-014-2 states, “To ensure that System Operating Limits (SOLs) used in the reliable planning and operation of the Bulk Electric System (BES) are determined based on an established methodology or methodologies.” Since this standard requires establishment of SOLs and IROLs, which include voltage and stability limits, VAR-001-4 R2 is redundant with FAC-014-2. IRO-008-1 R1: VAR-001-4 R2 is also redundant with IRO-008-1 R1 that requires RCs to perform assessments to ensure they do not exceed IROLs. IRO-005-3a : The proposed VAR-001-4 R2 is redundant with the existing IRO-005-3a R1 and its sub-requiremetns. It has been proposed to retire IRO-005-3a R1 and its sub-requirements with the SDTs rationale of “monitoring capability can be objectively measured and is essential to real-time operations – however real-time monitoring is a supporting activity and is only one of several processes used to support operation within defined parameters. Monitoring capability should be assessed during certification of an RC and not as a

requirement. " Given the IRO-005 SDT's rationale, the fact that the NERC BOT approved IRO-005-4, and the fact that assessments are already required in other existing Reliability Standards, VAR-001-4 R2 should be deleted. VAR-001-4 R4: The statement, "Each Transmission Operator shall specify a voltage or Reactive Power schedule and tolerance band (at either the high side or low side of the Generator Step-Up transformer at the TOP's discretion) at the interconnection point between the generator facility and the Transmission Owner's facilities has a semantics glitch in that there is just one interconnect point. That is, mandating control at the interconnection eliminates any discretion in making the high vs. low-side selection. We suggest saying instead, "Each Transmission Operator shall specify a voltage or Reactive Power schedule and tolerance band, at the agreed upon metering point to which the GOP has access." This will typically be either the transmission bus or the generator terminals. If the TOP specifies this as the TO's "transmission bus", the TO should be required to make the same voltage point used by the TOP available to the GOP to ensure both are seeing the exact same voltage. VAR-001-4 R5 is redundant with the existing TOP-006-2 (R1 and R2), which states the following, and with the proposed TOP-003-2 that requires TOPs to specify and entities to provide data necessary for it to perform its required Operational Planning Analyses and Real-time monitoring. R1. Each Transmission Operator and Balancing Authority shall know the status of all generation and transmission resources available for use. R1.1. Each Generator Operator shall inform its Host Balancing Authority and the Transmission Operator of all generation resources available for use. R1.2. Each Transmission Operator and Balancing Authority shall inform the Reliability Coordinator and other affected Balancing Authorities and Transmission Operators of all generation and transmission resources available for use. R2. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall monitor applicable transmission line status, real and reactive power flows, voltage, load-tap-changer settings, and status of rotating and static reactive resources. VAR-001-4 R5 is redundant with the existing TOP-006-2 R5 because it also requires TOPs to know the status of resources to bring to the attention of operating personnel important deviations in operating conditions and to indicate, if appropriate, the need for corrective action. The Real Time Operations SDT proposed to delete this requirement as it should be covered in the certification process for RCs, TOPs, and BAs. The SDT also noted that this requirement was covered by over enforceable reliability standards (BAL-005, TOP-001, and IRO-008); thus the proposed VAR-001-4 R5 is redundant and should be deleted. In addition, the reactive resources are the generator and not the ancillary resources such as AVR and PSS. VAR-001 R6: Generators should be allowed to make these changes during a scheduled unit downtime as long as the time is within a reasonable period of time. We suggest the time be within 12 months and propose the following rewording fo this requirement: "After consultation with the Generator Owner regarding necessary step-up transformer tap changes, the Transmission Operator shall provide documentation to the Generator Owner specifying the required tap changes, a timeframe for making the changes that is mutually agreed and no longer than 12 months, and technical justification for these changes." On VAR-002, R2: We recommend eliminating "Facility Ratings" in R2 and in the footnote of VAR-002 R2 footnote 4. Use of the NERC-defined term "Facility Ratings" presents a problem, because only occasionally do equipment ratings define the amount of reactive power that a generating unit can import or export. We suggest using the term "unit capabilities" in lieu of the term "Facility Ratings." The clarification in footnote 4, "When a Generator is operating in manual control, reactive power capability may change based on stability considerations and this may lead to a change in the associated Facility Ratings," only further confuses the issue. R2 should read, "Unless exempted by the Transmission Operator, each Generator Operator shall maintain the generator voltage or Reactive Power schedule (within each unit's capabilities) as directed by the Transmission Operator." Footnote 4 should be moved to R2.2 and changed to "When a Generator is operating in manual control, reactive power capability may change based on stability considerations." On VAR-002, M2: a) remove "all" from "all attempts" and ; b) the documentation requirements listed in the measure are excessive and unreasonable and unduly burdensome. We recommend, alternatively (or in addition), a statement from the TOP is acceptable evidence of GOP compliance with R2 (the voltage support performance). On VAR-002, R4: This requirement should be revised to state; "For generator step-up and auxiliary transformers with nominal primary voltages equal to the generator terminal voltage:" This will clarify that R4 is N/A to startup transformers and other station auxiliary transformers connected to a HV bus at a plant. On VAR-002, R5 rational: We suggest modifying the rationale for R5, second sentence to read " If the tap setting is not properly set, then the VAR capability of a unit can be affected."

Yes

As previously stated in our response from Question #2: On VAR-001 and VAR-002 regarding voltage

schedule and compliance: The published reasons for the changes to these standards are 1) to eliminate nuisance calls and non-reliability gap reducing violations, and 2) to address the FERC directive to NERC to "consider a timeframe" for allowing a generator to be out of schedule before having to make a notification to its TOP. The changes to the standards do not fully address the first objective of reducing nuisance calls (GOP to TOP) regarding being off schedule. In addition, we have considered the idea of notification timeframes and do not suggest including such GOP notifications in the revised VAR-002. Currently, GOPs are required to maintain generator voltage or Reactive Power Schedules as directed by the TOP. If the GOP experiences problems maintaining voltage schedules, the TOPs, if warranted, will notify the GOP to either maintain or modify their voltage schedule as needed to maintain reliability of the TOP area. This existing construct has proved to work well and a new notification requirement is unnecessary.
We fully support the need for coordination between the TOP/GOP regarding the establishment of voltage schedules. We suggest that a joint tap coordination study be performed. VAR-002 R5 alludes to this need for coordination. This process should help identify any transmission system and generating unit limitations with respect to var limitations and voltage support.

1) VAR-001-4, R1 -- Although a good results-based reliability requirement, there is significant overlap with FAC-014 with regards to establishing SOL and IROL. The FAC-14 requires TOP to establish steady-state and stability-limited SOLs in accordance to its RC SOL methodology. For example, in the WECC RC SOL methodology, the RC states criteria for steady-state limit, voltage stability, and operating margins (in accordance with FAC-011 requirements) which apply to each TOP. Having these criteria to be established again in VAR-001-4 creates an issue of “Double Jeopardy” with FAC-014 and FAC-011 since system assessment done for establishing SOLs is fundamentally no different than described in this R1. 2) VAR-001-4, R2 -- Although a good results-based reliability requirement, there is significant overlap with TOP-002 enforceable standard. The TOP-002 R11 that states “The Transmission Operator shall perform seasonal, next-day, and current-day Bulk Electric System studies to determine SOLs”. Here the definition of SOLs already includes the steady state limits, voltage stability limit. So again, this creates a “Double Jeopardy” issue. It may be argued that TOP-002-3 has been approved by NERC BOD (but not by FERC yet) which may eliminate this issue. But even in the new TOP-002-3, R1 states “Each Transmission Operator shall have an Operational Planning Analysis that represents projected System conditions that will allow it to assess whether the planned operations for the next day within its Transmission Operator Area will exceed any of its Facility Ratings or Stability Limits during anticipated normal and Contingency event conditions” So even in this situation, the TOP already needs to have operating planning analysis... which is no different than performing assessment. 3) VAR-001-4, R2 addresses assessments for scheduling purposes while R2.1 mostly addresses real-time operation of devices. This seems inappropriate and we recommend moving R2.1 out to its own requirement. We believe that this requirement should include the RC as well as the TOP. The RC is required to do the assessment for scheduling in R2, but is not required to take any action to actually schedule the generation like the TOP is required to under R2.2. For example In the MISO region, the RC has more direct control over the generation dispatch than its members so I believe that they should also be subject to responsibility in R2.2. 4) VAR-002-3, Recommend firming up the language, such as “A Generator Operator shall notify its associated Transmission Operator…”. Also a timeframe needs to be applied to the second requirement to not

allow a GOP an infinite amount of time to return its voltage to the schedule. The M2 measure suggests that the reason the generator can't return to its schedule is because of a limiting factor. If that is the intent of the requirement, it should be stated in the requirement and not the measure. Part of the M2 measures seems to contradict statements made in the VAR-001-4 standard. M2 of VAR-002-3 states that the GOP has the "option to operate on a voltage schedule on either the high-side or convert the high-side schedule to a low-side schedule at the GOP's discretion" while R4 of VAR-001-4 states "Each Transmission Operator shall specify a voltage or Reactive Power schedule and tolerance band (at either the high side or low side of the Generator Step-Up transformer at the TOP's discretion)". This is confusing at best and contradictory at worse. Language in both standards should be cleaned up to clearly identify who has authority to determine where a voltage schedule is defined. 5) VAR-002-3, R2.1: Some vertically integrated utilities may have voltage monitoring systems managed by the TOP. In this case the notification would be done by the TOP to the GOP and the corrective actions jointly developed. Therefore, we suggest rewording R2.1 to something like this: [2.1. If a generating unit drifts out of the prescribed voltage or Reactive Power Schedule3 (within applicable Facility Ratings4) tolerance bands, the GOP and TOP shall have a process established to return the generator to the schedule or an acceptable alternative within 30 minutes.]

No
VAR-002-3 Regarding Measure M2, M2 presents the scenarios where a Generator Operator may not be able to meet a voltage schedule or comply with the TOP's directive, and how a GOP may manage the situations. The description part does not belong in a Measure, and should be moved to the Background Information Section that a Results-based standard template has made provision for. Regarding Measure M3, the latter part of M3 is not presented in a manner to require the evidence to demonstrate compliance. Suggest revising M3 to read: The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of any of the changes identified in Requirement 3, or evidence that the status had been restored within the first 15 minutes of such change. For all Measures, there are no examples of evidence provided. It would be appropriate if after each of the "evidence", additional wording "such as log, recording, or other documents" so as to be consistent with the way Measures are presented in other standards. Regarding Evidence Retention, it would be appropriate to reference the Measure Number for the GO's and the GOP's data retention requirements

EPSA believes that simultaneous processing of the SAR and the standard, as was done in this instance puts them at cross-purpose with one another. This risks a situation where if a SAR needs changes, stakeholder comments on standard will be based on a defective SAR that needs work and becomes an inefficient use of stakeholder resources. The SAR scope for proposed VAR-002-2 has not considered all the aspects that can ensure that the Standard will reach a steady state. Since its issuance in June of 2013, NERC and Stakeholders have recognized that the "Standards Independent Experts Review Project" provides a global assessment of Standards including VAR-002-2. The Independent Experts recommend that requirements that are part of VAR-002-2 are duplicative and covered under other

standards or covered by tariff requirements. To avoid duplication or conflating reliability and market issues the SAR scope would benefit from including the recommendations of the Independent Experts in the current VAR-002-2 project. This will avoid expending resources on the Independent Experts recommendations in the future.

Introduction

The Project 2013-04 standard drafting team (SDT) thanks all commenters who submitted comments on the draft VAR-002-3 standard. This standard was originally posted with VAR-001-4 for a 45-day public comment period from August 23, 2013 through September 3, 2013. Both proposed standards were revised and re-posted for a successive ballot from October 11, 2013 to November 26, 2013. VAR-001-4 received the necessary approval and went forward to a final ballot. However, VAR-002-3 only received 66.09% of the weighted segment vote. A total of 58 sets of comments were received during the second 45-day public comment period. This document will present a summary of the comments considers by the SDT after the most recent comment period for VAR-002-3.

All comments submitted may be reviewed in their original format on the standard's project page.[1]

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at mark.lauby@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[2]

[1] The project page is available here: http://www.nerc.com/pa/Stand/Pages/Project2013-04VoltageReactiveControl.aspx.
[2] The appeals process is in the Standard Processes Manual: http://www.nerc.com/files/Appendix_3A_StandardsProcessesManual_20120131.pdf

Consideration of Comments

Purpose

The VAR SDT appreciates the comments from industry regarding the VAR-002-3 standard. All comments were reviewed carefully by the SDT and changes were made to the standard accordingly. While all comments were reviewed, the new Standards Process Manual (SPM) does not require responses to each individual comment when a successive ballot is needed. However, this document provides a summary of responses to comments. The following pages will provide a summary of the comments received and how the comments were addressed by the VAR SDT. If a specific comment was not addressed in the summary of comments, please contact the NERC Standards Developer or one of the SDT members to discuss.

Duplication

Several commenters suggested that VAR-002-3 duplicated requirements in the TOP and MOD standards, namely TOP-001, TOP-003, and MOD-032. The VAR SDT is very mindful that the TOP-001 and TOP-003 on file with FERC are currently being re-evaluated in a separate project, and the Commission recently recommended a full remand of those standards. There is also an on-going effort to review the TOP/IRO standards, and until those standards have been finalized and approved, the SDT could not rely on those standards as a premise to remove requirements from VAR-002-3. Further, the MOD-032 standard does not apply to Transmission Operators (the entity making the data requests that would precipitate VAR-002 compliance), and the operating horizons are different from the VAR standards. Therefore, the SDT could not remove requirements based on MOD-032 overlap.

A commenter recommended removing Requirement R2 as duplicative of the TOP standards, but as explained above, that was not possible since the TOP standards are currently being reviewed. Further subpart 2.2 requires an explanation for why a voltage schedule cannot be met, and no other standard covers that. In addition, subpart 2.3 provides a caveat that a conversion methodology maybe provided during an audit, and auditor should not use the VAR standard to require high-side monitoring for GOPs. This is also not duplicated in any other standard.

AVR Modes

Some commenters recommended revisions to the standard to allow for multiple voltage control modes. The SDT agreed, and Requirement R1 was revised to allow GOPs to operate with the AVR in-service and in a mode different from “voltage controlling” if instructed by the TOP.

ERCOT RC Functions

Some commenters asked that the standard account for ERCOT nuances where the RC functions like a TOP in other areas. The VAR SDT determined the standard did not need to be modified because in ERCOT, RCs and TOPs have already determined their roles through contractual arrangements.

Deviations from Voltage Schedule

Some commenters recommended providing a minimum threshold for notifications when deviations to voltage schedules occur. The time-frames recommended were rolling averages (30 or 60 minutes), but the VAR SDT could not make these modifications. A smaller window was proposed in the last unsuccessful draft of VAR-002-3, and the industry could not reach a consensus on the right window for the entire continent. Thus, VAR-001-4 was modified to allow the TOPs to set notification timeframes based on the system needs. Also, NERC staff opposed creating too large of non-compliance window due to Reliability concerns.

Exemptions

Some commenters asked for more clarity on what qualifies as an exemption. In VAR-001-4 the TOP may set the exemption criteria for GOPs. TOPs must notify the GOPs when the exemption criteria has been met by the GOPs.

Dispersed Generation

Some commenters asked that VAR-002-3 be amended to account for dispersed generation. However, the VAR SDT is deferring to the Dispersed Generation team currently evaluating standards that would need certain updates. The VAR SDT has provided a copy of the proposed VAR-002 changes to the Dispersed Generation team.

Implementation/Effective Date

One commenter was concerned about the effective date being too soon; however, that commenter did not realize the standard will not go into effect in the United States until the first quarter after regulatory approval. The standard will not go into effect immediately after the approval by the NERC Board of Trustees.

Changing 15 minutes to 30 minutes in Requirements R3 and R4

Some commenters recommended allowing GOPs to have the full 30 minutes to correct a status or reactive capability change, and the VAR SDT agreed that this change will simplify the standard and maintain reliability. Therefore, Requirements R3 and R4 have been amended to allow the full 30 minutes to correct an issue before notifying the TOP.

One commenter also questioned the need for certain status changes. The VAR SDT re-affirmed the need for status change notifications, and the TOPs on the drafting team confirmed they should be notified when an AVR is in service and when it comes back on after an issue in order to know what resources are available in an area.

Requirement R6 Functional Entity

Some commenters questioned why Requirement R6 applies to GOs, while subpart R6.1 applies to GOPs. The VAR SDT agreed and determined that GOs are the appropriate entity for coordinating when a unit is taken offline to make the tap changes. Therefore, subpart R6.1 has been modified to apply to GOs.

VSL

Some commenters recommended changes to the VSLs to add back in time gradations for violations. However, the VAR SDT removed many of the time elements from the VSLs because those timing elements did not have a technical basis and appeared arbitrary.

Telemetering/Notifications

Some commenters asked that telemetering count for compliance purposes when making notifications to the TOP. The notification requirements are set in VAR-001-4, but the standard does not preclude telemetering in any form.

Compliance Input

Comments were received regarding the timing of the posting of a Reliability Standards Audit Worksheet (RSAW). NERC is providing a draft RSAW that will address compliance assessment questions for the draft standard within fifteen days of posting a revised VAR-002-3.

Introduction

The Project 2013-04 standard drafting team (SDT) thanks all commenters who submitted comments on the draft VAR-001-4 and VAR-002-3 standards. These standards were posted for a 45-day public comment period from August 23, 2013 through September 3, 2013. Stakeholders were asked to provide feedback on the standards and associated documents through a special electronic comment form. There were 78 sets of responses, including comments from approximately 211 different people from approximately 124 companies representing all 10 Industry Segments.

All comments submitted may be reviewed in their original format on the standard's project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at mark.lauby@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/files/Appendix_3A_StandardsProcessesManual_20120131.pdf

Consideration of Comments

Purpose

The VAR SDT appreciates the comments from industry regarding the VAR-001-4 and VAR-002-3 standards. All comments were reviewed carefully by the SDT and changes were made to the standard accordingly. While all comments were reviewed, the new Standards Process Manual (SPM) does not require responses to each individual comment when a successive ballot is needed. However, this document provides a summary of responses to comments. The following pages will provide a summary of the comments received and how the comments were addressed by the VAR SDT. If a specific comment was not addressed in the summary of comments, please contact the NERC Standards Developer or one of the SDT members to discuss.

Process Comments

Several commenters expressed concern that the simultaneous posting of the Standards Authorization Request (SAR) and the pro forma standard for initial comment and ballot was outside the scope of the Standards Process Manual (SPM). The SDT notes that, although this action was authorized by the NERC Standards Committee, NERC received an appeal of the SPM, which has been resolved. The SDT notes the process issue is outside the purview of the SDT.

Separate Postings / Merging Standards

Some commenters suggested merging the VAR standards or balloting the standards separately. Based on industry feedback and the difference in the timing of audits, the VAR SDT decided to keep the standards separate. However, the team agreed that it would be beneficial to ballot the standards separately.

WECC Variance

Some commenters were confused because the applicability section includes Generator Operators (GOP) within the Western Interconnection. This is necessary because the WECC variance in VAR-001-3 is being retained.

VAR-001 Comments

Reliability Coordinator

- Several commenters objected to adding Reliability Coordinators (RC) to the VAR-001 standard. In order to clarify the role of the RC, the VAR SDT is not going to add RCs to the standard at this time because the issue of RC monitoring is presently before FERC in another filing. Therefore, the VAR SDT will address this directive at a later time, pending a FERC order on the Interconnection Reliability Operations and Coordination (IRO) standards.

Administrative Burden

- Several commenters were concerned that there would be an administrative burden for Transmission Operators (TOPs) and RCs with the new standard. However, the new standard is intended to provide a vehicle for more efficiency and better communication once the VAR-001-4 standard is implemented; for example, fewer unnecessary phone calls/notifications will be made to the TOP once the TOP provides notification requirements to the GOPs. In addition, the standard has been modified to provide schedules to adjacent TOPs and RCs only upon request. This should alleviate some of the administrative burden involved with communicating schedules. Also, the SDT has opted to not add RCs to the standard at this time. The directive regarding RC monitoring will be addressed after order on the pending IRO standards has been issued.

Vagueness of VAR-001

- Several commenters said that several aspects of VAR-001-4 were “vague.” It was not clear to many what an “assessment” entailed and how compliance would be evaluated for many of the VAR-001-4

requirements. The revised VAR-001-4 is simplified and has clarified the standard by removing terms like "assessment," "implement," and "policies and procedures."

Duplication of Other Standards

- Several commenters stated the VAR-001-4 requirements were duplicative of several other standards. The VAR SDT determined that there is some overlap, particularly with regard to Requirements R1 and R5 of the initial posting. Requirement R5 of the initial posting has been removed, and Requirement R1 has been revised to simply require the TOP to specify voltage schedules. However, in order to show that System Operating Limits (SOLs) will encompass the details for voltage limits, both SOLs and Interconnection Reliability Operating Limits (IROLs) are referenced.

Interconnection Point

- Some commenters took issue with the phrase "at the interconnection point between the generator facility and Transmission Owner's facility." In order to allow the TOP the discretion for how to provide a voltage schedule, the phrase has been removed.

Technically Justified Schedules/Tolerance Bands

- Several commenters expressed concern because the standards did not require technically justified schedules or tolerance bands. In order to the balance the needs for maintaining a TOP's ability to monitor its system, the SDT did not add language requiring a "technically justified" schedule. Instead, the TOPs are now required under VAR-001-4 to provide the criteria to the GOPs for how the schedules were determined. This would provide GOPs with the ability to review technical documentation for schedules and tolerance bands, and this would prevent a TOP from having to dispute all of its schedules.

Power System Stabilizer

- Some commenters requested that the requirement for knowing the status of Power System Stabilizers (PSS) is a duplicate of the TOP standards. The VAR SDT determined that the importance of PSS monitoring varies by region and entity, and this requirement was removed because the TOP standards allow for the monitoring of certain data specifications. This allows the areas that require monitoring of the PSS to have this action included in the TOP data specifications, but for areas that do not need to monitor for reliability, the PSS will not have to be included. PSS equipment has not been removed from VAR-002-3 notification requirements because that equipment is part of the automatic voltage regulator (AVR).

Tap Setting Changes

- Many entities commented that the tap setting changes should have an "agreed upon" timeframe for making those changes. In order to maintain the TOPs authority, the VAR SDT only modified VAR-001-4 to require TOPs to include an implementation schedule as part of the tap setting consultation. However, the standard was not modified to require a particular timeframe for when a unit must be taken off line to make a tap setting change.

VAR-002 Comments

Testing

- Some commenters suggested modifying VAR-002-3 Requirement R1 to allow for testing of a unit. The revised standard now lists testing as a time when the unit does not have to be in AVR.

Multiple AVR Settings

- A commenter requested that the standard be updated to allow for multiple AVR settings if necessary for reliability purposes. The VAR-001-4 standard has been updated to allow for the TOPs to provide very

flexible exemptions based on system needs. These exemptions encompass being in various AVR settings based on the TOP's exemption criteria.

Timeframes for Notifications

- Many commenters questioned the timeframes proposed as a non-compliance window. It was very difficult to set a minimum notification requirement for the entire continent, particularly for being out of schedule, so the SDT opted to allow the TOPs to tailor when it should be notified by GOPs. Therefore, VAR-001-4 has a requirement to provide GOPs with their notification requirements for being out of schedule or tolerance based on system needs.

Monitoring and Conversion of a High-Side Schedule

- Although the VAR SDT initially added that the conversion of a high-side voltage schedule was acceptable in the measures for VAR-002-3, there were numerous comments that this needed to be a requirement. Thus, the VAR SDT added the requirement to provide conversion methodology for those units that do not have high-side monitoring capability.

Facility Ratings

- Some commenters suggested changing "Facility Ratings" to capability. The VAR SDT adopted this change.

VRFs/VSLs

- Some commenters recommended changes to the VRFs/VSLs for VAR-002-3 because they can be interpreted as being too severe with little to no reliability benefit. The VSLs have been simplified, and the VAR SDT modified the VRFs/VSLs significantly by removing several time constraints. The team reviewed the revised VSLs against the FERC order regarding VSL guidelines (123 FERC ¶ 61284).

Generator Owner

- One commenter suggested that the tap setting changes requirement should not include both the Generator Owner (GO) and GOP. However, both entities should be included. Several GOs are impacted when a unit has to come off-line, but the GOP is the one that will usually performs the actual changes.

Compliance Input

Comments were received regarding the posting of a Reliability Standards Audit Worksheet (RSAW). NERC is providing a Compliance Input document that acts as a draft RSAW and addresses compliance assessment questions for the draft standard.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR and supporting package posted for comment on July 19, 2013.
2. Draft standard posted for initial comments and ballot from July 19, 2013 to September 3, 2013.

Description of Current Draft

This is the second posting of the proposed draft standard. This proposed draft standard will be posted for a 45-day formal comment period and parallel ballot.

Anticipated Actions	Anticipated Date
Additional 45-Day Comment Period with Ballot	October/November 2013
Final Ballot	December 2013
NERC Board of Trustees Adoption	December 2013
Filing to Applicable Regulatory Authorities	December 2013

Version History

Version	Date	Action	Change Tracking
1	6/18/2007	Initial Standard is FERC approved	
2	1/10/2011	FERC approved added LSEs and Controllable Load to the standard.	
3	6/20/2013	WECC Variance is approved by FERC	

Definitions of Terms Used in the Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None.

A. Introduction

1. **Title:** Voltage and Reactive Control

2. **Number:** VAR-001-4

3. **Purpose:** To ensure that voltage levels, reactive flows, and reactive resources are monitored, controlled, and maintained within limits in real time to protect equipment and the reliable operation of the Interconnection.

4. **Applicability:**

   4.1. Transmission Operators

   4.2. Generator Operators within the Western Interconnection (for the WECC Variance)

5. **Effective Date:**

   5.1. The standard shall become effective on the first day of the first calendar quarter after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

B. Requirements and Measures

Rationale for R1: P 1868 of Order No. 693 requires NERC to add more "detailed and definitive requirements on “established limits” and “sufficient reactive resources”, and identify acceptable margins (i.e. voltage and/or reactive power margins)." Since Order No. 693 was issued, several FAC and TOP standards have become enforceable to add more requirements around voltage limits. More specifically, FAC-011 and FAC-014 require that System Operating Limits (“SOLs”) and reliability margins are established. The definition of SOLs must include both: 1) Voltage Stability Ratings (Applicable pre- and post-Contingency Voltage Stability) and *2)* System Voltage Limits (Applicable pre- and post-Contingency Voltage Limits). Therefore, for reliability reasons Requirement R1 now requires a Transmission Operator (TOP) to set voltage or Reactive Power schedules with associated tolerance bands. Further, since neighboring areas can affect each other greatly, each TOP must also provide a copy of these schedules to its Reliability Coordinator (RC) and adjacent TOP upon request.

R1. Each Transmission Operator shall specify a system voltage schedule (which is either a range or a target value with an associated tolerance band) as part of its plan to operate within System Operating Limits and Interconnection Reliability Operating Limits. *[Violation Risk Factor: High] [Time Horizon: Operational Planning]*

1.1. Each Transmission Operator shall provide a copy of the voltage schedules and associated tolerance bands to its Reliability Coordinator and adjacent Transmission Operators within 30 calendar days of a request.

M1. The Transmission Operator shall have evidence that it specified system voltage schedules using either a range or a target value with an associated tolerance band.

For part 1.1, the Transmission Operator shall have evidence that the voltage schedules were provided to its Reliability Coordinator and adjacent Transmission Operators within 30 days of a request. Evidence may include, but is not limited to, emails, website postings, and meeting minutes.

Rationale for R2:

P 1875 from Order No. 693 directed NERC to include requirements to run voltage stability analysis periodically, using online techniques where commercially available and offline tools when online tools are not available. This standard does not require the periodic voltage stability analysis because such analysis is now required pursuant to the SOL methodology in the FAC standards. TOP standards also require the TOP to operate within SOLs and Interconnection Reliability Operating Limits ("IROL"). The VAR standard drafting team ("SDT") and industry participants also concluded that the best models and tools are the ones that have been proven and the standard should not add a requirement for a responsible entity to purchase new online simulations tools. Thus, the VAR SDT simplified the requirements to ensuring sufficient reactive resources are online or scheduled. Controllable load is specifically included to answer FERC's directive in Order No. 693 at P 1879.

R2. Each Transmission Operator shall schedule sufficient reactive resources to regulate voltage levels under normal and Contingency conditions. Transmission Operators can provide sufficient reactive resources through various means including, but not limited to, reactive generation scheduling, transmission line and reactive resource switching, and using controllable load. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same-day Operations, and Operational Planning]*

M2. Each Transmission Operator shall have evidence of scheduling sufficient reactive resources based on their assessments of the system. For the operational planning time horizon, Transmission Operators shall provide copies of assessments used as the basis for how resources were scheduled.

Rationale for R3:

Similar to Requirement R2, the VAR SDT determined that for reliability purposes, the TOP must ensure sufficient voltage support is provided in Real-time in order to operate within an SOL.

R3. Each Transmission Operator shall operate or direct the Real-time operation of devices to regulate transmission voltage and reactive flow as necessary. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same-day Operations, and Operational Planning]*

M3. Each Transmission Operator shall have evidence that actions were taken to operate capacitive and inductive resources as needed in Real-time. This may include directions to Generator Operators to: 1) provide additional voltage support; 2) bring resources on-line; or 3) make manual adjustments.

Rationale for R4:

The VAR SDT received significant feedback on instances when a TOP would need the flexibility for defining exemptions for generators. These exemptions can be tailored as the TOP deems necessary for the specific area's needs. The goal of this requirement is to provide a TOP the ability to exempt a Generator Operator (GOP) from: 1) a voltage or Reactive Power schedule, 2) a setting on the AVR, or 3) any VAR-002 notifications based on the TOP's criteria. Feedback from the industry detailed many system events that would require these types of exemptions which included, but are not limited to: 1) maintenance during shoulder months, 2) scenarios where two units are located within close proximity and both cannot be in voltage control mode, and 3) large system voltage swings where it would harm reliability if all GOP were to notify their respective TOP of deviations at one time. Also, in an effort to improve the requirement, the sub-requirements containing an exemption list were removed from the currently enforceable standard because this created more compliance issues with regard to how often the list would be updated and maintained.

R4. The Transmission Operator shall specify the criteria that will exempt generators from compliance with the requirements defined in Requirement R5, part 5.1, and any associated notification requirements. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

4.1 If a Transmission Operator determines that a generator has satisfied the exemption criteria, it shall notify the associated Generator Operator.

M4. Each Transmission Operator shall have evidence of the documented criteria for generator exemptions.

For part 4.1, the Transmission Operator shall also have evidence to show that, for each generating unit in its area that is exempt from: 1) following a voltage or Reactive Power schedule, 2) from having its automatic voltage regulator (AVR) in service or from being in voltage control mode, or 3) from having to make any notifications, the associated Generator Operator was notified of this exemption.

Rationale for R5:

The new requirement provides transparency regarding the criteria used by the TOP to establish the voltage schedule. This requirement also provides a vehicle for the TOP to use appropriate granularity when setting notification requirements for deviation from the voltage or Reactive Power schedule. Additionally, this requirement provides clarity regarding a "tolerance band" as specified in the voltage schedule and the control dead-band in the generator's excitation system.

Voltage Schedule tolerances are the bandwidth that accompanies the voltage target in a voltage schedule, should reflect the anticipated fluctuation in voltage at the Generation Operator's facility during normal operations, and be based on the TOP's assessment of N-1 and credible N-2 system contingencies. The voltage schedule's bandwidth should not be confused with the control dead-band that is programmed into a Generation Operator's automatic voltage regulator's control system, which should be adjusting the AVR prior to reaching either end of the voltage schedule's bandwidth.

R5. Each Transmission Operator shall specify a voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) at either the high voltage side or low voltage side of the Generator Step-Up transformer at the Transmission Operator's discretion. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

- **5.1.** The Transmission Operator shall provide the voltage or Reactive Power schedule to the associated Generator Operator and direct the Generator Operator to comply with the schedule in automatic voltage control mode (the AVR is in service and controlling voltage).
- **5.2.** The Transmission Operator shall provide the Generator Operator with the notification requirements for deviations from the voltage or Reactive Power schedule.
- **5.3.** The Transmission Operator shall provide the criteria used to develop voltage schedules and associated tolerance bands to the Generator Operator within 30 days of receiving a request.

M5. The Transmission Operator shall have evidence of a documented voltage or Reactive Power Schedule and tolerance band.

For part 5.1, the Transmission Operator shall have evidence it provided a voltage or Reactive Power schedule and tolerance band to the applicable Generator Operators, and that the Generator Operator was directed to comply with the schedule in automatic voltage control mode, unless exempted. The evidence shall include written records, email, or voice recordings.

For part 5.2, the Transmission Operator shall have evidence it provided notification requirements for deviations from the voltage or Reactive Power schedule and associated tolerance band. The evidence shall include written records, email, or voice recordings.

For part 5.3, the Transmission Operator shall have evidence it provided the criteria used to develop voltage schedules and associated tolerance bands within 30 days of receiving a request by a Generator Operator.

Rationale for R6:

Although tap settings are first established prior to interconnection, this requirement could not be deleted because no other standard addresses when a tap setting must be adjusted. If the tap setting is not properly set, then the amount of VARs produced by a unit can be affected.

R6. After consultation with the Generator Owner regarding necessary step-up transformer tap changes and the implementation schedule, the Transmission Operator shall provide documentation to the Generator Owner specifying the required tap changes, a timeframe for making the changes, and technical justification for these changes. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M6. The Transmission Operator shall have evidence that it provided documentation to the Generator Owner when a change was needed to a generating unit's step-up transformer tap in accordance with the requirement and that it consulted with the Generator Owner.

C. Compliance

1. **Compliance Monitoring Process:**

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" refers to NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time a registered entity is required to retain specific evidence to demonstrate compliance. For instances in which the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask the registered entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Operator shall retain evidence for Measures 1 through 4 for 12 months. The Compliance Monitor shall retain any audit data for three years.

1.3. Compliance Monitoring and Assessment Processes:

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.4. Additional Compliance Information:

None

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operational Planning**	**High**	N/A	N/A	N/A	The Transmission Operator has not specified a system voltage.
R2	**Real-time Operations, Same-day Operations, and Operational Planning**	**High**	N/A	N/A	The Transmission Operator does not schedule sufficient reactive resources as necessary to avoid violating an SOL.	The Transmission Operator does not schedule sufficient reactive resources as necessary to avoid violating an IROL.
R3	**Real-time Operations, Same-day Operations, and Operational Planning**	**High**	N/A	N/A	The Transmission Operator does not operate or direct any real-time operation of devices as necessary to avoid violating an SOL.	The Transmission Operator does not operate or direct any real-time operation of devices as necessary to avoid violating an IROL.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R4	**Operations Planning**	**Lower**	N/A	N/A	The Transmission Operator has exemption criteria and notified the Generator Operator, but the Transmission Operator does not have evidence of the notification.	The Transmission Operator does not have exemption criteria.
R5	**Operations Planning**	**Medium**	N/A	The Transmission Operator provides the criteria for voltage schedules after 30 days of request.	The Transmission Operator provides voltage or Reactive Power schedules to some, but not all, Generator Operators.	The Transmission Operator does not provide voltage or Reactive Power. Or The Transmission Operator did not provide the Generator Operator with the notification requirements for deviations from the voltage or Reactive Power schedule.
R6	**Operations Planning**	**Lower**	Either the technical justification or timeframe are not provided.	N/A	N/A	Neither the technical justification nor the timeframe are provided.

D. Regional Variances

The following Interconnection-wide variance shall be applicable in the Western Electricity Coordinating Council (WECC) and replaces, in their entirety, Requirements R3 and R4. Please note that Requirement R3 is deleted and R4 is replaced with the following requirements.

Requirements

E.A.13 Each Transmission Operator shall issue any one of the following types of voltage schedules to the Generator Operators for each of their generation resources that are on-line and part of the Bulk Electric System within the Transmission Operator Area: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same-day Operations]*

- A voltage set point with a voltage tolerance band and a specified period.
- An initial volt-ampere reactive output or initial power factor output with a voltage tolerance band for a specified period that the Generator Operator uses to establish a generator bus voltage set point.
- A voltage band for a specified period.

E.A.14 Each Transmission Operator shall provide one of the following voltage schedule reference points for each generation resource in its Area to the Generator Operator. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same-day Operations]*

- The generator terminals.
- The high side of the generator step-up transformer.
- The point of interconnection.
- A location designated by mutual agreement between the Transmission Operator and Generator Operator.

E.A.15 Each Generator Operator shall convert each voltage schedule specified in Requirement E.A.13 into the voltage set point for the generator excitation system. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same-day Operations]*

E.A.16 Each Generator Operator shall provide its voltage set point conversion methodology from the point in Requirement E.A.14 to the generator terminals within 30 calendar days of request by its Transmission Operator. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

E.A.17 Each Transmission Operator shall provide to the Generator Operator, within 30 calendar days of a request for data by the Generator Operator, its transmission equipment data and operating data that supports development of the voltage set point conversion methodology. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

E.A.18 Each Generator Operator shall meet the following control loop specifications if the Generator Operator uses control loops external to the Automatic Voltage Regulators (AVR) to manage MVar loading: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

E.A.18.1. Each control loop's design incorporates the AVR's automatic voltage controlled response to voltage deviations during System Disturbances.

E.A.18.2. Each control loop is only used by mutual agreement between the Generator Operator and the Transmission Operator affected by the control loop.

Measures[1]

M.A.13 Each Transmission Operator shall have and provide upon request, evidence that it provided the voltage schedules to the Generator Operator. Dated spreadsheets, reports, voice recordings, or other documentation containing the voltage schedule including set points, tolerance bands, and specified periods as required in Requirement E.A.13 are acceptable as evidence.

M.A.14 The Transmission Operator shall have and provide upon request, evidence that it provided one of the voltage schedule reference points in Requirement E.A.14 for each generation resource in its Area to the Generator Operator. Dated letters, e-mail, or other documentation that contains notification to the Generator Operator of the voltage schedule reference point for each generation resource are acceptable as evidence.

M.A.15 Each Generator Operator shall have and provide upon request, evidence that it converted a voltage schedule as described in Requirement E.A.13 into a voltage set point for the AVR. Dated spreadsheets, logs, reports, or other documentation are acceptable as evidence.

M.A.16 The Generator Operator shall have and provide upon request, evidence that within 30 calendar days of request by its Transmission Operator it provided its voltage set point conversion methodology from the point in Requirement E.A.14 to the generator terminals. Dated reports, spreadsheets, or other documentation are acceptable as evidence.

M.A.17 The Transmission Operator shall have and provide upon request, evidence that within 30 calendar days of request by its Generator Operator it provided data to support development of the voltage set point conversion methodology. Dated reports, spreadsheets, or other documentation are acceptable as evidence.

M.A.18 If the Generator Operator uses outside control loops to manage MVar loading, the Generator Operator shall have and provide upon request, evidence that it met the control loop specifications in sub-parts E.A.18.1 through E.A.18.2. Design specifications with identified agreed-upon control loops, system reports, or other dated documentation are acceptable as evidence.

[1] The number for each measure corresponds with the number for each requirement, i.e. M.E.A.13 means the measure for Requirement E.A.13.

E. Interpretations

None.

F. Associated Documents

None.

Guidelines and Technical Basis

For technical basis for each requirement, please review the rationale provided for each requirement.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR and supporting package posted for comment on July 19, 2013.
2. Draft standard posted for initial comments and ballot from July 19, 2013 to September 3, 2013.

Description of Current Draft

This is the second posting of the proposed draft standard. This proposed draft standard will be posted for a 45-day formal comment period and parallel ballot.~~This draft standard is concluding informal development and will move to formal development when authorized by the Standards Committee.~~

Anticipated Actions	Anticipated Date
~~SAR Authorized by the Standards Committee~~	~~July~~
Additional 45--Day ~~SAR~~ Comment Period with~~and Initial~~ Ballot ~~Open~~	October/November 2013~~July~~
~~Nomination Period Opens~~	~~July~~
~~Standard Drafting Team Appointed~~	~~July~~
~~Initial Comment and Initial Ballot Closes~~	~~August~~
Final Ballot ~~Opens~~	December 2013~~October~~
~~Final Ballot Closes~~	~~October~~
NERC Board of Trustees~~BOT~~ Adoption	December 2013~~November~~
Filing to Applicable Regulatory Authorities	December 2013

~~Effective Dates~~

~~In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after applicable regulatory approval or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities. In those jurisdictions where no regulatory approval is required, this standard~~

~~shall become effective on the first day of the first calendar quarter after Board of Trustees approval.~~

Version History

Version	Date	Action	Change Tracking
1	6/18/2007	Initial Standard is FERC approved	
2	1/10/2011	FERC approved added LSEs and Controllable Load to the standard.	
3	6/20/2013	WECC Variance is approved by FERC	

Definitions of Terms Used in the Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None.

A. Introduction

1. **Title:** Voltage and Reactive Control

2. **Number:** VAR-001-4

3. **Purpose:** To ensure that voltage levels, reactive flows, and reactive resources are monitored, controlled, and maintained within limits in real time to protect equipment and the reliable operation of the Interconnection.

4. **Applicability:**

   4.1. Transmission Operators

   ~~**4.2.** Reliability Coordinators~~

   ~~4.3.~~4.2. Generator Operators within the Western Interconnection (for the WECC Variance)

5. **Effective Date:**

   5.1. The standard shall become effective on the first day of the first calendar quarter after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Requirements and Measures

~~**Rationale for R1:** This requirement will allow each Transmission Operator (TOP) to establish its own policies and procedures, and the criteria for periodic updates will be individualized based on the stability of each TOP's regions. The language is refined to show that coordination with neighboring TOPs is required. It also states TOP shall provide data to the Reliability Coordinator (RC) for its monitoring functions to respond to address the FERC directive in P 1855 of Order No. 693, which directed NERC to add RC monitoring to the VAR standards. P 1868 requires NERC to add more "detailed and definitive requirements to include more detailed and definitive requirements on "established limits" and "sufficient reactive resources" and identify acceptable margins (i.e. voltage and/or reactive power margins)."~~

Rationale for R1: P 1868 of Order No. 693 requires NERC to add more "detailed and definitive requirements on "established limits" and "sufficient reactive resources", and identify acceptable margins (i.e. voltage and/or reactive power margins)." Since Order No. 693 was issued, several FAC and TOP standards have become enforceable to add more requirements around voltage limits. More specifically, FAC-011 and FAC-014 require that System Operating Limits ("SOLs") and reliability margins are established. The definition of SOLs must include both: 1) Voltage Stability Ratings (Applicable pre- and post-Contingency Voltage Stability) and *2)* System Voltage Limits (Applicable pre- and post-Contingency Voltage Limits). Therefore, for reliability reasons Requirement R1 now requires a Transmission Operator (TOP) to set voltage or Reactive Power schedules with associated tolerance bands. Further, since neighboring areas can affect each other greatly, each TOP must also provide a copy of these schedules to its Reliability Coordinator (RC) and adjacent TOP upon request.

R1. Each Transmission Operator shall specify a system voltage schedule (which is either a range or a target value with an associated tolerance band) as part of its plan to operate within System Operating Limits and Interconnection Reliability Operating Limits~~have documented policies or procedures that are implemented to establish, monitor, and control voltage levels and Reactive Power flows (Mvar flows) within limits as defined below~~. *[Violation Risk Factor: High] [Time Horizon: Operational Planning~~Operations~~]*

~~**1.1.** These documented policies or procedures shall include criteria used in system assessments. The criteria for the assessments shall include established steady-state limits, voltage stability limits and associated operating margins, and voltage schedules along with associated tolerance bands.~~

1.1. Each Transmission Operator shall provide a copy of the voltage schedules and associated tolerance bands to its Reliability Coordinator and ~~these documented policies or procedures to~~ adjacent Transmission Operators within 30 calendar days of a request.

~~**1.2.** Each Transmission Operator shall provide a copy of these documented policies or procedures to its Reliability Coordinator.~~

M1. The Transmission Operator shall have evidence that it specified system voltage schedules using either a range or a target value with an associated tolerance band.

~~The Transmission Operator shall have evidence of documented voltage schedules and associated tolerance bands.~~

For part~~policies or procedures as specified in Requirement~~ 1.1~~ As stated in R1~~, the Transmission Operator shall have~~policies and procedures must detail how criteria for steady state and voltage stability limits are used in the Transmission Operator's assessments of the system. In order to demonstrate the Transmission Operator is implementing the policies or procedures, the Transmission Operator must be able to provide~~ evidence that the~~proves~~ voltage schedules~~ and associated tolerance bands~~is currently being monitored. Such evidence may include, but is not limited to: 1) proof that points are telemetered, 2) alarms are functioning, and 3) during events of low or high voltage the policies and procedures are being followed to respond to control voltage levels. The Transmission Operator must also provide evidence that the policies or procedures~~ were provided to its Reliability Coordinator and ~~communicated to~~ adjacent Transmission Operators within 30 days of a request.~~and to its Reliability Coordinator.~~ Evidence may include, but is not limited to, emails, website postings, and meeting minutes.~~ Simply posting a copy of the policies or procedure on a public website is not sufficient if the Transmission Operator and Reliability Coordinator were not notified as to where to find the policies or procedures.~~

~~Rationale for R2:~~

~~P 1875 from Order No. 693 directed NERC to include requirements to run voltage stability analysis periodically. The informal ad hoc group and industry participants concluded that the best models and tools are the ones that have been proven over time, and that the requirement should not require any utility to purchase new online simulations tools. Therefore, the new requirement does not specify when to use online tools. The sub-requirements detail the real-time and day-ahead assessments necessary under R1. The existing VAR-001 also requires a list of sufficient reactive resources; this was retained in the proposed requirement as FERC determined in a letter order that this list answered the directive in P 1868 to detail the list of "sufficient reactive resources." Controllable load is specifically included to answer FERC's directive in P 1879.~~

Rationale for R2:

P 1875 from Order No. 693 directed NERC to include requirements to run voltage stability analysis periodically, using online techniques where commercially available and offline tools when online tools are not available. This standard does not require the periodic voltage stability analysis because such analysis is now required pursuant to the SOL methodology in the FAC standards. TOP standards also require the TOP to operate within SOLs and Interconnection Reliability Operating Limits ("IROL"). The VAR standard drafting team ("SDT") and industry participants also concluded that the best models and tools are the ones that have been proven and the standard should not add a requirement for a responsible entity to purchase new online simulations tools. Thus, the VAR SDT simplified the requirements to ensuring sufficient reactive resources are online or scheduled. Controllable load is specifically included to answer FERC's directive in Order No. 693 at P 1879.

R2. Each Transmission Operator ~~and Reliability Coordinator~~ shall schedule~~perform assessments on their respective areas in order to ensure~~ sufficient reactive resources ~~are available for scheduling~~ to regulate~~maintain~~ voltage levels~~stability~~ under normal and Contingency~~contingency~~ conditions. Transmission Operators can provide sufficient reactive resources through various means including, but not limited to, reactive generation scheduling, transmission line and reactive resource switching, and using controllable load. ~~in order to provide the voltage levels as defined in Requirement R1.~~ *[Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same-day Operations, and Operational Planning]*

M2. Each Transmission Operator shall have evidence of scheduling sufficient reactive resources based on their assessments of the system. For the operational planning time horizon, Transmission Operators shall provide copies of assessments used as the basis for how resources were scheduled.

Rationale for R3:

Similar to Requirement R2, the VAR SDT determined that for reliability purposes, the TOP must ensure sufficient voltage support is provided in Real-time in order to operate within an SOL.

R3. Each Transmission Operator shall operate or direct the Real~~real~~-time operation of ~~-~~devices ~~necessary~~ to regulate transmission voltage and reactive flow as necessary. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same-day* ~~necessary to regulate transmission voltage and reactive flow which may include, but is not limited to reactive generation scheduling; transmission line and reactive resource switching; controllable load; and, if necessary, load shedding, to maintain system voltages within established limits.~~*Operations, and Operational Planning]*

~~**3.1.** As a result of the assessments, each Transmission Operator shall ensure that sufficient reactive resources have been scheduled to meet acceptable day-ahead voltage limits identified in Requirement R1. Sufficient reactive resources may include, but is not limited to reactive generation scheduling; transmission line and reactive resource switching; and controllable load.~~

~~M1.~~M3. Each Transmission Operator ~~and Reliability Coordinator~~ shall have evidence that actions~~of current or past studies used to schedule sufficient reactive resources. Each Transmission Operator shall also provide proof that additional resources~~ were taken to operate ~~scheduled when necessary. During a real-time event where voltage must be adjusted, a Transmission Operator shall show evidence to show directions were given to adjust the operation of~~ capacitive and inductive resources as needed in Real-time. This may include directions to Generator Operators to: 1) provide additional voltage support; 2) bring resources on-line; or 3)~~ operate within new tolerance bands or to~~ make manual adjustments. ~~if necessary. Transmission Operators shall also have evidence to show proof of directing new resources to come online. Those resources can include, but is not limited to capacitor banks, switching, adjusting controllable load, and when necessary load can be shed. For the day-ahead scheduling, Transmission Operators shall provide copies of provide day-ahead studies used to schedule enough resources to meet expected voltage requirements.~~

Rationale for R4:

The VAR SDT received significant feedback on instances when a TOP would need the flexibility for defining exemptions for generators. These exemptions can be tailored as the TOP deems necessary for the specific area's needs. The goal of this requirement is to provide a TOP the ability to exempt a Generator Operator (GOP) from: 1) a voltage or Reactive Power schedule, 2) a setting on the AVR, or 3) any VAR-002 notifications based on the TOP's criteria. Feedback from the industry detailed many system events that would require these types of exemptions which included, but are not limited to: 1) maintenance during shoulder months, 2) scenarios where two units are located within close proximity and both cannot be in voltage control mode, and 3) large system voltage swings where it would harm reliability if all GOP were to notify their respective TOP of deviations at one time. Also, in an effort to improve the requirement, the sub-requirements containing an exemption list were removed from the currently enforceable standard because this created more compliance issues with regard to how often the list would be updated and maintained.

~~**Rationale for R4.**~~

~~These exemptions offer TOPs the option to exempt certain generators during maintenance or system events when those units are not able to maintain voltage schedules. Sub-requirements containing an exemption list were removed from the existing standard because this created more compliance issues with regard to how often the list would be updated and maintained.~~

R4. The Transmission Operator shall specify the criteria that will exempt generators from compliance with the requirements defined in Requirement R5, part 5.1,~~4~~ and any associated notification requirements. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

If~~In the event~~ a Transmission Operator determines that~~approves~~ a generator has satisfied~~as satisfying~~ the exemption criteria, it shall notify the associated Generator Operator.

M4. Each Transmission Operator shall have evidence of the documented criteria for generator exemptions.

For part 4.1, the~~The~~ Transmission Operator shall also have evidence to show that, for each generating unit in its area that is exempt from: 1) following a voltage or Reactive Power schedule, 2) from having its automatic voltage regulator (AVR) in service or from being in voltage control mode, or 3) from having to make any notifications, the associated Generator Operator was notified of this exemption. ~~following a voltage or Reactive Power schedule, the associated Generator Owner was notified of this exemption in accordance with Requirement 3. Temporary exemptions maybe provided to generators during scenarios where notifications/communications are not necessary due to a system event that prevents a Generator Operator from maintaining a schedule. Similarly, when an Automatic Voltage Regulator (AVR) is malfunctioning, which prevents a Generator Operator from maintaining a voltage schedule and tolerance band, temporary exemptions may be provided. For temporary exemptions, evidence showing the exemptions were granted must be provided. If the exemptions were given verbally from the Transmission Operator, the phone recordings or emails commemorating the phone~~

~~call must be provided. For temporary exemptions, the evidence of communication must also include the timeframe for how long the exemption will last.~~

Rationale for R5:

The new requirement provides transparency regarding the criteria used by the TOP to establish the voltage schedule. This requirement also provides a vehicle for the TOP to use appropriate granularity when setting notification requirements for deviation from the voltage or Reactive Power schedule. Additionally, this requirement provides clarity regarding a "tolerance band" as specified in the voltage schedule and the control dead-band in the generator's excitation system.

Voltage Schedule tolerances are the bandwidth that accompanies the voltage target in a voltage schedule, should reflect the anticipated fluctuation in voltage at the Generation Operator's facility during normal operations, and be based on the TOP's assessment of N-1 and credible N-2 system contingencies. The voltage schedule's bandwidth should not be confused with the control dead-band that is programmed into a Generation Operator's automatic voltage regulator's control system, which should be adjusting the AVR prior to reaching either end of the voltage schedule's bandwidth.

~~**Rationale for R5:**~~

~~The new requirement adds "tolerance band" in order to provide more detailed information when establishing limits.~~

R5. Each Transmission Operator shall specify a voltage or Reactive Power schedule (which is either a range~~,~~ or a target value with an associated~~and~~ tolerance band) ~~(~~at either the high voltage side or low voltage side of the Generator Step-Up transformer at the ~~TOP's discretion) at the interconnection point between the generator facility and the~~ Transmission Operator's discretion~~Owner's facilities to be maintained by each generator~~. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

5.1. The Transmission Operator shall provide the voltage or Reactive Power schedule ~~and tolerance band~~ to the associated Generator Operator and direct the Generator Operator to comply with the schedule in automatic voltage control mode (the AVR is in service and controlling voltage).

5.2. The Transmission Operator shall provide the Generator Operator with the notification requirements for deviations from the voltage or Reactive Power schedule.

5.3. The Transmission Operator shall provide the criteria used to develop voltage schedules and associated tolerance bands to the Generator Operator within 30 days of receiving a request.

M5. The Transmission Operator shall have evidence of a documented voltage or Reactive Power Schedule and tolerance band.

For part 5.1, theThe Transmission Operator shall have evidence it provided a voltage or Reactive Power schedule and tolerance band ~~as specified in Requirement 4~~ to the applicable Generator Operators, and that the Generator Operator was directed to comply with the schedule in automatic voltage control mode, unless exempted. The~~. For real-time directives,~~ evidence shall~~may~~ include written records, email, or voice recordings. ~~recorded phone logs.~~

For part 5.2,

~~**R6.** The Transmission Operator shall know~~ the ~~status of all transmission Reactive Power resources, automatic voltage regulators, and power system stabilizers in their system. *[Violation Risk Factor: Medium] [Time Horizon: Operations]*~~

~~The~~ Transmission Operator shall have evidence it provided notification requirements for deviations from the voltage or Reactive Power schedule and associated tolerance band. The evidence shall~~to show Reactive Power resources are being monitored. Evidence may~~ include written records, email, or voice recordings~~, but is not limited to screen shots of EMS/SCADA data, alarms, and phone logs. In the event the monitoring system does not work, each Transmission Operator should have a protocol in place to show these resources are being monitored~~.

For part 5.3, the Transmission Operator shall have evidence it provided the criteria used to develop voltage schedules and associated tolerance bands within 30 days of receiving a request by a Generator Operator.

Rationale for R6:

Although tap settings are first established prior to interconnection, this requirement could not be deleted because no other standard addresses when a tap setting must be adjusted. If the tap setting is not properly set, then the amount of VARs produced by a unit can be affected.

~~**Rationale for R6:**~~

~~Since power system stabilizers (PSS) equipment is not highlighted in any other standard, the VAR standard is the appropriate place to ensure the equipment is being monitored. This requirement is not duplicative of the TOP standards because the voltage regulators and power system stabilizer are highlighted.~~

~~R7.~~R6. After consultation with the Generator Owner regarding necessary step-up transformer tap changes and the implementation schedule, the Transmission Operator shall provide documentation to the Generator Owner specifying the required tap changes, a timeframe for

making the changes, and technical justification for these changes. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

~~M2.~~M6. The Transmission Operator shall have evidence that it provided documentation to the Generator Owner when a change was needed to a generating unit's step-up transformer tap in accordance with the requirement and that it consulted with the Generator Owner.

C. Compliance

1. **Compliance Monitoring Process:**

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" refers to~~means~~ NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time a registered entity is required to retain specific evidence to demonstrate compliance. For instances in which the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask the registered entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Operator shall retain evidence for Measures 1 through 4 for 12 months. The Compliance Monitor shall retain any audit data for three years.

1.3. Compliance Monitoring and Assessment Processes:

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.4. Additional Compliance Information:

None

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	~~Operations~~Operational Planning	High	N/A~~The Transmission Operator has documented criteria for assessments, but has provided a copy to only one of the parties that should have received a copy (either a neighboring TOPs or its RC).~~	N/A~~The Transmission Operator has documented policies and procedures, but has not provided copies to either the neighboring TOPs or its RC.~~	N/A~~The Transmission Operator has documented policies or procedures, but none of the sub-requirements were followed.~~	The Transmission Operator has not specified a system voltage schedule.
R2	Real-time Operations, Same-day Operations, and Operational Planning	High	N/A	N/A~~The Transmission Operator only performs day-ahead assessments and only schedules day-ahead resources.~~	The Transmission Operator does not schedule sufficient reactive resources as necessary to avoid violating an SOL.~~N/A~~	The Transmission Operator does not schedule~~perform assessments and therefore does not have policies and procedures implemented to have~~ sufficient reactive resources as necessary to avoid violating an IROL~~Mvars. A lack of real-time operations is also severe~~.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R3	Real-time Operations, Same-day Operations, and Operational Planning	High~~Lower~~	N/A	N/A	The Transmission Operator does not operate or direct any real-time operation of devices as necessary to avoid violating an SOL. ~~N/A~~	The Transmission Operator does not operate or direct any real-time operation of devices as necessary to avoid violating an IROL~~have exemption criteria~~.
R4	Operations Planning	Lower~~Medium~~	N/A	N/A	The Transmission Operator has exemption criteria and notified the Generator Operator, but the Transmission Operator does not have evidence~~provides voltage or Reactive Power schedules to only some~~ of the notification~~GOPs~~.	The Transmission Operator does not have exemption criteria~~provide voltage or Reactive Power schedules and tolerance bands at all~~.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R5	Operations Planning	Medium~~Lower~~	N/A	The Transmission Operator provides ~~is unaware of~~ the criteria for voltage schedules after 30 days of request~~status in a stable area~~.	The Transmission Operator provides voltage or Reactive Power schedules to some, but~~does~~ not all, Generator Operators~~know the status of important equipment in weaker areas that were identified in assessments as part of R1~~.	The Transmission Operator does not provide voltage or Reactive Power schedules-. Or The Transmission Operator did not provide the Generator Operator with the notification requirements for deviations from the voltage or Reactive Power schedule. ~~N/A~~
R6	Operations Planning	Lower	Either the technical justification or timeframe are not provided.	~~Neither the technical justification nor the timeframe are provided.~~N/A	N/A	~~N/A~~Neither the technical justification nor the timeframe are provided.

D. Regional Variances

The following Interconnection-wide variance shall be applicable in ~~Regional Variance for~~ the Western Electricity Coordinating Council (WECC) and replaces, in their entirety, Requirements R3 and R4. Please note that Requirement R3 is deleted and R4 is replaced with the following requirements.

Requirements

E.A.13 Each Transmission Operator shall issue any one of the following types of voltage schedules to the Generator Operators for each of their generation resources that are on-line and part of the Bulk Electric System within the Transmission Operator Area: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same-day Operations]*

- A voltage set point with a voltage tolerance band and a specified period.
- An initial volt-ampere reactive output or initial power factor output with a voltage tolerance band for a specified period that the Generator Operator uses to establish a generator bus voltage set point.
- A voltage band for a specified period.

E.A.14 Each Transmission Operator shall provide one of the following voltage schedule reference points for each generation resource in its Area to the Generator Operator. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same-day Operations]*

- The generator terminals.
- The high side of the generator step-up transformer.
- The point of interconnection.
- A location designated by mutual agreement between the Transmission Operator and Generator Operator.

E.A.15 Each Generator Operator shall convert each voltage schedule specified in Requirement E.A.13 into the voltage set point for the generator excitation system. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same-day Operations]*

E.A.16 Each Generator Operator shall provide its voltage set point conversion methodology from the point in Requirement E.A.14 to the generator terminals within 30 calendar days of request by its Transmission Operator. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

E.A.17 Each Transmission Operator shall provide to the Generator Operator, within 30 calendar days of a request for data by the Generator Operator, its transmission equipment data and operating data that supports development of the voltage set point conversion methodology. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

E.A.18 Each Generator Operator shall meet the following control loop specifications if the Generator Operator uses control loops external to the Automatic Voltage Regulators (AVR) to manage MVar loading: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

E.A.18.1. Each control loop's design incorporates the AVR's automatic voltage controlled response to voltage deviations during System Disturbances.

E.A.18.2. Each control loop is only used by mutual agreement between the Generator Operator and the Transmission Operator affected by the control loop.

Measures[1]

M.A.13 Each Transmission Operator shall have and provide upon request, evidence that it provided the voltage schedules to the Generator Operator. Dated spreadsheets, reports, voice recordings, or other documentation containing the voltage schedule including set points, tolerance bands, and specified periods as required in Requirement E.A.13 are acceptable as evidence.

M.A.14 The Transmission Operator shall have and provide upon request, evidence that it provided one of the voltage schedule reference points in Requirement E.A.14 for each generation resource in its Area to the Generator Operator. Dated letters, e-mail, or other documentation that contains notification to the Generator Operator of the voltage schedule reference point for each generation resource are acceptable as evidence.

M.A.15 Each Generator Operator shall have and provide upon request, evidence that it converted a voltage schedule as described in Requirement E.A.13 into a voltage set point for the AVR. Dated spreadsheets, logs, reports, or other documentation are acceptable as evidence.

M.A.16 The Generator Operator shall have and provide upon request, evidence that within 30 calendar days of request by its Transmission Operator it provided its voltage set point conversion methodology from the point in Requirement E.A.14 to the generator terminals. Dated reports, spreadsheets, or other documentation are acceptable as evidence.

M.A.17 The Transmission Operator shall have and provide upon request, evidence that within 30 calendar days of request by its Generator Operator it provided data to support development of the voltage set point conversion methodology. Dated reports, spreadsheets, or other documentation are acceptable as evidence.

~~M.A.13~~**M.A.18** If the Generator Operator uses outside control loops to manage MVar loading, the Generator Operator shall have and provide upon request, evidence that it met the control loop specifications in sub-parts E.A.18.1 through E.A.18.2. Design specifications with identified agreed-upon control loops, system reports, or other dated documentation are acceptable as evidence~~VAR-001-3 is retained~~.

[1] The number for each measure corresponds with the number for each requirement, i.e. M.E.A.13 means the measure for Requirement E.A.13.

E. Interpretations

None.

F. Associated Documents

None.

Guidelines and Technical Basis

For technical basis for each requirement, please review~~see~~ the rationale provided~~VAR White Paper~~ for each requirement~~further technical information~~.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR and supporting package posted for comment on July 19, 2013.
2. Draft standard posted for initial comments and ballot from July 19, 2013 to September 3, 2013.

Description of Current Draft

This is the second posting of the proposed draft standard. This proposed draft standard will be posted for a 45-day formal comment period and parallel ballot.

Anticipated Actions	Anticipated Date
Additional 45-Day SAR Comment Period with Ballot	October/November 2013
Final Ballot	December 2013
NERC Board of Trustees Adoption	December 2013
Filing to Applicable Regulatory Authorities	December 2013

Version History

Version	Date	Action	Change Tracking
1	5/1/2006	Added "(R2)" to the end of levels on non-compliance 2.1.2, 2.2.2, 2.3.2, and 2.4.3.	July 5, 2006
1a	12/19/2007	Added Appendix 1 – Interpretation of R1 and R2 approved by BOT on August 1, 2007	Revised
1a	1/16/2007	In Section A.2., Added "a" to end of standard number. Section F: added "1."; and added date.	Errata
1.1a	10/29/2008	BOT adopted errata changes; updated version number to "1.1a"	Errata
1.1b	3/3/2009	Added Appendix 2 – Interpretation of VAR-002-1.1a approved by BOT on February 10, 2009	Revised
2b	4/16/2013	Revised R1 to address an Interpretation Request. Also added previously approved VRFs, Time Horizons and VSLs. Revised R2 to address consistency issue with VAR-001-2, R4. FERC Order issued approving VAR-002-2b.	Revised

Definitions of Terms Used in the Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None.

A. Introduction

1. Title: **Generator Operation for Maintaining Network Voltage Schedules**

2. Number: VAR-002-3

3. Purpose: To ensure generators provide reactive support and voltage control, within generating Facility capabilities, in order to protect equipment and maintain reliable operation of the Interconnection.

4. Applicability:

4.1. Generator Operator

4.2. Generator Owner

5. Effective Dates

The standard shall become effective on the first day of the first calendar quarter after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, VAR-002-3 shall become effective on the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

B. Requirements and Measures

Rationale for R1: This requirement has been maintained due to the importance of running a unit with its automatic voltage regulator (AVR) in service and in voltage controlling mode. However, the requirement has been modified to allow for testing, and the measure has been updated to include some of the evidence that can be used for compliance purposes.

R1. The Generator Operator shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) in service and controlling voltage) unless the Generator Operator 1) is exempted by the Transmission Operator, or 2) has notified the Transmission Operator of one of the following: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

- That the generator is being operated in start-up,[1] shutdown,[2] or testing mode pursuant to a Real-time communication or a procedure that was previously provided to the Transmission Operator; or
- That the generator is not being operated in the automatic voltage control mode for a reason other than start-up, shutdown, or testing.

M1. The Generator Operator shall have evidence to show that it notified its associated Transmission Operator any time it failed to operate a generator in the automatic voltage control mode as specified in Requirement R1. If a generator is being started up or shut down with the automatic voltage control off, or is being tested, and no notification of the AVR status is made to the Transmission Operator, the Generator Operator will have evidence that it notified the Transmission Operator of its procedure for placing the unit into automatic voltage control mode. Such evidence must include, but is not limited to, dated evidence of transmittal of the procedure such as an electronic message or a transmittal letter with the procedure included or attached. If exempted, the Generator Operator shall also have evidence that it is exempted from being in automatic voltage control mode (with its AVR in service and controlling voltage).

[1] Start-up is deemed to have ended when the generator is ramped up to its minimum continuously sustainable load and the generator is prepared for continuous operation.
[2] Shutdown is deemed to begin when the generator is ramped down to its minimum continuously sustainable load and the generator is prepared to go offline.

Rationale for R2:

Requirement R2 details how a Generator Operator (GOP) operates the system to maintain a voltage schedule and when the GOP is expected to notify the Transmission Operator (TOP). In an effort to remove prescriptive notification requirements for the entire continent, the VAR standard drafting team (SDT) opted to allow each TOP to determine the notification requirements for each of its respective GOPs based on system requirements. A new part 2.3 has been added to detail that each GOP shall monitor voltage based on its existing facility equipment.

Conversion Methodology: There are many ways to convert the voltage schedule from one voltage level to another. Some entities may choose to develop voltage regulation curves for their transformers; others may choose to do a straight ratio conversion; others may choose an entirely different methodology. All of these methods have technical challenges, but the studies performed by the TOP, which consider N-1 and credible N-2 contingencies, should compensate for the error introduced by these methodologies, and the TOP possesses the authority to direct the GOP to modify its output if its performance is not satisfactory. During a significant system event, such as a voltage collapse, even a generation unit in automatic voltage control that controls based on the low-side of the generator step-up transformer should see the event on the low-side of the generator step-up transformer and respond accordingly.

Voltage Schedule Tolerances: The bandwidth that accompanies the voltage target in a voltage schedule should reflect the anticipated fluctuation in voltage at the GOP's Facility during normal operations and be based on the TOP's assessment of N-1 and credible N-2 system contingencies. The voltage schedule's bandwidth should not be confused with the control dead-band that is programmed into a GOP's AVR control system, which should be adjusting the AVR prior to reaching either end of the voltage schedule's bandwidth.

R2. Unless exempted by the Transmission Operator, each Generator Operator shall maintain the generator voltage or Reactive Power schedule[3] (within each generating Facility's capabilities[4]) provided by the Transmission Operator, or otherwise shall meet the conditions of notification for deviations from the voltage schedule provided by the Transmission Operator. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

2.1. When a generator's AVR is out of service or the generator does not have an AVR, the Generator Operator shall use an alternative method to control the generator reactive output to meet the voltage or Reactive Power schedule directed by the Transmission Operator.

[3] The voltage or Reactive Power schedule is a target value with a tolerance band or a voltage or Reactive Power range communicated by the Transmission Operator to the Generator Operator.

[4] Generating Facility capability may be established by test or other means, and may not be sufficient at times to pull the system voltage within the schedule tolerance band. Also, when a Generator is operating in manual control, reactive power capability may change based on stability considerations.

2.2. When directed to modify voltage, the Generator Operator shall comply or provide an explanation of why the schedule cannot be met.

2.3. Generator Operators that do not monitor the voltage at the location specified in their voltage schedule shall have a methodology for converting the scheduled voltage specified by the Transmission Operator to the voltage point being monitored by the Generator Operator.

M2. In order to identify when a unit is deviating from its schedule, the Generator Operator will monitor voltage based on existing equipment at its Facility. The Generator Operator shall have evidence to show that the generator maintained the voltage or Reactive Power schedule provided by the Transmission Operator, or shall have evidence of meeting the conditions of notification for deviations from the voltage schedule provided by the Transmission Operator. Evidence may include, but is not limited to, operator logs, SCADA data, phone logs, and any other notifications that would alert the Transmission Operator or otherwise demonstrate that the Generator Operator complied with the Transmission Operator's instructions for addressing deviations from the voltage schedule.

For part 2.1, when a generator's AVR is out of service or the generator does not have an AVR, a Generator Operator shall have evidence to show an alternative method was used to control the generator reactive output to meet the voltage or Reactive Power schedule directed by the Transmission Operator.

For part 2.2, the Generator Operator shall have evidence that it complied with the Transmission Operator's directions to modify its voltage or provided an explanation to the Transmission Operator of why the Generator Operator was unable to comply with the direction. Evidence may include, but is not limited to, operator logs, SCADA data, and phone logs.

For part 2.3, for units that do not monitor the voltage at the location specified on the voltage schedule, the Generator Operator shall document or be able to demonstrate the method of conversion from the voltage level monitored to the voltage level specified on the voltage schedule.

Rationale for R3:

This requirement has been modified to limit the notifications required when an AVR goes out of service and quickly comes back in service. Such notifications provided little to no benefit to reliability. Fifteen (15) minutes have been built into the requirement to allow a GOP time to resolve an issue before having to notify the TOP of a status or capability change. The requirement has also been amended to remove the sub-requirement to provide an estimate for the expected duration of the status change. The 15-minute window should resolve most issues.

R3. Each Generator Operator shall notify its associated Transmission Operator of a status change on the AVR, power system stabilizer, or alternative voltage controlling device within 30 minutes of the change. If the status has been restored within the first 15 minutes of such change, then there is

no need to notify the Transmission Operator. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

M3. The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of the change identified in Requirement R3. If the status has been restored within the first 15 minutes, no notification is necessary; therefore, if a status change lasts more than 15 minutes, the GOP must notify its associated Transmission Operator within 30 minutes of when the change first occurred.

Rationale for R4:

This requirement has been bifurcated from the earlier Requirement R3. This requirement allows GOPs to report reactive capability changes after they are made aware of the change. The current standard requires notification as soon as the change occurs, but many GOPs are already in non-compliance situations by the time it is known that a reactive capability change has taken place.

R4. Each Generator Operator shall notify its associated Transmission Operator within 30 minutes after becoming aware of a change in reactive capability due to factors other than a status change described in Requirement R3. If the capability has been restored within the first 15 minutes of such change, then there is no need to notify the Transmission Operator. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

M4. The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of the recognition of a reactive capability change identified in Requirement R4. If the capability has been restored within the first 15 minutes, no notification is necessary; therefore, if a capability change lasts more than 15 minutes, the Generator Operator must notify its associated Transmission Operator within 30 minutes of when the change first occurred.

Rationale for R5:

This requirement and corresponding measure have been maintained due to the importance of having accurate tap settings. If the tap setting is not properly set, then the amount of VARs produced by a unit can be affected. The original sub-requirement 4.1.4 (the +/- voltage range with step-change in % for load-tap changing transformers) has been removed.

R5. The Generator Owner shall provide the following to its associated Transmission Operator and Transmission Planner within 30 calendar days of a request. *[Violation Risk Factor: Lower] [Time Horizon: Real-time Operations]*

5.1. For generator step-up transformers and auxiliary transformers with primary voltages equal to or greater than the generator terminal voltage:

5.1.1. Tap settings.

5.1.2. Available fixed tap ranges.

5.1.3. Impedance data.

M5. The Generator Owner shall have evidence it provided its associated Transmission Operator and Transmission Planner with information on its step-up transformers and auxiliary transformers as required in Requirements R5 part 5.1.1 through part 5.1.3.

Rationale for R6:

This requirement and corresponding measure have been maintained due to the importance of having accurate tap settings. If the tap setting is not properly set, then the amount of VARs produced by a unit can be affected.

R6. After consultation with the Transmission Operator regarding necessary step-up transformer tap changes, the Generator Owner shall ensure that transformer tap positions are changed according to the specifications provided by the Transmission Operator, unless such action would violate safety, an equipment rating, a regulatory requirement, or a statutory requirement. *[Violation Risk Factor: Lower] [Time Horizon: Real-time Operations]*

6.1. If the Generator Operator cannot comply with the Transmission Operator's specifications, the Generator Operator shall notify the Transmission Operator and shall provide the technical justification.

M6. The Generator Owner shall have evidence that its step-up transformer taps were modified per the Transmission Operator's documentation as identified in Requirement R6. The Generator Operator shall have evidence that it notified its associated Transmission Operator when it could not comply with the Transmission Operator's step-up transformer tap specifications as identified in Requirement R6 part 6.1.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" refers to NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner shall keep its latest version of documentation on its step-up and auxiliary transformers. The Generator Operator shall maintain all other evidence for the current and previous calendar year.

The Compliance Monitor shall retain any audit data for three years.

1.3. Compliance Monitoring and Assessment Processes:

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.4. Additional Compliance Information:

None.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Real-time Operations**	**Medium**	N/A	N/A	N/A	Unless exempted, the responsible entity did not operate each generator in the automatic voltage control mode and failed to notify the Transmission Operator as identified in Requirement R1.
R2	**Real-time Operations**	**Medium**	N/A	N/A	The responsible entity did not have conversion methodology when it monitors voltage at a location different from the schedule provided by the Transmission Operator.	The responsible entity did not maintain voltage or Reactive schedule as directed by the Transmission Operator and did not make the necessary notifications required by the Transmission Operator. OR The responsible entity did not have an operating AVR, and the responsible entity did not use an alternative method for controlling voltage. OR The responsible entity did not modify voltage when directed, and the responsible entity did not provide any explanation.
R3	**Real-time Operations**	**Medium**	N/A	N/A	N/A	The responsible entity did not make the notification within 30 minutes.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR and supporting package posted for comment on July 19~~XX~~, 2013.
2. Draft standard posted for initial comments and ballot from July 19, 2013 to September 3, 2013.

Description of Current Draft

This is the second posting of the proposed draft standard. This proposed draft standard will be posted for a 45-day formal comment period and parallel ballot.~~This draft standard is concluding informal development and will move to formal development when authorized by the Standards Committee.~~

Anticipated Actions	Anticipated Date
~~SAR Authorized by the Standards Committee~~	~~July~~
Additional 45-~~-~~Day SAR Comment Period with~~and Initial~~ Ballot ~~Open~~	October/November 2013~~July~~
~~Nomination Period Opens~~	~~July~~
~~Standard Drafting Team Appointed~~	~~July~~
~~Initial Comment and Initial Ballot Closes~~	~~August~~
Final Ballot ~~Opens~~	December 2013~~October~~
~~Final Ballot Closes~~	~~October~~
NERC Board of Trustees~~BOT~~ Adoption	December 2013~~November~~
Filing to Applicable Regulatory Authorities	December 2013

~~Effective Dates~~

~~In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after applicable regulatory approval or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after Board of Trustees approval.~~

Version History

Version	Date	Action	Change Tracking
1	5/1/2006	Added "(R2)" to the end of levels on non-compliance 2.1.2, 2.2.2, 2.3.2, and 2.4.3.	July 5, 2006
1a	12/19/2007	Added Appendix 1 – Interpretation of R1 and R2 approved by BOT on August 1, 2007	Revised
1a	1/16/2007	In Section A.2., Added "a" to end of standard number. Section F: added "1."; and added date.	Errata
1.1a	10/29/2008	BOT adopted errata changes; updated version number to "1.1a"	Errata
1.1b	3/3/2009	Added Appendix 2 – Interpretation of VAR-002-1.1a approved by BOT on February 10, 2009	Revised
2b	4/16/2013	Revised R1 to address an Interpretation Request. Also added previously approved VRFs, Time Horizons and VSLs. Revised R2 to address consistency issue with VAR-001-2, R4. FERC Order issued approving VAR-002-2b.	Revised

Definitions of Terms Used in the Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None.

A. Introduction

1. Title: **Generator Operation for Maintaining Network Voltage Schedules**

2. Number: VAR-002-3

3. Purpose: To ensure generators provide reactive support and voltage control, ~~necessary to ensure voltage levels, reactive flows, and reactive resources are maintained~~ within generating~~applicable~~ Facility capabilities, in order~~Ratings~~ to protect equipment and maintain~~the~~ reliable operation of the Interconnection.

4. Applicability:

4.1. Generator Operator

4.2. Generator Owner

5. Effective Dates

~~All requirements~~The standard shall become effective on the first day of the first calendar quarter after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, VAR-002-3 shall become effective on the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

B. Requirements and Measures

Rationale for R1: This requirement has been maintained due to the importance of running a unit with its automatic voltage regulator (AVR) in service and in voltage controlling mode. However, the requirement has been modified to allow for testing, and the measure has been updated to include some of the evidence that can be used for compliance purposes.

~~**Rationale for R1:** This requirement has been maintained due to the importance of running a unit with its automatic voltage regulator (AVR) in service and in voltage controlling mode. The measure has been updated include some of the evidence that can be used for Compliance purposes.~~

R1. The Generator Operator shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) in service and controlling voltage) unless the Generator Operator 1) is exempted by the Transmission Operator, or 2) has notified the Transmission Operator of one of the following: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

- That the generator is being operated in start-up,[1] ~~or~~ shutdown,[3] or testing[4] mode pursuant to a Real-time communication or a procedure that was previously provided to the Transmission Operator; or
- That the generator is not being operated in the automatic voltage control mode for a reason other than start-up, ~~or~~ shutdown, or testing.

M1. The Generator Operator shall have evidence to show that it notified its associated Transmission Operator any time it failed to operate a generator in the automatic voltage control mode as specified in Requirement R1~~1~~. If a generator is being started up or shut down with the automatic voltage control off, or is being tested, and no notification of the AVR~~automatic voltage regulator~~ status is made to the Transmission Operator, the Generator Operator will have evidence that it notified the Transmission Operator of its procedure for placing the unit into automatic voltage control mode. Such evidence must include, but is not limited to, dated evidence of transmittal of the procedure such as an electronic message or a transmittal letter with the procedure included or attached. If exempted, the Generator Operator shall also have evidence that it is exempted from being in automatic voltage control mode (with its AVR in service and controlling voltage).

[1] Start-up is deemed to have ended when the generator is ramped up to its minimum continuously sustainable load and the generator is prepared for continuous operation.

~~[2] Start-up is deemed to have ended when the generator is ramped up to its minimum continuously sustainable load and the generator is prepared for continuous operation.~~

[3] Shutdown is deemed to begin when the generator is ramped down to its minimum continuously sustainable load and the generator is prepared to go offline.

Rationale for R2:

Requirement R2 details how a Generator Operator (GOP) operates the system to maintain a voltage schedule and when the GOP is expected to notify the Transmission Operator (TOP). In an effort to remove prescriptive notification requirements for the entire continent, the VAR standard drafting team (SDT) opted to allow each TOP to determine the notification requirements for each of its respective GOPs based on system requirements. A new part 2.3 has been added to detail that each GOP shall monitor voltage based on its existing facility equipment.

Conversion Methodology: There are many ways to convert the voltage schedule from one voltage level to another. Some entities may choose to develop voltage regulation curves for their transformers; others may choose to do a straight ratio conversion; others may choose an entirely different methodology. All of these methods have technical challenges, but the studies performed by the TOP, which consider N-1 and credible N-2 contingencies, should compensate for the error introduced by these methodologies, and the TOP possesses the authority to direct the GOP to modify its output if its performance is not satisfactory. During a significant system event, such as a voltage collapse, even a generation unit in automatic voltage control that controls based on the low-side of the generator step-up transformer should see the event on the low-side of the generator step-up transformer and respond accordingly.

Voltage Schedule Tolerances: The bandwidth that accompanies the voltage target in a voltage schedule should reflect the anticipated fluctuation in voltage at the GOP's Facility during normal operations and be based on the TOP's assessment of N-1 and credible N-2 system contingencies. The voltage schedule's bandwidth should not be confused with the control dead-band that is programmed into a GOP's AVR control system, which should be adjusting the AVR prior to reaching either end of the voltage schedule's bandwidth.

~~**Rationale for R2:**~~

~~R2 details how a Generator Operator (GOP) operates the system to a maintain voltage schedule and when the GOP is expected to notify the Transmission Operator (TOP). Sub-requirement 2.1 provides guidance on a non-compliance window in the event a unit is deviating from schedule, and the GOP must notify the TOP if it is unable to return to schedule. Thus, the non-compliance window allows for notifications when a unit is unable to provide additional VAR support (e.g., when hitting an operational limit) or when the unit is too small to raise voltage. In both instances, the TOP may then provide some type of temporary exemption as outlined in VAR-001.~~

R2. Unless exempted by the Transmission Operator, each Generator Operator shall maintain the generator voltage or Reactive Power schedule[5] (within each generating Facility's capabilities[6]) provided by the Transmission Operator, or otherwise shall meet the conditions of notification for deviations from the voltage schedule provided by the Transmission Operator.~~applicable Facility Ratings[7]) as directed by the Transmission Operator.~~ *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

~~**2.1.** If a GOP drifts out of schedule, each Generator Operator shall notify its associated Transmission Operator within 15 minutes when both of the following conditions are met: 1) the GOP is operating outside of the prescribed voltage or Reactive Power schedule tolerance band[8] for 15 minutes; and 2) the GOP is no longer able to return to its voltage or Reactive Power schedule.~~

~~2.2.~~2.1. When a generator's AVR~~automatic voltage regulator~~ is out ~~-~~of ~~-~~service or the generator does not have an AVR, the Generator Operator shall use an alternative method to control the generator reactive output to meet the voltage or Reactive Power schedule directed by the Transmission Operator.

~~2.3.~~2.2. When directed to modify voltage, the Generator Operator shall comply or provide an explanation of why the schedule cannot be met.

2.3. Generator Operators that do not monitor the voltage at the location specified in their voltage schedule shall have a methodology for converting the scheduled voltage specified by the Transmission Operator to the voltage point being monitored by the Generator Operator.

M2. In order to identify when a unit is deviating from its schedule, the Generator Operator will monitor voltage based on existing equipment at its Facility. The Generator Operator shall have evidence to show that the generator maintained the voltage or Reactive Power schedule provided by the Transmission Operator, or shall have evidence of meeting the conditions of notification for deviations from the voltage schedule provided by the Transmission Operator. Evidence may include, but is not limited to, operator logs, SCADA data, phone logs, and any other notifications that would alert the Transmission Operator or otherwise demonstrate that the Generator Operator complied with the Transmission Operator's instructions for addressing deviations from the voltage schedule.

For part 2.1, when a generator's AVR is out of service or the generator does not have an AVR, a Generator Operator shall have evidence to show an alternative method was used to control the generator reactive output to meet the voltage or Reactive Power schedule directed by the Transmission Operator.

---

[5] The voltage or Reactive Power schedule is a target value with a tolerance band or a voltage or Reactive Power range communicated by the Transmission Operator to the Generator Operator~~ establishing a tolerance band within which the target value is to be maintained during a specified period~~.

[6] Generating Facility capability may be established by test or other means, and may not be sufficient at times to pull the system voltage within the schedule tolerance band. Also, when a Generator is operating in manual control, reactive power capability may change based on stability considerations.

~~[7] When a Generator is operating in manual control, reactive power capability may change based on stability considerations and this may lead to a change in the associated Facility Ratings.~~

~~[8] GOPs monitor and control voltage based on their equipment limitations. GOPs will monitor their voltage or Reactive Power schedule tolerance bands either at the high side or low side/terminal voltage.~~

For part 2.2, the Generator Operator shall have evidence that it complied with the Transmission Operator's directions to modify its voltage or provided an explanation of why the Generator Operator was unable to comply with the direction. Evidence may include, but is not limited to, operator logs, SCADA data, and phone logs.

~~**M2.**~~ For part 2.3, for units that do not monitor the voltage at the location specified on the voltage schedule the Generator Operator shall document or be able to demonstrate the method of conversion from the voltage level monitored to the voltage level specified on the voltage schedule.~~Generator Operators will still make all attempts to operate within the tolerance bands provided by the TOP, but natural drifting may occur. In instances where there is an event occurring to pull a unit out of the tolerance band, the Generator Operator will not be held in non-compliance with this requirement if the sub-requirements 2.1, 2.2, and 2.3 are met. In order to identify when a unit is deviating from its schedule, GOPs will monitor voltage based on existing equipment at its facility. Therefore, GOPs have the option to operate on a voltage schedule on either the high-side or convert the high-side schedule to a low-side schedule at the GOP's discretion. For units that monitor on the low-side/terminal voltage, Generator Operators shall provide evidence of the method of conversion from the high-side schedule to low-side monitoring. For sub-requirement 2.1, most units will not be able to return to schedule due to a limiting factor. Such limiting factors may include, but are not limited to: 1) terminal voltage, 2) bus voltage, 3) equipment temperature, 4) transformer, 5) auxiliary equipment, 6) Volts/Hz limits, and 7) excitation or regulator limits. GOP shall have evidence to show compliance with requirement R2 by providing 1) Communications with the TOP when the Generator Operator was operating outside of the prescribed voltage or Reactive Power schedule tolerance band for 30 minutes or less (the 30 minutes allow for 15 minutes to call and 15 minutes to be outside of the tolerance band) AND Generator Operator is no longer able to return to its voltage or Reactive Power schedule; 2) Generator Operator implemented an alternative method to control reactive output when the AVR was out-of-service or unavailable; 3) compliance with directive to modify voltage or a notification that the directive could not be met. Evidence may include, but is not limited to Generator Operator logs, SCADA data, phone logs, and any other alarming notifications that would alert the Transmission Operator that both conditions were met. Timing for Requirement R2.1 is crucial, and Generator Operators are expected to begin timing an event as soon as the unit is operating outside of the tolerance band. Further, voltage documentation during a system event maybe requested by an auditor to show measures were taken to bring the unit back into schedule.

Rationale for R3:

This requirement has been modified to limit the notifications required when an AVR goes out of service and quickly comes back in service. Such notifications provided little to no benefit to reliability. Fifteen (15) minutes have been built into the requirement to allow a GOP time to resolve an issue before having to notify the TOP of a status or capability change. The requirement has also been amended to remove the sub-requirement to provide an estimate for the expected duration of the status change. The 15-minute window should resolve most issues.

~~**Rationale for R3:**~~

~~This requirement has been modified to reduce the number of violations for when an AVR goes out of service and then comes back in service. Fifteen (15) minutes have been built into the requirement to allow a Generator Operator time to resolve an issue before having to notify the Transmission Operator of a status or capability change. The requirement has also been amended to remove the sub-requirement to provide an estimate for the expected duration of the status change. The 15-minute window should resolve most issues, and further trouble-shooting will probably be required if the status change is unresolved within 15 minutes.~~

R3. Each Generator Operator shall notify its associated Transmission Operator of a status ~~or capability~~ change on the AVR,~~any generator Reactive Power resource, including the status of each automatic voltage regulator and~~ power system stabilizer, or alternative voltage controlling device~~ and the expected duration of the change in status or capability~~ within 30 minutes of the change. If the status has been restored within the first 15 minutes of such change, then there is no need to notify~~call~~ the Transmission Operator~~TOP~~. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

M3. The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of ~~any of~~ the change~~changes~~ identified in Requirement R3~~3~~. If the status has been restored within the first 15 minutes, no notification~~call~~ is necessary; therefore, if a status ~~on Reactive Power resource has changed, and that~~ change lasts more~~greater~~ than 15 minutes, the GOP must notify its associated Transmission Operator~~TOP~~ within 30 minutes of when the change first occurred.

~~**Rationale for R4:**~~

~~This requirement and corresponding measure language has been maintained due to the importance of having accurate tap settings. If the tap setting is not properly set, then the amount of VARs produced by a unit can be affected.~~

Rationale for R4:

This requirement has been bifurcated from the earlier Requirement R3. This requirement allows GOPs to report reactive capability changes after they are made aware of the change. The current standard requires notification as soon as the change occurs, but many GOPs are already in non-compliance situations by the time it is known that a reactive capability change has taken place.

R4. Each Generator Operator shall notify its associated Transmission Operator within 30 minutes after becoming aware of a change in reactive capability due to factors other than a status change described in Requirement R3. If the capability has been restored within the first 15 minutes of such change, then there is no need to notify the Transmission Operator. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

M4. The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of the recognition of a reactive capability change identified in Requirement R4. If the capability has been restored within the first 15 minutes, no notification is necessary; therefore, if a capability change lasts more than 15 minutes, the Generator Operator must notify its associated Transmission Operator within 30 minutes of when the change first occurred.

Rationale for R5:

This requirement and corresponding measure language has been maintained due to the importance of having accurate tap settings. If the tap setting is not properly set, then the amount of VARs produced by a unit can be affected.

Rationale for R5:

This requirement and corresponding measure have been maintained due to the importance of having accurate tap settings. If the tap setting is not properly set, then the amount of VARs produced by a unit can be affected. The original sub-requirement 4.1.4 (the +/- voltage range with step-change in % for load-tap changing transformers) has been removed.

~~R4.~~R5. The Generator Owner shall provide the following to its associated Transmission Operator and Transmission Planner within 30 calendar days of a request. *[Violation Risk Factor: Lower] [Time Horizon: Real-time Operations]*

~~4.1.~~5.1. For generator step-up transformers and auxiliary transformers with primary voltages equal to or greater than the generator terminal voltage:

~~4.1.1.~~5.1.1. Tap settings.

~~4.1.2.~~5.1.2. Available fixed tap ranges.

~~4.1.3.~~5.1.3. Impedance data.

M5. The Generator Owner shall have evidence it provided its associated Transmission Operator and Transmission Planner with information on its step-up transformers and auxiliary transformers as required in Requirements R5 part 5~~4~~.1.1 through part 5~~4~~.1.3.

Rationale for R6:

This requirement and corresponding measure have been maintained due to the importance of having accurate tap settings. If the tap setting is not properly set, then the amount of VARs produced by a unit can be affected.

~~R5.~~R6. After consultation with the Transmission Operator regarding necessary step-up transformer tap changes, the Generator Owner shall ensure that transformer tap positions are changed according to the specifications provided by the Transmission Operator, unless such action would violate safety, an equipment rating, a regulatory requirement, or a statutory requirement. *[Violation Risk Factor: Lower] [Time Horizon: Real-time Operations]~~].~~*

~~5.1.~~6.1. If the Generator Operator cannot~~can't~~ comply with the Transmission Operator's specifications, the Generator Operator shall notify the Transmission Operator and shall provide the technical justification.

M6. The Generator Owner shall have evidence that its step-up transformer taps were modified per the Transmission Operator's documentation as identified in Requirement R6~~5~~. The Generator Operator shall have evidence that it notified its associated Transmission Operator when it could not~~couldn't~~ comply with the Transmission Operator's step-up transformer tap specifications as identified in Requirement R6 part 6~~5~~.1.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" refers to~~means~~ NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner shall keep its latest version of documentation on its step-up and auxiliary transformers. The Generator Operator shall maintain all other evidence for the current and previous calendar year.

The Compliance Monitor shall retain any audit data for three years.

1.3. Compliance Monitoring and Assessment Processes:

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.4. Additional Compliance Information:

None

Implementation Plan for VAR-001-4 and VAR-002-3

Approvals Required

VAR-001-4 – Voltage and Reactive Control
VAR-002-3 — Generator Operation for Maintaining Network Voltage Schedules

Prerequisite Approvals

There are no other standards that must receive approval prior to the approval of this standard.

Revisions to Glossary Terms

None

Applicable Entities

Generator Operators (VAR-002-3)

Generator Owners (VAR-002-3)

Transmission Operators (VAR-001-4)

Applicable Facilities

N/A

Conforming Changes to Other Standards

None

Effective Dates

VAR-001-4 and VAR-002-3 – All requirements shall become effective on the first day of the first calendar quarter after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, VAR-001-4 and VAR-002-3 shall become effective on the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Justification

The currently effective VAR-002 standard is one of the most violated standards; however, the industry argues these violations do not address any reliability gaps. Instead, Generator Operators and Transmission Operators are required to handle many nuisance phone calls for slight deviations from a voltage schedule. The nuisance phone calls can be a distraction during a scheduled maintenance or a system event; thus, the industry would support making the changes as soon as possible. However, since VAR-001 now requires determining voltage and reactive power schedules with associated tolerance bands in addition to any notification requirements, the Transmission Operators need a quarter to prepare documentation. The VAR-002 standards cannot go into effect without the new TOP schedules and notification requirements. Also for Transmission Operators that do not already provide tolerance bands with voltage schedules, those Transmission Operators will need some time to adjust to providing new data (more specifically, the criteria for schedules) to Generator Operators.

Retirements

VAR-001-3 and VAR-002-2b will be retired at midnight of the day immediately prior to the Effective Date of VAR-001-4 and VAR-002-3 in the particular jurisdiction in which the new standards are becoming effective.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan

VAR Directives Project

Implementation Plan for VAR-001 and VAR-002

Approvals Required

VAR-001-4 – Voltage and Reactive Control
VAR-002-3 — Generator Operation for Maintaining Network Voltage Schedules

Prerequisite Approvals

There are no other standards that must receive approval prior to the approval of this standard.

Revisions to Glossary Terms

None

Applicable Entities

Generator Operators (VAR-002-3)

Generator Owners (VAR-002-3)

Transmission Operators (VAR-001-4)

~~Reliability Coordinators~~

Applicable Facilities

N/A

Conforming Changes to Other Standards

None

Effective Dates

VAR-001-4 and VAR-002-3 – All requirements ~~- In those jurisdictions where regulatory approval is required, this standard~~ shall become effective on the first day of the first calendar quarter after the date that the standard is approved by an applicable governmental authority ~~regulatory approval~~ or as otherwise provided for in a jurisdiction where approval by an~~made effective pursuant to the laws~~ applicable ~~to such ERO~~ governmental authority~~authorities. In those jurisdictions where no regulatory approval~~ is required for a~~, this~~ standard to go into effect. Where approval by an applicable governmental authority is not required, VAR-001-4 and VAR-002-3 shall become effective on the first

day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction~~approval~~.

Justification

The currently effective VAR-002 standard is one of the most violated standards; however, the industry argues these violations do not address any reliability gaps. Instead, Generator Operators and Transmission Operators are required to handle many nuisance phone calls for slight deviations from a voltage schedule. The nuisance phone calls can be a distraction during a scheduled maintenance or a system event; thus, the industry would support making the changes as soon as possible. However, since VAR-001 now requires determining voltage and reactive power schedules with associated tolerance bands in addition to any notification requirements~~a documented policy or procedure for assessments~~,~~;~~ the Transmission Operators need a quarter to prepare documentation. The VAR-002 standards cannot go into effect without the new TOP schedules and notification requirements. Also for Transmission Operators that do not already provide tolerance bands with voltage schedules, those Transmission Operators will need some time to adjust to providing new data (more specifically, the criteria for schedules) to Generator Operators.

Retirements

VAR-001-3 and VAR-002-2b will be retired at midnight of the day immediately prior to the Effective Date of VAR-001-4 and VAR-002-3 in the particular j~~J~~urisdiction in which the new standards are becoming effective.

Unofficial Comment Form

Project 2013-04 Voltage and Reactive Control (VAR) Revisions

Please **DO NOT** use this form for submitting comments. Please use the electronic form to submit comments on the draft VAR-001-4 and VAR-002-3 standards. The electronic comment form must be completed by 8:00 p.m. ET by **November 25 , 2013**.

If you have questions please contact Soo Jin Kim via email or by telephone at 404-446-9742.

The project page may be accessed by clicking here.

Background Information

When the first versions of the VAR standards were approved in FERC Order No. 693,[1] the Commission also issued FERC issued several directives with regard to how to improve the standard. Each of the outstanding directives are explained in detail in the technical white paper (see project page).

The informal consensus building for VAR began in February 2013. Specifically, the ad hoc group engaged stakeholders on how best to address the FERC directives, remove paragraph 81 candidates, and implement results-based approaches. A discussion of the ad hoc group's consensus building and collaborative activities are also included in the technical white paper.

Project 2013-04 posted an initial draft for comment and ballot form July 19, 2013 to September 3, 2013. Although the VAR standards did not pass, the industry provided numerous helpful coments, and the standard drafting team made significant revisions based on the stakeholder input.

The proposed VAR-001 answers most of the FERC directives from Order No. 693, and the VAR-002 has been modified to address certain compliance issues today. Some directives are not being addressed at this time pending FERC determiniations in related filings, but those directives may be revisted during a phase 2 of this project. This posting is now soliciting comment on the revised VAR-001 and VAR-002 standards.

You do not have to answer all questions. Enter comments in simple text format. Bullets, numbers, and special formatting will not be retained.

[1] *See Mandatory Reliability Standards for the Bulk-Power System,* Order No. 693, FERC Stats. & Regs. ¶ 31,242, *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

Question

1. Although FERC directed NERC to provide more details on "established limits," the VAR standards development team determined that the FAC and TOP standards provide explicit requirements on voltage limits. Further, the definition of a System Operating Limit requires Voltage Stability Ratings (Applicable pre- and post-Contingency Voltage Stability) System Voltage Limits (Applicable pre- and post-Contingency Voltage Limits) to be included. Is it clear that the specifics with regard to voltage limits are to be determined and monitored as part of operating within System Operating Limits and Interconnection Reliability Operating Limits?

☐ Yes
☐ No

Comments:

2. Several requirements were removed because they duplicated other standards. Do you agree with this approach? Do you have any specific questions or comments relating to the requirements in the revised VAR-001-4?

☐ Yes
☐ No

Comments:

3. VAR-002 was modified to remove several compliance issues, and in order to address burdensome notification requirements, the VAR-001 standard has been modified to allow each TOP to tailor notification requirements based on system/area needs. Do you agree with these revisions?

☐ Yes
☐ No

Comments:

4. The VRFs/VSLs for VAR-002 were modified to remove arbitrary time requirements. Do you have any specific comments or questions about the new VSLs/VRFs?

Comments:

Compliance Operations

Draft Reliability Standard Compliance Guidance for VAR-001-4 and VAR-002-3
October 21, 2013

Introduction

The NERC Compliance department (Compliance) worked with the VAR standard drafting team (SDT) to review the proposed standards VAR-001-4 and VAR-002-3. The purpose of the review was to discuss the requirements of the proposed standard to obtain an understanding of its intended purpose and the evidence necessary to support compliance. The purpose of this document is to address specific questions posed by the VAR SDT in order to aid in the drafting of the requirements and provide a level of understanding regarding evidentiary support necessary to demonstrate compliance.

While all compliance evaluations require levels of auditor judgment, participating in these reviews allows Compliance to develop training and approaches to support a high level of consistency in audits conducted by the Regional Entities. The following questions and answers are intended to assist the SDT in further refining the standard and to serve as a resource in the development of training for auditors.

VAR-001 and VAR-002 Questions

Question 1

How will compliance determine if sufficient reactive resources were scheduled as part of VAR-001-4 Requirement R2?

Compliance Response to Question 1

For VAR-001-4 Requirement R2, an auditor would review the studies that a TOP used to schedule resources to see that the studies show whether new resources should be brought online, or if the resources online are sufficient to regulate voltage levels. An auditor may observe a TOP reviewing the study and scheduling live and may pull samples from various time periods to determine whether a TOP scheduled resources as required in the study.

Question 2

Is it clear that VAR-001-4 Requirement R4 allows for exemptions, for any duration, from: 1) voltage schedules, 2) being in automatic voltage control mode, or 3) any notification requirements?

Compliance Response to Question

It is clear that VAR-001 Requirement R4 allows for any combination of exemptions for generator operators from 1) voltage schedules, 2) being in automatic voltage control mode, or 3) any notification requirements, as long as the

exemption meets the criteria specified by the TOP. An auditor will not look for any pre-authorization from the TOP; rather an auditor will verify that the generator operator has met the criteria set forth by the TOP.

Question 3

Tolerance bands apply to a set voltage or Reactive Power number with a +/- percentage as the tolerance band. The voltage range or Reactive Power range is a high and low number that a Generator Operator is expected to operate within for reliability purposes. With regard to VAR-001-4 Requirement R5, is it clear that when a voltage range or Reactive Power range is provided as a schedule, a tolerance band is not expected to also be provided?

Compliance Response to Question 3

Yes, it is clear based on VAR-001-4 Requirement R5 that a voltage or Reactive power schedule can be either: 1) a target number with a tolerance band, OR 2) a voltage or Reactive Power range to operate within. An auditor would not expect to see a tolerance band provided with an operating range for voltage or Reactive Power.

Question 4

With regard to VAR-002-3, will generators receive a violation for instances where a system event is affecting system voltage, but the generators made the appropriate conversions and set the AVRs to meet the original schedule provided by the TOP?

Compliance Response to Question 4

No, the generator operators can only be responsible for maintaining the schedule provided by the TOP based on existing facility equipment. In the event that a generator operator does not have the equipment to have visibility of high-side system voltage, the GOP will not have the ability to adjust VARs to maintain system voltage. An auditor is not to determine that, where the GOP does not have the high side monitoring equipment and where the AVR is set appropriately based on existing facility equipment, the generator operator is non-compliant. However, if the TOP provides a new directive or schedule, the GOP is required to follow the new directive. This directive can include modifying an AVR setting or providing more voltage support, and the generator operator is expected to comply pursuant to VAR-002-3.

Question 5

Related to VAR-002-3, generators can monitor voltage on either the low side and high side of the GSU (depending on equipment limitation) and the “number” being monitored by the Generator will not always equate to the number provided by the TOP. Is it clear that VAR-002 Requirement R2, part 2.3 only wants a conversion of the schedule provided to the number monitored? Is it clear that there should not be a violation if the schedule does not match the number being monitored on the low side as long as there is a documented conversion?

Compliance Response to Question 5

The Generator should be able to provide documentation that identifies the "number" being monitored and the calculation demonstrating how the "number" equates to the schedule provided by the TOP. The measure for VAR-002-3 Requirement R2, part 2.3 is clear on what evidence should be able to demonstrate this during an audit.

Question 6

VAR-002-3, Requirement R4 was added because generators cannot report a capability change until they are aware of the change. The currently enforceable standard requires a notification as soon as the capability change occurs; however, many times the change occurred well before the generators were aware of the problem. Is it clear that VAR-002-3 Requirement R4 is only violated after the generator is made aware of the change?

Compliance Response to Question 6

It is clear that VAR-002-3, Requirement R4 will only be a violation if the change is not reported after 30 minutes of becoming aware of the reactive capability change. An auditor will ask an entity for evidence to demonstrate when it became aware of the change in reactive capability. This will not be purely subjective; there are technical instances where it will be clear that an entity would have been made aware of the change in reactive capability. For example, one instance is where a unit is ramping to an expected VAR output, and it cannot reach it; a reactive capability change has occurred.

Conclusion

Following final approval of the Reliability Standard, Compliance will develop the final Reliability Standards Auditor Worksheet (RSAW) and associated training.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

VAR Mapping Document

Transition of VAR-001-3 and VAR-002-2b

Standard: VAR-001-4 – Voltage and Reactive Control		
Requirement in Approved Standard	**Transitions to the below Requirement in New Standard or Other Action**	**Description and Change Justification**
VAR-001-3 R1	Requirement R1	This requirement is duplicated in other standards, and the new requirement has been simplified to require the specification of the voltage and Reactive Power schedules and associated tolerance bands. A new part 1.1 has been added to allow for voltage coordination with adjacent TOPs and applicable RCs.
VAR-001-3 R2	Requirement R2	The new requirement has been updated to scheduling of resources. It eliminates the need for the existing R7, R8, and R9. It also maintains a list of sufficient reactive resources.
VAR-001-3 R3	Requirement R4	The new requirement has been simplified by removing the need to maintain an exemption list. Instead, the standard focuses on whether the exemption criteria are known and whether a granted exemption was communicated to the applicable Generator.

Standard: VAR-001-4 – Voltage and Reactive Control		
Requirement in Approved Standard	**Transitions to the below Requirement in New Standard or Other Action**	**Description and Change Justification**
VAR-001-3 R4	Requirement R5	The new requirements have been updated to allow the TOP to provide the voltage or Reactive Power schedule at either the high side or the low side of the GSU. Also as tolerance band is now required under the new requirement. New parts have also been added to direct a GOP to operate in AVR, to require the TOP to provide notification requirements, and to provide the criteria for developing schedules and tolerance bands upon request.
VAR-001-3 R5	Deleted	Pending a final rulemaking on P81, this requirement has been deleted.
VAR-001-3 R6	Deleted	This requirement is deleted because the TOP standards require knowing the status of Reactive Power resources. Although power system stabilizers are not specifically named in the TOP standards, the areas that rely on PSS equipment will require monitoring the status under the data specifications of the TOP standards.
VAR-001-3 R7	Deleted	This has moved into the new R3.
VAR-001-3 R8	Deleted	This has moved into the new R3.
VAR-001-3 R9	Deleted	See comments for new R2.
VAR-001-3 R10	Deleted	This is duplicative of TOP-001-2 and the Tv definition.
VAR-001-3 R11	Requirement R6	The requirement has been updated to allow for scheduling consultation.
VAR-001-3 R12	Deleted	This requirement was deleted because the EOP standards address taking any corrective action including load-shedding. Also the new TOP-002-3 R2 and TOP-001-2 R11 address the TOP taking corrective actions.

Standard: VAR-002-3 – Capacity Benefit Margin		
Requirement in Approved Standard	**Transitions to the below Requirement in New Standard or Other Action**	**Description and Change Justification**
VAR-002-2b R1	Requirement R1	The requirement has been modified to allow for testing and exemptions for other AVR modes when necessary.
VAR-002-2b R2	Requirement R2	The new requirement has been updated to allow for TOP-defined notification requirements. The requirement also adds parts to allow for the conversion of a high side schedule to a low side number for monitoring purposes.
VAR-002-2b R3	Requirement R3 and R4.	The old requirement has been broken into two requirements: 1) one for AVR/PSS status, and 2) one for reactive capability. Both allow 15 minutes to correct an issue before having to notify the TOP.
VAR-002-2b R3	Requirement R4	The requirement has not been modified.
VAR-002-2b R4	Requirement R5	The requirement has not been modified.

VAR Mapping Document

[1] NERC developed this Reliability Standard Audit Worksheet (RSAW) language in order to facilitate NERC's and the Regional Entities' assessment of a registered entity's compliance with this Reliability Standard. The NERC RSAW language is written to specific versions of each NERC Reliability Standard. Entities using this RSAW should choose the version of the RSAW applicable to the Reliability Standard being assessed. While the information included in this RSAW provides some of the methodology that NERC has elected to use to assess compliance with the requirements of the Reliability Standard, this document should not be treated as a substitute for the Reliability Standard or viewed as additional Reliability Standard requirements. In all cases, the Regional Entity should rely on the language contained in the Reliability Standard itself, and not on the language contained in this RSAW, to determine compliance with the Reliability Standard. NERC's Reliability Standards can be found on NERC's website. Additionally, NERC Reliability Standards are updated frequently, and this RSAW may not necessarily be updated with the same frequency. Therefore, it is imperative that entities treat this RSAW as a reference document only, and not as a substitute or replacement for the Reliability Standard. It is the responsibility of the registered entity to verify its compliance with the latest approved version of the Reliability Standards, by the applicable governmental authority, relevant to its registration status.

The NERC RSAW language contained within this document provides a non-exclusive list, for informational purposes only, of examples of the types of evidence a registered entity may produce or may be asked to produce to demonstrate compliance with the Reliability Standard. A registered entity's adherence to the examples contained within this RSAW does not necessarily constitute compliance with the applicable Reliability Standard, and NERC and the Regional Entity using this RSAW reserves the right to request additional evidence from the registered entity that is not included in this RSAW. Additionally, this RSAW includes excerpts from FERC Orders and other regulatory references. The FERC Order cites are provided for ease of reference only, and this document does not necessarily include all applicable Order provisions. In the event of a discrepancy between FERC Orders, and the language included in this document, FERC Orders shall prevail.

[2] Compliance Assessment Date(s): The date(s) the actual compliance assessment (on-site audit, off-site spot check, etc.) occurs.

DRAFT

R1 Supporting Evidence and Documentation

R1. Each Transmission Operator shall specify a system voltage schedule (which is either a range or a target value with an associated tolerance band) as part of its plan to operate within System Operating Limits and Interconnection Reliability Operating Limits.

1.1. Each Transmission Operator shall provide a copy of the voltage schedules and associated tolerance bands to its Reliability Coordinator and adjacent Transmission Operators within 30 calendar days of a request.

M1. The Transmission Operator shall have evidence that it specified system voltage schedules using either a range or a target value with an associated tolerance band.

For part 1.1, the Transmission Operator shall have evidence that the voltage schedules were provided to its Reliability Coordinator and adjacent Transmission Operators within 30 days of a request. Evidence may include, but is not limited to, emails, website postings, and meeting minutes.

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[3]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.
See M1.
Documentation of request made per Part 1.1 from Reliability Coordinator and/or adjacent Transmission Operators, if applicable and requested by auditor.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

[3] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to VAR-001-4, R1
This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	(R1) Review evidence provided and ensure it meets the requirements outlined in Requirement R1.
	(Part 1.1) Examine evidence to verify that voltage schedules were provided within 30 days of request per Part 1.1.

Note to Auditor: Auditors, at their discretion and based on the risk of the entity's compliance with this requirement to the BES, may communicate with Balancing Authorities and other Transmission Operators to determine if data requests were made of the entity. Auditors may also accept entity assertions regarding whether data requests made.

Entity assertions that no data requests were made do not have to be in writing.

Auditor Notes:

R2 Supporting Evidence and Documentation

R2. Each Transmission Operator shall schedule sufficient reactive resources to regulate voltage levels under normal and Contingency conditions. Transmission Operators can provide sufficient reactive resources through various means including, but not limited to, reactive generation scheduling, transmission line and reactive resource switching, and using controllable load.

M2. Each Transmission Operator shall have evidence of scheduling sufficient reactive resources based on their assessments of the system. For the operational planning time horizon, Transmission Operators shall provide copies of assessments used as the basis for how resources were scheduled.

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[4]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.
See M2.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to VAR-001-4, R2
This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	Review the studies/assessments that entity used to schedule resources to determine that the studies show whether new resources should be brought online, or if the resources online are sufficient to regulate voltage levels. Auditors should verify that actual scheduling reflected the results of the studies/assessments.

[4] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

Note to Auditor: Based on the risk of the entity's compliance with this requirement on the Bulk Electric System (BES) and the auditor's assessment of the entity's management practices (or internal controls) over compliance with this Requirement, auditors will determine the extent of the above audit procedures to apply. In cases where risk to the BES is low and the entity's management practices, gleaned by the auditor through walkthroughs or documentation review, are sound, only limited audit testing is necessary. In cases where risk is higher and controls are less effective, an auditor should sample enough instances, per above, to gain reasonable assurance that entity is complying with Requirement R2.

Auditor Notes:

R3 Supporting Evidence and Documentation

R3. Each Transmission Operator shall operate or direct the Real-time operation of devices to regulate transmission voltage and reactive flow as necessary.

M3. Each Transmission Operator shall have evidence that actions were taken to operate capacitive and inductive resources as needed in Real-time. This may include directions to Generator Operators to: 1) provide additional voltage support; 2) bring resources on-line; or 3) make manual adjustments.

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[5]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.
Any written policies, procedures or protocols describing how the entity operates or directs devices to regulate transmission voltage and reactive flow as necessary, if the entity has such documents.
Evidence as outlined in M3 as requested by auditor.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location

[5] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to VAR-001-4, R3
This section to be completed by the Compliance Enforcement Authority

	Review evidence to understand how entity operates or directs devices to regulate transmission voltage and reactive flow as necessary. Auditors may sample system events or other instances of voltage irregularities to verify that operations or directions occurred as required per Requirement R2.

Note to Auditor: Based on the risk of the entity's compliance with this requirement on the Bulk Electric System (BES) and the auditor's assessment of the entity's management practices (or internal controls) over compliance with this Requirement, auditors will determine the extent of the above audit procedures to apply. In cases where risk to the BES is low and the entity's management practices, gleaned by the auditor through walkthroughs or documentation review, are sound, only limited audit testing is necessary. In cases where risk is higher and controls are less effective, an auditor should sample enough events or other instances of voltage irregularities, per above, to gain reasonable assurance that entity is complying with Requirement R2.

Auditor Notes:

R4 Supporting Evidence and Documentation

R4. The Transmission Operator shall specify the criteria that will exempt generators from compliance with the requirements defined in Requirement R5, part 5.1, and any associated notification requirements.

4.1 If a Transmission Operator determines that a generator has satisfied the exemption criteria, it shall notify the associated Generator Operator.

M4. Each Transmission Operator shall have evidence of the documented criteria for generator exemptions.

For part 4.1, the Transmission Operator shall also have evidence to show that, for each generating unit in its area that is exempt from: 1) following a voltage or Reactive Power schedule, 2) from having its automatic voltage regulator (AVR) in service or from being in voltage control mode, or 3) from having to make any notifications, the associated Generator Operator was notified of this exemption.

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[6]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.
See M4.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to VAR-001-4, R4
This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	(R4) Review evidence and note existence of exemption criteria per Requirement R4. For a sample of exempted generators, verify that exemption was granted in accordance with criteria.

[6] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

	(Part 1.1) For a sample of exempted generators, ensure exempted generator was notified.

Note to Auditor: Based on the risk of the entity's compliance with this requirement on the Bulk Electric System (BES) and the auditor's assessment of the entity's management practices (or internal controls) over compliance with this Requirement, auditors will determine the extent of the above audit procedures to apply. In cases where risk to the BES is low and the entity's management practices, gleaned by the auditor through walkthroughs or documentation review, are sound, only limited audit testing is necessary. In cases where risk is higher and controls are less effective, an auditor should sample enough generators, per above, to gain reasonable assurance that entity is complying with Requirement R4.

Requirement R4 allows for any combination of exemptions for generator operators from 1) voltage schedules, 2) being in automatic voltage control mode, or 3) any notification requirements, as long as the exemption meets the criteria specified by the entity. An auditor will not look for any pre-authorization from the entity; rather an auditor will verify that the generator operator has met the criteria set forth by the entity.

Auditor Notes:

R5 Supporting Evidence and Documentation

R5. Each Transmission Operator shall specify a voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) at either the high voltage side or low voltage side of the Generator Step-Up transformer at the Transmission Operator's discretion.

5.1. The Transmission Operator shall provide the voltage or Reactive Power schedule to the associated Generator Operator and direct the Generator Operator to comply with the schedule in automatic voltage control mode (the AVR is in service and controlling voltage).

5.2. The Transmission Operator shall provide the Generator Operator with the notification requirements for deviations from the voltage or Reactive Power schedule.

5.3. The Transmission Operator shall provide the criteria used to develop voltage schedules and associated tolerance bands to the Generator Operator within 30 days of receiving a request.

M5. The Transmission Operator shall have evidence of a documented voltage or Reactive Power Schedule and tolerance band.

For part 5.1, the Transmission Operator shall have evidence it provided a voltage or Reactive Power schedule and tolerance band to the applicable Generator Operators, and that the Generator Operator was directed to comply with the schedule in automatic voltage control mode, unless exempted. The evidence shall include written records, email, or voice recordings.

For part 5.2, the Transmission Operator shall have evidence it provided notification requirements for deviations from the voltage or Reactive Power schedule and associated tolerance band. The evidence shall include written records, email, or voice recordings.

For part 5.3, the Transmission Operator shall have evidence it provided the criteria used to develop voltage schedules and associated tolerance bands within 30 days of receiving a request by a Generator Operator.

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[7]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.
See M5.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to VAR-001-4, R5
This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	(R5) Verify existence of voltage or Reactive Power schedule and that it meets the requirements of Requirement R5.
	(Part 5.1) For a sample of Generator Operators, verify voltage or Reactive Power schedule was provided

[7] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

	per Part 5.1.
	(Part 5.2) For a sample of Generator Operators, verify the notification requirements for deviations from the voltage or Reactive Power schedule was provided per Part 5.2.
	(Part 5.3) For a sample of Generator Operators, verify criteria was provided as requested per Part 5.3.

Note to Auditor: Based on the risk of the entity's compliance with this requirement on the Bulk Electric System (BES) and the auditor's assessment of the entity's management practices (or internal controls) over compliance with this Requirement, auditors will determine the extent of the above audit procedures to apply. In cases where risk to the BES is low and the entity's management practices, gleaned by the auditor through walkthroughs or documentation review, are sound, only limited audit testing is necessary. In cases where risk is higher and controls are less effective, an auditor should sample enough notifications, per above, to gain reasonable assurance that entity is complying with Requirement R5.

It is clear based on VAR-001-4 Requirement R5 that a voltage or Reactive power schedule can be either: 1) a target number with a tolerance band, Or 2) a voltage or Reactive Power range to operate within. An auditor would not expect to see a tolerance band provided with an operating range for voltage or Reactive Power.

Auditor Notes:

R6 Supporting Evidence and Documentation

R6. After consultation with the Generator Owner regarding necessary step-up transformer tap changes and the implementation schedule, the Transmission Operator shall provide documentation to the Generator Owner specifying the required tap changes, a timeframe for making the changes, and technical justification for these changes.

M6. The Transmission Operator shall have evidence that it provided documentation to the Generator Owner when a change was needed to a generating unit's step-up transformer tap in accordance with the requirement and that it consulted with the Generator Owner.

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[8]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.

[8] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

See M6.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to VAR-001-4, R6
This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	Understand entity's procedures concerning coordinating tap settings with Generator Owners per Requirement R6.
	For a sample of Generator Owners, verify tap setting changes were executed per Requirement R6.
Note to Auditor: Based on the risk of the entity's compliance with this requirement on the Bulk Electric System (BES) and the auditor's assessment of the entity's management practices (or internal controls) over compliance with this Requirement, auditors will determine the extent of the above audit procedures to apply. In cases where risk to the BES is low and the entity's management practices, gleaned by the auditor through walkthroughs or documentation review, are sound, only limited audit testing is necessary. In cases where risk is higher and controls are less effective, an auditor should sample enough tap setting communications, per above, to gain reasonable assurance that entity is complying with Requirement R6.

[1] NERC developed this Reliability Standard Audit Worksheet (RSAW) language in order to facilitate NERC's and the Regional Entities' assessment of a registered entity's compliance with this Reliability Standard. The NERC RSAW language is written to specific versions of each NERC Reliability Standard. Entities using this RSAW should choose the version of the RSAW applicable to the Reliability Standard being assessed. While the information included in this RSAW provides some of the methodology that NERC has elected to use to assess compliance with the requirements of the Reliability Standard, this document should not be treated as a substitute for the Reliability Standard or viewed as additional Reliability Standard requirements. In all cases, the Regional Entity should rely on the language contained in the Reliability Standard itself, and not on the language contained in this RSAW, to determine compliance with the Reliability Standard. NERC's Reliability Standards can be found on NERC's website. Additionally, NERC Reliability Standards are updated frequently, and this RSAW may not necessarily be updated with the same frequency. Therefore, it is imperative that entities treat this RSAW as a reference document only, and not as a substitute or replacement for the Reliability Standard. It is the responsibility of the registered entity to verify its compliance with the latest approved version of the Reliability Standards, by the applicable governmental authority, relevant to its registration status.

The NERC RSAW language contained within this document provides a non-exclusive list, for informational purposes only, of examples of the types of evidence a registered entity may produce or may be asked to produce to demonstrate compliance with the Reliability Standard. A registered entity's adherence to the examples contained within this RSAW does not necessarily constitute compliance with the applicable Reliability Standard, and NERC and the Regional Entity using this RSAW reserves the right to request additional evidence from the registered entity that is not included in this RSAW. Additionally, this RSAW includes excerpts from FERC Orders and other regulatory references. The FERC Order cites are provided for ease of reference only, and this document does not necessarily include all applicable Order provisions. In the event of a discrepancy between FERC Orders, and the language included in this document, FERC Orders shall prevail.

[2] Compliance Assessment Date(s): The date(s) the actual compliance assessment (on-site audit, off-site spot check, etc.) occurs.

DRAFT

R1 Supporting Evidence and Documentation

R1. The Generator Operator shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) in service and controlling voltage) unless the Generator Operator 1) is exempted by the Transmission Operator, or 2) has notified the Transmission Operator of one of the following:

- That the generator is being operated in start-up,[3] shutdown,[4] or testing mode pursuant to a Real-time communication or a procedure that was previously provided to the Transmission Operator; or
- That the generator is not being operated in the automatic voltage control mode for a reason other than start-up, shutdown, or testing.

M1. The Generator Operator shall have evidence to show that it notified its associated Transmission Operator any time it failed to operate a generator in the automatic voltage control mode as specified in Requirement R1. If a generator is being started up or shut down with the automatic voltage control off, or is being tested, and no notification of the AVR status is made to the Transmission Operator, the Generator Operator will have evidence that it notified the Transmission Operator of its procedure for placing the unit into automatic voltage control mode. Such evidence must include, but is not limited to, dated evidence of transmittal of the procedure such as an electronic message or a transmittal letter with the procedure included or attached. If exempted, the Generator Operator shall also have evidence that it is exempted from being in automatic voltage control mode (with its AVR in service and controlling voltage).

Registered Entity Response to Question (Required):

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[5]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.

[3] Start-up is deemed to have ended when the generator is ramped up to its minimum continuously sustainable load and the generator is prepared for continuous operation.
[4] Shutdown is deemed to begin when the generator is ramped down to its minimum continuously sustainable load and the generator is prepared to go offline.
[5] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

See M1.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to VAR-002-3, R1
This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	For instances where entity did not operate a generator in automatic voltage control mode, ensure notification was given to the Transmission Operator in accordance with Requirement R1.

Note to Auditor: Auditors can identify instances where entities operated generators outside of automatic voltage control mode through their general knowledge of the interconnected transmission system in the entity's area. Auditor knowledge is obtained through activities such as conversations with the entity under audit or the Transmission Operator, and an awareness of events occurring on the interconnected transmission system. In situations where the entity's compliance with this requirement poses little risk to the BES, conversations with other entities, such as Transmission Operators, is most likely not necessary.

Auditor Notes:

R2 Supporting Evidence and Documentation

R2. Unless exempted by the Transmission Operator, each Generator Operator shall maintain the generator voltage or Reactive Power schedule[6] (within each generating Facility's capabilities[7]) provided by the Transmission Operator, or otherwise shall meet the conditions of notification for deviations from the voltage schedule provided by the Transmission Operator.

2.1. When a generator's AVR is out of service or the generator does not have an AVR, the Generator Operator shall use an alternative method to control the generator reactive output to meet the voltage or Reactive Power schedule directed by the Transmission Operator.

2.2. When directed to modify voltage, the Generator Operator shall comply or provide an explanation of why the schedule cannot be met.

2.3. Generator Operators that do not monitor the voltage at the location specified in their voltage schedule shall have a methodology for converting the scheduled voltage specified by the Transmission Operator to the voltage point being monitored by the Generator Operator.

M2. In order to identify when a unit is deviating from its schedule, the Generator Operator will monitor voltage based on existing equipment at its Facility. The Generator Operator shall have evidence to show that the generator maintained the voltage or Reactive Power schedule provided by the Transmission Operator, or shall have evidence of meeting the conditions of notification for deviations from the voltage schedule provided by the Transmission Operator. Evidence may include, but is not limited to, operator logs, SCADA data, phone logs, and any other notifications that would alert the Transmission Operator or otherwise demonstrate that the Generator Operator complied with the Transmission Operator's instructions for addressing deviations from the voltage schedule.

For part 2.1, when a generator's AVR is out of service or the generator does not have an AVR, a Generator Operator shall have evidence to show an alternative method was used to control the generator reactive output to meet the voltage or Reactive Power schedule directed by the Transmission Operator.

For part 2.2, the Generator Operator shall have evidence that it complied with the Transmission Operator's directions to modify its voltage or provided an explanation to the Transmission Operator of why the Generator Operator was unable to comply with the direction. Evidence may include, but is not limited to, operator logs, SCADA data, and phone logs.

For part 2.3, for units that do not monitor the voltage at the location specified on the voltage schedule, the Generator Operator shall document or be able to demonstrate the method of conversion from the voltage level monitored to the voltage level specified on the voltage schedule.

Question: As a Generation Operator, have you operated the generator with the AVR out of service?

[6] The voltage or Reactive Power schedule is a target value with a tolerance band or a voltage or Reactive Power range communicated by the Transmission Operator to the Generator Operator.

[7] Generating Facility capability may be established by test or other means, and may not be sufficient at times to pull the system voltage within the schedule tolerance band. Also, when a Generator is operating in manual control, reactive power capability may change based on stability considerations.

Registered Entity Response to Question (Required):

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[8]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.
See M2.
Any written policies, procedures or protocols describing how the entity maintains the generator voltage or Reactive Power schedule provided by Transmission Operator, if the entity has such documents.
Generator voltage or Reactive Power schedule provided to entity by Transmission Operator, or entity's record thereof, for timeframes selected by the auditor.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to VAR-002-3, R2
This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.

[8] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

	Interview entity staff and/or review documentation provided by the entity to understand how they maintain the generator voltage or Reactive Power schedule or authorized exemption per Requirement R2.
	Read entity's response to compliance Question above and understand how entity complies with Requirement R2, when they operate a generator with AVR in not in service.
	Select a sample of timeframes during the audit period and have entity walkthrough how they complied with Requirement R2 for those timeframes.

Note to Auditor: Based on the risk of the entity's compliance with this requirement on the Bulk Electric System (BES) and the auditor's assessment of the entity's management practices (or internal controls) over compliance with this Requirement, auditors will determine the extent of the above audit procedures to apply. In cases where risk to the BES is low and the entity's management practices, gleaned by the auditor through walkthroughs or documentation review, are sound only limited audit testing is necessary. In cases where risk is higher and controls are less effective, an auditor should sample enough timeframes, per above, to gain reasonable assurance that entity is complying with Requirement R2.

For part 2.3, the entity should be able to provide documentation that identifies the voltage number being monitored and the calculation demonstrating how it equates to the schedule provided by the Transmission Operator. The measure for VAR-002-3 Requirement R2, part 2.3 is clear on what evidence should be able to demonstrate this during an audit. The entity can only be responsible for maintaining the schedule provided by the Transmission Operator based on existing facility equipment. In the event that an entity does not have the equipment to have visibility of high-side system voltage, the entity will not have the ability to adjust VARs to maintain system voltage. An auditor is not to determine that, where the entity does not have the high side monitoring equipment and where the AVR is set appropriately based on existing facility equipment, the entity is non-compliant. However, if the Transmission Operator provides a new directive or schedule, the entity is required to follow the new directive. This directive can include modifying an AVR setting or providing more voltage support, and the entity is expected to comply pursuant to VAR-002-3.

Auditor Notes:

R3 Supporting Evidence and Documentation

R3. Each Generator Operator shall notify its associated Transmission Operator of a status change on the AVR, power system stabilizer, or alternative voltage controlling device within 30 minutes of the change. If the status has been restored within the first 15 minutes of such change, then there is no need to notify the Transmission Operator.

M3. The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of the change identified in Requirement R3. If the status has been restored within the first 15 minutes, no notification is necessary; therefore, if a status change lasts more than 15

minutes, the GOP must notify its associated Transmission Operator within 30 minutes of when the change first occurred.

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[9]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.
Any written policies, procedures or protocols describing how the entity responds to a status change on AVR, if the entity has such documents. An example of entity's response to a status change on AVR provided by entity, if applicable.
Auditor may select certain instances where entity had a status change on AVR. In such instances, provide associated evidence of awareness and resolution/notification.
Evidence as outlined in M3.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to VAR-002-3, R3
This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	Interview entity staff and/or review documentation provided by the entity to understand how they

[9] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

	respond to status changes on AVR.
	Review evidence provided to determine if entity responded to status change on AVR in accordance with Requirement R3.

Note to Auditor: Based on the risk of the entity's compliance with this requirement on the Bulk Electric System (BES) and the auditor's assessment of the entity's management practices (or internal controls) over compliance with this Requirement, auditors will determine the extent of the above audit procedures to apply. In cases where risk to the BES is low and the entity's management practices, gleaned by the auditor through walkthroughs or documentation review, are sound only limited audit testing is necessary. In cases where risk is higher and controls are less effective, an auditor should sample enough timeframes, per above, to gain reasonable assurance that entity is complying with Requirement R3.

Auditor Notes:

R4 Supporting Evidence and Documentation

R4. Each Generator Operator shall notify its associated Transmission Operator within 30 minutes after becoming aware of a change in reactive capability due to factors other than a status change described in Requirement R3. If the capability has been restored within the first 15 minutes of such change, then there is no need to notify the Transmission Operator.

M4. The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of the recognition of a reactive capability change identified in Requirement R4. If the capability has been restored within the first 15 minutes, no notification is necessary; therefore, if a capability change lasts more than 15 minutes, the Generator Operator must notify its associated Transmission Operator within 30 minutes of when the change first occurred.

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[10]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means

[10] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

of reduction of the quantity of evidence submitted.
Any written policies, procedures or protocols describing how the entity responds to a change in reactive capability, if the entity has such documents. An example of entity's response to a change in reactive capability provided by entity, if applicable.
Auditor may select certain instances where entity should have been aware of a status change in reactive capability. In such instances, provide associated evidence of awareness and resolution/notification. See Note to Auditor for additional details.
Evidence as outlined in M4.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to VAR-002-3, R4
This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	Interview entity staff and/or review documentation provided by the entity to understand how they respond to change in reactive capability.
	Review evidence provided to determine if entity responded to change in reactive capability in accordance with Requirement R4.
Note to Auditor: It is clear that VAR-002-3, Requirement R4 will only be a violation if the change is not reported after 30 minutes of becoming aware of the status change in reactive capability. An auditor will ask an entity for evidence to demonstrate when it became aware of the change. This will not be purely subjective; there are technical instances (e.g. unit trips, ramping, equipment/AVR failures) where it will be clear that an entity would have been made aware of the change in reactive capability. For example, one instance is where a unit is ramping to an expected VAR output, and it cannot reach it; a reactive capability change has occurred.	

Auditor Notes:

R5 Supporting Evidence and Documentation

R5. The Generator Owner shall provide the following to its associated Transmission Operator and Transmission Planner within 30 calendar days of a request.

5.1. For generator step-up transformers and auxiliary transformers with primary voltages equal to or greater than the generator terminal voltage:

5.1.1. Tap settings.

5.1.2. Available fixed tap ranges.

5.1.3. Impedance data.

M5. The Generator Owner shall have evidence it provided its associated Transmission Operator and Transmission Planner with information on its step-up transformers and auxiliary transformers as required in Requirements R5 part 5.1.1 through part 5.1.3.

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[11]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.
Evidence as outlined in M4. Evidence of transmittal of the data could include, but is not limited to, items such as an electronic message or a transmittal letter with the information included or attached.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

[11] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

Compliance Assessment Approach Specific to VAR-002-3, R5
This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	Review evidence (documented date of request and reply) to determine if entity responded to information request(s) as required in Requirement R5 within 30 days of receiving a request from associated Transmission Operator.

Note to Auditor: Based on the auditors professional judgment, he or she may confirm with Transmission Operators to determine if requests for data were made or simply confirm the existence of such requests with the entity under audit.

Auditor Notes:

R6 Supporting Evidence and Documentation

R6. After consultation with the Transmission Operator regarding necessary step-up transformer tap changes, the Generator Owner shall ensure that transformer tap positions are changed according to the specifications provided by the Transmission Operator, unless such action would violate safety, an equipment rating, a regulatory requirement, or a statutory requirement.

6.1. If the Generator Operator cannot comply with the Transmission Operator's specifications, the Generator Operator shall notify the Transmission Operator and shall provide the technical justification.

M6. The Generator Owner shall have evidence that its step-up transformer taps were modified per the Transmission Operator's documentation as identified in Requirement R6. The Generator Operator shall have evidence that it notified its associated Transmission Operator when it could not comply with the Transmission Operator's step-up transformer tap specifications as identified in Requirement R6 part 6.1.

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[12]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.
See M6.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to VAR-002-3, R6
This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	Review evidence (documented date of request and response) to determine if entity responded to change(s) as required in Requirement R6.
Note to Auditor: Based on the auditors professional judgment, he or she may confirm with Transmission Operators to determine if requests for changes to transformer tap positions were made or simply confirm the existence of such requests with the entity under audit.	

Auditor Notes:

Revision History

Version	Date	Reviewers	Revision Description
1	11/XX/2013	NERC compliance,	New Document

[12] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

DRAFT

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

Project 2013-04 Voltage and Reactive Control
VAR-001-4 & VAR-002-3

Comment Period: October 11, 2013 – November 25, 2013

Upcoming:
Additional Ballot and Non-Binding Poll: November 15, 2013 – November 25, 2013

Now Available

A 45-day formal comment period for **VAR-001-4 and VAR-002-3** is open through **8 p.m. Eastern on Monday, November 25, 2013.**

Background information for this project can be found on the project page.

Instructions for Commenting

A formal comment period is open through **8 p.m. Eastern on Monday, November 25, 2013.** Please use the electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Arielle Cunningham. An off-line, unofficial copy of the comment form is posted on the project page.

Next Steps

Additional ballots for the standards and non-binding polls of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) will be conducted as previously outlined. During the initial comment period, two ballot pools were formed (one to ballot the standards and one for the non-binding polls). For this ballot and non-binding poll, each standard and its associated non-binding poll will be balloted separately (for a total of two standard ballots and two non-binding polls). The original ballot pools will be used for the individual standard ballots and non-binding polls.

Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Arielle Cunningham, Standards Development Administrator, at Arielle.Cunningham@nerc.net or at 404-446-2560.

Standards Announcement Reminder

Project 2013-04 Voltage and Reactive Control
VAR-001-4 and VAR-002-3

Additional Ballots and Non-Binding Polls now open through November 25, 2013

Now Available

Additional ballots for **VAR-001-4 and VAR-002-3** and non-binding polls of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) are open through **8 p.m. Eastern on Monday, November 25, 2013.**

Background information for this project can be found on the project page.

Instructions for Commenting
Members of the ballot pools associated with this project may log in and submit their vote for the standards and non-binding polls of the associated VRFs and VSLs by clicking here.

Next Steps
The ballot results for **VAR-001-4 and VAR-002-3** will be announced and posted on the project page. The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standards. If the comments do not show the need for significant revisions, the standards will proceed to final ballots.

Standards Development Process
The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Additional Ballot and Non-Binding Poll Results

Now Available

Additional ballots for **VAR-001-4 and VAR-002-3** and non-binding polls of the associated Violation Risk Factors and Violation Severity Levels concluded at **8 p.m. Eastern on Tuesday, November 26, 2013.**

VAR-001-4 received sufficient affirmative votes for approval. Voting statistics are listed below, and the Ballot Results page provides a link to the detailed results for the ballots.

	Ballot	Non-Binding Poll
	Quorum /Approval	Quorum/Supportive Opinions
VAR-001-4	80.81% / 69.43%	78.73% / 57.75%
VAR-002-3	81.06% / 66.09%	79.01% / 57.87%

Background information for this project can be found on the project page.

Next Steps

The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standards. If the comments show the need for significant revisions, the standards will proceed to an additional comment and ballot period. If the comments do not show the need for significant revisions, the standards will proceed to a final ballot.

Yes
In requirement 5.1 a Transmission Operator is required direct a Generator Operator to "comply with the schedule" provided by the Transmission Operator. In 5.2, however, the potential for deviations from the schedule is implied. To avoid conflict between these two, the following change to 5.1 is recommended: "The Transmission Operator shall provide the voltage or Reactive Power schedule to the associated Generator Operator and direct the Generator Operator to comply with the schedule in automatic voltage control mode unless notification of deviation is provided in accordance with 5.2." For consistency M2 should be reworded as follows: "For the operational planning time horizon, Transmission Operators shall have evidence of assessments used as the basis for how resources were scheduled" The current wording of "shall provide copies" imposes an action that is not included in the associated requirement. In previous comments regarding voltage schedules issued by a Transmission Operator a mechanism for a Generator Operator to provide explanations if a proposed schedule could not reasonably be met based on specific equipment limitations and to get a revised schedule or exemption was suggested. In this version the Transmission Operator is obligated to provide additional information about the schedule, but is not obligated to respond to Generator Operator concerns regarding the schedule. Under VAR-002 a Generator Operator is required to comply with the schedule provide by the Transmission Operator unless notification is provided. There then is the potential situation where a schedule issued by a Transmission Operator cannot be met due to equipment or system conditions and the only action available is for a Generator Operator to provide multiple notifications. A better solution it seems would be to include some sort of feedback process

between Generator Operators and Transmission Operations in the VAR-001 standard that would result in an agreed-upon schedule that could reasonably be met without burdensome periodic notifications. As recommended in previous comments a process of reaching “mutual agreement” on the schedule for making transformer tap changes is suggested . The SDT responded in the consideration of comments that they did not chose to include the suggested agreement language but did add a requirement for the transmission operator to provide an “implementation schedule”. While this change is an improvement it does not completely solve the concern presented. The objective should be that a tap change schedule is agreed upon that would meet the reasonable needs of both the Transmission Operator and Generator Operator. The following from requirement R2: “Transmission Operators can provide sufficient reactive resources through various means including, but not limited to, reactive generation scheduling, transmission line and reactive resource switching, and using controllable load” implies that all of the items listed need to be considered. If the intent is that the items are intended to be examples it is suggested that the words “including , but not limited to” be replaced by “such as”. It is recommended that R5.1 be modified as recommended by the NERC IGVT report of September 2012: 5.1. The Transmission Operator shall provide the voltage or Reactive Power schedule to the associated Generator Operator and direct the Generator Operator to comply with the schedule in automatic voltage control mode (the AVR or plant-level volt/var regulator is in service and controlling voltage). The standard should be reviewed and where AVR is referred to, the plant-level volt/var regulator should be added in a similar way to this recommended change to R5.1. The referenced NERC report provides the technical basis for this recommendation.

The revised VAR-002 R2.1 removes the 15 minute deviation criteria for notification by Generator Operators to Transmission Operators. The revised VAR-001-4 requires Transmission Operators to provide notification requirements. The drafting team in the consideration of comments explained “In an effort to remove prescriptive notification requirements for the entire continent” the change was made. This leaves the Generator Operators at the mercy of Transmission Operators who could potentially set a no deviation criteria. It is recommended that a compromise be struck by specifying a limit on the criteria such as “no less than 15 minutes”. For clarification it is recommended that the word “generator” be added before the word “stability” in the last sentence of footnote 6. [Note to NSRF: a comment on this was submitted previously but it did not have a recommended language change] In M2 it is recommended that “alarm logs” be added to the list of evidence. We support the deletion of the language regarding notification of the expected duration of a change in status. At the time a status change occurs it is often difficult to provide a meaningful estimate of the duration of the change. Requirement 3 should be revised to state – Notification must be made within 30 minutes of becoming aware of the change from automatic controlling voltage for the AVR, and from in-service of the PSS. Measure 3 should be revised to reflect this as well. The following change to requirement R4 is recommended: “Reactive capability changes due to factors such as a change in the wind speed for wind generators or a change in the solar resource for solar facilities do not require Transmission Operator notification” Measure 4 should be revised to reflect the wording in Requirement 4 – Notification must be made within 30 minutes of becoming aware of the change of state of the AVR. For the same reason

described above for VAR-001 (NERC IGVT Report), R1 should be modified as follows: “R1. The Generator Operator shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) or plant-level volt/var regulator in service and controlling voltage) unless the Generator Operator 1) is exempted by the Transmission Operator, or 2) has notified the Transmission Operator of one of the following:” A similar addition should be made where the AVR is referred to in the other requirements of VAR-002.

Yes
We support the direction being taken and the SDT’s decision to not reiterate or duplicate the voltage assessment requirements already addressed by the FAC and TOP standards.
Yes
We support the SDT’s proposal to remove the requirements that may be redundant with other standards. However, regarding VAR-001-4 Requirement R1 was revised to read: R1. Each Transmission Operator shall specify a system voltage schedule (which is either a range or a target value with an associated tolerance band) as part of its plan to operate within System Operating Limits and Interconnection Reliability Operating Limits 1.1 Each Transmission Operator shall provide a copy of the voltage schedules and asspociated tolerance bands to its Reliability Coordinator and adjacent Transmission Operators within 30 calendar days of a request. What is meant by “system voltage schedule.” Is it a high-level, overall voltage schedule by voltage class, or a voltage schedule by station (even if there is no direct means of controlling voltage at that station)? Requirement R5 already addresses specification of generator voltage schedules, so if that is what is intended to be addressed under R1, why is R1 needed at all? Requirement R5 states: R5. Each Transmission Operator shall specify a voltage or Reactive Power schedule (which is either a range, or a target value with an associated tolerance band) at either the high voltage side or low voltage side of the Generator Step-Up transformer at the Transmission Operator’s discretion. There is inconsistency in the tense used in various VSLs. Some are in present tense while others are in the past tense. This should be reviewed and and revised as appropriate. “Schedule” is used in both VAR-001 Requirements R1 and R5. However, it is modified by different phrases in each, implying different types of “schedules.” These two different types of “schedules” have caused confusion, making the use and intended meaning less than perfectly clear. VAR-001 Requirement R1 - To improve clarity and consistency, suggest that the word “schedule” be deleted here and only be used when referring to GOP operation. Suggest revising Requirement R1 wording as follows: R1. Each Transmission Operator shall specify a system voltage range or a target value with an associated tolerance band as part of its plan to operate within System Operating Limits and Interconnection Reliability Operating Limits. Note that Requirement R1 only requires that the TOP establish the target system voltage level and tolerance band. There is no mention of GOP operation. Requirement R2 requires that the TOP schedule its arrangement of sufficient reactive resources, whether actually used (dispatched)

or not, a Planning function (see Measure M2). The Rationale box states: “to ensuring sufficient reactive resources are online or scheduled.” The use of the word “scheduled” here again has caused confusion. We suggest it be replaced to clarify the meaning, as follows: R2. Each Transmission Operator shall make arrangements for sufficient on-line, available reactive resources to regulate voltage levels under normal and Contingency conditions. Transmission Operators can provide sufficient reactive resources through various means including, but not limited to, making arrangements for reactive generation resources, transmission line and reactive resource switching, and using controllable load. Further recommend revising M2 to synchronize it with the revised Requirement R2 above, as follows: M2. Each Transmission Operator shall have evidence of sufficient reactive resources based on their assessments of the system. For the operational planning time horizon, Transmission Operators shall provide copies of assessments used as the basis for determining how resources were made available. Organizationally, R4 should be swapped with R5. A requirement dealing with exemptions should come after the “foundation” requirement. The Drafting Team must consider the following regarding Hydro-Quebec TransEnergie. "Schedule" in the standard is confusing and does not apply to Hydro-Québec TransÉnergie. Hydro-Quebec TransEnergie does not issue a schedule of voltage or reactive power. Hydro-Quebec TransEnergie sets voltage ranges to comply at all times for the different voltage levels. During light or peak load, these operating situations are governed with voltage setupoints for specific substations. The standard should therefore consider (in addition to the preceding comments) the terms used. For example, consider substituting the term " voltage or reactive power setpoint " for the word “schedule” which does not reflect our operating procedures. Regarding Requirement R5, NERC now requires a specified program voltage or reactive power be given to central planning and forecasting. This requirement is not applicable to Hydro-Québec TransÉnergie because there is no voltage or reactive power schedule, but rather the requirement that every generating facility of more than 10 MW have an automatic voltage regulation system. Hydro-Quebec TransEnergie also requires them to provide a specific power factor for each of those generating units.
Suggest the following changes to more effectively convey the intents of Measure M3 and Requirement R6. Suggest that Measure M3 be reworded to require demonstration of compliance rather than to require actions which should have been stipulated in the requirement. Specifically, we proposed the last part in Measure M3 be revised to: “…therefore, if a status change lasts more than 15 minutes, the GOP shall provide evidence such as system log, electronic message or a transmittal letter that it notified its associated Transmission Operator within 30 minutes of when the change first occurred.” Regarding R6, the wording “the Generator Owner shall ensure that transformer tap positions are changed according to the specifications provided by the Transmission Operator…” is not a direct action and may not be measurable. Suggest revising it to read: “the Generator Owner shall implement the transformer tap positions according to the specifications provided by the Transmission Operator….” We further propose that the SDT insert the evidence language into the first sentence of Measure M3 which asks for evidence that the Generator notified its associated Transmission Operator within 30 minutes of the change identified in Requirement R3. Generators may be asked by their TOP to operate in other modes. Reword Requirement

R1 as follows: R1. The Generator Operator shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) in service and controlling voltage) unless the Generator Operator 1) is exempted by the Transmission Operator, 2) is notified by the Transmission Operator to operate in a different viable operating mode (e.g., constant VAR output mode), or 3) has notified the Transmission Operator of one of the following:… The comments in Question 2 regarding Hydro-Quebec regarding the word "schedule" apply.
We support the proposed VRFs and VSLs.

Yes
Yes
The Bureau of Reclamation (Reclamation) notes that the WECC variance indicates that it is intended to replace requirements R3 and R4. However, R3 and R4 in VAR-001-4 are not the same as R3 and R4 in VAR-001-3. Reclamation suggests that the drafting team should examine the WECC variance to determine which requirements it will replace because it appears that the WECC variance should replace R4 and R5. In WECC, it would be difficult for Transmission Operators to comply with both R5 and E.A. 14 because they refer to different voltage schedule reference points. VAR-001-4 R3 specifies that Transmission Operators must operate or direct the Real-time operation of devices to regulate transmission voltage and reactive flow as necessary. Measure M3 specifies that “this may include directions to Generator Operators to: 1) provide additional voltage support; 2) bring resources on-line; or 3) make manual adjustments.” Reclamation suggests that this detail should be included in Requirement R3 rather than solely in the measure. VAR-001-4 R4 requires a Transmission Operator to notify a Generator Operator if the “Transmission Operator determines that a generator has satisfied exemption criteria” but does not specify a timeframe for this notification. Reclamation suggests that the drafting team update VAR-001-4 R4 to specify that the Transmission Operator must notify the Generator Operator within 30 days if the Transmission Operator determines that a generator has satisfied criteria for exemption from voltage or Reactive Power requirements and associated notification requirements. Reclamation also suggests that R4 on exemptions should follow R5 on voltage or Reactive Power scheduling and notification criteria. VAR-001 R5 allows the Transmission Operator to specify a voltage or Reactive Power schedule at either the high voltage side or low voltage side of the Generator Step Up transformer. Reclamation suggests that like in requirement E.A.14, Transmission Operators should be able to specify the voltage schedule at the generator terminals, high side of the generator step-up transformer, point of interconnection, or a location designated by mutual

agreement. VAR-001 R5.2 specifies that “The Transmission Operator shall provide the Generator Operator with the notification requirements for deviations from the voltage or Reactive Power schedule.” M5 regarding part 5.2 specifies that voice recordings may be used to establish compliance with this requirement. Reclamation suggests that voice recordings should be removed from the list in M5 for part 5.2 because notification requirements established in the planning horizon should be transmitted in writing. Reclamation notes that there is a potential inconsistency between the Transmission Operator notification requirements discussed in VAR-001 R5.2 and the Generator Operator notification requirements discussed VAR-002 R3 and R4. Reclamation recommends that VAR-001 R5.2 be modified to solely address planning horizon notifications. For consistency with the Generator Operator real-time notification requirements established in VAR-002 R3 and R4, Reclamation also recommends that VAR-001-4 R5 should include an additional subrequirement which specifies that the “TOP shall develop real-time notification requirements for the deviations from the voltage of Reactive Power schedule within 30 minutes of when a Generator Operator becomes aware of a change in reactive capability, AVR status, power system stabilizer status, or alternative voltage controlling device status, unless the status is restored within 15 minutes.” VAR-001-4 R5 requires the Transmission Operator to specify a voltage or Reactive Power schedule “at either the high voltage side or low voltage side of the Generator Step-Up transformer.” VAR-002-3 R2.3 allows Generator Operators to monitor voltages at another location so long as the Generator Operator has a “methodology for converting the scheduled voltage specified by the Transmission Operator to the voltage point being monitored by the Generator Operator.” Reclamation suggests that having the Transmission Operator and Generator Operator monitor voltages at different locations could lead to confusion in real-time communications. Reclamation suggests that VAR-001-4 R5 be updated to require the Transmission Operator to set voltages based on common monitoring locations to avoid confusion in real-time communications between Transmission Operators and Generator Operators. Reclamation suggests that R6 should be updated to specify that the Transmission Operator must coordinate outages to accommodate required step-up transformer tap changes. Reclamation suggests the drafting team update the requirement to read “After consultation with the Generator Owner regarding necessary step-up transformer tap changes, associated outages, and the implementation schedule…”. Reclamation also notes that "Generator Step-Up transformer" is sometimes capitalized in the standard. However, it is not capitalized in the WECC variance or NERC Glossary. Reclamation suggests that the drafting team remove capitalization in the term “Generator Step-Up transformer” because it is not defined in the NERC Glossary.
Reclamation believes that the notification requirements in R2 and R3 should provide the continent-wide standard. Reclamation suggests that the bullet points in R1 should be relabeled as sub-requirements R1.1 and R1.2. Reclamation requests that the drafting team clarify the timeframe for notifications required by R1. Reclamation suggests that the drafting team update VAR-002-3 R2 to allow Generator Operators to notify Transmission Operators that a voltage schedule cannot be met for equipment or other reasons, so that the Transmission Operator can alter the voltage schedule accordingly. R2.2 recognizes that a Generator Operator can provide an explanation that a voltage schedule cannot be met “when

directed to modify voltage" but does not address the planning horizon. Reclamation appreciates that R2 recognizes that generators only need to comply with voltage schedules within facility capabilities, and that footnote 6 recognizes that generating facility capability may not be sufficient at times to pull the system voltage within scheduled tolerance bands. Nevertheless, Reclamation believes that R2 subrequirements should more clearly articulate that (1) Generator Operators should provide Transmission Operators with feedback that they cannot meet voltage schedules in the planning horizon, and (2) generators may not always be capable of modifying system voltage. Reclamation notes that R2.3 applies to real-time operations, and suggests that R2.3 should be updated to require Generator Operators and Transmission Operators to monitor voltage at mutually-agreed upon locations to avoid confusion in real-time communications. Reclamation suggests that the drafting team update VAR-002-3 R3 to specify that the "Generator Operator shall notify its associated Transmission Operator of a status change on the AVR, power system stabilizer, or alternative voltage controlling device within 30 minutes of becoming aware of the change." Reclamation also suggests that M3 should be updated to specify that the GOP must notify its associated Transmission Operator "within 30 minutes of becoming aware of the change" rather than "within 30 minutes of when the change first occurred." Reclamation notes that VAR-002-3 R4 specifies that the "Generator Operator shall notify its associated Transmission Operator within 30 minutes after becoming aware of a change in reactive capability… ." Reclamation suggests that M4 should be updated to match this language and specify that the GOP must notify its associated Transmission Operator "within 30 minutes of becoming aware of the change" rather than "within 30 minutes of when the change first occurred." Reclamation requests clarification on types of "changes in reactive capability" that could trigger the notification requirement in R4. Reclamation notes that the time horizon for VAR-002-3 R6 should probably be changed from "Real-Time Operations" to "Operations Planning" to match VAR-001-4 R6 and reflect that tap setting changes are agreed upon in advance rather than in real-time. Reclamation suggests that VAR-002-3 R6 should be updated to match VAR-001-4 R6 and to specify that the Transmission Operator must coordinate outages to accommodate required step-up transformer tap changes. Reclamation suggests the drafting team update the requirement to read "After consultation with the Generator Owner regarding necessary step-up transformer tap changes, associated outages, and the implementation schedule…".
Reclamation suggests that the VSLs for VAR-002-3 R3 and R4 should reflect a range of noncompliance like in VAR-002-2. A failure to notify the Transmission Operator of an AVR, power system stabilizer, or reactive capability change for 35 minutes should not be treated the same as a failure to notify the Transmission Operator of the status change for 75 minutes.

NorthWestern Energy
Yes
For R2, M2 - It would be very helpful if "their assessments of the system" be clearly defined. For example, would TPL studies suffice as evidence for meeting this requirement or is this more of a real time requirement and if so, what types of evidence is NERC lokking for.

Individual
Chris de Graffenried
Consolidated Edison Co. of NY, Inc.
Yes
The drafting team used the word “schedule” in both VAR-001 Requirements R1 and R5. However, it is modified by different phrases in each, implying different types of “schedules.” These two different types of “schedules” has caused confusion, making the use and intended meaning less than perfectly clear. VAR-001 Requirement R1 - To improve clarity and consistency, we recommend that the word “schedule” be deleted here and only be used when referring to GOP operation. The revised Requirement R1 wording recommended follows: R1. Each Transmission Operator shall specify a system voltage [delete: schedule (which is either a] range or a target value with an associated tolerance band) as part of its plan to operate within System Operating Limits and Interconnection Reliability Operating Limits. Note that Requirement R1 only requires that the TOP establish the target system voltage level and tolerance band. There is no mention of GOP operation. Requirement R2 requires that the TOP document its arrangement of sufficient reactive resources, whether actually used (dispatched) or not, a Planning function (see Measure M2). The Rationale box states: “to ensuring sufficient reactive resources are online or scheduled.” Comment: The use of the word “scheduled” here again has caused confusion. We recommend it be replaced to clarify the meaning, as follows: R2. Each Transmission Operator shall make arrangement for [delete: schedule] sufficient on-line, available reactive resources to regulate voltage levels under normal and Contingency conditions. Transmission Operators can provide sufficient reactive resources through various means including, but not limited to, making arrangements for reactive generation resources [delete: scheduling], transmission line and reactive resource switching, and using controllable load. We further recommend revising M2 to synchronize it with the revised Requirement R2 above, as follows: M2. Each Transmission Operator shall have evidence of [delete: scheduling]sufficient reactive resources based on their assessments of the system. For the operational planning time horizon, Transmission Operators shall provide copies of assessments used as the basis for determining how resources were [delete: scheduled] made available. The verbiage of R4 should come after R5 is stated. From an organizational perspective, a requirement paragraph on exemptions should come after the referenced requirement.
Generators may be asked by their TOP to operate in other modes. Reword Requirement R1 as follows: R1. The Generator Operator shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) in service and controlling voltage) unless the Generator Operator 1) is exempted by the Transmission Operator, [delete: or] 2) is notified by the Transmission Operator to operate in a different viable operating mode (e.g., constant VAR output mode), or 3) has notified the Transmission Operator of one of the following:

Yes
1st question: Yes - we agree with this approach 2nd question: We have comments on R2. In ERCOT, the TOP can only plan to respond to voltage issues with the resources they have available. They do not have authority to order generation on line for voltage support nor do they have authority to back down fully loaded generation for voltage support. Only the RC has this authority.
Individual

American Electric Power
No
R5: Rather than allowing only 30 days, we instead recommend that the Generator Owner be allowed to provide the data within the timeframe agreed upon by the GO and either the Transmission Operator or Transmission Planner. This data is often part of larger data submission that may stretch beyond the proposed time horizon. In addition, providing this data to the TP appears to be duplicative of the MOD standards currently being updated. As a result, we recommend removing the TP from this requirement. R6: We recommend that Requirement 6 and its subrequirement be applicable only to the Generator Owner and not split between the Generator Owner and Generator Operator. If both are to be retained, we recommend that the subrequirement be changed to state "*If* the Generator Owner cannot provide tap setting changes as requested, the Generator Owner or Generator Operator should notify the Transmission Operator…"
R3 & R4 do not require communications for all instances. As a result, the severe VSL text must be qualified so that it only applies to those situations where notification is actually necessary.

1. R4 and part 4.1 address generator exemptions. R4 requires TOPs to develop criteria for exempting generators from R5, part 5.1. Those criteria should be made available. However, TOPs, not generators, must comply with R5, part 5.1. If the SDT's intent is to exempt specific generators from following a voltage or Reactive Power schedule, we suggest the following rewrite for R4, with no change to part 4.1: R4. Each Transmission Operator shall specify the generator criteria that will exempt Generator Operators of generators that meet these criteria from compliance with the requirement to maintain a voltage or Reactive Power schedule and

publish or provide such criteria upon request. M4 would have to be rewritten, with item 2) and item 3) deleted. Because 1) exempts a generator from having to meet a voltage of Reactive Power Schedule and 2) exempts a generator from having its automatic voltage regulator (AVR) in service or from being in voltage control mode, being exempt from having to meet a voltage schedule in 1) is equivalent to being exempt from 2). Item 3) is addressed by exemptions stated in VAR-002-3, R1 and R2. 2. R5, part 5.1 should have the phrase “in automatic voltage control mode (the AVR is in service and controlling voltage)” stricken since it would not apply to a Reactive Power schedule. In addition, the TOP should not be required to provide voltage or Reactive Power schedules to exempt generators under part 5.1. Finally, the text box for R5 refers to maintaining a schedule for “normal operations.” “Normal operations” is a critical assumption, which we believe is equivalent to “normal operating conditions.” For example, a generator that experiences a fault on its GSU will be outside of any voltage or Reactive Power schedule during that fault. Therefore, part 5.1 should be rewritten: 5.1. Except for exempt generators, the Transmission Operator shall provide the voltage or Reactive Power schedule for the associated Generator Operator and direct the Generator Operator to comply with the schedule during normal operating conditions. 3. R5, part 5.3 should have the phrase “or Reactive Power” inserted after “voltage.”
1. In R1, a generator that is exempt from having to meet a voltage or Reactive Power schedule is exempt from R1. However, a generator that must meet a Reactive Power schedule should also be exempted from R1 because R1only applies to AVRs in the voltage control mode. R1 should be rewritten as follows: R1. The Generator Operator shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) in service and controlling voltage) unless the Generator Operator 1) is exempted by the Transmission Operator, or 2) has been directed by its Transmission Operator to meet a Reactive Power schedule, or 3) has notified the Transmission Operator of one of the following: 2. We suggest R2 have “or Reactive Power” inserted in the following phrase: “…for otherwise shall meet the conditions of notifications for deviations from the voltage or Reactive Power schedule provided by the Transmission Operator.” 3. R2, part 2.3 should be moved to M3 since it addresses measures to prove compliance with R2. We suggest the second sentence in M2 be modified as follows: “The Generator Operator shall have evidence to show that the its generator(s) maintained the voltage or Reactive Power schedule provided by the Transmission Operator (either at the location specified by the Transmission Operator or at an alternate location that includes a methodology for converting the schedule from Transmission Operator’s location to the alternate location), or shall have evidence of meeting the conditions of notification for deviations from the voltage schedule provided by the Transmission Operator."

Yes
Yes

(1) M1 – the language in the second paragraph re: Part 1.1 does not match the language of the requirement itself in that the measure refers only to voltage schedules, not voltage schedules 'and associated tolerance bands'. (2) R3 – without further clarification, 'as necessary' will be interpreted to mean as deemed necessary by the Transmission Operator. (3) M3 – the measure in this part contains more details and is more narrow than the requirement itself. The requirement refers to the operation of 'devices to regulate transmission voltage and reactive flow' while the measure refers to the operation of 'capacitive and inductive resources'. Language should be consistent. (4) R4 – the language goes back and forth between 'generators' and 'generating units' – this should be made consistent. Also, the reference to 'associated notification requirements' presumably refers to the associated notification requirements in R5 but this is not specified. (5) M4 – the qualification language that it refers only to generating units 'in its area' appears only in the measure and not in Part 4.1 itself. (6) R5 – neither Generator nor Step-Up is a defined term so they should not be capitalized. (7) M5 – there is a shift in language here. Generally the measures indicate that the responsible entity 'shall have evidence' and that the evidence 'may include'. In this measure, the language is that the responsible entity 'shall have evidence' and that the evidence 'shall include'. This is much more restrictive and may make compliance more difficult as there is no longer flexibility in the evidence that will meet the criteria of the measure. (8) Compliance, Evidence Retention 1.2 – Measures 5 and 6 are not mentioned. (9) Compliance, Compliance Monitoring, 1.3 - The language refers specifically to processes found in the NERC Rules of Procedure. Generally in draft standards, there is just a list of processes that may be used. The reference included in this draft standard is concerning because MB Hydro has their own Compliance and Monitoring program and has only adopted select aspects of the NERC Rules of Procedure. (10) VSLs, R4 – the words 'of the Generator Operator' are missing from the end of this section. (11) VSLs, R5 – the words 'and associated tolerance bands' is missing from Moderate VSL after 'voltage schedules' and is not fully referenced in Severe VSL. (12) VSLs, R6 – the words 'Documentation specifying requiring tap changes was provided to the Generator Owner but' could be inserted at the start of each of the Lower VSL and Severe VSL.
Although Manitoba Hydro is in general agreement with the standards, we have the following comments: (1) M1 – the language in the measure is that evidence 'must' include which is a shift from typical language that evidence 'may' include. It also seems to be a shift from what is discussed in the rationale that the measure has been updated to include some of the evidence that 'can be used' for compliance purposes as the evidence listed is made mandatory by the 'must'. (2) R1 – footnote 2 and 4 seems to be missing (3) M2 – refers to 'unit' while rest of standard refers to generator. For part 2.3, I believe the reference to 'units' should be to 'Generator Operators'. (4) M3 –the acronym GOP is used while every other reference in the standard is to Generator Operator. (5) M4 – the language between the measure and the requirement differs slightly. The measure requires evidence of notification within 30 minutes of 'the recognition' of a change, while the requirement requires notification within 30 minutes of 'becoming aware' of a change. (6) M5 – there is nothing in the measure that addresses the timeline upon which the Generator Owner is required to provide information. (7) R6/M6 – the requirement and measure refers to both Generator Owner and Generator Operator. Its not

clear whether this is intentional or inadvertent. The words 'and provided technical justification' should be added to the end of M6 after 'tap specifications'. (8) Compliance, 1.2 – there is no time limit on the requirement for a Generator Owner to keep documentation on its step up and auxillary transformers. Its it meant to be for as long as that version is current? (9) Compliance, Compliance Monitoring, 1.3 - The language refers specifically to processes found in the NERC Rules of Procedure. Generally in draft standards, there is just a list of processes that may be used. The reference included in this draft standard is concerning because MB Hydro has their own Compliance and Monitoring program and has only adopted select aspects of the NERC Rules of Procedure.

(1) VSLs, - not clear why the references throughout the VSLs are to 'responsible entity' when the requirements are clear as to an obligation on either the Generator Owner or Generator Operator. Those entities should be listed in the VSLs as they are in the requirements and standards. (2) VSLs, R2, Severe VSL – the word 'Power' is missing after 'Reactive'. Also doesn't mention that the Generator Operator 'did not have an exemption'. (3) VSLs, R3 and R4 – would read better if stated 'the Generator Operator did not make the notification of a change that lasted more than 15 minutes within 30 minutes of the first occurrence of the change as required'.

No

Please note that my affirmative ballot vote was in error. We are voting NO on VAR-001. Since there is no catchall section for comments on VAR-001, we are providing comments here. Although We do agree with the removal of duplicative requirements, we are voting No on VAR-001. VAR-001 R2 remove everything after the but not limited to phrase. The various methods to obtain reactive power do not belong in the requirement but they can be included in the measure. VAR-001 R3: Clearly this is something a TOP perfroms but the compliance evidence will be overwhelming. The TOP is being asked to demonstrate that it has constantly monitored reactive and provided direction to operate reactive devices. This will require the retention of the evidence of why a reactive adjustment was necessary as well as the various adjustments made. This would mean maintaining snapshots of the normal operation of the system, records of adjustments, corrections, etc.

Yes

Angela P Gaines

Portland General Electric Co

PGE appreciates NERC's efforts to revise VAR-002. The standard as whole is a significant improvement from the previous version. However, R3 still requires a 30 minute notification for notifying the transmission operator (TOP). The 30 minute limit is a challenge for generator operations to meet. The SDT should consider increasing this limit to 60 minutes. In addition,

the requirement should allow registered entities to set up an alternative method to provide real-time AVR/PSS/voltage control device telemetry. This method would eliminate a need for notifying the transmission operator within 30 minutes. Also, the NERC glossary should fully define the term, 'voltage controlling device', as stated in R3.

Dominion
Louis Slade
Yes
Yes
Yes. In order to be consistent, Dominion also suggests reviewing the need to use "its associated Transmission Operator" throughout the entire standard (i.e. R1 - "has notified the Transmission Operator", R2/M2 - "provided by the Transmission Operator", R6 - "specifications provided by the Transmission Operator", etc).
Individual
Anthony Jablonski
ReliabilityFirst
1. General Comment - ReliabilityFirst believes that due to the interdependency of the VAR-001-4 and VAR-002-3 standards, the SDT should consider combining the two into a single standard. It would be a natural progression to list a requirement associated with the Transmission Operator having it immediately followed by the associated Generator Owner/Operator requirement. ReliabilityFirst believes the Generator Owner/Operator would benefit from knowing what is being required of the associated Transmission Operator. Specific VAR-002-3 Comments 1. Requirement R6 - The parent Requirement R6 is applicable to the Generator Owner while the sub-part 6.1 specifies the Generator Operator. The same applicable entity listed in the "parent" requirement should be the same as any associated sub-parts. Since only Requirements are enforceable in Reliability Standards, if the Generator Operator fails to notify the Transmission Operator and fails to provide the technical justification per sub-part 6.1, a Possible Violation would be rolled up to Requirement R6. This would not work since Requirement R6 is only applicable to the Generator Owner. ReliabilityFirst completely understands that the Generator Owner is the responsible entity for ensuring that transformer tap positions are changed and that the Generator Operator is the entity responsible for actually performing the change. ReliabilityFirst recommends splitting Requirement R6 and sub-part 6.1 into two separate requirements (i.e., create a new Requirement R7 using the language of sub-part 6.1).

Yes
Yes

Yes
The VRF of “high” is not justified for any of the requirements. We would suggest a VRF of “medium” or “low”. If the drafting team thinks a VRF of “high “ is justified, some reasoning should be provided by the team. Lack of documented voltage schedules does not mean the system is being operated unreliably. Units are still being operated in AVR mode as required by other schedules and transmission operators coordinate the voltage schedules as needed.

ERCOT agrees it is clear voltage limits are to be monitored as either SOLs or IROLs. However it seems the SDT could make more changes to clear up more items. A. VAR-001 R3 grammatical: recommend deleting “as necessary” from this sentence. It adds no value and is not needed. B. It appears VAR-001 R4 allows the TOP to not comply with the VAR Standards by utilizing exemptions?
Yes
ERCOT agrees that duplicative requirements should be removed. However, the standard would benefit from additional revisions. A. R1 and R5 should be merged. This could be accomplished in the following manner: “Each Transmission Operator shall notify associated RCs and adjacent TOPs, and specify assigned GOs the a system voltage schedule (which is either a range or a target value with an associated tolerance band) as part of its plan required forassigned GOs to operate within System Operating Limits and Interconnection Reliability Operating Limits. B. The second sentence of VAR-001 R2 is not needed. This is not an actionable requirement, but rather is an instruction as to how it’s to be done. The 2nd sentence is not a requirement. C. Recommend deleting from R5.1 the words, “…in automatic voltage control mode (the AVR is in service and controlling voltage).” The standard should establish what needs to be done, and how the GO elects to comply with the requirement should be left to the discretion of the GO. Furthermore, VAR-002 requires the GO to have its AVR in service and in auto, so this requirement is also redundant. D. It appears that VAR-001 R6 is redundant to R5.3. Also see comments on VAR-002 R6.
Yes. ERCOT supports the revisions but recommends that the SDT consider the following additional issues: A. Consider revising R2 as follows: “The generator shall follow the voltage schedule assigned by its TOP.” Otherwise this is effectively a “fill in the blank” standard. As drafted, R2 also establishes “how” entities are required to meet their obligations. The standards should establish what is required and leave it to the discretion of the functional entity to determine how to meet the relevant objective. R3 provides the needed notification.

B. VAR-002 R2 requires GOs to notify TOPs of voltage. This seems to create an unnecessary requirement given that TOPs are obligated to monitor system voltage. C. VAR-002 R2.1 appears to require that GOs maintain the voltage assigned. Consistent with the general principle that the standards should establish what is required, how GOs maintain voltage assignments should be within the discretion of the entity. D. VAR-002 R2.2 is redundant. If GOs have to maintain the voltage assigned, this is unnecessary. E. VAR-002 R2.3 is redundant if a GO has to maintain the voltage assigned. F. VAR-002 M2 includes a statement that has a "will" in it. This effectively establishes a requirement. Measures are means of demonstrating compliance, they are not requirements. The measure should be revised accordingly. G. VAR-002 R3 should state that the notification is not required during startup or shutdown. A TOP can determine from telemetered information when a unit is operating below their lower stability limit. Requiring reporting of AVR/PSS status coming on/going off line is not necessary and creates unnecessary distractions that could undermine reliability. H. The 2nd sentence of R3 is redundant with the 1st. If notification is required within 30 minutes it is implicit that the entity does not have to notify within 15 minutes? I. If a GO maintains the assigned voltage, the status of a GO's AVR is irrelevant. If a GO failed to maintain the assigned voltage they are in violation of R2 regardless of the reason. M3 seems to unnecessarily create the potential for double violation issue on a reporting obligation.J. The standard should make clear that telemetry on status of AVRs and PSSs to TOPs meets this notification obligation. The term 'notify' seems to imply a manual written or verbal communication. K. VAR-002 R4 second sentence dealing with 15 min language- - please refer to R3/M3 comments. L. VAR-002 R5 – This requirement is unnecessary if GOs have to respond to any reasonable data request from their TOP. M. VAR-002 R6 is redundant with R2. If a GO has to maintain assigned voltage, and adjusting taps is necessary to do that, then this instructional requirement is not needed. If R6 is kept, in VAR-002-3 Standard the entity changes in R6.1. VAR-001-4 states the TOP will work with the GO in R6. Then in VAR-002-3 it states the following: R6. After consultation with the Transmission Operator regarding necessary step-up transformer tap changes, the Generator Owner shall ensure that transformer tap positions are changed according to the specifications provided by the Transmission Operator, unless such action would violate safety, an equipment rating, a regulatory requirement, or a statutory requirement. [Violation Risk Factor: Lower] [Time Horizon: Real-time Operations] 6.1. If the Generator Operator cannot comply with the Transmission Operator's specifications, the Generator Operator shall notify the Transmission Operator and shall provide the technical justification. Why does it change from the GO to the GOP? The SDT should address the differences within VAR-002-3 to mirror R6 in the VAR-001-4 Standard.

Michael Falvo
Independent Electricity System Operator
Yes
We support this direction and the SDT's decision to not reiterate or duplicate the voltage assessment requirements already addressed by the FAC and TOP standards.
Yes

We support the SDT's proposal to remove the requirements that may be redundant with other standards. We do not have any comments on the requirements, Measures or VRFs, but we do have some comments on the VSLs: a. R1: The word "schedule" after "system voltage" is missing from the VSL. b. There is inconsistency in the tense used in various VSLs – some are in present tense while others in past tense. Please review and revise as appropriate.
We agree with most of the proposed changes, but would suggest the following changes to more effective convey the intent of Requirement R3 and Measure M3. a. R3: The wording "the Generator Owner shall ensure that transformer tap positions are changed according to the specifications provided by the Transmission Operator" is not a direct action and may not be measurable. We suggest to revise it to read: "the Generator Owner shall implement the transformer tap positions according to the specifications provided by the Transmission Operator…." b. M3: We suggest it be reworded to require demonstration of compliance rather than to require actions which should have been stipulated in the requirement. Specifically, we proposed the last part in Measure M3 be revised to: "…therefore, if a status change lasts more than 15 minutes, the GOP shall provide evidence such as system log, electronic message or a transmittal letter that it notified its associated Transmission Operator within 30 minutes of when the change first occurred." We further propose that the SDT insert the evidence language into the first sentence of Measure M3 which asks for evidence that the Generator notified its associated Transmission Operator within 30 minutes of the change identified in Requirement R3. We assess the changes proposed under Q2 and Q 3, above, are not substantive and do not materially change the intent or content of the standards. Therefore, if the standards receives 2/3 majority approval at the ballot, these changes can be implemented and posted for recirculating ballot without having to post and ballot the standards for a successive ballot.
We support the proposed VRFs and VSLs.

Marcus Pelt
Yes
R1: The modifications in this version of VAR-001 R1 are good because they standards that are now enforceable, particularly FAC-011 and FAC-014. M2: All Transmission Operators are required to run contingency analysis on the real time system on a periodic basis per TOP-008-1 R4. We suggest modifying VAR-001 M2 to state: "If the assessment is performed in the Operations Planning Horizon, Transmission Operators shall provide copies of assessments used as the basis for how resources were scheduled." M3: Actions are not always required to be taken because of automatic settings of reactive devices. We suggest modifying VAR-001 M3 to state: "Each Transmission Operator shall have evidence that actions were taken as necessary to operate capacitive and inductive resources as needed in Real-time. This may include directions to Generator Operators to: 1) provide additional voltage support; 2) bring resources on-line; or 3) make manual adjustments." R5.3 states, "The Transmission Operator

shall provide the criteria used to develop voltage schedules and associated tolerance bands to the Generator Operator within 30 days of receiving a request." We suggest that this requirement is removed due to administrative burden. We recognize the need for transpency; however, this requirement does not serve a reliabity purpose.
Yes
: The High VSL for VAR-001 R4 should be changed from the proposed state to "The TOP has exemption criteria, but did not notify the GOP." As it is currently written, the TOP satisfied R4, but simply cannot show documentation to prove the satisfaction. The proposed change wording focuses on the TOP not satisfying the requirement. The first clause in the Severe VSL for VAR-001 R5 should be corrected to state "voltage or Reactive Power schedules." In addition, the Severe VSL for VAR-001 R5 should have another OR clause to include the failure to comply with R5.3.
Adding "testing" to VAR-002 R1 was a good move. This will serve to avoid nuisance notifications for routine testing. Modifying VAR-002 R2 to allow the TOP to specify notification instructions is a good move. Each TOP will be able to specify notifications appropriate for characteristics of their transmission system. Removing the VAR-002 R3 notification of duration was a good move - the GO often does not know how long it will be out until some troubleshooting is performed. Splitting the old R3 into new R3 and new R4 was a good move. This separates two distinct types of trouble. The addition of "after becoming aware of a change in reactive capability" to the new R4 was a good move - this change is not always immediately evident. M4 should be modified to match R4 - "after becoming aware of a change needs to appear in M4".
The removal of "up to 45 minutes for the R2 VSL was a major improvement. The comma in the second and third OR statements of the Severe VSL for VAR-002 R2 is not needed. The comma in the second OR statement of the Severe VSL for VAR-002 R6 is not needed.

Kansas City Power & Light
Yes
I agree with the approach to condense standards if they are duplicated in other standards.
NO. R2 is the part of VAR-002 that I disagree with because the Transmission System Operator is monitoring the system voltage and notifies each generating facility when they need to raise/lower voltage in that particular area of the system. If the voltage at the generating facility is high/low the TSO has received an alarm and will be notifying the plants control operator to correct the voltage and there already is a requirement for the control operators to comply with the TSO request.
No.

No
ATC agrees with the approach in removing any duplicate requirements. ATC also has a couple comments and is recommending the following changes for the drafting team to consider: 1. For consistency, Measure M2, 2nd sentence should be reworded as follows: “For the operational planning time horizon, Transmission Operators shall “have evidence of assessments” used as the basis for how resources were scheduled” The current wording of “shall provide copies” imposes an action that is not included in the associated requirement R2. 2. The following from requirement R2: “Transmission Operators can provide sufficient reactive resources through various means including, but not limited to, reactive generation scheduling, transmission line and reactive resource switching, and using controllable load” implies that all of the items listed need to be considered. If the intent is that the items are intended to be examples it is suggested that the words “including , but not limited to” be replaced by “such as”.

Xcel Energy
Yes
Yes
Xcel Energy appreciates the hard work of the Standard Drafting Team. We recognize that significant effort has been put into the modifications of the VAR-001 and VAR-002 standards and we applaud the direction the team is moving. We are voting Negative on VAR-001-4 for one reason which we explain below. Xcel Energy believes that the WECC Regional Variance should not replace R4 in the NERC standard based on the rationale provided for modifications to the proposed R4. Instead, WECC Regional Variance Requirement E.A.13 should be removed and the remaining Regional Variance Requirements should supplement the NERC Requirements in the Western Interconnection. As proposed, the NERC standard states that the TOP is not bound to provide a voltage schedule for each BES generator; however , due to the WECC variance, the TOP would be found in violation if any BES Generator was not provided a voltage schedule. In order to resolve the issue, Xcel Energy asks the drafting team to delete E.A.13 in its entirety and modify the language of the Regional Variance to state that the additional requirements are for in addition to the NERC requirements. Once this modification is made, Xcel Energy could support the proposed standard.
Yes. Xcel Energy appreciates the hard work of the Standard Drafting Team. We recognize that significant effort has been put into the modifications of the VAR-001 and VAR-002 standards and we applaud the direction the team is moving. We are voting Negative on VAR-002 for one reason which we explain below. Xcel Energy understands that the existing language in the VAR-002 standard uses the term “status change” but believe that this term is not well defined and is subject to different interpretations. AVRs and PSSs are designed to cycle based on the parameters being monitored by the devices. This as-designed cycling may be interpreted as a status change. We note here that the drafting team does not use the term status change in its

rationale statement. Instead, the rationale statement is much clearer in meaning than the proposed requirement language. To address Xcel Energy's concern, we request that the drafting team replace the first sentence in Requirement R3 with the following sentence. (We believe that this change does not constitute a significant modification but is instead providing more clarity in the requirement language based on the wording of the Rationale for Requirement R3.) "Each Generator Operator shall notify its associated Transmission Operator when the AVR, power system stabilizer, or alternative voltage controlling device goes out of service within 30 minutes of the change."
If the drafting team makes the requested modifications to the requirements, Xcel Energy has no concerns with either the VSLs or VRFs.
Individual
Lynda Kupfer
Puget Sound Energy
- The implementation period might be as short as one day as the Effective Date section is currently formulated. For example, if approval occurs on 12/31/2013, the first day of the first calendar quarter after that date would be 1/1/2014. A short implementation period for this standard is appropriate; however, language such as "The first day of the first calendar quarter that is one month beyond the date that this standard is approved..." would ensure that a minimum of one month is available for implementation.
Yes
- The first paragraph of the Regional Variance section of VAR-001 should be updated to reflect that requirements R3 and R4 of the current standard are requirements R4 and R5 in the proposed standard. - M4 should be updated to reflect that the Generator Operator "must notify its associated Transmission Operator within 30 minutes of when the change first occurred. after becoming aware of the change in reactive capability" to be consistent with the wording of R4.

Luminant Generation
Yes
Yes
Luminant appreciates the work of the SDT and agrees that most of the revisions are appropriate, and that the intent of the SDT to allow for more than one method of voltage support is correct. However, as written, VAR-002, R2, does not clearly identify that generators can provide voltage support by a method other than maintaining a voltage schedule, continuously monitoring voltage and reporting deviations from the voltage schedule. In some areas of the country, the TOP monitors the voltage at all busses in it area, including the busses connecting generators, and directs generators to modify reactive output as the TOP requests. Luminant believes the language of VAR-002, R2 should be modified to provide clarity as follows: R2. Unless exempted by the Transmission Operator, each Generator Operator shall provide generator voltage support or Reactive Power support (within each generating Facility's capabilities4) as follows: [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations] 2.1. When a generator's AVR is out of service or the generator does not have an AVR, the Generator Operator shall use an alternative method to control the generator reactive output to provide voltage or Reactive Power support directed by the Transmission Operator. 2.2. When directed to modify voltage, the Generator Operator shall comply or provide an explanation of why the request cannot be met. 2.3. When directed by the Transmission Operator, each Generator Operator shall maintain the generator voltage or Reactive Power schedule3 (within each generating Facility's capabilities4) provided by the Transmission Operator, and shall meet the conditions of notification for deviations from the voltage schedule provided by the Transmission Operator. 2..3.1 Generator Operators that do not monitor the voltage at the location specified in their voltage schedule shall have a methodology for converting the scheduled voltage specified by the Transmission Operator to the voltage point being monitored by the Generator Operator. With this proposed language, the GOP would have to maintain a voltage schedule and report deviations only if that is the normal method of voltage support requested by the TOP. 2.3 and 2.3.1 would only apply to a GOP that maintains a voltage schedule. The measures for 2.1 and 2.2 would include operator logs, voice recordings, etc.

City of Austin dba Austin Energy
Yes
Yes
City of Austin dba Austin Energy (AE) agrees with removing duplication. AE does not have any comments about the requirements, but requests the SDT review the VSL for R2 because the text does not match the requirement text.
Yes.

No. Because NERC has not provided an area for "Additional Comments," we are adding them here. The City of Austin dba Austin Energy (AE) commends the Standard Drafting Team's efforts related to Project 2013-04. The quality of the standard is enhanced over previous approved versions, providing additional clarity and compliance sensitivity. AE respectfully submits the following comments on VAR-001-4 and VAR-002-3 to the Standard Drafting Team (SDT): VAR-002-3, R1, Pertaining to the phrase "… unless the Generator Operator 1) is exempted by the Transmission Operator, or 2) has notified the Transmission Operator…" AE recommends the SDT clarify whether the TOP may exempt all the units represented by a GOP, or instead, specific generating facilities or a generator bus. AE suggests altering the language to read "… unless 1) the generator is exempted by the Transmission Operator, or 2) the Generator Operator has notified the Transmission Operator…" This change will make the language in VAR-002-3 R1 consistent with the language in VAR-001-4 R4. VAR-002-3, R2.3: The requirement makes it mandatory for Generator Operators to monitor the voltage at the location specified in the voltage schedule or have a methodology for converting the scheduled voltage specified by the TOP. This may imply that the Generator Operator should make voltage corrections independent from the TOP. AE believes that maintaining the appropriate transmission level voltage is the key for sustaining system stability and that responsibility falls on the TOP. Because the TOP already monitors the transmission level voltages, the R2.3 requirement for GOPs to monitor voltage is redundant and may create a situation where the TOP and GOP do not agree on the monitored value (i.e. the voltage readings can be different due to step-up voltage equipment). To avoid confusion and potential compliance ambiguities, AE suggests the standard specifically state TOPs are responsible for monitoring the system voltage schedule and notifying the GOP when voltage drifts outside acceptable parameters. This appears to be a common practice of operating the grid. The GOP will be responsible for meeting the reactive support requested by the TOP. If the GOP cannot meet the reactive support requested by the TOP, the GOP should have to notify the TOP. AE suggests the following: Add "Transmission Operators" under R4 – "4.3 Transmission Operators", and alter R2.3 to: "Each Transmission Operator shall monitor the system voltage and notify its associated GOPs for additional voltage support if system voltage fails to meet the voltage schedule. If the GOP cannot meet the reactive support requested by the TOP due to equipment limitations, it shall notify the TOP of the limitations within 15 minutes. VAR-002-3, R4: AE believes the phrase "a change in reactive capability" is vague. As written, even the slightest change in reactive capability must be reported to the TOP. Is it the SDT intent the TOP be notified if a reactive capability (leading or lagging) of a generation resource changes by 1 MVAR? Detecting and reporting small reductions in reactive capability will create onerous reporting. AE recommends the following for R4: "Each Generator Operator shall notify its associated Transmission Operator within 30 minutes that a resource's reactive capability changed by 20 MVAR or 10%, whichever is greater, of the previously provided reactive capability due to factors other than a status change described in Requirement R3."

No
We request that the SDT leave the language as currently used in VAR-001-2, R4.
We request that the SDT support adding to R3 the "…after becoming aware of…" language now proposed for R4. This will help reduce the number of unnecessary GOP notifications to the TOP.
Group
Florida Municipal Power Agency
Frank Gaffney
Yes
Yes
FMPA appreciates the efforts of the SDT to remove some of the duplicative requirements of the VAR standards with other standards (e.g., TOP and FAC standards). However, FMPA is voting Negative because we believe more requirements ought to be treated in the same fashion as described in our earlier comments on the September posting, as provided in a mapping document submitted directly the the SDT to better illustrate those duplications, and as summarized below. VAR-001-4 R2 is duplicative of the requirements of TOPs to plan for and operate to SOLs in the TOP and FAC standards. In order to plan to and operate to SOLs, TOPs must schedule sufficient reactive resources, or they will violate those requirements (just as must-run generators need to be scheduled, yet those are not discussed within the standards). Operating to SOLs is results based, VAR-001-4 R2 is not. VAR-001-4 R2 ought to be deleted. VAR-001-4 R3 is duplicative of requirements of TOPs to plan for and operate to SOLs as described above. As far as TOPs ability to direct, that is covered in TOP-001. VAR-001-4 R3 should be deleted. Although FMPA supports both VAR-001-4 R1 and R5, we wonder if there is some duplication between those requirements and whether they can be combined into a single requirement.
FMPA appreciates these changes. However, VAR-002-3 remains duplicative of other requirements within the standards VAR-002-3 R2, bullet 2.3 is duplicative of TOP-001-2 R1. Both require the GOP to follow the direction of the TOP. Bullet 2.3 should be deleted. VAR-002-3 R5 is duplicative of TOP-003-2 and should be deleted. VAR-002-3 R5 requires the GO to provide the TOP information about the GSU. TOP-003-2 R5 requires the GO to submit data as specified by the TOP. The TOP cannot perform their obligations of VAR-001-4 R6 to specify GSU tap positions without the data of VAR-002-3 R5; however, the TOP will ask for that data in accordance with TOP-003-2 R3. Hence, these requirements are redundant and VAR-002-3 R5 ought to be deleted. FMPA also wonders how duplication between TOP-003-2 that gives TOPs a carte blanche opportunity to develop data requests on any information they need and the notification requirements of VAR-002-3 will be managed. In other words, the TOP can develop their TOP-003-2 data specification to include the notification requirements of VAR-002-3 and as such GOPs would be subject to double jeopardy risk.

The SDT is requested to clarify the word “directions” as used in M3. The word “directions” is close to, but not, the word “directive” which has a very specific meaning. If the intent is to capture directives, then the word directives should be used. If the intent is to capture communications that are not directives, then the word “directions” should be replaced with wording that is not so close to the word “directives.” Current M3 draft language: M3. Each Transmission Operator shall have evidence that actions were taken to operate capacitive and inductive resources as needed in Real-time. This may include directions to Generator Operators to: 1) provide additional voltage support; 2) bring resources on-line; or 3) make manual adjustments. The SDT is requested to consider a modification to R4: Current R4 draft language: R4. The Transmission Operator shall specify the criteria that will exempt generators from compliance with the requirements defined in Requirement R5, part 5.1, and any associated notification requirements. Suggested modification to R4: R4. The Transmission Operator shall specify the criteria, ADD: “if any” that will exempt generators from compliance with the requirements defined in Requirement R5, part 5.1, and any associated notification requirements.

Yes
PacifiCorp supports MidAmerican's comments.
The following change to requirement R4 is recommended: “Reactive capability changes due to change in the wind speed for wind generators or a change in the solar resource for solar

facilities do not require Transmission Operator notification." Given the variable nature of wind, the reliance of weather forecasting does not rest explicitly with the GOP. The TOP has access to weather forecasting that would make the need of notification by the GOP unnecessary. Additionally, PacifiCorp supports the following comments from MidAmerican: We support the deletion of the language regarding notification of the expected duration of a change in status. At the time a status change occurs it is often difficult to provide a meaningful estimate of the duration of the change. Requirement 3 should be revised to state – Notification must be made within 30 minutes of becoming aware of the change from automatic controlling voltage for the AVR, and from in-service of the PSS. Measure 3 should be revised to reflect this as well. The revised VAR-002 R2.1 removes the 15 minute deviation criteria for notification by Generator Operators to Transmission Operators. The revised VAR-001-4 requires Transmission Operators to provide notification requirements. The drafting team in the consideration of comments explained "In an effort to remove prescriptive notification requirements for the entire continent" the change was made. This leaves the Generator Operators at the mercy of Transmission Operators who could potentially set a no deviation criteria. It is recommended that a comprise be struck by specifying a limit on the criteria such as "no less than 15 minutes".

Yes
Yes
Many of the other standards that require the provision of this sort of information to the RC and neighboring entities includes a requirement that the entity respond to comments/concerns from the copied entities. Why not here? R2 appears to be a little ambiguous; does this apply to all contingency conditions? Just N-1? Only those chosen by the TOP? This would appear to be hard to determine compliance by the Region. It looks like R6 assumes that the GO has a non-LTC transformer. We are seeing LTCs in generation facilities; shouldn't this be modified to address the LTC GSUs? For M2 and M3 particularly, Evidence Retention could require a lot of data for 12 months.
For R2, what about the situation where the generator cannot actually influence the voltage? There may be a significant amount of hours where they can't keep the voltage in range. For M2, for a generator that does not have an AVR, what type of evidence is required to show compliance for 8760 hours per year? Sounds like a lot of evidence potentially.

Duke Energy
Colby Bellville
Yes
Yes

Duke Energy approves of the approach of removing duplicative requirements based on other standards. Duke Energy seeks clarification on the definition of “system voltage schedule” and believes that once this is more clearly defined, it should be added to the NERC Glossary of Terms. The Rationale for Requirement 1 discusses the TOP setting voltage or Reactive Power schedules with associated tolerance bands. However, Requirement 1 makes no mention of using Reactive Power schedules. Is the use of Reactive Power Schedules implied in Requirement 1? Duke Energy suggests changing “Each Transmission Operator shall schedule” to “Each Transmission Operator shall maintain” in Requirement 2 for more clarity. In Duke Energy’s opinion, not all reactive resources can be “scheduled” in order to regulate voltage levels. For example, SVCs cannot be scheduled, the reactive resources of an SVC dynamically change to maintain set voltage levels. The TOP needs to ensure that adequate static and dynamic reactive resources are availble to the System Operator in real time to support the Reliability needs of the BES. Reliability Studies are performed in the Operations Planning horizon to ensure that reactive resources are adequate to support the planned BES configuration.
No. Duke Energy does not agree with the revisions made. Duke Energy is unclear whether the exemptions referenced in R1 and R2 in VAR-002-3 are the same as the exemptions created in VAR-001-4 R4. We believe using the word “exempted” in multiple requirements without identifying the origin of the exemption is a cause of confusion. Requirement 2 - Revise R2.1 to read, ” When a generator’s AVR is out of service, the generator does not have an AVR, or is not in a TOP approved mode of AVR operation as specified in R1, the Generator Operator shall use an alternative method to control the generator reactive output to meet the voltage or Reactive Power schedule directed by the Transmission Operator. “ The VRF/VSL for Requirement 2 would need to be modified if this change is made. Requirement 3 – Duke Energy is unclear as to what is considered an alternative voltage controlling device. Duke Energy prefers the language in the previous draft of this standard which states, “Each Generator Operator shall notify its associated Transmission Operator of a status or capability change on any generator Reactive Power resource, including the status of each automatic voltage regulator and power system stabilizer and the expected duration of the change in status or capability within 30 minutes of the change. If the status has been restored within the first 15 minutes of such change, then there is no need to call the TOP. “ The language in the previous draft provides more clarity on what would prompt notification from a GOP to a TOP based on status or capability change. Requirement 5 – Duke Energy would like the SDT to review and verify that the Transmission Planner, and not the Planning Authority or Planning Coordinator, is the correct functional entity for this requirement. Lastly, Duke Energy would like to clarify that we encouraged our ballot body members to vote “Negative” on this ballot for reasons stipulated above. However, one of our ballot body members mistakenly voted “Affirmative” which was in error. Our decision to vote “Negative” on this ballot was unanimous among all those involved. We apologize for any confusion this may have caused.

An additional change should be made – R3 should state that when real-time status is provided to the TOP electronically there is no need for additional notification.
Time requirements are not necessarily arbitrary, and it is in fact important to establish explicit and meaningful criteria regarding the acceptable time (and magnitude) of voltage schedule deviations. The principal reason that VAR-002 has been so troublesome in the past is that one could interpret a 10 MW hydro unit being out of the bandwidth by 0.1 kV for 1 minute as constituting a violation, despite there being no meaningful impact on BES reliability. There are moreover many occasions when a the system voltage unavoidably strays briefly outside the bandwidth due to a disturbance or because there are step-changes in the TOP's voltage schedule. VAR-002-3 makes a slight movement in the right direction by stating in R2 that a unit must keep within the bandwidth or, "meet the conditions of notification," but there is nothing in VAR-001 or 002 to require TOPs to create justifiable requirements in this respect. We presently suffer under a system in which meaningless violations are spawned by abusive practices, such as establishing a bandwidth of only +/- 0.5%, and VAR-001 and 002 should be revised in a fashion that prohibits such practices.

Consumers Energyu
Yes
Yes
This is a two part question with only one YES/NO answer. YES we agree with the approach. YES we have questions or comments on the remaining revised requirements. In R4, there should be a statement that the TOP will publish the exemption criteria to GOPs in the area. A consideration should be made to reserves R1 and R5. It is imperative both get the voltage schedules but if the GOP does not have them there is no control.
It is important to clarify the statement of "notification requirements." In the context of VAR-

002 this term refers to the notification from the GOP to the TOP on status of the AVR, Ability to follow the voltage schedule or the status of the unit. We would suggest the timing on VAR-002 R3 be similar to R4 in that the clock starts at the awareness of the GOP of a status change. VAR-001 clearly defines a Voltage or Reactive Power schedule. We suggest this be done in VAR-002 for consistency rather than the footnotes provided.

Exelon Companies
Yes
Yes
Yes, agree with approach, no additional comments relating to requirements. Exelon companies would vote Affirmative for VAR-001-4 if it were being balloted separately from VAR-002-3.
Exelon appreciates changes made to the standard the current revision is a significant improvement on the previous draft version. As mentioned above, we support VAR-001-4 as written but feel important issues remain unaddressed with VAR-002-3 and will therefore vote Negative. Our principal concerns include: VAR-002-3 Effective Dates. The Implementation Plan for VAR-001-4 and VAR-002-3 requires the new Standard revisions to be implemented the first day of the first calendar quarter after applicable regulatory approval. Although the Implementation Plan justification states that the VAR-002 standard “cannot go into effect without the new TOP schedules and notification requirements” it does not address the implementation associated with changes to VAR-002 with respect to status notifications. This is not sufficient time to allow generating units to implement training of operators and procedural changes necessary to implement the proposed changes to notification requirements associated with the AVR, PSS or alternative voltage controlling device. We suggest at least a 6 month implementation period following regulatory approval. VAR-002 R1 or in the applicability section of the standard. This standard or requirement does not account for dispersed Generation (such as wind or solar as found in the new BES definition). These generators may not have traditional AVR, may only provide limited Reactive resources and the individual elements may not have AVR or be capable of operating in Voltage control mode. VAR-002-3 R2.3 Exelon believes it is reasonable to allow the GOP to monitor the voltage at the location specified in their TOP issued voltage schedule by allowing the GOP to monitor at a different location by applying a methodology for converting the voltage monitored; however, the conversion method should be communicated and agreed to by the Transmission Operator. There is not a one for one conversion between grid voltage and terminal voltage and both parties should agree on the conversion method and monitoring point to avoid any future audit or implementation issues. VAR-002-3 R3 Exelon agrees with the fifteen (15) minutes to allow a GOP time to resolve an issue before having to notify the TOP of a status or capability change; however, postponing the notification by 15 minutes to alleviate short term / nuisance notifications has the effect, as written, of shortening the notification window to 15 minutes. Fifteen minutes is not a reasonable timeframe for such notifications to occur,

especially in large dispersed fleet operators where the GOPs do not communicate directly to their TOP and must notify via a third party (e.g., an independent generation dispatching organization). Exelon suggests that the 30 minute notification timeframe for a status change on the AVR, PPS or alternative voltage controlling device be started following the inability to restore within 15 minutes. VAR-002-3 R4 Exelon suggests that the VAR SDT provide guidance to the industry on examples of reactive capability changes that would require notification to the TOP within 30 minutes after becoming aware of a change. The only guidance provided to date is in the VAR-002 Compliance Analysis Report dated August, 2010.
We understand that R3 and R4 are binary requirements, (did or did not notify in 30 minutes), but it seems unreasonable that a complete failure to notify would have the same VSL as a notification that is one or five minutes late.

SPP Standards Review Group
Robert Rhodes
Yes
We thank the drafting team for taking this stance in not establishing details in the VAR standards and relying on those that already exist within defined SOLs and IROLs. Adding additional detail here would be redundant and possibly conflicting with requirements in other standards.
Yes
We agree with the retirement of redundant requirements and suggest that the drafting team delete R2 and R3 in addition to the other deletions already proposed. R2 is redundant with the pending TOP-002-3, R1. R3 is redundant with pending TOP-001-2, R7 and R9.
Yes. We also offer the following comments on the two standards. Generic Comments on VAR-001-4 We recommend changing ‘real time’ in the Purpose to ‘Real-time’ as defined in the NERC Glossary of Terms. We suggest rewording R1.1 to the following: ‘Each Transmission Operator shall provide a copy of the voltage schedules as specified in R1 to its Reliability Coordinator and adjacent Transmission Operators within 30 calendar days of such a request.’ Although we have proposed deleting R2, if the drafting team decides to keep it, we recommend deleting the last sentence in R2. It is really an example and doesn’t contribute substantially to the requirement. We also recommended deleting R3 but if the drafting team decides to keep it, we suggest adding ‘to operate within SOLs and IROLs’ following ‘as necessary’ at the end of the requirement. The use of the term ‘direct’ in R3 and R5.1 lead to implications of issuing directives. To get away from this situation, we suggest substituting ‘instruct’ for ‘direct’. This change will also need to be reflected in the Measures and the VSLs. Since R4 contains an exemption for R5, we suggest reordering requirements R4 and R5 such that R5 becomes R4 and R4 becomes R5. That way the exemption follows the requirement. We suggest the drafting team delete the phrase ‘…at the Transmission Operator’s discretion.’ at the end of R5. We suggest changing ’associated’ to ‘applicable’ in and deleting the redundant phrase at the end of R5.1. The requirement would then read: ‘The Transmission Operator shall provide the voltage or Reactive Power schedule to the applicable Generator

Operator.' The Measure will also need to be revised to correspond with the revised requirement. We recommend adding 'for that criteria' following 'request' at the end of R5.3. We recommend changing the Time Horizon in R6 to Long-Term Planning since the Transmission Planner is typically the entity that will determine when a tap change is necessary and will notify the Transmission Operator that it needs to be done. In the Rationale Box for R6 there is a reference to VAR capability and tap setting. We suggest rewording that sentence to the following: 'If the tap setting is not properly set, then the VARs available from that unit can be affected.' The Severe VSL for R3 contains 'real-time'. It needs to be 'Real-time'. Generic Comments on VAR-002-3 The use of the term 'direct' in R2.2 lead to implications of issuing directives. To get away from this situation, we suggest substituting 'instruct' for 'direct'. This change would need to be reflected in the Measure 2.1 and 2.2 and the VSL also. We suggest changing the notification timing requirements in R3 to the Generator Operator must notify the Transmission Operator within 30 minutes of the change of AVR status unless the AVR has been restored to service. In the second sentence in the Rationale Box for R3, use 'provide' instead of 'provided.' In the Rationale Boxes for R5 and R6 there is a reference to VAR capability and tap setting. We suggest rewording that sentence to the following: 'If the tap setting is not properly set, then the VARs available from that unit can be affected.'
We suggest the following change for the High VSL for R2. The responsible entity did not have a conversion methodology when it monitored voltage…' We recommend replacing the word 'directive' with 'specification' in the Severe VSL for R6.
Individual
Texas Reliability Entity
Texas Reliability Entity
(1) Under the currently enforceable TOP standards, there is a requirement to operate within SOLs and IROLs (in TOP-004-2 R1). However, in the proposed TOP standards currently filed at FERC for approval, the wording of this requirement changed. In TOP-001-2 R8 thru R9, the TOP only has to operate within SOLs that "deserved increased attention" according to the rationale stated in the proposed Standard. What effect does that change have on these VAR requirements, and the stated rationales? (2) If it is the SDT's intent for R2 and R3 that the TOP operate within voltage SOLs, then we suggest rewording R3 to remove "as necessary" to say "within System Operating Limits" or "under normal and Contingency conditions" to match R2. (3) The VSL language for VAR-001-4 R2 and R3 does not match the wording in the requirements. If the intent is to require operation within SOLs and IROLs as suggested by the VSLs, then the requirements should expressly say so. If it is not, then the VSLs should be revised to match the requirements. (4) For VAR-001-4 R1 and R5, should there be a process to provide feedback to the TOP on the voltage schedule? For example, if the TOP sets the voltage schedule in a manner that requires the generator to be at or near a reactive limit for the unit, then the unit may not be able to provide the necessary reactive support under a contingency situation.
(1) The status and capability notifications in R3 and R4 may be directly or indirectly in conflict with TOP-005-2a Attachment 1, Item 1.2.4, IRO-005-3.1a R1.1 and R12, IRO-002-2 R5, IRO-003-2 R2, TOP-006-2 R1 and R2, TOP-008-1 R4 and possibly future TOP-003-2 R1. Will the TOP

and RC be able to satisfy their obligations under these other standards in view of the proposed GOP reporting parameters? (2) In VAR-002-3 R4, does the “reactive capability” include static capacitive or reactive devices that are behind the fence (for example, static capacitors and reactors installed on the low voltage feeders at wind plants to meet power factor requirements). Would this requirement apply to such devices if they are not included in the Bulk Electric System per the new BES definition?
Individual
Dave Willis
Idaho Power Company
Yes
Yes
Yes, exempting the intermittent outages of AVR’s and only requiring notification for extended interruptions is an improvement and lessens the documentation necessary to show compliance.
No
Group
ACES Standards Collaborators
Jason Marshall
Yes
Yes this is clear. We thank the drafting team for removing the duplication from the previous draft.
Yes
(1) Requirement VAR-001-4 R1 is vague and ambiguous and may be duplicative of VAR-001-4 R5. It requirements need further refinement. First, it states that the TOP shall specify “a system voltage schedule”. This is singular. A system always has multiple schedules for generators, capacitor banks, reactors, etc. It does not have a single voltage schedule. Second, what equipment or facilities is the voltage schedule supposed to apply? Is this supposed to be the voltage schedule for a generator? Is this supposed to the voltage for reactor or capacitor switching? Is this supposed to be the voltage limits on a transmission bus? Schedule would tend to imply a level of control and, thus, not a limit but the simple reality is that the requirement is vague, ambiguous, and unenforceable as written. Third, if the requirement applies to voltage schedules at generators, it is duplicative to VAR-001-4 R5 because this already compels the TOP to provide voltage schedules for generators. Please provide additional clarifications in the requirement. (2) We appreciate the drafting team removing duplicate requirements. This version of the standard has been improved greatly. However, we still believe there is some duplication that needs to be addressed. For example, VAR-001-4 R1 requires a TOP to “specify a system voltage schedule… as part of its plan to operate with System Operating Limits and Interconnection Reliability Operating Limits” while VAR-001-4 R2 requires the TOP to “schedule sufficient reactive resources to regulate voltage levels under normal and Contingency conditions”. How does a TOP specify a voltage schedule per R1 and

not also schedule sufficient reactive resources per R2? The TOP can't maintain the voltage schedule without scheduling sufficient reactive resources. Please eliminate the duplication. (3) VAR-001-4 R2 is also duplicative of VAR-001-4 R3. R2 requires the TOP to "schedule sufficient reactive resources to regulate voltage levels under normal and Contingency conditions" while R3 requires the TOP "to operate or direct the Real-time operation of devices to regulate transmission voltage and reactive flow". How does the TOP schedule sufficient reactive resources without regulating transmission voltage and reactive flow? The TOP would be operating the voltage-regulation devices when they schedule sufficient reactive resources since the voltage-regulation devices are reactive resources. If the purpose was to delineate by time frames implied by the use of "Real-time Operation" in R3 and "schedule" in R2, the requirements need further refinement to be clear that the targeted time frames are supposed to be different. Furthermore, the Time Horizons for both R2 and R3 are duplicate covering Real-time Operations, Same-day Operations, and Operational Planning which would imply that different time frames are not intended. Please eliminate the duplication or clarify the time frames as appropriate. Detailed application guidelines would help eliminate some of the confusion. (4) Part 1.1 meets P81 criteria and should be retired. The requirement meets Criterion A (overarching) because it "does little, if anything, to benefit or protect the reliable operation of the BES" and meets criterion B4 – Reporting because it requires the TOP to report to another party and has "no discernible impact on promoting the reliable operation of the BES." The mere fact that Part 1.1 only requires reporting upon receiving a request is supportive that it has no impact on reliability. If it did materially support reliability, the RC would be required to have the data and the TOP would be obligated to provide it. Please remove Part 1.1. If Part 1.1. persists in the next draft, we request that the drafting team provide written justification for why these requirements do not meet P81 criteria and actually materially support reliability. (5) Measure VAR-001-4 M2 is inconsistent with the main requirement R2 and needs to be modified. M2 proposed that the TOP shall have evidence of scheduling resources based on their system assessment. While we agree this is likely the method the TOP will use to schedule resources, the simple fact is that it is not part of the requirement and cannot be compelled in the measure. Please modify the measure to be consistent with the requirement. (6) The second sentence of R2 is an explanation and not a requirement. Thus, it should be moved to the application guidelines section. We understand that FERC previously directed NERC to include use of controllable load as a reactive resource because it was not one of the explicitly listed reactive resources. FERC likely included this statement as evidenced by the first sentence of paragraph 1879 of Order 693 to further a policy goal of expanding the use of demand side management (DSM). At the time the order was issued, DSM was in its infancy. Today, DSM has become ubiquitous as demonstrated by the almost 40,000 MW reported in the NERC 2013 Summer Assessment. Given that all organized markets include at least one DSM product, its proliferation will only continue. Thus, the policy goal has been clearly met and specific mention in NERC standards in no longer necessary. In fact, an equally efficient and effective alternative would be to eliminate specific references of any type of reactive resource by striking the second sentence in its entirety. (7) The Time Horizons for VAR-001-4 R3 are inconsistent with the requirement. R3 specifically states that it deals with Real-time operation. Thus, how could Operational Planning and Same-

day Operation be applicable? These timelines are conflicting and need to be modified. (8) For requirement VAR-001-4 R4, why can't the GOP make a self-determination that it meets the TOP criteria? Is the TOP obligated to make a determination or to simply supply the criteria to the GOP? The RSAW indicates that the auditor will not determine if the GOP received pre-authorization from the TOP. Thus, the requirement should either be modified so that audit practices will have to be modified or aligned with how the RSAW indicates compliance will be assessed. We recommend that the drafting team work with NERC compliance to align the requirement with the RSAW language. (9) VAR-001-4 R5 should be modified to clarify that the TOP is not required to provide a voltage schedule to all generators but only to those generators that it determines it needs to provide reactive supply. A TOP may determine that a generator is too small to control voltage at its location and that it does not need to provide a voltage schedule for this generator. Including all generators is unnecessary for reliability. (10) Part 5.3 meets a P81 criterion and should be retired. The requirement meets Criterion A (overarching) because it "does little, if anything, to benefit or protect the reliable operation of the BES" and meets criterion B4 – Reporting because it requires the TOP to report its criteria to another party and has "no discernible impact on promoting the reliable operation of the BES." The mere fact that Part 5.3 only requires reporting upon receiving a request is supportive that it has no impact on reliability. If it did support reliability, the GOP would be required to have the data. Please remove Part 5.3. If Part 5.3 persists in the next draft, we request that the drafting team provide written justification for why these requirements do not meet P81 criteria and actually materially support reliability. (11) We request that R6 be modified to state that the timeframe shall be mutually agreeable. The TOP is only required to consult with the GO and could still provide an unreasonable timeframe after such consultation. At the very least, the requirement needs to be clear that the GO and GOP are not obligated to take an outage to implement tap changes and would be allowed make them at the next scheduled maintenance or forced outage with sufficiently long outage window to allow such changes. (12) The evidence retention section needs to be updated. First, it covers only measures one through four when there are actually six. Second, it covers measures when it should cover requirements to be consistent with existing standards. (13) As written, the VSL for R1 is overly harsh. If a TOP simply failed to create a single voltage schedule, it would be a severe violation. It seems the VSLs could be graduated based on the number of voltage schedules that are not created as a percentage of the total voltage schedules. (14) The VSLs for R2 and R3 are inconsistent with the requirement. The High VSL and Severe VSL mention avoiding violating an SOL or IROL respectively. However, the requirement mentions neither. This would be inconsistent with FERC guideline three that VSLs should be consistent with the corresponding requirement. (15) The High and Severe VSLs for R2 and R3 overlap with one another. High VSLs for both requirements apply to SOL violations and Severe VSLs for both requirements apply to IROL violations. By definition in the NERC glossary, an IROL is a subset of a SOL. Thus, a failure to schedule or operate reactive resources that results in an IROL violation would be both a High and Severe violation simultaneously. (16) From a compliance perspective, the High VSL for VAR-001-4 R4 is a logical fallacy. Compliance requires evidence. Thus, an auditor cannot make a determination that a TOP has exemption criteria but does not have evidence of exemption criteria. Thus, the High VSL could never be assigned by a

compliance enforcement authority. This needs to be modified. (17) The VSLs for VAR-001-4 R5 need to be modified. In the FERC order approving VSLs, FERC was clear that as many VSLs as possible should be used. Clearly, each VSL could be assigned based on the number of GOPs that the TOP failed to provide voltage schedules. This essentially means that the High VSL should be graduated. We disagree with assigning a moderate VSL for the failure of a TOP to provide its criteria in response to Part 5.3 by one minute. As written, the TOP could literally be one minute past the 30 day time frame and reach a moderate violation. This should not even be a violation let alone a Moderate VSL. The solution is to remove Part 5.3. If Part 5.3 persists, at a minimum, the VSL should be Lower because reliability is not impacted. The second half of the Severe VSL regarding not supplying the notification requirements to the GOP should be moved to Moderate VSL. Failure to provide voltage schedules misses significantly more of the spirit of the requirement than failure to provide exemption criteria. The purpose of failure to provide exemption criteria is an attempt to avoid nuisance violations not directly support reliability. (18) In the regional variances section, E.A. 16 and E.A. 17 meet P81 criteria and should be removed from the next draft. The purpose of these two requirements is to provide transparency between the GOP and TOP in determining voltage schedules and implementation of voltage schedules. While establishing transparency is certainly a laudable goal, it simply does not directly support reliability. Thus, these two regional variance requirements meet Criterion A (overarching) because they do little, if anything, to benefit or protect the reliable operation of the BES and meet criterion B4 – Reporting because they require the TOP and GOP to report to each other. (19) It is unnecessary to require the TOP to direct the Generator Operator to comply with the voltage schedule with the AVR in voltage control mode in VAR-001-4 Part 5.1. It is redundant with VAR-002-3 R2 which compels the GOP to follow the voltage schedule. If drafting team feels the “directive” language is necessary in VAR-001-4 Part 5.1, then VAR-002-3 R2 should be removed because it would be redundant with TOP-001-1a R3 (existing) and TOP-001-2 R1 (pending regulatory approval). Both require the GOP to follow the directives of its TOP.

(1) Consistent with our comment number 9 in question 2, VAR-002-3 R2 and Part 2.1 need to be modified so that the GOP is only required to follow the voltage schedule if provided by the TOP. It is not desirable for the TOP to provide all generators voltage schedules. As an example, the TOP may determine it does not need to provide a voltage schedule to a small generator. To consider this situation, the clause “if a voltage schedule is provided by the TOP” could be added to both Part 2.1 and the main requirement. (2) VAR-002-3 R5 meets multiple P81 criteria and should be removed. It meets Criterion A (overarching) because it does little, if anything, to benefit or protect the reliable operation of the BES and meets B2 – Data Collection/Data Retention and B4 – Reporting because it requires the GOP to gather their tap setting information and report it to a third party (i.e. its TOP) which is unnecessary to implement as a reliability requirements. A GOP is not going to refuse to provide data to its TOP on its generator step up transformer in a compliance driven world. In fact, making this data subject to compliance slows the free exchange of the information because of all the extra checking that goes into managing (i.e. verifying, checking, storing) compliance documentation. This requirement also meets B7 – Redundant because the TOP can specify this data in its data specification per TOP-003-2 R1, distribute to the GO per TOP-003-2 R3 and then GO would

have to respond per TOP-003-2 R5. (3) VAR-002-3 Part 6.1 meets a P81 criterion and should be struck. It meets Criterion A (overarching) because it does little, if anything, to benefit or protect the reliable operation of the BES and meets B4 – Reporting because it requires the GO to report a technical justification for not implementing tap changes. This technical justification simply does not support reliability. The TOP can make adjustments to other voltage schedules to account for the GO's inability to implement the tap changes. What is the purpose of the GO providing the TOP a technical justification? Is it to provide the TOP some assurance there is a technical reason for failing to implement the tap changes? In a compliance driven world, the TOP can reasonably expect the GOP to implement the tap changes unless the changes would violate safety, equipment limits, regulatory or statutory requirements since these only the only deviations allowed by the main requirement. The threat of sanctions assures this. Furthermore, the GOP may legitimately not have a "technical" justification because a regulatory requirement is a legal justification not a technical justification. (4) The RSAW for VAR-002-3 indicates that compliance assessment for R4 could be vague and result in inconsistent outcomes. The RSAW indicates that the auditor will look for evidence when the GOP became aware of changes. If the entity's data historian or another piece of evidence indicates a reactive capability change occurred at a certain time, does this mean that the entity is aware? We think the answer is no. The entity is only aware when its personnel become aware and not when a measurement first records that something is askew. Furthermore, we believe personnel should be limited to the plant operators in the control room who have overall responsibility. Any evidence review for when the entity became aware should be limited to plant operator logs because this evidence will most closely demonstrate what the plant operator knew based on information provided and will not be as likely to be second-guessed on what the plant operator should have known. (5) VAR-002-3 R2 will be problematic for some GOPs because it does not reflect the characteristics of the voltage schedule provided by some TOPs. For example, some TOPs provide an hourly average voltage schedule to avoid the need for notification for every time the GOP drifts out of schedule. How would R2 be applicable in this situation? Would it only apply for the first 15 minutes of each hour looking back at the last hour? Please modify the requirement accordingly to address this issue.
We do not support the VSLs for R5 because it meets P81 criteria and should be removed. We also do not support the VSLs for requirements that need modifications as identified in question 3.

We support this direction and the SDT's decision to not reiterate or duplicate the voltage assessment requirements already addressed by the FAC and TOP standards.
Yes
We support the SDT's proposal to remove the requirements that may be redundant with other standards. We do not have any comments on the requirements, Measures or VRFs, but we do have some comments on the VSLs: a. R1: The word "schedule" after "system voltage" is missing from the VSL. b. There is inconsistency in the tense used in various VSLs – some are in present tense while others in past tense. Please review and revise as appropriate.
We assess the changes proposed under Q2 and Q 3, above, are not substantive and do not materially change the intent or content of the standards. Therefore, if the standards receives 2/3 majority approval at the ballot, these changes can be implemented and posted for recirculating ballot without having to post and ballot the standards for a successive ballot. We agree with most of the proposed changes, but would suggest the following changes to more effective convey the intent of Requirement R3 and Measure M3. a. R3: The wording "the Generator Owner shall ensure that transformer tap positions are changed according to the specifications provided by the Transmission Operator" is not a direct action and may not be measurable. We suggest to revise it to read: "the Generator Owner shall implement the transformer tap positions according to the specifications provided by the Transmission Operator…." b. M3: We suggest it be reworded to require demonstration of compliance rather than to require actions which should have been stipulated in the requirement. Specifically, we proposed the last part in Measure M3 be revised to: "…therefore, if a status change lasts more than 15 minutes, the GOP shall provide evidence such as system log, electronic message or a transmittal letter that it notified its associated Transmission Operator within 30 minutes of when the change first occurred." We further propose that the SDT insert the evidence language into the first sentence of Measure M3 which asks for evidence that the Generator notified its associated Transmission Operator within 30 minutes of the change identified in Requirement R3.
We support the proposed VRFs and VSLs.

Ingleside Cogeneration LP
Yes
Yes
Yes,Ingleside Cogeneration agrees that there must be reasonable notification criteria controlled by TOPs that allows them to specify when notification of change in AVR or reactive resource status is necessary. In many cases, the status is telemetered in real-time, but a call is required anyways to specify the expected duration of the status change. This is overcommunication in most cases, and only serves to tie up resources at the GOP and TOP. The same is true of notifications when the GOP cannot maintain the voltage at the interconnection point. Many GOPs do not control interconnection voltage and could actually resist an adjustment that the TOP is trying to make in response to system conditions. Again, some reasonable notification criteria could stop a lot of nuisance calls under these circumstances.

CenterPoint Energy, Houston Electric LLC.
Yes
CenterPoint Energy believes the language proposed in R1 supplemented by the rationale for R1 is clear in stipulating that a Transmission Operator specified voltage schedule must operate within the boundaries of System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs). What is missing from this standard is the coordination that occurs between the Reliability Coordinators, Transmission Operators, and Generator Operators in defining voltage schedules that do not violate established SOLs and IROLs. Transmission Operators have capabilities to monitor, study, and control their systems but do not have the complete data that a Reliability Coordinator uses to establish SOLs and IROLs. Furthermore, the Reliability Coordinator establishes a baseline voltage profile for the Reliability Coordinators area and its Transmission Operators to review before the schedule is finalized, distributed, and posted. CenterPoint Energy believes that Voltage and Reactive standards that apply strictly to the TOP and/or the GOP and GO create a possible misalignment in the operation of the Bulk Electric System. Moving forward with these standards only to address

the RC's applicability to the monitoring and control of voltage and reactive at a future date would not accurately reflect the industry's Real-Time operation with respect to voltage and reactive processes and does not align with NERC's Functional Model definition and relationships of an RC with other Functional Entities. CenterPoint Energy appreciates the efforts of the Standard Drafting Team and recommends the following requirement lanauge to add the Reliability Coordinator back into the applicability of the standard: "Each Transmission Operator shall coordinate with the applicable Reliability Coordinator to specify a system voltage schedule (which is either a range or a target value with an associated tolerance band) as part of its plan to operate within System Operating Limits and any Interconnection Reliability Operating Limits established by the applicable Reliability Coordinator."
Yes
CenterPoint Energy agrees with the SDT's efforts to eliminate duplicated standards, but has the following concerns. R1.1 is unclear on the applicability of the "30 days of a request." Is the requirement for Transmission Operators to provide their perspective Reliability Coordinators the voltage schedule automatically without a request and only to any adjacent Transmission Operators that requests the schedule within 30 days of the request; or is it the intent of the SDT for the Reliability Coordinator to also request the Transmission Operator for the schedule with the same "30 days of request" requirement. In order for a TOP to obtain evidence to prove compliance to this requirement, a TOP must receive documentable requests from its RC and/or its adjacent Transmission Operators to then provide the voltage schedule within the 30 days of the request. If the Transmission Operators do not receive such requests then essentially according to the standard they do not have to provide the established voltage schedules as the requirement currently specifies. Many Reliability Coordinators or regions have established voltage working groups with processes or its equivalence to aid in the corroboration and defining of company specific voltage schedules within the RCs area or region then such voltage schedules would already be provided as part of the regional processes. CenterPoint Energy recommends the following clarifying language: "If requested, Eeach Transmission Operator shall provide, a copy of the voltage schedules and associated tolerance bands to its Reliability Coordinator and adjacent Transmission Operators within 30 calendar days of such a request." CenterPoint Energy agrees with providing the Generator Operators the voltage or Reactive Power schedule; however, we believe R5.1, which also requires the Transmission Operator to direct the Generator Operators to comply with such schedule to the specificity that the AVR be in automatic voltage control mode, is redundant and is an unnecessary requirement as well as a compliance burden for the Transmission Operators. Exemptions to the Generator Operator to deviate from the established voltage schedule or the Automatic Voltage Regulator functioning in any mode other than automatic voltage control are addressed in R4 and VAR-002-3 R1 and R2 and will be handled in Real-Time operations and will be scenario specific. VAR-002 R1 and R2 requires Generator Operators to maintain the voltage or Reactive Power schedule and operate each generator with its AVR in service and in the automatic voltage control mode. Based upon this redundancy and Paragraph 81 criteria regarding duplicative and redundant requirements CenterPoint Energy recommends removal of the language "…and direct the Generator Operator to comply with the schedule in automatic voltage control mode (the AVR is in

service and controlling voltage)”.
Yes, CenterPoint Energy agrees with these revisions to VAR-002 removing compliance issues that address burdensome notification requirements, allowing the Transmission Operator, through VAR-001 to tailor notification requirements based on system/area needs.
CenterPoint Energy believes the VSLs associated with VAR-001 R2 and R3 do not consider changes in Real-Time topography such as forced outages, Resource inadequacy, or changes in weather that can drastically change the outcome of any planned or studied environment in both normal and emergency operations. A transmission operator could have scheduled sufficient reactive resources as necessary and have them available to mitigate known and identified SOLs or IROLs, but cannot schedule sufficient reactive resources for the unknown. CenterPoint energy suggests adding “identified” to the VSL language. “The Transmission Operator does not schedule sufficient reactive resources as necessary to avoid violating an identified SOL or IROL”. CenterPoint energy believes that the High VSL for R4 is inappropriate and is indicative of a zero tolerance environment. If a Transmission Operator has an exemption criteria established, notifies the Generator Operator of such exemption, and captures evidence for compliance to prove notification 99 times out of 100, then the one instance in which the TOP notified the Generator Operator, but failed to capture evidence would warrant a High VSL possible violation.

PJM Interconnection
Yes
Yes
PJM recommends the drafting team revise R1 as follows: Each Transmission Operator shall specify a system voltage schedule. The remaining language in that requirement is not needed to support reliability. PJM does not understand the scope of controllable load in R2. We urge the drafting team to include clarification. For R3, PJM recommends revision to the Time Horizon to include Real Time only. PJM recommends the following addition to R5 as the last phrase in the requirement for consistency with R4 language. “unless otherwise exempted as noted in R4.”
Yes.

Sergio Banuelos
Tri-State Generation and Transmission Association, Inc.
No

Yes
In the draft of VAR-001-4 R2 the use of the word 'schedule' when referring to all reactive resources is unclear. This is in conjunction with the Compliance response to question 2 part 2, "…provide the documentation for the day ahead scheduling in addition to documentation supporting that it was scheduled..." found in the NERC document Draft Reliability Standard Compliance Guidance for VAR-001 and VAR-002 dated July 8, 2013. Is it the ad hoc group's intent to have a schedule for all reactive resources including capacitors, reactors, Static var Compensators and generators? Is the schedule meant to be similar to that of a generator (i.e. Insert capacitors at 1.0pu and remove at 1.05) or on a time base? Is schedule just supposed to take into account availability of all reactive resources? Also TSGT believes the statement "(at either the high or low side of the Generator Step-Up transformer at the TOP's discretion)" currently in VAR-001-4 R4 to should be changed to "(at an agreed upon metering point to which the GOP has direct access)." For VAR-001-4 R6 why did the ad hoc group not change the consultation requirement from GO to GOP? Tri-State believes that this information would better serve the GOP function particularly at Co-Owned facilities. This change would not have a negative effect on the reliability of the BES would reduce duplicative notification to be administered by the TOP.
For VAR-002-3 R5 TSGT believes the TOP should consult with the GOP rather than the GO to better align requirement R5 with its subrequirement R5.1.

Mary Lou Ideus
EDP Renewables North America LLC
Yes
Yes
Yes. EDPR NA believes it is important for TOPs to have the flexibility to tailor its requirements, as long as there is sufficient coordination among affected entities. We also offer the following comment: VAR-002 R1: We support the concept that a GOP need not notify its TOP that its AVR is out of service if it has previously advised its TOP that it will not have its AVR in service during start-up and shut-down. We recommend that similar provision be made for variable energy resources which are not able to provide voltage support when operating in similar circumstances. Wind farms, for example, generally have equipment limitations that can affect their ability to follow voltage schedules when operating at low levels. Wind farms will not telemeter a different status in that circumstance, however. We propose that, if a variable energy resource has notified its TOP of equipment limitations that affect its ability to follow a voltage schedule until it achieves a certain level of production, also not be required to notify the TOP that its AVR is out of service.
No.

Yes
The SDT considered standards put in place after Order 693 was issued and avoided overlapping FAC and TOP standards. The SDT did include the tolerance band requirement to be consistent with voltage limit requirements in other standards.
Yes
There are two questions under Question #2. BPA answered the first question in the check box. BPA's answer to the second part of the question is No.
Yes. Comments: BPA requests further clarification of VAR-002-3 R3 and M3, to be revised such that a status or capability change in generator Reactive Power should be reported within 30 minutes from an entity becoming aware of the change in condition, rather than the current form, which is 30 minutes from the change in condition.

Consideration of Comments

Project 2013-04 Voltage & Reactive Control

The Project 2013-04 Voltage & Reactive Control Drafting Team thanks all commenters who submitted comments on the draft VAR-001-4 and VAR-002-3 standards. These standards were posted for a 45-day public comment period from October 11, 2013 to November 25, 2013. Stakeholders were asked to provide feedback on the standards and associated documents through a special electronic comment form. There were 58 sets of comments, including comments from approximately 165 different people from approximately 107 companies representing 8 of the 10 Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at mark.lauby@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/comm/SC/Documents/Appendix_3A_StandardsProcessesManual.pdf

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 — Regional Reliability Organizations, Regional Entities

Organization	Agree	Supporting Comments of "Entity Name"
Santee Cooper		We agree with the comments of the North American Generator Forum.

1. **Although FERC directed NERC to provide more details on "established limits," the VAR standards development team determined that the FAC and TOP standards provide explicit requirements on voltage limits. Further, the definition of a System Operating Limit requires Voltage Stability Ratings (Applicable pre- and post-Contingency Voltage Stability) System Voltage Limits (Applicable pre- and post-Contingency Voltage Limits) to be included. Is it clear that the specifics with regard to voltage limits are to be determined and monitored as part of operating within System Operating Limits and Interconnection Reliability Operating Limits?**

Organization	Yes or No	Question 1 Comment
Tri-State Generation and Transmission Association, Inc.	No	
Northeast Power Coordinating Council	Yes	We support the direction being taken and the SDT's decision to not reiterate or duplicate the voltage assessment requirements already addressed by the FAC and TOP standards.
Response: Thank you for your comments. The VAR SDT determined that SOLs and IROLs will cover voltage limits as needed in Order No. 693.		
ISO/RTO Standards Review Committee	Yes	We support this direction and the SDT's decision to not reiterate or duplicate the voltage assessment requirements already addressed by the FAC and TOP standards.
Response: Thank you for your comments.		
Electric Reliability Council of Texas, Inc.	Yes	ERCOT agrees it is clear voltage limits are to be monitored as either SOLs or IROLs. However it seems the SDT could make more changes to clear up more items.A. VAR-001 R3 grammatical: recommend deleting "as necessary" from this sentence. It adds no value and is not needed.B. It appears VAR-001 R4 allows the TOP to not comply with the VAR Standards by utilizing exemptions?

Organization	Yes or No	Question 1 Comment
Response: Thank you for your comments. The phrase "as necessary" was retained because several TOPs do not intervene and direct devices unless the other applicable entities have not taken other steps to control voltage as necessary or required by various other standards. The exemptions provide a mechanism for TOPs to give exemptions based on system needs and individual GOP characteristics. R4 provides exemptions for GOPs from: 1) following a schedule; 2) being in voltage control mode; or 3) providing particular notifications. Based on industry input the standards needed specificity on the types of exemptions that a TOP can provide.		
Independent Electricity System Operator	Yes	We support this direction and the SDT's decision to not reiterate or duplicate the voltage assessment requirements already addressed by the FAC and TOP standards.
Response: Thank you for your comments.		
Southern Company: Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing	Yes	R1: The modifications in this version of VAR-001 R1 are good because they standards that are now enforceable, particularly FAC-011 and FAC-014.M2: All Transmission Operators are required to run contingency analysis on the real time system on a periodic basis per TOP-008-1 R4. We suggest modifying VAR-001 M2 to state: "If the assessment is performed in the Operations Planning Horizon, Transmission Operators shall provide copies of assessments used as the basis for how resources were scheduled." M3: Actions are not always required to be taken because of automatic settings of reactive devices. We suggest modifying VAR-001 M3 to state: "Each Transmission Operator shall have evidence that actions were taken as necessary to operate capacitive and inductive resources as needed in Real-time. This may include directions to Generator Operators to: 1) provide additional voltage support; 2) bring resources on-line; or 3) make manual adjustments."R5.3 states, "The Transmission Operator shall provide the criteria used to develop voltage schedules and associated tolerance bands to the Generator Operator within 30 days of receiving a request." We suggest that this requirement is removed due to administrative burden.

Organization	Yes or No	Question 1 Comment
		We recognize the need for transpency; however, this requirement does not serve a reliabity purpose.
Response: Thank you for your comments. Since FERC recently proposed remanding the most recent TOP filing, the TOP and VAR interplay will be further evaluated. However, the concerns with regard to TOP-008-1 will be conveyed to Compliance for a future iteration of an RSAW and auditor training. Requirement R5, part 5.3 could not be removed because that specially addresses a FERC directive for VAR-002. Part 5.3 demonstrates who a TOP will provide technically justified schedules.		
Bonneville Power Administration	Yes	The SDT considered standards put in place after Order 693 was issued and avoided overlapping FAC and TOP standards. The SDT did include the tolerance band requirement to be consistent with voltage limit requirements in other standards.
Response: Thank you for your comments.		
SPP Standards Review Group	Yes	We thank the drafting team for taking this stance in not establishing details in the VAR standards and relying on those that already exist within defined SOLs and IROLs. Adding additional detail here would be redundant and possibly conflicting with requirements in other standards.
Response: Thank you for your comments.		
ACES Standards Collaborators	Yes	Yes this is clear. We thank the drafting team for removing the duplication from the previous draft.
Response: Thank you for your comments.		
CenterPoint Energy, Houston Electric LLC.	Yes	CenterPoint Energy believes the language proposed in R1 supplemented by the rationale for R1 is clear in stipulating that a Transmission Operator specified voltage schedule must operate within the boundaries of System Operating Limits (SOLs) and Interconnection Reliability Operating Limits

Organization	Yes or No	Question 1 Comment
		(IROLs). What is missing from this standard is the coordination that occurs between the Reliability Coordinators, Transmission Operators, and Generator Operators in defining voltage schedules that do not violate established SOLs and IROLs. Transmission Operators have capabilities to monitor, study, and control their systems but do not have the complete data that a Reliability Coordinator uses to establish SOLs and IROLs. Furthermore, the Reliability Coordinator establishes a baseline voltage profile for the Reliability Coordinators area and its Transmission Operators to review before the schedule is finalized, distributed, and posted. CenterPoint Energy believes that Voltage and Reactive standards that apply strictly to the TOP and/or the GOP and GO create a possible misalignment in the operation of the Bulk Electric System. Moving forward with these standards only to address the RC's applicability to the monitoring and control of voltage and reactive at a future date would not accurately reflect the industry's Real-Time operation with respect to voltage and reactive processes and does not align with NERC's Functional Model definition and relationships of an RC with other Functional Entities. CenterPoint Energy appreciates the efforts of the Standard Drafting Team and recommends the following requirement lanauge to add the Reliability Coordinator back into the applicability of the standard: "Each Transmission Operator shall coordinate with the applicable Reliability Coordinator to specify a system voltage schedule (which is either a range or a target value with an associated tolerance band) as part of its plan to operate within System Operating Limits and any Interconnection Reliability Operating Limits established by the applicable Reliability Coordinator."
Response: Thank you for your comments. The VAR SDT recognizes the ERCOT roles of the Reliability Coordinator, but it is the VAR SDT's understanding that the coordination between the RC and TOP are handled by registration or contract. Further, the next project addressing the IRO family of standards will address the RC functions.

Puget Sound Energy		- The implementation period might be as short as one day as the Effective Date section is currently formulated. For example, if approval occurs on 12/31/2013, the first day of the first calendar quarter after that date would be 1/1/2014. A short implemen
Response: Thank you for your comments. For the United States, if the VAR-001 standard passes a final ballot in December, the standard would not be presented to the Board of Trustees until February. It is not until the Board of Trustees approves the standard that the new standards would even be filed with FERC. FERC has not typically issued an order on a standards filing within six months. Therefore, it is unlikely that these VAR standards would even be able to go into effect before April 2014 in the United States.		

2. Several requirements were removed because they duplicated other standards. Do you agree with this approach? Do you have any specific questions or comments relating to the requirements in the revised VAR-001-4?

Organization	Yes or No	Question 2 Comment
American Electric Power	No	
Public Service Enterprise Group	No	1. R4 and part 4.1 address generator exemptions. R4 requires TOPs to develop criteria for exempting generators from R5, part 5.1. Those criteria should be made available. However, TOPs, not generators, must comply with R5, part 5.1. If the SDT's intent is to exempt specific generators from following a voltage or Reactive Power schedule, we suggest the following rewrite for R4, with no change to part 4.1:R4. Each Transmission Operator shall specify the generator criteria that will exempt Generator Operators of generators that meet these criteria from compliance with the requirement to maintain a voltage or Reactive Power schedule and publish or provide such criteria upon request.M4 would have to be rewritten, with item 2) and item 3) deleted. Because 1) exempts a generator from having to meet a voltage of Reactive Power Schedule and 2) exempts a generator from having its automatic voltage regulator (AVR) in service or from being in voltage control mode, being exempt from having to meet a voltage schedule in 1) is equivalent to being exempt from 2). Item 3) is addressed by exemptions stated in VAR-002-3, R1 and R2.2. R5, part 5.1 should have the phrase "in automatic voltage control mode (the AVR is in service and controlling voltage)" stricken since it would not apply to a Reactive Power schedule. In addition, the TOP should not be required to provide voltage or Reactive Power schedules to exempt generators under part 5.1. Finally, the text box for R5 refers to maintaining a schedule for "normal operations." "Normal operations" is a critical assumption, which we believe is equivalent to "normal operating conditions." For example, a generator that experiences a fault on its GSU will be outside of any

Organization	Yes or No	Question 2 Comment
		voltage or Reactive Power schedule during that fault. Therefore, part 5.1 should be rewritten:5.1. Except for exempt generators, the Transmission Operator shall provide the voltage or Reactive Power schedule for the associated Generator Operator and direct the Generator Operator to comply with the schedule during normal operating conditions.3. R5, part 5.3 should have the phrase "or Reactive Power" inserted after "voltage."
Response: Thank you for your comments. Exemptions are based solely on the exemption criteria set by the TOP. The language in R4 is broader than the proposed language, and the VAR SDT wanted to provide TOPs with the latitude for providing exemptions as necessary. R4 provides exemptions from: 1) voltage schedules, 2) being in voltage control mode, or 3) any notification requirements. However, an exemption from a schedule does not necessarily equate to an exemption from an AVR setting. Also, since VAR-002 did not pass successive ballot, there is no exemption mechanism in place in VAR-002. Finally, the phrase "or Reactive Power" is being added as clarification to R5.3.		
The United Illuminating Company	No	Please note that my affirmative ballot vote was in error. We are voting NO on VAR-001.Since there is no catchall section for comments on VAR-001, we are providing comments here. Although We do agree with the removal of duplicative requirements, we are voting No on VAR-001.VAR-001 R2 remove everything after the but not limited to phrase. The various methods to obtain reactive power do not belong in the requirement but they can be included in the measure.VAR-001 R3: Clearly this is something a TOP perfroms but the compliance evidence will be overwhelming. The TOP is being asked to demonstrate that it has constantly monitored reactive and provided direction to operate reactive devices. This will require the retention of the evidence of why a reactive adjustment was necessary as well as the various adjustments made. This would mean maintaining snapshots of the normal operation of the system, records of adjustments, corrections, etc.
Response: Thank you for your comments. The draft RSAW clarifies how this requirement would be evaluated during an audit, but the compliance concerns will be conveyed for future iterations of the RSAW and auditor training.		
American Transmission	No	ATC agrees with the approach in removing any duplicate requirements.ATC also has a

Organization	Yes or No	Question 2 Comment
Company, LLC		couple comments and is recommending the following changes for the drafting team to consider:1. For consistency, Measure M2, 2nd sentence should be reworded as follows: “For the operational planning time horizon, Transmission Operators shall “have evidence of assessments” used as the basis for how resources were scheduled” The current wording of “shall provide copies” imposes an action that is not included in the associated requirement R2. 2. The following from requirement R2: “Transmission Operators can provide sufficient reactive resources through various means including, but not limited to, reactive generation scheduling, transmission line and reactive resource switching, and using controllable load” implies that all of the items listed need to be considered. If the intent is that the items are intended to be examples it is suggested that the words “including , but not limited to” be replaced by “such as”.
Response: Thank you for your response. M2 will be updated to clarify that TOPs shall have evidence of assessments, rather than provide copies of assessments. The list in R2 was originally added to answer a FERC directive on including controllable load. It was approved in an earlier version of VAR-001, so the SDT retained the same list for R2.		
Ameren	No	We request that the SDT leave the language as currently used in VAR-001-2, R4.
Response: Thank you for your comments. VAR-001-2 R4 does not allow for notifications when deviating from voltage schedules, and the VAR SDT improved on that standard language by requiring the TOP to provide more data such as notifications and criteria for schedules upon request.		
Hydro-QuÃ©bec Production	No	The requirement number five has to be removed, the reactive power of an auxiliairy transformer unit has a little impact on the ability of a groupe or plant to provide the reactive power required by the network.
Response: Thank you for your comments. VAR-002 did not pass the last ballot, and the VAR SDT will consider this during the next successive ballot.		
MRO NSRF	Yes	In requirement 5.1 a Transmission Operator is required direct a Generator Operator

Organization	Yes or No	Question 2 Comment
		to "comply with the schedule" provided by the Transmission Operator. In 5.2, however, the potential for deviations from the schedule is implied. To avoid conflict between these two, the following change to 5.1 is recommended: "The Transmission Operator shall provide the voltage or Reactive Power schedule to the associated Generator Operator and direct the Generator Operator to comply with the schedule in automatic voltage control mode unless notification of deviation is provided in accordance with 5.2."For consistency M2 should be reworded as follows: "For the operational planning time horizon, Transmission Operators shall have evidence of assessments used as the basis for how resources were scheduled" The current wording of "shall provide copies" imposes an action that is not included in the associated requirement. In previous comments regarding voltage schedules issued by a Transmission Operator a mechanism for a Generator Operator to provide explanations if a proposed schedule could not reasonably be met based on specific equipment limitations and to get a revised schedule or exemption was suggested. In this version the Transmission Operator is obligated to provide additional information about the schedule, but is not obligated to respond to Generator Operator concerns regarding the schedule. Under VAR-002 a Generator Operator is required to comply with the schedule provide by the Transmission Operator unless notification is provided. There then is the potential situation where a schedule issued by a Transmission Operator cannot be met due to equipment or system conditions and the only action available is for a Generator Operator to provide multiple notifications. A better solution it seems would be to include some sort of feedback process between Generator Operators and Transmission Operations in the VAR-001 standard that would result in an agreed-upon schedule that could reasonably be met without burdensome periodic notifications. As recommended in previous comments a process of reaching "mutual agreement" on the schedule for making transformer tap changes is suggested . The SDT responded in the consideration of comments that they did not chose to include the suggested agreement language but did add a requirement for the transmission operator to provide an "implementation schedule". While this change is an improvement it does not completely solve the concern

Organization	Yes or No	Question 2 Comment
		presented. The objective should be that a tap change schedule is agreed upon that would meet the reasonable needs of both the Transmission Operator and Generator Operator. The following from requirement R2: "Transmission Operators can provide sufficient reactive resources through various means including, but not limited to, reactive generation scheduling, transmission line and reactive resource switching, and using controllable load" implies that all of the items listed need to be considered. If the intent is that the items are intended to be examples it is suggested that the words "including , but not limited to" be replaced by "such as".It is recommended that R5.1 be modified as recommended by the NERC IGVT report of September 2012: 5.1. The Transmission Operator shall provide the voltage or Reactive Power schedule to the associated Generator Operator and direct the Generator Operator to comply with the schedule in automatic voltage control mode (the AVR or plant-level volt/var regulator is in service and controlling voltage). The standard should be reviewed and where AVR is referred to, the plant-level volt/var regulator should be added in a similar way to this recommended change to R5.1. The referenced NERC report provides the technical basis for this recommendation.
Response: Thank you for your comments. M2 has been modified to incorporate your suggestions. The VAR SDT determined that the mutually-agreed upon schedule could undermine TOP authority, and the VAR SDT also determined that AVR is a sufficiently broad term to encompass plant-level volt/VAR.		
Northeast Power Coordinating Council	Yes	We support the SDT's proposal to remove the requirements that may be redundant with other standards. However, regarding VAR-001-4 Requirement R1 was revised to read:R1. Each Transmission Operator shall specify a system voltage schedule (which is either a range or a target value with an associated tolerance band) as part of its plan to operate within System Operating Limits and Interconnection Reliability Operating Limits 1.1 Each Transmission Operator shall provide a copy of the voltage schedules and asspociated tolerance bands to its Reliability Coordinator and adjacent Transmission Operators within 30 calendar days of a request.What is meant by "system voltage schedule." Is it a highâ€ level, overall voltage schedule by voltage class, or a voltage schedule by station (even if there is no direct means of

Organization	Yes or No	Question 2 Comment
		controlling voltage at that station)? Requirement R5 already addresses specification of generator voltage schedules, so if that is what is intended to be addressed under R1, why is R1 needed at all? Requirement R5 states:R5. Each Transmission Operator shall specify a voltage or Reactive Power schedule (which is either a range, or a target value with an associated tolerance band) at either the high voltage side or low voltage side of the Generator Step-Up transformer at the Transmission Operator's discretion.There is inconsistency in the tense used in various VSLs. Some are in present tense while others are in the past tense. This should be reviewed and and revised as appropriate."Schedule" is used in both VAR-001 Requirements R1 and R5. However, it is modified by different phrases in each, implying different types of "schedules." These two different types of "schedules" have caused confusion, making the use and intended meaning less than perfectly clear. VAR-001 Requirement R1 - To improve clarity and consistency, suggest that the word "schedule" be deleted here and only be used when referring to GOP operation. Suggest revising Requirement R1 wording as follows:R1. Each Transmission Operator shall specify a system voltage range or a target value with an associated tolerance band as part of its plan to operate within System Operating Limits and Interconnection Reliability Operating Limits.Note that Requirement R1 only requires that the TOP establish the target system voltage level and tolerance band. There is no mention of GOP operation.Requirement R2 requires that the TOP schedule its arrangement of sufficient reactive resources, whether actually used (dispatched) or not, a Planning function (see Measure M2). The Rationale box states: "to ensuring sufficient reactive resources are online or scheduled." The use of the word "scheduled" here again has caused confusion. We suggest it be replaced to clarify the meaning, as follows: R2. Each Transmission Operator shall make arrangements for sufficient on-line, available reactive resources to regulate voltage levels under normal and Contingency conditions. Transmission Operators can provide sufficient reactive resources through various means including, but not limited to, making arrangements for reactive generation resources, transmission line and reactive resource switching, and using controllable load. Further recommend revising M2 to synchronize it with the revised

Organization	Yes or No	Question 2 Comment
		Requirement R2 above, as follows:M2. Each Transmission Operator shall have evidence of sufficient reactive resources based on their assessments of the system. For the operational planning time horizon, Transmission Operators shall provide copies of assessments used as the basis for determining how resources were made available. Organizationally, R4 should be swapped with R5. A requirement dealing with exemptions should come after the “foundation” requirement.The Drafting Team must consider the following regarding Hydro-Quebec TransEnergie. "Schedule" in the standard is confusing and does not apply to Hydro-QuÃ©bec TransÃ‰nergie. Hydro-Quebec TransEnergie does not issue a schedule of voltage or reactive power. Hydro-Quebec TransEnergie sets voltage ranges to comply at all times for the different voltage levels. During light or peak load, these operating situations are governed with voltage setupoints for specific substations. The standard should therefore consider (in addition to the preceding comments) the terms used. For example, consider substituting the term " voltage or reactive power setpoint " for the word “schedule” which does not reflect our operating procedures.Regarding Requirement R5, NERC now requires a specified program voltage or reactive power be given to central planning and forecasting. This requirement is not applicable to Hydro-QuÃ©bec TransÃ‰nergie because there is no voltage or reactive power schedule, but rather the requirement that every generating facility of more than 10 MW have an automatic voltage regulation system. Hydro-Quebec TransEnergie also requires them to provide a specific power factor for each of those generating units.
Response: Thank you for your comments. Requirement R1 is the overarching system voltage schedule, and Requirement R5 targets generating voltage schedule. The requirement does not require a schedule for a station with no way of controlling voltage. Voltage schedule is an industry term that is explicitly defined by the parenthetical definition. The VAR SDT could not make the proposed Requirement R2 changes because it could cause clarification for some while causing confusion for other industry members. Requirements R4 and R5 stand independently. Finally, for R5 the VAR SDT determined that the term “schedule” is broad enough to encompass Hydro Quebec’s concerns.		
Bureau of Reclamation	Yes	The Bureau of Reclamation (Reclamation) notes that the WECC variance indicates that it is intended to replace requirements R3 and R4. However, R3 and R4 in VAR-

Organization	Yes or No	Question 2 Comment
		001-4 are not the same as R3 and R4 in VAR-001-3. Reclamation suggests that the drafting team should examine the WECC variance to determine which requirements it will replace because it appears that the WECC variance should replace R4 and R5. In WECC, it would be difficult for Transmission Operators to comply with both R5 and E.A. 14 because they refer to different voltage schedule reference points. VAR-001-4 R3 specifies that Transmission Operators must operate or direct the Real-time operation of devices to regulate transmission voltage and reactive flow as necessary. Measure M3 specifies that "this may include directions to Generator Operators to: 1) provide additional voltage support; 2) bring resources on-line; or 3) make manual adjustments." Reclamation suggests that this detail should be included in Requirement R3 rather than solely in the measure.VAR-001-4 R4 requires a Transmission Operator to notify a Generator Operator if the "Transmission Operator determines that a generator has satisfied exemption criteria" but does not specify a timeframe for this notification. Reclamation suggests that the drafting team update VAR-001-4 R4 to specify that the Transmission Operator must notify the Generator Operator within 30 days if the Transmission Operator determines that a generator has satisfied criteria for exemption from voltage or Reactive Power requirements and associated notification requirements. Reclamation also suggests that R4 on exemptions should follow R5 on voltage or Reactive Power scheduling and notification criteria. VAR-001 R5 allows the Transmission Operator to specify a voltage or Reactive Power schedule at either the high voltage side or low voltage side of the Generator Step Up transformer. Reclamation suggests that like in requirement E.A.14, Transmission Operators should be able to specify the voltage schedule at the generator terminals, high side of the generator step-up transformer, point of interconnection, or a location designated by mutual agreement. VAR-001 R5.2 specifies that "The Transmission Operator shall provide the Generator Operator with the notification requirements for deviations from the voltage or Reactive Power schedule." M5 regarding part 5.2 specifies that voice recordings may be used to establish compliance with this requirement. Reclamation suggests that voice recordings should be removed from the list in M5 for part 5.2 because notification

Organization	Yes or No	Question 2 Comment
		requirements established in the planning horizon should be transmitted in writing. Reclamation notes that there is a potential inconsistency between the Transmission Operator notification requirements discussed in VAR-001 R5.2 and the Generator Operator notification requirements discussed VAR-002 R3 and R4. Reclamation recommends that VAR-001 R5.2 be modified to solely address planning horizon notifications. For consistency with the Generator Operator real-time notification requirements established in VAR-002 R3 and R4, Reclamation also recommends that VAR-001-4 R5 should include an additional subrequirement which specifies that the "TOP shall develop real-time notification requirements for the deviations from the voltage of Reactive Power schedule within 30 minutes of when a Generator Operator becomes aware of a change in reactive capability, AVR status, power system stabilizer status, or alternative voltage controlling device status, unless the status is restored within 15 minutes." VAR-001-4 R5 requires the Transmission Operator to specify a voltage or Reactive Power schedule "at either the high voltage side or low voltage side of the Generator Step-Up transformer." VAR-002-3 R2.3 allows Generator Operators to monitor voltages at another location so long as the Generator Operator has a "methodology for converting the scheduled voltage specified by the Transmission Operator to the voltage point being monitored by the Generator Operator." Reclamation suggests that having the Transmission Operator and Generator Operator monitor voltages at different locations could lead to confusion in real-time communications. Reclamation suggests that VAR-001-4 R5 be updated to require the Transmission Operator to set voltages based on common monitoring locations to avoid confusion in real-time communications between Transmission Operators and Generator Operators.Reclamation suggests that R6 should be updated to specify that the Transmission Operator must coordinate outages to accommodate required step-up transformer tap changes. Reclamation suggests the drafting team update the requirement to read "After consultation with the Generator Owner regarding necessary step-up transformer tap changes, associated outages, and the implementation schedule...". Reclamation also notes that "Generator Step-Up transformer" is sometimes capitalized in the standard. However, it is not capitalized

Organization	Yes or No	Question 2 Comment
		in the WECC variance or NERC Glossary. Reclamation suggests that the drafting team remove capitalization in the term "Generator Step-Up transformer" because it is not defined in the NERC Glossary.
Response: Thank you for your comments. WECC has a separate process for its regional variance, and WECC will revisit the variance as needed. The measure language does not belong in the standard because it is not an exhaustive list, and it serves as an example for what an auditor should look for in evaluating the requirement. The notifications for exemption are not specified because there may be instances where a GOP receives pre-authorized exemptions. For example, a TOP may specify instances where a GOP does not have to notify the TOP through a pre-approved process. The WECC variance will remain intact, but the variance could not be adopted continent-wide because there was no industry consensus on how to provide the schedule. The language for M5 has been updated to remove the list of evidence because it is not a comprehensive list of all communications. The VAR SDT determined that the GOP must make notifications to the TOP of reactive capability changes, and the deviations are not necessary in VAR-001. The VAR standard cannot add a mutually agreed upon reference point because several GOPs and TOPs can reach a consensus on the mutually agreed upon point. The VAR-002 issues will be addressed in the next successive ballots.		
Southern Company: Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing	Yes	: The High VSL for VAR-001 R4 should be changed from the proposed state to "The TOP has exemption criteria, but did not notify the GOP." As it is currently written, the TOP satisfied R4, but simply cannot show documentation to prove the satisfaction. The proposed change wording focuses on the TOP not satisfying the requirement. The first clause in the Severe VSL for VAR-001 R5 should be corrected to state "voltage or Reactive Power schedules." In addition, the Severe VSL for VAR-001 R5 should have another OR clause to include the failure to comply with R5.3.
Response: Thank you for your comments. The VAR SDT did not agree on all changes for the VSLs at this time, but a failure to comply with R5.3 is already in the moderate VSL category.		
Florida Municipal Power Agency	Yes	FMPA appreciates the efforts of the SDT to remove some of the duplicative requirements of the VAR standards with other standards (e.g., TOP and FAC

Organization	Yes or No	Question 2 Comment
		standards). However, FMPA is voting Negative because we believe more requirements ought to be treated in the same fashion as described in our earlier comments on the September posting, as provided in a mapping document submitted directly the the SDT to better illustrate those duplications, and as summarized below.VAR-001-4 R2 is duplicative of the requirements of TOPs to plan for and operate to SOLs in the TOP and FAC standards. In order to plan to and operate to SOLs, TOPs must schedule sufficient reactive resources, or they will violate those requirements (just as must-run generators need to be scheduled, yet those are not discussed within the standards). Operating to SOLs is results based, VAR-001-4 R2 is not. VAR-001-4 R2 ought to be deleted.VAR-001-4 R3 is duplicative of requirements of TOPs to plan for and operate to SOLs as described above. As far as TOPs ability to direct, that is covered in TOP-001. VAR-001-4 R3 should be deleted.Although FMPA supports both VAR-001-4 R1 and R5, we wonder if there is some duplication between those requirements and whether they can be combined into a single requirement.
Response: Thank you for your comments. However, the recent TOP standards are remanded by FERC and are being reevaluated generally. The standard cannot rely on implied processes in other standards that are currently in development. R2 and R3 are very specific to voltage requirements which are necessary for the reliable operation of the grid. R1 and R5 are not duplicative because R1 addresses an overall system voltage, and R5 is where TOPs provide a schedule for Generator Operators to maintain.		
Tennessee Valley Authority	Yes	The SDT is requested to clarify the word “directions” as used in M3. The word “directions” is close to, but not, the word “directive” which has a very specific meaning. If the intent is to capture directives, then the word directives should be used. If the intent is to capture communications that are not directives, then the word “directions” should be replaced with wording that is not so close to the word “directives.”Current M3 draft language: M3. Each Transmission Operator shall have evidence that actions were taken to operate capacitive and inductive resources as needed in Real-time. This may include directions to Generator Operators to: 1) provide additional voltage support; 2) bring resources on-line; or 3) make manual adjustments. The SDT is requested to consider a modification to R4:Current R4 draft language: R4. The Transmission Operator shall specify the criteria that will exempt

Organization	Yes or No	Question 2 Comment
		generators from compliance with the requirements defined in Requirement R5, part 5.1, and any associated notification requirements. Suggested modification to R4: R4. The Transmission Operator shall specify the criteria, ADD: "if any" that will exempt generators from compliance with the requirements defined in Requirement R5, part 5.1, and any associated notification requirements.
Response: Thank you for your comments. M3 has been updated to use the word "instructions" instead of "directions." The standard provides each TOP with the flexibility to determine its own exemption criteria and does not mandate that a TOP issue exemptions.		
PacifiCorp	Yes	PacifiCorp supports MidAmerican's comments.
Duke Energy	Yes	Duke Energy approves of the approach of removing duplicative requirements based on other standards.Duke Energy seeks clarification on the definition of "system voltage schedule" and believes that once this is more clearly defined, it should be added to the NERC Glossary of Terms.The Rationale for Requirement 1 discusses the TOP setting voltage or Reactive Power schedules with associated tolerance bands. However, Requirement 1 makes no mention of using Reactive Power schedules. Is the use of Reactive Power Schedules implied in Requirement 1?Duke Energy suggests changing "Each Transmission Operator shall schedule" to "Each Transmission Operator shall maintain" in Requirement 2 for more clarity. In Duke Energy's opinion, not all reactive resources can be "scheduled" in order to regulate voltage levels. For example, SVCs cannot be scheduled, the reactive resources of an SVC dynamically change to maintain set voltage levels. The TOP needs to ensure that adequate static and dynamic reactive resources are availble to the System Operator in real time to support the Reliability needs of the BES. Reliability Studies are performed in the Operations Planning horizon to ensure that reactive resources are adequate to support the planned BES configuration.
Response: Thank you for your comments. Requirement R1 requires an overarching system voltage schedule, and TOPs do not set Reactive Power schedules for the system. Requirement R5 is the requirement directed towards Generator Operators where a		

Organization	Yes or No	Question 2 Comment
voltage schedule or a Reactive Power schedule is maintained. The VAR SDT cannot come to a consensus that "maintain" will alleviate compliance issues with regard to specific equipment being available to address voltage levels.		
SPP Standards Review Group	Yes	We agree with the retirement of redundant requirements and suggest that the drafting team delete R2 and R3 in addition to the other deletions already proposed. R2 is redundant with the pending TOP-002-3, R1. R3 is redundant with pending TOP-001-2, R7 and R9.
Response: Thank you for your comments, but Requirements R2 and R3 cannot be deleted because they are specific to voltage and reactive flows.		
ACES Standards Collaborators	Yes	(1) Requirement VAR-001-4 R1 is vague and ambiguous and may be duplicative of VAR-001-4 R5. It requirements need further refinement. First, it states that the TOP shall specify "a system voltage schedule". This is singular. A system always has multiple schedules for generators, capacitor banks, reactors, etc. It does not have a single voltage schedule. Second, what equipment or facilities is the voltage schedule supposed to apply? Is this supposed to be the voltage schedule for a generator? Is this supposed to the voltage for reactor or capacitor switching? Is this supposed to be the voltage limits on a transmission bus? Schedule would tend to imply a level of control and, thus, not a limit but the simple reality is that the requirement is vague, ambiguous, and unenforceable as written. Third, if the requirement applies to voltage schedules at generators, it is duplicative to VAR-001-4 R5 because this already compels the TOP to provide voltage schedules for generators. Please provide additional clarifications in the requirement. (2) We appreciate the drafting team removing duplicate requirements. This version of the standard has been improved greatly. However, we still believe there is some duplication that needs to be addressed. For example, VAR-001-4 R1 requires a TOP to "specify a system voltage schedule... as part of its plan to operate with System Operating Limits and Interconnection Reliability Operating Limits" while VAR-001-4 R2 requires the TOP to "schedule sufficient reactive resources to regulate voltage levels under normal and Contingency conditions". How does a TOP specify a voltage schedule per R1 and not

Organization	Yes or No	Question 2 Comment
		also schedule sufficient reactive resources per R2? The TOP can't maintain the voltage schedule without scheduling sufficient reactive resources. Please eliminate the duplication. (3) VAR-001-4 R2 is also duplicative of VAR-001-4 R3. R2 requires the TOP to "schedule sufficient reactive resources to regulate voltage levels under normal and Contingency conditions" while R3 requires the TOP "to operate or direct the Real-time operation of devices to regulate transmission voltage and reactive flow". How does the TOP schedule sufficient reactive resources without regulating transmission voltage and reactive flow? The TOP would be operating the voltage-regulation devices when they schedule sufficient reactive resources since the voltage-regulation devices are reactive resources. If the purpose was to delineate by time frames implied by the use of "Real-time Operation" in R3 and "schedule" in R2, the requirements need further refinement to be clear that the targeted time frames are supposed to be different. Furthermore, the Time Horizons for both R2 and R3 are duplicate covering Real-time Operations, Same-day Operations, and Operational Planning which would imply that different time frames are not intended. Please eliminate the duplication or clarify the time frames as appropriate. Detailed application guidelines would help eliminate some of the confusion. (4) Part 1.1 meets P81 criteria and should be retired. The requirement meets Criterion A (overarching) because it "does little, if anything, to benefit or protect the reliable operation of the BES" and meets criterion B4 - Reporting because it requires the TOP to report to another party and has "no discernible impact on promoting the reliable operation of the BES." The mere fact that Part 1.1 only requires reporting upon receiving a request is supportive that it has no impact on reliability. If it did materially support reliability, the RC would be required to have the data and the TOP would be obligated to provide it. Please remove Part 1.1. If Part 1.1. persists in the next draft, we request that the drafting team provide written justification for why these requirements do not meet P81 criteria and actually materially support reliability.(5) Measure VAR-001-4 M2 is inconsistent with the main requirement R2 and needs to be modified. M2 proposed that the TOP shall have evidence of scheduling resources based on their system assessment. While we agree this is likely

Organization	Yes or No	Question 2 Comment
		the method the TOP will use to schedule resources, the simple fact is that it is not part of the requirement and cannot be compelled in the measure. Please modify the measure to be consistent with the requirement. (6) The second sentence of R2 is an explanation and not a requirement. Thus, it should be moved to the application guidelines section. We understand that FERC previously directed NERC to include use of controllable load as a reactive resource because it was not one of the explicitly listed reactive resources. FERC likely included this statement as evidenced by the first sentence of paragraph 1879 of Order 693 to further a policy goal of expanding the use of demand side management (DSM). At the time the order was issued, DSM was in its infancy. Today, DSM has become ubiquitous as demonstrated by the almost 40,000 MW reported in the NERC 2013 Summer Assessment. Given that all organized markets include at least one DSM product, its proliferation will only continue. Thus, the policy goal has been clearly met and specific mention in NERC standards in no longer necessary. In fact, an equally efficient and effective alternative would be to eliminate specific references of any type of reactive resource by striking the second sentence in its entirety. (7) The Time Horizons for VAR-001-4 R3 are inconsistent with the requirement. R3 specifically states that it deals with Real-time operation. Thus, how could Operational Planning and Same-day Operation be applicable? These timelines are conflicting and need to be modified.(8) For requirement VAR-001-4 R4, why can't the GOP make a self-determination that it meets the TOP criteria? Is the TOP obligated to make a determination or to simply supply the criteria to the GOP? The RSAW indicates that the auditor will not determine if the GOP received pre-authorization from the TOP. Thus, the requirement should either be modified so that audit practices will have to be modified or aligned with how the RSAW indicates compliance will be assessed. We recommend that the drafting team work with NERC compliance to align the requirement with the RSAW language.(9) VAR-001-4 R5 should be modified to clarify that the TOP is not required to provide a voltage schedule to all generators but only to those generators that it determines it needs to provide reactive supply. A TOP may determine that a generator is too small to control voltage at its location and that it does not need to provide a voltage schedule

Organization	Yes or No	Question 2 Comment
		for this generator. Including all generators is unnecessary for reliability.(10) Part 5.3 meets a P81 criterion and should be retired. The requirement meets Criterion A (overarching) because it "does little, if anything, to benefit or protect the reliable operation of the BES" and meets criterion B4 - Reporting because it requires the TOP to report its criteria to another party and has "no discernible impact on promoting the reliable operation of the BES." The mere fact that Part 5.3 only requires reporting upon receiving a request is supportive that it has no impact on reliability. If it did support reliability, the GOP would be required to have the data. Please remove Part 5.3. If Part 5.3 persists in the next draft, we request that the drafting team provide written justification for why these requirements do not meet P81 criteria and actually materially support reliability.(11) We request that R6 be modified to state that the timeframe shall be mutually agreeable. The TOP is only required to consult with the GO and could still provide an unreasonable timeframe after such consultation. At the very least, the requirement needs to be clear that the GO and GOP are not obligated to take an outage to implement tap changes and would be allowed make them at the next scheduled maintenance or forced outage with sufficiently long outage window to allow such changes. (12) The evidence retention section needs to be updated. First, it covers only measures one through four when there are actually six. Second, it covers measures when it should cover requirements to be consistent with existing standards. (13) As written, the VSL for R1 is overly harsh. If a TOP simply failed to create a single voltage schedule, it would be a severe violation. It seems the VSLs could be graduated based on the number of voltage schedules that are not created as a percentage of the total voltage schedules.(14) The VSLs for R2 and R3 are inconsistent with the requirement. The High VSL and Severe VSL mention avoiding violating an SOL or IROL respectively. However, the requirement mentions neither. This would be inconsistent with FERC guideline three that VSLs should be consistent with the corresponding requirement. (15) The High and Severe VSLs for R2 and R3 overlap with one another. High VSLs for both requirements apply to SOL violations and Severe VSLs for both requirements apply to IROL violations. By definition in the NERC glossary, an IROL is a subset of a SOL. Thus, a failure to schedule or operate

Organization	Yes or No	Question 2 Comment
		reactive resources that results in an IROL violation would be both a High and Severe violation simultaneously. (16) From a compliance perspective, the High VSL for VAR-001-4 R4 is a logical fallacy. Compliance requires evidence. Thus, an auditor cannot make a determination that a TOP has exemption criteria but does not have evidence of exemption criteria. Thus, the High VSL could never be assigned by a compliance enforcement authority. This needs to be modified.(17) The VSLs for VAR-001-4 R5 need to be modified. In the FERC order approving VSLs, FERC was clear that as many VSLs as possible should be used. Clearly, each VSL could be assigned based on the number of GOPs that the TOP failed to provide voltage schedules. This essentially means that the High VSL should be graduated. We disagree with assigning a moderate VSL for the failure of a TOP to provide its criteria in response to Part 5.3 by one minute. As written, the TOP could literally be one minute past the 30 day time frame and reach a moderate violation. This should not even be a violation let alone a Moderate VSL. The solution is to remove Part 5.3. If Part 5.3 persists, at a minimum, the VSL should be Lower because reliability is not impacted. The second half of the Severe VSL regarding not supplying the notification requirements to the GOP should be moved to Moderate VSL. Failure to provide voltage schedules misses significantly more of the spirit of the requirement than failure to provide exemption criteria. The purpose of failure to provide exemption criteria is an attempt to avoid nuisance violations not directly support reliability. (18) In the regional variances section, E.A. 16 and E.A. 17 meet P81 criteria and should be removed from the next draft. The purpose of these two requirements is to provide transparency between the GOP and TOP in determining voltage schedules and implementation of voltage schedules. While establishing transparency is certainly a laudable goal, it simply does not directly support reliability. Thus, these two regional variance requirements meet Criterion A (overarching) because they do little, if anything, to benefit or protect the reliable operation of the BES and meet criterion B4 - Reporting because they require the TOP and GOP to report to each other. (19) It is unnecessary to require the TOP to direct the Generator Operator to comply with the voltage schedule with the AVR in voltage control mode in VAR-001-4 Part 5.1. It is redundant with VAR-002-3 R2 which

Organization	Yes or No	Question 2 Comment
		compels the GOP to follow the voltage schedule. If drafting team feels the "directive" language is necessary in VAR-001-4 Part 5.1, then VAR-002-3 R2 should be removed because it would be redundant with TOP-001-1a R3 (existing) and TOP-001-2 R1 (pending regulatory approval). Both require the GOP to follow the directives of its TOP.
Response: Thank you for your comments. Requirement R1 is intended to be the requirement addressing an overarching system schedule, and R5 is directed to the schedules provided to the GOPs. Requirements R1, R2, and R3 are separate requirements where R1 sets a voltage schedule for the system. R2 and R3 represent the actual action a TOP will take to meet voltage requirements. Further, R1 is part of the operational planning horizon, while R2 and R3 include real-time and same day operations. Part 1.1 requires vital information to be shared between entities, and this is particularly important to have accurate studies with regard to interface facilities. M5 has been updated to remove "provide copy." Controllable Load was added per a FERC directive, and the VAR SDT does not believe that it should be removed through an equally effective and efficient manner. The second sentence in R2 is meant as an illustration. For the time horizon, Real-time events may bleed into next-day or longer operations. Directives may extend from the Operational Planning Horizon into the current-day. For reliability purposes, it would not be reasonable for the GOP to grant its own exemptions. All generators must follow a voltage or Reactive Power schedule. Part 5.3 provides the technical justification for a voltage schedule which answers a FERC directive. The TOP must set notifications and timeframes in order to prevent disputes between TOP and GOPs. The VAR SDT discussed this at length, and the VAR SDT determined "consult" was the appropriate word for making tap changes. The evidence retention section has been modified. Compliance will be provided a copy of these comments. The VSLs reflect the SOL and IROLs because those are the system events that would precipitate a TOP action. The VSLs for Requirements R2 and R3 refer to SOL and IROL violations because the purpose of requiring TOPs to "schedule sufficient reactive" and "operate or direct the Real-time operation of devices" is to avoid violations of SOLs and IROLs. As provided in Requirement R1, TOPs must specify a system voltage schedule to ensure that the system is operated within System Operating Limits and Interconnection Reliability Operating Limits, as required under the FAC and TOP standards. Thus, the VAR SDT did not determine a severity level is necessary for anything except an SOL or IROL violation. For all of the requirements the VRF determines the risk to the system while the VSL determines how a requirement is violated. For R4, the VRF is lower, but the violation is still high because a part of the requirement has been violated. WECC will determine if any updates should be made to the WECC variance. For part 5.1, VAR-001 represents the TOP obligations, and VAR-002 has a sister requirement that represents the GOP obligations.		

Organization	Yes or No	Question 2 Comment
ISO/RTO Standards Review Committee	Yes	We support the SDT's proposal to remove the requirements that may be redundant with other standards. We do not have any comments on the requirements, Measures or VRFs, but we do have some comments on the VSLs:a. R1: The word "schedule" after "system voltage" is missing from the VSL.b. There is inconsistency in the tense used in various VSLs - some are in present tense while others in past tense. Please review and revise as appropriate.
Response: Thank you for your comments. The VSLs have been reviewed and corrected to be in the same tense.		
Bonneville Power Administration	Yes	There are two questions under Question #2. BPA answered the first question in the check box. BPA's answer to the second part of the question is No.
Response: Thank you for your comments.		
NorthWestern Energy	Yes	For R2, M2 - It would be very helpful if "their assessments of the system" be clearly defined. For example, would TPL studies suffice as evidence for meeting this requirement or is this more of a real time requirement and if so, what types of evidence is NERC lokking for.
Response: Thank you for your support. TPL studies are part of a different time horizon than Requirement R1. Assessments may take several forms depending on the internal structure of the entity. Also the measure for this requirement will no longer include copies of the assessments.		
Consolidated Edison Co. of NY, Inc.	Yes	The drafting team used the word "schedule" in both VAR-001 Requirements R1 and R5. However, it is modified by different phrases in each, implying different types of "schedules." These two different types of "schedules" has caused confusion, making the use and intended meaning less than perfectly clear. VAR-001 Requirement R1 - To improve clarity and consistency, we recommend that the word "schedule" be deleted here and only be used when referring to GOP operation. The revised Requirement R1 wording recommended follows:R1. Each Transmission Operator shall specify a system voltage [delete: schedule (which is either a] range or a target value with an

Organization	Yes or No	Question 2 Comment
		associated tolerance band) as part of its plan to operate within System Operating Limits and Interconnection Reliability Operating Limits.Note that Requirement R1 only requires that the TOP establish the target system voltage level and tolerance band. There is no mention of GOP operation.Requirement R2 requires that the TOP document its arrangement of sufficient reactive resources, whether actually used (dispatched) or not, a Planning function (see Measure M2). The Rationale box states: "to ensuring sufficient reactive resources are online or scheduled." Comment: The use of the word "scheduled" here again has caused confusion. We recommend it be replaced to clarify the meaning, as follows: R2. Each Transmission Operator shall make arrangement for [delete: schedule] sufficient on-line, available reactive resources to regulate voltage levels under normal and Contingency conditions. Transmission Operators can provide sufficient reactive resources through various means including, but not limited to, making arrangements for reactive generation resources [delete: scheduling], transmission line and reactive resource switching, and using controllable load. We further recommend revising M2 to synchronize it with the revised Requirement R2 above, as follows:M2. Each Transmission Operator shall have evidence of [delete: scheduling]sufficient reactive resources based on their assessments of the system. For the operational planning time horizon, Transmission Operators shall provide copies of assessments used as the basis for determining how resources were [delete: scheduled] made available. The verbiage of R4 should come after R5 is stated. From an organizational perspective, a requirement paragraph on exemptions should come after the referenced requirement.
Response: Thank you for your comments. Please see the response to NPCC above.		
City of Garland	Yes	1st question: Yes - we agree with this approach2nd question: We have comments on R2. In ERCOT, the TOP can only plan to respond to voltage issues with the resources they have available. They do not have authority to order generation on line for voltage support nor do they have authority to back down fully loaded generation for voltage support. Only the RC has this authority.

Organization	Yes or No	Question 2 Comment
Response: Thank you for your comments. Please see the responses to ERCOT and CenterPoint above.		
Manitoba Hydro	Yes	(1) M1 - the language in the second paragraph re: Part 1.1 does not match the language of the requirement itself in that the measure refers only to voltage schedules, not voltage schedules 'and associated tolerance bands'. (2) R3 - without further clarification, 'as necessary' will be interpreted to mean as deemed necessary by the Transmission Operator. (3) M3 - the measure in this part contains more details and is more narrow than the requirement itself. The requirement refers to the operation of 'devices to regulate transmission voltage and reactive flow' while the measure refers to the operation of 'capacitive and inductive resources'. Language should be consistent. (4) R4 - the language goes back and forth between 'generators' and 'generating units' - this should be made consistent. Also, the reference to 'associated notification requirements' presumably refers to the associated notification requirements in R5 but this is not specified. (5) M4 - the qualification language that it refers only to generating units 'in its area' appears only in the measure and not in Part 4.1 itself. (6) R5 - neither Generator nor Step-Up is a defined term so they should not be capitalized. (7) M5 - there is a shift in language here. Generally the measures indicate that the responsible entity 'shall have evidence' and that the evidence 'may include'. In this measure, the language is that the responsible entity 'shall have evidence' and that the evidence 'shall include'. This is much more restrictive and may make compliance more difficult as there is no longer flexibility in the evidence that will meet the criteria of the measure. (8) Compliance, Evidence Retention 1.2 - Measures 5 and 6 are not mentioned. (9) Compliance, Compliance Monitoring, 1.3 - The language refers specifically to processes found in the NERC Rules of Procedure. Generally in draft standards, there is just a list of processes that may be used. The reference included in this draft standard is concerning because MB Hydro has their own Compliance and Monitoring program and has only adopted select aspects of the NERC Rules of Procedure. (10) VSLs, R4 - the words 'of the Generator Operator' are missing from the end of this section. (11) VSLs, R5 - the words 'and associated tolerance bands' is missing from Moderate VSL after 'voltage

Organization	Yes or No	Question 2 Comment
		schedules' and is not fully referenced in Severe VSL.(12) VSLs, R6 - the words 'Documentation specifying requiring tap changes was provided to the Generator Owner but' could be inserted at the start of each of the Lower VSL and Severe VSL.
Response: Thank you for your comments. Some clarifying language has been added to the VSLs. The measurement for M3 is an example of the type of information that can be provided and does not limit the breadth of the requirement. For R4 the associated notifications are specified because they are also used in VAR-002. The capitalization of generator step up in R5 has been corrected, in addition to the M5. Data retention has been changed to include all of the measures. Compliance Monitoring language has removed a reference to the Rules of Procedures. The VSLs have been updated to include "to the generator operator" and to include the definition of voltage or Reactive Power schedules.		
Electric Reliability Council of Texas, Inc.	Yes	ERCOT agrees that duplicative requirements should be removed. However, the standard would benefit from additional revisions.A. R1 and R5 should be merged. This could be accomplished in the following manner: "Each Transmission Operator shall notify associated RCs and adjacent TOPs, and specify assigned GOs the a system voltage schedule (which is either a range or a target value with an associated tolerance band) as part of its plan required forassigned GOs to operate within System Operating Limits and Interconnection Reliability Operating Limits.B. The second sentence of VAR-001 R2 is not needed. This is not an actionable requirement, but rather is an instruction as to how it's to be done. The 2nd sentence is not a requirement.C. Recommend deleting from R5.1 the words, "...in automatic voltage control mode (the AVR is in service and controlling voltage)." The standard should establish what needs to be done, and how the GO elects to comply with the requirement should be left to the discretion of the GO. Furthermore, VAR-002 requires the GO to have its AVR in service and in auto, so this requirement is also redundant.D. It appears that VAR-001 R6 is redundant to R5.3. Also see comments on VAR-002 R6.
Response: Thank you for your comments. The VAR SDT consensus was to leave Requirements R1 and R5 as separate requirements. R1 sets for requirements for the overarching system voltage while R5 specifies schedules for control buses. The second sentence is meant as an illustration. The VAR SDT and NERC staff determined that the AVR operation in the voltage		

Organization	Yes or No	Question 2 Comment
control mode is necessary for system reliability.		
Independent Electricity System Operator	Yes	We support the SDT's proposal to remove the requirements that may be redundant with other standards. We do not have any comments on the requirements, Measures or VRFs, but we do have some comments on the VSLs:a. R1: The word "schedule" after "system voltage" is missing from the VSL.b. There is inconsistency in the tense used in various VSLs - some are in present tense while others in past tense. Please review and revise as appropriate.
Response: Thank you for your comments. The VSLs have been modified to clarify language and correct the differences in tense.		
Kansas City Power & Light	Yes	I agree with the approach to condense standards if they are duplicated in other standards.
Response: Thank you for your comments.		
Xcel Energy	Yes	Xcel Energy appreciates the hard work of the Standard Drafting Team. We recognize that significant effort has been put into the modifications of the VAR-001 and VAR-002 standards and we applaud the direction the team is moving. We are voting Negative on VAR-001-4 for one reason which we explain below.Xcel Energy believes that the WECC Regional Variance should not replace R4 in the NERC standard based on the rationale provided for modifications to the proposed R4. Instead, WECC Regional Variance Requirement E.A.13 should be removed and the remaining Regional Variance Requirements should supplement the NERC Requirements in the Western Interconnection. As proposed, the NERC standard states that the TOP is not bound to provide a voltage schedule for each BES generator; however , due to the WECC variance, the TOP would be found in violation if any BES Generator was not provided a voltage schedule. In order to resolve the issue, Xcel Energy asks the drafting team to delete E.A.13 in its entirety and modify the language of the Regional Variance to state that the additional requirements are for in addition to the NERC requirements. Once this modification is made, Xcel Energy could support the

Organization	Yes or No	Question 2 Comment
		proposed standard.
Response: Thank you for your comments. The regional variance must be addressed through WECC. WECC will determine if the variance should be updated accordingly.		
Puget Sound Energy	Yes	- The first paragraph of the Regional Variance section of VAR-001 should be updated to reflect that requirements R3 and R4 of the current standard are requirements R4 and R5 in the proposed standard.- M4 should be updated to reflect that the Generator Op
Response: Thank you for your comments. The regional variance must be addressed through WECC. WECC will determine if the variance should be updated accordingly.		
City of Austin dba Austin Energy	Yes	City of Austin dba Austin Energy (AE) agrees with removing duplication. AE does not have any comments about the requirements, but requests the SDT review the VSL for R2 because the text does not match the requirement text.
Response: Thank you for your comments. The VSL have been updated to provide clarification and correct the difference in tenses.		
Utility System Efficiencies, Inc.	Yes	Many of the other standards that require the provision of this sort of information to the RC and neighboring entities includes a requirement that the entity respond to comments/concerns from the copied entities. Why not here?R2 appears to be a little ambiguous; does this apply to all contingency conditions? Just N-1? Only those chosen by the TOP? This would appear to be hard to determine compliance by the Region.It looks like R6 assumes that the GO has a non-LTC transformer. We are seeing LTCs in generation facilities; shouldn't this be modified to address the LTC GSUs?For M2 and M3 particularly, Evidence Retention could require a lot of data for 12 months.
Response: Thank you for your comments. The IRO standards will address the RC responsibilities. The contingencies are not		

Organization	Yes or No	Question 2 Comment
uniform across the continent, but the standard is concerned with contingencies to which the entity operates. The VAR standard does not define an entity's contingencies. R6 is focused on non-LTC transformers. An LTC would not require scheduling because the generating unit will not be taken offline to make the tap changes. There is no data retention requirement under VAR-001 for under load tap changers specifically, but the VAR-001 does provide data retention requirements generally.		
Consumers Energyu	Yes	This is a two part question with only one YES/NO answer. YES we agree with the approach. YES we have questions or comments on the remaining revised requirements.In R4, there should be a statement that the TOP will publish the exemption criteria to GOPs in the area.A consideration should be made to reserves R1 and R5. It is imperative both get the voltage schedules but if the GOP does not have them there is no control.
Response: Thank you for your comments. TOPs must notify GOPs when exemption criteria have been met. R1 sets the overarching system voltage schedule, and R5 provides GOPs with individual voltage or Reactive Power schedules.		
Exelon Companies	Yes	Yes, agree with approach, no additional comments relating to requirements. Exelon companies would vote Affirmative for VAR-001-4 if it were being balloted separately from VAR-002-3.
Response: Thank you for your comments. VAR-001-4 and VAR-002-3 were balloted separately.		
CenterPoint Energy, Houston Electric LLC.	Yes	CenterPoint Energy agrees with the SDT's efforts to eliminate duplicated standards, but has the following concerns. R1.1 is unclear on the applicability of the "30 days of a request." Is the requirement for Transmission Operators to provide their perspective Reliability Coordinators the voltage schedule automatically without a request and only to any adjacent Transmission Operators that requests the schedule within 30 days of the request; or is it the intent of the SDT for the Reliability Coordinator to also request the Transmission Operator for the schedule with the same "30 days of request" requirement. In order for a TOP to obtain evidence to prove compliance to this requirement, a TOP must receive documentable requests from its RC and/or its adjacent Transmission Operators to then provide the voltage

Organization	Yes or No	Question 2 Comment
		schedule within the 30 days of the request. If the Transmission Operators do not receive such requests then essentially according to the standard they do not have to provide the established voltage schedules as the requirement currently specifies. Many Reliability Coordinators or regions have established voltage working groups with processes or its equivalence to aid in the corroboration and defining of company specific voltage schedules within the RCs area or region then such voltage schedules would already be provided as part of the regional processes. CenterPoint Energy recommends the following clarifying language:"If requested, Eeach Transmission Operator shall provide, a copy of the voltage schedules and associated tolerance bands to its Reliability Coordinator and adjacent Transmission Operators within 30 calendar days of such a request." CenterPoint Energy agrees with providing the Generator Operators the voltage or Reactive Power schedule; however, we believe R5.1, which also requires the Transmission Operator to direct the Generator Operators to comply with such schedule to the specificity that the AVR be in automatic voltage control mode, is redundant and is an unnecessary requirement as well as a compliance burden for the Transmission Operators. Exemptions to the Generator Operator to deviate from the established voltage schedule or the Automatic Voltage Regulator functioning in any mode other than automatic voltage control are addressed in R4 and VAR-002-3 R1 and R2 and will be handled in Real-Time operations and will be scenario specific. VAR-002 R1 and R2 requires Generator Operators to maintain the voltage or Reactive Power schedule and operate each generator with its AVR in service and in the automatic voltage control mode. Based upon this redundancy and Paragraph 81 criteria regarding duplicative and redundant requirements CenterPoint Energy recommends removal of the language "...and direct the Generator Operator to comply with the schedule in automatic voltage control mode (the AVR is in service and controlling voltage)".
Response: Thank you for your comments. For part 1.1, the voltage schedules are provided to the RC and neighboring TOPs within 30 calendar days of a request by either entity. The VAR-002 issues will be addressed in the next successive ballot for VAR-002. The SDT and NERC staff believes that the AVR operation in the voltage control mode is necessary for system reliability.		

Organization	Yes or No	Question 2 Comment
PJM Interconnection	Yes	PJM recommends the drafting team revise R1 as follows:Each Transmission Operator shall specify a system voltage schedule. The remaining language in that requirement is not needed to support reliability.PJM does not understand the scope of controllable load in R2. We urge the drafting team to include clarification.For R3, PJM recommends revision to the Time Horizon to include Real Time only.PJM recommends the following addition to R5 as the last phrase in the requirement for consistency with R4 language. "unless otherwise exempted as noted in R4."
Response: Thank you for your comments. The additional language in R1 was added to clarify what is meant by "voltage schedule" at the request of my industry participants. Controllable load was added as FERC directive in Order No. 693. The SDT believes R3 applies to Real-time, Same-day, and Operational planning horizons.		
Tri-State Generation and Transmission Association, Inc.	Yes	In the draft of VAR-001-4 R2 the use of the word 'schedule' when referring to all reactive resources is unclear. This is in conjunction with the Compliance response to question 2 part 2, "...provide the documentation for the day ahead scheduling in addition to documentation supporting that it was scheduled..." found in the NERC document Draft Reliability Standard Compliance Guidance for VAR-001 and VAR-002 dated July 8, 2013.Is it the ad hoc group's intent to have a schedule for all reactive resources including capacitors, reactors, Static var Compensators and generators? Is the schedule meant to be similar to that of a generator (i.e. Insert capacitors at 1.0pu and remove at 1.05) or on a time base? Is schedule just supposed to take into account availability of all reactive resources?Also TSGT believes the statement "(at either the high or low side of the Generator Step-Up transformer at the TOP's discretion)" currently in VAR-001-4 R4 to should be changed to "(at an agreed upon metering point to which the GOP has direct access)." For VAR-001-4 R6 why did the ad hoc group not change the consultation requirement from GO to GOP? Tri-State believes that this information would better serve the GOP function particularly at Co-Owned facilities. This change would not have a negative effect on the reliability of the BES would reduce duplicative notification to be administered by the TOP.

Organization	Yes or No	Question 2 Comment
Response: For Requirement R2, the word schedule is used to reflect that equipment is available or on-line to provide voltage support. Compliance will review Tri-State's concerns regarding the RSAW. The VAR SDT did not agree on adding language that adds a mutually agreed upon metering point. Further, the GO is in R6 because that is the entity that would assume a loss when the unit is taken offline.		
Texas Reliability Entity		(1) Under the currently enforceable TOP standards, there is a requirement to operate within SOLs and IROLs (in TOP-004-2 R1). However, in the proposed TOP standards currently filed at FERC for approval, the wording of this requirement changed. In TOP-001-2 R8 thru R9, the TOP only has to operate within SOLs that "deserved increased attention" according to the rationale stated in the proposed Standard. What effect does that change have on these VAR requirements, and the stated rationales?(2) If it is the SDT's intent for R2 and R3 that the TOP operate within voltage SOLs, then we suggest rewording R3 to remove "as necessary" to say "within System Operating Limits" or "under normal and Contingency conditions" to match R2.(3) The VSL language for VAR-001-4 R2 and R3 does not match the wording in the requirements. If the intent is to require operation within SOLs and IROLs as suggested by the VSLs, then the requirements should expressly say so. If it is not, then the VSLs should be revised to match the requirements.(4) For VAR-001-4 R1 and R5, should there be a process to provide feedback to the TOP on the voltage schedule? For example, if the TOP sets the voltage schedule in a manner that requires the generator to be at or near a reactive limit for the unit, then the unit may not be able to provide the necessary reactive support under a contingency situation.
Response: Thank you for your comments. FERC recently remanded the TOP standards for further consideration. The "as necessary" phrase is needed to show a definitive action is not always required. The VSLs have been modified. The standard does not add a feedback mechanism on voltage schedules, but the GOPs and TOPs should be communicating as necessary for voltage coordination. However, VAR-001 does provide a vehicle for providing the criteria for studies.		
Idaho Power Company	Yes	

Organization	Yes or No	Question 2 Comment
Ingleside Cogeneration LP	Yes

Salt River Project	Yes	
DTE Electric Co.	Yes	

3. VAR-002 was modified to remove several compliance issues, and in order to address burdensome notification requirements, the VAR-001 standard has been modified to allow each TOP to tailor notification requirements based on system/area needs. Do you agree with these revisions?

Organization	Question 3 Comment
Southern Company: Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing	Adding "testing" to VAR-002 R1 was a good move. This will serve to avoid nuisance notifications for routine testing.Modifying VAR-002 R2 to allow the TOP to specify notification instructions is a good move. Each TOP will be able to specify notifications appropriate for characteristics of their transmission system. Removing the VAR-002 R3 notification of duration was a good move - the GO often does not know how long it will be out until some troubleshooting is performed. Splitting the old R3 into new R3 and new R4 was a good move. This separates two distinct types of trouble. The addition of "after becoming aware of a change in reactive capability" to the new R4 was a good move - this change is not always immediately evident. M4 should be modified to match R4 - "after becoming aware of a change needs to appear in M4".
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
PPL NERC Registered Affiliates	An additional change should be made - R3 should state that when real-time status is provided to the TOP electronically there is no need for additional notification.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
ACES Standards Collaborators	(1) Consistent with our comment number 9 in question 2, VAR-002-3 R2 and Part 2.1 need to be modified so that the GOP is only required to follow the voltage schedule if provided by the TOP. It is not desirable for the TOP to provide all generators voltage schedules. As an example, the TOP may determine it does not need to provide a voltage schedule to a small generator. To consider this situation, the clause “if a

Organization	Question 3 Comment
	voltage schedule is provided by the TOP" could be added to both Part 2.1 and the main requirement. (2) VAR-002-3 R5 meets multiple P81 criteria and should be removed. It meets Criterion A (overarching) because it does little, if anything, to benefit or protect the reliable operation of the BES and meets B2 - Data Collection/Data Retention and B4 - Reporting because it requires the GOP to gather their tap setting information and report it to a third party (i.e. its TOP) which is unnecessary to implement as a reliability requirements. A GOP is not going to refuse to provide data to its TOP on its generator step up transformer in a compliance driven world. In fact, making this data subject to compliance slows the free exchange of the information because of all the extra checking that goes into managing (i.e. verifying, checking, storing) compliance documentation. This requirement also meets B7 - Redundant because the TOP can specify this data in its data specification per TOP-003-2 R1, distribute to the GO per TOP-003-2 R3 and then GO would have to respond per TOP-003-2 R5. (3) VAR-002-3 Part 6.1 meets a P81 criterion and should be struck. It meets Criterion A (overarching) because it does little, if anything, to benefit or protect the reliable operation of the BES and meets B4 - Reporting because it requires the GO to report a technical justification for not implementing tap changes. This technical justification simply does not support reliability. The TOP can make adjustments to other voltage schedules to account for the GO's inability to implement the tap changes. What is the purpose of the GO providing the TOP a technical justification? Is it to provide the TOP some assurance there is a technical reason for failing to implement the tap changes? In a compliance driven world, the TOP can reasonably expect the GOP to implement the tap changes unless the changes would violate safety, equipment limits, regulatory or statutory requirements since these only the only deviations allowed by the main requirement. The threat of sanctions assures this. Furthermore, the GOP may legitimately not have a "technical" justification because a regulatory requirement is a legal justification not a technical justification. (4) The RSAW for VAR-002-3 indicates that compliance assessment for R4 could be vague and result in inconsistent outcomes. The RSAW indicates that the auditor will look for evidence when the GOP became aware of changes. If the entity's

Organization	Question 3 Comment
	data historian or another piece of evidence indicates a reactive capability change occurred at a certain time, does this mean that the entity is aware? We think the answer is no. The entity is only aware when its personnel become aware and not when a measurement first records that something is askew. Furthermore, we believe personnel should be limited to the plant operators in the control room who have overall responsibility. Any evidence review for when the entity became aware should be limited to plant operator logs because this evidence will most closely demonstrate what the plant operator knew based on information provided and will not be as likely to be second-guessed on what the plant operator should have known.(5) VAR-002-3 R2 will be problematic for some GOPs because it does not reflect the characteristics of the voltage schedule provided by some TOPs. For example, some TOPs provide an hourly average voltage schedule to avoid the need for notification for every time the GOP drifts out of schedule. How would R2 be applicable in this situation? Would it only apply for the first 15 minutes of each hour looking back at the last hour? Please modify the requirement accordingly to address this issue.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
Texas Reliability Entity	(1) The status and capability notifications in R3 and R4 may be directly or indirectly in conflict with TOP-005-2a Attachment 1, Item 1.2.4, IRO-005-3.1a R1.1 and R12, IRO-002-2 R5, IRO-003-2 R2, TOP-006-2 R1 and R2, TOP-008-1 R4 and possibly future TOP-003-2 R1. Will the TOP and RC be able to satisfy their obligations under these other standards in view of the proposed GOP reporting parameters?(2) In VAR-002-3 R4, does the “reactive capability” include static capacitive or reactive devices that are behind the fence (for example, static capacitors and reactors installed on the low voltage feeders at wind plants to meet power factor requirements). Would this requirement apply to such devices if they are not included in the Bulk Electric System per the new BES definition?
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the	

Organization	Question 3 Comment
entire standard before posting it for another 45-day comment/ballot.	
ReliabilityFirst	1. General Comment - ReliabilityFirst believes that due to the interdependency of the VAR-001-4 and VAR-002-3 standards, the SDT should consider combining the two into a single standard. It would be a natural progression to list a requirement associated with the Transmission Operator having it immediately followed by the associated Generator Owner/Operator requirement. ReliabilityFirst believes the Generator Owner/Operator would benefit from knowing what is being required of the associated Transmission Operator. Specific VAR-002-3 Comments1. Requirement R6 - The parent Requirement R6 is applicable to the Generator Owner while the sub-part 6.1 specifies the Generator Operator. The same applicable entity listed in the "parent" requirement should be the same as any associated sub-parts. Since only Requirements are enforceable in Reliability Standards, if the Generator Operator fails to notify the Transmission Operator and fails to provide the technical justification per sub-part 6.1, a Possible Violation would be rolled up to Requirement R6. This would not work since Requirement R6 is only applicable to the Generator Owner. ReliabilityFirst completely understands that the Generator Owner is the responsible entity for ensuring that transformer tap positions are changed and that the Generator Operator is the entity responsible for actually performing the change. ReliabilityFirst recommends splitting Requirement R6 and sub-part 6.1 into two separate requirements (i.e., create a new Requirement R7 using the language of sub-part 6.1).
Response: Thank you for your comments. Based on the independent expert report, the VAR standards may eventually be combined in a single family of standards, along with the TOP and IRO standards. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
Public Service Enterprise Group	1. In R1, a generator that is exempt from having to meet a voltage or Reactive Power schedule is exempt from R1. However, a generator that must meet a Reactive Power schedule should also be exempted from R1 because R1only applies to AVRs in the voltage control mode. R1 should be rewritten as follows:R1. The Generator Operator

Organization	Question 3 Comment
	shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) in service and controlling voltage) unless the Generator Operator 1) is exempted by the Transmission Operator, or 2) has been directed by its Transmission Operator to meet a Reactive Power schedule, or 3) has notified the Transmission Operator of one of the following:2. We suggest R2 have “or Reactive Power” inserted in the following phrase: “...for otherwise shall meet the conditions of notifications for deviations from the voltage or Reactive Power schedule provided by the Transmission Operator.” 3. R2, part 2.3 should be moved to M3 since it addresses measures to prove compliance with R2. We suggest the second sentence in M2 be modified as follows: “The Generator Operator shall have evidence to show that the its generator(s) maintained the voltage or Reactive Power schedule provided by the Transmission Operator (either at the location specified by the Transmission Operator or at an alternate location that includes a methodology for converting the schedule from Transmission Operator’s location to the alternate location), or shall have evidence of meeting the conditions of notification for deviations from the voltage schedule provided by the Transmission Operator."
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
Manitoba Hydro	Although Manitoba Hydro is in general agreement with the standards, we have the following comments:(1) M1 - the language in the measure is that evidence ‘must’ include which is a shift from typical language that evidence ‘may’ include. It also seems to be a shift from what is discussed in the rationale that the measure has been updated to include some of the evidence that ‘can be used’ for compliance purposes as the evidence listed is made mandatory by the ‘must’. (2) R1 - footnote 2 and 4 seems to be missing(3) M2 - refers to ‘unit’ while rest of standard refers to generator. For part 2.3, I believe the reference to ‘units’ should be to ‘Generator Operators’. (4) M3 -the acronym GOP is used while every other reference in the standard is to Generator Operator. (5) M4 - the language between the measure and the

Organization	Question 3 Comment
	requirement differs slightly. The measure requires evidence of notification within 30 minutes of 'the recognition' of a change, while the requirement requires notification within 30 minutes of 'becoming aware' of a change. (6) M5 - there is nothing in the measure that addresses the timeline upon which the Generator Owner is required to provide information. (7) R6/M6 - the requirement and measure refers to both Generator Owner and Generator Operator. Its not clear whether this is intentional or inadvertent. The words 'and provided technical justification' should be added to the end of M6 after 'tap specifications'. (8) Compliance, 1.2 - there is no time limit on the requirement for a Generator Owner to keep documentation on its step up and auxillary transformers. Its it meant to be for as long as that version is current?(9) Compliance, Compliance Monitoring, 1.3 - The language refers specifically to processes found in the NERC Rules of Procedure. Generally in draft standards, there is just a list of processes that may be used. The reference included in this draft standard is concerning because MB Hydro has their own Compliance and Monitoring program and has only adopted select aspects of the NERC Rules of Procedure.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
Exelon Companies	Exelon appreciates changes made to the standard the current revision is a significant improvement on the previous draft version. As mentioned above, we support VAR-001-4 as written but feel important issues remain unaddressed with VAR-002-3 and will therefore vote Negative. Our principal concerns include: VAR-002-3 Effective Dates. The Implementation Plan for VAR-001-4 and VAR-002-3 requires the new Standard revisions to be implemented the first day of the first calendar quarter after applicable regulatory approval. Although the Implementation Plan justification states that the VAR-002 standard "cannot go into effect without the new TOP schedules and notification requirements" it does not address the implementation associated with changes to VAR-002 with respect to status notifications. This is not sufficient time to allow generating units to implement training of operators and procedural changes necessary to implement the proposed changes to notification requirements

Organization	Question 3 Comment
	associated with the AVR, PSS or alternative voltage controlling device. We suggest at least a 6 month implementation period following regulatory approval. VAR-002 R1 or in the applicability section of the standard.This standard or requirement does not account for dispersed Generation (such as wind or solar as found in the new BES definition). These generators may not have traditional AVR, may only provide limited Reactive resources and the individual elements may not have AVR or be capable of operating in Voltage control mode. VAR-002-3 R2.3Exelon believes it is reasonable to allow the GOP to monitor the voltage at the location specified in their TOP issued voltage schedule by allowing the GOP to monitor at a different location by applying a methodology for converting the voltage monitored; however, the conversion method should be communicated and agreed to by the Transmission Operator. There is not a one for one conversion between grid voltage and terminal voltage and both parties should agree on the conversion method and monitoring point to avoid any future audit or implementation issues.VAR-002-3 R3Exelon agrees with the fifteen (15) minutes to allow a GOP time to resolve an issue before having to notify the TOP of a status or capability change; however, postponing the notification by 15 minutes to alleviate short term / nuisance notifications has the effect, as written, of shortening the notification window to 15 minutes. Fifteen minutes is not a reasonable timeframe for such notifications to occur, especially in large dispersed fleet operators where the GOPs do not communicate directly to their TOP and must notify via a third party (e.g., an independent generation dispatching organization). Exelon suggests that the 30 minute notification timeframe for a status change on the AVR, PPS or alternative voltage controlling device be started following the inability to restore within 15 minutes.VAR-002-3 R4Exelon suggests that the VAR SDT provide guidance to the industry on examples of reactive capability changes that would require notification to the TOP within 30 minutes after becoming aware of a change. The only guidance provided to date is in the VAR-002 Compliance Analysis Report dated August, 2010.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the	

Organization	Question 3 Comment
entire standard before posting it for another 45-day comment/ballot.	
Florida Municipal Power Agency	FMPA appreciates these changes. However, VAR-002-3 remains duplicative of other requirements within the standardsVAR-002-3 R2, bullet 2.3 is duplicative of TOP-001-2 R1. Both require the GOP to follow the direction of the TOP. Bullet 2.3 should be deleted.VAR-002-3 R5 is duplicative of TOP-003-2 and should be deleted. VAR-002-3 R5 requires the GO to provide the TOP information about the GSU. TOP-003-2 R5 requires the GO to submit data as specified by the TOP. The TOP cannot perform their obligations of VAR-001-4 R6 to specify GSU tap positions without the data of VAR-002-3 R5; however, the TOP will ask for that data in accordance with TOP-003-2 R3. Hence, these requirements are redundant and VAR-002-3 R5 ought to be deleted.FMPA also wonders how duplication between TOP-003-2 that gives TOPs a carte blanche opportunity to develop data requests on any information they need and the notification requirements of VAR-002-3 will be managed. In other words, the TOP can develop their TOP-003-2 data specification to include the notification requirements of VAR-002-3 and as such GOPs would be subject to double jeopardy risk.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
Utility System Efficiencies, Inc.	For R2, what about the situation where the generator cannot actually influence the voltage? There may be a significant amount of hours where they can't keep the voltage in range. For M2, for a generator that does not have an AVR, what type of evidence is required to show compliance for 8760 hours per year? Sounds like a lot of evidence potentially.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
Tri-State Generation and	For VAR-002-3 R5 TSGT believes the TOP should consult with the GOP rather than

Organization	Question 3 Comment
Transmission Association, Inc.	the GO to better align requirement R5 with its subrequirement R5.1.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
Consolidated Edison Co. of NY, Inc.	Generators may be asked by their TOP to operate in other modes. Reword Requirement R1 as follows: R1. The Generator Operator shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) in service and controlling voltage) unless the Generator Operator 1) is exempted by the Transmission Operator, [delete: or] 2) is notified by the Transmission Operator to operate in a different viable operating mode (e.g., constant VAR output mode), or 3) has notified the Transmission Operator of one of the following:
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
Consumers Energyu	It is important to clarify the statement of "notification requirements." In the context of VAR-002 this term refers to the notification from the GOP to the TOP on status of the AVR, Ability to follow the voltage schedule or the status of the unit.We would suggest the timing on VAR-002 R3 be similar to R4 in that the clock starts at the awareness of the GOP of a status change.VAR-001 clearly defines a Voltage or Reactive Power schedule. We suggest this be done in VAR-002 for consistency rather than the footnotes provided.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
Luminant Generation	Luminant appreciates the work of the SDT and agrees that most of the revisions are appropriate, and that the intent of the SDT to allow for more than one method of voltage support is correct. However, as written, VAR-002, R2, does not clearly

Organization	Question 3 Comment
	identify that generators can provide voltage support by a method other than maintaining a voltage schedule, continuously monitoring voltage and reporting deviations from the voltage schedule. In some areas of the country, the TOP monitors the voltage at all busses in it area, including the busses connecting generators, and directs generators to modify reactive output as the TOP requests. Luminant believes the language of VAR-002, R2 should be modified to provide clarity as follows:R2. Unless exempted by the Transmission Operator, each Generator Operator shall provide generator voltage support or Reactive Power support (within each generating Facility's capabilities4) as follows: [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations] 2.1. When a generator's AVR is out of service or the generator does not have an AVR, the Generator Operator shall use an alternative method to control the generator reactive output to provide voltage or Reactive Power support directed by the Transmission Operator. 2.2. When directed to modify voltage, the Generator Operator shall comply or provide an explanation of why the request cannot be met. 2.3. When directed by the Transmission Operator, each Generator Operator shall maintain the generator voltage or Reactive Power schedule3 (within each generating Facility's capabilities4) provided by the Transmission Operator, and shall meet the conditions of notification for deviations from the voltage schedule provided by the Transmission Operator. 2..3.1 Generator Operators that do not monitor the voltage at the location specified in their voltage schedule shall have a methodology for converting the scheduled voltage specified by the Transmission Operator to the voltage point being monitored by the Generator Operator. With this proposed language, the GOP would have to maintain a voltage schedule and report deviations only if that is the normal method of voltage support requested by the TOP. 2.3 and 2.3.1 would only apply to a GOP that maintains a voltage schedule. The measures for 2.1 and 2.2 would include operator logs, voice recordings, etc.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	

Organization	Question 3 Comment
Duke Energy	No. Duke Energy does not agree with the revisions made.Duke Energy is unclear whether the exemptions referenced in R1 and R2 in VAR-002-3 are the same as the exemptions created in VAR-001-4 R4. We believe using the word "exempted" in multiple requirements without identifying the origin of the exemption is a cause of confusion. Requirement 2 - Revise R2.1 to read," When a generator's AVR is out of service, the generator does not have an AVR, or is not in a TOP approved mode of AVR operation as specified in R1, the Generator Operator shall use an alternative method to control the generator reactive output to meet the voltage or Reactive Power schedule directed by the Transmission Operator. "The VRF/VSL for Requirement 2 would need to be modified if this change is made.Requirement 3 - Duke Energy is unclear as to what is considered an alternative voltage controlling device. Duke Energy prefers the language in the previous draft of this standard which states, "Each Generator Operator shall notify its associated Transmission Operator of a status or capability change on any generator Reactive Power resource, including the status of each automatic voltage regulator and power system stabilizer and the expected duration of the change in status or capability within 30 minutes of the change. If the status has been restored within the first 15 minutes of such change, then there is no need to call the TOP. "The language in the previous draft provides more clarity on what would prompt notification from a GOP to a TOP based on status or capability change.Requirement 5 - Duke Energy would like the SDT to review and verify that the Transmission Planner, and not the Planning Authority or Planning Coordinator, is the correct functional entity for this requirement. Lastly, Duke Energy would like to clarify that we encouraged our ballot body members to vote "Negative" on this ballot for reasons stipulated above. However, one of our ballot body members mistakenly voted "Affirmative" which was in error. Our decision to vote "Negative" on this ballot was unanimous among all those involved. We apologize for any confusion this may have caused.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	

Organization	Question 3 Comment
Kansas City Power & Light	NO. R2 is the part of VAR-002 that I disagree with because the Transmission System Operator is monitoring the system voltage and notifies each generating facility when they need to raise/lower voltage in that particular area of the system. If the voltage at the generating facility is high/low the TSO has received an alarm and will be notifying the plants control operator to correct the voltage and there already is a requirement for the control operators to comply with the TSO request.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
Portland General Electric Co	PGE appreciates NERC's efforts to revise VAR-002. The standard as whole is a significant improvement from the previous version. However, R3 still requires a 30 minute notification for notifying the transmission operator (TOP). The 30 minute limit is a challenge for generator operations to meet. The SDT should consider increasing this limit to 60 minutes. In addition, the requirement should allow registered entities to set up an alternative method to provide real-time AVR/PSS/voltage control device telemetry. This method would eliminate a need for notifying the transmission operator within 30 minutes. Also, the NERC glossary should fully define the term, 'voltage controlling device', as stated in R3.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
American Electric Power	R5: Rather than allowing only 30 days, we instead recommend that the Generator Owner be allowed to provide the data within the timeframe agreed upon by the GO and either the Transmission Operator or Transmission Planner. This data is often part of larger data submission that may stretch beyond the proposed time horizon. In addition, providing this data to the TP appears to be duplicative of the MOD standards currently being updated. As a result, we recommend removing the TP from this requirement.R6: We recommend that Requirement 6 and its subrequirement be applicable only to the Generator Owner and not split between the Generator Owner

Organization	Question 3 Comment
	and Generator Operator. If both are to be retained, we recommend that the subrequirement be changed to state "*If* the Generator Owner cannot provide tap setting changes as requested, the Generator Owner or Generator Operator should notify the Transmission Operator..."
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
Bureau of Reclamation	Reclamation believes that the notification requirements in R2 and R3 should provide the continent-wide standard. Reclamation suggests that the bullet points in R1 should be relabeled as sub-requirements R1.1 and R1.2.Reclamation requests that the drafting team clarify the timeframe for notifications required by R1. Reclamation suggests that the drafting team update VAR-002-3 R2 to allow Generator Operators to notify Transmission Operators that a voltage schedule cannot be met for equipment or other reasons, so that the Transmission Operator can alter the voltage schedule accordingly. R2.2 recognizes that a Generator Operator can provide an explanation that a voltage schedule cannot be met "when directed to modify voltage" but does not address the planning horizon. Reclamation appreciates that R2 recognizes that generators only need to comply with voltage schedules within facility capabilities, and that footnote 6 recognizes that generating facility capability may not be sufficient at times to pull the system voltage within scheduled tolerance bands. Nevertheless, Reclamation believes that R2 subrequirements should more clearly articulate that (1) Generator Operators should provide Transmission Operators with feedback that they cannot meet voltage schedules in the planning horizon, and (2) generators may not always be capable of modifying system voltage.Reclamation notes that R2.3 applies to real-time operations, and suggests that R2.3 should be updated to require Generator Operators and Transmission Operators to monitor voltage at mutually-agreed upon locations to avoid confusion in real-time communications. Reclamation suggests that the drafting team update VAR-002-3 R3 to specify that the "Generator Operator shall notify its associated Transmission Operator of a status change on the AVR, power system stabilizer, or alternative

Organization	Question 3 Comment
	voltage controlling device within 30 minutes of becoming aware of the change." Reclamation also suggests that M3 should be updated to specify that the GOP must notify its associated Transmission Operator "within 30 minutes of becoming aware of the change" rather than "within 30 minutes of when the change first occurred." Reclamation notes that VAR-002-3 R4 specifies that the "Generator Operator shall notify its associated Transmission Operator within 30 minutes after becoming aware of a change in reactive capability... ." Reclamation suggests that M4 should be updated to match this language and specify that the GOP must notify its associated Transmission Operator "within 30 minutes of becoming aware of the change" rather than "within 30 minutes of when the change first occurred." Reclamation requests clarification on types of "changes in reactive capability" that could trigger the notification requirement in R4. Reclamation notes that the time horizon for VAR-002-3 R6 should probably be changed from "Real-Time Operations" to "Operations Planning" to match VAR-001-4 R6 and reflect that tap setting changes are agreed upon in advance rather than in real-time. Reclamation suggests that VAR-002-3 R6 should be updated to match VAR-001-4 R6 and to specify that the Transmission Operator must coordinate outages to accommodate required step-up transformer tap changes. Reclamation suggests the drafting team update the requirement to read "After consultation with the Generator Owner regarding necessary step-up transformer tap changes, associated outages, and the implementation schedule...".
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
Northeast Power Coordinating Council	Suggest the following changes to more effectively convey the intents of Measure M3 and Requirement R6.Suggest that Measure M3 be reworded to require demonstration of compliance rather than to require actions which should have been stipulated in the requirement. Specifically, we proposed the last part in Measure M3 be revised to:"...therefore, if a status change lasts more than 15 minutes, the GOP shall provide evidence such as system log, electronic message or a transmittal letter that it notified its associated Transmission Operator within 30 minutes of when the

Organization	Question 3 Comment
	change first occurred."Regarding R6, the wording "the Generator Owner shall ensure that transformer tap positions are changed according to the specifications provided by the Transmission Operator..." is not a direct action and may not be measurable. Suggest revising it to read:"the Generator Owner shall implement the transformer tap positions according to the specifications provided by the Transmission Operator...."We further propose that the SDT insert the evidence language into the first sentence of Measure M3 which asks for evidence that the Generator notified its associated Transmission Operator within 30 minutes of the change identified in Requirement R3.Generators may be asked by their TOP to operate in other modes. Reword Requirement R1 as follows: R1. The Generator Operator shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) in service and controlling voltage) unless the Generator Operator 1) is exempted by the Transmission Operator, 2) is notified by the Transmission Operator to operate in a different viable operating mode (e.g., constant VAR output mode), or 3) has notified the Transmission Operator of one of the following:... The comments in Question 2 regarding Hydro-Quebec regarding the word "schedule" apply.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
PacifiCorp	The following change to requirement R4 is recommended: "Reactive capability changes due to change in the wind speed for wind generators or a change in the solar resource for solar facilities do not require Transmission Operator notification." Given the variable nature of wind, the reliance of weather forecasting does not rest explicitly with the GOP. The TOP has access to weather forecasting that would make the need of notification by the GOP unnecessary.Additionally, PacifiCorp supports the following comments from MidAmerican:We support the deletion of the language regarding notification of the expected duration of a change in status. At the time a status change occurs it is often difficult to provide a meaningful estimate of the duration of the change. Requirement 3 should be revised to state - Notification must

Organization	Question 3 Comment
	be made within 30 minutes of becoming aware of the change from automatic controlling voltage for the AVR, and from in-service of the PSS. Measure 3 should be revised to reflect this as well.The revised VAR-002 R2.1 removes the 15 minute deviation criteria for notification by Generator Operators to Transmission Operators. The revised VAR-001-4 requires Transmission Operators to provide notification requirements. The drafting team in the consideration of comments explained "In an effort to remove prescriptive notification requirements for the entire continent" the change was made. This leaves the Generator Operators at the mercy of Transmission Operators who could potentially set a no deviation criteria. It is recommended that a comprise be struck by specifying a limit on the criteria such as "no less than 15 minutes".
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
MRO NSRF	The revised VAR-002 R2.1 removes the 15 minute deviation criteria for notification by Generator Operators to Transmission Operators. The revised VAR-001-4 requires Transmission Operators to provide notification requirements. The drafting team in the consideration of comments explained "In an effort to remove prescriptive notification requirements for the entire continent" the change was made. This leaves the Generator Operators at the mercy of Transmission Operators who could potentially set a no deviation criteria. It is recommended that a compromise be struck by specifying a limit on the criteria such as "no less than 15 minutes".For clarification it is recommended that the word "generator" be added before the word "stability" in the last sentence of footnote 6. [Note to NSRF: a comment on this was submitted previously but it did not have a recommended language change]In M2 it is recommended that "alarm logs" be added to the list of evidence. We support the deletion of the language regarding notification of the expected duration of a change in status. At the time a status change occurs it is often difficult to provide a meaningful estimate of the duration of the change. Requirement 3 should be revised to state - Notification must be made within 30 minutes of becoming aware of the

Organization	Question 3 Comment
	change from automatic controlling voltage for the AVR, and from in-service of the PSS. Measure 3 should be revised to reflect this as well.The following change to requirement R4 is recommended: "Reactive capability changes due to factors such as a change in the wind speed for wind generators or a change in the solar resource for solar facilities do not require Transmission Operator notification"Measure 4 should be revised to reflect the wording in Requirement 4 - Notification must be made within 30 minutes of becoming aware of the change of state of the AVR.For the same reason described above for VAR-001 (NERC IGVT Report), R1 should be modified as follows:"R1. The Generator Operator shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) or plant-level volt/var regulator in service and controlling voltage) unless the Generator Operator 1) is exempted by the Transmission Operator, or 2) has notified the Transmission Operator of one of the following:" A similar addition should be made where the AVR is referred to in the other requirements of VAR-002.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
Independent Electricity System Operator	We agree with most of the proposed changes, but would suggest the following changes to more effective convey the intent of Requirement R3 and Measure M3.a. R3: The wording "the Generator Owner shall ensure that transformer tap positions are changed according to the specifications provided by the Transmission Operator" is not a direct action and may not be measurable. We suggest to revise it to read:"the Generator Owner shall implement the transformer tap positions according to the specifications provided by the Transmission Operator...."b. M3: We suggest it be reworded to require demonstration of compliance rather than to require actions which should have been stipulated in the requirement. Specifically, we proposed the last part in Measure M3 be revised to:"...therefore, if a status change lasts more than 15 minutes, the GOP shall provide evidence such as system log, electronic message or a transmittal letter that it notified its associated Transmission Operator within 30

Organization	Question 3 Comment
	minutes of when the change first occurred."We further propose that the SDT insert the evidence language into the first sentence of Measure M3 which asks for evidence that the Generator notified its associated Transmission Operator within 30 minutes of the change identified in Requirement R3.We assess the changes proposed under Q2 and Q 3, above, are not substantive and do not materially change the intent or content of the standards. Therefore, if the standards receives 2/3 majority approval at the ballot, these changes can be implemented and posted for recirculating ballot without having to post and ballot the standards for a successive ballot.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
ISO/RTO Standards Review Committee	We assess the changes proposed under Q2 and Q 3, above, are not substantive and do not materially change the intent or content of the standards. Therefore, if the standards receives 2/3 majority approval at the ballot, these changes can be implemented and posted for recirculating ballot without having to post and ballot the standards for a successive ballot.We agree with most of the proposed changes, but would suggest the following changes to more effective convey the intent of Requirement R3 and Measure M3.a. R3: The wording "the Generator Owner shall ensure that transformer tap positions are changed according to the specifications provided by the Transmission Operator" is not a direct action and may not be measurable. We suggest to revise it to read:"the Generator Owner shall implement the transformer tap positions according to the specifications provided by the Transmission Operator...."b. M3: We suggest it be reworded to require demonstration of compliance rather than to require actions which should have been stipulated in the requirement. Specifically, we proposed the last part in Measure M3 be revised to:"...therefore, if a status change lasts more than 15 minutes, the GOP shall provide evidence such as system log, electronic message or a transmittal letter that it notified its associated Transmission Operator within 30 minutes of when the change first occurred."We further propose that the SDT insert the evidence language into the first sentence of Measure M3 which asks for evidence that the Generator

Organization	Question 3 Comment
	notified its associated Transmission Operator within 30 minutes of the change identified in Requirement R3.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
Ameren	We request that the SDT support adding to R3 the "...after becoming aware of..." language now proposed for R4. This will help reduce the number of unnecessary GOP notifications to the TOP.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
Arizona Public Service Company	Yes
Salt River Project	Yes
Tennessee Valley Authority	Yes
The United Illuminating Company	Yes
CenterPoint Energy, Houston Electric LLC.	Yes, CenterPoint Energy agrees with these revisions to VAR-002 removing compliance issues that address burdensome notification requirements, allowing the Transmission Operator, through VAR-001 to tailor notification requirements based on system/area needs.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	

Organization	Question 3 Comment
Idaho Power Company	Yes, exempting the intermittent outages of AVR's and only requiring notification for extended interruptions is an improvement and lessens the documentation necessary to show compliance.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
Ingleside Cogeneration LP	Yes,Ingleside Cogeneration agrees that there must be reasonable notification criteria controlled by TOPs that allows them to specify when notification of change in AVR or reactive resource status is necessary. In many cases, the status is telemetered in real-time, but a call is required anyways to specify the expected duration of the status change. This is overcommunication in most cases, and only serves to tie up resources at the GOP and TOP.The same is true of notifications when the GOP cannot maintain the voltage at the interconnection point. Many GOPs do not control interconnection voltage and could actually resist an adjustment that the TOP is trying to make in response to system conditions. Again, some reasonable notification criteria could stop a lot of nuisance calls under these circumstances.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
City of Austin dba Austin Energy	Yes.
PJM Interconnection	Yes.
EDP Renewables North America LLC	Yes. EDPR NA believes it is important for TOPs to have the flexibility to tailor its requirements, as long as there is sufficient coordination among affected entities. We also offer the following comment:VAR-002 R1: We support the concept that a GOP need not notify its TOP that its AVR is out of service if it has previously advised its TOP that it will not have its AVR in service during start-up and shut-down. We

Organization	Question 3 Comment
	recommend that similar provision be made for variable energy resources which are not able to provide voltage support when operating in similar circumstances. Wind farms, for example, generally have equipment limitations that can affect their ability to follow voltage schedules when operating at low levels. Wind farms will not telemeter a different status in that circumstance, however. We propose that, if a variable energy resource has notified its TOP of equipment limitations that affect its ability to follow a voltage schedule until it achieves a certain level of production, also not be required to notify the TOP that its AVR is out of service.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
Bonneville Power Administration	Yes. Comments: BPA requests further clarification of VAR-002-3 R3 and M3, to be revised such that a status or capability change in generator Reactive Power should be reported within 30 minutes from an entity becoming aware of the change in condition, rather than the current form, which is 30 minutes from the change in condition.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
SPP Standards Review Group	Yes. We also offer the following comments on the two standards.Generic Comments on VAR-001-4We recommend changing 'real time' in the Purpose to 'Real-time' as defined in the NERC Glossary of Terms.We suggest rewording R1.1 to the following: 'Each Transmission Operator shall provide a copy of the voltage schedules as specified in R1 to its Reliability Coordinator and adjacent Transmission Operators within 30 calendar days of such a request.' Although we have proposed deleting R2, if the drafting team decides to keep it, we recommend deleting the last sentence in R2. It is really an example and doesn't contribute substantially to the requirement.We also recommended deleting R3 but if the drafting team decides to keep it, we suggest adding 'to operate within SOLs and IROLs' following 'as necessary' at the end of the

Organization	Question 3 Comment
	requirement.The use of the term 'direct' in R3 and R5.1 lead to implications of issuing directives. To get away from this situation, we suggest substituting 'instruct' for 'direct'. This change will also need to be reflected in the Measures and the VSLs.Since R4 contains an exemption for R5, we suggest reordering requirements R4 and R5 such that R5 becomes R4 and R4 becomes R5. That way the exemption follows the requirement.We suggest the drafting team delete the phrase '...at the Transmission Operator's discretion.' at the end of R5. We suggest changing 'associated' to 'applicable' in and deleting the redundant phrase at the end of R5.1. The requirement would then read: 'The Transmission Operator shall provide the voltage or Reactive Power schedule to the applicable Generator Operator.' The Measure will also need to be revised to correspond with the revised requirement.We recommend adding 'for that criteria' following 'request' at the end of R5.3.We recommend changing the Time Horizon in R6 to Long-Term Planning since the Transmission Planner is typically the entity that will determine when a tap change is necessary and will notify the Transmission Operator that it needs to be done.In the Rationale Box for R6 there is a reference to VAR capability and tap setting. We suggest rewording that sentence to the following: 'If the tap setting is not properly set, then the VARs available from that unit can be affected.'The Severe VSL for R3 contains 'real-time'. It needs to be 'Real-time'.Generic Comments on VAR-002-3The use of the term 'direct' in R2.2 lead to implications of issuing directives. To get away from this situation, we suggest substituting 'instruct' for 'direct'. This change would need to be reflected in the Measure 2.1 and 2.2 and the VSL also.We suggest changing the notification timing requirements in R3 to the Generator Operator must notify the Transmission Operator within 30 minutes of the change of AVR status unless the AVR has been restored to service.In the second sentence in the Rationale Box for R3, use 'provide' instead of 'provided.'In the Rationale Boxes for R5 and R6 there is a reference to VAR capability and tap setting. We suggest rewording that sentence to the following: 'If the tap setting is not properly set, then the VARs available from that unit can be affected.'
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire	

Organization	Question 3 Comment
standard before posting it for another 45-day comment/ballot.	
Xcel Energy	Yes. Xcel Energy appreciates the hard work of the Standard Drafting Team. We recognize that significant effort has been put into the modifications of the VAR-001 and VAR-002 standards and we applaud the direction the team is moving. We are voting Negative on VAR-002 for one reason which we explain below.Xcel Energy understands that the existing language in the VAR-002 standard uses the term "status change" but believe that this term is not well defined and is subject to different interpretations. AVRs and PSSs are designed to cycle based on the parameters being monitored by the devices. This as-designed cycling may be interpreted as a status change. We note here that the drafting team does not use the term status change in its rationale statement. Instead, the rationale statement is much clearer in meaning than the proposed requirement language. To address Xcel Energy's concern, we request that the drafting team replace the first sentence in Requirement R3 with the following sentence. (We believe that this change does not constitute a significant modification but is instead providing more clarity in the requirement language based on the wording of the Rationale for Requirement R3.)"Each Generator Operator shall notify its associated Transmission Operator when the AVR, power system stabilizer, or alternative voltage controlling device goes out of service within 30 minutes of the change."
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
Electric Reliability Council of Texas, Inc.	Yes.ERCOT supports the revisions but recommends that the SDT consider the following additional issues:A. Consider revising R2 as follows: "The generator shall follow the voltage schedule assigned by its TOP." Otherwise this is effectively a "fill in the blank" standard.As drafted, R2 also establishes "how" entities are required to meet their obligations. The standards should establish what is required and leave it to the discretion of the functional entity to determine how to meet the relevant objective. R3 provides the needed notification.B. VAR-002 R2 requires GOs to notify

Organization	Question 3 Comment
	TOPs of voltage. This seems to create an unnecessary requirement given that TOPs are obligated to monitor system voltage.C. VAR-002 R2.1 appears to require that GOs maintain the voltage assigned. Consistent with the general principle that the standards should establish what is required, how GOs maintain voltage assignments should be within the discretion of the entity.D. VAR-002 R2.2 is redundant. If GOs have to maintain the voltage assigned, this is unnecessary.E. VAR-002 R2.3 is redundant if a GO has to maintain the voltage assigned.F. VAR-002 M2 includes a statement that has a "will" in it. This effectively establishes a requirement. Measures are means of demonstrating compliance, they are not requirements. The measure should be revised accordingly.G. VAR-002 R3 should state that the notification is not required during startup or shutdown. A TOP can determine from telemetered information when a unit is operating below their lower stability limit. Requiring reporting of AVR/PSS status coming on/going off line is not necessary and creates unnecessary distractions that could undermine reliability.H. The 2nd sentence of R3 is redundant with the 1st. If notification is required within 30 minutes it is implicit that the entity does not have to notify within 15 minutes? I. If a GO maintains the assigned voltage, the status of a GO's AVR is irrelevant. If a GO failed to maintain the assigned voltage they are in violation of R2 regardless of the reason. M3 seems to unnecessarily create the potential for double violation issue on a reporting obligation.J. The standard should make clear that telemetry on status of AVRs and PSSs to TOPs meets this notification obligation. The term 'notify' seems to imply a manual written or verbal communication.K. VAR-002 R4 second sentence dealing with 15 min language- - please refer to R3/M3 comments.L. VAR-002 R5 - This requirement is unnecessary if GOs have to respond to any reasonable data request from their TOP.M. VAR-002 R6 is redundant with R2. If a GO has to maintain assigned voltage, and adjusting taps is necessary to do that, then this instructional requirement is not needed. If R6 is kept, in VAR-002-3 Standard the entity changes in R6.1. VAR-001-4 states the TOP will work with the GO in R6. Then in VAR-002-3 it states the following:R6. After consultation with the Transmission Operator regarding necessary step-up transformer tap changes, the Generator Owner shall ensure that

Organization	Question 3 Comment
	transformer tap positions are changed according to the specifications provided by the Transmission Operator, unless such action would violate safety, an equipment rating, a regulatory requirement, or a statutory requirement. [Violation Risk Factor: Lower] [Time Horizon: Real-time Operations] 6.1. If the Generator Operator cannot comply with the Transmission Operator's specifications, the Generator Operator shall notify the Transmission Operator and shall provide the technical justification. Why does it change from the GO to the GOP? The SDT should address the differences within VAR-002-3 to mirror R6 in the VAR-001-4 Standard.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
Dominion	Yes.In order to be consistent, Dominion also suggests reviewing the need to use "its associated Transmission Operator" throughout the entire standard (i.e. R1 - "has notified the Transmission Operator", R2/M2 - "provided by the Transmission Operator", R6 - "specifications provided by the Transmission Operator", etc).
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
DTE Electric Co.	YesComments: Adding the 15 minute window in VAR-002 is a great improvement.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	

4. The VRFs/VSLs for VAR-002 were modified to remove arbitrary time requirements. Do you have any specific comments or questions about the new VSLs/VRFs?

Organization	Question 4 Comment
Southern Company: Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing	The removal of "up to 45 minutes for the R2 VSL was a major improvement.The comma in the second and third OR statements of the Severe VSL for VAR-002 R2 is not needed. The comma in the second OR statement of the Severe VSL for VAR-002 R6 is not needed.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
Manitoba Hydro	(1) VSLs, - not clear why the references throughout the VSLs are to 'responsible entity' when the requirements are clear as to an obligation on either the Generator Owner or Generator Operator. Those entities should be listed in the VSLs as they are in the requirements and standards. (2) VSLs, R2, Severe VSL - the word 'Power' is missing after 'Reactive'. Also doesn't mention that the Generator Operator 'did not have an exemption'. (3) VSLs, R3 and R4 - would read better if stated 'the Generator Operator did not make the notification of a change that lasted more than 15 minutes within 30 minutes of the first occurrence of the change as required'.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	

Organization	Question 4 Comment
CenterPoint Energy, Houston Electric LLC.	CenterPoint Energy believes the VSLs associated with VAR-001 R2 and R3 do not consider changes in Real-Time topography such as forced outages, Resource inadequacy, or changes in weather that can drastically change the outcome of any planned or studied environment in both normal and emergency operations. A transmission operator could have scheduled sufficient reactive resources as necessary and have them available to mitigate known and identified SOLs or IROLs, but cannot schedule sufficient reactive resources for the unknown. CenterPoint energy suggests adding "identified" to the VSL language. "The Transmission Operator does not schedule sufficient reactive resources as necessary to avoid violating an identified SOL or IROL". CenterPoint energy believes that the High VSL for R4 is inappropriate and is indicative of a zero tolerance environment. If a Transmission Operator has an exemption criteria established, notifies the Generator Operator of such exemption, and captures evidence for compliance to prove notification 99 times out of 100, then the one instance in which the TOP notified the Generator Operator, but failed to capture evidence would warrant a High VSL possible violation.
Response: Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, the SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
Xcel Energy	If the drafting team makes the requested modifications to the requirements, Xcel Energy has no concerns with either the VSLs or VRFs.
Response: Thank you for your comments.	
Utility System Efficiencies, Inc.	No
Idaho Power Company	No
Tennessee Valley Authority	No comments

Organization	Question 4 Comment
Salt River Project	No.
Bonneville Power Administration	No.
Kansas City Power & Light	No.
EDP Renewables North America LLC	No.
City of Austin dba Austin Energy	No.Because NERC has not provided an area for "Additional Comments," we are adding them here.The City of Austin dba Austin Energy (AE) commends the Standard Drafting Team's efforts related to Project 2013-04. The quality of the standard is enhanced over previous approved versions, providing additional clarity and compliance sensitivity. AE respectfully submits the following comments on VAR-001-4 and VAR-002-3 to the Standard Drafting Team (SDT):VAR-002-3, R1, Pertaining to the phrase "... unless the Generator Operator 1) is exempted by the Transmission Operator, or 2) has notified the Transmission Operator..." AE recommends the SDT clarify whether the TOP may exempt all the units represented by a GOP, or instead, specific generating facilities or a generator bus. AE suggests altering the language to read "... unless 1) the generator is exempted by the Transmission Operator, or 2) the Generator Operator has notified the Transmission Operator..." This change will make the language in VAR-002-3 R1 consistent with the language in VAR-001-4 R4.VAR-002-3, R2.3: The requirement makes it mandatory for Generator Operators to monitor the voltage at the location specified in the voltage schedule or have a methodology for converting the scheduled voltage specified by the TOP. This may imply that the Generator Operator should make voltage corrections independent from the TOP. AE believes that maintaining the appropriate transmission level voltage is the key for sustaining system stability and that responsibility falls on the TOP. Because the TOP already monitors the transmission level voltages, the R2.3

Organization	Question 4 Comment
	requirement for GOPs to monitor voltage is redundant and may create a situation where the TOP and GOP do not agree on the monitored value (i.e. the voltage readings can be different due to step-up voltage equipment). To avoid confusion and potential compliance ambiguities, AE suggests the standard specifically state TOPs are responsible for monitoring the system voltage schedule and notifying the GOP when voltage drifts outside acceptable parameters. This appears to be a common practice of operating the grid. The GOP will be responsible for meeting the reactive support requested by the TOP. If the GOP cannot meet the reactive support requested by the TOP, the GOP should have to notify the TOP. AE suggests the following: Add "Transmission Operators" under R4 - "4.3 Transmission Operators", and alter R2.3 to: "Each Transmission Operator shall monitor the system voltage and notify its associated GOPs for additional voltage support if system voltage fails to meet the voltage schedule. If the GOP cannot meet the reactive support requested by the TOP due to equipment limitations, it shall notify the TOP of the limitations within 15 minutes.VAR-002-3, R4: AE believes the phrase "a change in reactive capability" is vague. As written, even the slightest change in reactive capability must be reported to the TOP. Is it the SDT intent the TOP be notified if a reactive capability (leading or lagging) of a generation resource changes by 1 MVAR? Detecting and reporting small reductions in reactive capability will create onerous reporting. AE recommends the following for R4: "Each Generator Operator shall notify its associated Transmission Operator within 30 minutes that a resource's reactive capability changed by 20 MVAR or 10%, whichever is greater, of the previously provided reactive capability due to factors other than a status change described in Requirement R3."
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, so the VAR SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
American Electric Power	R3 & R4 do not require communications for all instances. As a result, the severe VSL text must be qualified so that it only applies to those situations where notification is actually necessary.

Organization	Question 4 Comment
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, so the VAR SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
Bureau of Reclamation	Reclamation suggests that the VSLs for VAR-002-3 R3 and R4 should reflect a range of noncompliance like in VAR-002-2. A failure to notify the Transmission Operator of an AVR, power system stabilizer, or reactive capability change for 35 minutes should not be treated the same as a failure to notify the Transmission Operator of the status change for 75 minutes.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, so the VAR SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
Duke Energy	See our comments on VAR-002 Requirement 2.
Arizona Public Service Company	The VRF of "high" is not justified for any of the requirements. We would suggest a VRF of "medium" or "low". If the drafting team thinks a VRF of "high " is justified, some reasoning should be provided by the team. Lack of documented voltage schedules does not mean the system is being operated unreliably. Units are still being operated in AVR mode as required by other schedules and transmission operators coordinate the voltage schedules as needed.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, so the VAR SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
PPL NERC Registered Affiliates	Time requirements are not necessarily arbitrary, and it is in fact important to establish explicit and meaningful criteria regarding the acceptable time (and magnitude) of voltage schedule deviations. The principal reason that VAR-002 has been so troublesome in the past is that one could interpret a 10 MW hydro unit being out of the bandwidth by 0.1 kV for 1 minute as constituting a violation, despite there being no meaningful impact on BES reliability. There are moreover many occasions when a the system voltage unavoidably strays briefly outside the bandwidth due to a

Organization	Question 4 Comment
	disturbance or because there are step-changes in the TOP's voltage schedule. VAR-002-3 makes a slight movement in the right direction by stating in R2 that a unit must keep within the bandwidth or, "meet the conditions of notification," but there is nothing in VAR-001 or 002 to require TOPs to create justifiable requirements in this respect. We presently suffer under a system in which meaningless violations are spawned by abusive practices, such as establishing a bandwidth of only +/- 0.5%, and VAR-001 and 002 should be revised in a fashion that prohibits such practices.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, so the VAR SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
ACES Standards Collaborators	We do not support the VSLs for R5 because it meets P81 criteria and should be removed. We also do not support the VSLs for requirements that need modifications as identified in question 3.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, so the VAR SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
SPP Standards Review Group	We suggest the following change for the High VSL for R2. The responsible entity did not have a conversion methodology when it monitored voltage...'We recommend replacing the word 'directive' with 'specification' in the Severe VSL for R6.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, so the VAR SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	
Northeast Power Coordinating Council	We support the proposed VRFs and VSLs.
ISO/RTO Standards Review Committee	We support the proposed VRFs and VSLs.

Organization	Question 4 Comment
Independent Electricity System Operator	We support the proposed VRFs and VSLs.
Exelon Companies	We understand that R3 and R4 are binary requirements, (did or did not notify in 30 minutes), but it seems unreasonable that a complete failure to notify would have the same VSL as a notification that is one or five minutes late.
Response: Thank you for your comments. Since VAR-002 did not pass successive ballot, so the VAR SDT will revisit the entire standard before posting it for another 45-day comment/ballot.	

Additional Comments:

Seminole Electric
Bret T. Galbraith

VAR-001-4 Comments

(1) Requirement R2 states the following:

"Each Transmission Operator shall schedule '**sufficient reactive resources to regulate voltage levels'** under normal and Contingency conditions." (emphasis added)

Seminole requires clarification concerning the phrase "sufficient reactive resources to regulate voltage levels." Seminole requests additional clarity as to what it means to regulate voltage levels, e.g., does this mean to operate within SOLs? Please add clarity to the language of the Requirement, and not in guidance documents. Seminole believes adding clarity will assist auditors in determining what is "sufficient."

(2) Requirement R3 states the following:

"Each Transmission Operator shall operate or direct the Real-time operation of devices to '**regulate transmission voltage and reactive flow as necessary'**." (emphasis added)

Seminole believes that the language "as necessary" does not provide enough due process notification of what is required. Seminole would like clarification as to what is necessary, for example, "necessary to ensure sufficient voltage support to prevent …"

VAR-002-3 Comments

(1) Requirement R1. defines "start-up" as ending "when the generator is ramped up to its minimum continuously sustainable load and the generator is prepared for continuous operation." The drafting also defines "shutdown" as beginning "when the generator is ramped down to its minimum continuously sustainable load and the generator is prepared to go offline." Seminole reasons that these definitions for "start-up" and "shutdown" inaccurately describe generator start-up and shutdown in the traditional meaning of these terms. For example, operators may consider start-up to cover the generator load above the minimum sustainable load value to base load for environmental permitting regulations. It appears that the drafting team is attempting to define a unique generator operational region, and therefore, Seminole suggests that the drafting team utilize different terms than "start-up" and "shutdown" in order to prevent confusion.

However, the drafting team does not define "testing mode," and Seminole reasons that without additional guidelines, such as qualitative and quantitative factors, the misinterpretation of "testing mode" is a concern. Therefore, Seminole requests the drafting team to describe in greater detail "testing mode."

(2) Requirement R3 states the following:

"Each Generator Operator shall notify its associated Transmission Operator of a status change on the AVR, power system stabilizer, or alternative voltage controlling device within **'30 minutes'** of the change. If the status has been restored within the first '**15 minutes'** of such change, then there is no need to notify the Transmission Operator." (emphasis added)

Reviewing the timeframes listed, it appears the numbers are significant to the whole number value. Therefore, if an entity has an AVR status change that lasts 15 minutes and 29 seconds, that AVR status change does not need to be reported, because proper significant digits rounding will round that value to 15 minutes and not 16 minutes. Please clarify the significant digit in these timeframes, i.e., is it 15, 15.0, 15.00, 15.0000, etc.?

Response: Thank you for your comments. The phrase "as necessary" is retained because the Transmission Operator is not expected to always operate or direct the actions of a Generator Operator. This allows the TOP to intervene as necessary to avoid system events or instances of high or low voltage. Also, since VAR-002 did not pass successive ballot, so the VAR SDT will revisit the entire standard before posting it for another 45-day comment/ballot.

Santee Cooper
Rene' Free

1. The rationale statement for R1 of VAR-001 says that it, "will allow each Transmission Operator (TOP) to establish its own policies and procedures," regarding voltage schedules and tolerance bands. This wording does nothing to prevent specifying an unreasonably-tight bandwidth (e.g. +/- 0.5%). We suggest that R1.1 end as follows, "…voltage schedules along with associated tolerance bands of not less than 1.5% of the schedule voltage unless technically justified." There may be some resistance to making the standard prescriptive, but it's not a burdensome requirement.
2. VAR-002, R5 should be revised to state; "For generator step-up and auxiliary transformers with nominal primary voltages equal to the generator terminal voltage:" This is to clarify that R4 is N/A to startup transformers and other station auxiliary transformers connected to a HV bus at a plant.

Response: Thank you for your comments. The industry could not reach a consensus on a minimum tolerance band, and some TOPs provided feedback that some tolerance bands are very narrow due to the area's voltage constraints. Also, since VAR-002 did not pass successive ballot, so the VAR SDT will revisit the entire standard before posting it for another 45-day comment/ballot.

END OF REPORT

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR and supporting package posted for comment on July 19, 2013.
2. Draft standard posted for initial comments and ballot from July 19, 2013 to September 3, 2013.
3. Draft standard posted for an additional comment and ballot from November 15, 2013 to November 26, 2013.

Description of Current Draft

This is the third posting of the proposed draft standard. This proposed draft standard will be posted for a 10-day final ballot.

Anticipated Actions	Anticipated Date
Additional 45-Day Comment Period with Ballot	October/November 2013
Final Ballot	December 2013
NERC Board of Trustees Adoption	February 2014
Filing to Applicable Regulatory Authorities	February 2014

Version History

Version	Date	Action	Change Tracking
1	6/18/2007	Initial Standard is FERC approved	
2	1/10/2011	FERC approved added LSEs and Controllable Load to the standard.	
3	6/20/2013	WECC Variance is approved by FERC	

Definitions of Terms Used in the Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None.

A. Introduction

1. **Title:** Voltage and Reactive Control

2. **Number:** VAR-001-4

3. **Purpose:** To ensure that voltage levels, reactive flows, and reactive resources are monitored, controlled, and maintained within limits in Real-time to protect equipment and the reliable operation of the Interconnection.

4. **Applicability:**

   4.1. Transmission Operators

   4.2. Generator Operators within the Western Interconnection (for the WECC Variance)

5. **Effective Date:**

   5.1. The standard shall become effective on the first day of the first calendar quarter after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

B. Requirements and Measures

Rationale for R1: Paragraph 1868 of Order No. 693 requires NERC to add more "detailed and definitive requirements on “established limits” and “sufficient reactive resources”, and identify acceptable margins (i.e. voltage and/or reactive power margins)." Since Order No. 693 was issued, however, several FAC and TOP standards have become enforceable to add more requirements around voltage limits. More specifically, FAC-011 and FAC-014 require that System Operating Limits (SOLs) and reliability margins are established. The NERC Glossary definition of SOLs includes both: 1) Voltage Stability Ratings (Applicable pre- and post-Contingency Voltage Stability) and 2*)* System Voltage Limits (Applicable pre- and post-Contingency Voltage Limits). Therefore, for reliability reasons Requirement R1 now requires a Transmission Operator (TOP) to set voltage or Reactive Power schedules with associated tolerance bands. Further, since neighboring areas can affect each other greatly, each TOP must also provide a copy of these schedules to its Reliability Coordinator (RC) and adjacent TOP upon request.

R1. Each Transmission Operator shall specify a system voltage schedule (which is either a range or a target value with an associated tolerance band) as part of its plan to operate within System Operating Limits and Interconnection Reliability Operating Limits. *[Violation Risk Factor: High] [Time Horizon: Operational Planning]*

1.1. Each Transmission Operator shall provide a copy of the voltage schedules (which is either a range or a target value with an associated tolerance band) to its Reliability Coordinator and adjacent Transmission Operators within 30 calendar days of a request.

M1. The Transmission Operator shall have evidence that it specified system voltage schedules using either a range or a target value with an associated tolerance band.

For part 1.1, the Transmission Operator shall have evidence that the voltage schedules (which is either a range or a target value with an associated tolerance band) were provided to its Reliability Coordinator and adjacent Transmission Operators within 30 days of a request. Evidence may include, but is not limited to, emails, website postings, and meeting minutes.

Rationale for R2:

Paragraph 1875 from Order No. 693 directed NERC to include requirements to run voltage stability analysis periodically, using online techniques where commercially available and offline tools when online tools are not available. This standard does not explicitly require the periodic voltage stability analysis because such analysis would be performed pursuant to the SOL methodology developed under the FAC standards. TOP standards also require the TOP to operate within SOLs and Interconnection Reliability Operating Limits (IROL). The VAR standard drafting team (SDT) and industry participants also concluded that the best models and tools are the ones that have been proven and the standard should not add a requirement for a responsible entity to purchase new online simulations tools. Thus, the VAR SDT simplified the requirements to ensuring sufficient reactive resources are online or scheduled. Controllable load is specifically included to answer FERC's directive in Order No. 693 at Paragraph 1879.

R2. Each Transmission Operator shall schedule sufficient reactive resources to regulate voltage levels under normal and Contingency conditions. Transmission Operators can provide sufficient reactive resources through various means including, but not limited to, reactive generation scheduling, transmission line and reactive resource switching, and using controllable load. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same-day Operations, and Operational Planning]*

M2. Each Transmission Operator shall have evidence of scheduling sufficient reactive resources based on their assessments of the system. For the operational planning time horizon, Transmission Operators shall have evidence of assessments used as the basis for how resources were scheduled.

Rationale for R3:

Similar to Requirement R2, the VAR SDT determined that for reliability purposes, the TOP must ensure sufficient voltage support is provided in Real-time in order to operate within an SOL.

R3. Each Transmission Operator shall operate or direct the Real-time operation of devices to regulate transmission voltage and reactive flow as necessary. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same-day Operations, and Operational Planning]*

M3. Each Transmission Operator shall have evidence that actions were taken to operate capacitive and inductive resources as necessary in Real-time. This may include instructions to Generator Operators to: 1) provide additional voltage support; 2) bring resources on-line; or 3) make manual adjustments.

Rationale for R4:

The VAR SDT received significant feedback on instances when a TOP would need the flexibility for defining exemptions for generators. These exemptions can be tailored as the TOP deems necessary for the specific area's needs. The goal of this requirement is to provide a TOP the ability to exempt a Generator Operator (GOP) from: 1) a voltage or Reactive Power schedule, 2) a setting on the AVR, or 3) any VAR-002 notifications based on the TOP's criteria. Feedback from the industry detailed many system events that would require these types of exemptions which included, but are not limited to: 1) maintenance during shoulder months, 2) scenarios where two units are located within close proximity and both cannot be in voltage control mode, and 3) large system voltage swings where it would harm reliability if all GOP were to notify their respective TOP of deviations at one time. Also, in an effort to improve the requirement, the sub-requirements containing an exemption list were removed from the currently enforceable standard because this created more compliance issues with regard to how often the list would be updated and maintained.

R4. The Transmission Operator shall specify the criteria that will exempt generators from: 1) following a voltage or Reactive Power schedule, 2) from having its automatic voltage regulator (AVR) in service or from being in voltage control mode, or 3) from having to make any associated notifications. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

4.1 If a Transmission Operator determines that a generator has satisfied the exemption criteria, it shall notify the associated Generator Operator.

M4. Each Transmission Operator shall have evidence of the documented criteria for generator exemptions.

For part 4.1, the Transmission Operator shall also have evidence to show that, for each generator in its area that is exempt from: 1) following a voltage or Reactive Power schedule, 2) from having its automatic voltage regulator (AVR) in service or from being in voltage control mode, or 3) from having to make any notifications, the associated Generator Operator was notified of this exemption.

Rationale for R5:

The new requirement provides transparency regarding the criteria used by the TOP to establish the voltage schedule. This requirement also provides a vehicle for the TOP to use appropriate granularity when setting notification requirements for deviation from the voltage or Reactive Power schedule. Additionally, this requirement provides clarity regarding a "tolerance band" as specified in the voltage schedule and the control dead-band in the generator's excitation system.

Voltage Schedule tolerances are the bandwidth that accompanies the voltage target in a voltage schedule, should reflect the anticipated fluctuation in voltage at the Generation Operator's facility during normal operations, and be based on the TOP's assessment of N-1 and credible N-2 system contingencies. The voltage schedule's bandwidth should not be confused with the control dead-band that is programmed into a Generation Operator's automatic voltage regulator's control system, which should be adjusting the AVR prior to reaching either end of the voltage schedule's bandwidth.

R5. Each Transmission Operator shall specify a voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) at either the high voltage side or low voltage side of the generator step-up transformer at the Transmission Operator's discretion. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

5.1. The Transmission Operator shall provide the voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) to the associated Generator Operator and direct the Generator Operator to comply with the schedule in automatic voltage control mode (the AVR is in service and controlling voltage).

5.2. The Transmission Operator shall provide the Generator Operator with the notification requirements for deviations from the voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band).

5.3. The Transmission Operator shall provide the criteria used to develop voltage schedules Reactive Power schedule (which is either a range or a target value with an associated tolerance band) to the Generator Operator within 30 days of receiving a request.

M5. The Transmission Operator shall have evidence of a documented voltage or Reactive Power Schedule (which is either a range or a target value with an associated tolerance band).

For part 5.1, the Transmission Operator shall have evidence it provided a voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) to the applicable Generator Operators, and that the Generator Operator was directed to comply with the schedule in automatic voltage control mode, unless exempted.

For part 5.2, the Transmission Operator shall have evidence it provided notification requirements for deviations from the voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band). For part 5.3, the Transmission Operator shall have evidence it provided the criteria used to develop voltage schedules or Reactive Power schedule

(which is either a range or a target value with an associated tolerance band) within 30 days of receiving a request by a Generator Operator.

Rationale for R6:

Although tap settings are first established prior to interconnection, this requirement could not be deleted because no other standard addresses when a tap setting must be adjusted. If the tap setting is not properly set, then the amount of VARs produced by a unit can be affected.

R6. After consultation with the Generator Owner regarding necessary step-up transformer tap changes and the implementation schedule, the Transmission Operator shall provide documentation to the Generator Owner specifying the required tap changes, a timeframe for making the changes, and technical justification for these changes. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M6. The Transmission Operator shall have evidence that it provided documentation to the Generator Owner when a change was needed to a generating unit's step-up transformer tap in accordance with the requirement and that it consulted with the Generator Owner.

C. Compliance

1. **Compliance Monitoring Process:**

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" refers to NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time a registered entity is required to retain specific evidence to demonstrate compliance. For instances in which the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask the registered entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Operator shall retain evidence for Measures 1 through 6 for 12 months. The Compliance Monitor shall retain any audit data for three years.

1.3. Compliance Monitoring and Assessment Processes:

"Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.4. Additional Compliance Information:

None

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operational Planning**	**High**	N/A	N/A	N/A	The Transmission Operator does not specify a system voltage schedule (which is either a range or a target value with an associated tolerance band).
R2	**Real-time Operations, Same-day Operations, and Operational Planning**	**High**	N/A	N/A	The Transmission Operator does not schedule sufficient reactive resources as necessary to avoid violating an SOL.	The Transmission Operator does not schedule sufficient reactive resources as necessary to avoid violating an IROL.
R3	**Real-time Operations, Same-day Operations, and Operational Planning**	**High**	N/A	N/A	The Transmission Operator does not operate or direct any real-time operation of devices as necessary to avoid violating an SOL.	The Transmission Operator does not operate or direct any real-time operation of devices as necessary to avoid violating an IROL.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R4	**Operations Planning**	**Lower**	N/A	N/A	The Transmission Operator has exemption criteria and notified the Generator Operator, but the Transmission Operator does not have evidence of the notification to the Generator Operator.	The Transmission Operator does not have exemption criteria.
R5	**Operations Planning**	**Medium**	N/A	The Transmission Operator does not provide the criteria for voltage or Reactive Power schedules (which is either a range or a target value with an associated tolerance band) after 30 days of a request.	The Transmission Operator does not provide voltage or Reactive Power schedules (which is either a range or a target value with an associated tolerance band) to all Generator Operators.	The Transmission Operator does not provide voltage or Reactive Power schedules (which is either a range or a target value with an associated tolerance band) to any Generator Operators. Or The Transmission Operator does not provide the Generator Operator with the notification requirements for deviations from the

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band).
R6	**Operations Planning**	**Lower**	The Transmission Operator does not provide either the technical justification or timeframe for changing generator step-up tap settings.	N/A	N/A	The Transmission Operator does not provide the technical justification and the timeframe for changing generator step-up tap settings.

D. Regional Variances

The following Interconnection-wide variance shall be applicable in the Western Electricity Coordinating Council (WECC) and replaces, in their entirety, Requirements R4 and R5. Please note that Requirement R4 is deleted and R5 is replaced with the following requirements.

Requirements

E.A.13 Each Transmission Operator shall issue any one of the following types of voltage schedules to the Generator Operators for each of their generation resources that are on-line and part of the Bulk Electric System within the Transmission Operator Area: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same-day Operations]*

- A voltage set point with a voltage tolerance band and a specified period.
- An initial volt-ampere reactive output or initial power factor output with a voltage tolerance band for a specified period that the Generator Operator uses to establish a generator bus voltage set point.
- A voltage band for a specified period.

E.A.14 Each Transmission Operator shall provide one of the following voltage schedule reference points for each generation resource in its Area to the Generator Operator. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same-day Operations]*

- The generator terminals.
- The high side of the generator step-up transformer.
- The point of interconnection.
- A location designated by mutual agreement between the Transmission Operator and Generator Operator.

E.A.15 Each Generator Operator shall convert each voltage schedule specified in Requirement E.A.13 into the voltage set point for the generator excitation system. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same-day Operations]*

E.A.16 Each Generator Operator shall provide its voltage set point conversion methodology from the point in Requirement E.A.14 to the generator terminals within 30 calendar days of request by its Transmission Operator. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

E.A.17 Each Transmission Operator shall provide to the Generator Operator, within 30 calendar days of a request for data by the Generator Operator, its transmission equipment data and operating data that supports development of the voltage set point conversion methodology. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

E.A.18 Each Generator Operator shall meet the following control loop specifications if the Generator Operator uses control loops external to the Automatic Voltage Regulators (AVR) to manage MVar loading: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

E.A.18.1. Each control loop's design incorporates the AVR's automatic voltage controlled response to voltage deviations during System Disturbances.

E.A.18.2. Each control loop is only used by mutual agreement between the Generator Operator and the Transmission Operator affected by the control loop.

Measures[1]

M.A.13 Each Transmission Operator shall have and provide upon request, evidence that it provided the voltage schedules to the Generator Operator. Dated spreadsheets, reports, voice recordings, or other documentation containing the voltage schedule including set points, tolerance bands, and specified periods as required in Requirement E.A.13 are acceptable as evidence.

M.A.14 The Transmission Operator shall have and provide upon request, evidence that it provided one of the voltage schedule reference points in Requirement E.A.14 for each generation resource in its Area to the Generator Operator. Dated letters, e-mail, or other documentation that contains notification to the Generator Operator of the voltage schedule reference point for each generation resource are acceptable as evidence.

M.A.15 Each Generator Operator shall have and provide upon request, evidence that it converted a voltage schedule as described in Requirement E.A.13 into a voltage set point for the AVR. Dated spreadsheets, logs, reports, or other documentation are acceptable as evidence.

M.A.16 The Generator Operator shall have and provide upon request, evidence that within 30 calendar days of request by its Transmission Operator it provided its voltage set point conversion methodology from the point in Requirement E.A.14 to the generator terminals. Dated reports, spreadsheets, or other documentation are acceptable as evidence.

M.A.17 The Transmission Operator shall have and provide upon request, evidence that within 30 calendar days of request by its Generator Operator it provided data to support development of the voltage set point conversion methodology. Dated reports, spreadsheets, or other documentation are acceptable as evidence.

M.A.18 If the Generator Operator uses outside control loops to manage MVar loading, the Generator Operator shall have and provide upon request, evidence that it met the control loop specifications in sub-parts E.A.18.1 through E.A.18.2. Design specifications with identified agreed-upon control loops, system reports, or other dated documentation are acceptable as evidence.

[1] The number for each measure corresponds with the number for each requirement, i.e. M.E.A.13 means the measure for Requirement E.A.13.

E. Interpretations

None.

F. Associated Documents

None.

Guidelines and Technical Basis

For technical basis for each requirement, please review the rationale provided for each requirement.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR and supporting package posted for comment on July 19, 2013.
2. Draft standard posted for initial comments and ballot from July 19, 2013 to September 3, 2013.
~~2.~~3. Draft standard posted for an additional comment and ballot from November 15, 2013 to November 26, 2013.

Description of Current Draft

This is the ~~second~~ third posting of the proposed draft standard. This proposed draft standard will be posted for a ~~45~~10-day ~~formal comment period and parallel~~final ballot.

Anticipated Actions	Anticipated Date
Additional 45-Day Comment Period with Ballot	October/November 2013
Final Ballot	December 2013
NERC Board of Trustees Adoption	~~December~~ February 2014~~3~~
Filing to Applicable Regulatory Authorities	~~December~~ February 2014~~3~~

Version History

Version	Date	Action	Change Tracking
1	6/18/2007	Initial Standard is FERC approved	
2	1/10/2011	FERC approved added LSEs and Controllable Load to the standard.	
3	6/20/2013	WECC Variance is approved by FERC	

Definitions of Terms Used in the Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None.

A. Introduction

1. **Title:** Voltage and Reactive Control

2. **Number:** VAR-001-4

3. **Purpose:** To ensure that voltage levels, reactive flows, and reactive resources are monitored, controlled, and maintained within limits in ~~r~~Real-time to protect equipment and the reliable operation of the Interconnection.

4. **Applicability:**

   4.1. Transmission Operators

   4.2. Generator Operators within the Western Interconnection (for the WECC Variance)

5. **Effective Date:**

   5.1. The standard shall become effective on the first day of the first calendar quarter after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

B. Requirements and Measures

Rationale for R1: Paragraph 1868 of Order No. 693 requires NERC to add more "detailed and definitive requirements on “established limits” and “sufficient reactive resources”, and identify acceptable margins (i.e. voltage and/or reactive power margins)." Since Order No. 693 was issued, however, several FAC and TOP standards have become enforceable to add more requirements around voltage limits. More specifically, FAC-011 and FAC-014 require that System Operating Limits (~~“~~SOLs~~”~~) and reliability margins are established. The NERC Glossary definition of SOLs ~~must~~ includes both: 1) Voltage Stability Ratings (Applicable pre- and post-Contingency Voltage Stability) and 2*)* System Voltage Limits (Applicable pre- and post-Contingency Voltage Limits). Therefore, for reliability reasons Requirement R1 now requires a Transmission Operator (TOP) to set voltage or Reactive Power schedules with associated tolerance bands. Further, since neighboring areas can affect each other greatly, each TOP must also provide a copy of these schedules to its Reliability Coordinator (RC) and adjacent TOP upon request.

R1. Each Transmission Operator shall specify a system voltage schedule (which is either a range or a target value with an associated tolerance band) as part of its plan to operate within System Operating Limits and Interconnection Reliability Operating Limits. *[Violation Risk Factor: High] [Time Horizon: Operational Planning]*

1.1. Each Transmission Operator shall provide a copy of the voltage schedules (which is either a range or a target value with an associated tolerance band) ~~and associated tolerance bands~~ to its Reliability Coordinator and adjacent Transmission Operators within 30 calendar days of a request.

M1. The Transmission Operator shall have evidence that it specified system voltage schedules using either a range or a target value with an associated tolerance band.

For part 1.1, the Transmission Operator shall have evidence that the voltage schedules (which is either a range or a target value with an associated tolerance band) were provided to its Reliability Coordinator and adjacent Transmission Operators within 30 days of a request. Evidence may include, but is not limited to, emails, website postings, and meeting minutes.

Rationale for R2:

Paragraph 1875 from Order No. 693 directed NERC to include requirements to run voltage stability analysis periodically, using online techniques where commercially available and offline tools when online tools are not available. This standard does not explicitly require the periodic voltage stability analysis because such analysis ~~is now required~~ would be performed ~~-~~pursuant to the SOL methodology developed under~~in~~ the FAC standards. TOP standards also require the TOP to operate within SOLs and Interconnection Reliability Operating Limits (~~"~~IROL~~"~~). The VAR standard drafting team (~~"~~SDT~~"~~) and industry participants also concluded that the best models and tools are the ones that have been proven and the standard should not add a requirement for a responsible entity to purchase new online simulations tools. Thus, the VAR SDT simplified the requirements to ensuring sufficient reactive resources are online or scheduled. Controllable load is specifically included to answer FERC's directive in Order No. 693 at Paragraph 1879.

R2. Each Transmission Operator shall schedule sufficient reactive resources to regulate voltage levels under normal and Contingency conditions. Transmission Operators can provide sufficient reactive resources through various means including, but not limited to, reactive generation scheduling, transmission line and reactive resource switching, and using controllable load. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same-day Operations, and Operational Planning]*

M2. Each Transmission Operator shall have evidence of scheduling sufficient reactive resources based on their assessments of the system. For the operational planning time horizon, Transmission Operators shall ~~provide copies~~ have evidence of assessments used as the basis for how resources were scheduled.

Rationale for R3:

Similar to Requirement R2, the VAR SDT determined that for reliability purposes, the TOP must ensure sufficient voltage support is provided in Real-time in order to operate within an SOL.

R3. Each Transmission Operator shall operate or direct the Real-time operation of devices to regulate transmission voltage and reactive flow as necessary. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same-day Operations, and Operational Planning]*

M3. Each Transmission Operator shall have evidence that actions were taken to operate capacitive and inductive resources as ~~needed~~ necessary in Real-time. This may include ~~directions~~ instructions to Generator Operators to: 1) provide additional voltage support; 2) bring resources on-line; or 3) make manual adjustments.

Rationale for R4:

The VAR SDT received significant feedback on instances when a TOP would need the flexibility for defining exemptions for generators. These exemptions can be tailored as the TOP deems necessary for the specific area's needs. The goal of this requirement is to provide a TOP the ability to exempt a Generator Operator (GOP) from: 1) a voltage or Reactive Power schedule, 2) a setting on the AVR, or 3) any VAR-002 notifications based on the TOP's criteria. Feedback from the industry detailed many system events that would require these types of exemptions which included, but are not limited to: 1) maintenance during shoulder months, 2) scenarios where two units are located within close proximity and both cannot be in voltage control mode, and 3) large system voltage swings where it would harm reliability if all GOP were to notify their respective TOP of deviations at one time. Also, in an effort to improve the requirement, the sub-requirements containing an exemption list were removed from the currently enforceable standard because this created more compliance issues with regard to how often the list would be updated and maintained.

R4. The Transmission Operator shall specify the criteria that will exempt generators from: ~~compliance with the requirements defined in Requirement R5, part 5.1, and any associated notification requirements~~ 1) following a voltage or Reactive Power schedule, 2) from having its automatic voltage regulator (AVR) in service or from being in voltage control mode, or 3) from having to make any associated notifications. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

4.1 If a Transmission Operator determines that a generator has satisfied the exemption criteria, it shall notify the associated Generator Operator.

M4. Each Transmission Operator shall have evidence of the documented criteria for generator exemptions.

For part 4.1, the Transmission Operator shall also have evidence to show that, for each ~~generating unit~~generator in its area that is exempt from: 1) following a voltage or Reactive Power schedule, 2) from having its automatic voltage regulator (AVR) in service or from being in voltage control mode, or 3) from having to make any notifications, the associated Generator Operator was notified of this exemption.

Rationale for R5:

The new requirement provides transparency regarding the criteria used by the TOP to establish the voltage schedule. This requirement also provides a vehicle for the TOP to use appropriate granularity when setting notification requirements for deviation from the voltage or Reactive Power schedule. Additionally, this requirement provides clarity regarding a "tolerance band" as specified in the voltage schedule and the control dead-band in the generator's excitation system.

Voltage Schedule tolerances are the bandwidth that accompanies the voltage target in a voltage schedule, should reflect the anticipated fluctuation in voltage at the Generation Operator's facility during normal operations, and be based on the TOP's assessment of N-1 and credible N-2 system contingencies. The voltage schedule's bandwidth should not be confused with the control dead-band that is programmed into a Generation Operator's automatic voltage regulator's control system, which should be adjusting the AVR prior to reaching either end of the voltage schedule's bandwidth.

R5. Each Transmission Operator shall specify a voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) at either the high voltage side or low voltage side of the ~~Generator Step-Up~~ generator step-up transformer at the Transmission Operator's discretion. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

5.1. The Transmission Operator shall provide the voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) to the associated Generator Operator and direct the Generator Operator to comply with the schedule in automatic voltage control mode (the AVR is in service and controlling voltage).

5.2. The Transmission Operator shall provide the Generator Operator with the notification requirements for deviations from the voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band).

5.3. The Transmission Operator shall provide the criteria used to develop voltage schedules Reactive Power schedule (which is either a range or a target value with an associated tolerance band) ~~and associated tolerance bands~~ to the Generator Operator within 30 days of receiving a request.

M5. The Transmission Operator shall have evidence of a documented voltage or Reactive Power Schedule (which is either a range or a target value with an associated tolerance band)~~and tolerance band~~.

For part 5.1, the Transmission Operator shall have evidence it provided a voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band)~~and tolerance band~~ to the applicable Generator Operators, and that the Generator Operator was directed to comply with the schedule in automatic voltage control mode, unless exempted. ~~The evidence shall include written records, email, or voice recordings.~~

For part 5.2, the Transmission Operator shall have evidence it provided notification requirements for deviations from the voltage or Reactive Power schedule (which is either a range or a target

value with an associated tolerance band) ~~and associated tolerance band~~. ~~The evidence shall include written records, email, or voice recordings.~~

For part 5.3, the Transmission Operator shall have evidence it provided the criteria used to develop voltage schedules or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) ~~and associated tolerance bands~~ within 30 days of receiving a request by a Generator Operator.

Rationale for R6:

Although tap settings are first established prior to interconnection, this requirement could not be deleted because no other standard addresses when a tap setting must be adjusted. If the tap setting is not properly set, then the amount of VARs produced by a unit can be affected.

R6. After consultation with the Generator Owner regarding necessary step-up transformer tap changes and the implementation schedule, the Transmission Operator shall provide documentation to the Generator Owner specifying the required tap changes, a timeframe for making the changes, and technical justification for these changes. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M6. The Transmission Operator shall have evidence that it provided documentation to the Generator Owner when a change was needed to a generating unit's step-up transformer tap in accordance with the requirement and that it consulted with the Generator Owner.

C. Compliance

1. **Compliance Monitoring Process:**

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" refers to NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time a registered entity is required to retain specific evidence to demonstrate compliance. For instances in which the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask the registered entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Operator shall retain evidence for Measures 1 through ~~4~~ 6 for 12 months. The Compliance Monitor shall retain any audit data for three years.

1.3. Compliance Monitoring and Assessment Processes:

~~As defined in the NERC Rules of Procedure,~~ "Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.4. Additional Compliance Information:

None

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operational Planning**	**High**	N/A	N/A	N/A	The Transmission Operator ~~has~~does not specify~~ied~~ a system voltage schedule (which is either a range or a target value with an associated tolerance band)~~and associated tolerance bands~~.
R2	**Real-time Operations, Same-day Operations, and Operational Planning**	**High**	N/A	N/A	The Transmission Operator does not schedule sufficient reactive resources as necessary to avoid violating an SOL.	The Transmission Operator does not schedule sufficient reactive resources as necessary to avoid violating an IROL.
R3	**Real-time Operations, Same-day Operations, and Operational Planning**	**High**	N/A	N/A	The Transmission Operator does not operate or direct any real-time operation of devices as necessary to avoid violating an SOL.	The Transmission Operator does not operate or direct any real-time operation of devices as necessary to avoid violating an IROL.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R4	**Operations Planning**	**Lower**	N/A	N/A	The Transmission Operator has exemption criteria and notified the Generator Operator, but the Transmission Operator does not have evidence of the notification to the Generator Operator.	The Transmission Operator does not have exemption criteria.
R5	**Operations Planning**	**Medium**	N/A	The Transmission ~~Operator~~ Operator does not provide~~s~~ the criteria for voltage or Reactive Power schedules (which is either a range or a target value with an associated tolerance band) ~~-~~after 30 days of a request.	The Transmission Operator does not provide~~s~~ voltage or Reactive Power schedules (which is either a range or a target value with an associated tolerance band ~~to~~) to ~~some, but not~~ all~~,~~ Generator Operators.	The Transmission Operator does not provide voltage or Reactive Power schedules (which is either a range or a target value with an associated tolerance band) ~~and tolerance bands~~ to any Generator Operators.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						Or The Transmission Operator ~~did~~ does not provide the Generator Operator with the notification requirements for deviations from the voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band).
R6	**Operations Planning**	**Lower**	The Transmission Operator does not provide ~~E~~either the technical justification or timeframe for changing generator step-up tap settings~~are not provided~~.	N/A	N/A	The Transmission Operator does not provide ~~Neither~~ the technical justification ~~nor~~ and the timeframe for changing generator step-up tap settings ~~are provided.~~.

D. Regional Variances

The following Interconnection-wide variance shall be applicable in the Western Electricity Coordinating Council (WECC) and replaces, in their entirety, Requirements R~~3~~4 and R~~4~~5. Please note that Requirement R~~3~~4 is deleted and R~~4~~5 is replaced with the following requirements.

Requirements

E.A.13 Each Transmission Operator shall issue any one of the following types of voltage schedules to the Generator Operators for each of their generation resources that are on-line and part of the Bulk Electric System within the Transmission Operator Area: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same-day Operations]*

- A voltage set point with a voltage tolerance band and a specified period.
- An initial volt-ampere reactive output or initial power factor output with a voltage tolerance band for a specified period that the Generator Operator uses to establish a generator bus voltage set point.
- A voltage band for a specified period.

E.A.14 Each Transmission Operator shall provide one of the following voltage schedule reference points for each generation resource in its Area to the Generator Operator. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same-day Operations]*

- The generator terminals.
- The high side of the generator step-up transformer.
- The point of interconnection.
- A location designated by mutual agreement between the Transmission Operator and Generator Operator.

E.A.15 Each Generator Operator shall convert each voltage schedule specified in Requirement E.A.13 into the voltage set point for the generator excitation system. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same-day Operations]*

E.A.16 Each Generator Operator shall provide its voltage set point conversion methodology from the point in Requirement E.A.14 to the generator terminals within 30 calendar days of request by its Transmission Operator. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

E.A.17 Each Transmission Operator shall provide to the Generator Operator, within 30 calendar days of a request for data by the Generator Operator, its transmission equipment data and operating data that supports development of the voltage set point conversion methodology. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

E.A.18 Each Generator Operator shall meet the following control loop specifications if the Generator Operator uses control loops external to the Automatic Voltage Regulators (AVR) to manage MVar loading: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

E.A.18.1. Each control loop's design incorporates the AVR's automatic voltage controlled response to voltage deviations during System Disturbances.

E.A.18.2. Each control loop is only used by mutual agreement between the Generator Operator and the Transmission Operator affected by the control loop.

Measures[1]

M.A.13 Each Transmission Operator shall have and provide upon request, evidence that it provided the voltage schedules to the Generator Operator. Dated spreadsheets, reports, voice recordings, or other documentation containing the voltage schedule including set points, tolerance bands, and specified periods as required in Requirement E.A.13 are acceptable as evidence.

M.A.14 The Transmission Operator shall have and provide upon request, evidence that it provided one of the voltage schedule reference points in Requirement E.A.14 for each generation resource in its Area to the Generator Operator. Dated letters, e-mail, or other documentation that contains notification to the Generator Operator of the voltage schedule reference point for each generation resource are acceptable as evidence.

M.A.15 Each Generator Operator shall have and provide upon request, evidence that it converted a voltage schedule as described in Requirement E.A.13 into a voltage set point for the AVR. Dated spreadsheets, logs, reports, or other documentation are acceptable as evidence.

M.A.16 The Generator Operator shall have and provide upon request, evidence that within 30 calendar days of request by its Transmission Operator it provided its voltage set point conversion methodology from the point in Requirement E.A.14 to the generator terminals. Dated reports, spreadsheets, or other documentation are acceptable as evidence.

M.A.17 The Transmission Operator shall have and provide upon request, evidence that within 30 calendar days of request by its Generator Operator it provided data to support development of the voltage set point conversion methodology. Dated reports, spreadsheets, or other documentation are acceptable as evidence.

M.A.18 If the Generator Operator uses outside control loops to manage MVar loading, the Generator Operator shall have and provide upon request, evidence that it met the control loop specifications in sub-parts E.A.18.1 through E.A.18.2. Design specifications with identified agreed-upon control loops, system reports, or other dated documentation are acceptable as evidence.

[1] The number for each measure corresponds with the number for each requirement, i.e. M.E.A.13 means the measure for Requirement E.A.13.

E. Interpretations

None.

F. Associated Documents

None.

Guidelines and Technical Basis

For technical basis for each requirement, please review the rationale provided for each requirement.

Implementation Plan

VAR Directives Project

Implementation Plan for VAR-001-4

Approvals Required

VAR-001-4 – Voltage and Reactive Control

Prerequisite Approvals

There are no other standards that must receive approval prior to the approval of this standard.

Revisions to Glossary Terms

None

Applicable Entities

Transmission Operators (VAR-001-4)

Applicable Facilities

N/A

Conforming Changes to Other Standards

None

Effective Dates

VAR-001-4shall become effective on the first day of the first calendar quarter after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, VAR-001-4 shall become effective on the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Justification

Because VAR-001 now requires determining voltage and reactive power schedules with associated tolerance bands in addition to any notification requirements, the Transmission Operators need a quarter to prepare documentation. Additionally, the Transmission Operators that do not already provide tolerance bands with voltage schedules will need some time to adjust to providing new data (more specifically, the criteria for schedules) to Generator Operators.

Retirements

VAR-001-3 will be retired at midnight of the day immediately prior to the Effective Date of VAR-001-4 in the particular jurisdiction in which the new standard becomes effective.

Implementation Plan

VAR Directives Project

Implementation Plan for VAR-001-4 ~~and VAR-002-3~~

Approvals Required

VAR-001-4 – Voltage and Reactive Control

~~VAR-002-3 — Generator Operation for Maintaining Network Voltage Schedules~~

Prerequisite Approvals

There are no other standards that must receive approval prior to the approval of this standard.

Revisions to Glossary Terms

None

Applicable Entities

~~Generator Operators (VAR-002-3)~~

~~Generator Owners (VAR-002-3)~~

Transmission Operators (VAR-001-4)

Applicable Facilities

N/A

Conforming Changes to Other Standards

None

Effective Dates

VAR-001-4 ~~and VAR-002-3 – All requirements~~ shall become effective on the first day of the first calendar quarter after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, VAR-001-4 ~~and VAR-002-3~~ shall become effective on the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Justification

~~The currently effective VAR-002 standard is one of the most violated standards; however, the industry argues these violations do not address any reliability gaps. Instead, Generator Operators and Transmission Operators are required to handle many nuisance phone calls for slight deviations from a voltage schedule. The nuisance phone calls can be a distraction during a scheduled maintenance or a system event; thus, the industry would support making the changes as soon as possible. However, since~~ Because VAR-001 now requires determining voltage and reactive power schedules with associated tolerance bands in addition to any notification requirements, the Transmission Operators need a quarter to prepare documentation. ~~The VAR-002 standards cannot go into effect without the new TOP schedules and notification requirements. Also for~~ Additionally, the Transmission Operators that do not already provide tolerance bands with voltage schedules~~, those Transmission Operators~~ will need some time to adjust to providing new data (more specifically, the criteria for schedules) to Generator Operators.

Retirements

VAR-001-3 ~~and VAR-002-2b~~ will be retired at midnight of the day immediately prior to the Effective Date of VAR-001-4 ~~and VAR-002-3~~ in the particular jurisdiction in which the new standard~~s are becoming~~ becomes effective.

Compliance Operations

Draft Reliability Standard Compliance Guidance for VAR-001-4 and VAR-002-3
October 21, 2013

Introduction

The NERC Compliance department (Compliance) worked with the VAR standard drafting team (SDT) to review the proposed standards VAR-001-4 and VAR-002-3. The purpose of the review was to discuss the requirements of the proposed standard to obtain an understanding of its intended purpose and the evidence necessary to support compliance. The purpose of this document is to address specific questions posed by the VAR SDT in order to aid in the drafting of the requirements and provide a level of understanding regarding evidentiary support necessary to demonstrate compliance.

While all compliance evaluations require levels of auditor judgment, participating in these reviews allows Compliance to develop training and approaches to support a high level of consistency in audits conducted by the Regional Entities. The following questions and answers are intended to assist the SDT in further refining the standard and to serve as a resource in the development of training for auditors.

VAR-001 and VAR-002 Questions

Question 1

How will compliance determine if sufficient reactive resources were scheduled as part of VAR-001-4 Requirement R2?

Compliance Response to Question 1

For VAR-001-4 Requirement R2, an auditor would review the studies that a TOP used to schedule resources to see that the studies show whether new resources should be brought online, or if the resources online are sufficient to regulate voltage levels. An auditor may observe a TOP reviewing the study and scheduling live and may pull samples from various time periods to determine whether a TOP scheduled resources as required in the study.

Question 2

Is it clear that VAR-001-4 Requirement R4 allows for exemptions, for any duration, from: 1) voltage schedules, 2) being in automatic voltage control mode, or 3) any notification requirements?

Compliance Response to Question

It is clear that VAR-001 Requirement R4 allows for any combination of exemptions for generator operators from 1) voltage schedules, 2) being in automatic voltage control mode, or 3) any notification requirements, as long as the

exemption meets the criteria specified by the TOP. An auditor will not look for any pre-authorization from the TOP; rather an auditor will verify that the generator operator has met the criteria set forth by the TOP.

Question 3

Tolerance bands apply to a set voltage or Reactive Power number with a +/- percentage as the tolerance band. The voltage range or Reactive Power range is a high and low number that a Generator Operator is expected to operate within for reliability purposes. With regard to VAR-001-4 Requirement R5, is it clear that when a voltage range or Reactive Power range is provided as a schedule, a tolerance band is not expected to also be provided?

Compliance Response to Question 3

Yes, it is clear based on VAR-001-4 Requirement R5 that a voltage or Reactive power schedule can be either: 1) a target number with a tolerance band, OR 2) a voltage or Reactive Power range to operate within. An auditor would not expect to see a tolerance band provided with an operating range for voltage or Reactive Power.

Question 4

With regard to VAR-002-3, will generators receive a violation for instances where a system event is affecting system voltage, but the generators made the appropriate conversions and set the AVRs to meet the original schedule provided by the TOP?

Compliance Response to Question 4

No, the generator operators can only be responsible for maintaining the schedule provided by the TOP based on existing facility equipment. In the event that a generator operator does not have the equipment to have visibility of high-side system voltage, the GOP will not have the ability to adjust VARs to maintain system voltage. An auditor is not to determine that, where the GOP does not have the high side monitoring equipment and where the AVR is set appropriately based on existing facility equipment, the generator operator is non-compliant. However, if the TOP provides a new directive or schedule, the GOP is required to follow the new directive. This directive can include modifying an AVR setting or providing more voltage support, and the generator operator is expected to comply pursuant to VAR-002-3.

Question 5

Related to VAR-002-3, generators can monitor voltage on either the low side and high side of the GSU (depending on equipment limitation) and the “number” being monitored by the Generator will not always equate to the number provided by the TOP. Is it clear that VAR-002 Requirement R2, part 2.3 only wants a conversion of the schedule provided to the number monitored? Is it clear that there should not be a violation if the schedule does not match the number being monitored on the low side as long as there is a documented conversion?

Compliance Response to Question 5

The Generator should be able to provide documentation that identifies the "number" being monitored and the calculation demonstrating how the "number" equates to the schedule provided by the TOP. The measure for VAR-002-3 Requirement R2, part 2.3 is clear on what evidence should be able to demonstrate this during an audit.

Question 6

VAR-002-3, Requirement R4 was added because generators cannot report a capability change until they are aware of the change. The currently enforceable standard requires a notification as soon as the capability change occurs; however, many times the change occurred well before the generators were aware of the problem. Is it clear that VAR-002-3 Requirement R4 is only violated after the generator is made aware of the change?

Compliance Response to Question 6

It is clear that VAR-002-3, Requirement R4 will only be a violation if the change is not reported after 30 minutes of becoming aware of the reactive capability change. An auditor will ask an entity for evidence to demonstrate when it became aware of the change in reactive capability. This will not be purely subjective; there are technical instances where it will be clear that an entity would have been made aware of the change in reactive capability. For example, one instance is where a unit is ramping to an expected VAR output, and it cannot reach it; a reactive capability change has occurred.

Conclusion

Following final approval of the Reliability Standard, Compliance will develop the final Reliability Standards Auditor Worksheet (RSAW) and associated training.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

VAR Mapping Document
Transition of VAR-001-3

Standard: VAR-001-4 – Voltage and Reactive Control		
Requirement in Approved Standard	**Transitions to the below Requirement in New Standard or Other Action**	**Description and Change Justification**
VAR-001-3 R1	Requirement R1	This requirement is duplicated in other standards, and the new requirement has been simplified to require the specification of the voltage and Reactive Power schedules and associated tolerance bands. A new part 1.1 has been added to allow for voltage coordination with adjacent TOPs and applicable RCs. In the currently enforceable standards, the TOP-004-2 Requirements R1, R2, and R3 duplicate monitoring and controlling voltage requirements. The same requirements that make the TOP operate within the IROLs and SOLs also require the monitoring and controlling of voltage as a necessary action. The pending TOP-002-3 Requirement R2 and TOP-001-2 Requirements R7 and R9 also cover this function because collectively those requirements mandate: 1) having a plan to operate within IROLs and SOLs and 2) operating within IROLs and SOLs.
VAR-001-3 R2	Requirement R2	The new requirement has been updated to just reflect the scheduling of resources. It eliminates the need for the existing R7, R8, and R9. It also maintains a list of sufficient reactive resources.

Standard: VAR-001-4 – Voltage and Reactive Control		
Requirement in Approved Standard	**Transitions to the below Requirement in New Standard or Other Action**	**Description and Change Justification**
VAR-001-3 R3	Requirement R4	The new requirement has been simplified by removing the need to maintain an exemption list. Instead, the standard focuses on whether the exemption criteria are known and whether a granted exemption was communicated to the applicable Generator.
VAR-001-3 R4	Requirement R5	The new requirements have been updated to allow the TOP to provide the voltage or Reactive Power schedule at either the high side or the low side of the GSU. Also a tolerance band is now required under the new requirement. New parts have also been added to direct a GOP to operate in AVR, to require the TOP to provide notification requirements, and to provide the criteria for developing schedules and tolerance bands upon request.
VAR-001-3 R5	Deleted	This requirement was proposed to be retired in the P81 NOPR. Therefore, pending a final rulemaking on P81, this requirement has been deleted.
VAR-001-3 R6	Deleted	This requirement is deleted because the TOP standards require knowing the status of Reactive Power resources. In the pending TOP-006-3 R1 and the currently enforceable TOP-006-2 R1, the TOP and BA must know the status of all generating and transmission resources available for use. Although power system stabilizers are not specifically named in either of the TOP standards, the areas that rely on PSS equipment will require monitoring the PSS status under the data specifications of the TOP standards.

Standard: VAR-001-4 – Voltage and Reactive Control		
Requirement in Approved Standard	**Transitions to the below Requirement in New Standard or Other Action**	**Description and Change Justification**
VAR-001-3 R7	Deleted	This has moved into the new R3.
VAR-001-3 R8	Deleted	This has moved into the new R3.
VAR-001-3 R9	Deleted	See comments for new R2.
VAR-001-3 R10	Deleted	This is duplicative of the pending TOP-001-2 Requirements R9, R10, and R11 before FERC and the Glossary Tv definition which states that IROL and SOL violations must be corrected within 30 minutes. The currently enforceable TOP-004-2 R4 also duplicates this requirement to correct IROLs and SOLs within 30 minutes.
VAR-001-3 R11	Requirement R6	The requirement has been updated to allow for scheduling consultation.
VAR-001-3 R12	Deleted	This requirement was deleted because the EOP standards address taking any corrective action including load-shedding. Also the pending TOP-002-3 Requirement R2 and TOP-001-2 Requirement R11 address the TOP taking corrective actions. The currently enforceable TOP-004-2 R4 also duplicates this requirement to take corrective action.

VAR Mapping Document

Transition of VAR-001-3 ~~and VAR-002-2b~~

Standard: VAR-001-4 – Voltage and Reactive Control		
Requirement in Approved Standard	**Transitions to the below Requirement in New Standard or Other Action**	**Description and Change Justification**
VAR-001-3 R1	Requirement R1	This requirement is duplicated in other standards, and the new requirement has been simplified to require the specification of the voltage and Reactive Power schedules and associated tolerance bands. A new part 1.1 has been added to allow for voltage coordination with adjacent TOPs and applicable RCs. In the currently enforceable standards, the TOP-004-2 Requirements R1, R2, and R3 duplicate monitoring and controlling voltage requirements. The same requirements that make the TOP operate within the IROLs and SOLs also require the monitoring and controlling of voltage as a necessary action. ~~The pending TOP-002-3 Requirement R2 and TOP-001-2 Requirements R7 and R9 also cover this function because collectively those requirements mandate: 1) having a plan to operate within IROLs and SOLs and 2) operating within IROLs and SOLs.~~

Standard: VAR-001-4 – Voltage and Reactive Control		
Requirement in Approved Standard	**Transitions to the below Requirement in New Standard or Other Action**	**Description and Change Justification**
VAR-001-3 R2	Requirement R2	The new requirement has been updated to just reflect the scheduling of resources.- Scheduling is a more accurate term for TOP operations. It eliminates the need for the existing ~~R7, R8, and~~ R9. It also maintains a list of sufficient reactive resources.
VAR-001-3 R3	Requirement R4	The new requirement has been simplified by removing the need to maintain an exemption list. Instead, the standard focuses on whether the exemption criteria are known and whether a granted exemption was communicated to the applicable Generator. It eliminates the need for the existing R7 and R8.
VAR-001-3 R4	Requirement R5	The new requirements have been updated to allow the TOP to provide the voltage or Reactive Power schedule at either the high side or the low side of the GSU. Also a tolerance band is now required under the new requirement. New parts have also been added to direct a GOP to operate in AVR, to require the TOP to provide notification requirements, and to provide the criteria for developing schedules and tolerance bands upon request.
VAR-001-3 R5	Deleted	This requirement was proposed to be retired in the P81 NOPR. Therefore, pending a final rulemaking on P81, this requirement has been deleted.

Standard: VAR-001-4 – Voltage and Reactive Control		
Requirement in Approved Standard	**Transitions to the below Requirement in New Standard or Other Action**	**Description and Change Justification**
VAR-001-3 R6	Deleted	This requirement is deleted because the TOP standards require knowing the status of Reactive Power resources. In the pending TOP-006-3 R1 and the currently enforceable TOP-006-2 R1, the TOP and BA must know the status of all generating and transmission resources available for use. Although power system stabilizers are not specifically named in either of the TOP standards, the areas that rely on PSS equipment will require monitoring the PSS status under the data specifications of the TOP standards.
VAR-001-3 R7	Deleted	This has moved into the new R3.
VAR-001-3 R8	Deleted	This has moved into the new R3.
VAR-001-3 R9	Deleted	See comments for new R2.
VAR-001-3 R10	Deleted	This is duplicative of the pending TOP-001-2 Requirements R9, R10, and R11 before FERC and the Glossary Tv definition which states that IROL and SOL violations must be corrected within 30 minutes. The currently enforceable TOP-004-2 R4 also duplicates this requirement to correct IROLs and SOLs within 30 minutes.
VAR-001-3 R11	Requirement R6	The requirement has been updated to allow for scheduling consultation.

Standard: VAR-001-4 – Voltage and Reactive Control		
Requirement in Approved Standard	**Transitions to the below Requirement in New Standard or Other Action**	**Description and Change Justification**
VAR-001-3 R12	Deleted	This requirement was deleted because the EOP standards address taking any corrective action including load-shedding. ~~Also the pending TOP-002-3 Requirement R2 and TOP-001-2 Requirement R11 address the TOP taking corrective actions.~~ The currently enforceable TOP-004-2 R4 ~~also~~ duplicates this requirement to take corrective action.

~~Standard: VAR-001-2 — Capacity Benefit Margin~~		
~~**Requirement in Approved Standard**~~	~~**Transitions to the below Requirement in New Standard or Other Action**~~	~~**Description and Change Justification**~~
~~VAR-002-2b R1~~	~~Requirement R1~~	~~The requirement has been modified to allow for testing and exemptions for other AVR modes when necessary.~~
~~VAR-002-2b R2~~	~~Requirement R2~~	~~The new requirement has been updated to allow for the TOP to define notification requirements. The requirement also adds parts to allow for the conversion of a high side schedule to a low side number for monitoring purposes.~~
~~VAR-002-2b R3~~	~~Requirement R3 and R4.~~	~~The old requirement has been broken into two requirements: 1) one for AVR/PSS status, and 2) one for reactive capability. Both allow 15 minutes to correct an issue before having to notify the TOP.~~
~~VAR-002-2b R3~~	Requirement ~~R4~~R5	~~The requirement has not been modified.~~The original sub-requirement 4.1.4 (the +/- voltage range with step-change in % for load-tap changing transformers) has been removed because other data specifications in MOD-10-0 requirement R2 duplicate this requirement.
~~VAR-002-2b R4~~	~~Requirement R5~~	~~The requirement has not been modified.~~

[1] NERC developed this Reliability Standard Audit Worksheet (RSAW) language in order to facilitate NERC's and the Regional Entities' assessment of a registered entity's compliance with this Reliability Standard. The NERC RSAW language is written to specific versions of each NERC Reliability Standard. Entities using this RSAW should choose the version of the RSAW applicable to the Reliability Standard being assessed. While the information included in this RSAW provides some of the methodology that NERC has elected to use to assess compliance with the requirements of the Reliability Standard, this document should not be treated as a substitute for the Reliability Standard or viewed as additional Reliability Standard requirements. In all cases, the Regional Entity should rely on the language contained in the Reliability Standard itself, and not on the language contained in this RSAW, to determine compliance with the Reliability Standard. NERC's Reliability Standards can be found on NERC's website. Additionally, NERC Reliability Standards are updated frequently, and this RSAW may not necessarily be updated with the same frequency. Therefore, it is imperative that entities treat this RSAW as a reference document only, and not as a substitute or replacement for the Reliability Standard. It is the responsibility of the registered entity to verify its compliance with the latest approved version of the Reliability Standards, by the applicable governmental authority, relevant to its registration status.

The NERC RSAW language contained within this document provides a non-exclusive list, for informational purposes only, of examples of the types of evidence a registered entity may produce or may be asked to produce to demonstrate compliance with the Reliability Standard. A registered entity's adherence to the examples contained within this RSAW does not necessarily constitute compliance with the applicable Reliability Standard, and NERC and the Regional Entity using this RSAW reserves the right to request additional evidence from the registered entity that is not included in this RSAW. Additionally, this RSAW includes excerpts from FERC Orders and other regulatory references. The FERC Order cites are provided for ease of reference only, and this document does not necessarily include all applicable Order provisions. In the event of a discrepancy between FERC Orders, and the language included in this document, FERC Orders shall prevail.

[2] Compliance Assessment Date(s): The date(s) the actual compliance assessment (on-site audit, off-site spot check, etc.) occurs.

DRAFT

R1 Supporting Evidence and Documentation

R1. Each Transmission Operator shall specify a system voltage schedule (which is either a range or a target value with an associated tolerance band) as part of its plan to operate within System Operating Limits and Interconnection Reliability Operating Limits.

1.1. Each Transmission Operator shall provide a copy of the voltage schedules and associated tolerance bands to its Reliability Coordinator and adjacent Transmission Operators within 30 calendar days of a request.

M1. The Transmission Operator shall have evidence that it specified system voltage schedules using either a range or a target value with an associated tolerance band.

For part 1.1, the Transmission Operator shall have evidence that the voltage schedules were provided to its Reliability Coordinator and adjacent Transmission Operators within 30 days of a request. Evidence may include, but is not limited to, emails, website postings, and meeting minutes.

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[3]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.
See M1.
Documentation of request made per Part 1.1 from Reliability Coordinator and/or adjacent Transmission Operators, if applicable and requested by auditor.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

[3] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to VAR-001-4, R1
This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	(R1) Review evidence provided and ensure it meets the requirements outlined in Requirement R1.
	(Part 1.1) Examine evidence to verify that voltage schedules were provided within 30 days of request per Part 1.1.

Note to Auditor: Auditors, at their discretion and based on the risk of the entity's compliance with this requirement to the BES, may communicate with Balancing Authorities and other Transmission Operators to determine if data requests were made of the entity. Auditors may also accept entity assertions regarding whether data requests made.

Entity assertions that no data requests were made do not have to be in writing.

Auditor Notes:

R2 Supporting Evidence and Documentation

R2. Each Transmission Operator shall schedule sufficient reactive resources to regulate voltage levels under normal and Contingency conditions. Transmission Operators can provide sufficient reactive resources through various means including, but not limited to, reactive generation scheduling, transmission line and reactive resource switching, and using controllable load.

M2. Each Transmission Operator shall have evidence of scheduling sufficient reactive resources based on their assessments of the system. For the operational planning time horizon, Transmission Operators shall provide copies of assessments used as the basis for how resources were scheduled.

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[4]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.
See M2.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to VAR-001-4, R2
This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	Review the studies/assessments that entity used to schedule resources to determine that the studies show whether new resources should be brought online, or if the resources online are sufficient to regulate voltage levels. Auditors should verify that actual scheduling reflected the results of the studies/assessments.

[4] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

Note to Auditor: Based on the risk of the entity's compliance with this requirement on the Bulk Electric System (BES) and the auditor's assessment of the entity's management practices (or internal controls) over compliance with this Requirement, auditors will determine the extent of the above audit procedures to apply. In cases where risk to the BES is low and the entity's management practices, gleaned by the auditor through walkthroughs or documentation review, are sound, only limited audit testing is necessary. In cases where risk is higher and controls are less effective, an auditor should sample enough instances, per above, to gain reasonable assurance that entity is complying with Requirement R2.

Auditor Notes:

R3 Supporting Evidence and Documentation

R3. Each Transmission Operator shall operate or direct the Real-time operation of devices to regulate transmission voltage and reactive flow as necessary.

M3. Each Transmission Operator shall have evidence that actions were taken to operate capacitive and inductive resources as needed in Real-time. This may include directions to Generator Operators to: 1) provide additional voltage support; 2) bring resources on-line; or 3) make manual adjustments.

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[5]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.
Any written policies, procedures or protocols describing how the entity operates or directs devices to regulate transmission voltage and reactive flow as necessary, if the entity has such documents.
Evidence as outlined in M3 as requested by auditor.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location

[5] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to VAR-001-4, R3
This section to be completed by the Compliance Enforcement Authority

	Review evidence to understand how entity operates or directs devices to regulate transmission voltage and reactive flow as necessary. Auditors may sample system events or other instances of voltage irregularities to verify that operations or directions occurred as required per Requirement R2.

Note to Auditor: Based on the risk of the entity's compliance with this requirement on the Bulk Electric System (BES) and the auditor's assessment of the entity's management practices (or internal controls) over compliance with this Requirement, auditors will determine the extent of the above audit procedures to apply. In cases where risk to the BES is low and the entity's management practices, gleaned by the auditor through walkthroughs or documentation review, are sound, only limited audit testing is necessary. In cases where risk is higher and controls are less effective, an auditor should sample enough events or other instances of voltage irregularities, per above, to gain reasonable assurance that entity is complying with Requirement R2.

Auditor Notes:

R4 Supporting Evidence and Documentation

R4. The Transmission Operator shall specify the criteria that will exempt generators from compliance with the requirements defined in Requirement R5, part 5.1, and any associated notification requirements.

4.1 If a Transmission Operator determines that a generator has satisfied the exemption criteria, it shall notify the associated Generator Operator.

M4. Each Transmission Operator shall have evidence of the documented criteria for generator exemptions.

For part 4.1, the Transmission Operator shall also have evidence to show that, for each generating unit in its area that is exempt from: 1) following a voltage or Reactive Power schedule, 2) from having its automatic voltage regulator (AVR) in service or from being in voltage control mode, or 3) from having to make any notifications, the associated Generator Operator was notified of this exemption.

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[6]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.
See M4.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to VAR-001-4, R4
This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	(R4) Review evidence and note existence of exemption criteria per Requirement R4. For a sample of exempted generators, verify that exemption was granted in accordance with criteria.

[6] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

	(Part 1.1) For a sample of exempted generators, ensure exempted generator was notified.

Note to Auditor: Based on the risk of the entity's compliance with this requirement on the Bulk Electric System (BES) and the auditor's assessment of the entity's management practices (or internal controls) over compliance with this Requirement, auditors will determine the extent of the above audit procedures to apply. In cases where risk to the BES is low and the entity's management practices, gleaned by the auditor through walkthroughs or documentation review, are sound, only limited audit testing is necessary. In cases where risk is higher and controls are less effective, an auditor should sample enough generators, per above, to gain reasonable assurance that entity is complying with Requirement R4.

Requirement R4 allows for any combination of exemptions for generator operators from 1) voltage schedules, 2) being in automatic voltage control mode, or 3) any notification requirements, as long as the exemption meets the criteria specified by the entity. An auditor will not look for any pre-authorization from the entity; rather an auditor will verify that the generator operator has met the criteria set forth by the entity.

Auditor Notes:

R5 Supporting Evidence and Documentation

R5. Each Transmission Operator shall specify a voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) at either the high voltage side or low voltage side of the Generator Step-Up transformer at the Transmission Operator's discretion.

5.1. The Transmission Operator shall provide the voltage or Reactive Power schedule to the associated Generator Operator and direct the Generator Operator to comply with the schedule in automatic voltage control mode (the AVR is in service and controlling voltage).

5.2. The Transmission Operator shall provide the Generator Operator with the notification requirements for deviations from the voltage or Reactive Power schedule.

5.3. The Transmission Operator shall provide the criteria used to develop voltage schedules and associated tolerance bands to the Generator Operator within 30 days of receiving a request.

M5. The Transmission Operator shall have evidence of a documented voltage or Reactive Power Schedule and tolerance band.

For part 5.1, the Transmission Operator shall have evidence it provided a voltage or Reactive Power schedule and tolerance band to the applicable Generator Operators, and that the Generator Operator was directed to comply with the schedule in automatic voltage control mode, unless exempted. The evidence shall include written records, email, or voice recordings.

For part 5.2, the Transmission Operator shall have evidence it provided notification requirements for deviations from the voltage or Reactive Power schedule and associated tolerance band. The evidence shall include written records, email, or voice recordings.

For part 5.3, the Transmission Operator shall have evidence it provided the criteria used to develop voltage schedules and associated tolerance bands within 30 days of receiving a request by a Generator Operator.

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[7]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.
See M5.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to VAR-001-4, R5
This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	(R5) Verify existence of voltage or Reactive Power schedule and that it meets the requirements of Requirement R5.
	(Part 5.1) For a sample of Generator Operators, verify voltage or Reactive Power schedule was provided

[7] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

	per Part 5.1.
	(Part 5.2) For a sample of Generator Operators, verify the notification requirements for deviations from the voltage or Reactive Power schedule was provided per Part 5.2.
	(Part 5.3) For a sample of Generator Operators, verify criteria was provided as requested per Part 5.3.

Note to Auditor: Based on the risk of the entity's compliance with this requirement on the Bulk Electric System (BES) and the auditor's assessment of the entity's management practices (or internal controls) over compliance with this Requirement, auditors will determine the extent of the above audit procedures to apply. In cases where risk to the BES is low and the entity's management practices, gleaned by the auditor through walkthroughs or documentation review, are sound, only limited audit testing is necessary. In cases where risk is higher and controls are less effective, an auditor should sample enough notifications, per above, to gain reasonable assurance that entity is complying with Requirement R5.

It is clear based on VAR-001-4 Requirement R5 that a voltage or Reactive power schedule can be either: 1) a target number with a tolerance band, Or 2) a voltage or Reactive Power range to operate within. An auditor would not expect to see a tolerance band provided with an operating range for voltage or Reactive Power.

Auditor Notes:

R6 Supporting Evidence and Documentation

R6. After consultation with the Generator Owner regarding necessary step-up transformer tap changes and the implementation schedule, the Transmission Operator shall provide documentation to the Generator Owner specifying the required tap changes, a timeframe for making the changes, and technical justification for these changes.

M6. The Transmission Operator shall have evidence that it provided documentation to the Generator Owner when a change was needed to a generating unit's step-up transformer tap in accordance with the requirement and that it consulted with the Generator Owner.

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[8]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.

[8] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

See M6.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to VAR-001-4, R6
This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	Understand entity's procedures concerning coordinating tap settings with Generator Owners per Requirement R6.
	For a sample of Generator Owners, verify tap setting changes were executed per Requirement R6.
Note to Auditor: Based on the risk of the entity's compliance with this requirement on the Bulk Electric System (BES) and the auditor's assessment of the entity's management practices (or internal controls) over compliance with this Requirement, auditors will determine the extent of the above audit procedures to apply. In cases where risk to the BES is low and the entity's management practices, gleaned by the auditor through walkthroughs or documentation review, are sound, only limited audit testing is necessary. In cases where risk is higher and controls are less effective, an auditor should sample enough tap setting communications, per above, to gain reasonable assurance that entity is complying with Requirement R6.

DRAFT

Violation Risk Factor and Violation Severity Level Justifications

VAR-001-4 – Voltage and Reactive Control

This document provides the Standard Drafting Team's (SDT) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in VAR-001-4 – Voltage and Reactive Control. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project. A copy of the standard with the associated VRFs and VSLs is available here.

NERC Criteria - Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Violation Risk Factor Guidelines

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities

• Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) – Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) –Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria - Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

FERC's VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline 1 – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline 2 – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.

Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3 – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4 – Violation Severity Level Assignment Should Be Based on a Single Violation, Not on a Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the

Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF Justification – VAR-001-4 Requirement R1	
Proposed VRF	**High**
NERC VRF Discussion	A VRF of High is necessary because this requirement ensures that a system voltage schedule is created to ensure system stability.
FERC VRF G1 Discussion	Guideline 1 – Consistency with Blackout Report: This High VRF is consistent with the Blackout Report because Reactive Power and voltage control are part of the list of critical areas where a violation could severely affect the reliability of the Bulk-Power System.
FERC VRF G2 Discussion	Guideline 2 – Consistency within a Reliability Standard: The VRF applies to the entire requirement. The sub-part within Requirement R1 is consistent and considered a High VRF.
FERC VRF G3 Discussion	Guideline 3 – Consistency among Reliability Standards: Because maintaining a voltage schedule is critical to preventing a violation of a System Operating Limit, this VRF was drafted to be consistent with the VRFs for other standards (e.g., TOP, FAC, etc.) addressing operating within the appropriate limits.
FERC VRF G4 Discussion	Guideline 4 – Consistency with NERC Definitions of VRFs: This VRF is consistent with the NERC Definition because voltage instability will cause "Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures."
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More Than One Obligation: This VRF does not co-mingle multiple objectives, nor does it water down the Requirement to reflect a lower risk level.

VSL Justification – VAR-001-4 Requirement R1	
NERC VSL Guidelines	Consistent with NERC's VSL Guideline, this VSL acknowledges the criticality of this requirement and whether or not a system voltage schedule was created.
FERC VSL G1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The current level of compliance is not lowered with the proposed VSL because this is a new requirement, and it only has a "severe" VSL.
FERC VSL G2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The single VSL assignment category for "Binary" Requirements is not consistent Guideline 2b: VSL Assignments that contain ambiguous language	The proposed VSL is written to ensure uniformity and consistency in the determination of penalties. Guideline 2a: The proposed VSL is binary, and therefore, a single severe VSL is necessary. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3: Violation Severity Level Assignment Should Be Consistent with the	The proposed VSL is consistent with the corresponding requirements.

Corresponding Requirement	
FERC VSL G4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on a cumulative number of violations.

VRF Justification – VAR-001-2 Requirement R2	
Proposed VRF	**High**
NERC VRF Discussion	A VRF of High is consistent with the NERC VRF definition. Requirement R2 focuses on ensuring there are enough reactive resources online to regulate voltage levels, and a High VRF represents the criticality of making sure the system resources are adjusted to meeting normal and Contingency conditions.
FERC VRF G1 Discussion	Guideline 1 – Consistency with Blackout Report: This High VRF is consistent with the Blackout Report because Reactive Power and voltage control are part of the list of critical areas where a violation could severely affect the reliability of the Bulk-Power System. Therefore, ensuring the proper resources are online for voltage support warrants a High VRF.
FERC VRF G2 Discussion	Guideline 2 – Consistency within a Reliability Standard: There is no sub-part to Requirement R2; therefore, it is consistent.
FERC VRF G3 Discussion	Guideline 3 – Consistency among Reliability Standards: Because scheduling resources is critical to preventing a system operating limit, this VRF is drafted to be consistent with other standards (e.g., TOP, FAC, etc.) that address operating within the appropriate limits.
FERC VRF G4 Discussion	Guideline 4 – Consistency with NERC Definitions of VRFs:

	This VRF is consistent with the NERC Definition because not scheduling enough resources to support system conditions will cause "Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures."
FERC VRF G5 Discussion	Guideline 5 - Treatment of Requirements that Co-mingle More Than One Obligation: This VRF does not co-mingle multiple objectives, nor does it water down the requirement to reflect a lower risk level.

VSL Justification – VAR-001-4 Requirement R2	
NERC VSL Guidelines	Consistent with NERC's VSL Guidelines, the VSL describes degrees of noncompliant performance in an incremental manner.
FERC VSL G1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	There is no prior compliance obligation related to the subject of this standard.
FERC VSL G2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The single VSL assignment category for	The proposed VSL is written to ensure uniformity and consistency in the determination of penalties. Guideline 2a: The proposed VSL is not binary. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.

"Binary" Requirements is not consistent Guideline 2b: VSL Assignments that contain ambiguous language	
FERC VSL G3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.
FERC VSL G4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on cumulative number of violations.

VRF Justification – VAR-001-4 Requirement R3	
Proposed VRF	**High**
NERC VRF Discussion	This requirement warrants a High VRF and is consistent with the NERC definition because this requirement represents a critical step that TOPs should take in order to avoid an SOL violation in Real-time.
FERC VRF G1 Discussion	Guideline 1 – Consistency with Blackout Report: This High VRF is consistent with the Blackout Report because Reactive Power and voltage control are part of the list of critical areas where a violation could severely affect the reliability of the Bulk-Power System. Therefore, ensuring that the TOP directs the Real-time devices as necessary to regulate voltage and reactive flow warrants a High VRF.

FERC VRF G2 Discussion	Guideline 2 – Consistency within a Reliability Standard: There is no sub-part to Requirement 3; therefore, the requirement is consistent.
FERC VRF G3 Discussion	Guideline 3 – Consistency among Reliability Standards: Because directing other Real-time devices for voltage and reactive flows is critical to preventing a system operating limit, this VRF is drafted to be consistent with other standards (e.g., TOP, FAC, etc.) that address operating within the appropriate limit.
FERC VRF G4 Discussion	Guideline 4 – Consistency with NERC Definitions of VRFs: This VRF is consistent with the NERC Definition because not directing Real-time operation of devices as necessary could directly cause "Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures."
FERC VRF G5 Discussion	Guideline 5 - Treatment of Requirements that Co-mingle More Than One Obligation This VRF does not co-mingle multiple objectives, nor does it water down the Requirement to reflect a lower risk level

VSL Justification – VAR-001-4 Requirement R3	
NERC VSL Guidelines	Consistent with NERC's VSL Guidelines. The VSL describes degrees of noncompliant performance in an incremental manner.
FERC VSL G1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The current level of compliance is not lowered with the proposed VSL.

FERC VSL G2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The single VSL assignment category for "Binary" Requirements is not consistent Guideline 2b: VSL Assignments that contain ambiguous language	The proposed VSL is written to ensure uniformity and consistency in the determination of penalties. Guideline 2a: The proposed VSL is not binary. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.
FERC VSL G4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on cumulative number of violations.

VRF Justification – VAR-001-4 Requirement R4	
Proposed VRF	**Lower**
NERC VRF Discussion	This requirement is Lower because it focuses on whether a TOP has created an exemption criteria. The Lower VRF is warranted because many entities will not have any exemptions allowed generators within their system. Additionally, a violation of this requirement would not adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System.
FERC VRF G1 Discussion	Guideline 1 – Consistency with Blackout Report: This VRF is consistent with the Blackout Report because although Reactive Power and voltage control are part of the list of critical areas where a violation could severely affect the reliability of the Bulk-Power System, a violation of the requirements to have exemption criteria would result in the GOPs being held to a more stringent performance requirement and is unlikely to severely affect the reliability of the bulk Power System. Therefore, a lower VRF is warranted.
FERC VRF G2 Discussion	Guideline 2 – Consistency within a Reliability Standard: The sub-part within Requirement R4 is consistent with R4 and is considered a Lower VRF.
FERC VRF G3 Discussion	Guideline 3 – Consistency among Reliability Standards: Other standards do not address exemptions from 1) voltage schedules; 2) AVR settings; or 3) any associated notifications.
FERC VRF G4 Discussion	Guideline 4 – Consistency with NERC Definitions of VRFs: This VRF is consistent with the NERC Definition because if the GOP is not exempted, a higher performance expectation maintained for GOPs. This does more to protect against events that could cause “Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures.”
FERC VRF G5 Discussion	Guideline 5 - Treatment of Requirements that Co-mingle More Than One Obligation:

	This VRF does not co-mingle multiple objectives, nor does it water down the Requirement to reflect a Lower risk level.

VSL Justification – VAR-001-4 Requirement R4	
NERC VSL Guidelines	This VSL is consistent with NERC's VSL Guidelines. The VSL describes degrees of noncompliant performance in an incremental manner.
FERC VSL G1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The current level of compliance is not lowered with the proposed VSL.
FERC VSL G2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The single VSL assignment category for "Binary" Requirements is not consistent Guideline 2b: VSL Assignments that contain ambiguous language	The proposed VSL is written to ensure uniformity and consistency in the determination of penalties. Guideline 2a: The proposed VSL is not binary. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3:	The proposed VSL is worded consistently with the corresponding requirement.

Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	
FERC VSL G4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on cumulative number of violations.

VRF Justification – VAR-001-4 Requirement R5	
Proposed VRF	**Medium**
NERC VRF Discussion	This requirement is a Medium because even if a TOP does not provide the voltage or Reactive Power schedules to all GOPs, the TOP is still monitoring the system and will direct the GOPs within an area to provide voltage support as necessary.
FERC VRF G1 Discussion	Guideline 1 – Consistency with Blackout Report: This VRF is consistent with the Blackout Report because although Reactive Power and voltage control are part of the list of critical areas where a violation could severely affect the reliability of the Bulk-Power System, the TOP standards and Requirements R1-4, still require the TOP to monitor voltage to operate within System Operating Limits. Therefore, a Medium VRF is warranted.
FERC VRF G2 Discussion	Guideline 2 – Consistency within a Reliability Standard: The parts within Requirement R5 are consistent with Requirement R5 and is considered a Medium VRF.

FERC VRF G3 Discussion	Guideline 3 – Consistency among Reliability Standards: As explained in Guideline 1, this requirement is consistent with other standards, namely TOP standards.
FERC VRF G4 Discussion	Guideline 4 – Consistency with NERC Definitions of VRFs: This VRF is consistent with the NERC Definition because a violation "could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System." However, due to the TOP standards, a violation is unlikely to like to a lead "to Bulk Electric System instability, separation, or cascading failures."
FERC VRF G5 Discussion	Guideline 5 - Treatment of Requirements that Co-mingle More Than One Obligation: This VRF does not co-mingle multiple objectives, nor does it water down the Requirement to reflect a lower risk level.

VSL Justification – VAR-001-4 Requirement R5	
NERC VSL Guidelines	Consistent with NERC's VSL Guidelines. The VSL describes degrees of noncompliant performance in an incremental manner.
FERC VSL G1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	There is no prior compliance obligation related to the subject of this standard.
FERC VSL G2:	The proposed VSL is written to ensure uniformity and consistency in the determination of penalties.

Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The single VSL assignment category for "Binary" Requirements is not consistent Guideline 2b: VSL Assignments that contain ambiguous language	Guideline 2a: The proposed VSL is not binary. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.
FERC VSL G4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on cumulative number of violations.

VRF Justification – VAR-001-4 Requirement R6

Proposed VRF	Lower
NERC VRF Discussion	This requirement ensures there is coordination for making TOP-directed tap setting changes. A violation of this requirement would not lead to a system event, but the coordination must happen in order for a TOP to know when a generator is going offline. The proper tap settings also ensures Max VAR capability of a unit is maintained.
FERC VRF G1 Discussion	Guideline 1 – Consistency with Blackout Report: This VRF is consistent with the Blackout Report because although Reactive Power and voltage control are part of the list of critical areas where a violation could severely affect the reliability of the Bulk-Power System, this requirement is aimed at improving the max VARs put into the system. If this requirement were violated, the system would still operate at the level it was prior to making the tap changes.
FERC VRF G2 Discussion	Guideline 2 – Consistency within a Reliability Standard: There is no sub-part to Requirement R6, and a TOP would still be monitoring the system in order to prevent a system event. Therefore, this requirement is consistent and considered a Medium VRF.
FERC VRF G3 Discussion	Guideline 3 – Consistency among Reliability Standards: This requirement is not addressed by other standards.
FERC VRF G4 Discussion	Guideline 4 – Consistency with NERC Definitions of VRFs: This VRF is consistent with the NERC Definition because a violation "could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System." However, due to the TOP standards, a violation of this requirement alone is unlikely to like to a lead "to Bulk Electric System instability, separation, or cascading failures."
FERC VRF G5 Discussion	Guideline 5 - Treatment of Requirements that Co-mingle More Than One Obligation:

	This VRF does not co-mingle multiple objectives, nor does it water down the Requirement to reflect a lower risk level.

VSL Justification – VAR-001-4 Requirement R6	
NERC VSL Guidelines	Consistent with NERC's VSL Guidelines. The VSL describes degrees of noncompliant performance in an incremental manner.
FERC VSL G1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	There is no prior compliance obligation related to the subject of this standard.
FERC VSL G2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The single VSL assignment category for "Binary" Requirements is not consistent Guideline 2b: VSL Assignments that contain ambiguous language	The proposed VSL is written to ensure uniformity and consistency in the determination of penalties. Guideline 2a: The proposed VSL is not binary. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3:	The proposed VSL is worded consistently with the corresponding requirement.

Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	
FERC VSL G4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on cumulative number of violations.

DRAFT-Consideration of Issues and Directives

Project 2013-04 – Voltage and Reactive Control

Voltage and Reactive Control		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Summary of Directives from FERC: **1.** VAR-001: FERC ordered that the standard be developed to: (1) expand the applicability to include reliability coordinators and LSEs; (2) include detailed and definitive requirements on "established limits" and "sufficient reactive resources", and identifies acceptable margins above the voltage instability points; (3) include Requirements to perform voltage stability analysis periodically, using online techniques where commercially available and offline techniques where online techniques are not available, to assist real-time operations, for areas susceptible to voltage instability; (4) include controllable load among the reactive resources to satisfy reactive requirements and (5) addresses the power factor range at the interface between LSEs and the transmission grid. **2.** VAR-001: FERC clarified that voltage schedules must have a technical basis and remanded an interpretation of VAR-001 back to NERC for reconsideration. **3.** VAR-002: FERC directed NERC to consider Dynegy's suggestions to improve the standard by providing more detailed and definitive requirements for establishing time frames associated with an incident of non-compliance.		
Accordingly, the ERO should modify VAR-001-1 to include reliability coordinators as applicable entities and	Order No. 693, P 1855	FERC recently issued a Notice of Proposed Rulemaking on the IRO family of standards.[1] Although FERC recommended a remand of the IRO filing, the monitoring role of the Reliability

[1] *Monitoring System Conditions - Transmission Operations Reliability Standard Transmission Operations Reliability Standards Interconnection Reliability Operations and Coordination Reliability Standards*, 145 FERC ¶ 61,158 (2013).

Voltage and Reactive Control		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
include a new requirement(s) that identifies the reliability coordinator's monitoring responsibilities.		Coordinator is best addressed in the IRO standards generally. Therefore, this directive will be addressed by a future IRO project.
The Commission directs the ERO to address the reactive power requirements for LSEs on a comparable basis with purchasing-selling entities.	Order No. 693, P 1858	This directive has been met, and is effectively retired. This directive has already been addressed and reviewed by FERC in a prior version VAR-001-2.[2] However, the applicable requirement (R5 of the currently effective VAR-001-3) that initially addressed this directive has been removed from the VAR standards due to overlap with the *pro forma* Open Access Transmission Tariff ("OATT).[3] Thus, this directive is no longer needed for reliability and should be withdrawn or retired.
In the NOPR, the Commission asked for comments on acceptable ranges of net power factor at the interface at which the LSEs receive service from the Bulk-Power System during normal and extreme load conditions... The Commission believes that Reliability Standard VAR-001-1 is an appropriate place for the ERO to take steps to address these concerns by setting out requirements for transmission owners and LSEs to maintain an appropriate power factor range at their interface. **We direct the ERO**	Order No. 693, P 1861	This directive is no longer needed for reliability and should be withdrawn. Power factor ranges/requirements are established by contract, and to include such ranges/requirements in the VAR standard would be duplicative. The TPL-001-4 has now been approved and will address requirements for power factors. TPL-001-4, Requirement R1, part 1.1.4 requires system models to include Real and reactive Load forecasts. These two inputs in the TOP's models ultimately provide the appropriate power factors that should be maintained.

[2] *See* FERC letter order, *NERC Petition for Approval of Proposed Modifications to Reliability Standards BAL-002-1; EOP-002-3; FAC-002-1; MOD-021-2; PRC-004-2; and VAR-001-2,* 134 FERC ¶ 61,015 (2011).

[3] *Electric Reliability Organization Proposal to Retire Requirements in Reliability Standards,* Order No. 788, 145 FERC ¶ 61,147 (2013).

Voltage and Reactive Control		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
to develop appropriate modifications to this Reliability Standard to address the power factor range at the interface between LSEs and the Bulk- Power System.		In addition, the FAC-001-0 standard requires Transmission Owners (TOs) to set interconnection requirements including "Voltage, Reactive Power, and power factor control" (emphasis added). Thus, the power factor controls and requirements are outlined as part of the interconnection studies/process. Finally, as markets have matured the RTO's have addressed the reliability issues regarding wholesale LSE's through various governance agreements. These agreements speak to the reliable planning, operation, and coordination between the BPS and LSE's.
We direct the ERO to include APPA's concern in the Reliability Standards development process. We note that transmission operators currently have access to data through their energy management systems to determine a range of power factors at which load operates during various conditions, and **we suggest that the ERO use this type of data as a starting point for developing this modification.**	Order No. 693, P 1862	The directive has been addressed by the VAR SDT, and APPA's concerns were discussed early in Project 2013-04. In Order No. 693 APPA stated, "it may be difficult to reach an agreement on acceptable ranges of net power factors at the interfaces where LSEs receive service from the Bulk-Power System because the acceptable range of power factors at any particular point on the electrical system varies based on many location-specific factors. APPA further states that system power factors will be affected by the transmission infrastructure used to supply the load."[4]

[4] *See Mandatory Reliability Standards for the Bulk-Power System,* Order No. 693, FERC Stats. & Regs. ¶31,242 at P 1861, *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

Voltage and Reactive Control		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		As stated above, the VAR SDT determined the power factor will be addressed by interconnection agreements, the OATT, and other standards. In light of how the directives for PP 1858 and 1863 are addressed, the VAR SDT determined the appropriate power factor range is addressed through the OATT and the interconnection process. Therefore, the VAR SDT determined that it was not necessary to add VAR requirements to access power factor data because that would be duplicative, and FERC determined these types of requirement are not needed for reliability, as stated in Order No. 788 which approved certain P81 retirements.[5]
The Commission expects that the appropriate power factor range developed for the interface between the bulk electric system and the LSE from VAR-001-1 would be used as an input to the transmission and operations planning Reliability Standards. The range of power factors developed in this Reliability Standard provides the input to the range of power factors identified in the modifications to the TPL Reliability Standards.	Order No. 693, P 1863	The Commission clarified that this is not a directive to change or modify a standard.[6]
In the NOPR, the Commission expressed concern that the technical requirements containing terms such as	Order No. 693, P1868	This directive on established limits is being addressed in an equally effective and efficient manner through the TOP and FAC

[5] *See* Order No. 788.

[6] *Id.* at Attachment A.

Voltage and Reactive Control		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
"established limits" or "sufficient reactive resources" are not definitive enough to address voltage instability and ensure reliable operations. To address this concern, the NOPR proposed directing the ERO to modify VAR-001-1 to include more detailed and definitive requirements on "established limits" and "sufficient reactive resources" and identify acceptable margins (i.e. voltage and/or reactive power margins) above voltage instability points to prevent voltage instability and to ensure reliable operations. **We will keep this direction, and direct the ERO to include this modification in this Reliability Standard**.		family of standards. After Order No. 693 was issued, several standards were approved by FERC providing specific requirements on "established limits" and associated margins. FAC-011 and FAC-014 both address SOLs which by definition must include both voltage stability ratings and system voltage limits. An SOL is the value (such as MW, MVar, Amperes, Frequency or Volts) that satisfies the most limiting of the prescribed operating criteria for a specified system configuration to ensure operation within acceptable reliability criteria. System Operating Limits are based upon certain operating criteria. These include, but are not limited to: • Facility Ratings (Applicable pre- and post-Contingency equipment or facility ratings) • Transient Stability Ratings (Applicable pre- and post-Contingency Stability Limits) • Voltage Stability Ratings (Applicable pre- and post-Contingency Voltage Stability) • System Voltage Limits (Applicable pre- and post-Contingency Voltage Limits). [7] Further, FAC-014-2 Requirement R2 demands "[t]he Transmission Operator shall establish SOLs (as directed by its

[7] *See NERC Glossary of Terms Used in Reliability Standards,* available at *http://www.nerc.com/pa/Stand/Glossary%20of%20Terms/Glossary_of_Terms.pdf.*

Voltage and Reactive Control		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		Reliability Coordinator) for its portion of the Reliability Coordinator Area that are consistent with its Reliability Coordinator's SOL Methodology." FAC-011-2 Requirement R2 states "[t]he Reliability Coordinator's SOL Methodology shall include a requirement that SOLs provide BES performance consistent with the following: R2.1. In the pre-contingency state, the BES shall demonstrate transient, dynamic and voltage stability; all Facilities shall be within their Facility Ratings and within their thermal, voltage and stability limits. In the determination of SOLs, the BES condition used shall reflect current or expected system conditions and shall reflect changes to system topology such as Facility outages. R2.2. Following the single Contingencies identified in Requirement 2.2.1 through Requirement 2.2.3, the system shall demonstrate transient, dynamic and voltage stability; all Facilities shall be operating within their Facility Ratings and within their thermal, voltage and stability limits; and Cascading or uncontrolled separation shall not occur." (emphases added). FAC-011-2, R3 states: "The Reliability Coordinator's methodology for determining SOLs, shall include, as a minimum,

Voltage and Reactive Control		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		a description of the following, along with any reliability margins…" (emphasis added). Although FAC standards require the establishment and criteria of SOLs, the TOP standards require operations within SOLs and IROLs. The currently enforceable TOP-002-2.1b requires that "Each Balancing Authority and Transmission Operator shall plan to meet all System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs)." TOP-004-2 R1 states "Each Transmission Operator shall operate within the Interconnection Reliability Operating Limits (IROLs) and System Operating Limits (SOLs)." Thus, the TOP and FAC standards provide sufficient details on established limits and acceptable margins for voltage by providing vehicles for monitoring and operating within SOLs and IROLs. If a system event were to occur due to voltage, the TOP and FAC standards would be the appropriate place for a violation because a limit would have been violated. With regard to the directive on sufficient reactive resources, VAR-001 R2 has been modified to state the TOP will "schedule sufficient reactive resources to regulate voltage levels under normal and Contingency conditions. Transmission Operators can provide sufficient reactive resources through various means

Voltage and Reactive Control		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		including, but not limited to, reactive generation scheduling, transmission line and reactive resource switching, and using controllable load." As explained in the rationale for the new requirement ensures sufficient reactive resources are online or scheduled to regulate voltage levels. The old requirement used the term "acquire" instead of schedule, and there was industry confusion on how to acquire sufficient reactive resources.
We recognize that our proposed modification does not identify what definitive requirements the Reliability Standard should use for "established limits" and "sufficient reactive resources." **Rather, the ERO should develop appropriate requirements that address the Commission's concerns through the ERO Reliability Standards development process.**	Order No. 693, P 1869	The Commission clarified that this is not a directive to change or modify a standard.[8]
In response to the concerns of APPA, SDG&E and EEI on the availability of tools, the Commission recognizes that transient voltage stability analysis is often conducted as an offline study, and that steady-state voltage stability analysis can be done online. The Commission clarifies that it does not wish to require anyone to use tools that are not validated for real-time operations. Taking these comments into consideration, the Commission clarifies its	Order No. 693, P 1875	Analytical tools or online techniques in general will be addressed in Project 2009-02, Real-time Monitoring and Analysis Capabilities. Therefore, this directive will be addressed in that project. Further, the VAR SDT determined that the Commission is not requiring TOPs to purchase new online models or to implement tools that will not adequately study a TOP's reactive power requirements. The VAR SDT also

[8] *See* Order No. 788 at Attachment A.

Voltage and Reactive Control		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
proposed modification from the NOPR. For the Final Rule, **we direct the ERO, through its Reliability Standards development process, to modify Reliability Standard VAR-001-1 to include Requirements to perform voltage stability analysis periodically, using online techniques where commercially-available, and offline simulation tools where online tools are not available, to assist real-time operations. The ERO should consider the available technologies and software as it develops this modification to VAR-001-1 and identify a process to assure that the Reliability Standard is not limiting the application of validated software or other tools.**		determined that the most reliable models are the ones proven over time to correctly model the system. Further, the VAR SDT also determined the TOP standards require periodic voltage stability analysis. The currently enforceable standards: TOP-004-2 and TOP-006-2 require actively monitoring voltage in order to operate within SOLs.
The Commission noted in the NOPR that in many cases, load response and demand-side investment can reduce the need for reactive power capability in the system. Based on this assertion, the Commission proposed to direct the ERO to include controllable load among the reactive resources to satisfy reactive requirements for incorporation into Reliability Standard VAR-001-1. **While we affirm this requirement, we expect the ERO to consider the comments of SoCal Edison with regard to**	Order No. 693, P 1879	NERC addressed this directive in a prior version of the VAR standard, but as mentioned above, examples of sufficient reactive resources including controllable load are listed in VAR-001 R2.[9]

[9] *supra* at note 2.

Voltage and Reactive Control		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
reliability and SMA in its process for developing the technical capability requirements for using controllable load as a reactive resource in the applicable Reliability Standards.		
Dynegy has suggested an improvement to Reliability Standard VAR-002-1, and NERC should consider this in its Reliability Standards development process.	Order No. 693, P 1885	Dynegy stated that VAR-002-1 should be modified to require detailed and definitive requirements when defining the timeframe associated with an "incident" of non-compliance. The VAR SDT, NERC staff, and industry participants could not agree on an appropriate number for creating a non-compliance window for the continent. Instead, VAR-001 was modified to require TOPs to create notification requirements for their GOPs in VAR-001-4 Requirement 5, part 5.2. The TOPs can then tailor their notification requirements based on their area's reliability needs/voltage constraints.
The Commission remands to the ERO the proposed interpretation of VAR-001-1, Requirement R4 and directs the ERO to revise the interpretation consistent with the Commission's discussion below.	Order No. 724, P 47.	P 49 of Order No. 724 explains this directive by stating "the Commission adopts its NOPR proposal, and finds that a voltage schedule should reflect sound engineering, as well as operating judgment and experience. The Commission remands NERC's proposed VAR-001-1, Requirement R4 interpretation, in order

Voltage and Reactive Control		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		that NERC may reconsider its interpretation consistent with this order."[10] NERC staff and TOPs expressed concern that having to justify a schedule could provide a forum for disputing voltage schedules in general. This could harm reliability if GOPs were permitted to not implement a schedule until there was consensus on the technical merits of a voltage schedule. Therefore, in order to maintain a TOPs authority for setting schedules, the VAR SDT determined the standard should require sharing study data for how a voltage schedule was determined. The VAR SDT determined that in order to show voltage schedules reflect sound engineering and judgment, a TOP should provide the criteria for developing schedules and tolerance bands when requested by a GOP. This is reflected in VAR-001-4 Requirement 5, part 5.3. This requirement allows the GOP to understand the technical basis for a voltage schedule, but it does not create a vehicle for the GOPs to approve the voltage schedule.

Standards Announcement Update

Project 2013-04 Voltage and Reactive Control
VAR-001-4

Final Ballot Now Open through December 23, 2013

Now Available

It has come to NERC's attention that an administrative error resulted in incorrect votes being carried forward for the VAR-001-4 final ballot that opened on December 11, 2013. The final ballot for VAR-001-4 is being restarted today with the appropriate votes carried forward and will end on Monday, December 23, 2013. Anyone who has logged in during the incorrect final ballot period to change their vote will need to log in again to revote in this ballot. We recognize that this ballot now closes the Monday of a holiday week and apologize for the inconvenience.

As this final ballot needed to be restarted due to the administrative error, the following two additional clarifying changes were made to the standard:

- **The language in Requirement R4 regarding criteria for generator exemptions was clarified to match the language in the measure.**
- **Requirement references in the WECC Regional Variance were updated to match the corresponding requirements in VAR-001-4.**

Background information for this project can be found on the project page.

Instructions for Balloting

In the final ballot, votes are counted by exception. Only members of the ballot pool may cast a ballot; all ballot pool members may change their previously cast votes. A ballot pool member who failed to cast a ballot during the last ballot window may cast a ballot in the final ballot window. If a ballot pool member does not participate in the final ballot, that member's vote cast in the previous ballot will be carried over as that member's vote in the final ballot.

Members of the ballot pool associated with this project may log in and submit their vote for the standard by clicking here.

Next Steps

Voting results for the standard will be posted and announced after the ballot window closes. If approved, it will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Wendy Muller, Standards Development Administrator, or at 404-446-2560.

A final ballot for **VAR-001-4** concluded at **8 p.m. Eastern on Monday, December 23, 2013.**

The standard achieved a quorum and sufficient affirmative votes for approval. Voting statistics are listed below, and the Ballot Results page provides a link to the detailed results for the ballots.

Standard	Quorum /Approval
VAR-001-4	84.34% / 75.35%

Background information for this project can be found on the project page.

Next Steps

The standard will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Wendy Muller, Standards Development Administrator, or at 404-446-2560.

Ballot Results	
Ballot Name:	Project 2013-04 Voltage and Reactive Control VAR-001-4 _
Ballot Period:	12/13/2013 - 12/23/2013
Ballot Type:	Final Ballot
Total # Votes:	334
Total Ballot Pool:	396
Quorum:	**84.34 % The Quorum has been reached**
Weighted Segment Vote:	75.35 %
Ballot Results:	**A quorum was reached and there were sufficient affirmative votes for approval.**

Summary of Ballot Results

Segment	Ballot Pool	Segment Weight	Affirmative # Votes	Affirmative Fraction	Negative # Votes	Negative Fraction	Negative Vote without a Comment	Abstain	No Vote
1 - Segment 1	106	1	57	0.695	25	0.305	0	8	16

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR and supporting package posted for comment on July 19, 2013.
2. Draft standard posted for initial comments and ballot from July 19, 2013 to September 3, 2013.
3. Draft standard posted for additional comments and ballot from October 11, 2013 to November 26, 2013.

Description of Current Draft

This is the third posting of the proposed draft standard. This proposed draft standard will be posted for a 45-day formal comment period and parallel ballot.

Anticipated Actions	Anticipated Date
Additional 45-Day SAR Comment Period with Ballot	February/March
Final Ballot	April 2014
NERC Board of Trustees Adoption	May 2014
Filing to Applicable Regulatory Authorities	May 2014

Version History

Version	Date	Action	Change Tracking
1	5/1/2006	Added "(R2)" to the end of levels on non-compliance 2.1.2, 2.2.2, 2.3.2, and 2.4.3.	July 5, 2006
1a	12/19/2007	Added Appendix 1 – Interpretation of R1 and R2 approved by BOT on August 1, 2007	Revised
1a	1/16/2007	In Section A.2., Added "a" to end of standard number. Section F: added "1."; and added date.	Errata
1.1a	10/29/2008	BOT adopted errata changes; updated version number to "1.1a"	Errata
1.1b	3/3/2009	Added Appendix 2 – Interpretation of VAR-002-1.1a approved by BOT on February 10, 2009	Revised
2b	4/16/2013	Revised R1 to address an Interpretation Request. Also added previously approved VRFs, Time Horizons and VSLs. Revised R2 to address consistency issue with VAR-001-2, R4. FERC Order issued approving VAR-002-2b.	Revised

Definitions of Terms Used in the Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None.

A. Introduction

1. Title: **Generator Operation for Maintaining Network Voltage Schedules**

2. Number: VAR-002-3

3. Purpose: To ensure generators provide reactive support and voltage control, within generating Facility capabilities, in order to protect equipment and maintain reliable operation of the Interconnection.

4. Applicability:

4.1. Generator Operator

4.2. Generator Owner

5. Effective Dates

The standard shall become effective on the first day of the first calendar quarter after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, VAR-002-3 shall become effective on the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

B. Requirements and Measures

Rationale for R1: This requirement has been maintained due to the importance of running a unit with its automatic voltage regulator (AVR) in service and in either voltage controlling mode or the mode instructed by the TOP. However, the requirement has been modified to allow for testing, and the measure has been updated to include some of the evidence that can be used for compliance purposes.

R1. The Generator Operator shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) in service and controlling voltage) or in a different control mode, as instructed by the Transmission Operator unless: 1) the generator is exempted by the Transmission Operator, or 2) the Generator Operator has notified the Transmission Operator of one of the following: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

- That the generator is being operated in start-up,[1] shutdown,[2] or testing mode pursuant to a Real-time communication or a procedure that was previously provided to the Transmission Operator; or
- That the generator is not being operated in the control mode that was instructed by the Transmission Operatorfor a reason other than start-up, shutdown, or testing.

M1. The Generator Operator shall have evidence to show that it notified its associated Transmission Operator any time it failed to operate a generator in the automatic voltage control mode or a different control mode as specified in Requirement R1. If a generator is being started up or shut down with the automatic voltage control off, or is being tested, and no notification of the AVR status is made to the Transmission Operator, the Generator Operator will have evidence that it notified the Transmission Operator of its procedure for placing the unit into automatic voltage control mode as required in Requirement R1. Such evidence may include, but is not limited to, dated evidence of transmittal of the procedure such as an electronic message or a transmittal letter with the procedure included or attached. If a generator is exempted, the Generator Operator shall also have evidence that the generator is exempted from being in automatic voltage control mode (with its AVR in service and controlling voltage).

[1] Start-up is deemed to have ended when the generator is ramped up to its minimum continuously sustainable load and the generator is prepared for continuous operation.
[2] Shutdown is deemed to begin when the generator is ramped down to its minimum continuously sustainable load and the generator is prepared to go offline.

Rationale for R2:

Requirement R2 details how a Generator Operator (GOP) operates its generator(s) to provide voltage support and when the GOP is expected to notify the Transmission Operator (TOP). In an effort to remove prescriptive notification requirements for the entire continent, the VAR-002-3 standard drafting team (SDT) opted to allow each TOP to determine the notification requirements for each of its respective GOPs based on system requirements. Additionally, a new part 2.3 has been added to detail that each GOP may monitor voltage by using its existing facility equipment.

Conversion Methodology: There are many ways to convert the voltage schedule from one voltage level to another. Some entities may choose to develop voltage regulation curves for their transformers; others may choose to do a straight ratio conversion; others may choose an entirely different methodology. All of these methods have technical challenges, but the studies performed by the TOP, which consider N-1 and credible N-2 contingencies, should compensate for the error introduced by these methodologies, and the TOP possesses the authority to direct the GOP to modify its output if its performance is not satisfactory. During a significant system event, such as a voltage collapse, even a generation unit in automatic voltage control that controls based on the low-side of the generator step-up transformer should see the event on the low-side of the generator step-up transformer and respond accordingly.

Voltage Schedule Tolerances: The bandwidth that accompanies the voltage target in a voltage schedule should reflect the anticipated fluctuation in voltage at the GOP's Facility during normal operations and be based on the TOP's assessment of N-1 and credible N-2 system contingencies. The voltage schedule's bandwidth should not be confused with the control dead-band that is programmed into a GOP's AVR control system, which should be adjusting the AVR prior to reaching either end of the voltage schedule's bandwidth.

R2. Unless exempted by the Transmission Operator, each Generator Operator shall maintain the generator voltage or Reactive Power schedule[3] (within each generating Facility's capabilities[4]) provided by the Transmission Operator, or otherwise shall meet the conditions of notification for deviations from the voltage or Reactive Power schedule provided by the Transmission Operator. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

2.1. When a generator's AVR is out of service or the generator does not have an AVR, the Generator Operator shall use an alternative method to control the generator reactive output to meet the voltage or Reactive Power schedule provided by the Transmission Operator.

[3] The voltage or Reactive Power schedule is a target value with a tolerance band or a voltage or Reactive Power range communicated by the Transmission Operator to the Generator Operator.

[4] Generating Facility capability may be established by test or other means, and may not be sufficient at times to pull the system voltage within the schedule tolerance band. Also, when a generator is operating in manual control, reactive power capability may change based on stability considerations.

2.2. When instructed to modify voltage, the Generator Operator shall comply or provide an explanation of why the schedule cannot be met.

2.3. Generator Operators that do not monitor the voltage at the location specified in their voltage schedule shall have a methodology for converting the scheduled voltage specified by the Transmission Operator to the voltage point being monitored by the Generator Operator.

M2. In order to identify when a generator is deviating from its schedule, the Generator Operator will monitor voltage based on existing equipment at its Facility. The Generator Operator shall have evidence to show that the generator maintained the voltage or Reactive Power schedule provided by the Transmission Operator, or shall have evidence of meeting the conditions of notification for deviations from the voltage or Reactive Power schedule provided by the Transmission Operator. Evidence may include, but is not limited to, operator logs, SCADA data, phone logs, and any other notifications that would alert the Transmission Operator or otherwise demonstrate that the Generator Operator complied with the Transmission Operator's instructions for addressing deviations from the voltage or Reactive Power schedule.

For part 2.1, when a generator's AVR is out of service or the generator does not have an AVR, a Generator Operator shall have evidence to show an alternative method was used to control the generator reactive output to meet the voltage or Reactive Power schedule provided by the Transmission Operator.

For part 2.2, the Generator Operator shall have evidence that it complied with the Transmission Operator's instructions to modify its voltage or provided an explanation to the Transmission Operator of why the Generator Operator was unable to comply with the instruction. Evidence may include, but is not limited to, operator logs, SCADA data, and phone logs.

For part 2.3, for Generator Operators that do not monitor the voltage at the location specified on the voltage schedule, the Generator Operator shall document or be able to demonstrate the method of conversion from the voltage level monitored to the voltage level specified on the voltage schedule.

Rationale for R3:

This requirement has been modified to limit the notifications required when an AVR goes out of service and quickly comes back in service. Such notifications provide little to no benefit to reliability. Thirty (30) minutes have been built into the requirement to allow a GOP time to resolve an issue before having to notify the TOP of a status or capability change. The requirement has also been amended to remove the sub-requirement to provide an estimate for the expected duration of the status change. The 30-minute window should resolve most issues.

R3. Each Generator Operator shall notify its associated Transmission Operator of a status change on the AVR, power system stabilizer, or alternative voltage controlling device within 30 minutes of the

change. If the status has been restored within 30 minutes of such change, then to the Generator Operator is not required to notify the Transmission Operator of the status change *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

M3. The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of any status change identified in Requirement R3. If the status has been restored within the first 30 minutes, no notification is necessary.

Rationale for R4:

This requirement has been bifurcated from the prior version VAR-00202b Requirement R3. This requirement allows GOPs to report reactive capability changes after they are made aware of the change. The current standard requires notification as soon as the change occurs, but many GOPs are not aware of a reactive capability change until it has taken place.

R4. Each Generator Operator shall notify its associated Transmission Operator within 30 minutes of becoming aware of a change in reactive capability due to factors other than a status change described in Requirement R3. If the capability has been restored within 30 minutes of such change, then to the Generator Operator is not required to notify the Transmission Operator of the change in reactive capability. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

M4. The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of becoming aware of a change in reactive capability in accordance with Requirement R4. If the capability has been restored within the first 30 minutes, no notification is necessary.

Rationale for R5:

This requirement and corresponding measure have been maintained due to the importance of having accurate tap settings. If the tap setting is not properly set, then the VARs available from that unit can be affected. The prior version of VAR-002-2b subpart 4.1.4 (the +/- voltage range with step-change in % for load-tap changing transformers) has been removed. The percentage information was not needed because the tap settings, ranges and impedance are required. Those inputs can be used to calculate the step-change percentage if needed.

R5. The Generator Owner shall provide the following to its associated Transmission Operator and Transmission Planner within 30 calendar days of a request. *[Violation Risk Factor: Lower] [Time Horizon: Real-time Operations]*

5.1. For generator step-up transformers and auxiliary transformers with primary voltages equal to or greater than the generator terminal voltage:

5.1.1. Tap settings.

5.1.2. Available fixed tap ranges.

5.1.3. Impedance data.

M5. The Generator Owner shall have evidence it provided its associated Transmission Operator and Transmission Planner with information on its step-up transformers and auxiliary transformers as required in Requirement R5 part 5.1.1 through part 5.1.3 within 30 calendar days.

Rationale for R6:

This requirement and corresponding measure have been maintained due to the importance of having accurate tap settings. If the tap setting is not properly set, then the VARs available from that unit can be affected.

R6. After consultation with the Transmission Operator regarding necessary step-up transformer tap changes, the Generator Owner shall ensure that transformer tap positions are changed according to the specifications provided by the Transmission Operator, unless such action would violate safety, an equipment rating, a regulatory requirement, or a statutory requirement. *[Violation Risk Factor: Lower] [Time Horizon: Real-time Operations]*

6.1. If the Generator Owner cannot comply with the Transmission Operator's specifications, the Generator Owner shall notify the Transmission Operator and shall provide the technical justification.

M6. The Generator Owner shall have evidence that its step-up transformer taps were modified per the Transmission Operator's documentation in accordance with Requirement R6. The Generator Owner shall have evidence that it notified its associated Transmission Operator when it could not comply with the Transmission Operator's step-up transformer tap specifications in accordance with Requirement R6 part 6.1.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" refers to NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner shall keep its latest version of documentation on its step-up and auxiliary transformers. The Generator Operator shall maintain all other evidence for the current and previous calendar year.

The Compliance Monitor shall retain any audit data for three years.

1.3. Compliance Monitoring and Assessment Processes:

"Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.4. Additional Compliance Information:

None.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Real-time Operations**	**Medium**	N/A	N/A	N/A	Unless exempted, the Generator Operator did not operate each generator in the automatic voltage control mode or in a different control mode, as instructed by the Transmission Operator, and failed to provide the required notifications to Transmission Operator as identified in Requirement R1.
R2	**Real-time Operations**	**Medium**	N/A	N/A	The Generator Operator did not have conversion methodology when it monitors voltage at a location different from the schedule provided by the Transmission Operator.	The Generator Operator did not maintain voltage or Reactive Power schedule as directed by the Transmission Operator and did not make the necessary notifications required by the Transmission Operator. OR The Generator Operator did not have an operating AVR, and the responsible entity did not use an alternative method for controlling voltage. OR The Generator Operator did not modify voltage when directed, and the responsible entity did not provide any explanation.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R3	**Real-time Operations**	**Medium**	N/A	N/A	N/A	The Generator Operator did not make the required notification within 30 minutes.
R4	**Real-time Operations**	**Medium**	N/A	N/A	N/A	The Generator Operator did not make the required notification within 30 minutes.
R5	**Real-time Operations**	**Lower**	N/A	N/A	The Generator Operator failed to provide its associated Transmission Operator and Transmission Planner one of the types of data specified in Requirement R5 parts 5.1.1, 5.1.2, and 5.1.3.	The Generator Operator failed to provide to its associated Transmission Operator and Transmission Planner two or more of the types of data specified in Requirement R5 parts 5.1.1, 5.1.2, and 5.1.3.
R6	**Real-time Operations**	**Lower**	N/A	N/A	N/A	The Generator Owner did not ensure the tap changes were made according the Transmission Operator's specifications. OR

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						The Generator Owner failed to perform the tap changes, and the Generator Owner did not provide technical justification for why it cannot comply with the Transmission Operator specifications.

D. Regional Variances

None.

E. Interpretations

None.

F. Associated Documents

None.

Guidelines and Technical Basis

For technical basis for each requirement, please review the rationale provided for each requirement.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR and supporting package posted for comment on July 19, 2013.
2. Draft standard posted for initial comments and ballot from July 19, 2013 to September 3, 2013.
3. Draft standard posted for additional comments and ballot from October 11, 2013 to November 26, 2013.

Description of Current Draft

This is the ~~second~~ third posting of the proposed draft standard. This proposed draft standard will be posted for a 45-day formal comment period and parallel ballot.

Anticipated Actions	Anticipated Date
Additional 45-Day SAR Comment Period with Ballot	~~October/November 2013~~February/March
Final Ballot	~~December 2013~~April 2014
NERC Board of Trustees Adoption	~~December 2013~~May 2014
Filing to Applicable Regulatory Authorities	~~December 2013~~May 2014

Version History

Version	Date	Action	Change Tracking
1	5/1/2006	Added "(R2)" to the end of levels on non-compliance 2.1.2, 2.2.2, 2.3.2, and 2.4.3.	July 5, 2006
1a	12/19/2007	Added Appendix 1 – Interpretation of R1 and R2 approved by BOT on August 1, 2007	Revised
1a	1/16/2007	In Section A.2., Added "a" to end of standard number. Section F: added "1."; and added date.	Errata
1.1a	10/29/2008	BOT adopted errata changes; updated version number to "1.1a"	Errata
1.1b	3/3/2009	Added Appendix 2 – Interpretation of VAR-002-1.1a approved by BOT on February 10, 2009	Revised
2b	4/16/2013	Revised R1 to address an Interpretation Request. Also added previously approved VRFs, Time Horizons and VSLs. Revised R2 to address consistency issue with VAR-001-2, R4. FERC Order issued approving VAR-002-2b.	Revised

Definitions of Terms Used in the Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None.

A. Introduction

1. Title: **Generator Operation for Maintaining Network Voltage Schedules**

2. Number: VAR-002-3

3. Purpose: To ensure generators provide reactive support and voltage control, within generating Facility capabilities, in order to protect equipment and maintain reliable operation of the Interconnection.

4. Applicability:

4.1. Generator Operator

4.2. Generator Owner

5. Effective Dates

The standard shall become effective on the first day of the first calendar quarter after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, VAR-002-3 shall become effective on the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

B. Requirements and Measures

Rationale for R1: This requirement has been maintained due to the importance of running a unit with its automatic voltage regulator (AVR) in service and in either voltage controlling mode or the mode instructed by the TOP. However, the requirement has been modified to allow for testing, and the measure has been updated to include some of the evidence that can be used for compliance purposes.

R1. The Generator Operator shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) in service and controlling voltage) or in a different control mode, as instructed by the Transmission Operator unless ~~the Generator Operator~~: 1) the generator is exempted by the Transmission Operator, ~~-~~or 2) the Generator Operator has notified the Transmission Operator of one of the following: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

- That the generator is being operated in start-up,[1] shutdown,[2] or testing mode pursuant to a Real-time communication or a procedure that was previously provided to the Transmission Operator; or
- That the generator is not being operated in the ~~automatic voltage~~ control mode that was instructed by the Transmission Operator ~~-~~for a reason other than start-up, shutdown, or ~~-~~ testing.

M1. The Generator Operator shall have evidence to show that it notified its associated Transmission Operator any time it failed to operate a generator in the automatic voltage control mode or a different control mode as specified in Requirement R1. If a generator is being started up or shut down with the automatic voltage control off, or is being tested, and no notification of the AVR status is made to the Transmission Operator, the Generator Operator will have evidence that it notified the Transmission Operator of its procedure for placing the unit into automatic voltage control mode as required in Requirement R1. Such evidence ~~must~~ may include, but is not limited to, dated evidence of transmittal of the procedure such as an electronic message or a transmittal letter with the procedure included or attached. If a generator is exempted, the Generator Operator shall also have evidence that the generator ~~it~~ is exempted from being in automatic voltage control mode (with its AVR in service and controlling voltage).

[1] Start-up is deemed to have ended when the generator is ramped up to its minimum continuously sustainable load and the generator is prepared for continuous operation.
[2] Shutdown is deemed to begin when the generator is ramped down to its minimum continuously sustainable load and the generator is prepared to go offline.

Rationale for R2:

Requirement R2 details how a Generator Operator (GOP) operates ~~the~~ its generator(s) ~~system~~ to ~~maintain~~ provide ~~a~~ voltage ~~schedule~~ support and when the GOP is expected to notify the Transmission Operator (TOP). In an effort to remove prescriptive notification requirements for the entire continent, the VAR-002-3 standard drafting team (SDT) opted to allow each TOP to determine the notification requirements for each of its respective GOPs based on system requirements. Additionally, a new part 2.3 has been added to detail that each GOP ~~shall~~ may monitor voltage ~~based~~ by using ~~on~~ its existing facility equipment.

Conversion Methodology: There are many ways to convert the voltage schedule from one voltage level to another. Some entities may choose to develop voltage regulation curves for their transformers; others may choose to do a straight ratio conversion; others may choose an entirely different methodology. All of these methods have technical challenges, but the studies performed by the TOP, which consider N-1 and credible N-2 contingencies, should compensate for the error introduced by these methodologies, and the TOP possesses the authority to direct the GOP to modify its output if its performance is not satisfactory. During a significant system event, such as a voltage collapse, even a generation unit in automatic voltage control that controls based on the low-side of the generator step-up transformer should see the event on the low-side of the generator step-up transformer and respond accordingly.

Voltage Schedule Tolerances: The bandwidth that accompanies the voltage target in a voltage schedule should reflect the anticipated fluctuation in voltage at the GOP's Facility during normal operations and be based on the TOP's assessment of N-1 and credible N-2 system contingencies. The voltage schedule's bandwidth should not be confused with the control dead-band that is programmed into a GOP's AVR control system, which should be adjusting the AVR prior to reaching either end of the voltage schedule's bandwidth.

R2. Unless exempted by the Transmission Operator, each Generator Operator shall maintain the generator voltage or Reactive Power schedule[3] (within each generating Facility's capabilities[4]) provided by the Transmission Operator, or otherwise shall meet the conditions of notification for deviations from the voltage or Reactive Power schedule provided by the Transmission Operator. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

2.1. When a generator's AVR is out of service or the generator does not have an AVR, the Generator Operator shall use an alternative method to control the generator reactive output to meet the voltage or Reactive Power schedule ~~directed~~ provided by the Transmission Operator.

[3] The voltage or Reactive Power schedule is a target value with a tolerance band or a voltage or Reactive Power range communicated by the Transmission Operator to the Generator Operator.

[4] Generating Facility capability may be established by test or other means, and may not be sufficient at times to pull the system voltage within the schedule tolerance band. Also, when a ~~Generator~~ generator is operating in manual control, reactive power capability may change based on stability considerations.

2.2. When ~~directed~~ instructed to modify voltage, the Generator Operator shall comply or provide an explanation of why the schedule cannot be met.

2.3. Generator Operators that do not monitor the voltage at the location specified in their voltage schedule shall have a methodology for converting the scheduled voltage specified by the Transmission Operator to the voltage point being monitored by the Generator Operator.

M2. In order to identify when a ~~unit~~ generator is deviating from its schedule, the Generator Operator will monitor voltage based on existing equipment at its Facility. The Generator Operator shall have evidence to show that the generator maintained the voltage or Reactive Power schedule provided by the Transmission Operator, or shall have evidence of meeting the conditions of notification for deviations from the voltage or Reactive Power schedule provided by the Transmission Operator. Evidence may include, but is not limited to, operator logs, SCADA data, phone logs, and any other notifications that would alert the Transmission Operator or otherwise demonstrate that the Generator Operator complied with the Transmission Operator's instructions for addressing deviations from the voltage or Reactive Power schedule.

For part 2.1, when a generator's AVR is out of service or the generator does not have an AVR, a Generator Operator shall have evidence to show an alternative method was used to control the generator reactive output to meet the voltage or Reactive Power schedule ~~directed~~ provided by the Transmission Operator.

For part 2.2, the Generator Operator shall have evidence that it complied with the Transmission Operator's ~~directions~~ instructions to modify its voltage or provided an explanation to the Transmission Operator of why the Generator Operator was unable to comply with the ~~direction~~instruction. Evidence may include, but is not limited to, operator logs, SCADA data, and phone logs.

For part 2.3, for ~~units~~ Generator Operators that do not monitor the voltage at the location specified on the voltage schedule, the Generator Operator shall document or be able to demonstrate the method of conversion from the voltage level monitored to the voltage level specified on the voltage schedule.

Rationale for R3:

This requirement has been modified to limit the notifications required when an AVR goes out of service and quickly comes back in service. Such notifications provide~~d~~ little to no benefit to reliability. ~~Fifteen~~ Thirty (~~15~~30) minutes have been built into the requirement to allow a GOP time to resolve an issue before having to notify the TOP of a status or capability change. The requirement has also been amended to remove the sub-requirement to provide an estimate for the expected duration of the status change. The 30~~15~~-minute window should resolve most issues.

R3. Each Generator Operator shall notify its associated Transmission Operator of a status change on the AVR, power system stabilizer, or alternative voltage controlling device within 30 minutes of the

change. If the status has been restored within ~~the first 15~~ 30 minutes of such change, then ~~there is no need to~~to the Generator Operator is not required to notify the Transmission Operator of the status change~~.~~ *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

M3. The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of ~~the~~ any status change identified in Requirement R3. If the status has been restored within the first ~~15~~ 30 minutes, no notification is necessary~~; therefore, if a status change lasts more than 15 minutes, the GOP must notify its associated Transmission Operator within 30 minutes of when the change first occurred~~.

Rationale for R4:

This requirement has been bifurcated from the ~~earlier~~ prior version VAR-00202b Requirement R3. This requirement allows GOPs to report reactive capability changes after they are made aware of the change. The current standard requires notification as soon as the change occurs, but many GOPs ~~are already in non-compliance situations by the time it is known that~~are not aware of a reactive capability change until it has taken place.

R4. Each Generator Operator shall notify its associated Transmission Operator within 30 minutes ~~after~~ of becoming aware of a change in reactive capability due to factors other than a status change described in Requirement R3. If the capability has been restored within ~~the first 15~~ 30 minutes of such change, then ~~there is no need to~~to the Generator Operator is not required to notify the Transmission Operator of the change in reactive capability. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

M4. The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes ~~of the recognition~~ of becoming aware of a change in reactive capability ~~change identified~~ in accordance with Requirement R4. If the capability has been restored within the first ~~15~~ 30 minutes, no notification is necessary~~; therefore, if a capability change lasts more than 15 minutes, the Generator Operator must notify its associated Transmission Operator within 30 minutes of when the change first occurred~~.

Rationale for R5:

This requirement and corresponding measure have been maintained due to the importance of having accurate tap settings. If the tap setting is not properly set, then the ~~amount of~~ VARs ~~produced by a~~ available from that unit can be affected. The ~~original~~ prior version of VAR-002-2b sub~~-requirement~~part 4.1.4 (the +/- voltage range with step-change in % for load-tap changing transformers) has been removed. The percentage information was not needed ~~since~~ because the tap settings, ranges and impedance are required. Those inputs can be used to calculate the step-change percentage if needed.

R5. The Generator Owner shall provide the following to its associated Transmission Operator and Transmission Planner within 30 calendar days of a request. *[Violation Risk Factor: Lower] [Time Horizon: Real-time Operations]*

5.1. For generator step-up transformers and auxiliary transformers with primary voltages equal to or greater than the generator terminal voltage:

5.1.1. Tap settings.

5.1.2. Available fixed tap ranges.

5.1.3. Impedance data.

M5. The Generator Owner shall have evidence it provided its associated Transmission Operator and Transmission Planner with information on its step-up transformers and auxiliary transformers as required in Requirement~~s~~ R5 part 5.1.1 through part 5.1.3 within 30 calendar days.

Rationale for R6:

This requirement and corresponding measure have been maintained due to the importance of having accurate tap settings. If the tap setting is not properly set, then the ~~amount of~~ VARs ~~produced by~~ available from that ~~a~~ unit can be affected.

R6. After consultation with the Transmission Operator regarding necessary step-up transformer tap changes, the Generator Owner shall ensure that transformer tap positions are changed according to the specifications provided by the Transmission Operator, unless such action would violate safety, an equipment rating, a regulatory requirement, or a statutory requirement. *[Violation Risk Factor: Lower] [Time Horizon: Real-time Operations]*

6.1. If the Generator ~~Operator~~ Owner cannot comply with the Transmission Operator's specifications, the Generator ~~Operator~~ Owner shall notify the Transmission Operator and shall provide the technical justification.

M6. The Generator Owner shall have evidence that its step-up transformer taps were modified per the Transmission Operator's documentation ~~as identified~~ in accordance with Requirement R6. The Generator ~~Operator~~ Owner shall have evidence that it notified its associated Transmission

Operator when it could not comply with the Transmission Operator's step-up transformer tap specifications ~~as identified~~ in accordance with Requirement R6 part 6.1.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" refers to NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner shall keep its latest version of documentation on its step-up and auxiliary transformers. The Generator Operator shall maintain all other evidence for the current and previous calendar year.

The Compliance Monitor shall retain any audit data for three years.

1.3. Compliance Monitoring and Assessment Processes:

"Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

~~As defined in the NERC Rules of Procedure, "Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.~~

1.4. Additional Compliance Information:

None.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Real-time Operations**	**Medium**	N/A	N/A	N/A	Unless exempted, the ~~responsible entity~~Generator Operator did not operate each generator in the automatic voltage control mode or in a different control mode, as instructed by the Transmission Operator, and failed to ~~notify~~ provide the required notifications to Transmission Operator as identified in Requirement R1.
R2	**Real-time Operations**	**Medium**	N/A	N/A	The ~~responsible entity~~Generator Operator did not have conversion methodology when it monitors voltage at a location different from the schedule provided by the Transmission Operator.	The Generator Operator ~~responsible entity~~ did not maintain voltage or Reactive Power schedule as directed by the Transmission Operator and did not make the necessary notifications required by the Transmission Operator. OR The Generator Operator ~~responsible entity~~ did not have an operating AVR, and the responsible entity did not use an alternative method for controlling voltage. OR The Generator Operator ~~responsible entity~~ did not modify voltage when directed, and the responsible entity did not provide any explanation.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R3	**Real-time Operations**	**Medium**	N/A	N/A	N/A	The Generator Operator ~~responsible entity~~ did not make the required notification within 30 minutes.
R4	**Real-time Operations**	**Medium**	N/A	N/A	N/A	The Generator Operator ~~responsible entity~~ did not make the required notification within 30 minutes.
R5	**Real-time Operations**	**Lower**	N/A	N/A	The Generator Operator ~~responsible entity~~ failed to provide ~~to~~ its associated Transmission Operator and Transmission Planner one of the types of data specified in Requirement~~s~~ R5 parts 5.1.1 ~~and~~ , 5.1.2, and 5.1.3.	The Generator Operator ~~responsible entity~~ failed to provide to its associated Transmission Operator and Transmission Planner two or more of the types of data specified in Requirement~~s~~ R5 parts 5.1.1, ~~and~~ 5.1.2, and 5.1.3.
R6	**Real-time Operations**	**Lower**	N/A	N/A	N/A	The Generator Owner did not ensure the tap changes were made according the Transmission Operator's specifications.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						OR The Generator ~~Operator~~ Owner failed to perform the tap changes, and the Generator ~~Operator~~ Owner did not provide technical justification for why it cannot comply with the Transmission Operator ~~directive~~specifications.

D. Regional Variances

None.

E. Interpretations

None.

F. Associated Documents

None.

Guidelines and Technical Basis

For technical basis for each requirement, please review the rationale provided for each requirement.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan

VAR Directives Project

Implementation Plan for VAR-001-4 and VAR-002-3

Approvals Required

VAR-001-4 – Voltage and Reactive Control
VAR-002-3 — Generator Operation for Maintaining Network Voltage Schedules

Prerequisite Approvals

There are no other standards that must receive approval prior to the approval of this standard.

Revisions to Glossary Terms

None

Applicable Entities

Generator Operators (VAR-002-3)

Generator Owners (VAR-002-3)

Transmission Operators (VAR-001-4)

Applicable Facilities

N/A

Conforming Changes to Other Standards

None

Effective Dates

VAR-001-4 and VAR-002-3 – All requirements shall become effective on the first day of the first calendar quarter after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, VAR-001-4 and VAR-002-3 shall become effective on the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Justification

The currently effective VAR-002 standard is one of the most violated standards; however, the industry argues these violations do not address any reliability gaps. Instead, Generator Operators and Transmission Operators are required to handle many nuisance phone calls for slight deviations from a voltage schedule. The nuisance phone calls can be a distraction during a scheduled maintenance or a system event; thus, the industry would support making the changes as soon as possible. However, since VAR-001 now requires determining voltage and reactive power schedules with associated tolerance bands in addition to any notification requirements, the Transmission Operators need a quarter to prepare documentation. The VAR-002 standards cannot go into effect without the new TOP schedules and notification requirements. Also for Transmission Operators that do not already provide tolerance bands with voltage schedules, those Transmission Operators will need some time to adjust to providing new data (more specifically, the criteria for schedules) to Generator Operators.

Retirements

VAR-001-3 and VAR-002-2b will be retired at midnight of the day immediately prior to the Effective Date of VAR-001-4 and VAR-002-3 in the particular jurisdiction in which the new standards are becoming effective.

Unofficial Comment Form

Project 2013-04 Voltage and Reactive Control (VAR) Revisions

Please **DO NOT** use this form for submitting comments. Please use the electronic form to submit comments on the draft VAR-002-3 standard. The electronic comment form must be completed by 8:00 p.m. ET by **April 14, 2014**.

If you have questions please contact Soo Jin Kim via email or by telephone at 404-446-9742.

The project page may be accessed by clicking here.

Background Information

When the first versions of the VAR standards were approved in FERC Order No. 693,[1] the Commission also issued FERC issued several directives with regard to how to improve the standard. Each of the outstanding directives are explained in detail in the technical white paper (see project page).

The informal consensus building for VAR began in February 2013. Specifically, the ad hoc group engaged stakeholders on how best to address the FERC directives, remove paragraph 81 candidates, and implement results-based approaches. A discussion of the ad hoc group's consensus building and collaborative activities are also included in the technical white paper.

Project 2013-04 posted an initial draft for comment and ballot from July 19, 2013 to September 3, 2013. Although the VAR standards did not pass, the industry provided numerous helpful coments, and the standard drafting team made significant revisions based on the stakeholder input. Both VAR-001 and VAR-002 were posted for another comment and ballot from October 11, 2013 to November 26, 2013. VAR-001 successfully passed, but VAR-002 did not receive the necessary votes. This posting is now soliciting comment on the revised VAR-002 standard.

Enter comments in simple text format. Bullets, numbers, and special formatting will not be retained.

Compliance Operations

Draft Reliability Standard Compliance Guidance for VAR-001-4 and VAR-002-3
October 21, 2013

Introduction

The NERC Compliance department (Compliance) worked with the VAR standard drafting team (SDT) to review the proposed standards VAR-001-4 and VAR-002-3. The purpose of the review was to discuss the requirements of the proposed standard to obtain an understanding of its intended purpose and the evidence necessary to support compliance. The purpose of this document is to address specific questions posed by the VAR SDT in order to aid in the drafting of the requirements and provide a level of understanding regarding evidentiary support necessary to demonstrate compliance.

While all compliance evaluations require levels of auditor judgment, participating in these reviews allows Compliance to develop training and approaches to support a high level of consistency in audits conducted by the Regional Entities. The following questions and answers are intended to assist the SDT in further refining the standard and to serve as a resource in the development of training for auditors.

VAR-001 and VAR-002 Questions

Question 1

How will compliance determine if sufficient reactive resources were scheduled as part of VAR-001-4 Requirement R2?

Compliance Response to Question 1

For VAR-001-4 Requirement R2, an auditor would review the studies that a TOP used to schedule resources to see that the studies show whether new resources should be brought online, or if the resources online are sufficient to regulate voltage levels. An auditor may observe a TOP reviewing the study and scheduling live and may pull samples from various time periods to determine whether a TOP scheduled resources as required in the study.

Question 2

Is it clear that VAR-001-4 Requirement R4 allows for exemptions, for any duration, from: 1) voltage schedules, 2) being in automatic voltage control mode, or 3) any notification requirements?

Compliance Response to Question

It is clear that VAR-001 Requirement R4 allows for any combination of exemptions for generator operators from 1) voltage schedules, 2) being in automatic voltage control mode, or 3) any notification requirements, as long as the

exemption meets the criteria specified by the TOP. An auditor will not look for any pre-authorization from the TOP; rather an auditor will verify that the generator operator has met the criteria set forth by the TOP.

Question 3

Tolerance bands apply to a set voltage or Reactive Power number with a +/- percentage as the tolerance band. The voltage range or Reactive Power range is a high and low number that a Generator Operator is expected to operate within for reliability purposes. With regard to VAR-001-4 Requirement R5, is it clear that when a voltage range or Reactive Power range is provided as a schedule, a tolerance band is not expected to also be provided?

Compliance Response to Question 3

Yes, it is clear based on VAR-001-4 Requirement R5 that a voltage or Reactive power schedule can be either: 1) a target number with a tolerance band, OR 2) a voltage or Reactive Power range to operate within. An auditor would not expect to see a tolerance band provided with an operating range for voltage or Reactive Power.

Question 4

With regard to VAR-002-3, will generators receive a violation for instances where a system event is affecting system voltage, but the generators made the appropriate conversions and set the AVRs to meet the original schedule provided by the TOP?

Compliance Response to Question 4

No, the generator operators can only be responsible for maintaining the schedule provided by the TOP based on existing facility equipment. In the event that a generator operator does not have the equipment to have visibility of high-side system voltage, the GOP will not have the ability to adjust VARs to maintain system voltage. An auditor is not to determine that, where the GOP does not have the high side monitoring equipment and where the AVR is set appropriately based on existing facility equipment, the generator operator is non-compliant. However, if the TOP provides a new directive or schedule, the GOP is required to follow the new directive. This directive can include modifying an AVR setting or providing more voltage support, and the generator operator is expected to comply pursuant to VAR-002-3.

Question 5

Related to VAR-002-3, generators can monitor voltage on either the low side and high side of the GSU (depending on equipment limitation) and the “number” being monitored by the Generator will not always equate to the number provided by the TOP. Is it clear that VAR-002 Requirement R2, part 2.3 only wants a conversion of the schedule provided to the number monitored? Is it clear that there should not be a violation if the schedule does not match the number being monitored on the low side as long as there is a documented conversion?

Compliance Response to Question 5

The Generator should be able to provide documentation that identifies the "number" being monitored and the calculation demonstrating how the "number" equates to the schedule provided by the TOP. The measure for VAR-002-3 Requirement R2, part 2.3 is clear on what evidence should be able to demonstrate this during an audit.

Question 6

VAR-002-3, Requirement R4 was added because generators cannot report a capability change until they are aware of the change. The currently enforceable standard requires a notification as soon as the capability change occurs; however, many times the change occurred well before the generators were aware of the problem. Is it clear that VAR-002-3 Requirement R4 is only violated after the generator is made aware of the change?

Compliance Response to Question 6

It is clear that VAR-002-3, Requirement R4 will only be a violation if the change is not reported after 30 minutes of becoming aware of the reactive capability change. An auditor will ask an entity for evidence to demonstrate when it became aware of the change in reactive capability. This will not be purely subjective; there are technical instances where it will be clear that an entity would have been made aware of the change in reactive capability. For example, one instance is where a unit is ramping to an expected VAR output, and it cannot reach it; a reactive capability change has occurred.

Conclusion

Following final approval of the Reliability Standard, Compliance will develop the final Reliability Standards Auditor Worksheet (RSAW) and associated training.

VAR-002 Mapping Document

Transition of VAR-002-2b

Standard: VAR-002-3 – Generator Operation for Maintaining Network Voltage Schedules		
Requirement in Approved Standard	**Transitions to the below Requirement in New Standard or Other Action**	**Description and Change Justification**
VAR-002-2b, R1	Requirement R1	The requirement has been modified to allow for testing and exemptions for other AVR modes when necessary. This requirement was also modified to allow GOPs to operate in a different control mode as instructed by the TOP.
VAR-002-2b, R2	Requirement R2	The new requirement has been updated to allow for the TOP to define notification requirements. The requirement also adds parts to allow for the conversion of a high side schedule to a low side number for monitoring purposes. Reactive Power schedules have been added for generators that use those schedules, and for consistency purposes "unit" has been changed to "generator".

Standard: VAR-002-3 – Generator Operation for Maintaining Network Voltage Schedules		
Requirement in Approved Standard	**Transitions to the below Requirement in New Standard or Other Action**	**Description and Change Justification**
VAR-002-2b, R3	Requirement R3 and R4.	The old requirement has been broken into two requirements: 1) one for AVR/PSS status, and 2) one for reactive capability. Both allow 30 minutes to correct an issue before having to notify the TOP.
VAR-002-2b, R3	Requirement R5	The requirement has been modified to remove the sub-part that requires the GOP to provide "[t]he +/- voltage range with step-change in % for load-tap changing transformers." The measure was also modified to add that a GOP must provide the data "within 30 calendar days"
VAR-002-2b, R4	Requirement R6	The requirement has been updated to apply to the same functional entity for the Requirement and sub-part.

[1] NERC developed this Reliability Standard Audit Worksheet (RSAW) language in order to facilitate NERC's and the Regional Entities' assessment of a registered entity's compliance with this Reliability Standard. The NERC RSAW language is written to specific versions of each NERC Reliability Standard. Entities using this RSAW should choose the version of the RSAW applicable to the Reliability Standard being assessed. While the information included in this RSAW provides some of the methodology that NERC has elected to use to assess compliance with the requirements of the Reliability Standard, this document should not be treated as a substitute for the Reliability Standard or viewed as additional Reliability Standard requirements. In all cases, the Regional Entity should rely on the language contained in the Reliability Standard itself, and not on the language contained in this RSAW, to determine compliance with the Reliability Standard. NERC's Reliability Standards can be found on NERC's website. Additionally, NERC Reliability Standards are updated frequently, and this RSAW may not necessarily be updated with the same frequency. Therefore, it is imperative that entities treat this RSAW as a reference document only, and not as a substitute or replacement for the Reliability Standard. It is the responsibility of the registered entity to verify its compliance with the latest approved version of the Reliability Standards, by the applicable governmental authority, relevant to its registration status.

The NERC RSAW language contained within this document provides a non-exclusive list, for informational purposes only, of examples of the types of evidence a registered entity may produce or may be asked to produce to demonstrate compliance with the Reliability Standard. A registered entity's adherence to the examples contained within this RSAW does not necessarily constitute compliance with the applicable Reliability Standard, and NERC and the Regional Entity using this RSAW reserves the right to request additional evidence from the registered entity that is not included in this RSAW. Additionally, this RSAW includes excerpts from FERC Orders and other regulatory references. The FERC Order cites are provided for ease of reference only, and this document does not necessarily include all applicable Order provisions. In the event of a discrepancy between FERC Orders, and the language included in this document, FERC Orders shall prevail.

[2] Compliance Assessment Date(s): The date(s) the actual compliance assessment (on-site audit, off-site spot check, etc.) occurs.

DRAFT

R1 Supporting Evidence and Documentation

R1. The Generator Operator shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) in service and controlling voltage) or in a different control mode, as instructed by the Transmission Operator unless ~~the Generator Operator~~ 1) the generator is exempted by the Transmission Operator, or 2) the Generator Operator has notified the Transmission Operator of one of the following:

- That the generator is being operated in start-up,[3] shutdown,[4] or testing mode pursuant to a Real-time communication or a procedure that was previously provided to the Transmission Operator; or
- That the generator is not being operated in the ~~automatic voltage~~ control mode that was instructed by the Transmission Operator for a reason other than start-up, shutdown, or testing.

M1. The Generator Operator shall have evidence to show that it notified its associated Transmission Operator any time it failed to operate a generator in the automatic voltage control mode or a different control mode as specified in Requirement R1. If a generator is being started up or shut down with the automatic voltage control off, or is being tested, and no notification of the AVR status is made to the Transmission Operator, the Generator Operator will have evidence that it notified the Transmission Operator of its procedure for placing the unit into automatic voltage control mode as required in Requirement R1. Such evidence ~~must~~ may include, but is not limited to, dated evidence of transmittal of the procedure such as an electronic message or a transmittal letter with the procedure included or attached. If a generator is exempted, the Generator Operator shall also have evidence that the generator ~~it~~ is exempted from being in automatic voltage control mode (with its AVR in service and controlling voltage).

Registered Entity Response to Question (Required):

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[5]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this

[3] Start-up is deemed to have ended when the generator is ramped up to its minimum continuously sustainable load and the generator is prepared for continuous operation.
[4] Shutdown is deemed to begin when the generator is ramped down to its minimum continuously sustainable load and the generator is prepared to go offline.
[5] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.
See M1.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to VAR-002-3, R1
This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	For instances where entity did not operate a generator in automatic voltage control mode or in a different control mode, as instructed by the Transmission Operator, ensure notification was given to the Transmission Operator in accordance with Requirement R1.

Note to Auditor: Auditors can identify instances where entities did not operate~~d~~ generators ~~outside of~~in automatic voltage control mode, or in a different control mode, as instructed by the Transmission Operator, through their general knowledge of the interconnected transmission system in the entity's area. Auditor knowledge is obtained through activities such as conversations with the entity under audit or the Transmission Operator, and an awareness of events occurring on the interconnected transmission system. In situations where the entity's compliance with this requirement poses little risk to the BES, conversations with other entities, such as Transmission Operators, is most likely not necessary.

Auditor Notes:

R2 Supporting Evidence and Documentation

R2. Unless exempted by the Transmission Operator, each Generator Operator shall maintain the generator voltage or Reactive Power schedule[6] (within each generating Facility's capabilities[7]) provided by the Transmission Operator, or otherwise shall meet the conditions of notification for deviations from the voltage or Reactive Power schedule provided by the Transmission Operator.

2.1. When a generator's AVR is out of service or the generator does not have an AVR, the Generator Operator shall use an alternative method to control the generator reactive output to meet the voltage or Reactive Power schedule ~~directed~~ provided by the Transmission Operator.

2.2. When ~~directed~~ instructed to modify voltage, the Generator Operator shall comply or provide an explanation of why the schedule cannot be met.

2.3. Generator Operators that do not monitor the voltage at the location specified in their voltage schedule shall have a methodology for converting the scheduled voltage specified by the Transmission Operator to the voltage point being monitored by the Generator Operator.

M2. In order to identify when a ~~unit~~ generator is deviating from its schedule, the Generator Operator will monitor voltage based on existing equipment at its Facility. The Generator Operator shall have evidence to show that the generator maintained the voltage or Reactive Power schedule provided by the Transmission Operator, or shall have evidence of meeting the conditions of notification for deviations from the voltage or Reactive Power schedule provided by the Transmission Operator. Evidence may include, but is not limited to, operator logs, SCADA data, phone logs, and any other notifications that would alert the Transmission Operator or otherwise demonstrate that the Generator Operator complied with the Transmission Operator's instructions for addressing deviations from the voltage or Reactive Power schedule.

For part 2.1, when a generator's AVR is out of service or the generator does not have an AVR, a Generator Operator shall have evidence to show an alternative method was used to control the generator reactive output to meet the voltage or Reactive Power schedule ~~directed~~ provided by the Transmission Operator.

For part 2.2, the Generator Operator shall have evidence that it complied with the Transmission Operator's ~~directions~~ instructions to modify its voltage or provided an explanation to the Transmission Operator of why the Generator Operator was unable to comply with the

[6] The voltage or Reactive Power schedule is a target value with a tolerance band or a voltage or Reactive Power range communicated by the Transmission Operator to the Generator Operator.

[7] Generating Facility capability may be established by test or other means, and may not be sufficient at times to pull the system voltage within the schedule tolerance band. Also, when a ~~Generator~~ generator is operating in manual control, reactive power capability may change based on stability considerations.

~~direction~~instruction. Evidence may include, but is not limited to, operator logs, SCADA data, and phone logs.

For part 2.3, for ~~units~~ Generator Operators that do not monitor the voltage at the location specified on the voltage schedule, the Generator Operator shall document or be able to demonstrate the method of conversion from the voltage level monitored to the voltage level specified on the voltage schedule.

Question: As a Generation Operator, have you operated the generator with the AVR out of service?

Registered Entity Response to Question (Required):

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[8]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.
See M2.
Any written policies, procedures or protocols describing how the entity maintains the generator voltage or Reactive Power schedule provided by Transmission Operator, if the entity has such documents.
Generator voltage or Reactive Power schedule provided to entity by Transmission Operator, or entity's record thereof, for timeframes selected by the auditor.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

[8] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

Compliance Assessment Approach Specific to VAR-002-3, R2

This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	Interview entity staff and/or review documentation provided by the entity to understand how they maintain the generator voltage or Reactive Power schedule or authorized exemption per Requirement R2.
	Read entity's response to compliance Question above and understand how entity complies with Requirement R2, when they operate a generator with AVR in not in service.
	Select a sample of timeframes during the audit period and have entity walkthrough how they complied with Requirement R2 for those timeframes.

Note to Auditor: Based on the risk of the entity's compliance with this requirement on the Bulk Electric System (BES) and the auditor's assessment of the entity's management practices (or internal controls) over compliance with this Requirement, auditors will determine the extent of the above audit procedures to apply. In cases where risk to the BES is low and the entity's management practices, gleaned by the auditor through walkthroughs or documentation review, are sound only limited audit testing is necessary. In cases where risk is higher and controls are less effective, an auditor should sample enough timeframes, per above, to gain reasonable assurance that entity is complying with Requirement R2.

For part 2.3, the entity should be able to provide documentation that identifies the voltage number being monitored and the calculation demonstrating how it equates to the schedule provided by the Transmission Operator. The measure for VAR-002-3 Requirement R2, part 2.3 is clear on what evidence should be able to demonstrate this during an audit. The entity can only be responsible for maintaining the schedule provided by the Transmission Operator based on existing facility equipment. In the event that an entity does not have the equipment to have visibility of high-side system voltage, the entity will not have the ability to adjust VARs to maintain system voltage. An auditor is not to determine that, where the entity does not have the high side monitoring equipment and where the AVR is set appropriately based on existing facility equipment, the entity is non-compliant. However, if the Transmission Operator provides a new directive or schedule, the entity is required to follow the new directive. This directive can include modifying an AVR setting or providing more voltage support, and the entity is expected to comply pursuant to VAR-002-3.

Auditor Notes:

R3 Supporting Evidence and Documentation

R3. Each Generator Operator shall notify its associated Transmission Operator of a status change on the AVR, power system stabilizer, or alternative voltage controlling device within 30 minutes of the change. If the status has been restored within ~~the first 15~~30 minutes of such change, then the Generator Operator is not required to ~~there is no need to~~ notify the Transmission Operator of the status change.

M3. The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of ~~the~~ any status change identified in Requirement R3. If the status has been restored within the first ~~15~~ 30 minutes, no notification is necessary~~; therefore, if a status change lasts more than 15 minutes, the GOP must notify its associated Transmission Operator within 30 minutes of when the change first occurred~~.

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[9]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.
Any written policies, procedures or protocols describing how the entity responds to a status change on AVR, if the entity has such documents. An example of entity's response to a status change on AVR provided by entity, if applicable.
Auditor may select certain instances where entity had a status change on AVR. In such instances, provide associated evidence of awareness and resolution/notification.
Evidence as outlined in M3.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

[9] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

Compliance Assessment Approach Specific to VAR-002-3, R3
This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	Interview entity staff and/or review documentation provided by the entity to understand how they respond to status changes on AVR.
	Review evidence provided to determine if entity responded to status change on AVR in accordance with Requirement R3.

Note to Auditor: Based on the risk of the entity's compliance with this requirement on the Bulk Electric System (BES) and the auditor's assessment of the entity's management practices (or internal controls) over compliance with this Requirement, auditors will determine the extent of the above audit procedures to apply. In cases where risk to the BES is low and the entity's management practices, gleaned by the auditor through walkthroughs or documentation review, are sound only limited audit testing is necessary. In cases where risk is higher and controls are less effective, an auditor should sample enough timeframes, per above, to gain reasonable assurance that entity is complying with Requirement R3.

Auditor Notes:

R4 Supporting Evidence and Documentation

R4. Each Generator Operator shall notify its associated Transmission Operator within 30 minutes after becoming aware of a change in reactive capability due to factors other than a status change described in Requirement R3. If the capability has been restored within the first 15 minutes of such change, then there is no need to notify the Transmission Operator.

M4. The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of the recognition of a reactive capability change identified in Requirement R4. If the capability has been restored within the first 15 minutes, no notification is necessary; therefore, if a capability change lasts more than 15 minutes, the Generator Operator must notify its associated Transmission Operator within 30 minutes of when the change first occurred.

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[10]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.
Any written policies, procedures or protocols describing how the entity responds to a change in reactive capability, if the entity has such documents. An example of entity's response to a change in reactive capability provided by entity, if applicable.
Auditor may select certain instances where entity ~~should~~ may have been aware of a status change in reactive capability. In such instances, provide associated evidence of awareness and resolution/notification. See Note to Auditor for additional details.
Evidence as outlined in M4.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to VAR-002-3, R4
This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	Interview entity staff and/or review documentation provided by the entity to understand how they respond to change in reactive capability.
	Review evidence provided to determine if entity responded to change in reactive capability in accordance with Requirement R4.
Note to Auditor: It is clear that VAR-002-3, Requirement R4 will only be a violation if the change is not reported after 30 minutes of becoming aware of the status change in reactive capability. An auditor will ask an entity for evidence to demonstrate when it became aware of the change. This will not be purely	

[10] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

subjective; there are technical instances (e.g. unit trips, ramping, equipment/AVR failures) where it ~~will be~~is ~~clear~~ likely that an entity ~~would have been~~was made aware of the change in reactive capability. ~~For example, one instance is where a unit is ramping to an expected VAR output, and it cannot reach it; a reactive capability change has occurred.~~

Auditor Notes:

R5 Supporting Evidence and Documentation

R5. The Generator Owner shall provide the following to its associated Transmission Operator and Transmission Planner within 30 calendar days of a request.

5.1. For generator step-up transformers and auxiliary transformers with primary voltages equal to or greater than the generator terminal voltage:

5.1.1. Tap settings.

5.1.2. Available fixed tap ranges.

5.1.3. Impedance data.

M5. The Generator Owner shall have evidence it provided its associated Transmission Operator and Transmission Planner with information on its step-up transformers and auxiliary transformers as required in Requirements R5 part 5.1.1 through part 5.1.3.

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[11]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.
Evidence as outlined in M4. Evidence of transmittal of the data could include, but is not limited to, items such as an electronic message or a transmittal letter with the information included or attached.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted:

[11] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to VAR-002-3, R5
This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	Review evidence (documented date of request and reply) to determine if entity responded to information request(s) as required in Requirement R5 within 30 days of receiving a request from associated Transmission Operator.
Note to Auditor: Based on the auditors professional judgment, he or she may confirm with Transmission Operators to determine if requests for data were made or simply confirm the existence of such requests with the entity under audit.	

Auditor Notes:

R6 Supporting Evidence and Documentation

R6. After consultation with the Transmission Operator regarding necessary step-up transformer tap changes, the Generator Owner shall ensure that transformer tap positions are changed according to the specifications provided by the Transmission Operator, unless such action would violate safety, an equipment rating, a regulatory requirement, or a statutory requirement.

6.1. If the Generator Operator cannot comply with the Transmission Operator's specifications, the Generator Operator shall notify the Transmission Operator and shall provide the technical justification.

M6. The Generator Owner shall have evidence that its step-up transformer taps were modified per the Transmission Operator's documentation as identified in Requirement R6. The Generator Operator shall have evidence that it notified its associated Transmission Operator when it could not comply with the Transmission Operator's step-up transformer tap specifications as identified in Requirement R6 part 6.1.

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[12]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.
See M6.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to VAR-002-3, R6
This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	Review evidence (documented date of request and response) to determine if entity responded to change(s) as required in Requirement R6.
Note to Auditor: Based on the auditors professional judgment, he or she may confirm with Transmission Operators to determine if requests for changes to transformer tap positions were made or simply confirm the existence of such requests with the entity under audit.	

[12] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

Violation Risk Factor and Violation Severity Level Justifications

VAR-002-3 – Generator Operation for Maintaining Network Voltage Schedules

This document provides the Standard Drafting Team's (SDT) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in VAR-002-3 – Generator Operation for Maintaining Network Voltage Schedules. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project. A copy of the standard with the associated VRFs and VSLs is available here.

NERC Criteria - Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Violation Risk Factor Guidelines

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities

• Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) – Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) –Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria - Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

FERC's VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline 1 – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline 2 – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.

Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3 – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4 – Violation Severity Level Assignment Should Be Based on a Single Violation, Not on a Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the

Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF Justification – VAR-002-3 Requirement R1	
Proposed VRF	**Medium**
NERC VRF Discussion	A VRF of Medium is necessary because this requirement could affect the stability of the BES, but the requirement itself addresses instances where a GOP will not necessarily operate in with the AVR in different control modes or when the TOP will instruct a GOP to operate in other modes.
FERC VRF G1 Discussion	Guideline 1 – Consistency with Blackout Report: Although the Blackout Report list Reactive Power and voltage control are part of the list of critical areas where a violation could severely affect the reliability of the Bulk-Power System, the GOP control modes are not as critical because the TOP is monitoring the system. The companion requirement to VAR-002-3 (in VAR-001-4) are properly designated with a HIGH VRF to ensure voltage schedules are provided as part of the TOPs plan to operate within System Operating Limits and Interconnection Reliability Operating Limits.
FERC VRF G2 Discussion	Guideline 2 – Consistency within a Reliability Standard: The VRF applies to the entire requirement.
FERC VRF G3 Discussion	Guideline 3 – Consistency among Reliability Standards: Because maintaining a voltage schedule is critical to preventing a violation of a System Operating Limit, this VRF was drafted to be the same VRFs for VAR-001-4 Requirement R5. VAR-001-4 Requirement R5 requires the TOP to specify a schedule and notification requirements that the GOP must follow.
FERC VRF G4 Discussion	Guideline 4 – Consistency with NERC Definitions of VRFs: This VRF is consistent with the NERC Definition because a GOP not operating in the proper control mode can affect the BES, but a single violation is unlikely to lead to instability, separation, or cascading failure. This is especially the case since a TOP will also be monitoring for voltage deviations.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More Than One Obligation:

	This VRF does not co-mingle multiple objectives, nor does it water down the Requirement to reflect a lower risk level.

VSL Justification – VAR-002-3 Requirement R1	
NERC VSL Guidelines	Consistent with NERC's VSL Guideline, this VSL acknowledges the criticality of this requirement and whether or not a system voltage schedule was created.
FERC VSL G1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The current level of compliance is not lowered with the proposed VSL because this requirement only has a "severe" VSL.
FERC VSL G2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The single VSL assignment category for "Binary" Requirements is not consistent Guideline 2b: VSL Assignments that contain ambiguous language	The proposed VSL is written to ensure uniformity and consistency in the determination of penalties. Guideline 2a: The proposed VSL is binary, and therefore, a single severe VSL is necessary. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.

FERC VSL G3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is consistent with the corresponding requirements.
FERC VSL G4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on a cumulative number of violations.

VRF Justification – VAR-002-3 Requirement R2	
Proposed VRF	**Medium**
NERC VRF Discussion	A VRF of Medium is consistent with the NERC VRF definition. Requirement R2 focuses on GOPs maintaining a schedule, but there could be system events that will pull a GOP out of schedule. Also, late at night and early in the morning, the system may experience instances of low or high voltage. This could impact the BES, but a single instance is unlikely to lead to instability, separation, or cascading failure. The sub-requirements also require the GOP to modify the voltage schedule when directed by the TOP.
FERC VRF G1 Discussion	Guideline 1 – Consistency with Blackout Report: Although the Blackout Report lists Reactive Power and voltage control as critical areas where a violation could severely affect the reliability of the Bulk-Power System, there are general times when a GOP will be unable to maintain a voltage schedule due to system condition. These instances occur frequently during the early morning and late at night. The companion requirement to VAR-002-3 (in VAR-001-4) are properly designated

	with a HIGH VRF to ensure voltage schedules are provided as part of the TOP's plan to operate within System Operating Limits and Interconnection Reliability Operating Limits.
FERC VRF G2 Discussion	Guideline 2 – Consistency within a Reliability Standard: The VRF applies to the entire requirement, including all sub-parts.
FERC VRF G3 Discussion	Guideline 3 – Consistency among Reliability Standards: Because maintaining a voltage schedule is critical to preventing a violation of a System Operating Limit, this VRF was drafted to be the same VRFs for VAR-001-4 Requirement R5. VAR-001-4 Requirement R5 requires the TOP to specify a schedule and notification requirements that the GOP must follow.
FERC VRF G4 Discussion	Guideline 4 – Consistency with NERC Definitions of VRFs: This VRF is consistent with the NERC Definition because a GOP not maintaining a schedule can affect the BES, but a single violation is unlikely to lead to instability, separation, or cascading failures. This is especially the case since a TOP will also be monitoring for voltage deviations
FERC VRF G5 Discussion	Guideline 5 - Treatment of Requirements that Co-mingle More Than One Obligation: This VRF does not co-mingle multiple objectives, nor does it water down the requirement to reflect a lower risk level.

VSL Justification – VAR-002-3 Requirement R2	
NERC VSL Guidelines	Consistent with NERC's VSL Guidelines, the VSL describes degrees of noncompliant performance in an incremental manner.
FERC VSL G1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering	There is no prior compliance obligation related to the subject of this standard.

the Current Level of Compliance	
FERC VSL G2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The single VSL assignment category for "Binary" Requirements is not consistent Guideline 2b: VSL Assignments that contain ambiguous language	The proposed VSL is written to ensure uniformity and consistency in the determination of penalties. Guideline 2a: The proposed VSL is not binary. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.
FERC VSL G4: Violation Severity Level Assignment Should Be Based on A Single Violation,	The proposed VSL is not based on cumulative number of violations.

Not on A Cumulative Number of Violations	

VRF Justification – VAR-002-3 Requirement R3	
Proposed VRF	**Medium**
NERC VRF Discussion	This requirement warrants a Medium VRF and is consistent with the NERC definition because this requirement is whether the GOP made the required notifications to the TOP within the appropriate timeframes.
FERC VRF G1 Discussion	Guideline 1 – Consistency with Blackout Report: Although the Blackout Report list Reactive Power and voltage control are part of the list of critical areas where a violation could severely affect the reliability of the Bulk-Power System, the GOP notifications are unlikely to lead to system instability, separation, or cascading failures. This is particularly the case because the TOP is still operating the system to stay within System Operating Limits and Interconnection Reliability Operating Limits.
FERC VRF G2 Discussion	Guideline 2 – Consistency within a Reliability Standard: There is no sub-part to Requirement 3; therefore, the requirement is consistent.
FERC VRF G3 Discussion	Guideline 3 – Consistency among Reliability Standards: This VRF is drafted to be consistent with other standards (e.g., BAL) that address making appropriate notifications.
FERC VRF G4 Discussion	Guideline 4 – Consistency with NERC Definitions of VRFs: This VRF is consistent with the NERC Definition because not making the appropriate notifications can impact the grid, but the TOPs are still effectively monitoring the system; thus, instability, separation, or cascading failures are unlikely due to a single violation.
FERC VRF G5 Discussion	Guideline 5 - Treatment of Requirements that Co-mingle More Than One Obligation This VRF does not co-mingle multiple objectives, nor does it water down the Requirement to reflect a lower risk level

VSL Justification – VAR-002-3 Requirement R3	
NERC VSL Guidelines	Consistent with NERC's VSL Guidelines. The VSL describes degrees of noncompliant performance in an incremental manner.
FERC VSL G1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The current level of compliance is not lowered with the proposed VSL.
FERC VSL G2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The single VSL assignment category for "Binary" Requirements is not consistent Guideline 2b: VSL Assignments that contain ambiguous language	The proposed VSL is written to ensure uniformity and consistency in the determination of penalties. Guideline 2a: The proposed VSL is binary because the standard is violated only when a notification is not made to the TOP; therefore, a severe VSL is warranted. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3: Violation Severity Level Assignment Should Be	The proposed VSL is worded consistently with the corresponding requirement.

Consistent with the Corresponding Requirement	
FERC VSL G4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on cumulative number of violations.

VRF Justification – VAR-002-3 Requirement R4	
Proposed VRF	**Medium**
NERC VRF Discussion	This requirement warrants a Medium VRF and is consistent with the NERC definition because this requirement is whether the GOP made the required notifications to the TOP within the appropriate timeframes.
FERC VRF G1 Discussion	Guideline 1 – Consistency with Blackout Report: Although the Blackout Report list Reactive Power and voltage control are part of the list of critical areas where a violation could severely affect the reliability of the Bulk-Power System, the GOP notifications are unlikely to lead to system instability, separation, or cascading failures. This is particularly the case because the TOP is still operating the system to stay within System Operating Limits and Interconnection Reliability Operating Limits.
FERC VRF G2 Discussion	Guideline 2 – Consistency within a Reliability Standard: There is no sub-part to Requirement 3; therefore, the requirement is consistent.
FERC VRF G3 Discussion	Guideline 3 – Consistency among Reliability Standards: This VRF is drafted to be consistent with other standards (e.g., BAL) that address making appropriate notifications.

FERC VRF G4 Discussion	Guideline 4 – Consistency with NERC Definitions of VRFs: This VRF is consistent with the NERC Definition because not making the appropriate notifications can impact the grid, but the TOPs are still effectively monitoring the system; thus, instability, separation, or cascading failures are unlikely due to a single violation.
FERC VRF G5 Discussion	Guideline 5 - Treatment of Requirements that Co-mingle More Than One Obligation This VRF does not co-mingle multiple objectives, nor does it water down the Requirement to reflect a lower risk level

VSL Justification – VAR-002-3 Requirement R4	
NERC VSL Guidelines	Consistent with NERC's VSL Guidelines. The VSL describes degrees of noncompliant performance in an incremental manner.
FERC VSL G1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The current level of compliance is not lowered with the proposed VSL.
FERC VSL G2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The single VSL assignment category for	The proposed VSL is written to ensure uniformity and consistency in the determination of penalties. Guideline 2a: The proposed VSL is binary because the standard is violated only when a notification is not made to the TOP; therefore, a severe VSL is warranted.

"Binary" Requirements is not consistent Guideline 2b: VSL Assignments that contain ambiguous language	Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.
FERC VSL G4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on cumulative number of violations.

VRF Justification – VAR-002-3 Requirement R5	
Proposed VRF	**Lower**
NERC VRF Discussion	This requirement is a Lower VRF because the tap setting data does not change frequently, and a violation is not expected adversely affect the BES.
FERC VRF G1 Discussion	Guideline 1 – Consistency with Blackout Report: Although Reactive Power and voltage control are part of the list of critical areas where a violation could severely affect the reliability of the Bulk-Power System, this requirement would not adversely impact the BES

	if violated. The tap information is provided during interconnection, and it is not expected to change frequently. Therefore, a Lower VRF is warranted.
FERC VRF G2 Discussion	Guideline 2 – Consistency within a Reliability Standard: The parts within Requirement R5 are consistent with Requirement R5 and is considered a Lower VRF.
FERC VRF G3 Discussion	Guideline 3 – Consistency among Reliability Standards: There are no other standards that address Tap settings.
FERC VRF G4 Discussion	Guideline 4 – Consistency with NERC Definitions of VRFs: This VRF is consistent with the NERC Definition because a violation is similar to an administrative violation. Further, since tap settings are infrequently changed, a violation would not adversely impact the BES.
FERC VRF G5 Discussion	Guideline 5 - Treatment of Requirements that Co-mingle More Than One Obligation: This VRF does not co-mingle multiple objectives, nor does it water down the Requirement to reflect a lower risk level.

VSL Justification – VAR-002-3 Requirement R5	
NERC VSL Guidelines	Consistent with NERC's VSL Guidelines. The VSL describes degrees of noncompliant performance in an incremental manner.
FERC VSL G1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering	There is no prior compliance obligation related to the subject of this standard.

the Current Level of Compliance	
FERC VSL G2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The single VSL assignment category for "Binary" Requirements is not consistent Guideline 2b: VSL Assignments that contain ambiguous language	The proposed VSL is written to ensure uniformity and consistency in the determination of penalties. Guideline 2a: The proposed VSL is not binary. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.
FERC VSL G4: Violation Severity Level Assignment Should Be Based on A Single Violation,	The proposed VSL is not based on cumulative number of violations.

Not on A Cumulative Number of Violations	

VRF Justification – VAR-002-3 Requirement R6	
Proposed VRF	**Lower**
NERC VRF Discussion	This requirement is a Lower VRF because the tap setting data does not change frequently, and a violation is not expected adversely affect the BES.
FERC VRF G1 Discussion	Guideline 1 – Consistency with Blackout Report: Although Reactive Power and voltage control are part of the list of critical areas where a violation could severely affect the reliability of the Bulk-Power System, this requirement would not adversely impact the BES if violated. The tap information is provided during interconnection, and it is not expected to change frequently. If a violation were to occur, the system would still operate at the level prior to making any tap setting changes. Therefore, a Lower VRF is warranted.
FERC VRF G2 Discussion	Guideline 2 – Consistency within a Reliability Standard: The part within Requirement R6 is consistent with Requirement R6 and is considered a Lower VRF.
FERC VRF G3 Discussion	Guideline 3 – Consistency among Reliability Standards: There are no other standards that address Tap settings.
FERC VRF G4 Discussion	Guideline 4 – Consistency with NERC Definitions of VRFs: This VRF is consistent with the NERC Definition because a violation is similar to an administrative violation. Further, since tap settings are infrequently changed, a violation would not adversely impact the BES.
FERC VRF G5 Discussion	Guideline 5 - Treatment of Requirements that Co-mingle More Than One Obligation:

	This VRF does not co-mingle multiple objectives, nor does it water down the Requirement to reflect a lower risk level.

VSL Justification – VAR-002-3 Requirement R6	
NERC VSL Guidelines	Consistent with NERC's VSL Guidelines. The VSL describes degrees of noncompliant performance in an incremental manner.
FERC VSL G1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	There is no prior compliance obligation related to the subject of this standard.
FERC VSL G2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The single VSL assignment category for "Binary" Requirements is not consistent Guideline 2b: VSL Assignments that contain ambiguous language	The proposed VSL is written to ensure uniformity and consistency in the determination of penalties. Guideline 2a: The proposed VSL is binary because the requirement focuses on whether tap changes were made. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.

FERC VSL G3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.
FERC VSL G4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on cumulative number of violations.

Standards Announcement

Project 2013-04 Voltage and Reactive Control
VAR-002-3

Comment Period Open Now Open through April 14, 2014

Upcoming:
Additional Ballot and Non-Binding Poll: April 4-14, 2014

Now Available

A comment period for **Project 2013-04 – Voltage and Reactive Control (VAR-002-3 - Generator Operation for Maintaining Network Voltage Schedules)** is open through **8 p.m. Eastern on Monday, April 14, 2014.**.

Background information for this project can be found on the project page.

Instructions

Please use the electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Wendy Muller. An off-line, unofficial copy of the comment form is posted on the project page.

Next Steps

An additional ballot of **VAR-002-3** and non-binding poll of the associated Violation Risk Factors and Violation Severity Levels will be conducted **April 4, 2014 through 8 p.m. Eastern on Monday, April 14, 2014**.

For more information on the Standards Development Process, please refer to the Standard Processes Manual.

For more information or assistance, please contact Wendy Muller, Standards Development Administrator, or at 404-446-2560.

Additional Ballot and Non-Binding Poll Results

Now Available

An additional ballot for **VAR-002-3 – Generator Operation for Maintaining Network Voltage Schedules** and non-binding poll of the associated Violation Risk Factors and Violation Severity Levels concluded at **8 p.m. Eastern on Wednesday, April 16, 2014.**

This standard achieved a quorum and sufficient affirmative votes for approval. Voting statistics are listed below, and the Ballot Results page provides a link to the detailed results for the ballot.

Approval	Non-Binding Poll Results
Quorum: 78.03%	Quorum: 76.52%
Approval: 82.40%	Supportive Opinions: 79.09%

Background information for this project can be found on the project page.

Next Steps

The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standard. If the standard does not show the need for significant revisions, it will proceed to a final ballot

For information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Wendy Muller (via email), Standards Development Administrator, or at 404-446-2560.

Consideration of Comments

Project 2013-04 Voltage & Reactive Control

The Voltage & Reactive Control Drafting Team thanks all commenters who submitted comments on the draft VAR-002-3. These standards were posted for a 45-day public comment period from February 27, 2014 through April 14, 2014. Stakeholders were asked to provide feedback on the standards and associated documents through a special electronic comment form. There were 25 sets of comments, including comments from approximately 112 different people from approximately 68 companies representing 8 of the 10 Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at mark.lauby@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/comm/SC/Documents/Appendix_3A_StandardsProcessesManual.pdf

Index to Questions, Comments, and Responses

1. Please provide your comments on the proposed VAR-002-3 below: 10

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 — Regional Reliability Organizations, Regional Entities

1. Please provide your comments on the proposed VAR-002-3 below:

Organization	Question 1 Comment
Northeast Power Coordinating Council	Section M1. Add the word "in" to the following sentence: "The Generator Operator shall have evidence to show that it notified its associated Transmission Operator any time it failed to operate a generator in the automatic voltage control mode or in a difference control mode ...."Footnote 3: suggest rewording the sentence to "The generator voltage or Reactive Power schedule is a target value with a tolerance band or a voltage or a Reactive Power range communicated by the Transmission Operator to the Generator Operator."Footnote 4: suggest rewording the sentence to "A generating Facility's capability may be established by tests or other means, and may not be sufficient at times to return the system voltage within the schedule tolerance band...."Section M2, part 2.3: suggest rewording the sentence to "Generator Operators that do not monitor the voltage at the location specified on the voltage schedule shall document or be able to demonstrate the methodology for converting the scheduled voltage specified by the Transmission Operator to the voltage point being monitored by the Generator Operator."R3: While we agree with the 30 minute window to allow a GOP time to resolve an issue before having to notify the TOP of a status or capability change, the second part of the sentence seems to negate the first. The GOP has to notify the TOP of a status change within 30 minutes but if the status has been restored within 30 minutes then the GOP is not required to notify the TOP of the status change.Rationale for R4: typo in the version number of the standard VAR-002-2b.Section R4: remove the word "then" and "to" in the sentence. Suggest rewording the sentence to "Each Generator Operator shall notify its associated Transmission Operator within 30 minutes of becoming aware of a change in reactive capability due to factors other than a status change described in Requirement R3. If the capability has been restored within the first 30 minutes of such change, the Generator Operator is not required to notify the Transmission Operator of the change in reactive capability".R1 Severe VSL: for consistency with the wording of the requirement, suggest rewording to "Unless exempted, the Generator Operator did not operate each generator connected to the interconnected transmission system in the automatic voltage

Organization	Question 1 Comment
	control mode ...."R2 Severe VSL: for consistency with the wording of the requirement, suggest adding the word "the" to the sentence: "The Generator Operator did not maintain the voltage or Reactive Power schedule ...." And "The Generator Operator did not modify the voltage when directed ....".R5 High VSL and Severe VSL: the requirement on page 9 applies to the Generator Owner yet the responsible entity for the VSL is the Generator Operator. The word " Generator Operator" needs to be changed to "Generator Owner".
Response: Thank you for your comments. Several of the clarifying changes were made to the wording in the standard based on your feedback. VSLs for R5 and rationales were also corrected. However, the intent behind R3 was to allow GOPs 30 minutes to address or correct an issue before having to notify the TOP of the status change. Currently, if the AVR goes in and out of service multiple times within a short timeframe, the GOP is obligated to make multiple notifications to the TOP, even if the AVR is corrected in less than a few minutes. The drafting team concluded the other suggested changes did not provide additional clarify.	
US Bureau of Reclamation	The US Bureau of Reclamation (Reclamation) reiterates that the VSLs for VARâ€002â€3 R3 and R4 should reflect a range of noncompliance like in VARâ€002â€2. A failure to notify the Transmission Operator of an AVR, power system stabilizer, or reactive capability change for 35 minutes should not be treated as severely as a failure to notify the Transmission Operator of a status change for 75 minutes or longer. Reclamation recommends that R4 be updated to specify a threshold of reactive capability change that requires notification (e.g., 20 MVAR). As written, R4 would require GOPs to notify TOPs of a change in reactive capability of as little as 1 MVAR. Reclamation also requests clarification on types of “changes in reactive capability” that could trigger the notification requirement in R4.Reclamation suggests that the time horizon for R6 should be changed from “Realâ€Time Operations” to “Operations Planning” to match VARâ€001â€4 R6 and reflect that tap setting changes are agreed upon in advance rather than in realâ€time. If the drafting team intends only to refer to tap settings that can be adjusted in real-time (e.g., On Load Tap Changers), the requirement should be more specific.Reclamation appreciates the drafting team’s efforts and recognizes that the proposed revisions include a number of improvements to VAR-001 and VAR-002. However, Reclamation disagrees with the drafting team’s approach to responding to all

Organization	Question 1 Comment
	November 2013 comments on VAR-002 with the statement, "Thank you for your comments. VAR-002 did not pass the last ballot, and the VAR SDT will consider this during the next successive ballot." By responding in this way to all VAR-002 comments, the drafting team provided no responses to the technical issues raised by commenters.
Response: Thank you for your response. The drafting team determined that the best way to ensure reliability was to allow the TOP to provide guidance on when to make notifications based on system needs. This is reflected in VAR-001-4 where the TOP may exempt GOPs from making certain notifications. Further, the drafting team determined that it was not possible to set a reactive capability change threshold that could apply continent-wide. Such a threshold will have to vary based on the entity's size and location of the entity. The drafting team did not change the time horizon for R6 because the currently enforceable standard that previously passed industry comment and ballot used "Real-time operations."	
Arizona Public Service Company	R3 & R4: Please provide the technical justification for the 30 minute time limit. Also, please provide an example of a specific action taken by the Transmission Operator in response to a notification of status change of AVR or PSS. In order to allow the GO time to fix minor problems before reporting, a minimum of 60 minutes should be allowed. This will eliminate unnecessary reporting and limit the impact of reporting on the Transmission Operator. We recommend that all time periods in these requirements be changed to 60 minutes.R5.1: copied below for discussion:For generator step-up transformers and auxiliary transformers with primary voltages equal to or greater than the generator terminal voltage: The above language implies that if my GSU primary voltage is rated less than the generator primary voltage, this requirement will not apply. Hopefully, that is not the intent. There are examples of GSU transformers that have the primary voltage intentionally specified to be 5% less than the generator rated voltage to provide a voltage boost. R6: This requirement implies that an action is required whether there is a need for tap change or not. It should be clarified that it applies only when either a GO or a TO is planning a tap change.

Organization	Question 1 Comment
Response: Thank you for your comments. The 30 minutes was selected for two reasons: 1) an IROL T_v must be corrected within 30 minutes in accordance with the NERC Glossary, and 2) the industry consensus was that 30 minutes was appropriate for R3 and R4.	
DTE Electric	Positive improvements!Two minor grammar changes:Second sentence of R3 and R4 - remove "to" before "the Generator Operator"If the capability has been restored within 30 minutes of such change, then to the Generator Operator...
Response: Thank you for your comments. The word "to" was removed from the requirements R3 and R4.	
Dominion	Dominion has the following comments. o While we do not strongly oppose inclusion of the last sentence in requirements 3 and 4, we do not believe they are necessary. We are slightly concerned that such inclusion in this standard could infer that notification is required under similar circumstances in other standards o If the SDT choses to keep the last sentence in R3 and R4, Dominion suggests removing the first 'to' to read "....then the Generator Operator is not required to....".
Response: Thank you for your comments. The last sentences in R3 and R4 are necessary to avoid the situations where multiple entities are notifying TOPs of an issue being addressed/corrected thereby diverting the TOP from their primary objective of system reliability. The drafting team also removed the word "to" from both requirements R3 and R4.	
Texas Reliability Entity, Inc.	We would suggest rewording R2.2 to say "When instructed to modify voltage, the Generator Operator shall comply unless such action would violate safety, an equipment rating, a regulatory requirement, or a statutory requirement. If the Generator Operator cannot comply with the Transmission Operator's instructions, the Generator Operator shall provide an explanation why the instruction cannot be met."In R4, does the "reactive capability" include static capacitive or reactive devices that are behind the fence (for example, static capacitors and reactors installed on the low voltage feeders at wind plants). Would this requirement apply to such devices if they are not included in the Bulk Electric System per the new BES definition?The status and capability notifications in R3 and R4 may be directly or indirectly in conflict with IRO-005-3.1a, R1.1, TOP-005-2a,

Organization	Question 1 Comment
	Attachment 1, Item 1.2.4, and TOP-006-2, R2. These requirements require monitoring the status of generation and/or AVR status by the RC and BA, as well as the TOP. Will the TOP and RC be able to satisfy their obligations under these other standards in view of the proposed GOP reporting parameters?
Response: Thank you for your comments. The drafting team did not adopt the suggested changes in Part 2.2 because it is outside the scope of what was being addressed in this project. With regard to R4, the TOP may provide the GOP with an exemption for certain notifications under VAR-001-4, and the BES definition will apply with regard to the applicability of this standard.	
Southern Company: Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Power Company; Southern Company generation; Southern Company Generationa and Energy Marketing	Southern Company has the following general comments that are meant to provide non-substantial changes to parts of the standard:1. In the second sentence of the "Rational for R3" box, add "of this type of status change" between "notifications" and "provide". This provides emphasis that the scenario described in the first sentence is one type of status change that may occur. 2. In the third sentence of the "Rational for R3" box, delete "or capability". R3 deals with status changes and R4 deals with capability changes.3. In R4, delete the unneeded word "to" in the second sentence that appears between "then" and "the": ",,, change, then to the Generator Operator is not required ...."4. It is noted that TOP-003-2, R5 and MOD-032-1, R2 (both currently filed with FERC for approval) contain requirements for the GO to provide data to the TOP and the TP similar to that found in VAR-002-3 R5. Duplication of identical requirements for the GO may occur if all three standards are ratified.
Response: Thank you for your comments. The drafting team adopted most of the changes based on your feedback. However, the drafting team retained R5 because the TOP standards are currently being revised. Additionally, MOD-032-1, which is currently pending before FERC, addresses a different time horizon.	
SPP Standards Review Group	Standard:In Requirement R3 second sentence, we would suggest the removal of 'to' from the phrase ' then to the Generator' and have it to read as followed: 'then the Generator Operator'. In Requirement R 4 we would like to suggest the second sentence to be revised and to read as followed; "If the capability has been restored within 30 minutes of

Organization	Question 1 Comment
	becoming aware of such change, then the Generator Operator is not required to notify the Transmission Operator of the change in reactive capability. In Requirement R4 second sentence, we would suggest the removal of 'to' from the phrase ' then to the Generator' and have it to read as followed: 'then the Generator Operator'. In the last line of the 2nd bullet of R1, insert space between 'Operator' and 'for'.Capitalize Part whenever it is referencing a Requirement. For example, in the Rationale Box for R2, the last sentence in the 1st paragraph would read 'Additionally, a new Part 2.3 has been...' Do this throughout the standard.In the Rationale Box for R4, correct the reference to VAR-002-2b.In the Rationale Box for R5, the 3rd sentence should read 'The prior version of VAR-002-2b, Part 4.1.4 (the +/- voltage range...'In the High VSL for R2, insert an 'a' between 'have' and 'conversion'.Replace 'cannot' with 'could not' in the Severe VSL for R6.RSAWIn the RSAW R5 (page 11) under Evidence Requested11, we would like to suggest changing 'M4' to 'M5'....then it would read 'Evidence as outlined in M5'.Similar to the standard, Part should be capitalized when referenced in conjunction with a requirement.In the 3rd row of the table under the Compliance Assessment Approach Specific to VAR-002-3, R2 heading, delete the 'in' in the last line in the cell. In the 5th line in the 1st paragraph in the Note to Auditor section, insert a comma between 'sound' and 'only' such that it reads '...documentation review, are sound, only limited audit...'. In the last line of the same paragraph, insert a 'the' between 'that' and 'entity'.In the 3rd row of the table under the Compliance Assessment Approach Specific to VAR-002-3, R3 heading, insert a 'the' between 'if' and 'entity'. In the 5th line in the 1st paragraph in the Note to Auditor section, insert a comma between 'sound' and 'only' such that it reads '...documentation review, are sound, only limited audit...'. In the last line of the same paragraph, insert a 'the' between 'that' and 'entity'.In the Evidence Requested table for R4, insert a 'the' in front of 'entity' or 'entity's' in the 2nd and 3rd line of the 2nd row and the 1st line of the 3rd row. In the 1st line of the 3rd row of the table under the Compliance Assessment Approach Specific to VAR-002-3, R4 heading, insert a 'the' between 'if' and 'entity'.In the Evidence Requested table for R5, change the reference to M5 in the 2nd row to M4.In the 1st line of the 2nd row of the table under the Compliance Assessment Approach Specific to VAR-002-3, R5 heading, insert a 'the' between 'if' and 'entity'.In the 1st line of the 2nd

Organization	Question 1 Comment
	row of the table under the Compliance Assessment Approach Specific to VAR-002-3, R6 heading, insert a 'the' between 'if' and 'entity'.
Response: Thank you for your comments. The drafting team was able make most of the recommended changes to the standard. The drafting team will forward your recommendations for the RSAW to NERC Compliance staff for their consideration.	
SERC OC Review Group	Requirement R1:The OC Review Group believes that R1 would be strengthened with further report timing clarification is required in the case where the AVR changes state unexpectedly. The OC Review Group respectfully recommends adding a bullet to R1 which reads "In cases where the AVR changes state unexpectedly the Generator Operator will notify the Transmission Operator within 30 minutes."Current R1: The Generator Operator shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) in service and controlling voltage) or in a different control mode, as instructed by the Transmission Operator unless: 1) the generator is exempted by the Transmission Operator, or 2) the Generator Operator has notified the Transmission Operator of one of the following: [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations] o That the generator is being operated in start-up,1 shutdown,2 or testing mode pursuant to a Real-time communication or a procedure that was previously provided to the Transmission Operator; or o That the generator is not being operated in the control mode that was instructed by the Transmission Operator for a reason other than start-up, shutdown, or testing. Proposed R1: The Generator Operator shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) in service and controlling voltage) or in a different control mode, as instructed by the Transmission Operator unless: 1) the generator is exempted by the Transmission Operator, or 2) the Generator Operator has notified the Transmission Operator of one of the following: [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations] o That the generator is being operated in start-up,1 shutdown,2 or testing mode pursuant to a Real-time communication or a procedure that was previously provided to the Transmission Operator; or o That the generator is not

Organization	Question 1 Comment
	being operated in the control mode that was instructed by the Transmission Operator for a reason other than start-up, shutdown, or testing. o In cases where the AVR changes state unexpectedly the Generator Operator will notify the Transmission Operator within 30 minutes only if reactive capability is not restored.Measure 1:The OC Review Group recommends that Measure 1 be modified to specifically include that SCADA alarming may be used for real-time notification.Current Measure 1: The Generator Operator shall have evidence to show that it notified its associated Transmission Operator any time it failed to operate a generator in the automatic voltage control mode or a different control mode as specified in Requirement R1. If a generator is being started up or shut down with the automatic voltage control off, or is being tested, and no notification of the AVR status is made to the Transmission Operator, the Generator Operator will have evidence that it notified the Transmission Operator of its procedure for placing the unit into automatic voltage control mode as required in Requirement R1. Such evidence may include, but is not limited to, dated evidence of transmittal of the procedure such as an electronic message or a transmittal letter with the procedure included or attached. If a generator is exempted, the Generator Operator shall also have evidence that the generator is exempted from being in automatic voltage control mode (with its AVR in service and controlling voltage). Proposed Measure 1: The Generator Operator shall have evidence to show that it notified its associated Transmission Operator any time it failed to operate a generator in the automatic voltage control mode or a different control mode as specified in Requirement R1. If a generator is being started up or shut down with the automatic voltage control off, or is being tested, and no notification of the AVR status is made to the Transmission Operator, the Generator Operator will have evidence that it notified the Transmission Operator of its procedure for placing the unit into automatic voltage control mode as required in Requirement R1. Such evidence may include, but is not limited to, dated evidence of transmittal of the procedure such as an electronic message or a transmittal letter with the procedure included or attached. SCADA alarming may be used for real-time notification. If a generator is exempted, the Generator Operator shall also have evidence that the generator is exempted from being in automatic voltage control mode (with its AVR in service and controlling voltage). Requirement 2:The OC Review

Organization	Question 1 Comment
	Group believes and recommends that the phrase “or other control capabilities” to provide further clarification to the Requirement.Current R2. Unless exempted by the Transmission Operator, each Generator Operator shall maintain the generator voltage or Reactive Power schedulecapabilities4) provided by the Transmission Operator, or otherwise shall meet the conditions of notification for deviations from the voltage or Reactive Power schedule provided by the Transmission Operator. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations] Proposed R2. Unless exempted by the Transmission Operator, each Generator Operator shall maintain the generator voltage, Reactive Power schedule, or other control capabilities provided by the Transmission Operator, or otherwise shall meet the conditions of notification for deviations from the voltage or Reactive Power schedule provided by the Transmission Operator. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations] Measure 2:The OC Review Group believes and recommends that the phrase “or other control capabilities” to provide further clarification to the Measure.Current M2, paragraph 1: M2. In order to identify when a generator is deviating from its schedule, the Generator Operator will monitor voltage based on existing equipment at its Facility. The Generator Operator shall have evidence to show that the generator maintained the voltage or Reactive Power schedule provided by the Transmission Operator, or shall have evidence of meeting the conditions of notification for deviations from the voltage or Reactive Power schedule provided by the Transmission Operator. Evidence may include, but is not limited to, operator logs, SCADA data, phone logs, and any other notifications that would alert the Transmission Operator or otherwise demonstrate that the Generator Operator complied with the Transmission Operator’s instructions for addressing deviations from the voltage or Reactive Power schedule. Proposed M2, paragraph 1: M2. In order to identify when a generator is deviating from its schedule, the Generator Operator will monitor voltage based on existing equipment at its Facility. The Generator Operator shall have evidence to show that the generator maintained the voltage, Reactive Power schedule or other control capabilities, provided by the Transmission Operator, or shall have evidence of meeting the conditions of notification for deviations from the voltage or Reactive Power schedule provided by the Transmission Operator. Evidence may include, but is not limited to, operator logs, SCADA

Organization	Question 1 Comment
	data, phone logs, and any other notifications that would alert the Transmission Operator or otherwise demonstrate that the Generator Operator complied with the Transmission Operator's instructions for addressing deviations from the voltage or Reactive Power schedule.Requirement 3:The OC Review Group believes that R3 would be strengthened with further report timing The OC Review Group respectfully recommends adding a bullet to R3 which reads "The Generator Operator is not required to notify the Transmission Operator of the status change if the change is expected as part of a startup, shutdown, or testing procedure previously provided to the Transmission Operator per Requirement 1."Current R3. Each Generator Operator shall notify its associated Transmission Operator of a status change on the AVR, power system stabilizer, or alternative voltage controlling device within 30 minutes of the change. If the status has been restored within 30 minutes of such change, then to the Generator Operator is not required to notify the Transmission Operator of the status change [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]Proposed R3: Each Generator Operator shall notify its associated Transmission Operator of a status change on the AVR, power system stabilizer, or alternative voltage controlling device within 30 minutes of the change. If the status has been restored within 30 minutes of such change, then to the Generator Operator is not required to notify the Transmission Operator of the status change [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations] o The Generator Operator is not required to notify the Transmission Operator of the status change if the change is expected as part of a startup, shutdown, or testing procedure previously provided to the Transmission Operator per Requirement 1.Measure 3:The OC Review Group recommends that Measure 3 be modified to specifically include that SCADA alarming may be used for real-time notification.Current Measure 3: The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of any status change identified in Requirement R3. If the status has been restored within the first 30 minutes, no notification is necessary. Proposed Measure 3: The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of any status change identified in Requirement R3. SCADA alarming may be used for real-time notification. If the status has been restored within the first 30 minutes, no notification is

Organization	Question 1 Comment
	necessary. Requirement 4:Current R4. Each Generator Operator shall notify its associated Transmission Operator within 30 minutes of becoming aware of a change in reactive capability due to factors other than a status change described in Requirement R3. If the capability has been restored within 30 minutes of such change, then to the Generator Operator is not required to notify the Transmission Operator of the change in reactive capability. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations] The SERC OC Review Group respectfully requests further clarification for the phrase "becoming aware of a change in reactive capability". Without clarifying the size "of a change in reactive capability" it is possible that the TOP will receive numerous calls reporting extremely small changes in reactive capability.Violation Severity Levels:Requirement 1: The SERC OC Review Group proposed change does not require VSL modifications.Requirement 2: The SERC OC Review Group proposes the following change to the VSL to reflect the modification to Requirement 2. Current R2 Severe VSL: The Generator Operator did not maintain voltage or Reactive Power schedule as directed by the Transmission Operator and did not make the necessary notifications required by the Transmission Operator. OR The Generator Operator did not have an operating AVR, and the responsible entity did not use an alternative method for controlling voltage. OR The Generator Operator did not modify voltage when directed, and the responsible entity did not provide any explanation. Proposed R2 Severe VSL: The Generator Operator did not maintain voltage, Reactive Power schedule, or other control capabilities as directed by the Transmission Operator and did not make the necessary notifications required by the Transmission Operator. OR The Generator Operator did not have an operating AVR, and the responsible entity did not use an alternative method for controlling voltage. OR The Generator Operator did not modify voltage when directed, and the responsible entity did not provide any explanation. The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Review Group only and should not be construed as the position of the SERC Reliability Corporation, or its board or its officers.
Response: Thank you for your comments. The drafting team did not make the suggested change to R1 because it would create a conflict with R3. The measure for R3 does not prevent SCADA alarms/data from serving as evidence of compliance, and the	

Organization	Question 1 Comment
standard does not explicitly list all the forms of compliance. With regard to R4, the TOP can provide notification exemptions under VAR-001-4. This will allow the TOP to tailor notifications based on size of reactive capability if necessary. For the R2 VSL, the language was not modified because the GOP must maintain the voltage or Reactive Power schedules, regardless of the method of control.	
PPL Corporation NERC Registered Affiliates	1. The PPL NERC Registered Affiliates agree with R2 stating that GOPs shall maintain the voltage/MVAR schedule or meet the TOP's deviation notification criteria; however, there is no explicit requirement for TOPs to issue any such notification criteria. We request that the standard be revised to require TOPs to issue reasonable notification criteria for deviations from the TOP-provided voltage or reactive power schedule. Such criteria can enhance reliability by reducing the number of repetitive, unnecessary telephone calls to TOP system operators that could distract from other reliability tasks. 2.We recommend that the first sentence of VAR-002-3 R6 be changed from, "After consultation with the Transmission Operator regarding necessary step-up transformer tap changes," to, "After consultation with the Transmission Operator regarding necessary step-up transformer tap changes and the implementation schedule," to mirror the language in R6 of VAR-001-3.3. We wish to point-out also that the low side-to-high side ratio of a transformer is fixed only for an ideal (no losses) device, and for actual equipment it changes with load (termed "regulation"), and this effect is not trivial in magnitude. The "Rationale for R2" section of VAR-002-3 explicitly permits "straight ratio conversion," however; so, if the standard passes in its present form, GOPs using this method can be officially compliant yet factually operating well outside the voltage schedule bandwidth. The term, "straight ratio conversion," should be replaced with "nominal ratio conversion compensated for transformer regulation."3. We recommend that Measures M1 and M3 include language that would allow for SCADA alarms to count as evidence of notification to the TOP from the GOP. We suggest adding the language, "SCADA alarming, or some other electronic automatic system, may be used for real-time notification."
Response: Thank you for your comments. VAR-001-4 does address TOP notification requirements, and VAR-001-4 allows the TOP to tailor the notifications based on their system needs. For R6, the consultation with the TOP can encompass the implementation schedule. R2 rationale was not modified because the standard allows each entity to select the conversion	

Organization	Question 1 Comment
methodology that best suits their needs. For M1 and M3, SCADA alarms are not precluded as evidence of compliance, but the drafting team did not want to provide an exhaustive list of all forms of compliance.	
Florida Municipal Power Agency	There are grammar issues with R1 including a ambiguous references. There are at least two ways to read R1: (i) does R1 mean that the AVR is put into automatic voltage control mode as a default with the ability to operate in a different control modes only at the instruction of a TOP - in other words, there is no instruction from a TOP if the AVR is operating in automatic voltage control mode; or (ii) a TOP instruction is required to determine in which control mode to operate, including automatic voltage control mode? Also, does the "... unless ..." and the ensuing two bullets apply only to alternative control modes or also to automatic voltage control mode?Another ambiguity is the use of the word "notified" in R1. "Notify" as used in R3 allows the GOP a 30 minute (after the fact) window. Does R1 allow the same after the fact notification period? R1, R2, R3 and R4 all include notifaction provisions that in some ways overlap and cause confusion. If the Generator Operator needs to take immediate or emergency actions and transfer the automatic voltage controller from "auto" to "manual", it is not clear in the requirements (especially requirement R1) that the Generator Operator is allowed to perform this action without obtaining prior instruction from the Transmisison Operator or giving prior notification to the Transmission Operator. FMPA believes it would be clearer to re-write R1, R2, R3 and R4 into two requirements: R1 for desired performance and R2 for notifications of when that performance cannot be maintained.FMPA offers the following re-write of R1, R2, R3 and R4 into two proposed requirements that we believe reflects the intent of the SDT while clarifying:"R1 The Generator Operator shall operate each generator connected to the interconnected transmission system with its automatic voltage regulator (AVR): (i) in service; (ii) in the control mode instructed by the Transmission Operator; and (iii) maintaining the generator voltage or Reactive Power schedule (within each generating Facility's capabilities) provided by the Transmission Operator, unless: (a) the generator is exempted by the Transmission Operator; (b) the generator does not have an AVR; or (c) the Generator Operator has notified the Transmission Operator in accordance with R2 of an inability to meet these performance requirements:1.1 When a generator's AVR is out of service or the generator does not have

Organization	Question 1 Comment
	an AVR, the Generator Operator shall use an alternative method to control the generator reactive output to meet the voltage or Reactive Power schedule provided by the Transmission Operator.1.2 Generator Operators that do not monitor the voltage at the location specified in their voltage schedule shall have a methodology for converting the scheduled voltage specified by the Transmission Operator to the voltage point being monitored by the Generator Operator.R2 Each Generator Operator shall notify its associated Transmission Operator prior to or within 30 minutes of becoming aware of any of the following, unless the performance requirements of R1 are restored within 30 minutes: o That the generator is not being operated in the control mode that was instructed by the Transmission Operator; or o A status change of the AVR, power system stabilizer, or alternative voltage controlling device o A change in reactive capability of a generator due to factors other than those described aboveA procedure previously provided by the Generator Operator to the Transmission Operator that includes a description of AVR, power system stabilizer or alterantive voltage controlling device status changes or control mode changes during start-up, shutdown or testing acts as standing notification such that the Real-time communication of start-up, shutdown, or testing also fulfilles the required notification."FMPA is aware that this offered language removes the SDTs proposed R2 bullet 2.2 that requires the GOP to modify voltage when instructred to do so by the TOP; however, this bullet is duplicative of the parent requirement (e.g., if a TOP instructs the GOP to modify voltage, is that not a new voltage schedule, albeit maybe a temporary schedule?) and TOP-001-1, R3 that requires GOPs to comply with directives from a TOP. FMPA believes that this offered alterantive language simplifies and clarifies the SDT's intent.
Response: Thank you for your comments. R1 has been modified to provide clarity with regard to AVR settings. R1 clearly states that the AVR must be run in either controlling voltage mode or the mode instructed by the TOP. The only time that the GOP can run in a different mode or in manual is if the GOP has been exempted or the GOP has notified the TOP of one of the bulleted items. Both bullets for R1 still apply to the entire body of R1. Further, the timing for the second bullet of R1 must work in tandem with the new R3.	

Organization	Question 1 Comment
ACES Standards Collaborators	(1) VAR-002-3 R1 is confusing. Please clarify the second bullet in R1 so it ties into the previous part of the sentence. Read literally, R1 states, "The GOP shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) in service and controlling voltage) or in a different control mode, as instructed by the TOP unless... 2) the GOP has notified the TOP of one of the following: [second bullet] That the generator is not being operated in the control mode that was instructed by the TOP for a reason other than start-up, shutdown, or testing." This exception is circular and needs to be revised.(2) The RSAW for R1 does not provide any additional details for compliance beyond the language in the requirement and corresponding measure. We would like to see additional compliance statements in the RSAWs, especially considering that the compliance input document contained several relevant issues with VAR-002-3.(3) VAR-002-3 R2 and Part 2.1 need to be modified so that the GOP is only required to follow the voltage schedule if provided by the TOP. It is not desirable for the TOP to provide all generators voltage schedules. As an example, the TOP may determine it does not need to provide a voltage schedule to a small generator. To consider this situation, the clause "if a voltage schedule is provided by the TOP" could be added to both Part 2.1 and the main requirement. (4) VAR-002-3 R2 will be problematic for some GOPs because it does not reflect the characteristics of the voltage schedule provided by some TOPs. For example, some TOPs provide an hourly average voltage schedule to avoid the need for notification for every time the GOP drifts out of schedule. How would R2 be applicable in this situation? Would it only apply for the first 15 minutes of each hour looking back at the last hour? Please modify the requirement accordingly to address this issue.(5) The RSAW for R2 contains ambiguous language, stating that the auditor should "select a sample of timeframes" to verify compliance. The evidence retention section (section C.1.2.) of VAR-002-3 states that the Generator Owner shall keep its latest version of documentation on its step-up and auxiliary transformers and maintain all other evidence for the current and previous calendar year. The RSAW should be revised to "review instances when a generator deviates from its schedule" for time periods applicable to the evidence retention section of the standard. (6) VAR-002-3 R3 is improved by expanding the time from 15 to 30 minutes before a GOP must notify the

Organization	Question 1 Comment
	TOP of a status or capability change. We thank the drafting team for providing additional flexibility.(7) The RSAW for R3 states that the auditor may select certain instances where an entity had a status change on AVR. Is the intent of the drafting team to require an entity to maintain a list of all status changes? This does not appear to align with the requirement, especially considering that the rationale for R3 clarifies that the requirement was modified to limit notifications for quick status changes, as these provide little to no benefit to reliability. Having to maintain a list of status changes for an auditor verify also provides little to no benefit to reliability. We recommend revising the RSAW to state that the auditor may select "evidence of GOP status change notifications to its TOP."(8) Requirement R4 in the RSAW is inconsistent with the requirement in the proposed standards. It still contains 15 minutes which has been updated to 30 minutes in the latest proposed standard.(9) VAR-002-3 R4 could be clarified further in the second sentence to account for awareness. We recommend modifying the language to state, "If the capability has been restored within 30 minutes of [becoming aware] of such change..." This revision will align both sentences in R4.(10) We are concerned about the statement in the "Note to Auditor" section that the auditor will look for instances "where it is likely that an entity was made aware of the change in reactive capability" such as when a unit trips or an AVR fails. The statement is problematic for two reasons. First, the requirement is clear that the GOP must be aware of the change before they are required to communicate it. The auditor should not be looking for evidence such as when an AVR fails but rather for log book entries and similar information that the GOP was aware of the change. They should not be looking for when the AVR went offline. Second, a unit trip is a bad example because the TOP will have telemetry necessary to observe when a unit is forced off-line. Is it really necessary to have a compliance requirement for the GOP to notify the TOP when the TOP will already know of the unit's off-line status? We agree that communication between the GOP and the TOP should take place following such an event, but we do not think it rises to a compliance level for this specific example.(11) VAR-002-3 R5 meets multiple P81 criteria and should be removed. It meets Criterion A because it does little, if anything, to benefit or protect the reliable operation of the BES. It also meets Criterion B2 - Data Collection/Data Retention and Criterion B4 - Reporting because

Organization	Question 1 Comment
	it requires the GOP to gather their tap setting information and report it to a third party (i.e. its TOP), which is unnecessary to implement, as a reliability requirement. A GOP is not going to refuse to provide data to its TOP on its generator step-up transformer in a compliance-driven world. In fact, making this data subject to compliance slows down the free exchange of the information because of all the extra checking that goes into managing (i.e. verifying, checking, storing) compliance documentation. This requirement also meets B7 - Redundant because the TOP can specify this data in its data specification per TOP-003-2 R1, distribute it to the GO per TOP-003-2 R3, and then have the GO respond per TOP-003-2 R5. We do not support the VSLs for R5 because it meets P81 criteria and should be removed. (12) The RSAW for R5 should specify the evidence auditors will verify, including tap settings, available fixed tap ranges, and impedance data. The current RSAW refers to "evidence as outlined in M4." This is an incorrect reference to the wrong measure and needs to be updated.(13) VAR-002-3 Part 6.1 meets a P81 criterion and should be removed. It meets Criterion A because it does little, if anything, to benefit or protect the reliable operation of the BES. It also meets Criterion B4 - Reporting because it requires the GO to report a technical justification for not implementing tap changes. This technical justification simply does not support reliability. The TOP can make adjustments to other voltage schedules to account for the GO's inability to implement the tap changes. What is the purpose of the GO providing the TOP a technical justification? Is it to provide the TOP some assurance there is a technical reason for failing to implement the tap changes? In a compliance-driven world, the TOP can reasonably expect the GOP to implement the tap changes unless the changes would violate safety, equipment limits, or regulatory and statutory requirements since these are the only deviations allowed by the main requirement. The threat of sanctions assures this. Furthermore, the GOP may legitimately not have a "technical" justification because a regulatory requirement is a legal justification, not a technical justification. (14) The RSAW for R6 needs to be developed. It is currently incomplete and does not list any evidence or any additional guidance beyond what is listed in the measure.(15) Thank you for the opportunity to comment.
Response: Thank you for your comments. R1 has been modified to provide clarity with regard to AVR settings. R1 clearly states that the AVR must be run in either controlling voltage mode or the mode instructed by the TOP. The only time that the	

Organization	Question 1 Comment
GOP can run in a different mode or in manual is if the GOP has been exempted or the GOP has notified the TOP of one of the bulleted items. Both bullets for R1 still apply to the entire body of R1. The RSAW was concurrently developed with the standard so the intent of the drafting team is reflected in how compliance is assessed, but the RSAW is a NERC Compliance document that the drafting team does edits. However, these comments will be forwarded to the appropriate individuals for review. The drafting team could not remove the requirements to make tap setting changes and provide tap data under P81 because the TOP standards are being currently revised, and FERC has not approved the most recent MOD filing. Further, the data requirements are important for TOP studies which impact tap setting/max VAR output. With regard to the technical justification for a tap setting, the TOP will need to understand why the GOP cannot make a tap setting modification. Changing a tap will impact reactive support from a generating unit, and this will impact reliability. Finally, the requirement to provide a technical justification is an existing requirement in the currently enforceable VAR-002-2b.	
Florida Power & Light	For R4, the loss of an individual wind turbine should not be considered a reactive capability change, since the real power capability would change incrementally along with the reactive capability change and in most cases other turbines would compensate for the reactive capability loss. In general, these requirements should all be applied on the aggregate level for dispersed generating resource facilities. Clarification on R5 is needed to better understand applicability of tap settings changes and request on dispersed generating resources as these typically are designed with a smaller padmount transformer or similar for each individual generating resource, along with a larger aggregating GSU to collect the aggregate generation. Intent would be to include the GSU, but exclude the smaller individual padmount transformers.
Response: Thank you for your comments. With regard to R4, the TOP may provide the GOP with an exemption for certain notifications under VAR-001-4, and the BES definition will apply with regard to the applicability of this standard.	
FirstEnergy Corp	FirstEnergy would like to offer the following comments:1. With regards to clarifying that the Generation Operator will follow the condition of notification of the Transmission Operator. We offered the following two options, where option 1 modifies the current red line version of the Requirement 2 and option 2 adds a sub Requirement to explicitly specify the situational required action of the Generator Operator for the Transmission Operator.OPTION 1:R2. Unless exempted by the Transmission Operator, each Generator

Organization	Question 1 Comment
	Operator shall maintain the generator voltage or Reactive Power schedule (within each generating Facility's capabilities) provided by the Transmission Operator, or otherwise shall meet the conditions of notification provided by the Transmission Operator for deviations from the voltage or Reactive Power schedule. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]OPTION 2:R2. Unless exempted by the Transmission Operator, each Generator Operator shall maintain the generator voltage or Reactive Power schedule3 (within each generating Facility's capabilities4) provided by the Transmission Operator. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]2.1 The Generator Operator shall meet the conditions of notification provided by the Transmission Operator for deviations from the voltage or Reactive Power schedule. Then renumber remaining sub Requirement as needed.Pertaining to Measure 2:Remove the first sentence ("In order to identify when a unit generator is deviating from its schedule, the Generator Operator will monitor voltage based on existing equipment at its Facility") from measure 2. This sentence does not apply to requirement 2 since it only requires the Generator Operator to maintain the generator voltage or Reactive Power schedule that is provided by the Transmission Operator. The inclusion of this sentence could be interpreted that the Generator Operator will need to provide evidence of "monitoring" activities which is not a performance based requirement.
Response: Thank you for your comments. The requirement and measure language was selected very carefully. The first and second sentences of M2 provide GOPs with the ability to monitor and maintain voltage based on existing equipment, and it does not require GOPs to install new metering.	
Manitoba Hydro	(1) R1 - R1 appears to be such a lax requirement that it is arguably unnecessary. Under the second bullet, the only step that a GO has to take in order to avoid compliance is to notify the TO that it is not complying and provide any reason whatsoever. This leads one to question how important the requirement is to reliability. (2) R3 - It appears that the two sentences in R3 conflict with each other. Based on the second sentence, the GOP is not required to notify the TOP if the status has been restored within 30 minutes. However, the first sentence requires the GOP to notify the TOP within 30 minutes of the change. If at the 30th minute, the GOP realizes that the status is not restored, there will not be enough

Organization	Question 1 Comment
	time for the GOP to notify the TOP. If the 30 minute notification time could be extended to 45 or 60 minutes, there will be enough time for the GOP to notify the TOP. (3) M3 - For consistency with that in R3, "the first" in the second sentence should be deleted. (4) R4 - Similar to that in R3, if the 30 minute notification time could be extended to 45 or 60 minutes, there will be enough time for the GOP to notify the TOP. (5) M4 - For consistency with that in R4, "the first" in the second sentence should be deleted. (6) Based on the Standards Process manual, "Time Horizon: The time period an entity has to mitigate an instance of violating the associated requirement." the Time Horizon for R5 and R6 should be changed from "Real-time Operations" to "Operations Planning" because in R5 the GO is required to provide the information within 30 days and in R6 the tap changes should be scheduled during an outage after consultation with the TOP.
Response: Thank you for your comments. R1 is important because it requires a notification to the TOP when the generator is not in AVR or the instructed control mode. It also provides flexibility for the GOP in case the AVR switches modes. The coordination is necessary in order to provide the TOP with the opportunity to plan for other reactive resources. The 30 minutes is similar to the requirement to correct T_V issues within 30 minutes. The 30 minutes did not exist in VAR-002-2b, and now the 30 minutes provide GOPs with the time to address issues before having to notify the TOPs. The time horizons for R5 and R6 exist in the currently enforceable standard, and were not modified by this drafting team.	
Exelon	1.VARâ€002â€3 Effective DatesThe Implementation Plan for VAR-001-4 and VARâ€002â€3 requires the new Standard revisions to be implemented the first day of the first calendar quarter after applicable regulatory approval, allowing for a situation in which the standard could receive regulatory approval towards the end of the calendar quarter, resulting in an effective date with little or no implementation time, e.g., if regulatory approval is received on March 30, the standard would need to be implemented on April 1. IN addition, although the Implementation Plan justification states that the VARâ€002 standard "cannot go into effect without the new TOP schedules and notification requirements" it does not address the implementation associated with changes to VARâ€002 with respect to status notifications. There is not sufficient time to allow generating units to implement training of operators and procedural changes necessary to implement the proposed changes to notification requirements associated

Organization	Question 1 Comment
	with the AVR, PSS or alternative voltage controlling device. In the VAR-002 Directives Project Implementation Plan, the NERC SDT acknowledges that the TOPs will "need some time" to adjust to providing data and therefore the TOPs are provided a quarter to prepare documentation. The GO/GOPs should be afforded at least that amount of time for implementation. We suggest a 6 month implementation period following regulatory approval.2.Dispersed GenerationThis version does not account for dispersed generation (such as wind or solar as found in the new BES definition). These generators may not have a traditional AVR, may only provide limited reactive resources and the individual elements may not have AVR or be capable of operating in voltage control mode. We understand Project 2014-04 is addressing standards changes for dispersed resources and recognize there are parallel efforts that may be difficult to reconcile. Given that, we request the Drafting Team consider how best to acknowledge that VAR-002-4 may have limited applicability to dispersed generation resources and that it is likely to be revised based on the work of Project 2014-04. 3.VAR-002-3 R2.3Exelon believes it is reasonable to allow the GOP to monitor the voltage specified in their TOP issued voltage schedule by allowing the GOP to monitor at a different location by applying a methodology for converting the voltage monitored; however, the conversion method should be specifically communicated to the TOP. There is not a one for one conversion between grid voltage and terminal voltage and therefore the conversion method and monitoring point should be clearly communicated to the TOP to avoid any future compliance audit or implementation issues.4.VSLsExelon understands that R3 and R4 are binary requirements as outlined in Guideline 2 of the "Violation Risk Factor and Violation Severity Level Justifications" associated with VAR-002-3, (e.g., did or did not notify in 30 minutes), it is however unreasonable that a complete failure to notify would have the same VSL as a notification that is one minute late versus one that is days or weeks late. We urge NERC to address this issue from reliability, not a strict compliance perspective; in instances such as this, there should be levels of severity not simply binary requirements.
Response: Thank you for your comments. The implementation schedule is shorter than other projects, but that date was selected originally because industry provided feedback that VAR-002-2b changes should be implemented quickly to avoid unnecessary notifications to the TOP. FERC has not historically approved standards within one quarter of filing. Further, the	

Organization	Question 1 Comment
Dispersed Generation project has released its whitepaper, and no changes are being recommended for VAR-002-2b. The standard does not require the GOPs to provide TOPs with the methodology for conversion because the TOPs provided feedback that their primary concern was that the voltage schedule was maintained. The VSLs were simplified to remove the gradation in the currently enforceable requirement. If a large unit reports later than a small unit, then the severity will vary between the two. Therefore, the timing elements were removed since the requirements are binary in nature.	
American Electric Power	AEP would like to thank the drafting team for their efforts on this project. Their willingness to incorporate industry's input into the draft standard is very much appreciated.VSL Table: The High and Severe VSL entries for R5 should indicate Generator Owner rather than Generator Operator.
Response: Thank you for your comments. The VSL table has been updated.	
Public Service Enterprise Group	PSEG appreciates the SDT's hard work on this standard and we have only one comment.In R2, subpart 2.3 uses the words "monitor" and "monitored." These words have unintended implications in two respects:1. There was never an obligation in the prior version of VAR-002 that the GOP "monitor" its voltage. The objective in this standard, as in its predecessor, is to require the GOP to maintain a voltage or Reactive Power schedule specified by the TOP. (Under VAR-001-4, R5.3, a TOP's schedule must have tolerance bands, which is an improvement over the R4 in the current VAR-001-3.) While "monitoring" the TOP-specified schedule in an activity that may be related to maintaining such a schedule, is not the results-based purpose of the standard. 2. What would constitute acceptable monitoring? As written, this is an open question that an auditor must answer. It's possible that a GOP could be in violation of subpart 2.3 if its "monitoring" was deemed unacceptable by an auditor even though the GOP maintained the TOP's schedule within the tolerance bands 100% of the time!We therefore recommend that the SDT replace prescribed activities of "monitor" and "monitored," respectively in subpart 2.3, with the performance requirement of "maintain" and "maintained." This would preserve the requirement that the GOP have a conversion methodology if it does not maintain the voltage schedule at the location specified by in TOP's schedule, without also prescribing that GOPs monitor voltage to do so. To

Organization	Question 1 Comment
	implement this change, subpart 2.3 would read:"Generator Operators that do not maintain the voltage at the location specified in their voltage schedule shall have a methodology for converting the scheduled voltage specified by the Transmission Operator to the voltage point being maintained by the Generator Operator."
Response: Thank you for your comments. The intent behind Part 2.3 is to require a methodology for a conversion, and the drafting team chose the word "monitor" and "monitored" to specifically alleviate concerns that an auditor will take issue with monitoring equipment and where it is located. The drafting team used the word monitor to convey where the GOP has visibility of the voltage. The words "maintain" and "maintained" may introduce ambiguity in Part 2.3 because the industry was concerned that an auditor would question how voltage is maintained if the GOP and TOP are not metering the same point. The drafting team selected "monitor" and "monitoring" based on input from many GOPs that they did not want their monitoring systems questioned, nor did they want to be required to install new monitoring systems for this standard.	
Ingleside Cogeneration LP	Ingleside Cogeneration LP (ICLP) believes that VAR-002-3 Draft 3 adds much needed flexibility in the manner that GOP supports voltage at the transmission interconnection. Combined with the updates to VAR-001-4, we agree that close coordination with the TOP is inherent in the process - which is a key reliability need. A primary example is the allowance for the TOP to determine how the GOP may communicate changes in AVR and PSS status. Those of less intrinsic importance to BES reliability may be required to notify a status change through telemetry; high-impact generation facilities may need to call the TOP as well. The result is that distracting calls are eliminated - which can otherwise pose a threat to the BES in as of themselves.In fact, our only concerns are related to the draft RSAW that was posted concurrently with the standard. First, a further description in the RSAW under R1 and R2 which directs how the CEAs must react to a TOP voltage control strategy that goes against today's model. For example, if exemptions are given, it must be clear that it is not up to the auditor to question their technical veracity. Their only focus must be how well the Generator Operator adhered to the TOP's voltage/Reactive schedule. In addition, the auditor instructions for R2 needs to include a line item addressing footnote 4 which allows capability exceptions for adherence to the TOP's voltage/Reactive schedule. This may take two forms - first, if the external system attempts to force the generator past its Facility Rating limits. Such a condition may persist

Organization	Question 1 Comment
	indefinitely, and can damage the unit if compliance is forced. Second, a rapid change in loading will create Reactive-power spikes that can easily exceed the TOP's specified range. These typically last for under a minute and must also be accepted as compliant by the CEA. In both cases, a notification to the TOP is unnecessary as it will serve only as a nuisance call.
Response: Thank you for your comments. The RSAW was concurrently developed with the standard so the intent of the drafting team is reflected in how compliance is assessed, but the RSAW is a NERC Compliance document that the drafting team does not edit. However, these comments will be forwarded to the appropriate individuals for review.	
Wisconsin Electric Power Co	R1 As written, the requirement is difficult to interpret (four different actions or qualifictions for one requirement). The draft language allows the Transmission Operator to instruct the Generator Operator to operate a generator in any number of undefined control modes without prior agreements in place between the TO and GO. Prior versions of the draft standard allowed for unusual circumstances to be addressed via the, "unless the Generator Operator is exempted by the Transmission Operator" language. The rational for keeping the Requirement 1 language as is in the July 18th draft is to avoid allowing Transmission Operators from determining the mode in which AVR is to be operated without the need for the process of exempting the generator from operating in AVR in the voltage control mode prior to making the request to the Generator Operator. The new Rationale for R1 does not address the change, but merely includes the proposed changes within the rationale. This is unacceptable and the Standard Drafting Team is asked to expanded the rational for inserting, "or in a different mode, as instructed by the Transmission Operator" into the VAR-002-3 Draft Standard should the request to use the July 18th 2014 draft version of VAR-002-3 not be returned.R2 The requirement references "conditions of notification for deviations from the voltage or Reactive Power schedule." Where are the conditions defined relative to voltage or Reactive Power?R3: The redline version includes an extra "to" in the following sentence, "If the status has been restored within 30 minutes of such change, then to the Generator Operator is not required to notify the Transmission Operator of the status change. Additionally, as currently written the requirement incents a delay in reporting changes in status. Entities should be

Organization	Question 1 Comment
	required to report status changes as soon as possible. Allowing entities to not report status changes that reverse within 30 minutes creates a mixed message. Entities may be incented to report status changes at 29 minues and 59 seconds in a hope that the status has been restored.
Response: Thank you for your comments. R1 has been modified to provide clarity with regard to AVR settings. R1 clearly states that the AVR must be run in either controlling voltage mode or the mode instructed by the TOP. The only time that the GOP can run in a different mode or in manual is if the GOP has been exempted or the GOP has notified the TOP of one of the bulleted items. Both bullets for R1 still apply to the entire body of R1. The notification conditions will come from the TOP under VAR-001-4. Also the extra words were removed from R3 and R4. The timing in R3 was added to improve reliability by allowing the GOP to address issues and correct them within the 30 minutes. This would alleviate the TOP from receiving numerous unnecessary notifications.	
City of Tallahassee	1. R3 & R4 - Need to delete the inserted "to" in front of the inserted "the Generator Operator is required to". (see redline to last posted)2. Table of Compliance Elements (pg 12 of 16, redline to last posted) for R2 under severe VSL, the last paragraph " The Generator Operator did not modify voltage when directed, and the responsible entity did not provide an explanation" should be modified to be "The Generator Operator did not modify voltage as instructed, and the responsible entity did not provide an explanation" to match the requirement language.
Response: Thank you for your comments. The extra words were removed from R3 and R4. The VS for R2 has also been modified.	
Tri-State Generation and Transmission Association, Inc.	The VRF chart in the standard contradicts the language in the requirements. Requirement R5 has the GO as the applicable entity but in the VRF chart it refers to the GOP as the applicable entity. Tri-State believes the GOP should be the applicable entity for requirement R5. Tri-State also believes R5 and R6 should match up and be applicable to the same entities. Thus Tri-State believes the GOP should be the applicable entity for R6.There are also minor edits needed to the requirements below: In R3... If the status has been restored within 30 minutes of such change, then the GOP is not required to notify

Organization	Question 1 Comment
	the TOP of the status change.In R4... If the capability has been restored within 30 minutes of such change, then the GOP is not required to notify the TOP of the change in reactive capability.
Response: Thank you for your comments. The VSL for R5 has been corrected, and the extra words have been removed from R3 and R4. For R5 and R6, the GO was selected because the owner of the asset is the entity that should have the ultimate responsibility for making those tap changes. The GO will work with the GOP to ensure those change are made.	
Tacoma Power	Tacoma Power submits the following comments: Requirement R4. There is no requirement for GOPs to calculate the baseline reactive capability, so it makes no sense to have R4 require GOPs to notify TOPs when the reactive capability deviates from the baseline reactive capability. Furthermore, the reactive capability of plants can vary in Real-time based on real power output, system voltage, or weather conditions. Per MOD-11 and 12, GOs/GOPs must provide modeling data to the that the TOP can use to evaluate reactive capability. Any notifications under R4 should be limited changes resulting equipment malfunctions. Revise R4 to state "Each Generator Operator shall notify its associated Transmission Operator within 30 minutes of becoming aware of a change in reactive capability due to equipment malfunctions other than those malfunctions requiring notification under Requirement R3. If the capability has been restored within 30 minutes of such change, then to the Generator Operator is not required to notify the Transmission Operator of the change in reactive capability."Requirement R5 is redundant to MOD-011 R1.4 and should therefore be removed from VAR-002-3. Requirement R5.1 does need to include auxiliary transformers because typically system powerflow models do not include unit auxiliary transformers or excitation transformers. If R5.1 is retained, please clarify that auxiliary transformer does not include PTs or CTs.
Response: Thank you for your comments. The standard does not require a baseline calculation, and the currently enforceable VAR-002-2b requires a notification to the TOP as soon as a reactive capability change occurs. Also, the MOD standards are in different time horizons from the VAR standards. R5.1 states "auxiliary transformers with primary voltages equal to or greater	

Organization	Question 1 Comment
than the generator terminal voltage." The drafting team does not believe this encompasses PTs or CTs or excitation transformers.	
Nebraska Public Power District	In Requirement R3 and R4 second sentence, we would suggest the removal of 'to' from the phrase ' then to the Generator' and have it to read as followed: 'then the Generator Operator'. In the last line of the 2nd bullet of R1, insert space between 'Operator' and 'for'.Second bullet of R1 reads: "That the generator is not being operated in the control mode that was instructed by the Transmission Operator for a reason other than start-up, shutdown, or testing." The language lends itself to the Generator Operator to not operate in control mode for any reason. We would suggest that the language be tightened up and we suggest the following: "that the generator is not capable of operating in control mode as instructed by the Transmission Operator other than start-up, shutdown, or testing". R4 second sentence: add the words "becoming aware of" between the words "of" and "such".M6: after "Requirment 6" add "and shall have evidence of technical justification as provided in Part 6.1".VSL's R3: add at the end "....of the status change".
Response: Thank you for your comments. The standard has been revised for R2-R4, and the second bullet for R1 has been modified for clarity. R4 has been modified to add the phrase "becoming aware of." The VSLs have also been updated to incorporate your feedback.	

Additional comments received from Doug Hils – Duke Energy:

Duke Energy suggests the following revision to R1 for added clarity on the instants when a GOP can have its AVR in another mode other than controlling voltage:

" The Generator Operator shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) in service and controlling voltage unless: 1) the generator is exempted by the Transmission Operator 2) the GOP is instructed by the Transmission Operator to operate in a different control mode or 3) the Generator Operator has notified the Transmission Operator of one of the following: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

- **That the generator is being operated in start-up,1 shutdown,[2] or testing mode pursuant to a Real-time communication or a procedure that was previously provided to the Transmission Operator; or**
- **That the generator is not being operated in the control mode that was instructed by the Transmission Operator for a reason other than start-up, shutdown, or testing. "**

We believe that without this rewording, ambiguity exists of the instances when a GOPs AVR can be different than in service and controlling voltage.

Response: Thank you for your comments. R1 has been modified to provide clarity with regard to AVR settings. R1 clearly states that the AVR must be run in either controlling voltage mode or the mode instructed by the TOP. The only time that the GOP can run in a different mode or in manual is if the GOP has been exempted or the GOP has notified the TOP of one of the bulleted items. Both bullets for R1 still apply to the entire body of R1.

END OF REPORT

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR and supporting package posted for comment on July 19, 2013.
2. Draft standard posted for initial comments and ballot from July 19, 2013 to September 3, 2013.
3. Draft standard posted for additional comments and ballot from October 11, 2013 to November 26, 2013.
4. Draft standard posted for additional comments and ballot from February 27, 2014 to April 14, 2014.

Description of Current Draft

This is the fourth posting of the proposed draft standard. This proposed draft standard will be posted for final ballot.

Anticipated Actions	Anticipated Date
Final Ballot	April 2014
NERC Board of Trustees Adoption	May 2014
Filing to Applicable Regulatory Authorities	May 2014

Version History

Version	Date	Action	Change Tracking
1	5/1/2006	Added "(R2)" to the end of levels on non-compliance 2.1.2, 2.2.2, 2.3.2, and 2.4.3.	July 5, 2006
1a	12/19/2007	Added Appendix 1 – Interpretation of R1 and R2 approved by BOT on August 1, 2007	Revised
1a	1/16/2007	In Section A.2., Added "a" to end of standard number. Section F: added "1."; and added date.	Errata
1.1a	10/29/2008	BOT adopted errata changes; updated version number to "1.1a"	Errata
1.1b	3/3/2009	Added Appendix 2 – Interpretation of VAR-002-1.1a approved by BOT on February 10, 2009	Revised
2b	4/16/2013	Revised R1 to address an Interpretation Request. Also added previously approved VRFs, Time Horizons and VSLs. Revised R2 to address consistency issue with VAR-001-2, R4. FERC Order issued approving VAR-002-2b.	Revised

Definitions of Terms Used in the Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the NERC Glossary of Terms used in Reliability Standards (Glossary) are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None.

A. Introduction

1. Title: **Generator Operation for Maintaining Network Voltage Schedules**

2. Number: VAR-002-3

3. Purpose: To ensure generators provide reactive support and voltage control, within generating Facility capabilities, in order to protect equipment and maintain reliable operation of the Interconnection.

4. Applicability:

4.1. Generator Operator

4.2. Generator Owner

5. Effective Dates

The standard shall become effective on the first day of the first calendar quarter after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, VAR-002-3 shall become effective on the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

B. Requirements and Measures

Rationale for R1: This requirement has been maintained due to the importance of running a unit with its automatic voltage regulator (AVR) in service and in either voltage controlling mode or the mode instructed by the TOP. However, the requirement has been modified to allow for testing, and the measure has been updated to include some of the evidence that can be used for compliance purposes.

R1. The Generator Operator shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) in service and controlling voltage) or in a different control mode as instructed by the Transmission Operator unless: 1) the generator is exempted by the Transmission Operator, or 2) the Generator Operator has notified the Transmission Operator of one of the following: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

- That the generator is being operated in start-up,[1] shutdown,[2] or testing mode pursuant to a Real-time communication or a procedure that was previously provided to the Transmission Operator; or
- That the generator is not being operated in automatic voltage control mode or in the control mode that was instructed by the Transmission Operator for a reason other than start-up, shutdown, or testing.

M1. The Generator Operator shall have evidence to show that it notified its associated Transmission Operator any time it failed to operate a generator in the automatic voltage control mode or in a different control mode as specified in Requirement R1. If a generator is being started up or shut down with the automatic voltage control off, or is being tested, and no notification of the AVR status is made to the Transmission Operator, the Generator Operator will have evidence that it notified the Transmission Operator of its procedure for placing the unit into automatic voltage control mode as required in Requirement R1. Such evidence may include, but is not limited to, dated evidence of transmittal of the procedure such as an electronic message or a transmittal letter with the procedure included or attached. If a generator is exempted, the Generator Operator shall also have evidence that the generator is exempted from being in automatic voltage control mode (with its AVR in service and controlling voltage).

[1] Start-up is deemed to have ended when the generator is ramped up to its minimum continuously sustainable load and the generator is prepared for continuous operation.
[2] Shutdown is deemed to begin when the generator is ramped down to its minimum continuously sustainable load and the generator is prepared to go offline.

Rationale for R2:

Requirement R2 details how a Generator Operator (GOP) operates its generator(s) to provide voltage support and when the GOP is expected to notify the Transmission Operator (TOP). In an effort to remove prescriptive notification requirements for the entire continent, the VAR-002-3 standard drafting team (SDT) opted to allow each TOP to determine the notification requirements for each of its respective GOPs based on system requirements. Additionally, a new Part 2.3 has been added to detail that each GOP may monitor voltage by using its existing facility equipment.

Conversion Methodology: There are many ways to convert the voltage schedule from one voltage level to another. Some entities may choose to develop voltage regulation curves for their transformers; others may choose to do a straight ratio conversion; others may choose an entirely different methodology. All of these methods have technical challenges, but the studies performed by the TOP, which consider N-1 and credible N-2 contingencies, should compensate for the error introduced by these methodologies, and the TOP possesses the authority to direct the GOP to modify its output if its performance is not satisfactory. During a significant system event, such as a voltage collapse, even a generation unit in automatic voltage control that controls based on the low-side of the generator step-up transformer should see the event on the low-side of the generator step-up transformer and respond accordingly.

Voltage Schedule Tolerances: The bandwidth that accompanies the voltage target in a voltage schedule should reflect the anticipated fluctuation in voltage at the GOP's Facility during normal operations and be based on the TOP's assessment of N-1 and credible N-2 system contingencies. The voltage schedule's bandwidth should not be confused with the control dead-band that is programmed into a GOP's AVR control system, which should be adjusting the AVR prior to reaching either end of the voltage schedule's bandwidth.

R2. Unless exempted by the Transmission Operator, each Generator Operator shall maintain the generator voltage or Reactive Power schedule[3] (within each generating Facility's capabilities[4]) provided by the Transmission Operator, or otherwise shall meet the conditions of notification for deviations from the voltage or Reactive Power schedule provided by the Transmission Operator. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

2.1. When a generator's AVR is out of service or the generator does not have an AVR, the Generator Operator shall use an alternative method to control the generator reactive

[3] The voltage or Reactive Power schedule is a target value with a tolerance band or a voltage or Reactive Power range communicated by the Transmission Operator to the Generator Operator.

[4] Generating Facility capability may be established by test or other means, and may not be sufficient at times to pull the system voltage within the schedule tolerance band. Also, when a generator is operating in manual control, reactive power capability may change based on stability considerations.

output to meet the voltage or Reactive Power schedule provided by the Transmission Operator.

2.2. When instructed to modify voltage, the Generator Operator shall comply or provide an explanation of why the schedule cannot be met.

2.3. Generator Operators that do not monitor the voltage at the location specified in their voltage schedule shall have a methodology for converting the scheduled voltage specified by the Transmission Operator to the voltage point being monitored by the Generator Operator.

M2. In order to identify when a generator is deviating from its schedule, the Generator Operator will monitor voltage based on existing equipment at its Facility. The Generator Operator shall have evidence to show that the generator maintained the voltage or Reactive Power schedule provided by the Transmission Operator, or shall have evidence of meeting the conditions of notification for deviations from the voltage or Reactive Power schedule provided by the Transmission Operator. Evidence may include, but is not limited to, operator logs, SCADA data, phone logs, and any other notifications that would alert the Transmission Operator or otherwise demonstrate that the Generator Operator complied with the Transmission Operator's instructions for addressing deviations from the voltage or Reactive Power schedule.

For Part 2.1, when a generator's AVR is out of service or the generator does not have an AVR, a Generator Operator shall have evidence to show an alternative method was used to control the generator reactive output to meet the voltage or Reactive Power schedule provided by the Transmission Operator.

For Part 2.2, the Generator Operator shall have evidence that it complied with the Transmission Operator's instructions to modify its voltage or provided an explanation to the Transmission Operator of why the Generator Operator was unable to comply with the instruction. Evidence may include, but is not limited to, operator logs, SCADA data, and phone logs.

For Part 2.3, for Generator Operators that do not monitor the voltage at the location specified on the voltage schedule, the Generator Operator shall demonstrate the methodology for converting the scheduled voltage specified by the Transmission Operator to the voltage point being monitored by the Generator Operator.

Rationale for R3:

This requirement has been modified to limit the notifications required when an AVR goes out of service and quickly comes back in service. Notifications of this type of status change provide little to no benefit to reliability. Thirty (30) minutes have been built into the requirement to allow a GOP time to resolve an issue before having to notify the TOP of a status change. The requirement has also been amended to remove the sub-requirement to provide an estimate for the expected duration of the status change.

R3. Each Generator Operator shall notify its associated Transmission Operator of a status change on the AVR, power system stabilizer, or alternative voltage controlling device within 30 minutes of the change. If the status has been restored within 30 minutes of such change, then the Generator Operator is not required to notify the Transmission Operator of the status change *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

M3. The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of any status change identified in Requirement R3. If the status has been restored within the first 30 minutes, no notification is necessary.

Rationale for R4:

This requirement has been bifurcated from the prior version VAR-002-2b Requirement R3. This requirement allows GOPs to report reactive capability changes after they are made aware of the change. The current standard requires notification as soon as the change occurs, but many GOPs are not aware of a reactive capability change until it has taken place.

R4. Each Generator Operator shall notify its associated Transmission Operator within 30 minutes of becoming aware of a change in reactive capability due to factors other than a status change described in Requirement R3. If the capability has been restored within 30 minutes of the Generator Operator becoming aware of such change, then the Generator Operator is not required to notify the Transmission Operator of the change in reactive capability. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

M4. The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of becoming aware of a change in reactive capability in accordance with Requirement R4. If the capability has been restored within the first 30 minutes, no notification is necessary.

Rationale for R5:

This requirement and corresponding measure have been maintained due to the importance of having accurate tap settings. If the tap setting is not properly set, then the VARs available from that unit can be affected. The prior version of VAR-002-2b, Requirement R4.1.4 (the +/- voltage range with step-change in % for load-tap changing transformers) has been removed. The percentage information was not needed because the tap settings, ranges and impedance are required. Those inputs can be used to calculate the step-change percentage if needed.

R5. The Generator Owner shall provide the following to its associated Transmission Operator and Transmission Planner within 30 calendar days of a request. *[Violation Risk Factor: Lower] [Time Horizon: Real-time Operations]*

5.1. For generator step-up transformers and auxiliary transformers with primary voltages equal to or greater than the generator terminal voltage:

5.1.1. Tap settings.

5.1.2. Available fixed tap ranges.

5.1.3. Impedance data.

M5. The Generator Owner shall have evidence it provided its associated Transmission Operator and Transmission Planner with information on its step-up transformers and auxiliary transformers as required in Requirement R5, Part 5.1.1 through Part 5.1.3 within 30 calendar days.

Rationale for R6:

This requirement and corresponding measure have been maintained due to the importance of having accurate tap settings. If the tap setting is not properly set, then the VARs available from that unit can be affected.

R6. After consultation with the Transmission Operator regarding necessary step-up transformer tap changes, the Generator Owner shall ensure that transformer tap positions are changed according to the specifications provided by the Transmission Operator, unless such action would violate safety, an equipment rating, a regulatory requirement, or a statutory requirement. *[Violation Risk Factor: Lower] [Time Horizon: Real-time Operations]*

6.1. If the Generator Owner cannot comply with the Transmission Operator's specifications, the Generator Owner shall notify the Transmission Operator and shall provide the technical justification.

M6. The Generator Owner shall have evidence that its step-up transformer taps were modified per the Transmission Operator's documentation in accordance with Requirement R6. The Generator Owner shall have evidence that it notified its associated Transmission Operator when it could not comply with the Transmission Operator's step-up transformer tap specifications in accordance with Requirement R6, Part 6.1.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" refers to NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner shall keep its latest version of documentation on its step-up and auxiliary transformers. The Generator Operator shall maintain all other evidence for the current and previous calendar year.

The Compliance Monitor shall retain any audit data for three years.

1.3. Compliance Monitoring and Assessment Processes:

"Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.4. Additional Compliance Information:

None.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Real-time Operations**	**Medium**	N/A	N/A	N/A	Unless exempted, the Generator Operator did not operate each generator connected to the interconnected transmission system in the automatic voltage control mode or in a different control mode as instructed by the Transmission Operator, and failed to provide the required notifications to Transmission Operator as identified in Requirement R1.
R2	**Real-time Operations**	**Medium**	N/A	N/A	The Generator Operator did not have a conversion methodology when it monitors voltage at a location different from the schedule provided by the Transmission Operator.	The Generator Operator did not maintain the voltage or Reactive Power schedule as instructed by the Transmission Operator and did not make the necessary notifications required by the Transmission Operator. OR The Generator Operator did not have an operating AVR, and the responsible entity did not use an alternative method for controlling voltage. OR The Generator Operator did not modify voltage when directed, and the responsible entity did not provide any

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						explanation.
R3	**Real-time Operations**	**Medium**	N/A	N/A	N/A	The Generator Operator did not make the required notification within 30 minutes of the status change.
R4	**Real-time Operations**	**Medium**	N/A	N/A	N/A	The Generator Operator did not make the required notification within 30 minutes of becoming aware of the capability change.
R5	**Real-time Operations**	**Lower**	N/A	N/A	The Generator Owner failed to provide its associated Transmission Operator and Transmission Planner one of the types of data specified in Requirement R5 Parts 5.1.1, 5.1.2, and 5.1.3.	The Generator Owner failed to provide to its associated Transmission Operator and Transmission Planner two or more of the types of data specified in Requirement R5 Parts 5.1.1, 5.1.2, and 5.1.3.
R6	**Real-time Operations**	**Lower**	N/A	N/A	N/A	The Generator Owner did not ensure the tap changes were made according the Transmission Operator's specifications. OR

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						The Generator Owner failed to perform the tap changes, and the Generator Owner did not provide technical justification for why it could not comply with the Transmission Operator specifications.

Guidelines and Technical Basis

For technical basis for each requirement, please review the rationale provided for each requirement.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR and supporting package posted for comment on July 19, 2013.
2. Draft standard posted for initial comments and ballot from July 19, 2013 to September 3, 2013.
3. Draft standard posted for additional comments and ballot from October 11, 2013 to November 26, 2013.
4. Draft standard posted for additional comments and ballot from February 27, 2014 to April 14, 2014.

Description of Current Draft

This is the third fourth posting of the proposed draft standard. This proposed draft standard will be posted for a 45-day formalfinal comment period and parallel ballot.

Anticipated Actions	Anticipated Date
Additional 45-Day SAR Comment Period with Ballot	February/March
Final Ballot	April 2014
NERC Board of Trustees Adoption	May 2014
Filing to Applicable Regulatory Authorities	May 2014

Version History

Version	Date	Action	Change Tracking
1	5/1/2006	Added "(R2)" to the end of levels on non-compliance 2.1.2, 2.2.2, 2.3.2, and 2.4.3.	July 5, 2006
1a	12/19/2007	Added Appendix 1 – Interpretation of R1 and R2 approved by BOT on August 1, 2007	Revised
1a	1/16/2007	In Section A.2., Added "a" to end of standard number. Section F: added "1."; and added date.	Errata
1.1a	10/29/2008	BOT adopted errata changes; updated version number to "1.1a"	Errata
1.1b	3/3/2009	Added Appendix 2 – Interpretation of VAR-002-1.1a approved by BOT on February 10, 2009	Revised
2b	4/16/2013	Revised R1 to address an Interpretation Request. Also added previously approved VRFs, Time Horizons and VSLs. Revised R2 to address consistency issue with VAR-001-2, R4. FERC Order issued approving VAR-002-2b.	Revised

Definitions of Terms Used in the Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the NERC Glossary of Terms used in Reliability Standards (Glossary)~~Reliability Standards Glossary of Terms~~ are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None.

A. Introduction

1. Title: **Generator Operation for Maintaining Network Voltage Schedules**

2. Number: VAR-002-3

3. Purpose: To ensure generators provide reactive support and voltage control, within generating Facility capabilities, in order to protect equipment and maintain reliable operation of the Interconnection.

4. Applicability:

4.1. Generator Operator

4.2. Generator Owner

5. Effective Dates

The standard shall become effective on the first day of the first calendar quarter after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, VAR-002-3 shall become effective on the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

B. Requirements and Measures

Rationale for R1: This requirement has been maintained due to the importance of running a unit with its automatic voltage regulator (AVR) in service and in either voltage controlling mode or the mode instructed by the TOP. However, the requirement has been modified to allow for testing, and the measure has been updated to include some of the evidence that can be used for compliance purposes.

R1. The Generator Operator shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) in service and controlling voltage) or in a different control mode~~,~~ as instructed by the Transmission Operator unless: 1) the generator is exempted by the Transmission Operator, or 2) the Generator Operator has notified the Transmission Operator of one of the following: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

- That the generator is being operated in start-up,[1] shutdown,[2] or testing mode pursuant to a Real-time communication or a procedure that was previously provided to the Transmission Operator; or
- That the generator is not being operated in automatic voltage control mode or in the control mode that was instructed by the Transmission Operator for a reason other than start-up, shutdown, or testing.

M1. The Generator Operator shall have evidence to show that it notified its associated Transmission Operator any time it failed to operate a generator in the automatic voltage control mode or in a different control mode as specified in Requirement R1. If a generator is being started up or shut down with the automatic voltage control off, or is being tested, and no notification of the AVR status is made to the Transmission Operator, the Generator Operator will have evidence that it notified the Transmission Operator of its procedure for placing the unit into automatic voltage control mode as required in Requirement R1. Such evidence may include, but is not limited to, dated evidence of transmittal of the procedure such as an electronic message or a transmittal letter with the procedure included or attached. If a generator is exempted, the Generator Operator shall also have evidence that the generator is exempted from being in automatic voltage control mode (with its AVR in service and controlling voltage).

[1] Start-up is deemed to have ended when the generator is ramped up to its minimum continuously sustainable load and the generator is prepared for continuous operation.
[2] Shutdown is deemed to begin when the generator is ramped down to its minimum continuously sustainable load and the generator is prepared to go offline.

Rationale for R2:

Requirement R2 details how a Generator Operator (GOP) operates its generator(s) to provide voltage support and when the GOP is expected to notify the Transmission Operator (TOP). In an effort to remove prescriptive notification requirements for the entire continent, the VAR-002-3 standard drafting team (SDT) opted to allow each TOP to determine the notification requirements for each of its respective GOPs based on system requirements. Additionally, a new ~~p~~Part 2.3 has been added to detail that each GOP may monitor voltage by using its existing facility equipment.

Conversion Methodology: There are many ways to convert the voltage schedule from one voltage level to another. Some entities may choose to develop voltage regulation curves for their transformers; others may choose to do a straight ratio conversion; others may choose an entirely different methodology. All of these methods have technical challenges, but the studies performed by the TOP, which consider N-1 and credible N-2 contingencies, should compensate for the error introduced by these methodologies, and the TOP possesses the authority to direct the GOP to modify its output if its performance is not satisfactory. During a significant system event, such as a voltage collapse, even a generation unit in automatic voltage control that controls based on the low-side of the generator step-up transformer should see the event on the low-side of the generator step-up transformer and respond accordingly.

Voltage Schedule Tolerances: The bandwidth that accompanies the voltage target in a voltage schedule should reflect the anticipated fluctuation in voltage at the GOP's Facility during normal operations and be based on the TOP's assessment of N-1 and credible N-2 system contingencies. The voltage schedule's bandwidth should not be confused with the control dead-band that is programmed into a GOP's AVR control system, which should be adjusting the AVR prior to reaching either end of the voltage schedule's bandwidth.

R2. Unless exempted by the Transmission Operator, each Generator Operator shall maintain the generator voltage or Reactive Power schedule[3] (within each generating Facility's capabilities[4]) provided by the Transmission Operator, or otherwise shall meet the conditions of notification for deviations from the voltage or Reactive Power schedule provided by the Transmission Operator. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

2.1. When a generator's AVR is out of service or the generator does not have an AVR, the Generator Operator shall use an alternative method to control the generator reactive

[3] The voltage or Reactive Power schedule is a target value with a tolerance band or a voltage or Reactive Power range communicated by the Transmission Operator to the Generator Operator.

[4] Generating Facility capability may be established by test or other means, and may not be sufficient at times to pull the system voltage within the schedule tolerance band. Also, when a generator is operating in manual control, reactive power capability may change based on stability considerations.

output to meet the voltage or Reactive Power schedule provided by the Transmission Operator.

2.2. When instructed to modify voltage, the Generator Operator shall comply or provide an explanation of why the schedule cannot be met.

2.3. Generator Operators that do not monitor the voltage at the location specified in their voltage schedule shall have a methodology for converting the scheduled voltage specified by the Transmission Operator to the voltage point being monitored by the Generator Operator.

M2. In order to identify when a generator is deviating from its schedule, the Generator Operator will monitor voltage based on existing equipment at its Facility. The Generator Operator shall have evidence to show that the generator maintained the voltage or Reactive Power schedule provided by the Transmission Operator, or shall have evidence of meeting the conditions of notification for deviations from the voltage or Reactive Power schedule provided by the Transmission Operator. Evidence may include, but is not limited to, operator logs, SCADA data, phone logs, and any other notifications that would alert the Transmission Operator or otherwise demonstrate that the Generator Operator complied with the Transmission Operator's instructions for addressing deviations from the voltage or Reactive Power schedule.

For ~~p~~Part 2.1, when a generator's AVR is out of service or the generator does not have an AVR, a Generator Operator shall have evidence to show an alternative method was used to control the generator reactive output to meet the voltage or Reactive Power schedule provided by the Transmission Operator.

For ~~p~~Part 2.2, the Generator Operator shall have evidence that it complied with the Transmission Operator's instructions to modify its voltage or provided an explanation to the Transmission Operator of why the Generator Operator was unable to comply with the instruction. Evidence may include, but is not limited to, operator logs, SCADA data, and phone logs.

For ~~p~~Part 2.3, for Generator Operators that do not monitor the voltage at the location specified on the voltage schedule, the Generator Operator shall demonstrate the methodology for converting the scheduled voltage specified by the Transmission Operator to the voltage point being monitored by the Generator Operator~~document or be able to demonstrate the method of conversion from the voltage level monitored to the voltage level specified on the voltage schedule~~.

Rationale for R3:

This requirement has been modified to limit the notifications required when an AVR goes out of service and quickly comes back in service. ~~Such n~~Notifications of this type of status change provide little to no benefit to reliability. Thirty (30) minutes have been built into the requirement to allow a GOP time to resolve an issue before having to notify the TOP of a status ~~or capability~~ change. The requirement has also been amended to remove the sub-requirement to provide an estimate for the expected duration of the status change. ~~The 30-minute window should resolve most issues.~~

R3. Each Generator Operator shall notify its associated Transmission Operator of a status change on the AVR, power system stabilizer, or alternative voltage controlling device within 30 minutes of the change. If the status has been restored within 30 minutes of such change, then ~~to~~ the Generator Operator is not required to notify the Transmission Operator of the status change *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

M3. The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of any status change identified in Requirement R3. If the status has been restored within the first 30 minutes, no notification is necessary.

Rationale for R4:

This requirement has been bifurcated from the prior version VAR-002~~0~~-2b Requirement R3. This requirement allows GOPs to report reactive capability changes after they are made aware of the change. The current standard requires notification as soon as the change occurs, but many GOPs are not aware of a reactive capability change until it has taken place.

R4. Each Generator Operator shall notify its associated Transmission Operator within 30 minutes of becoming aware of a change in reactive capability due to factors other than a status change described in Requirement R3. If the capability has been restored within ~~-~~30 minutes of the Generator Operator becoming aware of such change, then ~~to~~ the Generator Operator is not required to notify the Transmission Operator of the change in reactive capability. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

M4. The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes ~~-~~of becoming aware of a change in reactive capability in accordance with Requirement R4. If the capability has been restored within the first 30 minutes, no notification is necessary.

Rationale for R5:

This requirement and corresponding measure have been maintained due to the importance of having accurate tap settings. If the tap setting is not properly set, then the VARs available from that unit can be affected. The prior version of VAR-002-2b, Requirement ~~subpart~~ Part R4.1.4 (the +/- voltage range with step-change in % for load-tap changing transformers) has been removed. The percentage information was not needed because the tap settings, ranges and impedance are required. Those inputs can be used to calculate the step-change percentage if needed.

R5. The Generator Owner shall provide the following to its associated Transmission Operator and Transmission Planner within 30 calendar days of a request. *[Violation Risk Factor: Lower] [Time Horizon: Real-time Operations]*

5.1. For generator step-up transformers and auxiliary transformers with primary voltages equal to or greater than the generator terminal voltage:

5.1.1. Tap settings.

5.1.2. Available fixed tap ranges.

5.1.3. Impedance data.

M5. The Generator Owner shall have evidence it provided its associated Transmission Operator and Transmission Planner with information on its step-up transformers and auxiliary transformers as required in Requirement R5, P~~p~~art 5.1.1 through ~~p~~Part 5.1.3 within 30 calendar days.

Rationale for R6:

This requirement and corresponding measure have been maintained due to the importance of having accurate tap settings. If the tap setting is not properly set, then the VARs available from that unit can be affected.

R6. After consultation with the Transmission Operator regarding necessary step-up transformer tap changes, the Generator Owner shall ensure that transformer tap positions are changed according to the specifications provided by the Transmission Operator, unless such action would violate safety, an equipment rating, a regulatory requirement, or a statutory requirement. *[Violation Risk Factor: Lower] [Time Horizon: Real-time Operations]*

6.1. If the Generator Owner cannot comply with the Transmission Operator's specifications, the Generator Owner shall notify the Transmission Operator and shall provide the technical justification.

M6. The Generator Owner shall have evidence that its step-up transformer taps were modified per the Transmission Operator's documentation in accordance with Requirement R6. The Generator Owner shall have evidence that it notified its associated Transmission Operator when it could not

comply with the Transmission Operator's step-up transformer tap specifications in accordance with Requirement R6, Ppart 6.1.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" refers to NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner shall keep its latest version of documentation on its step-up and auxiliary transformers. The Generator Operator shall maintain all other evidence for the current and previous calendar year.

The Compliance Monitor shall retain any audit data for three years.

1.3. Compliance Monitoring and Assessment Processes:

"Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.4. Additional Compliance Information:

None.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Real-time Operations**	**Medium**	N/A	N/A	N/A	Unless exempted, the Generator Operator did not operate each generator connected to the interconnected transmission system in the automatic voltage control mode or in a different control mode~~,~~ as instructed by the Transmission Operator, and failed to provide the required notifications to Transmission Operator as identified in Requirement R1.
R2	**Real-time Operations**	**Medium**	N/A	N/A	The Generator Operator did not have a conversion methodology when it monitors voltage at a location different from the schedule provided by the Transmission Operator.	The Generator Operator did not maintain the voltage or Reactive Power schedule as ~~directed~~ instructed by the Transmission Operator and did not make the necessary notifications required by the Transmission Operator. OR The Generator Operator did not have an operating AVR, and the responsible entity did not use an alternative method for controlling voltage. OR The Generator Operator did not modify voltage when directed, and the responsible entity did not provide any

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						explanation.
R3	**Real-time Operations**	**Medium**	N/A	N/A	N/A	The Generator Operator did not make the required notification within 30 minutes of the status change.
R4	**Real-time Operations**	**Medium**	N/A	N/A	N/A	The Generator Operator did not make the required notification within 30 minutes of becoming aware of the capability change.
R5	**Real-time Operations**	**Lower**	N/A	N/A	The Generator ~~Operator~~ Owner failed to provide its associated Transmission Operator and Transmission Planner one of the types of data specified in Requirement R5 ~~p~~Parts 5.1.1, 5.1.2, and 5.1.3.	The Generator ~~Operator~~ Owner failed to provide to its associated Transmission Operator and Transmission Planner two or more of the types of data specified in Requirement R5 ~~p~~Parts 5.1.1, 5.1.2, and 5.1.3.
R6	**Real-time Operations**	**Lower**	N/A	N/A	N/A	The Generator Owner did not ensure the tap changes were made according the Transmission Operator's specifications. OR

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						The Generator Owner failed to perform the tap changes, and the Generator Owner did not provide technical justification for why it ~~cannot~~ could not comply with the Transmission Operator specifications.

VAR-001-4 – Voltage and Reactive Control
VAR-002-3 — Generator Operation for Maintaining Network Voltage Schedules

Prerequisite Approvals

There are no other standards that must receive approval prior to the approval of this standard.

Revisions to Glossary Terms

None

Applicable Entities

Generator Operators (VAR-002-3)

Generator Owners (VAR-002-3)

Transmission Operators (VAR-001-4)

Applicable Facilities

N/A

Conforming Changes to Other Standards

None

Effective Dates

VAR-001-4 and VAR-002-3 – All requirements shall become effective on the first day of the first calendar quarter after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, VAR-001-4 and VAR-002-3 shall become effective on the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Justification

The currently effective VAR-002 standard is one of the most violated standards; however, the industry argues these violations do not address any reliability gaps. Instead, Generator Operators and Transmission Operators are required to handle many nuisance phone calls for slight deviations from a voltage schedule. The nuisance phone calls can be a distraction during a scheduled maintenance or a system event; thus, the industry would support making the changes as soon as possible. However, since VAR-001 now requires determining voltage and reactive power schedules with associated tolerance bands in addition to any notification requirements, the Transmission Operators need a quarter to prepare documentation. The VAR-002 standards cannot go into effect without the new TOP schedules and notification requirements. Also for Transmission Operators that do not already provide tolerance bands with voltage schedules, those Transmission Operators will need some time to adjust to providing new data (more specifically, the criteria for schedules) to Generator Operators.

Retirements

VAR-001-3 and VAR-002-2b will be retired at midnight of the day immediately prior to the Effective Date of VAR-001-4 and VAR-002-3 in the particular jurisdiction in which the new standards are becoming effective.

Compliance Operations

Draft Reliability Standard Compliance Guidance for VAR-001-4 and VAR-002-3
October 21, 2013

Introduction

The NERC Compliance department (Compliance) worked with the VAR standard drafting team (SDT) to review the proposed standards VAR-001-4 and VAR-002-3. The purpose of the review was to discuss the requirements of the proposed standard to obtain an understanding of its intended purpose and the evidence necessary to support compliance. The purpose of this document is to address specific questions posed by the VAR SDT in order to aid in the drafting of the requirements and provide a level of understanding regarding evidentiary support necessary to demonstrate compliance.

While all compliance evaluations require levels of auditor judgment, participating in these reviews allows Compliance to develop training and approaches to support a high level of consistency in audits conducted by the Regional Entities. The following questions and answers are intended to assist the SDT in further refining the standard and to serve as a resource in the development of training for auditors.

VAR-001 and VAR-002 Questions

Question 1

How will compliance determine if sufficient reactive resources were scheduled as part of VAR-001-4 Requirement R2?

Compliance Response to Question 1

For VAR-001-4 Requirement R2, an auditor would review the studies that a TOP used to schedule resources to see that the studies show whether new resources should be brought online, or if the resources online are sufficient to regulate voltage levels. An auditor may observe a TOP reviewing the study and scheduling live and may pull samples from various time periods to determine whether a TOP scheduled resources as required in the study.

Question 2

Is it clear that VAR-001-4 Requirement R4 allows for exemptions, for any duration, from: 1) voltage schedules, 2) being in automatic voltage control mode, or 3) any notification requirements?

Compliance Response to Question

It is clear that VAR-001 Requirement R4 allows for any combination of exemptions for generator operators from 1) voltage schedules, 2) being in automatic voltage control mode, or 3) any notification requirements, as long as the

exemption meets the criteria specified by the TOP. An auditor will not look for any pre-authorization from the TOP; rather an auditor will verify that the generator operator has met the criteria set forth by the TOP.

Question 3

Tolerance bands apply to a set voltage or Reactive Power number with a +/- percentage as the tolerance band. The voltage range or Reactive Power range is a high and low number that a Generator Operator is expected to operate within for reliability purposes. With regard to VAR-001-4 Requirement R5, is it clear that when a voltage range or Reactive Power range is provided as a schedule, a tolerance band is not expected to also be provided?

Compliance Response to Question 3

Yes, it is clear based on VAR-001-4 Requirement R5 that a voltage or Reactive power schedule can be either: 1) a target number with a tolerance band, OR 2) a voltage or Reactive Power range to operate within. An auditor would not expect to see a tolerance band provided with an operating range for voltage or Reactive Power.

Question 4

With regard to VAR-002-3, will generators receive a violation for instances where a system event is affecting system voltage, but the generators made the appropriate conversions and set the AVRs to meet the original schedule provided by the TOP?

Compliance Response to Question 4

No, the generator operators can only be responsible for maintaining the schedule provided by the TOP based on existing facility equipment. In the event that a generator operator does not have the equipment to have visibility of high-side system voltage, the GOP will not have the ability to adjust VARs to maintain system voltage. An auditor is not to determine that, where the GOP does not have the high side monitoring equipment and where the AVR is set appropriately based on existing facility equipment, the generator operator is non-compliant. However, if the TOP provides a new directive or schedule, the GOP is required to follow the new directive. This directive can include modifying an AVR setting or providing more voltage support, and the generator operator is expected to comply pursuant to VAR-002-3.

Question 5

Related to VAR-002-3, generators can monitor voltage on either the low side and high side of the GSU (depending on equipment limitation) and the “number” being monitored by the Generator will not always equate to the number provided by the TOP. Is it clear that VAR-002 Requirement R2, part 2.3 only wants a conversion of the schedule provided to the number monitored? Is it clear that there should not be a violation if the schedule does not match the number being monitored on the low side as long as there is a documented conversion?

Compliance Response to Question 5

The Generator should be able to provide documentation that identifies the "number" being monitored and the calculation demonstrating how the "number" equates to the schedule provided by the TOP. The measure for VAR-002-3 Requirement R2, part 2.3 is clear on what evidence should be able to demonstrate this during an audit.

Question 6

VAR-002-3, Requirement R4 was added because generators cannot report a capability change until they are aware of the change. The currently enforceable standard requires a notification as soon as the capability change occurs; however, many times the change occurred well before the generators were aware of the problem. Is it clear that VAR-002-3 Requirement R4 is only violated after the generator is made aware of the change?

Compliance Response to Question 6

It is clear that VAR-002-3, Requirement R4 will only be a violation if the change is not reported after 30 minutes of becoming aware of the reactive capability change. An auditor will ask an entity for evidence to demonstrate when it became aware of the change in reactive capability. This will not be purely subjective; there are technical instances where it will be clear that an entity would have been made aware of the change in reactive capability. For example, one instance is where a unit is ramping to an expected VAR output, and it cannot reach it; a reactive capability change has occurred.

Conclusion

Following final approval of the Reliability Standard, Compliance will develop the final Reliability Standards Auditor Worksheet (RSAW) and associated training.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

VAR-002 Mapping Document

Transition of VAR-002-2b

Standard: VAR-002-3 – Generator Operation for Maintaining Network Voltage Schedules		
Requirement in Approved Standard	**Transitions to the below Requirement in New Standard or Other Action**	**Description and Change Justification**
VAR-002-2b, R1	Requirement R1	The requirement has been modified to allow for testing and exemptions for other AVR modes when necessary. This requirement was also modified to allow GOPs to operate in a different control mode as instructed by the TOP.
VAR-002-2b, R2	Requirement R2	The new requirement has been updated to allow for the TOP to define notification requirements. The requirement also adds parts to allow for the conversion of a high side schedule to a low side number for monitoring purposes. Reactive Power schedules have been added for generators that use those schedules, and for consistency purposes "unit" has been changed to "generator".

Standard: VAR-002-3 – Generator Operation for Maintaining Network Voltage Schedules		
Requirement in Approved Standard	**Transitions to the below Requirement in New Standard or Other Action**	**Description and Change Justification**
VAR-002-2b, R3	Requirement R3 and R4.	The old requirement has been broken into two requirements: 1) one for AVR/PSS status, and 2) one for reactive capability. Both allow 30 minutes to correct an issue before having to notify the TOP.
VAR-002-2b, R3	Requirement R5	The requirement has been modified to remove the sub-part that requires the GOP to provide "[t]he +/- voltage range with step-change in % for load-tap changing transformers." The measure was also modified to add that a GOP must provide the data "within 30 calendar days"
VAR-002-2b, R4	Requirement R6	The requirement has been updated to apply to the same functional entity for the Requirement and sub-part.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Transition of VAR-002-2b

Standard: VAR-002-3 – Generator Operation for Maintaining Network Voltage Schedules		
Requirement in Approved Standard	**Transitions to the below Requirement in New Standard or Other Action**	**Description and Change Justification**
VAR-002-2b, R1	Requirement R1	The requirement has been modified to allow for testing and exemptions for other AVR modes when necessary. This requirement was also modified to allow GOPs to operate in a different control mode as instructed by the TOP.
VAR-002-2b, R2	Requirement R2	The new requirement has been updated to allow for the TOP to define notification requirements. The requirement also adds parts to allow for the conversion of a high side schedule to a low side number for monitoring purposes. Reactive Power schedules have been added for generators that use those schedules, and for consistency purposes "unit" has been changed to "generator".

Standard: VAR-002-3 – Generator Operation for Maintaining Network Voltage Schedules		
Requirement in Approved Standard	**Transitions to the below Requirement in New Standard or Other Action**	**Description and Change Justification**
VAR-002-2b, R3	Requirement R3 and R4.	The old requirement has been broken into two requirements: 1) one for AVR/PSS status, and 2) one for reactive capability. Both allow ~~15~~ 30 minutes to correct an issue before having to notify the TOP.
VAR-002-2b, R3	Requirement R5	The requirement has ~~not been modified~~been modified to remove the sub-part that requires the GOP to provide "[t]he +/- voltage range with step-change in % for load-tap changing transformers." The measure was also modified to add that a GOP must provide the data "within 30 calendar days"~~.~~
VAR-002-2b, R4	Requirement R6	The requirement has ~~not been modified.~~been updated to apply to the same functional entity for the Requirement and sub-part.

[1] NERC developed this Reliability Standard Audit Worksheet (RSAW) language in order to facilitate NERC's and the Regional Entities' assessment of a registered entity's compliance with this Reliability Standard. The NERC RSAW language is written to specific versions of each NERC Reliability Standard. Entities using this RSAW should choose the version of the RSAW applicable to the Reliability Standard being assessed. While the information included in this RSAW provides some of the methodology that NERC has elected to use to assess compliance with the requirements of the Reliability Standard, this document should not be treated as a substitute for the Reliability Standard or viewed as additional Reliability Standard requirements. In all cases, the Regional Entity should rely on the language contained in the Reliability Standard itself, and not on the language contained in this RSAW, to determine compliance with the Reliability Standard. NERC's Reliability Standards can be found on NERC's website. Additionally, NERC Reliability Standards are updated frequently, and this RSAW may not necessarily be updated with the same frequency. Therefore, it is imperative that entities treat this RSAW as a reference document only, and not as a substitute or replacement for the Reliability Standard. It is the responsibility of the registered entity to verify its compliance with the latest approved version of the Reliability Standards, by the applicable governmental authority, relevant to its registration status.

The NERC RSAW language contained within this document provides a non-exclusive list, for informational purposes only, of examples of the types of evidence a registered entity may produce or may be asked to produce to demonstrate compliance with the Reliability Standard. A registered entity's adherence to the examples contained within this RSAW does not necessarily constitute compliance with the applicable Reliability Standard, and NERC and the Regional Entity using this RSAW reserves the right to request additional evidence from the registered entity that is not included in this RSAW. Additionally, this RSAW includes excerpts from FERC Orders and other regulatory references. The FERC Order cites are provided for ease of reference only, and this document does not necessarily include all applicable Order provisions. In the event of a discrepancy between FERC Orders, and the language included in this document, FERC Orders shall prevail.

[2] Compliance Assessment Date(s): The date(s) the actual compliance assessment (on-site audit, off-site spot check, etc.) occurs.

DRAFT

R1 Supporting Evidence and Documentation

R1. The Generator Operator shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) in service and controlling voltage) or in a different control mode, as instructed by the Transmission Operator unless ~~the Generator Operator~~ 1) the generator is exempted by the Transmission Operator, or 2) the Generator Operator has notified the Transmission Operator of one of the following:

- That the generator is being operated in start-up,[3] shutdown,[4] or testing mode pursuant to a Real-time communication or a procedure that was previously provided to the Transmission Operator; or
- That the generator is not being operated in the ~~automatic voltage~~ control mode that was instructed by the Transmission Operator for a reason other than start-up, shutdown, or testing.

M1. The Generator Operator shall have evidence to show that it notified its associated Transmission Operator any time it failed to operate a generator in the automatic voltage control mode or a different control mode as specified in Requirement R1. If a generator is being started up or shut down with the automatic voltage control off, or is being tested, and no notification of the AVR status is made to the Transmission Operator, the Generator Operator will have evidence that it notified the Transmission Operator of its procedure for placing the unit into automatic voltage control mode as required in Requirement R1. Such evidence ~~must~~ may include, but is not limited to, dated evidence of transmittal of the procedure such as an electronic message or a transmittal letter with the procedure included or attached. If a generator is exempted, the Generator Operator shall also have evidence that the generator ~~it~~ is exempted from being in automatic voltage control mode (with its AVR in service and controlling voltage).

Registered Entity Response to Question (Required):

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[5]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this

[3] Start-up is deemed to have ended when the generator is ramped up to its minimum continuously sustainable load and the generator is prepared for continuous operation.
[4] Shutdown is deemed to begin when the generator is ramped down to its minimum continuously sustainable load and the generator is prepared to go offline.
[5] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.
See M1.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to VAR-002-3, R1
This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	For instances where entity did not operate a generator in automatic voltage control mode or in a different control mode, as instructed by the Transmission Operator, ensure notification was given to the Transmission Operator in accordance with Requirement R1.

Note to Auditor: Auditors can identify instances where entities did not operate~~d~~ generators ~~outside of~~in automatic voltage control mode, or in a different control mode, as instructed by the Transmission Operator, through their general knowledge of the interconnected transmission system in the entity's area. Auditor knowledge is obtained through activities such as conversations with the entity under audit or the Transmission Operator, and an awareness of events occurring on the interconnected transmission system. In situations where the entity's compliance with this requirement poses little risk to the BES, conversations with other entities, such as Transmission Operators, is most likely not necessary.

Auditor Notes:

R2 Supporting Evidence and Documentation

R2. Unless exempted by the Transmission Operator, each Generator Operator shall maintain the generator voltage or Reactive Power schedule[6] (within each generating Facility's capabilities[7]) provided by the Transmission Operator, or otherwise shall meet the conditions of notification for deviations from the voltage or Reactive Power schedule provided by the Transmission Operator.

2.1. When a generator's AVR is out of service or the generator does not have an AVR, the Generator Operator shall use an alternative method to control the generator reactive output to meet the voltage or Reactive Power schedule ~~directed~~ provided by the Transmission Operator.

2.2. When ~~directed~~ instructed to modify voltage, the Generator Operator shall comply or provide an explanation of why the schedule cannot be met.

2.3. Generator Operators that do not monitor the voltage at the location specified in their voltage schedule shall have a methodology for converting the scheduled voltage specified by the Transmission Operator to the voltage point being monitored by the Generator Operator.

M2. In order to identify when a ~~unit~~ generator is deviating from its schedule, the Generator Operator will monitor voltage based on existing equipment at its Facility. The Generator Operator shall have evidence to show that the generator maintained the voltage or Reactive Power schedule provided by the Transmission Operator, or shall have evidence of meeting the conditions of notification for deviations from the voltage or Reactive Power schedule provided by the Transmission Operator. Evidence may include, but is not limited to, operator logs, SCADA data, phone logs, and any other notifications that would alert the Transmission Operator or otherwise demonstrate that the Generator Operator complied with the Transmission Operator's instructions for addressing deviations from the voltage or Reactive Power schedule.

For part 2.1, when a generator's AVR is out of service or the generator does not have an AVR, a Generator Operator shall have evidence to show an alternative method was used to control the generator reactive output to meet the voltage or Reactive Power schedule ~~directed~~ provided by the Transmission Operator.

For part 2.2, the Generator Operator shall have evidence that it complied with the Transmission Operator's ~~directions~~ instructions to modify its voltage or provided an explanation to the Transmission Operator of why the Generator Operator was unable to comply with the

[6] The voltage or Reactive Power schedule is a target value with a tolerance band or a voltage or Reactive Power range communicated by the Transmission Operator to the Generator Operator.

[7] Generating Facility capability may be established by test or other means, and may not be sufficient at times to pull the system voltage within the schedule tolerance band. Also, when a ~~Generator~~ generator is operating in manual control, reactive power capability may change based on stability considerations.

~~direction~~instruction. Evidence may include, but is not limited to, operator logs, SCADA data, and phone logs.

For part 2.3, for ~~units~~ Generator Operators that do not monitor the voltage at the location specified on the voltage schedule, the Generator Operator shall document or be able to demonstrate the method of conversion from the voltage level monitored to the voltage level specified on the voltage schedule.

Question: As a Generation Operator, have you operated the generator with the AVR out of service?

Registered Entity Response to Question (Required):

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[8]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.
See M2.
Any written policies, procedures or protocols describing how the entity maintains the generator voltage or Reactive Power schedule provided by Transmission Operator, if the entity has such documents.
Generator voltage or Reactive Power schedule provided to entity by Transmission Operator, or entity's record thereof, for timeframes selected by the auditor.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

[8] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

Compliance Assessment Approach Specific to VAR-002-3, R2

This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	Interview entity staff and/or review documentation provided by the entity to understand how they maintain the generator voltage or Reactive Power schedule or authorized exemption per Requirement R2.
	Read entity's response to compliance Question above and understand how entity complies with Requirement R2, when they operate a generator with AVR in not in service.
	Select a sample of timeframes during the audit period and have entity walkthrough how they complied with Requirement R2 for those timeframes.

Note to Auditor: Based on the risk of the entity's compliance with this requirement on the Bulk Electric System (BES) and the auditor's assessment of the entity's management practices (or internal controls) over compliance with this Requirement, auditors will determine the extent of the above audit procedures to apply. In cases where risk to the BES is low and the entity's management practices, gleaned by the auditor through walkthroughs or documentation review, are sound only limited audit testing is necessary. In cases where risk is higher and controls are less effective, an auditor should sample enough timeframes, per above, to gain reasonable assurance that entity is complying with Requirement R2.

For part 2.3, the entity should be able to provide documentation that identifies the voltage number being monitored and the calculation demonstrating how it equates to the schedule provided by the Transmission Operator. The measure for VAR-002-3 Requirement R2, part 2.3 is clear on what evidence should be able to demonstrate this during an audit. The entity can only be responsible for maintaining the schedule provided by the Transmission Operator based on existing facility equipment. In the event that an entity does not have the equipment to have visibility of high-side system voltage, the entity will not have the ability to adjust VARs to maintain system voltage. An auditor is not to determine that, where the entity does not have the high side monitoring equipment and where the AVR is set appropriately based on existing facility equipment, the entity is non-compliant. However, if the Transmission Operator provides a new directive or schedule, the entity is required to follow the new directive. This directive can include modifying an AVR setting or providing more voltage support, and the entity is expected to comply pursuant to VAR-002-3.

Auditor Notes:

R3 Supporting Evidence and Documentation

R3. Each Generator Operator shall notify its associated Transmission Operator of a status change on the AVR, power system stabilizer, or alternative voltage controlling device within 30 minutes of the change. If the status has been restored within ~~the first 15~~30 minutes of such change, then the Generator Operator is not required to ~~there is no need to~~ notify the Transmission Operator of the status change.

M3. The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of ~~the~~ any status change identified in Requirement R3. If the status has been restored within the first ~~15~~ 30 minutes, no notification is necessary~~; therefore, if a status change lasts more than 15 minutes, the GOP must notify its associated Transmission Operator within 30 minutes of when the change first occurred~~.

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[9]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.
Any written policies, procedures or protocols describing how the entity responds to a status change on AVR, if the entity has such documents. An example of entity's response to a status change on AVR provided by entity, if applicable.
Auditor may select certain instances where entity had a status change on AVR. In such instances, provide associated evidence of awareness and resolution/notification.
Evidence as outlined in M3.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

[9] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

Compliance Assessment Approach Specific to VAR-002-3, R3
This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	Interview entity staff and/or review documentation provided by the entity to understand how they respond to status changes on AVR.
	Review evidence provided to determine if entity responded to status change on AVR in accordance with Requirement R3.

Note to Auditor: Based on the risk of the entity's compliance with this requirement on the Bulk Electric System (BES) and the auditor's assessment of the entity's management practices (or internal controls) over compliance with this Requirement, auditors will determine the extent of the above audit procedures to apply. In cases where risk to the BES is low and the entity's management practices, gleaned by the auditor through walkthroughs or documentation review, are sound only limited audit testing is necessary. In cases where risk is higher and controls are less effective, an auditor should sample enough timeframes, per above, to gain reasonable assurance that entity is complying with Requirement R3.

Auditor Notes:

R4 Supporting Evidence and Documentation

R4. Each Generator Operator shall notify its associated Transmission Operator within 30 minutes after becoming aware of a change in reactive capability due to factors other than a status change described in Requirement R3. If the capability has been restored within the first 15 minutes of such change, then there is no need to notify the Transmission Operator.

M4. The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of the recognition of a reactive capability change identified in Requirement R4. If the capability has been restored within the first 15 minutes, no notification is necessary; therefore, if a capability change lasts more than 15 minutes, the Generator Operator must notify its associated Transmission Operator within 30 minutes of when the change first occurred.

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[10]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.
Any written policies, procedures or protocols describing how the entity responds to a change in reactive capability, if the entity has such documents. An example of entity's response to a change in reactive capability provided by entity, if applicable.
Auditor may select certain instances where entity ~~should~~ may have been aware of a status change in reactive capability. In such instances, provide associated evidence of awareness and resolution/notification. See Note to Auditor for additional details.
Evidence as outlined in M4.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to VAR-002-3, R4
This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	Interview entity staff and/or review documentation provided by the entity to understand how they respond to change in reactive capability.
	Review evidence provided to determine if entity responded to change in reactive capability in accordance with Requirement R4.
Note to Auditor: It is clear that VAR-002-3, Requirement R4 will only be a violation if the change is not reported after 30 minutes of becoming aware of the status change in reactive capability. An auditor will ask an entity for evidence to demonstrate when it became aware of the change. This will not be purely	

[10] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

subjective; there are technical instances (e.g. unit trips, ramping, equipment/AVR failures) where it ~~will be~~is ~~clear~~ likely that an entity ~~would have been~~was made aware of the change in reactive capability. ~~For example, one instance is where a unit is ramping to an expected VAR output, and it cannot reach it; a reactive capability change has occurred.~~

Auditor Notes:

R5 Supporting Evidence and Documentation

R5. The Generator Owner shall provide the following to its associated Transmission Operator and Transmission Planner within 30 calendar days of a request.

5.1. For generator step-up transformers and auxiliary transformers with primary voltages equal to or greater than the generator terminal voltage:

5.1.1. Tap settings.

5.1.2. Available fixed tap ranges.

5.1.3. Impedance data.

M5. The Generator Owner shall have evidence it provided its associated Transmission Operator and Transmission Planner with information on its step-up transformers and auxiliary transformers as required in Requirements R5 part 5.1.1 through part 5.1.3.

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[11]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.
Evidence as outlined in M4. Evidence of transmittal of the data could include, but is not limited to, items such as an electronic message or a transmittal letter with the information included or attached.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted:

[11] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to VAR-002-3, R5
This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	Review evidence (documented date of request and reply) to determine if entity responded to information request(s) as required in Requirement R5 within 30 days of receiving a request from associated Transmission Operator.
Note to Auditor: Based on the auditors professional judgment, he or she may confirm with Transmission Operators to determine if requests for data were made or simply confirm the existence of such requests with the entity under audit.	

Auditor Notes:

R6 Supporting Evidence and Documentation

R6. After consultation with the Transmission Operator regarding necessary step-up transformer tap changes, the Generator Owner shall ensure that transformer tap positions are changed according to the specifications provided by the Transmission Operator, unless such action would violate safety, an equipment rating, a regulatory requirement, or a statutory requirement.

6.1. If the Generator Operator cannot comply with the Transmission Operator's specifications, the Generator Operator shall notify the Transmission Operator and shall provide the technical justification.

M6. The Generator Owner shall have evidence that its step-up transformer taps were modified per the Transmission Operator's documentation as identified in Requirement R6. The Generator Operator shall have evidence that it notified its associated Transmission Operator when it could not comply with the Transmission Operator's step-up transformer tap specifications as identified in Requirement R6 part 6.1.

Registered Entity Response to General Compliance with this Requirement (Required):
Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[12]:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.
See M6.

Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted: File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to VAR-002-3, R6
This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	Review evidence (documented date of request and response) to determine if entity responded to change(s) as required in Requirement R6.
Note to Auditor: Based on the auditors professional judgment, he or she may confirm with Transmission Operators to determine if requests for changes to transformer tap positions were made or simply confirm the existence of such requests with the entity under audit.	

[12] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Violation Risk Factor and Violation Severity Level Justifications

VAR-002-3 – Generator Operation for Maintaining Network Voltage Schedules

This document provides the Standard Drafting Team's (SDT) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in VAR-002-3 – Generator Operation for Maintaining Network Voltage Schedules. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project. A copy of the standard with the associated VRFs and VSLs is available here.

NERC Criteria - Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Violation Risk Factor Guidelines

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities

• Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) – Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) –Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria - Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

FERC's VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline 1 – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline 2 – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.

Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3 – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4 – Violation Severity Level Assignment Should Be Based on a Single Violation, Not on a Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the

Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF Justification – VAR-002-3 Requirement R1	
Proposed VRF	**Medium**
NERC VRF Discussion	A VRF of Medium is necessary because this requirement could affect the stability of the BES, but the requirement itself addresses instances where a GOP will not necessarily operate in with the AVR in different control modes or when the TOP will instruct a GOP to operate in other modes.
FERC VRF G1 Discussion	Guideline 1 – Consistency with Blackout Report: Although the Blackout Report list Reactive Power and voltage control are part of the list of critical areas where a violation could severely affect the reliability of the Bulk-Power System, the GOP control modes are not as critical because the TOP is monitoring the system. The companion requirement to VAR-002-3 (in VAR-001-4) are properly designated with a HIGH VRF to ensure voltage schedules are provided as part of the TOPs plan to operate within System Operating Limits and Interconnection Reliability Operating Limits.
FERC VRF G2 Discussion	Guideline 2 – Consistency within a Reliability Standard: The VRF applies to the entire requirement.
FERC VRF G3 Discussion	Guideline 3 – Consistency among Reliability Standards: Because maintaining a voltage schedule is critical to preventing a violation of a System Operating Limit, this VRF was drafted to be the same VRFs for VAR-001-4 Requirement R5. VAR-001-4 Requirement R5 requires the TOP to specify a schedule and notification requirements that the GOP must follow.
FERC VRF G4 Discussion	Guideline 4 – Consistency with NERC Definitions of VRFs: This VRF is consistent with the NERC Definition because a GOP not operating in the proper control mode can affect the BES, but a single violation is unlikely to lead to instability, separation, or cascading failure. This is especially the case since a TOP will also be monitoring for voltage deviations.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More Than One Obligation:

	This VRF does not co-mingle multiple objectives, nor does it water down the Requirement to reflect a lower risk level.

VSL Justification – VAR-002-3 Requirement R1	
NERC VSL Guidelines	Consistent with NERC's VSL Guideline, this VSL acknowledges the criticality of this requirement and whether or not a system voltage schedule was created.
FERC VSL G1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The current level of compliance is not lowered with the proposed VSL because this requirement only has a "severe" VSL.
FERC VSL G2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The single VSL assignment category for "Binary" Requirements is not consistent Guideline 2b: VSL Assignments that contain ambiguous language	The proposed VSL is written to ensure uniformity and consistency in the determination of penalties. Guideline 2a: The proposed VSL is binary, and therefore, a single severe VSL is necessary. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.

FERC VSL G3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is consistent with the corresponding requirements.
FERC VSL G4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on a cumulative number of violations.

VRF Justification – VAR-002-3 Requirement R2	
Proposed VRF	**Medium**
NERC VRF Discussion	A VRF of Medium is consistent with the NERC VRF definition. Requirement R2 focuses on GOPs maintaining a schedule, but there could be system events that will pull a GOP out of schedule. Also, late at night and early in the morning, the system may experience instances of low or high voltage. This could impact the BES, but a single instance is unlikely to lead to instability, separation, or cascading failure. The sub-requirements also require the GOP to modify the voltage schedule when directed by the TOP.
FERC VRF G1 Discussion	Guideline 1 – Consistency with Blackout Report: Although the Blackout Report lists Reactive Power and voltage control as critical areas where a violation could severely affect the reliability of the Bulk-Power System, there are general times when a GOP will be unable to maintain a voltage schedule due to system condition. These instances occur frequently during the early morning and late at night. The companion requirement to VAR-002-3 (in VAR-001-4) are properly designated

	with a HIGH VRF to ensure voltage schedules are provided as part of the TOP's plan to operate within System Operating Limits and Interconnection Reliability Operating Limits.
FERC VRF G2 Discussion	Guideline 2 – Consistency within a Reliability Standard: The VRF applies to the entire requirement, including all sub-parts.
FERC VRF G3 Discussion	Guideline 3 – Consistency among Reliability Standards: Because maintaining a voltage schedule is critical to preventing a violation of a System Operating Limit, this VRF was drafted to be the same VRFs for VAR-001-4 Requirement R5. VAR-001-4 Requirement R5 requires the TOP to specify a schedule and notification requirements that the GOP must follow.
FERC VRF G4 Discussion	Guideline 4 – Consistency with NERC Definitions of VRFs: This VRF is consistent with the NERC Definition because a GOP not maintaining a schedule can affect the BES, but a single violation is unlikely to lead to instability, separation, or cascading failures. This is especially the case since a TOP will also be monitoring for voltage deviations
FERC VRF G5 Discussion	Guideline 5 - Treatment of Requirements that Co-mingle More Than One Obligation: This VRF does not co-mingle multiple objectives, nor does it water down the requirement to reflect a lower risk level.

VSL Justification – VAR-002-3 Requirement R2	
NERC VSL Guidelines	Consistent with NERC's VSL Guidelines, the VSL describes degrees of noncompliant performance in an incremental manner.
FERC VSL G1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering	There is no prior compliance obligation related to the subject of this standard.

the Current Level of Compliance	
FERC VSL G2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The single VSL assignment category for "Binary" Requirements is not consistent Guideline 2b: VSL Assignments that contain ambiguous language	The proposed VSL is written to ensure uniformity and consistency in the determination of penalties. Guideline 2a: The proposed VSL is not binary. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.
FERC VSL G4: Violation Severity Level Assignment Should Be Based on A Single Violation,	The proposed VSL is not based on cumulative number of violations.

Not on A Cumulative Number of Violations	

VRF Justification – VAR-002-3 Requirement R3	
Proposed VRF	**Medium**
NERC VRF Discussion	This requirement warrants a Medium VRF and is consistent with the NERC definition because this requirement is whether the GOP made the required notifications to the TOP within the appropriate timeframes.
FERC VRF G1 Discussion	Guideline 1 – Consistency with Blackout Report: Although the Blackout Report list Reactive Power and voltage control are part of the list of critical areas where a violation could severely affect the reliability of the Bulk-Power System, the GOP notifications are unlikely to lead to system instability, separation, or cascading failures. This is particularly the case because the TOP is still operating the system to stay within System Operating Limits and Interconnection Reliability Operating Limits.
FERC VRF G2 Discussion	Guideline 2 – Consistency within a Reliability Standard: There is no sub-part to Requirement 3; therefore, the requirement is consistent.
FERC VRF G3 Discussion	Guideline 3 – Consistency among Reliability Standards: This VRF is drafted to be consistent with other standards (e.g., BAL) that address making appropriate notifications.
FERC VRF G4 Discussion	Guideline 4 – Consistency with NERC Definitions of VRFs: This VRF is consistent with the NERC Definition because not making the appropriate notifications can impact the grid, but the TOPs are still effectively monitoring the system; thus, instability, separation, or cascading failures are unlikely due to a single violation.
FERC VRF G5 Discussion	Guideline 5 - Treatment of Requirements that Co-mingle More Than One Obligation This VRF does not co-mingle multiple objectives, nor does it water down the Requirement to reflect a lower risk level

VSL Justification – VAR-002-3 Requirement R3	
NERC VSL Guidelines	Consistent with NERC's VSL Guidelines. The VSL describes degrees of noncompliant performance in an incremental manner.
FERC VSL G1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The current level of compliance is not lowered with the proposed VSL.
FERC VSL G2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The single VSL assignment category for "Binary" Requirements is not consistent Guideline 2b: VSL Assignments that contain ambiguous language	The proposed VSL is written to ensure uniformity and consistency in the determination of penalties. Guideline 2a: The proposed VSL is binary because the standard is violated only when a notification is not made to the TOP; therefore, a severe VSL is warranted. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3: Violation Severity Level Assignment Should Be	The proposed VSL is worded consistently with the corresponding requirement.

Consistent with the Corresponding Requirement	
FERC VSL G4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on cumulative number of violations.

VRF Justification – VAR-002-3 Requirement R4	
Proposed VRF	**Medium**
NERC VRF Discussion	This requirement warrants a Medium VRF and is consistent with the NERC definition because this requirement is whether the GOP made the required notifications to the TOP within the appropriate timeframes.
FERC VRF G1 Discussion	Guideline 1 – Consistency with Blackout Report: Although the Blackout Report list Reactive Power and voltage control are part of the list of critical areas where a violation could severely affect the reliability of the Bulk-Power System, the GOP notifications are unlikely to lead to system instability, separation, or cascading failures. This is particularly the case because the TOP is still operating the system to stay within System Operating Limits and Interconnection Reliability Operating Limits.
FERC VRF G2 Discussion	Guideline 2 – Consistency within a Reliability Standard: There is no sub-part to Requirement 3; therefore, the requirement is consistent.
FERC VRF G3 Discussion	Guideline 3 – Consistency among Reliability Standards: This VRF is drafted to be consistent with other standards (e.g., BAL) that address making appropriate notifications.

FERC VRF G4 Discussion	Guideline 4 – Consistency with NERC Definitions of VRFs: This VRF is consistent with the NERC Definition because not making the appropriate notifications can impact the grid, but the TOPs are still effectively monitoring the system; thus, instability, separation, or cascading failures are unlikely due to a single violation.
FERC VRF G5 Discussion	Guideline 5 - Treatment of Requirements that Co-mingle More Than One Obligation This VRF does not co-mingle multiple objectives, nor does it water down the Requirement to reflect a lower risk level

VSL Justification – VAR-002-3 Requirement R4	
NERC VSL Guidelines	Consistent with NERC's VSL Guidelines. The VSL describes degrees of noncompliant performance in an incremental manner.
FERC VSL G1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The current level of compliance is not lowered with the proposed VSL.
FERC VSL G2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The single VSL assignment category for	The proposed VSL is written to ensure uniformity and consistency in the determination of penalties. Guideline 2a: The proposed VSL is binary because the standard is violated only when a notification is not made to the TOP; therefore, a severe VSL is warranted.

"Binary" Requirements is not consistent Guideline 2b: VSL Assignments that contain ambiguous language	Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.
FERC VSL G4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on cumulative number of violations.

VRF Justification – VAR-002-3 Requirement R5	
Proposed VRF	**Lower**
NERC VRF Discussion	This requirement is a Lower VRF because the tap setting data does not change frequently, and a violation is not expected adversely affect the BES.
FERC VRF G1 Discussion	Guideline 1 – Consistency with Blackout Report: Although Reactive Power and voltage control are part of the list of critical areas where a violation could severely affect the reliability of the Bulk-Power System, this requirement would not adversely impact the BES

	if violated. The tap information is provided during interconnection, and it is not expected to change frequently. Therefore, a Lower VRF is warranted.
FERC VRF G2 Discussion	Guideline 2 – Consistency within a Reliability Standard: The parts within Requirement R5 are consistent with Requirement R5 and is considered a Lower VRF.
FERC VRF G3 Discussion	Guideline 3 – Consistency among Reliability Standards: There are no other standards that address Tap settings.
FERC VRF G4 Discussion	Guideline 4 – Consistency with NERC Definitions of VRFs: This VRF is consistent with the NERC Definition because a violation is similar to an administrative violation. Further, since tap settings are infrequently changed, a violation would not adversely impact the BES.
FERC VRF G5 Discussion	Guideline 5 - Treatment of Requirements that Co-mingle More Than One Obligation: This VRF does not co-mingle multiple objectives, nor does it water down the Requirement to reflect a lower risk level.

VSL Justification – VAR-002-3 Requirement R5	
NERC VSL Guidelines	Consistent with NERC's VSL Guidelines. The VSL describes degrees of noncompliant performance in an incremental manner.
FERC VSL G1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering	There is no prior compliance obligation related to the subject of this standard.

the Current Level of Compliance	
FERC VSL G2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The single VSL assignment category for "Binary" Requirements is not consistent Guideline 2b: VSL Assignments that contain ambiguous language	The proposed VSL is written to ensure uniformity and consistency in the determination of penalties. Guideline 2a: The proposed VSL is not binary. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.
FERC VSL G4: Violation Severity Level Assignment Should Be Based on A Single Violation,	The proposed VSL is not based on cumulative number of violations.

Not on A Cumulative Number of Violations	

VRF Justification – VAR-002-3 Requirement R6	
Proposed VRF	**Lower**
NERC VRF Discussion	This requirement is a Lower VRF because the tap setting data does not change frequently, and a violation is not expected adversely affect the BES.
FERC VRF G1 Discussion	Guideline 1 – Consistency with Blackout Report: Although Reactive Power and voltage control are part of the list of critical areas where a violation could severely affect the reliability of the Bulk-Power System, this requirement would not adversely impact the BES if violated. The tap information is provided during interconnection, and it is not expected to change frequently. If a violation were to occur, the system would still operate at the level prior to making any tap setting changes. Therefore, a Lower VRF is warranted.
FERC VRF G2 Discussion	Guideline 2 – Consistency within a Reliability Standard: The part within Requirement R6 is consistent with Requirement R6 and is considered a Lower VRF.
FERC VRF G3 Discussion	Guideline 3 – Consistency among Reliability Standards: There are no other standards that address Tap settings.
FERC VRF G4 Discussion	Guideline 4 – Consistency with NERC Definitions of VRFs: This VRF is consistent with the NERC Definition because a violation is similar to an administrative violation. Further, since tap settings are infrequently changed, a violation would not adversely impact the BES.
FERC VRF G5 Discussion	Guideline 5 - Treatment of Requirements that Co-mingle More Than One Obligation:

	This VRF does not co-mingle multiple objectives, nor does it water down the Requirement to reflect a lower risk level.

VSL Justification – VAR-002-3 Requirement R6	
NERC VSL Guidelines	Consistent with NERC's VSL Guidelines. The VSL describes degrees of noncompliant performance in an incremental manner.
FERC VSL G1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	There is no prior compliance obligation related to the subject of this standard.
FERC VSL G2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The single VSL assignment category for "Binary" Requirements is not consistent Guideline 2b: VSL Assignments that contain ambiguous language	The proposed VSL is written to ensure uniformity and consistency in the determination of penalties. Guideline 2a: The proposed VSL is binary because the requirement focuses on whether tap changes were made. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.

FERC VSL G3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.
FERC VSL G4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on cumulative number of violations.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

Project 2013-04 Voltage and Reactive Control
VAR-002-3

Final Ballot Now Open through May 5, 2014

Now Available

A final ballot for **VAR-002-3 – Generator Operation for Maintaining Network Voltage Schedules** is open through **8 p.m. Eastern on Monday, May 5, 2014.**

Background information for this project can be found on the project page.

Instructions for Balloting

In the final ballot, votes are counted by exception. Only members of the ballot pool may cast a ballot; all ballot pool members may change their previously cast votes. A ballot pool member who failed to cast a ballot during the last ballot window may cast a ballot in the final ballot window. If a ballot pool member does not participate in the final ballot, that member's vote cast in the previous ballot will be carried over as that member's vote in the final ballot.

Members of the ballot pool associated with this project may log in and submit their vote for the standard by clicking here.

Next Steps

Voting results for the standard will be posted and announced after the ballot window closes. If approved, it will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

For more information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Wendy Muller, Standards Development Administrator, or at 404-446-2560.

Project 2013-04 Voltage and Reactive Control
VAR-002-3

Final Ballot Results

Now Available

A final ballot for **VAR-002-3 – Generator Operation for Maintaining Network Voltage Schedules** concluded at **8 p.m. Eastern on Monday, May 5, 2014.**

The standard achieved a quorum and sufficient affirmative votes for approval. Voting statistics are listed below, and the Ballot Results page provides a link to the detailed results for the ballot.

Standard	Quorum / Approval
VAR-002-3	83.84% / 88.26%

Background information for this project can be found on the project page.

Next Steps

The standard will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

For information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Wendy Muller (via email), Standards Development Administrator, or at 404-446-2560.

Standard Drafting Team Roster

Drafting Team Members and Observers for VAR

Name and Title	Company	Contact Info	Bio
Bill Harm, Chair	PJM Interconnection	(610) 666-8868 harm@pjm.com	Bill Harm is a Senior Consultant at PJM in the NERC and regional coordination department. Bill has over 39 years of experience in various aspects of the planning and operation of the PJM network. Before joining the NERC and regional coordination department Bill worked in operations, operations planning, system planning and operations support. Bill's background also includes technical support of operations and markets during the integration of new members into the PJM market as well as developing various joint operating agreements. Bill Harm has also participated in the follow NERC activities: • NERC Systems Analysis and Modeling Subcommittee • NERC Modifications to FAC-012 and FAC-013 for Order 729 • NERC ATC SAR Drafting team • ERAG Management Committee • MEN/VEM study Committees • Joint Inter regional Review Committee • NERC 2003 Blackout Investigation Team
Martin Kaufman, Vice Chair	ExxonMobil Research and Engineering	(281) 834-7549 martin.kaufman@exxonmobil.com	Martin Kaufman is experienced in industrial electric system design, operation, and configuration; including cogeneration facility operation and design, and an in-depth understanding of the supply needs of large end-users and how the operation and planning of the bulk power system impacts these needs. Martin Kaufman currently performs a global power system design and operation subject matter expert role for ExxonMobil, and provides compliance assurance support for NERC activities.

Name and Title	Company	Contact Info	Bio
Scott Berry	Indiana Municipal Power Agency	317-428-6710 sberry@impa.com	Scott Berry has 21 years of Generator experience which include, 6 years in the Navy Nuclear Power Program as a Reactor Operator and 15 years with Gas Combustion turbines as an Operator. Scott has also served as a Technician and Plant Superintendent, and he has been working with NERC and regional standards for approximately 6 years. Scott is currently active in the following areas: Transmission Access Study Group (TAPS); Small Entity Working Group (RFC and SERC Entities); North American Generator Forum; and Combustion Turbine Operation Task Force (CTOTF).
Brian Buckley	TECO Energy	bsbuckley@tecoenergy.com	Brian Buckley is the Manager of Compliance and Performance responsible for leading all Energy Supply regulatory activities including our Compliance Program for FERC, NERC and FRCC standards. Brian received a Bachelor of Science degree in Mechanical Engineering in 1997 from the Georgia Institute of Technology and a Master of Business Administration from the University of South Florida in 2003. Brian's past positions at Tampa Electric include: Operations Engineer at Gannon/Bayside Station (a natural gas combined cycle plant), Instrumentation and Controls Engineer at Big Bend Station (a coal-fired plant), and Senior Engineer in Operations Planning (maintaining reliability of all company plants).

Name and Title	Company	Contact Info	Bio
Steve Hitchens	Bonneville Power Administration	509-465-0339 sbhitchens@bpa.gov	Steve Hitchens is an Electrical Engineer with Bonneville Power Administration since 1991. Steve served for six years with substation Design, outdoor design for high voltage substations. From 1997 to present , Steve has worked as the Technical Operations Engineer responsible for: • Seasonal and outage planning studies for determining SOL's on the major BPA interchanges and flowgates; • BPA Dispatch support for main grid and sub grid operation; • NERC VAR-001 SME for Requirements R2, R3, R4, R6 and R11; and • Reactive and Voltage SME (since 2004) responsible for, in part, the BPA Voltage Schedule updates, modifications and circulation
Sharma Kolluri	SERC	(504) 576-4045 vkollur@entergy.com	Sharma Kolluri has over 30 years of experience in the Planning and Operation areas. He is currently the Manager of Transmission Planning at Entergy where is responsible for stability studies, reactive power planning studies, reactive power management and generator interconnection studies. Sharma is responsible for reactive power planning and management studies at Entergy. He has also published several papers at IEEE in the area of reactive power planning and voltage stability, especially dealing with static and dynamic reactive power compensation. He served as a past chairman of the Dynamics Review Sub Committee (DRS) at SERC, and he is a member of the IEEE Dynamic Performance Committee, Stability Controls sub-committee and Voltage stability task force.

Name and Title	Company	Contact Info	Bio
Joshua Pierce	Southern Company Services-Transmission Planning	205-257-6196 jspierce@southernco.com	Joshua Pierce has worked for Southern Company for more than ten years with extensive experience within the transmission organization of a vertically integrated utility. He began his career with Southern Company in 2002 as a student engineer in Transmission Line Design and Maintenance Support for Alabama Power Company (APC). He began full time employment in 2004 in APC Substation Protective Equipment and Controls Design and joined APC Substation Protection and Control Field Services in 2008. In 2011, he joined Transmission Planning for Southern Company Services where he presently works performing tariff generator interconnection and transmission service studies as well as regional planning.

Name and Title	Company	Contact Info	Bio
Joe Seabrook	Puget Sound Energy	(425) 462-3577 Joe.Seabrook@pse.com	Joe Seabrook has worked in transmission expansion planning and operating at Puget Sound Energy since 1980. Puget's transmission and transmission rights extend from Washington State to Canada, through Montana, and south to the Oregon-California border. Joe is currently chairing a WECC working group to add SPS, relays, contingency descriptions, sequence components and breaker-node topology to WECC planning and operating base cases. Joe also helped develop the reactive margin requirements and voltage stability assessment methodology used by WECC, and he co-authored WECC reports, studies, guidelines, methodology, and criteria on voltage stability, reactive margin, and under voltage load tripping beginning in 1994. Joe has served on the WECC Technical Studies Subcommittee since 1993, serving as the chair, vice-chair, and secretary, and leading and serving many work groups and task forces on reliability criteria, transmission path rating, off-nominal frequency, under voltage generator and load issues, and synchronous and wind generator dynamic modeling. Joe also helped develop the reactive margin requirements and voltage stability assessment methodology used by WECC. This began with the original report in 1997 that was used to develop the WECC reactive margin criteria requirements in 2002, and the WECC Safety Net policy.

Name and Title	Company	Contact Info	Bio
Hari Singh	Xcel Energy	(303) 571-7095 hari.singh@xcelenergy.com	Hari Singh has been a member of the NERC Transmission Issues Subcommittee (TIS) since 2009. Hari is also a member of the WECC Modeling & Validation Working Group (MVWG) and well versed with the composite load model being developed and tested by WECC MVWG for promoting improved dynamic load modeling to study FIDVR events and/or evaluate voltage stability in load centers to identify the need for implementing UVLS. Currently, Hari serves as the Transmission Planning Engineer responsible for conducting the periodic studies required by PRC-010 to assess the need for UVLS or the effectiveness of existing UVLS. Hari is also a member of the NERC System Analysis & Modeling Subcommittee and the WECC Reliability Subcommittee. He has also served as the WECC Modeling & Validation WG Technical Consultant to Rocky Mountain Voltage Coordination Guidelines Working Group.
Mike Swearingen	Tri-country Electric Cooperative, Inc.	580-652-3804 mikeswearingen@tri-countyelectric.coop	Mike Swearingen has over 19 years of experience as a power system engineer for transmission and distribution systems. Mike designed and oversaw the design and construction of substations and mobile substations. He also has field experience in power system operation and control systems. Mike has also participated in the IEEE Power Quality Subcommittee and associated working groups by helping in the development of standards. Further, Mike developed the NERC program and Internal Compliance Program for Tri-County Electric Cooperative

Name and Title	Company	Contact Info	Bio
Hamid Zakery	Calpine Corporation	(832) 325-5007 hamid.zakery@calpine.com	For the past 28 years, Hamid Zakery have served the utility industry in various technical and operation responsibilities. Hamid started his career with Illinois Power Company as a relay engineer where he designed protection schemes for Transmission, Distribution and Generation assets. Later he became responsible for operation and maintenance activities for utility substations ranging from 480 volts to 345 Kv systems. As a plant engineering manager, Hamid held responsibilities for fossil plants engineering functions including performance and predictive maintenance. Over the past 10 years, he has been involved with development and implementation of engineering, operation and maintenance programs to prepare IPP generation assets in all 8 NERC Regions for compliance with NERC standards and regional guidelines.

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

SUNSHINE ACT MEETING NOTICE

June 12, 2014

The following notice of meeting is published pursuant to section 3(a) of the government in the Sunshine Act (Pub. L. No. 94-409), 5 U.S.C. 552b:

AGENCY HOLDING MEETING:	FEDERAL ENERGY REGULATORY COMMISSION
DATE AND TIME:	June 19, 2014 10:00 A.M.
PLACE:	Room 2C 888 First Street, N.E. Washington, D.C. 20426
STATUS:	OPEN
MATTERS TO BE CONSIDERED:	Agenda * NOTE - Items listed on the agenda may be deleted without further notice.
CONTACT PERSON FOR MORE INFORMATION:	Kimberly D. Bose Secretary Telephone (202) 502-8400 For a recorded message listing items struck from or added to the meeting, call (202) 502-8627.

This is a list of matters to be considered by the Commission. It does not include a listing of all documents relevant to the items on the agenda. All public documents, however, may be viewed on line at the Commission's website at http://www.ferc.gov using the eLibrary link, or may be examined in the Commission's Public Reference Room.

1006TH - MEETING

REGULAR MEETING

June 19, 2014

10:00 AM

This statement is intended to notify the public that the press briefings that follow Commission meetings may now be viewed remotely at Commission headquarters, but will not be telecast through the Capitol Connection service.

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

SUNSHINE ACT MEETING NOTICE

June 12, 2014

The following notice of meeting is published pursuant to section 3(a) of the government in the Sunshine Act (Pub. L. No. 94-409), 5 U.S.C. 552b:

AGENCY HOLDING MEETING:	FEDERAL ENERGY REGULATORY COMMISSION
DATE AND TIME:	June 19, 2014 10:00 A.M.
PLACE:	Room 2C 888 First Street, N.E. Washington, D.C. 20426
STATUS:	OPEN
MATTERS TO BE CONSIDERED:	Agenda * NOTE - Items listed on the agenda may be deleted without further notice.
CONTACT PERSON FOR MORE INFORMATION:	Kimberly D. Bose Secretary Telephone (202) 502-8400 For a recorded message listing items struck from or added to the meeting, call (202) 502-8627.

This is a list of matters to be considered by the Commission. It does not include a listing of all documents relevant to the items on the agenda. All public documents, however, may be viewed on line at the Commission's website at http://www.ferc.gov using the eLibrary link, or may be examined in the Commission's Public Reference Room.

RSC Meeting #14-2, Agenda Item 11.0: Standards Activity Post NERC BOT Approval

Latest Changes (Since Last RSC Meeting):

Project	11.1: NERC Filings to FERC	11.2: FERC Orders / Rules	11.3: Federal Register	Stage
Project: 2007-09 — Generator Verification		**Docket #:** RM13-16-000 / **Date:** 3/20/2014 **Title:** Order No. 796 Approving Generator Verification Reliability Standards **Summary:** FERC issues a final rule approving five Generator Verification Reliability Standards MOD-025-2 (Verification and Data Reporting of Generator Real and Reactive Power Capability and Synchronous Condenser Reactive Power Capability), MOD-026-1 (Verification of Models and Data for Generator Excitation Control System or Plant Volt/Var Control Functions), MOD-027-1 (Verification of Models and Data for Turbine/Governor and Load Control or Active Power/Frequency Control Functions), PRC-019-1 (Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection), and PRC-024-1 (Generator Frequency and Voltage Protective Relay Settings).	**Vol. 79, No. 59 – Date: Thursday, March 27, 2014** **RULES** Generator Verification Reliability Standards **Key Dates:** Rule effective May 27, 2014	Subject to Future Enforcement

RSC Meeting #14-2, Agenda Item 11.0: Standards Activity Post NERC BOT Approval

Project	11.1: NERC Filings to FERC	11.2: FERC Orders / Rules	11.3: Federal Register	Stage
Project: 2008-06, Cyber Security Order 706 Version 5 CIP Standards	**Docket #:** RM13-5-000/ **Date:** 3/18/2014 **Title:** **Request of NERC for Extension of Time to File Revisions to the Violation Risk Factors Assigned to Reliability Standards CIP-006-5, Requirement R3 and CIP-004-5, Requirement R4** **Summary:** NERC submits a request for a 10-day extension of time to file revisions to the Violation Risk Factors ("VRFs") assigned to Reliability Standards CIP-006-5, Requirement R3 and CIP-004-5, Requirement R4.	**Docket #:** RM13-5-000 / **Date:** 2/28/2014 **Title:** **Notice of Reliability Technical Conference on Version 5 Critical Infrastructure Protection Reliability Standards** **Summary:** FERC issues a notice of a technical conference focused on Critical Infrastructure Protection Issues Identified in Order No. 791. This staff-led conference will take place on April 29, 2014 beginning at 9:00 AM and ending at approximately 5:00 PM EST at FERC. **Docket #:** RM13-5-000 / **Date:** 3/19/2014 **Title:** **Notice of Extension of Time** **Summary:** FERC issues a notice granting a 10-day extension of time, until May 15, 2014, to file revisions to the Violation Risk Factors (VRF) assigned to Reliability Standards CIP-006-5, Requirement R3 and CIP-004-5, Requirement R4 (motion). **Docket #:** RM13-5-001 / **Date:** 3/20/2014 **Title:** **Order on Clarification and Rehearing** **Summary:** FERC issues an order granting clarification in part and denying rehearing of Order No. 791, filed jointly by Edison Electric Institute (EEI) and Electric Power Supply Association (EPSA) as well as the American Public Power Association (APPA), National Rural Electric Cooperative Association (NRECA), and Utility Services, Inc. (Utility Services).		Subject to Future Enforcement

RSC Meeting #14-2, Agenda Item 11.0: Standards Activity Post NERC BOT Approval

Project	11.1: NERC Filings to FERC	11.2: FERC Orders / Rules	11.3: Federal Register	Stage
Project: 2008-12, Coordinate Interchange Standards	**Docket #:** RD14-4-000 / **Date:** 2/27/2014 **Title:** **Petition of NERC for Approval of Proposed Reliability Standards for Interchange Scheduling and Coordination** **Summary:** NERC submits a petition for approval of five proposed Reliability Standards INT-004-3 (Dynamic Transfers), INT-006-4 (Evaluation of Interchange Transactions), INT-009-2 (Implementation of Interchange), INT-010-2 (Interchange Initiation and Modification for Reliability), and INT-011-1 (Intra-Balancing Authority Transaction Identification).			Filed and Pending Regulatory Approval
Project: 2010-01, Support Personnel Training	**Docket #:** RM14-9-000 / **Date:** 3/7/2014 **Title:** **Petition of NERC for Approval of Proposed Reliability Standard PER-005-2 and Retirement of Reliability Standard PER-005-1** **Summary:** NERC submits a petition for approval of proposed Reliability Standard PER-005-2-Operations Personnel Training and the retirement of the currently effective Reliability Standard PER-005-1.			Filed and Pending Regulatory Approval
Project: 2010-03, Modeling Data (MOD B)	**Docket #:** RD14-5-000 / **Date:** 2/25/2014 **Title:** **Petition of NERC for Approval of Proposed Reliability Standards MOD-032-1 and MOD-033-1** **Summary:** NERC submits a petition for approval of proposed Reliability Standards MOD-032-1 (Data for Power System Modeling and Analysis) and MOD-033-1 (Steady-State and Dynamic System Model Validation).			Filed and Pending Regulatory Approval
Project: 2010-13.2 Relay Loadability		**Docket #:** RM13-19-000 and RM14-3-000 / **Date:** 3/20/2014 **Title:** **Notice of Proposed Rulemaking to Approve Reliability Standards PRC-025-1 and PRC-023-3** **Summary:** FERC issues a Notice of Proposed of Proposed Rulemaking (NOPR) proposing to approve Reliability Standards PRC-025-1 (Generator Relay Loadability) and PRC-023-3 (Transmission Relay Loadability).	**Vol. 79, No. 59 – Date: Thursday, March 27, 2014** **PROPOSED RULES** **Generator Relay Loadability and Revised Transmission Relay Loadability Reliability Standards** **Key Dates:** Comments due April 28, 2014	Filed and Pending Regulatory Approval

RSC Meeting #14-2, Agenda Item 11.0: Standards Activity Post NERC BOT Approval

Project	11.1: NERC Filings to FERC	11.2: FERC Orders / Rules	11.3: Federal Register	Stage
Project: 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves	**Docket #:** _____ / **Date:** 4/2/2014 **Title:** **Petition of NERC for Approval of Reliability Standard BAL-001-2-Real Power Balancing Control Performance** **Summary:** NERC submits a petition for approval of proposed Reliability Standard BAL-001-2-Real Power Balancing Control Performance.			
Project: 2010-17, BES Definition and BES Exception Procedure	**Docket #:** RD14-2-000 / **Date:** 4/1/2014 **Title:** **Revised Bulk Electric Definition in the NERC Rules of Procedure** **Summary:** NERC submits this filing to update the revised Phase 2 definition of Bulk Electric System, approved in FERC's March 20, 2014 order, in the NERC Rules of Procedure, Appendix 2 Definitions Used in the Rules of Procedure and Appendix 5B Statement of Compliance Registry Criteria.	**Docket** #: RD14-2-000 / **Date:** 3/20/2014 **Title:** **Order Approving Revised Definition** **Summary:** FERC issued an order approving revisions to the definition of "bulk electric system" in the NERC Glossary of Terms Used in Reliability Standards (NERC Glossary).		Subject to Future Enforcement
Project: 2013-03, Geomagnetic Disturbance Mitigation	**Docket #:** RM14-1-000 / **Date:** 3/24/2014 **Title:** **Comments of NERC in Response to Notice of Proposed Rulemaking EOP-010-1 (Geomagnetic Disturbance Operations)** **Summary:** NERC submits comments in response to the Notice of Proposed Rulemaking (NOPR) proposing to approve Reliability Standard EOP-010-1 (Geomagnetic Disturbance Operations).			Filed and Pending Regulatory Approval

RSC Meeting #14-2, Agenda Item 11.0: Standards Activity Post NERC BOT Approval

Project	11.1: NERC Filings to FERC	11.2: FERC Orders / Rules	11.3: Federal Register	Stage
Project: 2014-04, Physical Security	**Docket #:** RD14-6-000/ **Date:** 3/10/2014 **Title:** Doc-Less Motion to Intervene in Docket No. RD14-6-000 **Summary:** NERC submits a doc-less motion to intervene in the proceeding regarding direction to develop reliability standards requiring owners and operations of the Bulk-Power System to address risks due to physical security threats and vulnerabilities.	**Docket #:** RD14-6-000 / **Date:** 3/7/2014 **Title:** Notice of Designation of Commission Staff **Summary:** FERC issues a letter order identifying the staff from the Office of Electric Reliability designated as non-decisional, who are prohibited from communicating with advisory staff concerning any deliberations for Physical Security Measures Reliability Standards. **Docket #:** RD14-6-000 / **Date:** 3/7/2014 **Title:** Order Directing Filing of Standards **Summary:** FERC issues an order requiring NERC to develop reliability standards requiring owners and operators of the Bulk-Power System to address risks due to physical security threats and vulnerabilities.	**Vol. 79, No. 50 – Date: Friday, March 14, 2014** **NOTICES** **Reliability Standards for Physical Security Measures: Designation of Commission Staff as Non-Decisional** **Key Dates:** N/A	Under Development

    d. Highlights of Parliamentary Procedure*
14. **Adjourn**

*Background materials included.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and subgroups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost information and participants' expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.
- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

- Any other matters that do not clearly fall within these guidelines should be reviewed with NERC's General Counsel before being discussed.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and subgroups) may have a negative impact on particular entities and thus in that sense adversely impact competition. Decisions and actions by NERC (including its committees and subgroups) should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation, Bylaws, and Rules of Procedure are followed in conducting NERC business.

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or subgroup, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on electricity markets, and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.

Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and employment matters; and procedural matters such as planning and scheduling meetings.

Public Announcements

REMINDER FOR USE AT BEGINNING OF MEETINGS AND CONFERENCE CALLS THAT HAVE BEEN PUBLICLY NOTICED AND ARE OPEN TO THE PUBLIC

Conference call version:
Participants are reminded that this conference call is public. The access number was posted on the NERC website and widely distributed. Speakers on the call should keep in mind that the listening audience may include members of the press and representatives of various governmental authorities, in addition to the expected participation by industry stakeholders.

Draft Minutes
Standards Committee Meeting

May 14, 2014 | 1:00 - 4:00 p.m. Eastern

NERC Antitrust Compliance Guidelines and Public Announcement

Introductions and Chair's Remarks

S. J. Kim started the meeting and took attendance of Standards Committee (SC or Committee) members and determined a quorum. She reviewed the NERC Antitrust Compliance Guidelines and reminded participants that the meeting is public and that notice of the meeting had been widely distributed.

B. Murphy provided introductory remarks. He noted that at the recent NERC Board meeting, it was mentioned several times that several members were pleased with the direction of the Committee, the Committee's relationship with NERC staff, its relationship with stakeholders, and the flexibility it showed on the physical security standard. He also noted that PRC-005, PRC-026 was authorized for posting by the SC Executive Committee in between the SC calls, and that the SC would discuss the revised TOP/IRO authorization on a May 16, 2014 call. He also stated that FERC announced a June 10, 2014 technical conference, the same date as the June SC meeting. Informal polling of the SC members indicated that the SC would still like to meet on June 10 and 11 with the understanding that some members may want to watch the technical conference on June 10. In light of the possible desire to watch the FERC conference, the SC Committee may conduct its business on the June 11, if only a half day is anticipated to cover the entire agenda. He also announced that V. Agnew has been promoted to Director of Standards.

V. Agnew made introductory remarks, and explained further that M. Lauby has been promoted to Chief Reliability Officer. She also announced that the Board adopted the physical security standard yesterday. She also added that the SBS software launch has been delayed due to technical issues. NERC will address and fix those outstanding issues, and then it will continue the registration effort.

Agenda Items

1. **Review of Agenda — (Approve)**
   F. Plett moved to approve the agenda, striking item 10.b.i. and move that item to a May 16, 2014 call. F. Gaffney seconded the motion.

   -The Committee approved the motion with no objections or abstentions.

2. **Consent Agenda — (Approve)**

   a. April 9, 2014 Meeting Minutes **– (Approve)**

      A. Gallo moved to approve the Minutes.

E. Skiba seconded the motion.

-The Committee approved the motion by unanimous consent.

3. **Three-Month Outlook on Upcoming Standard Projects or Issues — (Update)**
   V. Agnew provided the three-month outlook. She indicated that the EOP project may be ready earlier than anticipated, and she said the project might be ready to present to the SC by the 30th.

4. **Projects Under Development — (Review)**

   a. Project Tracking Spreadsheet
      B. Murphy indicated that the PMOS representatives have been working well with NERC staff and FERC staff on the TOP/IRO project and invited PMOS representatives to discuss their projects.

      J. Seelke asked that the QR checklist be updated due to a concern he saw with the wording in the Stable Power Swings project. V. Agnew indicated that an updated checklist may not be necessary, but that she would investigate and report back to the Committee.

   b. Projected Posting Schedule
      B. Nutter reported that the BAL-002 team is coordinating with the EOP team, and NERC does not want to post until coordination is complete. Further, the PRC-027 team is resolving an issue with FERC before posting.

5. **Draft 2015-2017 Reliability Standards Development Plan and Enhanced Periodic Review — (Authorize)**

   B. Murphy asked for a motion to adopt the action item as written with the understanding that SC leadership will work to incorporate suggested edits by members of the SC.

   F. Plett moved to adopt the action item as written. G. Zito seconded the motion.

   -The Committee approved the motion with no objections or abstentions.

6. **SC Meeting Schedule for 2015* — (Approve)**
   B. Murphy thanked B. Hampton for volunteering to lead this effort. He asked for a motion to adopt the action item as written and solicited volunteers to work with B. Hampton.

   J. Sterling moved to adopt the action item as written. B. Li seconded the motion.

   B. Hampton noted that it is useful to work with NERC staff on where the Committee intends to meet in 2015, and emphasized she would like support from SC members. V. Agnew volunteered NERC staff to assist. F. Plett expressed a preference of two meetings in the west, two in the east. J. Sterling asked the planners to consider costs when scheduling meetings. B. Murphy also noted that times should not conflict with FERC open meetings and should be scheduled at a time that FERC staff is available to attend.

   -The Committee approved the motion with no objections or abstentions.

7. **Detail of Minutes re: Appointment of Drafting Teams — (Approve)**
   B. Murphy provided background on this agenda item. He explained that D. Kiguel expressed concern about whether to provide more detail in the SC minutes with regard to drafting team appointments. G. Zito expressed support for more detail in the meeting minutes as the official record for the meetings, but S. Miller stated most minutes are not providing this level of detail. The agenda item was tabled for further discussion on the options proposed regarding the enhanced minutes.

8. **Reliability Issues Steering Committee Triage Diagram — (Informational item)**
   B. Murphy explained that he presented the RISC diagram to the SCPS and PMOS. F. Gaffney asked who decides whether a triage moves forward. B. Murphy responded that the SC would make that determination. B. Murphy asked for comments within the next two weeks on the diagram.

9. **Update on Reaching Quorum for Standards Ballots — (Informational item)**
   B. Murphy noted that there have been issues in reaching quorum on two standards within the last month. B. Murphy and S. Miller sent emails asking people to vote in order to close the ballot. The emails were helpful, and both are willing to do this as an interim resolution.

   L. Lee indicated that on a more permanent basis she would be working with B. Nutter on this issue, hopefully through the new balloting software. She further explained that NERC will develop a report to present to the SC to make it aware of the new features of the new balloting software that will help with the problem. NERC also is looking at patterns of people failing to vote and is targeting the June 2014 Committee meeting for a more detailed write-up.

   B. Murphy asked legal to explore whether NERC can publish who has and has not voted in a ballot. Others have an issue with making public such a list.

10. **Subcommittee Reports**

    a. **PMOS – (Update)**
       J. Sterling noted that since the SC met on April 17, 2014, she has added a column to tracking spreadsheet indicating consistency with the IERP effort. She stated there has been good discussion with PMOS liaisons on the status of projects. PMOS is considering possible changes to the PMOS charter, but that was tabled in anticipation of further conversations. Additionally, she added that the PMOS meetings are set for the rest of the year.

    b. **Process Subcommittee**

       i. **Process Subcommittee Membership – CONFIDENTIAL (Approve)**

    -This agenda item was moved to the May 16th SC call.

11. **Communication Updates and Activities — (Update)**
    S. Miller provided an update, and M. Huggins noted that next year NERC is looking at one long week for ERO auditor and Standards and Compliance workshops during the same week. The expectations is

to get more NERC staff involved. B. Murphy asked for an update as these ideas are a little further developed.

12. **Upcoming Standards Filings — (Review)**
    H. Hawkins provided an overview of upcoming standards filings as detailed in the agenda packet**.**
13. **Informational Items — (Enclosed)**
    a. SC Expectations
    b. 2014 Meeting Dates and Locations
    c. 2014 Standards Committee Roster
    d. Highlights of Parliamentary Procedure
14. **Adjourn**

*Background materials included.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Draft Minutes
Standards Committee Meeting

May 16, 2014 | 3:00 p.m. Eastern

NERC Antitrust Compliance Guidelines and Public Announcement*

S.J. Kim determined a quorum and reviewed the NERC Antitrust Compliance Guidelines and reminded participants that notice of the meeting had been widely distributed.

Introductions and Chair's Remarks

B. Murphy provided no opening remarks, but, rather, immediately transitioned to the agenda.

Agenda Items

1. **Review of Agenda — (Approve)**
   G. Zito moved to approve the agenda. F. McElvain seconded the motion.

   -The Committee approved the motion with no objections or abstentions.

2. **Project 2014-03: Revisions to Transmission Operations/Interconnection Reliability Operations and Coordination Reliability Standards *— (Authorize)**
   G. Zito moved to approve the agenda item as written with an addendum for VRF revisions. B. Li seconded the motion.

   L. Hussey provided background on the project, and explained that an addendum was necessary for full transparency to show the VRFs were updated for consistency. Further, the rationale boxes within the standards were revised. She went on to explain no substantive changes were made to the proposed standard requirements. L. Hussey added that PRC-001 now will need to be updated based on the TOP/IRO project, but those changes are not currently in the scope of the current project. L. Hussey also noted that there will be some duplicate language in TOP/IRO and the PRC-001 project, but the team will work with Compliance and Enforcement to ensure no double jeopardy occurs. V. Agnew added that PRC-027 will not be adding PRC-001 revisions to its project scope either.

   G. Zito provided additional context for the proposed standards by stating he attended the last drafting team meeting and the workshop. He expressed that the drafting team addressed outstanding issues and were responsive to many concerns. F. Gaffney asked is the drafting team supported the VRF changes in the recent addendum, and E. Dobrowolski, A Pankratz (vice chair of the standards drafting team) and L. Hussey replied that the team did support the changes. F. Gaffney further inquired about the necessary changes for PRC-001, and E. Dobrowolski answered that the language was added back to the proposed drafts because there were two concerns: 1) coordination and 2) notification. He explained the notifications were covered by the proposed standards, but the relaying of information was not sufficient. F. Gaffney then asked if PRC-027 could handle revisions to PRC-001. E.

Dobrowolski stated the necessary changes for coordination will mean more than passing data between entities, and V. Agnew explained that coordination will take another drafting team effort.

-The Committee approved the motion with no objections or abstentions.

3. **Project 2008-02- Undervoltage Load shedding revised SAR to include UFLS* — (Review)**
   F. Plett moved to approve the agenda item as written. R. Crissman seconded the motion.

   V. Agnew provided background by explaining the revised SAR was necessary to address an outstanding PRC-006 directive. UVLS includes language on corrective actions, and the UFLS standard now needs to mirror that language. F. Gaffney asked for a sentence on steady-state in the SAR to be revised. V. Agnew agreed to revisions clarifying what steady-state meant. F. McElvain and R. Blohm supported removing references to steady-state from the SAR. B. Murphy suggested that they propose a friendly amendment clarifying steady-state meant results-based standards that follow P81 and independent expert recommendations. He further explained that striking the phrase on steady-state in entirety could alter the SAR to allow any modifications in the standard. F. Gaffney supported a friendly amendment to just clarify the language with regard to steady-state. G. Zito then interjected by asking if QR was done on the documents. V. Agnew explained the documents were reviewed internally, and the SAR changes were minimal.

   -The Committee approved the motion with no objections or abstentions.

4. **Process Subcommittee Membership* – CONFIDENTIAL (Approve)**
   G. Zito moved to approve the agenda item as written. B. Li seconded the motion.

   L. Lee explained that solicitations for new members were sent broadly throughout the industry. The recommended new members include some SC members, active observers, and a new person to the committee.

   -The Committee approved the motion with no objections or abstentions.

5. **Adjourn**

*Background materials included.

Drafting Team Appointments

- June 2014
  - Project 2010-14.2 Implementation of BAL Periodic Review Recommendations

Authorize Posting

- June 2014:
  - Project 2013-03: GMD Stage 2 (45-day comment and initial ballot of 1 standard) (High)
  - Project 2009-03: Emergency Operations (45-day comment and initial ballot of 1 standard) (High)
  - Project 2008-02: Undervoltage Load shedding (45-day comment and initial ballot for PRC-010-1) (High)
  - Project 2010-05.2: Protection Systems (Special Protection Systems) (45-day comment and initial ballot of one revised definition) (Medium)
  - Project 2014-01: Standards Applicability for Dispersed Power Producing Resources (45-day comment and ballot of high-priority standards) (High)
  - Project 2010-14.2: Implementation of BAL Periodic Review Recommendations (SAR for 30-day comment period) (Medium)

Authorize Posting

- July 2014:
  - Project 2008-02: Undervoltage Load shedding for UFLS (45-day comment and initial ballot for PRC-010-1) (High)

Authorize Posting

- August 2014:
  - Project 2012-09: Implementation of Interconnection Reliability Operations and Coordination Five-year Review (Medium)

Questions and Answers

Project 2008-02 Undervoltage Load Shedding (PRC-010-1)

Action

Authorize the posting of the Project 2008-02 Undervoltage Load Shedding proposed Reliability Standard PRC-010-1, Implementation Plan, Violation Risk Factors (VRFs), and Violation Severity Levels (VSLs) for an initial 45-day formal comment period with ballot pool formation during the first 30 days and initial ballot and non-binding poll during the last 10 days of the comment period.

Background

Project History

In January 2010, NERC posted the Project 2008-02 Undervoltage Load Shedding Standard Authorization Request (SAR) for public comment. The SAR cited NERC technical reports and assessments of UVLS programs and standards, along with the FERC Order No. 693 directive (Paragraph 1509) that approved PRC-010-0 but requested that it be modified to require that an integrated and coordinated approach be included in all protection systems on the Bulk Power System, including generators and transmission lines, generators' low voltage ride-through capabilities, and underfrequency load shedding (UFLS) and undervoltage load shedding (UVLS) programs.

Concurrently with the SAR posting, nominations were accepted for a drafting team. Work was deferred due to prioritization for the 2011–2013 Reliability Standards Development Plan (RSDP) and the effort was restarted as part of the 2013–2015 RSDP. A formal drafting team was appointed by the Standards Committee on May 21, 2013. The drafting team reevaluated the SAR to address NERC's existing UVLS standards such that they are results-based, address the Order No. 693 directive for PRC-010-0 and current reliability issues associated with UVLS, and consider all relative inputs, including appropriate NERC technical committee reports, Paragraph 81 criteria, Independent Expert Review Panel (IERP) recommendations, and existing standards and active development projects that may require coordinating changes.

A revised SAR was posted for a 30-day informal comment period in September 2013 along with draft standard requirements for a proposed PRC-010-1. Industry comments were considered and additional outreach was performed to develop a complete PRC-010-1, VRFs and VSLs, an Implementation Plan, and supporting documentation. The first formal posting was then postponed to coordinate with Project 2010-05.2 – Special Protection Systems (Phase 2 of Protection Systems) to accommodate the Project 2008-02 drafting team's proposed transition of certain types of UVLS systems to be covered by Special Protection System (SPS) or Remedial Action Scheme (RAS)-related standards due to commensurate design and characteristics. In the interim, PRC-010-1 and all supporting documents were posted for a 30-day informal comment period in March 2014 to solicit further feedback from the industry.

Proposal, Retirements, and Coordinating Efforts

Proposed PRC-010-1 consolidates, revises, and subsequently retires four existing UVLS standards: PRC-010-0 – Assessment of the Design and Effectiveness of UVLS Program; PRC-020-1 – Under-Voltage Load Shedding Program Database; PRC-021-1 – Under-Voltage Load Shedding Program Data; and PRC-022-1 – Under-Voltage Load Shedding Program Performance. Redlines to these standards are not provided because the revision resulted in changes to content and structure that do not lend themselves to a direct, one-to-one comparison.

PRC-010-1 also introduces a new NERC Glossary term "Undervoltage Load Shedding Program (UVLS Program)" to identify the systems to which the standard is applicable with respect to reliability requirement-related needs. As such, the term excludes a specific type of undervoltage-based load shedding that is more appropriately categorized as a SPS or RAS. This transition is being facilitated with concurrent Project 2010-05.2 – Special Protection Systems by way of a conforming revision to the definition of the term "Special Protection System" and is addressed in the implementation plans for both PRC-010-1 and the revised definition of "Remedial Action Scheme" proposed by Project 2010-05.2.

In addition, concurrent Project 2009-03 – Emergency Operations (EOP-011-1) proposes to retire certain requirements from EOP-003-2 that map to PRC-010-1. This transition is reflected in both the PRC-010-1 and EOP-011-1 implementation plans as well.

As a result of the coordinating efforts above, the effective dates of PRC-010-1 and its proposed new NERC Glossary term, EOP-011-1, the revised NERC Glossary definition of "Remedial Action Scheme," and each of the associated retirements are intended to align to accommodate the needed transitions of standard coverage. In addition, the formal comment periods and ballots for each of these projects are being timed to run concurrently or overlap.

Building Consensus and Quality

Over the course of Project 2008-02, NERC technical, legal, and compliance staff, and the Project Management and Oversight Committee (PMOS) liaison were intricately involved to facilitate a comprehensive approach to standard development. In addition, the Project 2008-02 drafting team regularly sought feedback on both quality and content of the standard from a variety of stakeholders, including representatives from trade associations, Regional standard review and system protection committees, appropriate NERC technical committees, and governmental authority staff. This included observer participation during drafting team meetings, informal discussions and reviews with colleagues, two informal comment periods, two industry webinars, and more than 20 outreach presentations with individual forums.

A final quality review of the Standard, VRFs and VSLs, and Implementation Plan was conducted May 21–28. All documents were reviewed by an industry technical expert, the PMOS liaison, and NERC staff from the Legal, Standards, and Reliability Assessments and Performance Analysis (RAPA) departments. Minor issues regarding clarity and consistency of language and general document formatting were identified and addressed by the lead Standards Developer and the drafting team Chair and Vice Chair. The documents provided to the Standards Committee reflect these revisions.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. Standard Authorization Request (SAR) posted for comment on January 20, 2010.
2. Revised SAR with supporting draft standard language posted for informal comment on September 10, 2013.
3. Draft standard posted for informal comment on March 17, 2014.

Description of Current Draft

The Undervoltage Load Shedding Standard Drafting Team is posting Draft 1 of PRC-010-1 – Undervoltage Load Shedding for a 45-day formal comment period and parallel (concurrent) initial ballot during the last 10 days of the comment period.

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with Parallel Initial Ballot	June 2014
Final Ballot	September 2014
BOT Adoption	November 2014

Effective Dates

The standard shall become effective on the first day of the first calendar quarter that is 12 months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is 12 months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Version History

Version	Date	Action	Change Tracking
1.0	TBD	Completed revision, merging and updating PRC-010-0, PRC-020-1, PRC-021-1, and PRC-022-1.	

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Undervoltage Load Shedding Program (UVLS Program): An automatic load shedding program consisting of distributed relays and controls used to mitigate undervoltage conditions leading to voltage instability, voltage collapse, or Cascading impacting the Bulk Electric System (BES). Centrally-controlled undervoltage-based load shedding is not included.

Rationale for Definition: As part of the development of PRC-010-1, the drafting team found it necessary to introduce the term Undervoltage Load Shedding Program (UVLS Program) to establish PRC-010-1's applicability. The following are critical defining elements of the proposed term:

1) The definition provides flexibility for the Planning Coordinator or Transmission Planner to determine if a UVLS system falls under the defined term with respect to the impact on the reliability of the BES. (See Guidelines and Technical Basis section for further discussion.)

2) Centrally-controlled undervoltage-based load shedding is excluded because its design and characteristics are commensurate with a Special Protection Systems (SPS) or Remedial Action Scheme (RAS) (wherein load shedding is the remedial action). As such, centrally-controlled undervoltage-based load shedding should therefore be subject to SPS/RAS-related Reliability Standards. (See Guidelines and Technical Basis section for rationale.)

Consequently, the drafting team has recommended that Project 2010-05.2 – Special Protection Systems (Phase 2 of Protection Systems) include centrally-controlled undervoltage-based load shedding in the definition of a Special Protection System/Remedial Action Scheme.

3) The definition of UVLS Program is independent of whether the undervoltage load shedding relays are armed manually or automatically since the arming is done in anticipation of extreme conditions and not during the events when load shedding needs to occur.

When this standard has received ballot approval, the text boxes will be moved to the Guidelines and Technical Basis section of the Standard.

A. Introduction

1. **Title: Undervoltage Load Shedding**

2. **Number: PRC-010-1**

3. **Purpose:** To establish an integrated and coordinated approach to the design, evaluation, and reliable operation of Undervoltage Load Shedding Programs (UVLS Programs).

Rationale for Applicability: This standard is applicable to Planning Coordinators and Transmission Planners that have or are developing a UVLS Program, and to Distribution Providers and Transmission Owners responsible for the ownership, operation, or control of UVLS equipment as required by the UVLS Program established by the Transmission Planner or Planning Coordinator. These Distribution Providers and Transmission Owners are referred to as UVLS entities for the purpose of this standard.

The applicability includes both the Planning Coordinator and Transmission Planner because either may be responsible for designing and coordinating the program based on agreements, memorandums of understanding, or tariffs.

The phrase "Planning Coordinator or Transmission Planner" provides the flexibility for applicability to the entity that will perform the action. The expectation is not that both parties will perform the action, but rather that the Planning Coordinator and Transmission Planner will engage in discussion to determine the appropriate responsible entity.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Planning Coordinator

   4.1.2 Transmission Planner

   4.1.3 Undervoltage load shedding (UVLS) entities – Distribution Providers and Transmission Owners responsible for the ownership, operation, or control of UVLS equipment as required by the UVLS Program established by the Transmission Planner or Planning Coordinator.

5. Background:

UVLS Programs must work correctly to properly protect system reliability. Evaluating program effectiveness and coordination, and ensuring accurate and timely program implementation, assessment, and data will improve UVLS Program performance.

PRC-010-1 – Undervoltage Load Shedding is a consolidation and revision of the following Reliability Standards:

- PRC-010-0 – Assessment of the Design and Effectiveness of UVLS Program
- PRC-020-1 – Under-Voltage Load Shedding Program Database
- PRC-021-1 – Under-Voltage Load Shedding Program Data
- PRC-022-1 – Under-Voltage Load Shedding Program Performance

The UVLS Standard Drafting Team (or drafting team) developed the revised PRC-010-1 to meet the following objectives:

- Address the FERC directive in Order No. 693, Paragraph 1509 to modify PRC-010-0 to require an integrated approach to all protection systems.
- Replace the applicability to and involvement of the Regional Reliability Organization (RRO) in PRC-020-1 and PRC-021-1.
- Consolidate the UVLS-related standards into one comprehensive standard (similar to the construct of FERC-approved PRC-006-1– Automatic Underfrequency Load Shedding).
- Clearly identify and separate centrally-controlled undervoltage-based load shedding due to the reliability requirements needed for this type of load shedding as compared to other UVLS systems.
- Create a single results-based standard that addresses current reliability issues associated with UVLS.

As noted above, the drafting team found it is necessary to establish a bright line with respect to the characteristics of centrally-controlled undervoltage-based load shedding with regard to its reliability requirement-related needs. Because the design and characteristics of a centrally-controlled undervoltage-based load shedding system are commensurate with a Special Protection System (SPS) or Remedial Action Scheme (RAS), the drafting team maintains that this type of load shedding should be covered by SPS/RAS-related Reliability Standards.

Therefore, PRC-010-1 introduces a new NERC Glossary term, UVLS Program, to establish PRC-010-1's applicability to automatic load shedding programs consisting of distributed relays and controls used to mitigate undervoltage conditions leading to voltage instability, voltage collapse, or Cascading impacting the Bulk Electric System (BES). It is noted that this term excludes centrally-controlled undervoltage-based load shedding.

Subsequently, since the current NERC Glossary definition of Special Protection System excludes UVLS, concurrent Project 2010-05.2 – Special Protection Systems (Phase 2 of Protection Systems) will adjust the definition to exclude only UVLS Programs as defined above and therefore include centrally-controlled undervoltage-based load shedding. Of note, the drafting team for Project 2010-05.2 is proposing to change the term from "Special Protection System" to "Remedial Action Scheme." Accordingly, PRC-010-1 uses the term Remedial Action Scheme instead of Special Protection System.

In the current inventory of NERC Reliability Standards, there is one instance of the term undervoltage load shedding program, which is in NUC-001-2.1. Project 2012-13 – Nuclear Plant Interface Coordination has adjusted the language of this reference in proposed NUC-001-3 to eliminate any potential confusion of a lowercase usage of a defined term. Likewise, future projects containing standards that feature variations of the term (e.g., undervoltage load shedding system) will also be advised to consider the newly defined term.

Requirements of the revised Reliability Standard PRC-010-1 meet the following objectives:

- Evaluate a UVLS Program's effectiveness prior to implementation, including the program's coordination with other protection systems and generator voltage ride-through capabilities.
- Adhere to UVLS Program specifications and implementation schedule.
- Perform periodic assessment and performance analysis of UVLS Programs and resolve identified deficiencies.
- Maintain and share UVLS Program data.

Also of note, Project 2009-03 – Emergency Operations is proposing EOP-011-1, which, as part of the overall revisions, retires specific requirements from EOP-003-2 – Load Shedding Plans to eliminate identified redundancy between PRC-010-1 and EOP-003-2. In addition, the UVLS drafting team's intention is for PRC-004 to address Misoperations of UVLS Programs that are intended to trip one or more BES Elements. A change to make these types of UVLS Programs explicitly applicable to PRC-004 will be addressed once PRC-004-3 – Protection System Misoperation Identification and Correction is completed under Project 2010-05.1 – Misoperations (Phase 1 of Protection Systems).

B. Requirements and Measures

Rationale for R1: In Paragraph 1509 from Order No. 693, FERC directed NERC to require an integrated and coordinated approach to all protection systems. The drafting team agrees that a lack of coordination among protection systems is a key risk to reliability, and that each Planning Coordinator or Transmission Planner that develops a UVLS Program should evaluate the program's viability and effectiveness prior to implementation. This evaluation should include studies and analyses used when developing the program that show implementation of the program resolves the identified undervoltage conditions that led to its design. These studies and analyses should also show that the UVLS Program is integrated through coordination with generator voltage ride-through capabilities and other protection and control systems. Though presented as separate items, the drafting team recognizes that the studies that show coordination considerations and that the program addresses undervoltage issues may be interrelated and presented as one comprehensive analysis.

In addition, Requirement R1 also requires the Planning Coordinator or Transmission Planner to provide the UVLS Program's specifications and implementation schedule to applicable UVLS entities to implement the program. It is noted that studies to evaluate the effectiveness of the program should be completed prior to providing the specifications and schedule.

R1. Each Planning Coordinator or Transmission Planner that is developing a UVLS Program shall evaluate its effectiveness and subsequently provide the UVLS Program's specifications and implementation schedule to the UVLS entities responsible for implementing the UVLS Program. The evaluation shall include, but is not limited to, studies and analyses that show: *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

1.1. The implementation of the UVLS Program resolves the identified undervoltage issues that led to its development and design.

1.2. The UVLS Program is integrated through coordination with generator voltage ride-through capabilities and other protection and control systems, including, but not limited to, transmission line protection, auto-reclosing, Remedial Action Schemes, and other undervoltage-based load shedding programs.

M1. Acceptable evidence may include, but is not limited to, date-stamped studies and analyses, reports, or other documentation detailing the effectiveness of the UVLS Program, and date-stamped communications showing that the UVLS Program specifications and implementation schedule were provided to UVLS entities.

Rationale for R2: UVLS entities must implement a UVLS Program or address any necessary corrective actions for a UVLS Program according to the specifications and schedule provided by the Planning Coordinator or Transmission Planner. If UVLS entities do not implement the UVLS Program according to the specifications and schedule provided, the UVLS Program may not be effective and may not achieve its intended goal.

R2. Each UVLS entity shall adhere to the UVLS Program specifications and implementation schedule determined by its Planning Coordinator or Transmission Planner associated with UVLS Program development per Requirement R1 or with any Corrective Action Plans per Requirement R5. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

M2. Acceptable evidence must include date-stamped documentation on the completion of actions and may include, but is not limited to, identifying the equipment armed with UVLS relays, the UVLS relay settings, associated Load summaries, work management program records, work orders, and maintenance records.

Rationale for R3: A periodic comprehensive assessment (detailed analysis) should be conducted to identify and catalogue the accumulated effects of minor changes to the system that have occurred since the last assessment was completed, and should include an evaluation of each UVLS Program to ensure the continued integration through coordination. This comprehensive assessment supplements the NERC Reliability Standard TPL-001-4 annual assessment requirement to evaluate the impact of protection systems.

Based on the drafting team's knowledge and experience, and in keeping with time frames contained in similar requirements from other PRC Reliability Standards, 60 calendar months was determined to be the maximum amount of time allowable between assessments. Assessments will be performed sooner than the end of the 60-calendar month period if the Planning Coordinator or Transmission Planner determines that there are material changes to system topology or operating conditions that affect the performance of a UVLS Program. Note that the 60-calendar month time frame would reset after each assessment.

R3. Each Planning Coordinator or Transmission Planner shall perform a comprehensive assessment to evaluate the effectiveness of each of its UVLS Programs at least once every 60 calendar months. Each assessment shall include, but is not limited to, studies and analyses that evaluate whether: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

3.1. The UVLS Program resolves the identified undervoltage issues for which the UVLS Program is designed.

3.2. The UVLS Program is integrated through coordination with generator voltage ride-through capabilities and other protection and control systems, including, but not limited to, transmission line protection, auto-reclosing, Remedial Action Schemes, and other undervoltage-based load shedding programs.

M3. Acceptable evidence may include, but is not limited to, date-stamped reports or other documentation detailing the assessment of the UVLS Program.

Rationale for R4: A UVLS Program not functioning as expected during a voltage excursion event for which the UVLS Program was designed to operate presents a critical risk to system reliability. Therefore, a timely assessment to evaluate whether the UVLS Program resolved the undervoltage issues associated with the applicable event is essential. The 12 calendar months (from the date of the event) provides adequate time to coordinate with other Planning Coordinators, Transmission Planners, Transmission Operators, and UVLS entities, simulate pre- and post-event conditions, and complete the performance assessment.

R4. Each Planning Coordinator or Transmission Planner shall, within 12 calendar months of an event that resulted in a voltage excursion for which its UVLS Program was designed to operate, perform an assessment to evaluate whether its UVLS Program resolved the undervoltage issues associated with the event. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M4. Acceptable evidence may include, but is not limited to, date-stamped event data, event analysis reports, or other documentation detailing the assessment of the UVLS Program.

Rationale for R5: If program deficiencies are identified during an assessment of a UVLS Program performed in either Requirement R3 or R4, the Planning Coordinator or Transmission Planner must develop a Corrective Action Plan (CAP) to address the deficiencies. Based on the drafting team's knowledge and experience with UVLS studies, three calendar months was determined to provide a judicious balance between the reliability need to address deficiencies expeditiously and the time needed to consider potential solutions, coordinate resources, develop a CAP and implementation schedule, and provide the CAP and schedule to UVLS entities.

It is noted that the three-month time frame is only to develop the CAP and provide it to UVLS entities and does not encompass the time UVLS entities have to implement the CAP. Requirement R2 requires UVLS entities to execute the CAP according to the schedule provided by the Planning Coordinator or Transmission Planner.

R5. Each Planning Coordinator or Transmission Planner that identifies deficiencies in its UVLS Program during an assessment performed in either Requirement R3 or R4 shall develop a Corrective Action Plan to address the deficiencies and subsequently provide the Corrective Action Plan, including an implementation schedule, to UVLS entities

within three calendar months of completing the assessment. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M5. Acceptable evidence must include a date-stamped Corrective Action Plan that addresses identified deficiencies and may also include date-stamped reports or other documentation supporting the Corrective Action Plan. Evidence should also include date-stamped communications showing that the Corrective Action Plan and an associated implementation schedule were provided to UVLS entities.

Rationale for R6: Having accurate and current data is required for the Planning Coordinator to perform undervoltage studies and for use in event analyses. Requirement R6 supports this reliability need by requiring the Planning Coordinator to update its UVLS Program database at least once each calendar year.

R6. Each Planning Coordinator that has a UVLS Program in its area shall update a database containing data necessary to model its UVLS Program for use in event analyses and assessments of the UVLS Program at least once each calendar year. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M6. Acceptable evidence may include, but is not limited to, date-stamped spreadsheets, database reports, or other documentation demonstrating a UVLS Program database was updated.

Rationale for R7: Having accurate and current data is required for the Planning Coordinator to perform undervoltage studies and for use in event analyses. Requirement R7 supports this reliability need by requiring the UVLS entity to provide UVLS Program data in accordance with specified parameters.

R7. Each UVLS entity shall provide data to its Planning Coordinator according to the format and schedule specified by the Planning Coordinator to support maintenance of a UVLS Program database. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M7. Acceptable evidence may include, but is not limited to, date-stamped emails, letters, or other documentation demonstrating data was provided to the Planning Coordinator as specified.

Rationale for R8: Requirement R8 supports the integrated and coordinated approach to UVLS programs directed by Paragraph 1509 of Order No. 693 by requiring that UVLS Program data be shared with neighboring Planning Coordinators and Transmission Planners within a reasonable time period. Requests for the database should also be fulfilled for those functional entities that have a reliability need for the data (such as the Transmission Operators that develop System Operating Limits and Reliability Coordinators that develop Interconnection Reliability Operating Limits).

R8. Each Planning Coordinator that has a UVLS Program in its area shall provide its UVLS Program database to other Planning Coordinators and Transmission Planners within its Interconnection, and other functional entities with a reliability need, within 30 calendar days of a written request. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M8. Acceptable evidence may include, but is not limited to, date-stamped emails, letters, or other documentation demonstrating that the UVLS Program database was provided within 30 calendar days of receipt of a written request.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The Planning Coordinator, Transmission Planner, Distribution Provider, and Transmission Owner shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The applicable entity shall retain documentation as evidence since the last audit.

If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

"Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.4. Additional Compliance Information

None

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Long-term Planning	High	N/A	N/A	N/A	The applicable entity that developed the UVLS Program failed to evaluate the program's effectiveness and subsequently provide the UVLS Program's specifications and implementation schedule to UVLS entities in accordance with Requirement R1, including the items specified in parts 1.1 and 1.2.

R2	Long-term Planning	High	N/A	N/A	The applicable entity failed to adhere to the UVLS Program specifications in accordance with Requirement R2. OR The applicable entity failed to adhere to the implementation schedule in accordance with Requirement R2.	The applicable entity failed to adhere to the UVLS Program specifications and implementation schedule in accordance with Requirement R2.
R3	Long-term Planning	Medium	N/A	N/A	N/A	The applicable entity failed to perform an assessment at least once during the 60 calendar months in accordance with Requirement R3, including the items specified in parts 3.1 and 3.2.

R4	Operations Planning	Medium	The applicable entity performed an assessment in accordance with Requirement R4 within a time period greater than 12 calendar months but less than or equal to 13 calendar months after an applicable event.	The applicable entity performed an assessment in accordance with Requirement R4 within a time period greater than 13 calendar months but less than or equal to 14 calendar months after an applicable event.	The applicable entity performed an assessment in accordance with Requirement R4 within a time period greater than 14 calendar months but less than or equal to 15 calendar months after an applicable event.	The applicable entity performed an assessment in accordance with Requirement R4 within a time period greater than 15 calendar months after an applicable event. OR The applicable entity failed to perform an assessment in accordance with Requirement R4.
R5	Operations Planning	Medium	The applicable entity developed a Corrective Action Plan and provided it to UVLS entities in accordance with Requirement R5 but was late by less than or equal to 15 calendar days.	The applicable entity developed a Corrective Action Plan and provided it to UVLS entities in accordance with Requirement R5 but was late by more than 15 calendar days but less than or equal to 30 calendar days.	The applicable entity developed a Corrective Action Plan and provided it to UVLS entities in accordance with Requirement R5 but was late by more than 30 calendar days but less than or equal to 45 calendar days.	The applicable entity developed a Corrective Action Plan and provided it to UVLS entities in accordance with Requirement R5 but was late by more than 45 calendar days. OR The responsible entity failed to develop a Corrective Action Plan or provide it to UVLS entities in accordance with Requirement R5.

R6	Operations Planning	Lower	The applicable entity updated the database in accordance with Requirement R6 but was late by less than or equal to 30 calendar days.	The applicable entity updated the database in accordance with Requirement R6 but was late by more than 30 calendar days but less than or equal to 60 calendar days.	The applicable entity updated the database in accordance with Requirement R6 but was late by more than 60 calendar days but less than or equal to 90 calendar days.	The applicable entity updated the database in accordance with Requirement R6 but was late by more than 90 calendar days. OR The applicable entity failed to update the database in accordance with Requirement R6.
R7	Operations Planning	Lower	The applicable entity provided data in accordance with Requirement R7 but was late by less than or equal to 30 calendar days per the specified schedule. OR The applicable entity provided data in accordance with Requirement R7 but the data was not provided according to the specified format.	The applicable entity provided data in accordance with Requirement R7 but was late by more than 30 calendar days but less than or equal to 60 calendar days per the specified schedule.	The applicable entity provided data in accordance with Requirement R7 but was late by more than 60 calendar days but less than or equal to 90 calendar days per the specified schedule.	The applicable entity provided data in accordance with Requirement R7 but was late by more than 90 calendar days per the specified schedule. OR The applicable entity failed to provide data in accordance with Requirement R7.

R8	Operations Planning	Lower	The applicable entity provided its UVLS Program database in accordance with Requirement R8 but was late by less than or equal to 15 calendar days.	The applicable entity provided its UVLS Program database in accordance with Requirement R8 but was late by more than 15 calendar days but less than or equal to 30 calendar days.	The applicable entity provided its UVLS Program database in accordance with Requirement R8 but was late by more than 30 calendar days but less than or equal to 45 calendar days.	The applicable entity provided its UVLS Program database in accordance with Requirement R8 but was late by more than 45 calendar days. OR The applicable entity failed to provide its UVLS Program database in accordance with Requirement R8.

Guidelines and Technical Basis

Introduction

PRC-010-1 is a single, comprehensive standard that addresses the same reliability principles outlined in its legacy standards, PRC-010-0, PRC-020-1, PRC-021-1, and PRC-022-1. The standard also addresses a FERC directive from Order No. 693, Paragraph 1509. This paragraph directs NERC to develop a modification to PRC-010-0 that requires an integrated and coordinated approach to all protection systems, including generators and transmission lines, generators' low voltage ride-through capabilities, and underfrequency load shedding (UFLS) and UVLS programs.

Since FERC-approved PRC-006-1 – Automatic Underfrequency Load Shedding was developed under a similar construct of combining existing standards and addressing a FERC Order No. 693 directive, the drafting team looked to this standard as a guide. With the understanding that UVLS and UFLS systems have fundamental differences, the drafting team adopted PRC-006-1's industry-vetted reliability principles and language as applicable to UVLS Programs.

The drafting team's established purpose for PRC-010-1 is to clearly define the responsibilities of applicable entities to pursue an integrated and coordinated approach to the design, evaluation, and reliable operation of UVLS Programs. Since the need for and design of UVLS Programs is unique to each system preservation footprint, the intent of the standard is to provide a framework of reliability requirements for such programs to which each individual entity can apply its program's specific considerations and characteristics. The drafting team emphasizes that PRC-010-1 does not require a mandatory UVLS Program, nor does this standard address the need to have a UVLS Program. PRC-010-1 applies only after an entity has determined the need for a UVLS Program as a result of its own planning studies.

The drafting team provides the following discussion to support the approach to the standard. The information is meant to enhance the understanding of the reliability needs and deliverable expectations of each requirement, supported as necessary by technical principles and industry experience.

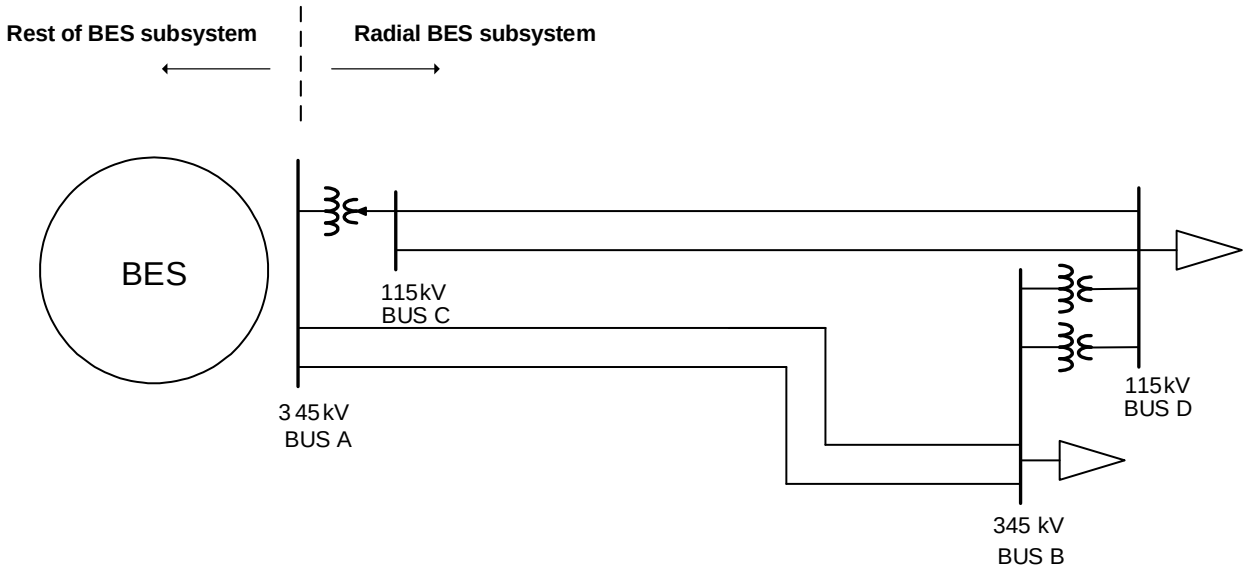
Guidelines for UVLS Program Definition

The definition for the term UVLS Program includes automatic load shedding programs that utilize only voltage inputs at locations where action is taken to shed load. As such, the failure of a single component is unlikely to affect the reliable operation of the program.

The definition for the term UVLS Program excludes centrally-controlled undervoltage-based load shedding, which utilizes inputs from multiple locations and may also utilize inputs other than voltages (such as generator reactive reserves, facility loadings, equipment statuses, etc.). The design and characteristics of a centrally-controlled undervoltage-based load shedding system are the same as that of a RAS, wherein load shedding is the remedial action. Therefore, just like for a RAS, the failure of a single component can compromise the reliable operation of centrally-controlled undervoltage-based load shedding.

To ensure that the UVLS Program standard's applicability is to only those undervoltage-based load shedding systems whose performance has an impact on system reliability, a UVLS Program must mitigate risk of one more of the following: voltage instability, voltage collapse, or Cascading impacting the BES. An example of a program that would not fall under this category is undervoltage-based load shedding installed to mitigate damage to equipment or local loads that are directly affected by the low voltage event.

Below is an example of a radial BES subsystem for which a UVLS system could be used as a solution to mitigate various issues following the loss of the 345 kV double circuit line between bus A and bus B. If the consequence of this Contingency is limited to undervoltage conditions, loss of load, or overloading of facilities within the contained area formed by buses A to D, a UVLS system (at buses B and D) used to mitigate this case would not fall under the definition of a UVLS Program. However, if this same UVLS system would be used to mitigate Adverse Reliability Impact outside this contained area, it would be classified as a wide-area undervoltage problem and would fall under the definition of UVLS Program.



High Level Requirement Overview

Requirement	Entity	Evaluate Program Effectiveness	Adhere to Program Specifications and Schedule	Perform Program Assessment (Periodic or Performance)	Develop a CAP to Address Program Deficiencies	Update and/or Share Program Data
R1	PC or TP	X				
R2	UVLS entity		X			
R3	PC or TP	X		X		
R4	PC or TP	X		X		
R5	PC or TP				X	
R6	PC					X
R7	UVLS entity					X
R8	PC					X

Guidelines for Requirement R1:

A UVLS Program may be developed and implemented to either serve as a safety net system protection measure against unforeseen extreme Contingencies or to achieve specific system performance for known transmission Contingencies for which dropping of load is allowed under Transmission Planning (TPL) Reliability Standards. Regardless of the purpose, it is important that the UVLS Program being implemented is effective in terms that it mitigates undervoltage conditions leading to voltage instability, voltage collapse, or Cascading. Consideration should be given to voltage set points and time delays, rate of voltage decay or recovery, power flow levels, etc. when designing a UVLS Program.

For the UVLS Program to be effective in achieving its goal, it is also necessary that the UVLS Program is coordinated with generator voltage ride-through capabilities and other protection and control systems that may have an impact on the performance of the UVLS Program. Some of these protection and control systems may include, but are not limited to, transmission line protection, RAS, other undervoltage-based load shedding programs, auto-reclosing, and controls of shunt capacitors, reactors, and static Var systems (SVSs).

For example, if the purpose of a UVLS Program is to mitigate fault-induced delayed voltage recovery (FIDVR) events in a large load center that also includes local generation, it is important that such a UVLS Program is coordinated with local generators' voltage ride-through capabilities. Generators in the vicinity of a load center are critical to providing dynamic voltage support to the system during FIDVR events. To maximize the benefit of online generation, the best practice may be to shed load prior to generation trip. However, occasionally, it may be best to let generation trip prior to load shed. Therefore, the impact of generation tripping should be considered while designing a UVLS Program.

Another example that can be highlighted is the coordination of a UVLS Program with automatic shunt reactor tripping devices if there are any on the system. Most likely, any shunt reactors on the system will trip off automatically after some time delay during low voltage conditions. In such cases, shunt reactors should be tripped before the load is shed to preserve the system. This may require coordination of time delays associated with the UVLS Program with shunt reactor tripping devices.

Examples given above demonstrate that, for a UVLS Program to be effective, proper consideration should be given to coordination of a UVLS Program with generator ride-through capabilities and other protection and control systems.

Guidelines for Requirement R2:

Once a Planning Coordinator or Transmission Planner has identified a need for a UVLS Program, the Planning Coordinator or Transmission Planner will develop a program that includes specifications and an implementation schedule, which are then provided to UVLS entities per Requirement R1. Specifications may include voltage set points, time delays, amount of load to be shed, the location at which load needs to be shed, etc. If UVLS entities do not implement the UVLS Program according to the specifications and schedule provided, the UVLS Program may not be effective and may not achieve its intended goal. The UVLS entity must document that all necessary actions were completed to implement the UVLS Program.

Similarly, when a Corrective Action Plan (CAP) to address UVLS Program deficiencies is developed by the Planning Coordinator or Transmission Planner and provided to UVLS entities per Requirement R5, UVLS entities must comply with the CAP and its associated implementation schedule to ensure that the UVLS Program is effective. The UVLS entity is required to complete the actions specified in the CAP, document the plan implementation, and retain the appropriate evidence to demonstrate implementation and completion.

Deferrals or other relevant changes to the UVLS Program specifications or CAP need to be documented so that the record includes not only what was planned, but what was implemented. Depending on the planning and documentation format used by the responsible entity, evidence of a successful execution could consist of signed-off work orders, printouts from work management systems, spreadsheets of planned versus completed work, timesheets, work inspection reports, paid invoices, photographs, walk-through reports, or other evidence.

For example, documentation of a CAP provides an auditable progress and completion confirmation for the identified UVLS Program deficiency:

> CAP Example 1 - Corrective actions for a quick triggering problem; preemptive actions for similar installations:
>
> > Fault records showed that a group of UVLS relays did trigger at the right undervoltage level but with shorter delays that expected. On-site inspections were completed in three weeks, confirming that the delay

time programmed on the relays was 60 cycles instead of 90 cycles. A plan was scheduled for the next eight weeks to correct to a 90-cycle time delay setting of those UVLS relays identified to have shorter time delay settings.

Applicability to other UVLS relays: Based on our risk assessment, we scheduled to verify and adjust all remaining UVLS relays time delay settings within a one-year period.

CAP Example 2 - Corrective actions for a firmware problem; preemptive actions for similar installations:

Fault records were provided to the manufacturer on 6/4/2014. On 6/11/2014, the manufacturer responded that the misoperation of the UVLS relay was caused by a bug in version 2 firmware, and recommended installing version 3 firmware. Version 3 firmware was installed on 6/12/2014.

Applicability to other UVLS relays: Based on our risk assessment, we plan to install firmware version 3 at all of our installations that are determined to be version 2. Proposed completion date is 12/31/2014.

The firmware replacements were completed on 12/4/2014.

Guidelines for Requirement R3:

In addition to the initial studies required to develop a UVLS Program, periodic comprehensive assessments (detailed analyses) are required to ensure its continued effectiveness. This assessment should be completed at least once every 60 calendar months to capture the accumulated effects of minor changes to the system that have occurred since the last assessment was completed. However, at any point in time, a Planning Coordinator or Transmission Planner may also determine that a material change to system topology or operating conditions affects the performance of the UVLS Program and therefore necessitates the same comprehensive assessment. Regardless of the trigger, each assessment should include an evaluation of each UVLS Program to ensure the continued integration through coordination.

This comprehensive assessment supplements the TPL-001-4 annual assessment requirement to evaluate the impact of protection systems. The 60-month period is the same time frame used in TPL-001-4 and in PRC-006-1.

With respect to situations in which a material change to system and topology or operating conditions would necessitate a comprehensive assessment of the UVLS Program, it is understood that the term material change is not transportable on a continent-wide basis. This determination must be made by the Planning Coordinator or Transmission Planner and should

be accompanied by documentation to support the technical rationale for determining material changes.

As specified in Requirement R3, a comprehensive assessment must be performed at least once every 60 calendar months. If a Planning Coordinator or Transmission Planner conducts a comprehensive assessment sooner for the reasons discussed above, the 60-month time period would restart upon completion of this assessment.

Guidelines for Requirement R4:

The goal of the assessment required in Requirement R4 is to evaluate whether the UVLS Program resolved the undervoltage issues for an event that occurred on the system. It is expected that the assessment should include event data analysis, such as the relevant sequence of events leading to the undervoltage conditions (e.g., Contingencies, operation of protection systems, and RAS) and field measurements useful to analyzing the behavior of the system. A comprehensive description of the UVLS Program operation should be presented, including conditions of the trigger (e.g., voltage levels, time delays) and amount of load shed for each affected substation. Simulations of the event shall be performed to evaluate the level of performance of the program for the event of interest and to identify deficiencies to be included in a CAP per Requirement R5.

The studies and analyses showing the effectiveness of the UVLS Program can be similar to what is required in Requirements R1 and R3, but should include a clear link between the evaluation of effectiveness (in studies using simulations) and the analysis of the event (with measurements and event data) that actually occurred. For example, differences between the expected and actual system behavior for the event of interest should be discussed and modeling assumptions should be evaluated. Important discrepancies between the simulations and the actual event should be investigated.

Considering the importance of an event that involves the operation of a UVLS Program, the 12-calendar-month period provides adequate time to analyze the event and perform an assessment while identifying deficiencies within a reasonable time. This time period is also required in PRC-006-1.

Guidelines for Requirement R5:

Requirement R5 promotes the prudent correction of an identified problem during assessment evaluations of each UVLS Program. Per Requirements R3 and R4, an assessment of an active UVLS Program is triggered:

- After material changes are made to system topology or operating conditions. Since every UVLS is unique, the Planning Coordinator or Transmission Planner will decide the degree to which the change in topology or operating condition becomes a material change sufficient to trigger an assessment of the existing UVLS Program.

- Within 12 calendar months of an event that resulted in a voltage excursion for which the program was designed to operate.

- At least once every 60 months. The default time frame of 60 months or less between assessments has the intention to assure that the cumulative changes to the network and operating condition affecting the UVLS Program are evaluated.

A CAP is a list of actions and an associated timetable for implementation to remedy a specific problem. It is a proven tool for resolving operational problems. Per Requirement R5, the Planning Coordinator or Transmission Planner is required to develop a CAP and provide it to UVLS entities to accomplish the purpose of this requirement, which is to prevent future deficiencies in the UVLS Program, thereby minimizing risk to the system. Determining the cause of the deficiency is essential in developing an effective CAP to avoid future re-occurrence of the same problem. A CAP can be revised if additional causes are found.

Based on industry experience and operational coordination timeframes, the drafting team believes that within three calendar months from the date an assessment is completed is a reasonable time frame for development of a CAP, including time to consider alternative solutions and coordination of resources. The "within three calendar months" time frame is solely to develop a CAP, including its implementation schedule, and provide it to UVLS entities. It does not include the time needed for its implementation by UVLS entities. This implementation time frame is dictated within the CAP's associated timetable for implementation, and the execution of the CAP according to its schedule is required in Requirement R2.

Guidelines for Requirements R6–R8

An accurate UVLS Program database is necessary for the Planning Coordinator or Transmission Planner to perform system reliability assessment studies and event analysis studies. Without accurate data, there is a possibility that annual reliability assessment studies that are performed by the Planning Coordinator can lead to erroneous results and therefore impact reliability. Also, without the accurate data, it is very difficult for the Planning Coordinator or Transmission Planner to duplicate a UVLS event and determine the root cause of the problem.

To support a UVLS Program database, it is necessary for each UVLS entity to provide accurate data to its Planning Coordinator. Each UVLS entity will provide the data according to the specified format and schedule provided by the Planning Coordinator. This is required in order for the Planning Coordinator to maintain and support a comprehensive UVLS Program database. By having a comprehensive database, the Planning Coordinator can embark on a reliability assessment or event analysis/benchmarking studies, identify the issues with the UVLS Program, and develop remedial action plans.

Items to be included in the UVLS Program database are as follows:

- Owner and operator of the UVLS Program
- Size and location of customer load, or percent of connected load, to be interrupted

- Corresponding voltage set points and clearing times
- Time delay from initiation to trip signal
- Breaker operating times
- Any other schemes that are part of or impact the UVLS Programs, such as related generation protection, islanding schemes, automatic load restoration schemes, UFLS, and RAS.

Additionally, the UVLS Program database should be updated annually (once every calendar year) by the Planning Coordinator. The intent here is for UVLS entities to review the data annually and provide changes to the Planning Coordinators so that Planning Coordinators can keep the databases current and accurate for performing event analysis and other assessments.

Finally, a Planning Coordinator is required to provide information to other Planning Coordinators and Transmission Planners within its Interconnection, and other functional entities with a reliability need, within 30 calendar days of receipt of a written request. Thirty calendar days was selected as the time frame as it is considered to be reasonable and well-accepted by the industry. Also, this requirement of sharing the database with applicable functional entities supports the directive provided by FERC that requires an integrated and coordinated approach to UVLS programs (Paragraph 1509 of FERC Order No. 693).

Implementation Plan

PRC-010-1 – Undervoltage Load Shedding

Standards Involved

Approval:

- PRC-010-1 – Undervoltage Load Shedding

Retirements:

- PRC-010-0 – Assessment of the Design and Effectiveness of UVLS Program
- PRC-020-1 – Under-Voltage Load Shedding Program Database
- PRC-021-1 – Under-Voltage Load Shedding Program Data
- PRC-022-1 – Under-Voltage Load Shedding Program Performance

Prerequisite Approvals

- Revised definition of "Remedial Action Scheme" in Project 2010-05.2 – Special Protection Systems (Phase 2 of Protection Systems)

  Approval of the proposed definition of "Remedial Action Scheme" in Project 2010-05.2 – Special Protection Systems (Phase 2 of Protection Systems) is required to align the classification of centrally-controlled undervoltage-based load shedding with the proposed definition of "Undervoltage Load Shedding Program (UVLS Program)" below. The term "UVLS Program" excludes centrally-controlled undervoltage-based load shedding because the design and characteristics of centrally-controlled undervoltage-based load shedding are commensurate with Special Protection Systems or Remedial Action Schemes. The proposed definition of "Remedial Action Scheme" excludes "UVLS Programs." As a result, the proposed definition of "Remedial Action Scheme" clarifies that centrally-controlled undervoltage-based load shedding is included in its scope.

- EOP-011-1 in Project 2009-03 – Emergency Operations

  Project 2009-03 – Emergency Operations (EOP-011-1) proposes to retire EOP-003-2. Requirements R2, R4, and R7 of EOP-003-2 are not included in EOP-011-1, since these requirements map to PRC-010-1, Requirement R1. As a result, approval of EOP-011-1 is necessary to prevent overlap with Requirement R1 of PRC-010-1.

Revisions to the NERC Glossary of Terms

The following new term is proposed for addition:

Undervoltage Load Shedding Program (UVLS Program): An automatic load shedding program consisting of distributed relays and controls used to mitigate undervoltage conditions leading to voltage instability, voltage collapse, or Cascading impacting the Bulk Electric System (BES). Centrally-controlled undervoltage-based load shedding is not included.

Applicable Entities

- Planning Coordinator
- Transmission Planner
- UVLS entities – Distribution Providers and Transmission Owners responsible for the ownership, operation, or control of UVLS equipment as required by the UVLS Program established by the Transmission Planner or Planning Coordinator.

General Considerations

The effective dates of PRC-010-1 and its proposed new NERC Glossary term, EOP-011-1, the revised NERC Glossary definition of "Remedial Action Scheme," and each of the associated retirements are intended to align to accommodate the needed transitions of standard coverage noted above.

The implementation plan for the revised definition of "Remedial Action Scheme" addresses entities that will have newly identified Remedial Action Schemes resulting from the application of the defined term with respect to the inclusion of centrally-controlled undervoltage-based load shedding. Please refer to the implementation plan posted with the definition of "Remedial Action Scheme" in Project 2010-05.2 – Special Protection Systems (Phase 2 of Protection Systems) for more information.

Effective Date

PRC-010-1 and the definition of "Undervoltage Load Shedding Program (UVLS Program)" shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard and definition are approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard and the definition shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard and definition are adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Retirement of Existing Standards:

PRC-010-0, PRC-020-1, PRC-021-1, and PRC-022-1 shall be retired at midnight of the day immediately prior to the effective date of PRC-010-1 in the particular jurisdiction in which the new standard is becoming effective.

PRC-010-1 is a consolidation of PRC-010-0 – Assessment of the Design and Effectiveness of UVLS Program, PRC-020-1 – Under-Voltage Load Shedding Program Database, PRC-021-1 – Under-Voltage Load Shedding Program Data, and PRC-022-1 – Under-Voltage Load Shedding Program Performance.

Project 2010-05.2 – Special Protection Systems

Action

Authorize posting of the revised definition of "Remedial Action Scheme" ("RAS"), the forty-three (43) Reliability Standards revised to reflect use of the single term RAS, and the associated Implementation Plan for an initial 45-day formal comment period with ballot pool formation during the first 30 days and initial ballot during the last 10 days of the comment period. A complete set of redlined and clean Reliability Standards has been included in the posting for convenience rather than forty-three (43) individual Reliability Standards.

Other supporting documents will be posted on the Project webpage. These include: an FAQ and Background document, a quick-reference guide for the changes to other Reliability Standards, and the redlined and final SAR for the Project.

Background

Project 2010-05.2 – Special Protection Systems was established to address issues identified in the technical report produced by the System Analysis and Modeling Subcommittee (SAMS) and System Protection and Control Subcommittee (SPCS). Those issues are:

1. The existing NERC Glossary of Terms definition for a Special Protection System (SPS) or Remedial Action Scheme (RAS) lacks the clarity and specificity necessary for consistent identification and classification of protection schemes as SPS or RAS across the eight NERC Regions, which leads to inconsistent application of the related NERC Reliability Standards.
2. There are six NERC (PRC) Reliability Standards that specifically pertain to SPS. Three of these standards are not mandatory and enforceable because FERC identified them as fill-in-the-blank standards in Order No. 693, Mandatory Reliability Standards for the Bulk-Power System. These standards assign the Regional Reliability Organizations responsibility to establish regional procedures and databases, and to assess and document the operation, coordination, and compliance of SPS. The deference to regional practices, coupled with lack of clarity in the definition of SPS, preclude consistent application of requirements pertaining to SPS.

The goals for this project as stated in the SAR are to:

1. Establish a definition of an SPS or RAS that provides the specificity needed to consistently identify and classify protection schemes as SPS or RAS across all eight NERC Regions, thereby promoting the consistent application of the NERC Reliability Standards related to SPS/RAS.
2. Correct the applicability of the NERC Reliability Standards related to SPS/RAS by assigning responsibilities to the specific users, owners, and operators of the Bulk-Power System rather than the RROs.
3. Develop continent-wide standards to address all aspects of SPS/RAS, including but not limited to, the:
    - planning, coordination, and design of SPS/RAS,
    - review, assessment, and documentation of SPS/RAS,

- operational considerations for monitoring, status notification, and response to failures,
- analysis of SPS/RAS operations, and defining and reporting of SPS/RAS misoperations,
- testing of SPS/RAS, and maintenance of any non-protection system components used.

Project 2010-05.2 is being conducted in two phases:

Phase 1 will address the definition of "Special Protection System" ("SPS") or "Remedial Action Scheme" ("RAS"). A revised definition of a SPS/RAS is required to provide the clarity and specificity necessary for the consistent identification and classification of protection schemes as SPS/RAS across the eight NERC Regions. Consequently, establishing a comprehensive industry-approved definition is mandatory to the development of quality Reliability Standards.

Phase 2 will address the six SPS/RAS-related Reliability Standards. The standards will be consolidated and will address all aspects of SPS/RAS. The applicability issues in PRC-012-0, PRC-013-0, and PRC-014-0 will be corrected by assigning the pertinent reliability objectives to the specific users, owners, and operators of the Bulk-Power System.

Phase 1

The Project 2010-05.2 – Special Protection System SDT is recommending to retain the term "Remedial Action Scheme" (RAS) and revise its definition, while retiring the term "Special Protection System" (SPS). After significant outreach, the drafting team asserts that a single term promotes consistency and that RAS is more descriptive of the purpose for which the scheme is installed.

Currently, NERC Reliability Standards and the NERC Glossary of Terms use both terms, "Special Protection System" and "Remedial Action Scheme" interchangeably. The terms appear in forty-three (43) standards and in several definitions. In most cases, both terms are included in the standards and written as: "Special Protection Systems or Remedial Action Schemes." The SDT evaluated the existing standards and recommended any necessary revisions to retain the single term, "RAS." Many of the same changes would be required regardless of which single term is retained. A summary of the occurrences of the terms is included in the posted document *Uses of "Special Protection System" and "Remedial Action Scheme"* and complete versions of the standards are included in the posted document *Revised Reliability Standards for the Revised Definition of "Remedial Action Scheme."*

NOTE: *The standard numbers currently include an (X) to indicate the version numbering will be updated. Some standards are open in current projects and others are pending with governmental authorities. As a result, NERC will assign the appropriate version number prior to BOT adoption.*

The proposed definition of RAS must be broad to include the variety of System conditions monitored and corrective actions taken by RAS. This "broadness," however, necessitates an

exclusion list because without the exclusions, equipment and schemes that should not be considered RAS could be subject to the requirements of the RAS-related Reliability Standards. The exclusion list assures that commonly applied protection and control systems are not unintentionally included as RAS.

The Project 2010-05.2 SPS SDT is coordinating the development of the RAS definition with the development of PRC-010-1 by the SDT for Project 2008-02 – Undervoltage Load Shedding. The UVLS SDT is introducing a new NERC Glossary term, UVLS Program, to clearly establish the applicability of PRC-010-1. The proposed term UVLS Program is defined as: "An automatic load shedding program consisting of distributed relays and controls used to mitigate undervoltage conditions leading to voltage instability, voltage collapse, or Cascading impacting the Bulk Electric System (BES). Centrally controlled undervoltage-based load shedding is not included."

Note that the proposed definition excludes centrally controlled undervoltage-based load shedding. The UVLS SDT maintains that the design and characteristics of centrally controlled undervoltage-based load shedding are commensurate with RAS (wherein load shedding is the remedial action) and, as such, should be subject to RAS-related Reliability Standards. The Project 2010-05.2 SPS SDT agrees with this assessment and revised the definition of RAS to clarify that it is inclusive of centrally controlled undervoltage-based load shedding. Collectively, the two definitions will promote consistency in the identification of centrally controlled undervoltage-based load shedding as RAS. The coordination of these revisions is required to maintain coverage of those systems and prevent a reliability gap.

Building Consensus and Quality

During the development of the proposed definition and Implementation Plan, NERC technical, legal, and compliance staff worked together to facilitate a comprehensive approach to the development. Additionally, the drafting team regularly sought feedback on both quality and content of the definition from a variety of stakeholders through numerous outreach presentations with individual forums that included Regional standard review groups and Regional system protection committees. The drafting team consulted with members of various NERC technical committees and governmental authority staff. The draft definition was posted for a 30-day informal comment period and the revised definition reflects many of the changes suggested by stakeholders.

A final quality review of the definition, Implementation Plan, and associated documents was conducted May 27–June 2. All documents were reviewed by NERC staff from the Legal, Standards, and Reliability Assessments and Performance Analysis (RAPA) departments, as well as the SDT Chair, Vice Chair, and the PMOS liaison. Minor issues regarding clarity and consistency of language and general document formatting were identified and addressed. The documents provided to the Standards Committee reflect these revisions.

Request to propose a new or a revision to a Reliability Standard			
Proposed Project Number and Name	Project 2010-05.2 – Special Protection Systems (Phase 2 of Protection Systems)		
Proposed Project Purpose:	Revise NERC Glossary of Terms definition: Special Protection System (SPS) Revise SPS-related Reliability Standards		
Date Submitted:	02/12/2014		
SAR Requester Information			
Name:	Al McMeekin		
Organization:	NERC		
Telephone:	404-446-9675	E-mail:	Al.McMeekin@nerc.net
SAR Type (Check as many as applicable)			
☒ New Standard ☒ Revision to existing Standard		☒ Withdrawal of existing Standard ☐ Urgent Action	

SAR Information
Industry Need (What is the industry problem this request is trying to solve?):
The existing NERC Glossary of Terms definition for a Special Protection System (SPS) or, as used in the Western Interconnection, a Remedial Action Scheme (RAS), lacks the clarity and specificity necessary for consistent identification and classification of protection schemes as SPS or RAS across the eight NERC Regions, leading to inconsistent application of the related NERC Reliability Standards. In FERC Order No. 693 (dated March 16, 2007), the Commission identified three of the SPS-related Reliability Standards (PRC-012-0, PRC-013-0, and PRC-014-0) as fill-in-the-blank standards because they are applicable to the Regional Reliability Organizations (RROs). Consequently, the Commission did not approve or remand them, rendering them neither mandatory nor enforceable. This project also addresses, in part, four recommendations related to identification and coordination of SPS from the joint FERC-NERC inquiry of the September 2011 Southwest Blackout Event. NOTE: Detailed information is included in the NERC Planning Committee report "Special Protection Systems (SPS) and Remedial Action Schemes (RAS): Assessment of Definition, Regional Practices, and Application of Related Standards" Revision 0.1 – April 2013.
Purpose or Goal (How does this request propose to address the problem described above?):
1) Establish a definition of an SPS or RAS that provides the specificity needed to consistently identify and classify protection schemes as SPS or RAS across all eight NERC Regions, thereby promoting the consistent application of the NERC Reliability Standards related to SPS. 2) Correct the applicability of the NERC Reliability Standards related to SPS/RAS by assigning responsibilities to the specific users, owners, and operators of the Bulk-Power System rather than the RROs. 3) Develop continent-wide standards to address all aspects of SPS/RAS, including but not limited to, the: • planning, coordination, and design of SPS/RAS, • review, assessment, and documentation of SPS/RAS, • operational considerations for monitoring, status notification, and response to failures, • analysis of SPS/RAS operations, and defining and reporting of SPS/RAS misoperations, • testing of SPS/RAS, and maintenance of any non-protection system components used.

SAR Information
Identify the Objectives of the proposed standard's requirements (What specific reliability deliverables are required to achieve the goal?):
Successful implementation of a modified definition for an SPS/RAS, with the revised SPS/RAS-related Reliability Standards will improve Bulk-Power System reliability by providing continent-wide consistency in the identification and classification of SPS or RAS, and by promoting the consistent application of the related Reliability Standards.
Brief Description (Provide a paragraph that describes the scope of this standard action.)
The project will develop a revised definition of SPS or RAS, as well as revise the NERC Reliability Standards that address the: • review of new or modified SPS/RAS, • annual assessments of SPS/RAS in transmission planning studies, • periodic comprehensive SPS/RAS assessments, • analysis and reporting of SPS/RAS misoperations, • maintenance, testing and operational aspects of SPS/RAS.
Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR. Also provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)
The SDT will revise the definition of SPS/RAS to provide the clarity and specificity necessary for consistent identification and classification of protection schemes as SPS/RAS across the eight NERC Regions. The SDT will revise or retire the six existing SPS/RAS-related Reliability Standards: • PRC-012-0 Special Protection System Review Procedure • PRC-013-0 Special Protection System Database • PRC-014-0 Special Protection System Assessment • PRC-015-0 Special Protection System Data and Documentation • PRC-016-0.1 Special Protection System Misoperations • PRC-017-0 Special Protection System Maintenance and Testing

SAR Information
The SDT will correct the applicability in PRC-012-0, PRC-013-0, and PRC-014-0 by assigning the requirements to the specific users, owners, and operators of the Bulk Power System. The SDT will combine appropriate requirements from PRC-012-0, PRC-013-0, PRC-014-0, PRC-015-0, PRC-016-0.1, and PRC-017-0 into one or more Reliability Standard(s). The new standard(s) will provide specific requirements for: • review of new or modified SPS/RAS; • annual assessments of SPS/RAS in transmission planning studies; • periodic comprehensive SPS/RAS assessments; • design of SPS/RAS; • operations and misoperations; • maintenance and testing of SPS/RAS; and • maintenance and testing of non-Protection System components used in SPS/RAS; and • coordination of SPS/RAS with other SPS/RAS, UFLS, UVLS, and Protection Systems. Due to the significant difference between Protection Systems and SPS, the subject of SPS misoperation is not addressed in the revision of Reliability Standard PRC-004. This SDT will develop a definition for SPS/RAS misoperation and revise PRC-016-0.1. The new Reliability Standard will provide specific requirements for the analysis of SPS operations and reporting of SPS misoperations. The SDT will address the complexity of maintaining and testing SPS, as well as the maintenance and testing of non-Protection System components used in SPS in a Reliability Standard. This SDT will coordinate with the PRC-005-4 SDT to prevent any overlaps or gaps in coverage. The SDT also will consider operational considerations for monitoring, status notification, and response to failures of SPS/RAS; and, if necessary, modify other related standards. The SDT will retire requirements that are administrative in nature that are not necessary for reliability of the Bulk-Power System, or that are superseded by other requirements; i.e., the new Reliability Standards will qualify as steady-state. No market interface impacts are anticipated.

Reliability Functions		
The Standard will Apply to the Following Functions (Check each one that applies.)		
☒	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☒	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☐	Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☒	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☒	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☐	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☒	Transmission Owner	Owns and maintains transmission facilities.
☒	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☒	Distribution Provider	Delivers electrical energy to the End-use customer.
☒	Generator Owner	Owns and maintains generation facilities.
☒	Generator Operator	Operates generation unit(s) to provide real and reactive power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.

Reliability Functions	
☐ Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles	
Applicable Reliability Principles (Check all that apply).	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☐	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☒	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☒	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☒	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber-attacks.

Does the proposed Standard comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	Yes

SAR Information
Industry Need (What is the industry problem this request is trying to solve?):
The existing NERC Glossary of Terms definition for a Special Protection System (SPS) or, as used in the Western Interconnection, a Remedial Action Scheme (RAS), lacks the clarity and specificity necessary for consistent identification and classification of protection schemes as SPS or RAS across the eight NERC Regions, leading to inconsistent application of the related NERC Reliability Standards. In FERC Order No. 693 (dated March 16, 2007), the Commission identified three of the SPS-related Reliability Standards (PRC-012-0, PRC-013-0, and PRC-014-0) as fill-in-the-blank standards because they are applicable to the Regional Reliability Organizations (RROs). Consequently, the Commission did not approve or remand them, rendering them neither mandatory nor enforceable. This project also addresses, in part, four recommendations related to identification and coordination of SPS from the joint FERC-NERC inquiry of the September 2011 Southwest Blackout Event. NOTE: Detailed information is included in the NERC Planning Committee report "Special Protection Systems (SPS) and Remedial Action Schemes (RAS): Assessment of Definition, Regional Practices, and Application of Related Standards" Revision 0.1 – April 2013.
Purpose or Goal (How does this request propose to address the problem described above?):
1) Establish a definition of an SPS or RAS that provides the specificity needed to consistently identify and classify protection schemes as SPS or RAS across all eight NERC Regions, thereby promoting the consistent application of the NERC Reliability Standards related to SPS. 2) Correct the applicability of the NERC Reliability Standards related to SPS/RAS by assigning responsibilities to the specific users, owners, and operators of the Bulk-Power System rather than the RROs. 3) Develop continent-wide standards to address all aspects of SPS/RAS, including but not limited to, the: • planning, coordination, and design of SPS/RAS, • review, assessment, and documentation of SPS/RAS, • operational considerations for monitoring, status notification, and response to failures, • analysis of SPS/RAS operations, and defining and reporting of SPS/RAS misoperations, • testing of SPS/RAS, and maintenance of any non-protection system components used.

SAR Information
Identify the Objectives of the proposed standard's requirements (What specific reliability deliverables are required to achieve the goal?):
Successful implementation of a modified definition for an SPS/RAS, with the revised SPS/RAS-related Reliability Standards will improve Bulk-Power System reliability by providing continent-wide consistency in the identification and classification of SPS or RAS, and by promoting the consistent application of the related Reliability Standards.
Brief Description (Provide a paragraph that describes the scope of this standard action.)
The project will develop a revised definition of SPS or RAS, as well as revise the NERC Reliability Standards that address the: • review of new or modified SPS/RAS, • annual assessments of SPS/RAS in transmission planning studies, • periodic comprehensive SPS/RAS assessments, • analysis and reporting of SPS/RAS misoperations, • maintenance, testing and operational aspects of SPS/RAS.
Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR. Also provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)
The SDT will revise the definition of SPS/RAS to provide the clarity and specificity necessary for consistent identification and classification of protection schemes as SPS/RAS across the eight NERC Regions. The SDT will revise or retire the six existing SPS/RAS-related Reliability Standards: • PRC-012-0 Special Protection System Review Procedure • PRC-013-0 Special Protection System Database • PRC-014-0 Special Protection System Assessment • PRC-015-0 Special Protection System Data and Documentation • PRC-016-0.1 Special Protection System Misoperations • PRC-017-0 Special Protection System Maintenance and Testing

SAR Information
The SDT will correct the applicability in PRC-012-0, PRC-013-0, and PRC-014-0 by assigning the requirements to the specific users, owners, and operators of the Bulk Power System. The SDT will combine appropriate requirements from PRC-012-0, PRC-013-0, PRC-014-0, PRC-015-0, PRC-016-0.1, and PRC-017-0 into one or more Reliability Standard(s). The new standard(s) will provide specific requirements for: • review of new or modified SPS/RAS; • annual assessments of SPS/RAS in transmission planning studies; • periodic comprehensive SPS/RAS assessments; • design of SPS/RAS; • operations and misoperations; • maintenance and testing of SPS/RAS; and • maintenance and testing of non-Protection System components used in SPS/RAS; and • coordination of SPS/RAS with other SPS/RAS, UFLS, UVLS, and Protection Systems. Due to the significant difference between Protection Systems and SPS, the subject of SPS misoperation is not addressed in the revision of Reliability Standard PRC-004. This SDT will develop a definition for SPS/RAS misoperation and revise PRC-016-0.1. The new Reliability Standard will provide specific requirements for the analysis of SPS operations and reporting of SPS misoperations. The SDT will address the complexity of maintaining and testing SPS, as well as the maintenance and testing of non-Protection System components used in SPS in a Reliability Standard. This SDT will coordinate with the PRC-005-4 SDT to prevent any overlaps or gaps in coverage. The SDT also will consider operational considerations for monitoring, status notification, and response to failures of SPS/RAS; and, if necessary, modify other related standards. The SDT will retire requirements that are administrative in nature that are not necessary for reliability of the Bulk-Power System, or that are superseded by other requirements; i.e., the new Reliability Standards will qualify as steady-state. No market interface impacts are anticipated.

Proposed Definition of "Remedial Action Scheme"

Remedial Action Scheme (RAS)

A scheme designed to detect predetermined System conditions and automatically take corrective actions that may include, but are not limited to, curtailing or tripping generation or other sources, curtailing or tripping load, or reconfiguring a System(s). RAS accomplish one or more of the following objectives:

- Meet requirements identified in the NERC Reliability Standards;
- Maintain System stability;
- Maintain acceptable System voltages;
- Maintain acceptable power flows;
- Limit the impact of Cascading; or
- Address other Bulk Electric System (BES) reliability concerns.

These schemes are not Protection Systems; however, they may share components with Protection Systems.

The following do not individually constitute a RAS:

a. Out-of-step tripping and power swing blocking
b. Automatic underfrequency load shedding (UFLS) programs
c. Undervoltage Load Shedding Programs (UVLS Programs)
d. Autoreclosing schemes
e. Schemes applied on an Element for non-Fault conditions, such as, but not limited to, generator loss-of-field, transformer top-oil temperature, high voltage, or overload to protect the Element against damage by removing it from service
f. Controllers that switch or regulate series or shunt reactive devices, flexible alternating current transmission system (FACTS) devices, phase-shifting transformers, variable-frequency transformers, tap-changing transformers, or generation excitation, and that are located at and monitor quantities solely at the same station as the Element being switched or regulated
g. FACTS controllers that remotely switch static shunt reactive devices located at other stations to regulate the output of a single FACTS device
h. Schemes or controllers that remotely switch shunt reactors and shunt capacitors for voltage regulation that would otherwise be manually switched
i. Schemes that automatically de-energize a line for a non-Fault operation when one end of the line is open

j. Schemes that provide anti-islanding protection (e.g., protect load from effects of being isolated with generation that may not be capable of maintaining acceptable frequency and voltage)

k. Automatic sequences that proceed when manually initiated solely by an operator

l. Modulation of HVdc or FACTS via supplementary controls, such as angle damping or frequency damping applied to damp local or inter-area oscillations

m. Sub-synchronous resonance (SSR) protection schemes that directly detect sub-synchronous quantities (e.g., currents or torsional oscillations)

Existing NERC Glossary of Terms Definitions

Special Protection System (Remedial Action Scheme)

An automatic protection system designed to detect abnormal or predetermined system conditions, and take corrective actions other than and/or in addition to the isolation of faulted components to maintain system reliability. Such action may include changes in demand, generation (MW and Mvar), or system configuration to maintain system stability, acceptable voltage, or power flows. An SPS does not include (a) underfrequency or undervoltage load shedding or (b) fault conditions that must be isolated or (c) out-of-step relaying (not designed as an integral part of an SPS). Also called Remedial Action Scheme.

Remedial Action Scheme

See “Special Protection System”

Uses of "Special Protection System" and "Remedial Action Scheme" in Reliability Standards

This document provides a summary of the occurrences of "Special Protection System" ("SPS") and "Remedial Action Scheme" ("RAS") in the existing NERC Reliability Standards to assist entities in assessing the impact of the proposed definition of "Remedial Action Scheme." The existing Reliability Standards and certain NERC Glossary of Terms use the terms interchangeably.[1] Changes are proposed in this Project for each applicable standard and NERC Glossary term to align the use of the terminology in each instance. Where only the term SPS occurs, it was replaced with RAS. Where both terms, SPS and RAS, occur, the drafting team deleted the references to SPS. Where only the term RAS occurs, no change was made. In all cases, entities should apply the proposed definition of RAS to its own schemes, and determine any impact.

General Description of Definition Change

The revised definition of RAS will create one definition to replace both existing definitions in the NERC Glossary of Terms, for use throughout the NERC Reliability Standards. The revised definition of RAS addresses ambiguities within the existing definition and provides clarity to promote consistency in the application of the standards by the responsible entities and the auditing of the standards by compliance staff. The revised definition of RAS recasts the existing definition of SPS to:

- more precisely describe the objectives of the schemes;
- more precisely describe exclusions;
- state the relationship between Protection Systems and RAS; and
- clarify that centrally controlled undervoltage-based load shedding is included in the definition.

Uses of SPS and RAS in Existing Reliability Standards and NERC Glossary of Terms

The table below includes each occurrence of SPS and RAS found in the applicability sections, requirements, tables, and attachments of the existing NERC Reliability Standards (as of May 16, 2014). The table does not reflect any associated occurrences in other sections of the standard such as the measures, compliance information, and Violation Severity Levels. All occurrences have been reflected in the separate document *Revised Reliability Standards for the Revised Definition of "Remedial Action Scheme."*

[1] NERC, *Reliability Standards for the Bulk Electric Systems of North America* (Updated May 16, 2014).

	permanent phase to ground Fault, with Normal Clearing, on any transmission circuit, transformer or bus section.
IRO-005-3.1a	**B. Requirements:** **R1.** Each Reliability Coordinator shall monitor its Reliability Coordinator Area parameters, including but not limited to the following: **R1.1.** Current status of Bulk Electric System elements (transmission or generation including critical auxiliaries such as Automatic Voltage Regulators and Special Protection Systems) and system loading.
	R9. Whenever a Special Protection System that may have an inter-Balancing Authority, or inter-Transmission Operator impact (e.g., could potentially affect transmission flows resulting in a SOL or IROL violation) is armed, the Reliability Coordinators shall be aware of the impact of the operation of that Special Protection System on inter-area flows. The Transmission Operator shall immediately inform the Reliability Coordinator of the status of the Special Protection System including any degradation or potential failure to operate as expected.
IRO-014-1	**B. Requirements** **R1.** The Reliability Coordinator shall have Operating Procedures, Processes, or Plans in place for activities that require notification, exchange of information or coordination of actions with one or more other Reliability Coordinators to support Interconnection reliability. These Operating Procedures, Processes, or Plans shall address Scenarios that affect other Reliability Coordinator Areas as well as those developed in coordination with other Reliability Coordinators. **R1.1.** These Operating Procedures, Processes, or Plans shall collectively address, as a minimum, the following: **R1.1.1.** Communications and notifications, including the conditions **[FN1]** under which one Reliability Coordinator notifies other Reliability Coordinators; the process to follow in making those notifications; and the data and information to be exchanged with other Reliability Coordinators. **[FN1]:** Examples of conditions when one Reliability Coordinator may need to notify another Reliability Coordinator may include (but aren't limited to) sabotage events, Interconnection Reliability Operating Limit violations, voltage reductions, insufficient resources, arming of special protection systems, etc.
MOD-029-1a	**B. Requirements** **R1.1.8.** Uses Special Protection System (SPS) models where currently existing or projected for implementation within the studied time horizon.
	R2.2. Where it is impossible to actually simulate a reliability-limited flow in a direction counter to prevailing flows (on an alternating current Transmission line), set the TTC for the non-prevailing direction equal to the TTC in the prevailing direction. If the TTC in the prevailing flow direction is dependent on a Special Protection System (SPS), set the TTC for the non-prevailing flow direction equal to the greater of the maximum

Standard No.	Existing Standard Language
	flow that can be simulated in the non-prevailing flow direction or the maximum TTC that can be achieved in the prevailing flow direction without use of a SPS.
MOD-030-02	**B. Requirements** **R2.1.1.1.** Use first Contingency criteria consistent with those first Contingency criteria used in planning of operations for the applicable time periods, including use of Special Protection Systems.
	R2.1.2.1. Use first Contingency criteria consistent with those first Contingency criteria used in planning of operations for the applicable time periods, including use of Special Protection Systems.
NUC-001-2.1	**B. Requirements** **R9.** The Nuclear Plant Generator Operator and the applicable Transmission Entities shall include, as a minimum, the following elements within the agreement(s) identified in R2: **R9.3.7.** Coordination of the NPIRs with transmission system Special Protection Systems and underfrequency and undervoltage load shedding programs.
PRC-001-1.1	**B. Requirements** **R6.** Each Transmission Operator and Balancing Authority shall monitor the status of each Special Protection System in their area, and shall notify affected Transmission Operators and Balancing Authorities of each change in status.
WECC Regional Standard PRC-004-WECC-1	**A. Introduction** **1. Title:** Protection System and Remedial Action Scheme Misoperation **2. Number:** PRC-004-WECC-1 **3. Purpose:** Regional Reliability Standard to ensure all transmission and generation Protection System and Remedial Action Scheme (RAS) Misoperations on Transmission Paths and RAS defined in section 4 are analyzed and/or mitigated. **4. Applicability** **4.1.**Transmission Owners of selected WECC major transmission path facilities and RAS listed in tables titled "Major WECC Transfer Paths in the Bulk Electric System" provided at http://www.wecc.biz/Standards/Approved%20Standards/Supporting%20Tables/Table%20Major%20Paths%204-28-08.pdf and "Major WECC Remedial Action Schemes (RAS)" provided at http://www.wecc.biz/Standards/Approved%20Standards/Supporting%20Tables/Table%20Major%20RAS%204-28-08.pdf. **4.2.**Generator Owners that own RAS listed in the Table titled "Major WECC Remedial Action Schemes (RAS)" provided at http://www.wecc.biz/Standards/Approved%20Standards/Supporting%20Tables/Table%20Major%20RAS%204-28-08.pdf. **4.3.**Transmission Operators that operate major transmission path facilities and RAS listed in Tables titled "Major WECC Transfer Paths in the Bulk Electric System" provided at

Standard No.	Existing Standard Language
	http://www.wecc.biz/Standards/Approved%20Standards/Supporting%20Tables/Table%20Major%20Paths%204-28-08.pdf and "Major WECC Remedial Action Schemes (RAS)" provided at http://www.wecc.biz/Standards/Approved%20Standards/Supporting%20Tables/Table%20Major%20RAS%204-28-08.pdf.
	B. Requirements The requirements below only apply to the major transmission paths facilities and RAS listed in the tables titled "Major WECC Transfer Paths in the Bulk Electric System" and "Major WECC Remedial Action Schemes (RAS)." **R.1.** System Operators and System Protection personnel of the Transmission Owners and Generator Owners shall analyze all Protection System and RAS operations. *[Violation Risk Factor: Lower] [Time Horizon: Operations Assessment]* **R1.1.** System Operators shall review all tripping of transmission elements and RAS operations to identify apparent Misoperations within 24 hours. **R1.2.** System Protection personnel shall analyze all operations of Protection Systems and RAS within 20 business days for correctness to characterize whether a Misoperation has occurred that may not have been identified by System Operators. **R.2.** Transmission Owners and Generator Owners shall perform the following actions for each Misoperation of the Protection System or RAS. It is not intended that Requirements R2.1 through R2.4 apply to Protection System and/or RAS actions that appear to be entirely reasonable and correct at the time of occurrence and associated system performance is fully compliant with NERC Reliability Standards. If the Transmission Owner or Generator Owner later finds the Protection System or RAS operation to be incorrect through System Protection personnel analysis, the requirements of R2.1 through R2.4 become applicable at the time the Transmission Owner or Generator Owner identifies the Misoperation: **R2.1.** If the Protection System or RAS has a Security-Based Misoperation and two or more Functionally Equivalent Protection Systems (FEPS) or Functionally Equivalent RAS (FERAS) remain in service to ensure Bulk Electric System (BES) reliability, the Transmission Owners or Generator Owners shall remove from service the Protection System or RAS that misoperated within 22 hours following identification of the Misoperation. Repair or replacement of the failed Protection System or RAS is at the Transmission Owners' and Generator Owners' discretion. **R2.2.** If the Protection System or RAS has a Security-Based Misoperation and only one FEPS or FERAS remains in service to ensure BES reliability, the Transmission Owner or Generator Owner shall perform the following. **R2.2.1.** Following identification of the Protection System or RAS Misoperation, Transmission Owners and Generator Owners shall remove from service within 22 hours for repair or modification the Protection System or RAS that misoperated.

Standard No.	Existing Standard Language
	R2.2.2. The Transmission Owner or Generator Owner shall repair or replace any Protection System or RAS that misoperated with a FEPS or FERAS within 20 business days of the date of removal. The Transmission Owner or Generator Owner shall remove the Element from service or disable the RAS if repair or replacement is not completed within 20 business days. **R2.3.** If the Protection System or RAS has a Security-Based or Dependability-Based Misoperation and a FEPS and FERAS is not in service to ensure BES reliability, Transmission Owners or Generator Owners shall repair and place back in service within 22 hours the Protection System or RAS that misoperated. If this cannot be done, then Transmission Owners and Generator Owners shall perform the following. **R2.3.1.** When a FEPS is not available, the Transmission Owners shall remove the associated Element from service. **R2.3.2.** When FERAS is not available, then **2.3.2.1.** The Generator Owners shall adjust generation to a reliable operating level, or **2.3.2.2.** Transmission Operators shall adjust the SOL and operate the facilities within established limits. **R2.4.** If the Protection System or RAS has a Dependability-Based Misoperation but has one or more FEPS or FERAS that operated correctly, the associated Element or transmission path may remain in service without removing from service the Protection System or RAS that failed, provided one of the following is performed. **R2.4.1.** Transmission Owners or Generator Owners shall repair or replace any Protection System or RAS that misoperated with FEPS and FERAS within 20 business days of the date of the Misoperation identification, or **R2.4.2.** Transmission Owners or Generator Owners shall remove from service the associated Element or RAS. *[Violation Risk Factor: Lower] [Time Horizon: Operations Assessment]* **R.3.** Transmission Owners and Generation Owners shall submit Misoperation incident reports to WECC within 10 business days for the following. **R3.1.** Identification of a Misoperation of a Protection System and/or RAS, **R3.2.** Completion of repairs or the replacement of Protection System and/or RAS that misoperated.
PRC-005-2	**4. Applicability:** **4.2.4** Protection Systems installed as a Special Protection System (SPS) for BES reliability.

PRC-017-0	**A. Introduction** **1. Title:** Special Protection System Maintenance and Testing **3. Purpose:** To ensure that all Special Protection Systems (SPS) are properly designed, meet performance requirements, and are coordinated with other protection systems. To ensure that maintenance and testing programs are developed and misoperations are analyzed and corrected. **4. Applicability:** **4.1.** Transmission Owner that owns an SPS **4.2.** Generator Owner that owns an SPS **4.3.** Distribution Provider that owns an SPS **B. Requirements** **R1.** The Transmission Owner, Generator Owner, and Distribution Provider that owns an SPS shall have a system maintenance and testing program(s) in place. The program(s) shall include: **R1.1.** SPS identification shall include but is not limited to: **R2.** The Transmission Owner, Generator Owner, and Distribution Provider that owns an SPS shall provide documentation of the program and its implementation to the appropriate Regional Reliability Organizations and NERC on request (within 30 calendar days).
PRC-020-1	**B. Requirements** **R1.6.** Any other schemes that are part of or impact the UVLS programs such as related generation protection, islanding schemes, automatic load restoration schemes, UFLS and Special Protection Systems.
PRC-021-1	**B. Requirements** **R1.5.** Any other schemes that are part of or impact the UVLS programs such as related generation protection, islanding schemes, automatic load restoration schemes, UFLS and Special Protection Systems.
PRC-023-2 Attachment A	**2.** The following protection systems are excluded from requirements of this standard: **2.5.** Relay elements used only for Special Protection Systems applied and approved in accordance with NERC Reliability Standards PRC-012 through PRC-017.
PRC-023-3 Attachment A	**2.** The following protection systems are excluded from requirements of this standard: **2.5.** Relay elements used only for Special Protection Systems applied and approved in accordance with NERC Reliability Standards PRC-012 through PRC-017.
PRC-024-1	**B. Requirements** **R2.** Each Generator Owner that has generator voltage protective relaying activated to trip its applicable generating unit(s) shall set its protective relaying such that the generator voltage protective relaying does not trip the applicable generating unit(s) as a result of a voltage excursion (at the point of interconnection2) caused by an event on the transmission system

Standard No.	Existing Standard Language
	external to the generating plant that remains within the "no trip zone" of PRC-024 Attachment 2. If the Transmission Planner allows less stringent voltage relay settings than those required to meet PRC-024 Attachment 2, then the Generator Owner shall set its protective relaying within the voltage recovery characteristics of a location-specific Transmission Planner's study. Requirement R2 is subject to the following exceptions: • Generating unit(s) may trip in accordance with a Special Protection System (SPS) or Remedial Action Scheme (RAS).
PRC-025-1 Attachment 1	**Relay Settings:** **Exclusions:** The following protection systems are excluded from the requirements of this standard: **5**. Protective relay elements used only for Special Protection Systems that are subject to one or more requirements in a NERC or Regional Reliability Standard.
TOP-005-2a Attachment 1	**Electric System Reliability Data** This Attachment lists the types of data that Balancing Authorities, and Transmission Operators are expected to share with other Balancing Authorities and Transmission Operators. **2.6.** New or degraded Special Protection Systems.
TPL-001-0.1 Category D	**Table 1. Transmission System Standards - Normal and Emergency Conditions** **12.** Failure of a fully redundant Special Protection System (or remedial action scheme) to operate when required **13.** Operation, partial operation, or misoperation of a fully redundant Special Protection System (or Remedial Action Scheme) in response to an event or abnormal system condition for which it was not intended to operate
TPL-001-4	**B. Requirements** **2.7.1.** List System deficiencies and the associated actions needed to achieve required System performance. Examples of such actions include: • Installation, modification, or removal of Protection Systems or Special Protection Systems **4.1.1.** For planning event P1: No generating unit shall pull out of synchronism. A generator being disconnected from the System by fault clearing action or by a Special Protection System is not considered pulling out of synchronism.
TPL-002-0b Category D	**Table I. Transmission System Standards — Normal and Emergency Conditions** **12.** Failure of a fully redundant Special Protection System (or remedial action scheme) to operate when required **13.** Operation, partial operation, or misoperation of a fully redundant Special Protection System (or Remedial Action Scheme) in response to an event or abnormal system condition for which it was not intended to operate

Standard No.	Existing Standard Language
TPL-003-0b Category D	**Table I. Transmission System Standards — Normal and Emergency Conditions** **12.** Failure of a fully redundant Special Protection System (or remedial action scheme) to operate when required **13.** Operation, partial operation, or misoperation of a fully redundant Special Protection System (or Remedial Action Scheme) in response to an event or abnormal system condition for which it was not intended to operate
TPL-004-0a Category D	**Table I. Transmission System Standards — Normal and Emergency Conditions** **12.** Failure of a fully redundant Special Protection System (or remedial action scheme) to operate when required **13.** Operation, partial operation, or misoperation of a fully redundant Special Protection System (or Remedial Action Scheme) in response to an event or abnormal system condition for which it was not intended to operate
WECC Regional Glossary Term:	**Definition: Dependability-Based Misoperation** Is the absence of a Protection System or RAS operation when intended. Dependability is a component of reliability and is the measure of a device's certainty to operate when required.
WECC Regional Glossary Term:	**Definition: Functionally Equivalent RAS (FERAS)** A Remedial Action Scheme ("RAS") that provides the same performance as follows: • Each RAS can detect the same conditions and provide mitigation to comply with all Reliability Standards. • Each RAS may have different components and operating characteristics
WECC Regional Glossary Term:	**Definition: Security-Based Misoperation** A Misoperation caused by the incorrect operation of a Protection System or RAS. Security is a component of reliability and is the measure of a device's certainty not to operate falsely.

Introduction

The Project 2010-05.2 – Special Protection Systems Standard Drafting Team (SDT) thanks all commenters who submitted comments on the proposed revision to the NERC Glossary term "Special Protection System" ("SPS") or "Remedial Action Scheme" ("RAS") definition from the SAMS-SCPS SPS Technical Reference report. The revised definition was posted for a 30-day informal comment period from March 11, 2014 through April 9, 2014. NERC asked stakeholders to provide feedback on the proposed definition through a special electronic comment form.

The SDT appreciates the stakeholder comments on the revised definition. The SDT reviewed all of the comments and made numerous changes to the definition based on the feedback received. These changes are reflected in the first formal posting of the proposed revised definition for comment and ballot. The SDT developed this background and Frequently Asked Questions (FAQ) document to explain the key concepts incorporated in the revised definition, as well as the team's approach and intent.

Contact the Standards Developer, Al McMeekin, at 404-446-9675 or at al.mcmeekin@nerc.net with any comments or questions.

Background – RAS Definition Development

Existing NERC Glossary of Terms Definitions

The existing NERC Glossary of Terms defines **SPS** or **RAS** as: "An automatic protection system designed to detect abnormal or predetermined system conditions, and take corrective actions other than and/or in addition to the isolation of faulted components to maintain system reliability. Such action may include changes in demand, generation (MW and Mvar), or system configuration to maintain system stability, acceptable voltage, or power flows. An SPS does not include (a) underfrequency or undervoltage load shedding or (b) fault conditions that must be isolated or (c) out-of-step relaying (not designed as an integral part of an SPS). Also called Remedial Action Scheme."

The NERC Glossary of Terms defines a **Protection System** as:

- Protective relays which respond to electrical quantities,
- Communications systems necessary for correct operation of protective functions,
- Voltage and current sensing devices providing inputs to protective relays,
- Station dc supply associated with protective functions (including batteries, battery chargers, and non-battery-based dc supply), and
- Control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.

Revision of the NERC Glossary of Terms Definition

Purpose of Revision of the NERC Glossary Terms SPS or RAS

The existing NERC Glossary of Terms definition for an SPS or RAS lacks the clarity and specificity necessary to consistently identify what equipment or schemes qualify as an SPS or RAS across the eight NERC Regions. This confusion leads to inconsistent application of the SPS or RAS-related NERC Reliability Standards.

The existing definition also lacks clarity in the actions stipulated as characteristics of an SPS or RAS. The actions listed in the definition are so broad that the definition may unintentionally include schemes whose purpose is not expressly related to preserving system reliability in response to predetermined system conditions. Inclusion of any scheme taking "corrective action other than isolation of faulted components to maintain system reliability" could be interpreted to mean that devices such as voltage regulators and switching controls for shunt capacitors should be included. This inclusion would then make these devices subject to requirements such as those addressing single-component failure considerations (sometimes referred to as redundancy considerations) in the SPS or RAS-related NERC Reliability Standards.

Recommendation to Change the Term to RAS Only

Currently, both terms, SPS and RAS, are used in the eight NERC Regions. The SDT contends that a single term promotes consistency. The SDT therefore recommends that the term RAS be retained as the industry-recognized term and that the term SPS be retired. The term RAS is more descriptive of the purpose for which the scheme is installed.

The term RAS also eliminates the confusion associated with the two defined terms, "Special Protection System" and "Protection System." The inclusion of Protection System in the term Special Protection System implies that SPS are a subset of Protection Systems. RAS are not Protection Systems; however, they may share components with Protection Systems.

Effects of Using Only the Term RAS in the Existing NERC Reliability Standards

The existing NERC Reliability Standards and NERC Glossary of Terms use the terms, SPS and RAS interchangeably. In most cases, both terms are included in the standards and written as: "SPS or RAS." The SDT evaluated the existing standards and recommended any necessary revisions to retain the single term, RAS. Many of the same changes would be required regardless of which single term is retained. A summary of the occurrences of the terms is included in the posted document *Uses of "Special Protection System" and "Remedial Action Scheme" in Reliability Standards.*

Proposed Definition of RAS

Remedial Action Scheme: A scheme designed to detect predetermined System conditions and automatically take corrective actions that may include, but are not limited to, curtailing or tripping generation or other sources, curtailing or tripping load, or reconfiguring a System(s). RAS accomplish one or more of the following objectives:

- Meet requirements identified in the NERC Reliability Standards;
- Maintain System stability;
- Maintain acceptable System voltages;
- Maintain acceptable power flows;
- Limit the impact of Cascading; or
- Address other Bulk Electric System (BES) reliability concerns.

These schemes are not Protection Systems; however, they may share components with Protection Systems.

The following do not individually constitute a RAS:

a. Out-of-step tripping and power swing blocking

b. Automatic underfrequency load shedding (UFLS) programs

c. Undervoltage Load Shedding Programs (UVLS Programs)

d. Autoreclosing schemes

e. Schemes applied on an Element for non-Fault conditions, such as, but not limited to, generator loss-of-field, transformer top-oil temperature, high voltage, or overload to protect the Element against damage by removing it from service

f. Controllers that switch or regulate series or shunt reactive devices, flexible alternating current transmission system (FACTS) devices, phase-shifting transformers, variable-frequency transformers, tap-changing transformers, or generation excitation, and that are located at and monitor quantities solely at the same station as the Element being switched or regulated

g. FACTS controllers that remotely switch static shunt reactive devices located at other stations to regulate the output of a single FACTS device

h. Schemes or controllers that remotely switch shunt reactors and shunt capacitors for voltage regulation that would otherwise be manually switched

i. Schemes that automatically de-energize a line for a non-Fault operation when one end of the line is open

j. Schemes that provide anti-islanding protection (e.g., protect load from effects of being isolated with generation that may not be capable of maintaining acceptable frequency and voltage)

k. Automatic sequences that proceed when manually initiated solely by an operator

l. Modulation of HVdc or FACTS via supplementary controls such as angle damping or frequency damping applied to damp local or inter-area oscillations

m. Sub-synchronous resonance (SSR) protection schemes that directly detect sub-synchronous quantities (e.g., currents or torsional oscillations)

Exclusion List Explanations

a. Out-of-step tripping and power swing blocking

The existing NERC Glossary of Terms definition of SPS or RAS excludes out-of-step relaying because it is a protective function. The SDT maintained the exclusion but changed the wording from "out-of-step relaying" to "out-of-step tripping and power swing blocking" to reflect current industry terminology.

b. Automatic underfrequency load shedding (UFLS) programs

The existing NERC Glossary of Terms definition of SPS or RAS excludes UFLS because it is a protective function that has unique design and implementation considerations that are covered by NERC Reliability Standard PRC-006-1. The SDT maintained the exclusion.

c. Undervoltage Load Shedding Programs (UVLS Programs)

The existing NERC Glossary of Terms definition of SPS or RAS excludes undervoltage load shedding (UVLS) because it is a protective function. The SDT maintained the exclusion but is using the new term UVLS Program proposed by the SDT for NERC Project 2008-02 – Undervoltage Load Shedding. UVLS Programs are addressed in proposed NERC Reliability Standard PRC-010-1.

d. Autoreclosing schemes

Autoreclosing schemes locally monitor and locally close interrupting devices to restore elements for the purpose of improving electric service availability. These schemes are deployed primarily as a convenience to supplement manual restoration activities. Autoreclosing is a common and understood industry function that has not previously been regarded as a RAS. The SDT accepts the exclusion consistent with industry practice.

e. Schemes applied on an Element for non-Fault conditions, such as, but not limited to, generator loss of field, transformer top-oil temperature, high voltage, or overload to protect the Element against damage by removing it from service

The SDT contends that these schemes are applied on an Element to protect it from damage. They are protective functions and are not RAS. The SDT accepts this exclusion consistent with industry practice.

f. Controllers that switch or regulate series or shunt reactive devices, FACTS devices, phase-shifting transformers, variable-frequency transformers, tap-changing transformers, or generation excitation, and that are located at and monitor quantities solely at the same station as the Element being switched or regulated

The SDT contends these devices are not RAS. The SDT accepts this exclusion consistent with industry practice.

g. FACTS controllers that remotely switch static shunt reactive devices located at other stations to regulate the output of a single FACTS device

The SDT contends these devices are not RAS. The SDT accepts this exclusion consistent with industry practice.

h. Schemes or controllers that remotely switch shunt reactors and shunt capacitors for voltage regulation that would otherwise be manually switched

Schemes or controllers that assist a System Operator in coordinating the switching of shunt reactors and shunt capacitors that would otherwise be manually switched are not remedial in the sense of being mitigations in response to predetermined System conditions, but are for general application to all System conditions.

i. Schemes that automatically de-energize a line for a non-Fault operation when one end of the line is open

When one end of a line is open, unacceptable voltage levels can occur. Opening the remote terminal(s) to de-energize the transmission line removes this voltage rise. These schemes have not historically been regarded as RAS, and the SDT accepts this exclusion consistent with industry practice.

j. Schemes that provide anti-islanding protection (e.g., protect load from effects of being isolated with generation that may not be capable of maintaining acceptable frequency and voltage)

These schemes are designed to protect load in an electrical island that might otherwise operate at an off-nominal frequency or voltage, or facilitate restoration. Actions taken on islanded facilities will not impact the interconnected BES because they are isolated. The SDT accepts this exclusion consistent with industry practice.

k. Automatic sequences that proceed when manually initiated solely by an operator

Automated sequences created to simplify the actions of an operator are not RAS because the decision to activate a specific sequence is left to the operator. If the automated sequence fails to execute correctly, the operator has the option to manually set those actions in motion. The SDT accepts this exclusion consistent with industry practice.

l. Modulation of HVdc or FACTS via supplementary controls such as angle damping or frequency damping applied to damp local or inter-area oscillations

Modulation of HVdc and FACTS via supplementary controls is occasionally used for damping local or inter-area oscillations. They perform a similar function as a Power System Stabilizer (PSS), which is a component of excitation controls in a generating unit. PSS are not classified as RAS. The SDT accepts this exclusion consistent with industry practice.

m. Sub-synchronous resonance (SSR) protection schemes that directly detect sub-synchronous quantities; (e.g., currents or torsional oscillations)

The SDT contends that directly detected SSR conditions and related mitigation are not RAS. The SDT accepts this exclusion consistent with industry practice.

Explanations Regarding Changes from the Exclusion List Cited in the SAMS-SPCS Report

The SDT revised the straw man definition proposed in the SAMS-SPCS report; however, the proposed definition is consistent with the SAMS-SPCS intent. The drafting team revised the definition in response to stakeholder comments from the informal posting. As a result, it is no longer necessary to explicitly state some of the exclusions.

1. **Schemes that prevent high line voltage by automatically switching the affected line**

   This scheme is now addressed by exceptions "e" (protection from high voltage) and "i" (automatic de-energization of a line when one end is open) in the proposed definition.

2. **Protection schemes that operate local breakers other than those on the faulted circuit to facilitate Fault clearing, such as, but not limited to, opening a circuit breaker to remove infeed so protection at a remote terminal can detect a Fault or to reduce fault duty**

   The scheme described in this exclusion is a Protection System. The proposed definition excludes Protection Systems from RAS.

3. **Blanket exclusion for SSR protection schemes**

   The proposed definition excludes schemes that directly detect sub-synchronous quantities; however, SSR mitigation schemes installed to detect distinct System configurations and loading conditions (that studies have shown may make a generator vulnerable to SSR), and take action to trip the generator or bypass the series capacitor, are classified as RAS.

4. **A Protection System that includes multiple elements within its zone of protection, or that isolates more than the faulted element because an interrupting device is not provided between the faulted element and one or more other elements**

   The scheme described in this exclusion is a Protection System. The proposed definition excludes Protection Systems from RAS.

Frequently Asked Questions

Why does the proposed definition have an exclusion list?

The definition must be broad enough to include the variety of System conditions monitored and corrective actions taken by RAS. Without the exclusions, equipment and schemes that should not be considered RAS could be subject to the requirements of the RAS-related NERC Reliability Standards. The exclusion list also assures that commonly applied protection and control systems are not unintentionally included as RAS.

Why did the SDT not propose a screening process to identify RAS?

The SDT contends that a comprehensive definition with specific exclusions is the best way to achieve consistency and immediacy in RAS identification. The SDT asserts that a study-based screening process would be labor-intensive and dependent on assumptions that could vary among the entities performing the studies.

Why does the proposed definition not include the classification types suggested in the SPCS-SAMS report?

The classification of a RAS is not necessary for defining whether or not a scheme qualifies as a RAS. Informal feedback from many stakeholders indicated uncertainty about the classification types. Therefore, the SDT decided not to include RAS classification types within the definition. The classifications are more appropriately addressed concurrently with revisions to the RAS-related Reliability Standards.

Why did the SDT not specifically reference the Transmission Planning (TPL) standards in the proposed definition?

The SDT acknowledges that many RAS are installed to address the performance requirements of the TPL standards; however, they are also installed to address other reliability concerns.

Would automatic actions taken by an Energy Management System (EMS), Supervisory Control and Data Acquisition (SCADA), or Distribution Control System (DCS) be considered a RAS?
The above-mentioned control systems support and enable grid operations by issuing control commands mostly to geographically distributed power System devices. In this normal application, these systems are not considered to be RAS. However, if these systems are configured to detect predetermined conditions and take corrective actions consistent with the RAS definition, these automatic functions would be considered RAS. The identification of RAS is not dependent upon the specific hardware or platform utilized in the scheme.

What are the Implementation Plan time frames?
The Implementation Plan provides RAS owners a minimum of twelve (12) months beyond the date of approval by a governmental authority to evaluate their current schemes for determining whether they are RAS, based on the new definition. The drafting team contends that twelve (12) months is an adequate period of time to review existing schemes to determine whether they are RAS.

The Implementation Plan also provides owners of newly identified RAS twenty-four (24) calendar months beyond the date of approval by a governmental authority to be fully compliant with all standards applicable to the revised definition of Remedial Action Scheme. The drafting team contends that twenty-four (24) calendar months provides the RAS owner sufficient time to become compliant with the revised standards proposed in the Implementation Plan.

Coordination with Project 2008-02 – Undervoltage Load Shedding

As part of the current development of PRC-010-1, the Project 2008-02 UVLS SDT is introducing a new NERC Glossary term, UVLS Program, to clearly establish applicability of PRC-010-1:

Undervoltage Load Shedding Program (UVLS Program): An automatic load shedding program consisting of distributed relays and controls used to mitigate undervoltage conditions leading to voltage instability, voltage collapse, or Cascading impacting the Bulk Electric System (BES). Centrally controlled undervoltage-based load shedding is not included.

Note that the definition excludes centrally controlled undervoltage-based load shedding. The UVLS SDT maintains that the design and characteristics of centrally controlled undervoltage-based load shedding are commensurate with RAS (wherein load shedding is the remedial action) and, as such, centrally controlled undervoltage-based load shedding should be subject to RAS-related Reliability Standards.

The Project 2010-05.2 SPS SDT agrees with the Project 2008-02 UVLS SDT that the design and characteristics of centrally controlled undervoltage-based load shedding are more appropriately categorized as RAS. The SPS SDT has therefore revised the definition of RAS to clarify that the definition is exclusive of only the newly defined term UVLS Program, and is therefore inclusive of centrally controlled undervoltage-based load shedding. The SDT is coordinating this change with the Project 2008-02 UVLS SDT. Collectively, the two definitions will promote consistency in the identification of centrally controlled undervoltage-based load shedding as a RAS. As a result, all NERC Reliability Standards that include the term RAS will be applicable to centrally controlled undervoltage-based load shedding upon the effective date of the revised definition of RAS.

Implementation Plan for the Revised Definition of "Remedial Action Scheme"

Project 2010-05.2 – Special Protection Systems

Background

The existing NERC Glossary of Terms definition for "Special Protection System" ("SPS") or "Remedial Action Scheme" ("RAS") lacks the specificity necessary to consistently identify what equipment or protection schemes qualify as SPS or RAS across the eight NERC Regions. The existing definition also does not clearly stipulate the characteristics of a SPS or RAS. The actions listed in the definition of SPS, which are incorporated by cross reference (NERC Glossary of Terms) into the definition of RAS, are ambiguous and may unintentionally include equipment whose purpose is not expressly related to preserving System reliability in response to predetermined System conditions. Employing a single term, i.e., RAS, and clarifying its definition will lead to more consistent application of the NERC Reliability Standards related to RAS.

The proposed definition of RAS must be broad to include the variety of System conditions monitored and corrective actions taken by RAS. This "broadness," however, necessitates an exclusion list because without the exclusions, equipment and schemes that should not be considered RAS could be subject to the requirements of the RAS-related Reliability Standards. The exclusion list assures that commonly applied protection and control systems are not unintentionally included as RAS.

The Project 2010-05.2 SPS SDT is coordinating the development of the RAS definition with the development of PRC-010-1 by the SDT for Project 2008-02 – Undervoltage Load Shedding. The UVLS SDT is introducing a new NERC Glossary term, UVLS Program, to clearly establish applicability of PRC-010-1. The proposed term UVLS Program is defined as: "An automatic load shedding program consisting of distributed relays and controls used to mitigate undervoltage conditions leading to voltage instability, voltage collapse, or Cascading impacting the Bulk Electric System (BES). Centrally controlled undervoltage-based load shedding is not included."

Note that the proposed definition excludes centrally controlled undervoltage-based load shedding. The UVLS SDT maintains that the design and characteristics of centrally controlled undervoltage-based load shedding are commensurate with RAS (wherein load shedding is the remedial action) and, as such, should be subject to RAS-related Reliability Standards. The Project 2010-05.2 SPS SDT agrees with this assessment and revised the definition of RAS to clarify that it is inclusive of centrally controlled undervoltage-based load shedding. Collectively, the two definitions will promote consistency in the identification of centrally controlled undervoltage-based load shedding as RAS. The coordination of these revisions is required to maintain coverage of those systems and prevent a reliability gap. As a result of these revisions, all NERC Reliability Standards that include the term RAS will be applicable to centrally

controlled undervoltage-based load shedding upon the effective dates of the revised definitions of RAS and UVLS Program.

Requested Approvals

Definition of "**Remedial Action Scheme**" and the standards listed below

The following standards are proposed for approval to align the use of RAS. This list is intended to reflect Reliability Standards currently in effect at the time of Project development. In certain cases, a standard listed below for approval may already be retired pursuant to an implementation plan of a successor version by the time the definition of "Remedial Action Scheme" becomes effective in a particular jurisdiction. In these cases, the standard below will not become effective.

> The standard numbers below currently include an (X) to indicate the version numbering will be updated. Some standards are open in current projects and others are pending with governmental authorities. As a result, NERC will assign the appropriate version number prior to BOT adoption.

General Considerations

The entity shall modify its processes as necessary to account for the revised definition. The revised definition of RAS clarifies that it is inclusive of centrally controlled undervoltage-based load shedding. Entities may have additional changes to the classification of certain schemes to align them with the revised definition. This Implementation Plan provides additional time for entities with newly-identified RAS to become compliant with the Reliability Standards during the transition to the revised definition.

Prerequisite Approvals

NERC Reliability Standard PRC-010-1 – Undervoltage Load Shedding
Definition of "Undervoltage Load Shedding Program (UVLS Program)" in Project 2008-02 Undervoltage Load Shedding

Revisions to the NERC Glossary of Terms

The drafting team proposes the following revised definition:

Remedial Action Scheme (RAS)

A scheme designed to detect predetermined System conditions and automatically take corrective actions that may include, but are not limited to, curtailing or tripping generation or other sources, curtailing or tripping load, or reconfiguring a System(s). RAS accomplish one or more of the following objectives:

- Meet requirements identified in the NERC Reliability Standards;
- Maintain System stability;
- Maintain acceptable System voltages;
- Maintain acceptable power flows;
- Limit the impact of Cascading; or
- Address other Bulk Electric System (BES) reliability concerns.

These schemes are not Protection Systems; however, they may share components with Protection Systems.

The following do not individually constitute a RAS:

a. Out-of-step tripping and power swing blocking

b. Automatic underfrequency load shedding (UFLS) programs

c. Undervoltage Load Shedding Programs (UVLS Programs)

d. Autoreclosing schemes

e. Schemes applied on an Element for non-Fault conditions, such as, but not limited to, generator loss-of-field, transformer top-oil temperature, high voltage, or overload to protect the Element against damage by removing it from service

f. Controllers that switch or regulate series or shunt reactive devices, flexible alternating current transmission system (FACTS) devices, phase-shifting transformers, variable-frequency transformers, tap-changing transformers, or generation excitation, and that are located at and monitor quantities solely at the same station as the Element being switched or regulated

g. FACTS controllers that remotely switch static shunt reactive devices located at other stations to regulate the output of a single FACTS device

h. Schemes or controllers that remotely switch shunt reactors and shunt capacitors for voltage regulation that would otherwise be manually switched

i. Schemes that automatically de-energize a line for a non-Fault operation when one end of the line is open

j. Schemes that provide anti-islanding protection (e.g., protect load from effects of being isolated with generation that may not be capable of maintaining acceptable frequency and voltage)

k. Automatic sequences that proceed when manually initiated solely by an operator

l. Modulation of HVdc or FACTS via supplementary controls such as angle damping or frequency damping applied to damp local or inter-area oscillations

m. Sub-synchronous resonance (SSR) protection schemes that directly detect sub-synchronous quantities (e.g., currents or torsional oscillations)

Conforming Changes to Other Standards

The existing Reliability Standards proposed for retirement contain references to SPS or RAS or both. The revised Reliability Standards will reflect the use of the single term RAS. The revised Reliability Standards noted above for approval are included in a separate document *Revised Reliability Standards for the Revised Definition of "Remedial Action Scheme."*

Effective Date for Revised Reliability Standards and Definition

The revised Reliability Standards and the revised definition of "Remedial Action Scheme" shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standards and definition are approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard and the definition shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standards and definition are adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Implementation Plan for Newly-Identified RAS

Entities with newly-identified RAS resulting from the application of the definition must be fully compliant with all Reliability Standards applicable to the revised definition of "Remedial Action Scheme" twenty-four (24) months from the Effective Date of the revised definition of "Remedial Action Scheme." This additional time applies only to existing schemes that must transition to RAS due to the revised definition. The additional time does not apply to future RAS that may be created following implementation of the revised definition.

Retirement of Existing Standards and Definitions

The requested Reliability Standards for retirement, the current definition of "Special Protection System," and the current definition of "Remedial Action Scheme" shall be retired at midnight of the day immediately prior to the Effective Date of the revised definition of "Remedial Action Scheme" in the particular jurisdiction in which the revised definition is becoming effective.

Project 2010-14.2 Periodic Review of BAL Standards

Action

- Accept the work of the BAL Periodic Review Team (PRT), as provided in these materials
- Accept the SAR prepared by the BAL PRT as superseding the original SAR; and authorize posting the SAR for informal comment
- Set a medium priority to Project 2010-14.2 based on the following factors: BAL-005-0.2b is a high RISC Standard family (BAL-006-2 not ranked); and the standards to be revised have outstanding regulatory directives and a number of P81 candidates, as well as Independent Experts content and quality issues.
- Appoint the BAL PRT as the standard drafting team for the new Project 2010-14.2 Implementation of BAL Periodic Review Recommendations.

Background

Project 2010-14 was approved by the NERC Standards Committee as a merger of Project 2007-05 Balancing Authority Controls and Project 2007-18 Reliability-based Control on July 28, 2010. The NERC Standards Committee also approved the separation of Project 2010-14 into two phases, moving Phase 1 into formal development on July 13, 2011. Subsequently, in June 2013, the Standards Committee approved retiring the previously-scoped Project 2010-14.2, which lacked sufficient focus for a drafting team to proceed, in order to allow a periodic review to take place first.

On October 17, 2013 the NERC Standards Committee appointed ten subject matter experts to serve on the BAL PRT. As part of its review, the BAL PRT referenced background documents, including 1) the currently-enforceable BAL-005-0.2b and BAL-006-2 standards; 2) outstanding issues and directives pertaining to the BAL-005-0.2b and BAL-006-2 standards; 3) the Independent Experts Report; and 4) Paragraph 81 criteria.

Based on this review, the BAL PRT developed a set of recommendations for revising BAL-005-0.2b and BAL-006-2. The BAL PRT recommendations for BAL-005-0.2b and BAL-006-2 were posted for a 45-day comment period from February 21, 2014 through April 7, 2014. There were 23 sets of comments, including comments from approximately 84 different people from approximately 62 companies, representing 8 of the 10 Industry Segments.

The BAL PRT carefully reviewed and considered the comments received during the posting period and, based on stakeholder comments, made revisions to its recommendations. To support implementation of these recommendations, the BAL PRT developed a new SAR intended to supersede the original SAR, which contains outdated information. To further support its recommendations, the BAL PRT developed redlined versions of the standards. Many improvements suggested by stakeholders during the comment period were incorporated into the final recommendations and redlined standards being provided to the Standards Committee.

The recommendations of the BAL PRT are in the attached Periodic Review Templates and SAR. The redlined standards are posted on the project page and will be included as part of the SAR for this project. Additional documents developed to support the team's recommendations have been posted on the project page, including 1) the BAL PRT's consideration of comments on the draft recommendation; 2) a list of directives and stakeholder-identified issues associated with the standards; and 3) the IERP recommendations associated with the standards, containing the BAL PRT's consideration of those recommendations.

This project addresses directives in Paragraphs 406[1], 415[2], 418[3], 419[4], 428 [5] and 438[6] of FERC Order 693, and provides additional clarity to many requirements, as well as retiring requirements that meet the criteria developed in the Paragraph 81 project.
Because the project will address outstanding FERC Order No. 693 directives, provide clarity to the requirements of the two standards, and apply Paragraph 81 criteria to ensure that all requirements in the two standards are necessary for reliability, the PRT considers this project to be medium priority.

Note that the BAL PRT has developed a separate recommendation for BAL-004, which is in the process of being finalized and will be posted for a 45-day stakeholder comment period following additional outreach to non-industry stakeholders. These non-industry stakeholders are potentially affected by the recommendation and NERC and the team want to ensure that the team considers the concerns of this unique group of stakeholders prior to posting a recommendation for stakeholder comment.

[1] "Given that most of the commenters' concerns over the inclusion of DSM as part of regulating reserves relate to the technical requirements, the Commission clarifies that to qualify as regulating reserves, these resources must be technically capable of providing the service. In particular, all resources providing regulation must be capable of automatically responding to real-time changes in load on an equivalent basis to the response of generation equipped with automatic generation control. From the examples provided above, the Commission understands that it may be technically possible for DSM to meet equivalent requirements as conventional generators and expects the Reliability Standards development process to provide the qualifications they must meet to participate. These qualifications will be reviewed by the Commission when the revised Reliability Standard is submitted to the Commission for approval."

[2] "Both Xcel and FirstEnergy question Requirement R17 but do not oppose the Commission's proposal to approve this Reliability Standard. Earlier in this Final Rule, we direct the ERO to consider the comments received to the NOPR in its Reliability Standards development process. Thus, the comments of Xcel and FirstEnergy should be addressed by the ERO when this Reliability Standard is revisited as part of the ERO's Work Plan."

[3] "The Commission adopts the NOPR proposal to require the ERO to modifiy the Reliability Standards to include a Measure that provides for a verification process over the minimum required automatic generation control or regulating reserves a balancing authority maintains."

[4] "FirstEnergy has a number of suggestions to improve the existing Reliability Standard and the ERO is directed to consider those suggestions in its Reliability Standards development process."

[5] "The Commission directs the ERO to develop a modification to BAL-006-1 that adds Measures concerning the accumulation of large inadvertent imbalances and Levels of Non-Compliance. . . [W]e are concerned that large imbalances represent dependence by some balancing authorities on their neighbors and are an indication of less than desirable balancing of generation with load. The Commission also notes that the stated purpose of this Reliability Standard is to define a process for monitoring balancing authorities to ensure that, over the long term, balancing authorities do not excessively depend on other balancing authorities in the Interconnection for meeting their demand or interchange obligations."

[6] "Since the ERO indicates that the reliability aspects of this issue will be addressed in a Reliability Standards filing later this year, the Commission asks the ERO, when filing the new Reliability Standard, to explain how the new Reliability Standard satisfies the Commission's concerns."

Periodic Review of BAL-005-0.2b – Automatic Generation Control and BAL-006-2 – Inadvertent Interchange (Recommendation to Revise both Standards)

~~April 25~~May 22~~0~~, 2014

Introduction

The North American Electric Reliability Corporation (NERC) is required to conduct a periodic review of each NERC Reliability Standard at least once every ten years, or once every five years for Reliability Standards approved by the American National Standards Institute as an American National Standard.[1] Project 2010-14.2 - Phase 2 of Balancing Authority Reliability-based Controls (BARC 2) was included in the current cycle of periodic reviews.

The NERC Standards Committee appointed ten industry subject matter experts to serve on the BARC 2 periodic review team (BARC 2 PRT) on September 19, 2013.[2] The BARC 2 PRT used background information on the standards and the questions set forth in the Periodic Review Template developed by NERC and approved by the Standards Committee, along with associated worksheets and reference documents, to determine whether BAL-005-0_2b and BAL-006-2 should be: (1) affirmed as is (i.e., no changes needed); (2) revised (which may include revising or retiring one or more requirements); or (3) withdrawn.

As a result of that examination, the BARC 2 PRT recommends to **REVISE** BAL-005-0_2b and BAL-006-2, and has therefore developed a draft Standard Authorization Request (SAR) outlining the proposed scope and technical justification for the revisions. **The purpose of all documents contained in this posting is to elicit feedback from industry on the BARC 2 PRT's recommendations.**

Applicable Reliability Standards: BAL-005-0.2b and BAL-006-2

Note: BAL-005-0 was filed for FERC approval on April 4, 2006 in Docket No. RM06-16-000 and was approved on March 16, 2007 in Order No. 693.6. Also, FERC accepted an errata filing to BAL-005-0.1b on September 13, 2012, which replaced Appendix 1 with a corrected version of a FERC-approved interpretation, and made an internal reference

[1] NERC Standard Processes Manual 45 (2013), posted at http://www.nerc.com/pa/Stand/Documents/Appendix_3A_StandardsProcessesManual.pdf.
[2] The Standards Committee subsequently appointed Scott Brooks of Manitoba Hydro to the BARC 2 PRT.

correction in the interpretation, thus resulting in BAL-005-0.2b. On March 16, 2007 FERC issued Order Number 693 approving Reliability Standard BAL-006-1. BAL-006-2, which removed the MISO waivers found in BAL-006-1, was approved by FERC on January 6, 2011 in Docket No. RD10-04-000.
Team Members (include name and organization): 1. Doug Hils, Duke Energy (Chair) 2. Thomas W. (Tom) Siegrist, Brickfield Burchette Ritts and Stone, PC (Vice Chair) 3. Scott Brooks, Manitoba Hydro 4. Ron Carlsen, Southern Company 5. Howard F. Illian, Energy Mark, Inc. 6. Mike Potishnak, Representing NPCC 7. Jerry Rust, Northwest Power Pool 8. Robert Staton, Xcel Energy 9. Glenn Stephens, Santee Cooper 10. Stephen Swan, MISO 11. Mark Trumble, Omaha Public Power District
Date Review Completed: February 14, 2014

Background Information *(initially completed by NERC staff)*

1. Are there any outstanding Federal Energy Regulatory Commission (FERC) directives associated with the Reliability Standards? (If so, NERC staff will attach a list of the directives with citations to associated FERC orders for inclusion in a SAR.)

   ☒ Yes

   ☐ No

   Please see the attached *Consideration of Issues and Directives*.

2. Have stakeholders requested clarity on the Reliability Standards in the form of an Interpretation (outstanding, in progress, or approved), Compliance Application Notice (CAN) (outstanding, in progress, or approved), or an outstanding submission to NERC's Issues Database? (If there are, NERC staff will include a list of the Interpretation(s), CAN(s), or stakeholder-identified issue(s) contained in the NERC Issues Database that apply to the Reliability Standard.)

   ☒ Yes (See BAL-005-0.2b, Appendix 1 - Interpretation of Requirement R17)

   ☐ No

3. Are the Reliability Standards one of the most violated Reliability Standards? If so, does the root cause of the frequent violation appear to be a lack of clarity in the language?

   ☐ Yes

   ☒ No

   Please explain:

4. Do the Reliability Standards need to be modified or converted to the results-based standard (RBS) format as outlined in *Attachment 1: Results-Based Standards*? Note that this analysis is twofold and requires collaboration among NERC staff and the Review Team. First, determine whether the *substance* of the Reliability Standard comports to the RBS principles described in Attachment 1. Second, ensure that, as Reliability Standards are reviewed, the *formatting* is changed as necessary to comply with the current format of a Reliability Standard. If the answer to either part of this question is "Yes," the standard should be revised.

   ☒ Yes

☐ No

Note: The BARC 2 PRT reviewed BAL-005-0.2b and BAL-006-2 and determined that many of the requirements were similar in nature and could be simplified to provide a clear and measurable expected outcome, such as: (1) a stated level of reliability performance; (2) a reduction in a specified reliability risk; or (3) a necessary competency.

Additional Questions Considered by the BARC 2 PRT

If NERC staff answered "Yes" to any of the questions above, the Reliability Standard probably requires revision. The questions below are intended to further guide your review. Some of the questions reference documents provided by NERC staff as indicated in the Background questions above.

1. **Paragraph 81**: Does one or more of the requirements in the Reliability Standard meet criteria for retirement or modification based on Paragraph 81 concepts? Use *Attachment 2: Paragraph 81 Criteria* to make this determination.

   ☒ Yes

   ☐ No

   Please summarize your application of Paragraph 81 Criteria, if any: The BARC 2 PRT applied the criteria specified in *Attachment 2: Paragraph 81 Criteria* in reviewing BAL-005 and BAL-006. As that document more fully explains, for a Reliability Standard requirement to be proposed for retirement or modification based on Paragraph 81 concepts, it must satisfy both an overarching criterion, specifically, whether the requirement does little, if anything, to benefit or protect the reliable operation of the Bulk Electric System (BES), and at least one other criterion specified therein. The PRT concluded that eight requirements should be retired under Paragraph 81 concepts as detailed in Table 1:

Table 1 - PRT Recommended Paragraph 81 Retirements

Requirement	Rationale
BAL-005, Requirement R4	The basis for coordination of common values between adjacent BAs is covered in Requirement R3, and correction of information not available has also been addressed. Therefore, this requirement is redundant and does little, if anything, to benefit or protect the reliable operation of the BES.
BAL-005, Requirement R5	The requirements placed upon the implementation of Dynamic Transfers are covered within Requirement R3. Therefore, this requirement is redundant and does little, if anything, to benefit or protect the reliable operation of the BES.
BAL-005, Requirement R7	The first sentence covers having a functional EMS or other system capable of calculating Reporting ACE and controlling resources, which can be done manually without any detriment to reliability. EOP-008-1 Requirement R1 recognizes that such automated capability may not be available for up to two hours for loss of control center functionality. In addition, the second sentence is not needed, as such actions would be covered under EOP-008. The PRT believes that the term "Operating AGC" in Requirement R7 refers to the

	capability to continuously calculate ACE (not automatic control of resources), which should be considered one of the BAs functional obligations with regard to the reliable operations and situational awareness of the BES. Though redundancy and other provisions may be in place to maintain EMS functionality, there are times when the information may not be available where the provisions under EOP-008-1 would apply. In light of these unnecessary redundancies, this requirement does little, if anything, to benefit or protect the reliable operation of the BES.
BAL-005, Requirement R9, Part 9.1	The Actual Net Interchange and Scheduled Net Interchange values in the Reporting ACE calculation include provisions for the Balancing Authority to include its high voltage direct (HVDC) link to another asynchronous interconnection. By assuring the values are handled consistently in the actual and scheduled Interchange terms included in the real-time Reporting ACE by definition, the Balancing Authority is not being instructed "how" to implement the HVDC link, but allowed to decide the method it will use. By focusing on real-time Reporting ACE, we are assuring reliability is addressed and maintained at all times. Because the Reporting ACE addresses the reliability concerns originally contemplated in this requirement, the requirement is needlessly redundant and does little, if anything, to benefit or protect the reliable operation of the BES.
BAL-005, Requirement R10	The definition of Reporting ACE includes the provision that Scheduled Net Interchange (NIs) used in the Reporting ACE calculation include Dynamic Schedules. Therefore, this requirement is redundant and does little, if anything, to benefit or protect the reliable operation of the BES.
BAL-005, Requirement R11	The definition of Reporting ACE includes the provision that the effect of schedule ramps be included in the value Scheduled Net Interchange (NIs) used in the Reporting ACE calculation. Therefore, this requirement is redundant and does little, if anything, to benefit or protect the reliable operation of the BES.
BAL-006, Requirement R1	Requirement R1 is written only as an energy accounting requirement. The Requirement is administrative in nature and does little, if anything to benefit or protect the reliable operation of the BES. However, the SDT should determine if there is merit in developing a reliability metric specific to this standard including the calculation of Inadvertent Interchange in a reliability metric to measure performance to certain requirements under BAL-0065, where the SDT may consider including the calculation of Inadvertent Interchange.
BAL-006, Requirement R2	Requirement R2 is written only as an energy accounting requirement. The Requirement is administrative in nature and does little, if anything to benefit or protect the reliable operation of the BES. However, the PRT recommends that the SDT incorporate Requirement R2 into a revised definition of Inadvertent Interchange.

The BARC 2 PRT carefully considered each recommendation made in the Independent Expert Review Report (IERR) as detailed in Table 2 below. Based on the BARC 2 PRT's discussions and expertise on the matter, including some having been involved in the development and revisions to NERC Policy 1 used as the basis for the NERC BAL Standards, the BARC 2 PRT determined that the balance of the requirements recommended for retirement by the Independent Expert Review Report are necessary to retain in some form for reliability:

Table 2 - PRT Consideration of IERR Recommendations

Requirement	IERR Recommendation	PRT Response
BAL-005, Requirement R2	Retire, P81. Phase 1	Requirement removed under Paragraph 81 Phase 1.
BAL-005, Requirement R3	Retire, P81. Duplicative of R1.	The PRT **disagreed** with the IERR, as the intent of Requirement R1 is to ensure that all load, resources and transmission facilities are accounted for within the BAs in an Interconnection, whereas Requirement R3 was intended to cover the metering communications, etc., when load or resources may be Dynamically Transferred. The PRT recommendations include treating the implementation of Tie-Lines, Pseudo-Ties, and Dynamic Schedules in a similar manner, as all require agreement on the common information that will be used between the Adjacent BAs and the implementation of dynamically changing data in the Reporting ACE. The PRT recommends that the SDT not use the term "Regulation Service," as in general this statement could apply to implementation of Dynamic Schedules or Pseudo-Ties, and the desire to have a common point for the data shared between the BAs implementing the Dynamic Transfer. Entities must have a process in place to always have common and agreed-upon information even when primary facilities are not available. The PRT recommends removing "adequate" and "Burden" from the requirement.

BAL-005, Requirement R8	Retire, P81. Outdated due to technology.	The PRT **disagreed** with the IERR, as Requirement R8 establishes the minimum expectation of how often ACE must be calculated by all Balancing Authorities. However, as written, Requirement R8 provides no provisions for abnormal or emergency operations when the automated calculation of ACE may not be available. The PRT recommendations include that the SDT revise the Requirement with the proper context of a minimum normal scan rate and clarify how frequently all components must be factored into the Reporting ACE equation under normal operation. With respect to the sub-requirements, the SDT should ensure that any proposed revisions accommodate abnormal and emergency operations, including the possibility that the EMS or supporting telemetry may not be available, such as during an evacuation to a backup site. The PRT notes that the SDT should consider a requirement focused on a minimum scan-rate expectation under normal operations, rather than a requirement that could be interpreted as if systems have 100% availability.
BAL-005, Requirement R9	Retire, P81. This is a definition not a requirement.	The PRT **agreed** with the IERR to retire Requirement R9, as the Interchange values are included the definition of Reporting ACE.
BAL-005, Requirement R10	Retire, P81. This is a definition not a requirement.	The PRT **agreed** with the IERR as the definition of Reporting ACE includes the provision that Scheduled Net Interchange (NIs) used in the Reporting ACE calculation include Dynamic Schedules.
BAL-005, Requirement R11	Retire, P81. This is a business practice and is automated in most EMS software.	The PRT **agreed** with the IERR, as the definition of Reporting ACE includes the provision that the effect of schedule ramps be included in the value Scheduled Net Interchange (NIs) used in the Reporting ACE calculation.
BAL-005, Requirement R12	Retire, P81. This in the ACE equation so does not need to be repeated.	The PRT **agreed** with the IERR to retire Requirement R12 as written. However, the intent of certain sub requirements still needs to be captured and written as applicable to Tie-Line, Pseudo-Ties and Dynamic Schedules. The PRT recommends a new requirement where each respective Adjacent BAalancing Authority has agreed to common

		measuring points that produce an agreed-to common value to be included in the calculation of Reporting ACE. Accuracy and review of the agreed-to common value is reflected in the new requirement requiring comparison of hourly megawatt-hour values against the integrated data operated to for Tie-Lines, Dynamic Schedules, and Pseudo-Ties. The SDT should review the requirement as it relates to current practices to ensure the reliability needs are met.
BAL-005, Requirement R13	Retire, P81. This is after the fact and is automated in most EMS software.	The PRT **disagreed** with the IERR on some aspects of R13. The PRT suggests deleting the first sentence of R13, and suggests that the SDT include in a guideline document the practice of performing hourly error checks of the NIA operated to for the hour against an end-of-the-hour reference. The PRT also recommends a separate requirement specific to adjustments as needed to the Reporting ACE to reflect the meter error adjustment. However, the PRT is concerned that requiring correction of a component of ACE when in error (no matter how negligible) would be problematic in that not all errors require correction. The PRT recommends that the SDT consider stating the requirement in such a manner that I_{ME} is required to be zero except during times needed to compensate for any data or equipment error affecting a component of the Reporting ACE calculation (Interchange or frequency). The SDT should also allow in this requirement for other means of addressing metering corrections, which may include possible revision to real-time metering data. Uses of the I_{ME} term in the Reporting ACE may also be an appropriate subject for the guideline document the PRT is recommending that the SDT develop to accompany BAL-005 covering some of the suggested best practices.

BAL-005, Requirement R16	Retire, This is a guide for the quality of the EMS system. Provide to the 2009-02 team for consideration.	The PRT **agreed** with the IERR to retire Requirement R16 contingent upon addressing one provision. The PRT recommends moving the requirement for flagging bad data to revisions made in Requirement R14.
BAL-006, Requirement R1	Retire. This is only for energy accounting. Covered by tagging requirements	The PRT **agreed** with the IERR that R1 is an energy accounting requirement and should be retired; however, the PRT recommends that the SDT determine if there is merit in developing a reliability metric specific to this standard to measure performance to certain requirements under BAL-006, where the SDT may consider including the calculation of Inadvertent Interchange. In development of any metric, the PRT recommends that the SDT determine the appropriate time-frame for reliability (as close to real-time as possible). Similar to how BAL-001-2 has CPS1 and BAAL measures dependent upon the BA calculating its Reporting ACE without a stated requirement that "Each BA shall calculate its Reporting ACE", the PRT felt that if the industry supports a measure being developed that uses Inadvertent Interchange in the measure of performance, that the BA would calculate Inadvertent Interchange as needed to comply. Also, similar to the approach taken for defining Reporting ACE in the Glossary with all of the components necessary for the calculation, the PRT is recommending in Requirement R2 below that the definition of Inadvertent Interchange also be updated so that all components necessary for the calculation are identified.
BAL-006, Requirement R2	Retire. This is only for energy accounting. Covered by tagging requirements.	The PRT **agreed** with the IERR that R2 is an energy accounting requirement and recommends retirement contingent upon the SDT incorporating Requirement R2 into a revised definition of Inadvertent Interchange. The PRT recommends that this definition be modified to capture that the calculation is on an hourly basis and includes the megawatt-hour values for Tie-Lines, Pseudo-Ties, and Dynamic Schedules, along with other scheduled

		interchange implemented under block scheduling, which does not include the effect of the ramps. The PRT recommends that the definition also include the NERC definitions of On-Peak Accounting and Off-Peak Accounting, which reference the NAESB business practice for inadvertent interchange accounting. The PRT also recommends that the definition clarify the treatment of scheduled and actual interchange associated with asynchronous ties between Interconnections.
BAL-006, Requirement R3	Retire. This is only for energy accounting. Covered by tagging requirements (automated).	The PRT **disagreed** with the IERR but recommends incorporating Requirement R3 into BAL-005, as the requirement relates to the agreement on common values used in Real-time and also recommends developing a guideline to cover the practice of comparing the hourly megawatt-hour values gathered at the end of the hour against the hourly integrated values of the scan-rate data operated to, in order to determine if significant error exists.
BAL-006, Requirement R4	Retire. This is only for energy accounting. Covered by tagging requirements (automated).	The PRT **disagreed** with the IERR, as it is important to reliability that Adjacent Balancing Authorities agree on the scheduled and actual Interchange between them on a timely basis as a means to detect when errors may exist so that they can be corrected in operations. The PRT recommends that the SDT review current practices for confirmation for interchange after-the-fact to determine and justify a shorter duration for agreement on such values for reliability purposes. The PRT also recommends that Requirement R4 be restated to require that the agreement is based upon the aggregate net schedules and net actuals by adjacent BAs as further defined in the new definition of Inadvertent Interchange. In concept, every Tie-Line, Pseudo-Tie, and Interchange Schedule (including Dynamic Schedules), implemented in the Reporting ACE calculation should have an accompanying after-the-fact megawatt-hour value accounted for in the calculation of Inadvertent Interchange. Requirement R4 Part 4.2 might be addressed in the

		new definition of Inadvertent Interchange by the proposed reference to On-Peak Accounting and Off-Peak Accounting. The SDT should review this requirement to determine what elements of the requirement are necessary to support reliability. The SDT also should consider including in a guideline document a practice to support providing operations personnel with information on the comparison of monthly revenue class meters to meters used for real-time operation.
BAL-006, Requirement R5	Retire. This is only for energy accounting. Covered by tagging requirements (automated).	The PRT **could not agree** with the IERR without investigation by the SDT. The SDT should review whether the practice that requires BAs to mutually agree by the 15th calendar day is needed for reliability. The PRT believes there may be merit in requiring BAs to identify the cause of the dispute, and to either correct it within a prescribed number of days, or follow a dispute resolution process. The SDT should ensure that the requirement is clear and distinct, which may require modifying or striking the language regarding dispute resolution.

2. **Clarity:** If the Reliability Standard has an Interpretation, CAN, or issue associated with it, or is frequently violated because of ambiguity, it probably needs to be revised for clarity. Beyond these indicators, is there any reason to believe that the Reliability Standard should be modified to address a lack of clarity? Consider:

   a. Is this a Version 0 Reliability Standard?
   b. Does the Reliability Standard have obviously ambiguous language or language that requires performance that is not measurable?
   c. Are the requirements consistent with the purpose of the Reliability Standard?

   ☒ Yes

   ☐ No

Please summarize your assessment: The BARC 2 PRT recommends the development of a reference document to clarify the requirements in BAL-005 and BAL-006, and recommends revising the following sections of BAL-005 and BAL-006 to improve clarity of the standards:

BAL-005

The BARC2 PRT has completed its review of BAL-005, and among other recommendations, proposes certain revisions below which would remove references to the types of resources and reserves utilized by the Balancing Authority to balance resources and demand. The PRT recommendations focus on the components that make up the Reporting ACE, and not on the ancillary service aspects of resource control that drew criticism from the industry for being specific to generation when BAL-005 was originally filed with the FERC. Among other recommendations, for the implementation of Tie-Lines, Pseudo-Ties, and Dynamic Schedules (all similar in that they utilize real-time data from an agreed-upon common source between Adjacent BAs), the PRT recommends requirements focused on the real-time values operated to. The PRT recommendations for BAL-005 are:

1) **Title**: The PRT recommends changing the title of BAL-005 to "Balancing Authority Control" to remove the implication that BAL-005 pertains exclusively to generation, and better reflect the focus on the BA acquiring necessary data to calculate Reporting ACE so that balancing of resources and demand can be achieved under Tie-Line Bias Control. Based upon the input from the industry, the PRT recommends that the SDT consider whether the term AGC should be retained within any requirements. The PRT also recommends that the SDT pursue revisions to the definition of AGC as proposed below to be resource-neutral.

   AGC: Equipment that automatically adjusts ~~generation~~ resources utilized in a Balancing Authority Area from a central location to maintain the Balancing Authority's Reporting ACE within the bounds required under the NERC Reliability Standards. Resources utilized under AGC may include conventional generation, variable energy resources, storage devices and loads acting as resources, such as Demand Response. ~~may interchange schedule plus Frequency Bias. AGC may also accommodate automatic inadvertent payback and time error correction.~~

2) **Purpose**: The Standards Drafting Team (SDT) tasked with implementing the SAR developed by the PRT should consider revising the "Purpose" statement to focus on acquiring the information necessary for calculating Reporting ACE, while remaining neutral on the types of reserves or resources utilized. The PRT recommends the following for SDT consideration:

   This standard establishes requirements for acquiring necessary data for the Balancing Authority so that balancing of resources and demand can be achieved under Tie-Line Bias Control~~This standard establishes requirements for acquiring necessary data for the~~

~~Balancing Authority to calculate Reporting ACE so that balancing of resources and demand can be achieved.~~

The PRT also recommends that the SDT consider addressing the Hydro Quebec exception for tie line bias control in some form, or a single-BA exception.

3) **Applicability**: The SDT should remove "Generator Operators", "Transmission Operators", and "Load Serving Entities" as applicable entities unless used in the SDT's suggested revisions of this standard. For example, the SDT discussed that the ownership of metering and other factors may drive why the LSE is included in this standard, along with other entities, however consideration should be given to moving requirements for facilities to be within a BA Area to a FAC standard. The PRT is concerned that removing any requirements of the LSE, TOP, and GOP and not reflecting them within another standard may inadvertently transfer certain obligations to the BA to ensure that such loads, resources, and facilities are within their metered boundaries. The SDT should ensure that any suggested revisions address this concern and should also consider placing a comparable requirement in a FAC Standard.

4) **Requirement R1**: The PRT recommends that the content of Requirement R1 be split between what is needed for ensuring facilities are within a BA Area prior to MW being generated or consumed, and what is needed for ensuring balanced operation within an Interconnection. First, the PRT recommends that the SDT consider continuing discussions with the FAC SDT on moving and restating or clarifying the TOP, LSE, and GOP requirements in a~~n~~ FAC Standard to ensure facilities are within the metered boundaries of a BA prior to transmission operation, resource operation, or load being served. The SDT should explore whether the role of the TOP would appropriately cover the loads interconnected to that TOP~~,~~ such that the LSE requirement may not be necessary. Second, the PRT recommends that the SDT revise Requirements R1 and R2 to be BA requirements that all Actual Net Interchange and Scheduled Net Interchange used by the BA in its Reporting ACE calculation, have an Adjacent BA, as proposed in the redlined Requirements R1 and R2. Note that the PRT does not intend ~~with~~ the proposed language to impose any additional requirements on the BA that currently apply to the LSE, GOP, and TOP, but believes that the requirements to identify the applicable BA should perhaps be in the interconnection agreements or a~~n~~ FAC requirement. With respect to proposed Requirement R2, the SDT should ensure that the requirement cannot be misinterpreted to imply that Dynamic Schedules can only be with physically adjacent BAs. The intent is to address adjacency in a manner consistent with the scheduling path no differently than used for interchange schedules.

5) **Requirement R2**: ~~The PRT recommends that the SDT review this requirement to ensure that it is appropriately worded so that adjacency is clearly defined~~Retirement approved by FERC effective January 21, 2014.

~~5)~~6) **Requirement R3**: The PRT recommends that the SDT not use the term "Regulation Service," as in general this statement could apply to implementation of Dynamic Schedules or Pseudo-Ties, and the desire to have a common point for the data shared between the BAs implementing the Dynamic Transfer. The PRT recommends removing "adequate" and "Burden" from the requirement. The PRT recommends expanding Requirement R3 to be applicable to the implementation of tie lines, Pseudo-Ties, and Dynamic Schedules, as all require agreement between adjacent BAs on the agreed-upon points to be implemented. The PRT recommends that the SDT review the other standards such as TOP-005 to assure there is no duplication or redundancy. Specific to the concern on swapping hourly values in BAL-005, the PRT recommends deleting the proposed R3.2 and the first sentence of the proposed R3.5.2, the PRT also recommends the SDT develop a guideline document to accompany BAL-005 covering some of the suggested best practices.

~~6)~~7) **Requirement R4**: The PRT reviewed Requirement R4 with respect to what notification or coordination is necessary that could be considered with the other requirements around Interchange. Initially the PRT was considering a recommendation that the SDT consider the requirement as it applies to Dynamic Transfer implementation as discussed in the Dynamic Transfer reliability guideline, and as it applies to the practice of implementing multiple-BA Dynamic Transfers under a process referred to as ACE Diversity Interchange. The PRT also considered recommendations to delete or modify Requirement R4 so that it requires communication with not only the BAs but any other affected entities, and to strike "providing Regulation Service." However, after further review, the PRT recommends retiring Requirement R4, as the basis for coordination of common values between adjacent BAs is covered in Requirement R3, and correction of information not available has also been addressed. These requirements should ensure that any failure to perform would be reflected in the BA performance under BAL-001-2.

~~7)~~8) **Requirement R5**: The PRT recommends retiring Requirement R5, as the requirements placed upon the implementation of Dynamic Transfers are covered within Requirement R3. With respect to having a backup plan to the extent that a service may no longer be provided, the PRT believes this would be in the terms of the business arrangement. As proposed by the PRT, the requirements remaining in BAL-005 would ensure that any failure to perform would be reflected in the BA performance under BAL-001-2.

~~8)~~9) **Requirement R6**: The PRT recommends that the sentence "Single Balancing Authorities operating asynchronously may employ alternative ACE calculations such as (but not limited to) flat frequency control" be captured in the definition of "Reporting ACE.". The terms used in the Requirement R6 need to be consistent with those used in Reporting ACE if the Requirement is retained. The SDT should consider whether the 30-minute requirement for RC notification is

sufficient or excessive. The PRT recommends that if a timing requirement remains in the standard that it be structured in a manner to not require communication with the RC if the capability to calculate Reporting ACE is restored within the defined notification period.

~~9)~~10) **Requirement R7**: The PRT recommends retiring this Requirement under Paragraph 81. The first sentence covers having a functional EMS or other system capable of calculating Reporting ACE and controlling resources, which can be done manually without any detriment to reliability. EOP-008-1 Requirement R1 recognizes that such automated capability may not be available for up to two hours for loss of control center functionality. In addition, the second sentence is not needed, as such actions would be covered under EOP-008. The PRT believes that the term "Operating AGC" in Requirement R7 refers to the capability to continuously calculate ACE (not automatic control of resources), which should be considered one of the BAs functional obligations with regard to the reliable operations and situational awareness of the BES. Though redundancy and other provisions may be in place to maintain EMS functionality, there are times when the information may not be available where the provisions under EOP-008-1 would apply.

~~10)~~11) **Requirement R8**: The PRT recommends that the SDT revise the Requirement with the proper context of a minimum normal scan rate and clarify how frequently all components must be factored into the Reporting ACE equation under normal operation. With respect to the sub-requirements, the SDT should ensure that any proposed revisions accommodate abnormal and emergency operations, including the possibility that the EMS or supporting telemetry may not be available, such as during an evacuation to a backup site. The PRT notes that the SDT should consider a requirement focused on a minimum scan-rate expectation under normal operations, rather than a requirement that could be interpreted as if systems have 100% availability.

~~11)~~12) **Requirement R8, Part 8.1**: The BA should have visibility of system frequency within parameters consistent with EOP-008, however the PRT recommends that the requirement not be prescriptive. The SDT should review EOP-008 to ensure the intent of this requirement is covered there, and to ensure consistency among the standards. In addition, the SDT should also consider remote and redundant frequency resources to the extent that the information otherwise available to the BA may not be available upon loss of control center functionality. Such capability may already be anticipated under EOP-008. The SDT should consider the following questions in the development of the revised requirement:

a) How much time is allowed to pass if the redundancy is lost before it must be restored?

b) Does the PRT believe it is acceptable for the second and independent frequency device to be one used by another Balancing Authority?

~~12)~~13) **Requirement R9, Part 9.1**: The PRT recommends retiring this Requirement. The Actual Net Interchange and Scheduled Net Interchange values in the Reporting ACE calculation include provisions for the Balancing Authority to include its high voltage direct (HVDC) link to another asynchronous interconnection. By assuring the values are handled consistently in the actual and scheduled Interchange terms included in the real-time Reporting ACE by definition, the Balancing Authority is not being instructed "how" to implement the HVDC link, but allowed to decide the method it will use. By focusing on real-time Reporting ACE, we are assuring reliability is addressed and maintained at all times. The PRT suggests that the Balancing Authority during an audit may be asked to provide evidence that its HVDC link was included or was not included in Reporting ACE under the provisions allowed by definition.

~~13)~~14) **Requirements R10 and R11**: The PRT recommends the retirement of these requirements, as the basics of both requirements are factored into the definition of Scheduled Net Interchange (NIs) used in the Reporting ACE calculation as defined in the NERC Glossary.

The PRT noted that Requirement R10 is written as if "Net Scheduled Interchange" is the value used in the ACE equation; however, Net Scheduled Interchange has two meanings – the algebraic sum of all Interchange Schedules across a given path, or between Balancing Authorities for a given period or instant in time. Aside from the concern of having a definition with two different meanings, the PRT believes that neither choice in the definition accurately depicts the value inserted into the ACE or Reporting ACE, which would be the algebraic sum of all Net Scheduled Interchange with all Adjacent Balancing Authorities, including Dynamic Schedules. In addition, the PRT could not find a definition of Scheduled Interchange as used in Requirement R11. Under Section 3 below, the PRT recommends changes to certain NERC definitions.

~~14)~~15) **Requirement R12**: The PRT took a holistic approach to Requirement R12 and other requirements related to the implementation of Tie-Lines, Pseudo-Ties, and Dynamic Schedules, as all relate to the information exchanged between adjacent BAs.

The PRT recommends a new ~~requirement~~ Requirement R3 related to the implementation of Tie-Lines, Pseudo-Ties, and Dynamic Schedules, where each respective Adjacent BA has agreed to common measuring points that produce an agreed-to value to be included in the calculation of Reporting ACE. The SDT should review the requirement as it relates to current practices to ensure the reliability needs are met.

The PRT suggests that the holistic approach shall only be achieved if there is a comprehensive definition of ACE. Therefore the PRT recommends the ACE and Reporting ACE definitions be reviewed (understanding and identifying as well why there is a difference) to assure that they are comprehensive (including items such as all AC Tie-Lines, Pseudo-ties, and all other

necessary Adjacent BA information). As the comprehensive details of the ACE calculation in BAL-001-1 will be retired upon implementation of BAL-001-2, where ACE will only be defined in the NERC Glossary, the PRT suggests that a complete review of all the NERC Standards is necessary to assure where ACE is utilized in a Standard, that any update to the ACE definition would not impact any other Standard.

~~15)~~16) **Requirement R13**: The PRT suggests deleting the first sentence of R13, and suggests that the SDT include in a guideline document the practice of performing hourly error checks of the NI_A operated to for the hour against an end-of-the-hour reference.

The PRT also recommends a separate requirement specific to adjustments as needed to the Reporting ACE to reflect the meter error adjustment. However, the PRT is concerned that requiring correction of a component of ACE when in error (no matter how negligible) would be problematic in that not all errors require correction. The PRT recommends that the SDT consider stating the requirement in such a manner that I_{ME} is required to be zero except during times needed to compensate for any data or equipment error affecting a component of the Reporting ACE calculation (Interchange or frequency). The SDT should also allow in this requirement for other means of addressing metering corrections, which may include possible revision to real-time metering data. Uses of the I_{ME} term in the Reporting ACE may also be an appropriate subject for the guideline document the PRT is recommending that the SDT develop to accompany BAL-005 covering some of the suggested best practices.

~~16)~~17) **Requirement R14**: The PRT recommends that the SDT delete the first sentence in R14 and revise the second sentence to cover the minimum amount of information expected for the BA to provide in real-time to its operatormade the recommendation reflected in the proposed redline to define minimum expectations for situational awareness of the BES. The PRT also recommends that the individual components of actual and scheduled interchange with each Adjacent Balancing Authority also be captured (Tie-Lines, Pseudo-Ties, Dynamic Schedules, block schedules as needed for coordination, and real-time schedules). Based on industry comments, the SDT should consider whether this requirement is needed in the BAL standards, whether it is adequately covered elsewhere in the standards, or whether it should be moved to the NERC Rules of Procedure for certification of the Functional Entity.

~~17)~~18) **Requirement R15**: The SDT should consider continued coordination with the Project 2010-02 FAC SDT on potentially placing a requirement in FAC with respect to supporting infrastructure or functionality, or review EOP-008 to determine if existing requirements adequately address primary control center functionality.

~~18)~~19) **Requirement R16**: The PRT recommends moving the requirement for flagging bad data to revisions made in Requirement R14.

~~19)~~20) **Requirement R17**: The PRT recommends that this requirement be written to be specific to the equipment used to determine the frequency component required for Reporting ACE. The PRT also recommends that the SDT recommend moving any accuracy requirements applicable to the needs of the Transmission Operator, which may include MW, MVAR, voltage, potential transformer, current transformer, and remote terminal unit or equivalent to a TOP or FAC standard. Further study would be needed on the ".25% of full scale" and the "appropriate accuracy" language.

BAL-006

The BARC2 PRT has completed its review of BAL-006 and recommends that it be revised. The recommendations below include moving any requirements with implications to real-time operations into BAL-005.

Among other work, the review team considered a FERC directive that recommended the development of a metric to bound the magnitude of inadvertent accumulations, as those accumulations may be indicative of a Balancing Authority excessively leaning on the resources of others in its Interconnection. The review team consensus was that an Inadvertent Interchange accumulation value alone cannot yield useful information concerning whether a Balancing Authority is operating reliably. The PRT document on the consideration of issues and directives more fully covers the PRT recommendations related to the FERC directives. The PRT recommendations for BAL-006 are:

1) **Purpose**: As the revisions proposed for BAL-006 focus on the minimum requirements for Adjacent Balancing Authorities to agree upon the hourly MW amounts of scheduled and actual Interchange between them, which reinforces that errors in coordination or process will be identified, the PRT recommends that the SDT revise the Purpose statement to be consistent with the Requirements as further developed under the SAR posted with this recommendation.

2) **Requirement R1**: The PRT recommends removing Requirement R1 as written and recommends that the SDT determine if there is merit in developing a reliability metric specific to this standard including the calculation of Inadvertent Interchange in a reliability metric to measure performance to certain requirements under BAL-0065, where the SDT may consider including the calculation of Inadvertent Interchange. In development of any metric, the PRT recommends that the SDT determine the appropriate time-frame for reliability (as close to real-time as possible). Similar to how BAL-001-2 has CPS1 and BAAL measures dependent upon the BA calculating its Reporting ACE without a stated requirement that "Each BA shall calculate its Reporting ACE", the PRT felt that if the industry supports a measure being developed that uses Inadvertent Interchange in the measure of performance, that the BA would calculate Inadvertent Interchange as needed to comply. Also, similar to the approach taken for defining Reporting ACE in the Glossary with all of the components necessary for the calculation, the PRT is recommending in Requirement R2 below that the definition of Inadvertent Interchange also be updated so that all components necessary for the calculation are identified.

3) **Requirement R2**: The PRT recommends incorporating R2 into a revised definition of Inadvertent Interchange: The PRT recommends that this definition be modified to capture that the calculation is on an hourly basis and includes the megawatt-hour values for Tie-Lines, Pseudo-Ties, and Dynamic Schedules, along with other scheduled interchange implemented under block scheduling, which does not include the effect of the ramps. The PRT recommends

that the definition also include the NERC definitions of On-Peak Accounting and Off-Peak Accounting, which reference the NAESB business practice for inadvertent interchange accounting. The PRT also recommends that the definition clarify the treatment of scheduled and actual interchange associated with asynchronous ties between Interconnections.

4) **Requirement R3**: The PRT recommends incorporating Requirement R3 into BAL-005, as the requirement relates to the agreement on common values used in Real-time and also recommends developing a guideline to cover the practice of comparing the hourly megawatt-hour values gathered at the end of the hour against the hourly integrated values of the scan-rate data operated to, in order to determine if significant error exists.

5) **Requirement R4**: With respect to Requirement R4, the SDT should review current practices for confirmation for interchange after-the-fact to determine and justify a shorter duration for agreement on such values for reliability purposes. The PRT also recommends that Requirement R4 be restated to require that the agreement is based upon the aggregate net schedules and net actuals by adjacent BAs as further defined in the new definition of Inadvertent Interchange. In concept, every Tie-Line, Pseudo-Tie, and Interchange Schedule (including Dynamic Schedules), implemented in the Reporting ACE calculation should have an accompanying after-the-fact megawatt-hour value accounted for in the calculation of Inadvertent Interchange.

6) **Requirement R4, Part 4.2:** The SDT should evaluate whether this requirement is addressed in the new definition of Inadvertent Interchange by the proposed reference to On-Peak Accounting and Off-Peak Accounting.

7) **Requirement R4, Part 4.3**: The SDT should review this requirement to determine what elements of the requirement are necessary to support reliability. The SDT also should consider including in a guideline document a practice to support providing operations personnel with information on the comparison of monthly revenue class meters to meters used for real-time operation.

8) **Requirement R5**: The SDT should review whether the practice that requires BAs to mutually agree by the 15th calendar day is needed for reliability. The PRT believes there may be merit in requiring BAs to identify the cause of the dispute, and to either correct it within a prescribed number of days, or follow a dispute resolution process. The SDT should ensure that the requirement is clear and distinct, which may require modifying or striking the language regarding dispute resolution.

3. **Definitions**: Do any of the defined terms used within the Reliability Standard need to be refined?

   ☒ Yes

☐ No

Please explain: The SDT should review definitions for consistency on Scheduled Interchange and clarification of Pseudo-Tie to indicate that it is treated no differently than tie line metering for a common point between two BAs, communication requirements, etc., and included in the calculation of Actual Net Interchange and the Reporting ACE equation. The SDT should also review proposed changes to the INT standards as part of this examination.

The use of multiple Interchange terms within the Standards prompted the PRT to reference the Glossary of Terms Used in NERC Reliability Standards. The PRT reviewed the definitions of Actual Net Interchange and Scheduled Net Interchange used within the definition of Reporting ACE, along with the definitions of Interchange Schedule, Net Interchange Schedule, Net Scheduled Interchange, and Net Actual Interchange. The PRT found it confusing to have multiple interchange definitions with similar titles, and some with similar meanings, and recommends the SDT consider the following:

a) Scan all of the NERC Standards, all terms in BAL-005 and -006, and the NERC Glossary to determine if the terms associated with the subject standards are used or defined appropriately (e.g., NI_S, NI_A, I_S, I_A, ACE, and Reporting ACE).
b) Ensure that any suggested revisions to scheduled interchange definitions retain the overall concepts that:
   - the schedule ramps must be reflected in the Reporting ACE;
   - the static schedules (any that are not Dynamic Schedules) coordinated between Adjacent BAs prior to implementation use block accounting ignoring the schedule ramps;
   - the estimated MW values of the Dynamic Schedules prior to implementation are typically not included in the scheduled interchange values coordinated and agreed to between Adjacent BAs; and
   - the megawatt-hour values of scheduled interchange agreed-to after the fact reflect the static schedules (any that are not Dynamic Schedules) operated to using block accounting integrated over the hour but ignoring the ramps, plus the hourly integrated values for any Dynamic Schedules.

Suggested Revisions to NERC Glossary Definitions:

Automatic Generation Control ("AGC")
Equipment that automatically adjusts ~~generation~~ **resources** utilized in a Balancing Authority Area from a central location to maintain the Balancing Authority's ACE within the bounds required under the NERC Reliability Standards**. Resources utilized under AGC may include conventional generation, variable energy resources, storage devices and loads acting as resources, such as Demand Response**. ~~may interchange schedule plus~~

~~Frequency Bias.~~ ~~AGC may also accommodate automatic inadvertent payback and time error correction.~~

Reporting ACE
The scan rate values of a Balancing Authority's Area Control Error (ACE) measured in MW, which includes the difference between the Balancing Authority's **Actual Net Interchange** and its **Scheduled Net Interchange**, plus its Frequency Bias obligation, plus any known meter error. In the Western Interconnection, Reporting ACE includes Automatic Time Error Correction (ATEC).

Reporting ACE is calculated as follows:
Reporting ACE = $(NI_A - NI_S) - 10B(F_A - F_S) - I_{ME}$
Reporting ACE is calculated in the Western Interconnection as follows:
Reporting ACE = $(NI_A - NI_S) - 10B(F_A - F_S) - I_{ME} + I_{ATEC}$

Where:
NI_A (Actual Net Interchange) is the algebraic sum of actual megawatt transfers across all Tie Lines and Pseudo-Ties ***with all Adjacent Balancing Authorities, which may use anti-aliasing filters as needed to more accurately represent the actual interchange as determined by the Adjacent Balancing Authorities.*** Balancing Authorities directly connected via asynchronous ties to another Interconnection may include or exclude ***the actual*** megawatt transfers on those Tie lines in ***the calculation of NI_A***, provided they are implemented in the same manner for ***Scheduled Net Interchange***.

NI_S (Scheduled Net Interchange) is the algebraic sum of all scheduled megawatt transfers, including Dynamic Schedules, with ***all A***djacent Balancing Authorities, and taking into account the effects of schedule ramps. Balancing Authorities directly connected via asynchronous ties to another Interconnection may include or exclude ***the scheduled*** megawatt transfers on those Tie Lines in the ***calculation of NI_S***, provided they are implemented in the same manner for ***Actual Net Interchange***.

B (Frequency Bias Setting) is the Frequency Bias Setting (in negative MW/0.1 Hz) for the Balancing Authority. **10** is the constant factor that converts the frequency bias setting units to MW/Hz.
F_A (Actual Frequency) is the measured frequency in Hz.
F_S (Scheduled Frequency) is 60.0 Hz, except during a time***-error*** correction.
I_{ME} (Interchange Meter Error) is the meter error correction factor and represents the difference between the integrated hourly average of the ~~net interchange actual~~ ***Actual Net Interchange*** (NI_A) and the cumulative hourly net Interchange energy measurement (in megawatt-hours).

4. **Compliance Elements:** Are the compliance elements associated with the requirements (Measures, Data Retention, Violation Risk Factors (VRF), and Violation Severity Levels (VSL)) consistent with the

direction of the Reliability Assurance Initiative and FERC and NERC guidelines? If you answered "No," please identify which elements require revision, and why:

☐ Yes

☒ No

The standard drafting team will address compliance elements.

5. **Consistency with Other Reliability Standards:** Does the Reliability Standard need to be revised for formatting and language consistency among requirements within the Reliability Standard or consistency with other Reliability Standards? If you answered "Yes," please describe the changes needed to achieve formatting and language consistency:

   ☒ Yes

   ☐ No

   As noted above, the PRT recommends a thorough review of all of the NERC Standards, all terms in BAL-005 and -006, and the NERC Glossary to determine if the Interchange-related terms associated with the subject standards are used or defined appropriately. For example, the PRT noted that BAL-005 R10 is written as if "Net Scheduled Interchange" is the value used in the ACE equation; however, Net Scheduled Interchange has two meanings – the algebraic sum of all Interchange Schedules across a given path, or between Balancing Authorities for a given period or instant in time. Also, the PRT could not find a definition of Scheduled Interchange as used in BAL-005 R11.

6. **Changes in Technology, System Conditions, or other Factors:** Does the Reliability Standard need to be revised to account for changes in technology, system conditions, or other factors? If you answered "Yes," please describe the changes and specifically what the potential impact is to reliability if the Reliability Standard is not revised:

   ☐ Yes

   ☒ No

7. **Consideration of Generator Interconnection Facilities:** Is responsibility for generator interconnection Facilities appropriately accounted for in the Reliability Standard?

   ☒ Yes

   ☐ No

Guiding Questions:

If the Reliability Standard is applicable to GOs/GOPs, is there any ambiguity about the inclusion of generator interconnection Facilities? (If generation interconnection Facilities could be perceived to be excluded, specific language referencing the Facilities should be introduced in the Reliability Standard.)

If the Reliability Standard is not applicable to GOs/GOPs, is there a reliability-related need for treating generator interconnection Facilities as transmission lines for the purposes of this Reliability Standard? (If so, GOs and GOPs that own or operate relevant generator interconnection Facilities should be explicit in the applicability section of the Reliability Standard.)

As indicated in the detail provided for BAL-005 R1, the PRT proposes that the GOP requirement to have its resource facilities within the metered boundaries of a BA be moved to an FAC requirement as no MWs should be generated prior to such arrangements.

Recommendation

The answers to the questions above, along with a preliminary recommendation of the Review Team, will be posted for a 45-day comment period, and the comments publicly posted. The Review Team will review the comments to evaluate whether to modify its initial recommendation, and will document the final recommendation which will be presented to the Standards Committee.

Preliminary Recommendation (to be completed by the Review Team after its review and prior to posting the results of the review for industry comment):

- ☐ REAFFIRM
- ☒ REVISE
- ☐ RETIRE

Technical Justification *(If the Review Team recommends that the Reliability Standard be revised, a draft SAR may be included and the technical justification included in the SAR)*: See the attached draft SAR.

Preliminary Recommendation posted for industry comment (date): February 21, 2014

Final Recommendation (to be completed by the Review Team after it has reviewed industry comments on the preliminary recommendation):

- ☐ REAFFIRM *(This should only be checked if there are no outstanding directives, interpretations or issues identified by stakeholders.)*
- ☐ REVISE
- ☐ RETIRE

Technical Justification *(If the Review Team recommends that the Reliability Standard be revised, a draft SAR may be included and the technical justification included in the SAR)*:

Date submitted to NERC Staff:

Attachment 1: Results-Based Standards

The fourth question for NERC staff and the Review Team asks if the Reliability Standard needs to be converted to the results-based standards (RBS) format. The information below will be used by NERC staff and the Review Team in making this determination.

Transitioning the current body of standards into a clear, concise, and effective body will require a comprehensive application of the RBS concept. RBS concepts employ a defense-in-depth strategy for Reliability Standards development where each requirement has a role in preventing system failures, and the roles are complementary and reinforcing. Reliability Standards should be viewed as a portfolio of requirements designed to achieve an overall defense-in-depth strategy and comply with the quality objectives identified in the resource document titled, "Acceptance Criteria of a Reliability Standard."

Accordingly, the Review Team shall consider whether the Reliability Standard contains results-based requirements with sufficient clarity to hold entities accountable without being overly prescriptive as to how a specific reliability outcome is to be achieved. The RBS concept, properly applied, addresses the clarity and effectiveness aspects of a standard.

A Reliability Standard that adheres to the RBS format should strive to achieve a portfolio of performance-, risk-, and competency-based mandatory reliability requirements that support an effective defense-in-depth strategy. Each requirement should identify a clear and measurable expected outcome, such as: a) a stated level of reliability performance, b) a reduction in a specified reliability risk, or c) a necessary competency.

a. **Performance-Based**—defines a particular reliability objective or outcome to be achieved. In its simplest form, a results-based requirement has four components: who, under what conditions (if any), shall perform what action, to achieve what particular result or outcome?

b. **Risk-Based**—preventive requirements to reduce the risks of failure to acceptable tolerance levels. A risk-based reliability requirement should be framed as: who, under what conditions (if any), shall perform what action, to achieve what particular result or outcome that reduces a stated risk to the reliability of the bulk power system?

c. **Competency-Based**—defines a minimum set of capabilities an entity needs to have to demonstrate it is able to perform its designated reliability functions. A competency-based reliability requirement should be framed as: who, under what conditions (if any), shall have what capability, to achieve what particular result or outcome to perform an action to achieve a result or outcome or to reduce a risk to the reliability of the bulk power system?

Additionally, each RBS-adherent Reliability Standard should enable or support one or more of the eight reliability principles listed below. Each Reliability Standard should also be consistent with all of the reliability principles.

1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.

2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.

3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.

4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained, and implemented.

5. Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of interconnected bulk power systems.

6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.

7. The reliability of the interconnected bulk power systems shall be assessed, monitored, and maintained on a wide-area basis.

8. Bulk power systems shall be protected from malicious physical or cyber attacks.

If the Reliability Standard does not provide for a portfolio of performance-, risk-, and competency-based requirements or consistency with NERC's reliability principles, NERC staff and the Review Team should recommend that the Reliability Standard be revised or reformatted in accordance with the RBS format.

Attachment 2: Paragraph 81 Criteria

The first question for the Review Team asks if one or more of the requirements in the Reliability Standard meet(s) criteria for retirement or modification based on Paragraph 81 concepts.[3] Use the Paragraph 81 criteria explained below to make this determination. Document the justification for the decisions throughout and provide them in the final assessment in the Periodic Review Template.

For a Reliability Standard requirement to be proposed for retirement or modification based on Paragraph 81 concepts, it must satisfy **both**: (i) Criterion A (the overarching criterion); and (ii) at least one of the Criteria B listed below (identifying criteria). In addition, for each Reliability Standard requirement proposed for retirement or modification, the data and reference points set forth below in Criteria C should be considered for making a more informed decision.

Criterion A (Overarching Criterion)

The Reliability Standard requirement requires responsible entities ("entities") to conduct an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.

Section 215(a) (4) of the United States Federal Power Act defines "reliable operation" as: "… operating the elements of the bulk power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cybersecurity incident, or unanticipated failure of system elements."

Criteria B (Identifying Criteria)

B1. Administrative

The Reliability Standard requirement requires responsible entities to perform a function that is administrative in nature, does not support reliability and is needlessly burdensome.

This criterion is designed to identify requirements that can be retired or modified with little effect on reliability and whose retirement or modification will result in an increase in the efficiency of the ERO compliance program. Administrative functions may include a task that is related to developing procedures or plans, such as establishing communication contacts. Thus, for certain requirements, Criterion B1 is closely related to Criteria B2, B3 and B4. Strictly administrative functions do not inherently negatively impact reliability directly and, where possible, should be eliminated or modified for purposes of efficiency and to allow the ERO and entities to appropriately allocate resources.

[3] In most cases, satisfaction of the Paragraph 81 criteria will result in the retirement of a requirement. In some cases, however, there may be a way to modify a requirement so that it no longer satisfies Paragraph 81 criteria. Recognizing that, this document refers to both options.

B2. Data Collection/Data Retention
These are requirements that obligate responsible entities to produce and retain data which document prior events or activities, and should be collected via some other method under NERC's rules and processes.

This criterion is designed to identify requirements that can be retired or modified with little effect on reliability. The collection and/or retention of data do not necessarily have a reliability benefit and yet are often required to demonstrate compliance. Where data collection and/or data retention is unnecessary for reliability purposes, such requirements should be retired or modified in order to increase the efficiency of the ERO compliance program.

B3. Documentation
The Reliability Standard requirement requires responsible entities to develop a document (*e.g.,* plan, policy or procedure) which is not necessary to protect reliability of the bulk power system.

This criterion is designed to identify requirements that require the development of a document that is unrelated to reliability or has no performance or results-based function. In other words, the document is required, but no execution of a reliability activity or task is associated with or required by the document.

B4. Reporting
The Reliability Standard requirement obligates responsible entities to report to a Regional Entity, NERC or another party or entity. These are requirements that obligate responsible entities to report to a Regional Entity on activities which have no discernible impact on promoting the reliable operation of the BES and if the entity failed to meet this requirement there would be little reliability impact.

B5. Periodic Updates
The Reliability Standard requirement requires responsible entities to periodically update (*e.g.,* annually) documentation, such as a plan, procedure or policy without an operational benefit to reliability.

This criterion is designed to identify requirements that impose an updating requirement that is out of sync with the actual operations of the BES, unnecessary, or duplicative.

B6. Commercial or Business Practice
The Reliability Standard requirement is a commercial or business practice, or implicates commercial rather than reliability issues.

This criterion is designed to identify those requirements that require: (i) implementing a best or outdated business practice or (ii) implicating the exchange of or debate on commercially sensitive information while doing little, if anything, to promote the reliable operation of the BES.

B7. Redundant
The Reliability Standard requirement is redundant with: (i) another FERC-approved Reliability Standard requirement(s); (ii) the ERO compliance and monitoring program; or (iii) a governmental regulation (*e.g.,* Open Access Transmission Tariff, North American Energy Standards Board ("NAESB"), etc.).

This criterion is designed to identify requirements that are redundant with other requirements and are, therefore, unnecessary. Unlike the other criteria listed in Criterion B, in the case of redundancy, the task or activity itself may contribute to a reliable BES, but it is not necessary to have two duplicative requirements on the same or similar task or activity. Such requirements can be retired or modified with little or no effect on reliability and removal will result in an increase in efficiency of the ERO compliance program.

Criteria C (Additional data and reference points)
Use the following data and reference points to assist in the determination of (and justification for) whether to proceed with retirement or modification of a Reliability Standard requirement that satisfies both Criteria A and B:

C1. Was the Reliability Standard requirement part of a FFT filing?
The application of this criterion involves determining whether the requirement was included in a FFT filing.

C2. Is the Reliability Standard requirement being reviewed in an ongoing Standards Development Project?
The application of this criterion involves determining whether the requirement proposed for retirement or modification is part of an active Standards Development Project, with consideration for the status of the project. If the requirement has been approved by Registered Ballot Body and is scheduled to be presented to the NERC Board of Trustees, in most cases it will not need to be addressed in the periodic review. The exception would be a requirement, such as the Critical Information Protection (CIP) requirements for Version 3 and 4, that is not due to be retired for an extended period of time. Also, for informational purposes, whether the requirement is included in a future or pending Standards Development Project should be identified and discussed.

C3. What is the VRF of the Reliability Standard requirement?
The application of this criterion involves identifying the VRF of the requirement proposed for retirement or modification, with particular consideration of any requirement that has been assigned as having a Medium or High VRF. Also, the fact that a requirement has a Lower VRF is not dispositive that

it qualifies for retirement or modification. In this regard, Criterion C3 is considered in light of Criterion C5 (Reliability Principles) and C6 (Defense in Depth) to ensure that no reliability gap would be created by the retirement or modification of the Lower VRF requirement. For example, no requirement, including a Lower VRF requirement, should be retired or modified if doing so would harm the effectiveness of a larger scheme of requirements that are purposely designed to protect the reliable operation of the BES.

C4. In which tier of the most recent Actively Monitored List (AML) does the Reliability Standard requirement fall?

The application of this criterion involves identifying whether the requirement proposed for retirement or modification is on the most recent AML, with particular consideration for any requirement in the first tier of the AML.

C5. Is there a possible negative impact on NERC's published and posted reliability principles?

The application of this criterion involves consideration of the eight following reliability principles published on the NERC webpage.

Reliability Principles

NERC Reliability Standards are based on certain reliability principles that define the foundation of reliability for North American bulk power systems. Each reliability standard shall enable or support one or more of the reliability principles, thereby ensuring that each standard serves a purpose in support of reliability of the North American bulk power systems. Each reliability standard shall also be consistent with all of the reliability principles, thereby ensuring that no standard undermines reliability through an unintended consequence.

Principle 1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.

Principle 2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.

Principle 3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.

Principle 4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained, and implemented.

Principle 5. Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of interconnected bulk power systems.

Principle 6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.

Principle 7. The reliability of the interconnected bulk power systems shall be assessed, monitored, and maintained on a wide-area basis.

Principle 8. Bulk power systems shall be protected from malicious physical or cyber attacks. (footnote omitted).

C6. Is there any negative impact on the defense in depth protection of the BES?
The application of this criterion considers whether the requirement proposed for retirement or modification is part of a defense in depth protection strategy. In order words, the assessment is to verify whether other requirements rely on the requirement proposed for retirement or modification to protect the BES.

C7. Does the retirement or modification promote results or performance based Reliability Standards?
The application of this criterion considers whether the requirement, if retired or modified, will promote the initiative to implement results- and/or performance-based Reliability Standards.

Standards Authorization Request Form

When completed, please email this form to: sarcomm@nerc.com.

NERC welcomes suggestions to improve the reliability of the Bulk-Power System through improved Reliability Standards. Please use this Standard Authorization Request (SAR) form to submit your request to propose a new Reliability Standard, a revision to a Reliability Standard, or the retirement of a Reliability Standard.

Request to propose a new Reliability Standard, a revision to a Reliability Standard, or the retirement of a Reliability Standard			
Title of Proposed Reliability Standard:	BAL-005-3 – Automatic Generation Control and BAL-006-3 – Inadvertent Interchange		
Date Submitted:	February 18, 2014		
SAR Requester Information			
Name:	Doug Hils		
Organization:	Duke Energy		
Telephone:	513.287.2149	Email:	doug.hils@duke-energy.com
SAR Type (Check as many as applicable)			
☐ New Reliability Standard ☒ Revision to existing Reliability Standards		☐ Retirement of existing Reliability Standard ☐ Urgent Action	

SAR Information
Industry Need (What is the industry problem this request is trying to solve?):
The North American Electric Reliability Corporation (NERC) is required to conduct a periodic review of each NERC Reliability Standard at least once every ten years, or once every five years for Reliability Standards approved by the American National Standards Institute as an American National Standard. Project 2010-14.2 - Phase 2 of Balancing Authority Reliability-based Controls (BARC 2) was included in the current cycle of periodic reviews.

SAR Information
The NERC Standards Committee appointed eleven industry subject matter experts to serve on the BARC 2 periodic review team (BARC 2 PRT) in the fall of 2013. The BARC 2 PRT used background information on the standards and the questions set forth in the Periodic Review Template developed by NERC and approved by the Standards Committee, along with associated worksheets and reference documents, to determine whether BAL-005-0_2b and BAL-006-2 should be: (1) affirmed as is (i.e., no changes needed); (2) revised (which may include revising or retiring one or more requirements); or (3) withdrawn. As a result of that examination, the BARC 2 PRT recommends to REVISE BAL-005-0_2b and BAL-006-2, and has therefore developed this Standard Authorization Request (SAR) outlining the proposed scope and technical justification for the revisions.
Purpose or Goal (How does this request propose to address the problem described above?):
This SAR proposes revising BAL-005 and BAL-006 in line with the recommendations of the BARC 2 PRT as described in the *PRT Recommendation to Revise BAL-005 and BAL-006*, (Attachment 1). The proposed changes to the standards add clarity, remove redundancy, take into account technological changes since the last versions of the standards, address FERC directives, and bring compliance elements in accordance with NERC guidelines. A detailed description of the PRT's recommended changes are contained later in this SAR.
Identify the Objectives of the proposed Reliability Standard's requirements (What specific reliability deliverables are required to achieve the goal?):
The objective of BAL-005 is to establish requirements for acquiring necessary data for the Balancing Authority to calculate Reporting ACE so that balancing of resources and demand can be achieved under Tie-Line Bias Control. The current objective of BAL-006 is to define define a process for monitoring Balancing Authorities to ensure that, over the long term, Balancing Authority Areas do not excessively depend on other Balancing Authority Areas in the Interconnection for meeting their demand or Interchange obligations. As the revisions proposed for BAL-006 focus on the minimum requirements for Adjacent Balancing Authorities to agree upon the hourly MW amounts of scheduled and actual Interchange between them, which reinforces that errors in coordination or process will be identified, the PRT recommends that the SDT revise the Purpose statement to be consistent with the Requirements as further developed under this SAR.

SAR Information
Brief Description (Provide a paragraph that describes the scope of this Reliability Standard action.)
The scope of this standard action is to revise BAL-005 and BAL-006 in accordance with the recommendations made by the PRT in the *PRT Recommendation to Revise BAL-005 and BAL-006*, (Attachment 1), and consistent with industry consensus to make additional standard revisions to the extent such consensus develops.
Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR. Also provide a justification for the development or revision of the Reliability Standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the Reliability Standard action.)

1. BAL-005

The BARC2 PRT has completed its review of BAL-005, and, among other recommendations, proposes certain revisions below which would remove references to the types of resources and reserves utilized by the Balancing Authority to balance resources and demand. The PRT recommendations focus on the components that make up the Reporting ACE, and not on the ancillary service aspects of resource control that drew criticism from the industry for being specific to generation when BAL-005 was originally filed with the FERC. Among other recommendations, for the implementation of Tie-Lines, Pseudo-Ties, and Dynamic Schedules (all similar in that they utilize real-time data from an agreed-upon common source between Adjacent BAs), the PRT recommends requirements focused on the real-time values operated to. The PRT's recommendations for BAL-005 are fully detailed below.

1) **Title**: The PRT recommends changing the title of BAL-005 to "Balancing Authority Control" to remove the implication that BAL-005 pertains exclusively to generation, and better reflect the focus on the BA acquiring necessary data to calculate Reporting ACE so that balancing of resources and demand can be achieved under Tie-Line Bias Control. Based upon the input from the industry, the PRT recommends that the SDT consider whether the term AGC should be retained within any requirements. The PRT also recommends that the SDT pursue revisions to the definition of AGC as proposed below to be resource-neutral.

AGC: Equipment that automatically adjusts ~~generation~~ resources utilized in a Balancing Authority Area from a central location to maintain the Balancing Authority's Reporting ACE within the bounds required under the NERC Reliability Standards. Resources utilized under AGC may include conventional generation, variable energy resources, storage devices and loads acting as resources, such as Demand Response. ~~may interchange~~

SAR Information

~~schedule plus Frequency Bias.~~ ~~AGC may also accommodate automatic inadvertent payback and time error correction.~~

2) **Purpose**: The SDT would also be tasked with consideration of revising the "Purpose" statement to focus on acquiring the information necessary for calculating Reporting ACE, while remaining neutral on the types of reserves or resources utilized. The PRT recommends the following revised Purpose statement for SDT consideration:

> This standard establishes requirements for acquiring necessary data for the Balancing Authority so that balancing of resources and demand can be achieved under Tie-Line Bias Control.

Within the Purpose statement or Applicability section, the PRT also recommends that the SDT consider addressing the Hydro Quebec exception for tie line bias control in some form, or a single-BA exception.

3) **Applicability**: The SDT should remove "Generator Operators", "Transmission Operators", and "Load Serving Entities" as applicable entities unless specificially added into a Standard requirement by the SDT.

4) **Requirement R1**: The PRT recommends that the content of Requirement R1 be split between what is needed for ensuring facilities are within a BA Area prior to MW being generated or consumed, and what is needed for ensuring balanced operation within an Interconnection. First, the PRT recommends that the SDT consider continuing discussions with the FAC SDT moving and restating or clarifying the TOP, LSE, and GOP requirements in a FAC Standard to ensure facilities are within the metered boundaries of a BA prior to transmission operation, resource operation, or load being served. The PRT discussed that the ownership of metering and other factors may drive why the LSE is included in this standard, along with other entities; however, consideration should be given to moving requirements for these facilities to be within a BA Area into a FAC standard. The PRT is concerned that removing any such requirements of the LSE, TOP, and GOP and not reflecting them within another standard may inadvertently transfer certain obligations to the BA to ensure that such loads, resources, and facilities are within the BA's metered boundaries. The SDT should explore whether the role of the TOP would appropriately cover the loads interconnected to that TOP, such that the LSE requirement may not be necessary. Second, the PRT recommends that the SDT revise Requirements R1 and R2 to be BA requirements that all Actual Net Interchange and Scheduled Net Interchange used by the BA in its Reporting ACE

SAR Information

calculation also have an Adjacent BA, as proposed in the redlined Requirements R1 and R2. Note that the PRT does not intend with the proposed language to impose any additional requirements on the BA that currently apply to the LSE, GOP, and TOP, but also believes that the requirements to identify the applicable BA should perhaps be in the interconnection agreements (via FERC's OATT or NAESB, for example) or a FAC requirement. With respect to proposed R2, the SDT should ensure that the requirement cannot be misinterpreted to imply that Dynamic Schedules can only be with physically adjacent BAs. The intent is to address adjacency in a manner consistent with the scheduling path no differently than used for interchange schedules.

5) **Requirement R2**: Retirement approved by FERC effective January 21, 2014.

6) **Requirement R3**: The PRT recommends that the SDT not use the term "Regulation Service," as in general this statement could apply to implementation of Dynamic Schedules or Pseudo-Ties, and the desire to have a common point for the data shared between the BAs implementing the Dynamic Transfer. The PRT recommends removing "adequate" and "Burden" from the requirement. The PRT recommends expanding Requirement R3 to be applicable to the implementation of tie lines, Pseudo-Ties, and Dynamic Schedules, as all require agreement between adjacent BAs on the agreed-upon points to be implemented. The PRT recommends that the SDT review the other standards such as TOP-005 to assure there is no duplication or redundancy. Specific to the concern on swapping hourly values in BAL-005 posted for industry comment. The PRT recommends deleting the proposed R3.2 and the first sentence of the proposed R3.5.2, the PRT also recommends the SDT develop a guideline document to accompany BAL-005 covering some of the suggested best practices.

7) **Requirement R4**: The PRT reviewed Requirement R4 with respect to what notification or coordination is necessary that could be considered with the other requirements in this Standard regarding Interchange. Initially the PRT was considering a recommendation that the SDT consider the requirement as it applies to Dynamic Transfer implementation as discussed in the Dynamic Transfer reliability guideline, and as it applies to the practice of implementing multiple-BA Dynamic Transfers under a process referred to as ACE Diversity Interchange. The PRT also considered recommendations to delete or modify Requirement R4 so that it requires communication with not only the BAs, but any other affected entities, and also to strike "providing Regulation Service." However, after further review, the PRT recommends retiring Requirement R4, as the basis for coordination of common values between adjacent BAs is covered in Requirement R3, and correction of information not available has also been addressed. These requirements should ensure that any failure to perform would be reflected in the BA performance under BAL-001-2.

SAR Information

8) **Requirement R5**: The PRT recommends retiring Requirement R5, as the requirements placed upon the implementation of Dynamic Transfers are covered within Requirement R3. With respect to having a backup plan to the extent that a service may no longer be provided, the PRT believes this would be covered in the terms agreed to between the parties implementing the Dynamic Transfer. As proposed by the PRT, the requirements remaining in BAL-005 would ensure that any failure to perform would be reflected in the BA performance under BAL-001-2.

9) **Requirement R6**: The PRT recommends that the sentence "Single Balancing Authorities operating asynchronously may employ alternative ACE calculations such as (but not limited to) flat frequency control" be captured in the definition of "Reporting ACE.". The terms used in the Requirement R6 need to be consistent with those used in Reporting ACE if the Requirement is retained. The SDT should consider whether the 30-minute requirement for RC notification is sufficient or excessive. The PRT recommends that if a timing requirement remains in the standard that it be structured in a manner to not require communication with the RC if the capability to calculate Reporting ACE is restored within the defined notification period.

10) **Requirement R7**: The PRT recommends retiring this Requirement under Paragraph 81. The first sentence covers having a functional EMS or other system capable of calculating Reporting ACE and controlling resources, which can be done manually without any detriment to reliability. EOP-008-1 Requirement R1 recognizes that such automated capability may not be available for up to two hours for loss of control center functionality. In addition, the second sentence is not needed, as such actions would be covered under EOP-008. The PRT believes that the term "Operating AGC" in Requirement R7 refers to the capability to continuously calculate ACE (not automatic control of resources), which should be considered one of the BAs functional obligations with regard to the reliable operations and situational awareness of the BES. Though redundancy and other provisions may be in place to maintain EMS functionality, there are times when the information may not be available where the provisions under EOP-008-1 would apply.

11) **Requirement R8**: The PRT recommends that the SDT revise the Requirement with the proper context of a minimum normal scan rate and clarify how frequently all components must be factored into the Reporting ACE equation under normal operation. With respect to the sub-requirements, the SDT should ensure that any proposed revisions accommodate abnormal and emergency operations, including the possibility that the EMS or supporting telemetry may not be available, such as during an evacuation to a backup site. The PRT notes that the SDT should consider a requirement focused on a minimum scan-rate expectation under normal operations, rather than a requirement that could be interpreted as if systems have 100% availability.

SAR Information

12) **Requirement R8, Part 8.1**: The BA should have visibility of system frequency within parameters consistent with EOP-008, however the PRT recommends that the requirement not be prescriptive. The SDT should review EOP-008 to ensure that this requirement is covered there. In addition, the SDT should also consider remote and redundant frequency resources to the extent that the information that is otherwise available to the BA may not be available upon loss of control center functionality. Such capability may already be anticipated under EOP-008. The SDT should consider the following questions in the development of the revised requirement:

    a) How much time is allowed to pass if the redundancy is lost before it must be restored?

    b) Does the PRT believe it is acceptable for the second and independent frequency device to be one used by another Balancing Authority?

13) **Requirement R9, Part 9.1**: The PRT recommends retiring this Requirement. The Actual Net Interchange and Scheduled Net Interchange values in the Reporting ACE calculation include provisions for the Balancing Authority to include its high voltage direct (HVDC) link to another asynchronous interconnection. By assuring the values are handled consistently in the actual and scheduled Interchange terms included in the real-time Reporting ACE by definition, the Balancing Authority is not being instructed "how" to implement the HVDC link, but allowed to decide the method it will use. By focusing on real-time Reporting ACE, we are assuring reliability is addressed and maintained at all times.

14) **Requirement R10 and R11**: The PRT recommends retiring these requirements, as the basics of both requirements are factored into the definition of Scheduled Net Interchange used in the Reporting ACE calculation as defined in the NERC Glossary.

    The PRT noted that Requirement R10 is written as if "Net Scheduled Interchange" is the value used in the ACE equation; however, Net Scheduled Interchange has two meanings – the algebraic sum of all Interchange Schedules across a given path, or between Balancing Authorities for a given period or instant in time. Aside from the concern of having a definition with two different meanings, the PRT believes that neither choice in the definition accurately depicts the value inserted into the ACE or Reporting ACE, which would be the algebraic sum of all Net Scheduled Interchange with all Adjacent Balancing Authorities, including Dynamic Schedules. In addition, the PRT could not find a definition of Scheduled Interchange as used in Requirement R11. Under Section 3 below, the PRT recommends changes to certain NERC definitions.

SAR Information

15) **Requirement R12**: The PRT took a holistic approach to Requirement R12 and other requirements related to the implementation of Tie-Lines, Pseudo-Ties, and Dynamic Schedules, as all relate to the information exchanged between adjacent BAs.

The PRT recommends a new Requirement R3 related to the implementation of Tie-Lines, Pseudo-Ties, and Dynamic Schedules, where each respective Adjacent BA has agreed to common measuring points that produce an agreed-to value to be included in the calculation of Reporting ACE. The SDT should review the requirement as it relates to current practices to ensure the reliability needs are met.

The PRT suggests that the holistic approach shall only be achieved if there is a comprehensive definition of ACE. Therefore, the PRT recommends the ACE and Reporting ACE definitions be reviewed (understanding and identifying as well why there is a difference) to assure that they are comprehensive (including items such as all AC Tie-Lines, Pseudo-ties, and all other necessary Adjacent BA information). The PRT notes that the comprehensive details of the ACE calculation in BAL-001-1 will be retired upon implementation of BAL-001-2, where ACE will only be defined in the NERC Glossary. The PRT suggests that a complete review of all the NERC Standards for use of the term "ACE" is necessary to assure that any update to the ACE definition would not impact any other Standard.

16) **Requirement R13**: The PRT suggests deleting the first sentence of R13, and suggests that the SDT include in a guideline document the practice of performing hourly error checks of the Actual Net Interchange ($NI_{A)}$ operated to for the hour against an end-of-the-hour reference.

The PRT also recommends a separate requirement specific to adjustments as needed to the Reporting ACE to reflect the meter error adjustment. However, the PRT is concerned that requiring correction of a component of ACE when in error (no matter how negligible) would be problematic in that not all errors require correction. The PRT recommends that the SDT consider stating the requirement in such a manner that I_{ME} is required to be zero except during times needed to compensate for any data or equipment error affecting a component of the Reporting ACE calculation (interchange or frequency). When writing the requirement, the SDT should also consider that there are other means of addressing metering corrections besides use of the I_{ME} term, which may include possible revision to real-time metering data. Uses of the I_{ME} term in the Reporting ACE may also be an appropriate subject for the guideline document the PRT is

SAR Information

recommending that the SDT develop to accompany BAL-005 covering some of the suggested best practices.

Requirement R14: The PRT recommends that the SDT delete the first sentence in R14 and revise the second sentence to cover the minimum amount of information expected for the BA to provide in real-time to its operator. The PRT also recommends that the individual components of actual and scheduled interchange with each Adjacent Balancing Authority also be captured (Tie-Lines, Pseudo-Ties, Dynamic Schedules, block schedules as needed for coordination, and real-time schedules). Based on industry comments, the SDT should consider whether this requirement is needed in the BAL standards, whether it is adequately covered elsewhere in the standards, or whether it should be moved to the NERC Rules of Procedure for certification of the Functional Entity.

17) **Requirement R15**: The SDT should consider placing a requirement in a FAC Standard with respect to supporting infrastructure or functionality, or review EOP-008 to determine if existing requirements adequately address primary control center functionality.

18) **Requirement R16**: The PRT recommends moving the requirement for flagging bad data to revisions made in Requirement R14.

19) **Requirement R17**: The PRT recommends that this requirement be written to be specific to the equipment used to determine the frequency component required for Reporting ACE. The PRT also recommends that the SDT move any accuracy requirements applicable to the needs of the Transmission Operator, (which may include MW, MVAR, voltage, potential transformer, current transformer, and remote terminal unit or equivalent) to a TOP or FAC standard. Further study would be needed on the ".25% of full scale" and the "appropriate accuracy" language.

2. BAL-006

The BARC2 PRT has completed its review of BAL-006 and recommends that it be revised. The recommendations below include moving any requirements with implications for real-time operations into BAL-005.

Among other work, the review team considered a FERC directive that recommended the development of a metric to bound the magnitude of inadvertent accumulations, as those accumulations may be indicative of a BA excessively leaning on the resources of others in its Interconnection. The review team

SAR Information

consensus was that an Inadvertent Interchange accumulation value alone cannot yield useful information concerning whether a BA is operating reliably. The PRT document on the consideration of issues and directives more fully covers the PRT recommendations related to the FERC directives. The PRT's recommendations for BAL-006 are fully detailed below.

1) **Purpose**: As the revisions proposed for BAL-006 focus on the minimum requirements for Adjacent Balancing Authorities to agree upon the hourly MW amounts of scheduled and actual Interchange between them, which reinforces that errors in coordination or process will be identified, the PRT recommends that the SDT revise the Purpose statement to be consistent with the Requirements as further developed under the SAR posted with this recommendation.

2) **Requirement R1**: The PRT recommends removing Requirement R1 as written and recommends that the SDT determine if there is merit in developing a reliability metric specific to this standard to measure performance to certain requirements under BAL-006, including the consideration of including the calculation of Inadvertent Interchange. In development of any metric, the PRT recommends that the SDT determine the appropriate time-frame for reliability (as close to real-time as possible). Similar to how BAL-001-2 has CPS1 and BAAL measures dependent upon the BA calculating its Reporting ACE without a stated requirement that "Each BA shall calculate its Reporting ACE", the PRT felt that if the industry supports a measure being developed that uses Inadvertent Interchange in the measure of performance, that the BA would calculate Inadvertent Interchange as needed to comply. Also, similar to the approach taken for defining Reporting ACE in the Glossary with all of the components necessary for the calculation, the PRT is recommending in Requirement R2 below that the definition of Inadvertent Interchange also be updated so that all components necessary for the calculation are identified.

3) **Requirement R2**: The PRT recommends incorporating Requirement R2 into a revised definition of Inadvertent Interchange: The PRT recommends that this definition be modified to capture that the calculation is on an hourly basis and includes the megawatt-hour values for Tie-Lines, Pseudo-Ties, and Dynamic Schedules, along with other scheduled interchange implemented under block scheduling, which does not include the effect of the ramps. The PRT recommends that the definition also include the NERC definitions of On-Peak Accounting and Off-Peak Accounting, which reference the NAESB business practice for inadvertent interchange accounting. The PRT also recommends that the definition clarify the treatment of scheduled and actual interchange associated with asynchronous ties between Interconnections.

4) **Requirement R3**: The PRT recommends incorporating Requirement R3 into BAL-005, as the requirement relates to the agreement on common values used in Real-time and also

SAR Information
recommends developing a guideline to cover the practice of comparing the hourly megawatt-hour values gathered at the end of the hour against the hourly integrated values of the scan-rate data operated to, in order to determine if significant error exists. 5) **Requirement R4**: The SDT should review current practices for confirmation of interchange after-the-fact to determine and justify a shorter duration for agreement on such values for reliability purposes. The PRT also recommends that Requirement R4 be restated to require that the agreement is based upon the aggregate net schedules and net actuals by adjacent BAs as further defined in the new definition of Inadvertent Interchange. In concept, every Tie-Line, Pseudo-Tie, and Interchange Schedule (including Dynamic Schedules) implemented in the Reporting ACE calculation should have an accompanying after-the-fact megawatt-hour value accounted for in the calculation of Inadvertent Interchange. 6) **Requirement R4, Part 4.2**: The SDT should evaluate whether to retire this Requirement, as it is addressed in the new definition of Inadvertent Interchange by the proposed reference to On-Peak Accounting and Off-Peak Accounting. 7) **Requirement R4.3**: The SDT should review this requirement to determine what elements of the requirement are necessary to support reliability. The SDT also should consider including in a guideline document a practice to support providing operations personnel with information on the comparison of monthly revenue class meters to meters used for real-time operation. 8) **Requirement R5**: The SDT should review whether the practice that requires BAs to mutually agree by the 15th calendar day is needed for reliability. The PRT believes there may be merit in requiring BAs to identify the cause of the dispute, and to either correct it within a prescribed number of days, or follow a dispute resolution process. The SDT should ensure that the requirement is clear and distinct, which may require modifying or striking the language regarding dispute resolution.

Reliability Functions	
The Reliability Standards will Apply to the Following Functions (Check each one that applies.)	
☐ Regional Reliability Organization	Conducts the regional activities related to planning and operations, and coordinates activities of Responsible Entities to secure the reliability of the Bulk Electric System within the region and adjacent regions.
☐ Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☒ Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☐ Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☐ Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐ Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☐ Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☐ Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☐ Transmission Owner	Owns and maintains transmission facilities.
☐ Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☐ Distribution Provider	Delivers electrical energy to the End-use customer.
☐ Generator Owner	Owns and maintains generation facilities.
☐ Generator Operator	Operates generation unit(s) to provide real and reactive power.

Reliability Functions		
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.
☐	Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles	
Applicable Reliability Principles (Check all that apply).	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Reliability Standards.
☒	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☐	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Reliability Standard comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A Reliability Standard shall not give any market participant an unfair competitive advantage.	Yes.
2. A Reliability Standard shall neither mandate nor prohibit any specific market structure.	Yes.
3. A Reliability Standard shall not preclude market solutions to achieving compliance with that Reliability Standard.	Yes.

Reliability and Market Interface Principles	
4. A Reliability Standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with Reliability Standards.	Yes.

Related Reliability Standards	
Reliability Standard No.	Explanation
BAL-001-2 and draft BAL-002-2	Some of the proposed revisions to BAL-005 focus on the components used to calculate Reporting ACE, used to measure compliance to CPS1 and BAAL in BAL-001-2, and measure compliance in the draft BAL-002-2 revisions.
EOP-008-1	The purpose of EOP-008-1 is to ensure continued reliable operations of the Bulk Electric System (BES) in the event that a control center becomes inoperable. For certain proposed revisions to BAL-005 in this SAR, the PRT recommends that the SDT consider provisions in EOP-008-1 for the loss of control center functionality.
FAC-001-1	With respect to BAL-005 Requirement R1, the PRT recommends that the SDT consider moving and restating the TOP, LSE, and GOP requirements in an FAC Standard to ensure facilities are within the metered boundaries of a BA prior to transmission operation, resource operation, or load being served. The PRT recommends that the SDT explore whether the role of the TOP would appropriately cover the loads interconnected to that TOP, such that the LSE requirement may not be necessary.
Other	The PRT recommendations include that the ACE and Reporting ACE definitions be reviewed (understanding and identifying as well why there is a difference) to assure that they are comprehensive (including items such as all AC Tie-Lines, Pseudo-ties, and all other necessary Adjacent BA information). As the comprehensive details of the ACE calculation in BAL-001-1 will be retired upon implementation of BAL-001-2, where ACE will only be defined in the NERC Glossary, the PRT suggests that a complete review of all the NERC Standards is necessary to assure where ACE is utilized in a Standard, that any update to the ACE definition would not impact any other Standard.

A. Introduction

1. **Title:** Balancing Authority Control~~Automatic Generation Control~~

2. **Number:** BAL-005-3~~0.2b~~

3. **Purpose:** This standard establishes requirements for acquiring necessary data for the Balancing Authority ~~Automatic Generation Control (AGC) necessary~~ to calculate Reporting ~~Area Control Error (~~ACE~~) and to routinely deploy the Regulating Reserve. The standard also ensures that all facilities and load electrically synchronized to the Interconnection are included within the metered boundary of a Balancing Area~~ so that balancing of resources and demand can be achieved under Tie-Line Bias Control.

4. **Applicability:**

   4.1. Balancing Authorities

   ~~4.2.~~ ~~Generator Operators~~

   ~~4.3.~~ ~~Transmission Operators~~

   ~~4.4.~~ ~~Load Serving Entities~~

5. **Effective Date:** ~~May 13, 2009~~To be determined.

B. Requirements

R1. ~~Only~~Each Balancing Authority shall implement only those Tie-Lines and Pseudo-Ties with A~~a~~djacent Balancing Authorities ~~shall be implemented~~ as Actual Net Interchange ~~Actual~~ in the Reporting ACE. ~~All generation, transmission, and load operating within an Interconnection must be included within the metered boundaries of a Balancing Authority Area.~~

~~R1.1.~~ ~~Each Generator Operator with generation facilities operating in an Interconnection shall ensure that those generation facilities are included within the metered boundaries of a Balancing Authority Area.~~

~~R1.2.~~ ~~Each Transmission Operator with transmission facilities operating in an Interconnection shall ensure that those transmission facilities are included within the metered boundaries of a Balancing Authority Area.~~

~~R1.3.~~ ~~Each Load-Serving Entity with load operating in an Interconnection shall ensure that those loads are included within the metered boundaries of a Balancing Authority Area.~~

R2. Each Balancing Authority shall implement only those~~Only~~ Interchange Schedules including Dynamic Schedules with A~~a~~djacent Balancing Authorities ~~shall be implemented~~ as Scheduled Net ~~Scheduled~~ Interchange in the Reporting ACE. ~~Each Balancing Authority shall maintain Regulating Reserve that can be controlled by AGC to meet the Control Performance Standard. (Retirement approved by NERC BOT pending applicable regulatory approval.)~~

~~R3.~~ ~~A Balancing Authority providing Regulation Service shall ensure that adequate metering, communications, and control equipment are employed to prevent such service from becoming a Burden on the Interconnection or other Balancing Authority Areas.~~

R3. ~~Adjacent~~ Each Balancing Authorit~~i~~yes shall ensure that ~~adequate metering, communications, and control equipment are employed between them to ensure that~~ common and agreed-upon values are communicated to each~~both~~ applicable adjacent Balancing Authority~~ies~~ for all Tie-Lines, Pseudo-Ties, and ~~Interchange Schedules including~~ Dynamic Schedules~~, even when primary source data is not available~~.

R3.1. A Balancing Authority with a high voltage direct current (HVDC) Tie-Line to another Balancing Authority connected asynchronously to the Interconnection may choose to omit the scheduled and actual Interchange related to the HVDC Tie-Line from the ACE equation if the HVDC Tie-Line is modeled as internal generation or load by both BAs at either end of the Tie-Line.

~~Each Balancing Authority shall perform hourly error checks using Tie-Line megawatt-hour meters with common time synchronization to determine the accuracy of its control equipment.~~

R3.2. The Balancing Authority shall maintain an I_{ME} equal to zero in its Reporting ACE except during times needed to compensate for any data or equipment error affecting a component of the Reporting ACE calculation (Interchange or frequency). ~~The Balancing Authority shall correct for any component (e.g., Interchange or frequency) of Reporting ACE that is in error or use the interchange meter error (IME) term of the Reporting ACE equation to compensate for any equipment error until repairs can be made~~[HD1].

R3.3. Adjacent Balancing Authorities shall ensure that each Tie-Line, Pseudo-Tie, and Dynamic Schedule between them is equipped with an agreed-upon common source to determine hourly megawatt-hour values. These values shall be provided hourly to each of the Adjacent Balancing Authorities.

R3.4. The Balancing Authority shall ensure that data acquisition for Reporting ACE occur at least every six seconds.

R3.4~~5~~.1. The Balancing Authority shall calculate Reporting ACE at least every six seconds.

R3.4~~5~~.2. ~~Each Balancing Authority shall perform hourly error checks of NA_E using clock-hour accumulations or integrations of Tie-Line megawatt-hour meter readings.~~ The time synchronization of the tie-line MWH meters shall use a common and agreed upon source (e.g., Coordinated Universal Time (UTC[HD2]))

~~**R4.** A Balancing Authority providing Regulation Service shall notify the Host Balancing Authority for whom it is controlling if it is unable to provide the service, as well as any Intermediate Balancing Authorities.~~

~~**R5.** A Balancing Authority receiving Regulation Service shall ensure that backup plans are in place to provide replacement Regulation Service should the supplying Balancing Authority no longer be able to provide this service.~~

~~**R6.**~~**R4.** ~~The Balancing Authority's AGC shall compare total Net Actual Interchange to total Net Scheduled Interchange plus Frequency Bias obligation to determine the Balancing Authority's ACE. Single Balancing Authorities operating asynchronously may employ alternative ACE calculations such as (but not limited to) flat frequency control.~~ If a Balancing Authority is unable to calculate ACE for more than 30 minutes it shall notify its Reliability Coordinator.

~~**R7.** The Balancing Authority shall operate AGC continuously unless such operation adversely impacts the reliability of the Interconnection. If AGC has become inoperative, the Balancing Authority shall use manual control to adjust generation to maintain the Net Scheduled Interchange.~~

~~**R7.1.** The Balancing Authority shall ensure that data acquisition for and calculation of ACE occur at least every six seconds.~~

~~**R8.**~~**R5.** Each Balancing Authority shall provide redundant and independent frequency metering equipment that shall automatically activate upon detection of failure of the primary metering source. This overall installation shall provide a minimum availability of 99.95%.

~~**R6.** The Balancing Authority shall include all Interchange Schedules with Adjacent Balancing Authorities in the calculation of Net Scheduled Interchange for the ACE equation.~~

~~**R6.5.** Balancing Authorities with a high voltage direct current (HVDC) link to another Balancing Authority connected asynchronously to their Interconnection may choose to omit the Interchange Schedule related to the HVDC link from the ACE equation if it is modeled as internal generation or load.~~

~~**R7.** The Balancing Authority shall include all Dynamic Schedules in the calculation of Net Scheduled Interchange for the ACE equation.~~

~~**R8.** Balancing Authorities shall include the effect of ramp rates, which shall be identical and agreed to between affected Balancing Authorities, in the Scheduled Interchange values to calculate ACE.~~

~~**R9.** Each Balancing Authority shall include all Tie Line flows with Adjacent Balancing Authority Areas in the ACE calculation.~~

~~**R9.5.** Balancing Authorities that share a tie shall ensure Tie Line MW metering is telemetered to both control centers, and emanates from a common, agreed upon source using common primary metering equipment. Balancing Authorities shall ensure that megawatt-hour data is telemetered or reported at the end of each hour.~~

~~**R9.6.** Balancing Authorities shall ensure the power flow and ACE signals that are utilized for calculating Balancing Authority performance or that are transmitted for Regulation Service are not filtered prior to transmission, except for the Anti-aliasing Filters of Tie Lines.~~

~~**R9.7.** Balancing Authorities shall install common metering equipment where Dynamic Schedules or Pseudo-Ties are implemented between two or more Balancing Authorities to deliver the output of Jointly Owned Units or to serve remote load.~~

~~**R10.** Each Balancing Authority shall perform hourly error checks using Tie Line megawatt-hour meters with common time synchronization to determine the accuracy of its control equipment. The Balancing Authority shall adjust the component (e.g., Tie Line meter) of ACE that is in error (if known) or use the interchange meter error (I_{ME}) term of the ACE equation to compensate for any equipment error until repairs can be made.~~

~~**R11.**~~**R6.** ~~The Balancing Authority shall provide its operating personnel with sufficient instrumentation and data recording equipment to facilitate monitoring of control performance, generation response, and after-the-fact analysis of area performance.~~ As a minimum, the Balancing Authority shall provide its operating personnel with real-time values for ACE, Interconnection frequency and Net Actual Interchange with each Adjacent Balancing Authority Area. The Balancing Authority shall flag missing or bad data for operator display and archival purposes.

~~**R12.**~~**R7.** The Balancing Authority shall provide adequate and reliable backup power supplies and shall periodically test these supplies at the Balancing Authority's control center and other critical locations to ensure continuous operation of AGC and vital data recording equipment during loss of the normal power supply.

~~**R13.** The Balancing Authority shall sample data at least at the same periodicity with which ACE is calculated. The Balancing Authority shall flag missing or bad data for operator display and~~

archival purposes. The Balancing Authority shall collect coincident data to the greatest practical extent, i.e., ACE, Interconnection frequency, Net Actual Interchange, and other data shall all be sampled at the same time.

R14. Each Balancing Authority shall at least annually check and calibrate its time error and frequency devices against a common reference. The Balancing Authority shall adhere to the minimum values for measuring devices as listed below:

Device	Accuracy
Digital frequency transducer	≤ 0.001 Hz
MW, MVAR, and voltage transducer	≤ 0.25 % of full scale
Remote terminal unit	≤ 0.25 % of full scale
Potential transformer	≤ 0.30 % of full scale
Current transformer	≤ 0.50 % of full scale

The PRT recommends that R17 be written to be specific to the equipment used to determine the frequency component required for Reporting ACE. The PRT also recommends that the SDT recommend moving any accuracy requirements applicable to the needs of the Transmission Operator, which may include MW, MVAR, voltage, potential transformer, current transformer, and remote terminal unit or equivalent to a TOP or FAC standard. Further study would be needed on the ".25% of full scale" and the "appropriate accuracy" language.

C. Measures

Not specified.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Balancing Authorities shall be prepared to supply data to NERC in the format defined below:

1.1.1. Within one week upon request, Balancing Authorities shall provide NERC or the Regional Reliability Organization CPS source data in daily CSV files with time stamped one minute averages of: 1) ACE and 2) Frequency Error.

1.1.2. Within one week upon request, Balancing Authorities shall provide NERC or the Regional Reliability Organization DCS source data in CSV files with time stamped scan rate values for: 1) ACE and 2) Frequency Error for a time period of two minutes prior to thirty minutes after the identified Disturbance.

1.2. Compliance Monitoring Period and Reset Timeframe

Not specified.

1.3. Data Retention

1.3.1. Each Balancing Authority shall retain its ACE, actual frequency, Scheduled Frequency, Net Actual Interchange, Net Scheduled Interchange, Tie Line meter error correction and Frequency Bias Setting data in digital format at the same scan rate at which the data is collected for at least one year.

1.3.2. Each Balancing Authority or Reserve Sharing Group shall retain documentation of the magnitude of each Reportable Disturbance as well as

the ACE charts and/or samples used to calculate Balancing Authority or Reserve Sharing Group disturbance recovery values. The data shall be retained for one year following the reporting quarter for which the data was recorded.

1.4. Additional Compliance Information

Not specified.

2. Levels of Non-Compliance

Not specified.

E. Regional Differences

None identified.

Effective Date: August 27, 2008 (U.S.)

Interpretation of BAL-005-0 Automatic Generation Control, R17

Request for Clarification received from PGE on July 31, 2007

PGE requests clarification regarding the measuring devices for which the requirement applies, specifically clarification if the requirement applies to the following measuring devices:

- *Only equipment within the operations control room*
- *Only equipment that provides values used to calculate AGC ACE*
- *Only equipment that provides values to its SCADA system*
- *Only equipment owned or operated by the BA*
- *Only to new or replacement equipment*
- *To all equipment that a BA owns or operates*

BAL-005-0

R17. Each Balancing Authority shall at least annually check and calibrate its time error and frequency devices against a common reference. The Balancing Authority shall adhere to the minimum values for measuring devices as listed below:

Device	Accuracy
Digital frequency transducer	≤ 0.001 Hz
MW, MVAR, and voltage transducer	≤ 0.25% of full scale
Remote terminal unit	≤ 0.25% of full scale
Potential transformer	≤ 0.30% of full scale
Current transformer	≤ 0.50% of full scale

Existing Interpretation Approved by Board of Trustees May 2, 2007

BAL-005-0, Requirement 17 requires that the Balancing Authority check and calibrate its control room time error and frequency devices against a common reference at least annually. The requirement to "annually check and calibrate" does not address any devices outside of the operations control room.

The table represents the design accuracy of the listed devices. There is no requirement within the standard to "annually check and calibrate" the devices listed in the table, unless they are included in the control center time error and frequency devices.

Interpretation provided by NERC Frequency Task Force on September 7, 2007 and Revised on November 16, 2007

As noted in the existing interpretation, BAL-005-0 Requirement 17 applies only to the time error and frequency devices that provide, or in the case of back-up equipment may provide, input into the reporting or compliance ACE equation or provide real-time time error or frequency information to the system operator. Frequency inputs from other sources that are for reference only are excluded. The time error and frequency measurement devices may not necessarily be located in the system operations control room or owned by the Balancing Authority; however the Balancing Authority has the responsibility for the

accuracy of the frequency and time error measurement devices. No other devices are included in R 17. The other devices listed in the table at the end of R17 are for reference only and do not have any mandatory calibration or accuracy requirements.

New or replacement equipment that provides the same functions noted above requires the same calibrations. Some devices used for time error and frequency measurement cannot be calibrated as such. In this case, these devices should be cross-checked against other properly calibrated equipment and replaced if the devices do not meet the required level of accuracy.

A. Introduction

1. **Title:** **Inadvertent Interchange**

2. **Number:** BAL-006-2

3. **Purpose:**

   This standard defines a process for monitoring Balancing Authorities to ensure that, over the long term, Balancing Authority Areas do not excessively depend on other Balancing Authority Areas in the Interconnection for meeting their demand or Interchange obligations.

4. **Applicability:**

   4.1. Balancing Authorities.

5. **Effective Date:** First day of first calendar quarter after applicable regulatory approval, or in those jurisdictions where no regulatory approval is required, first day of first calendar quarter after Board of Trustees adoption.

Note that as the revisions proposed for BAL-006 focus on the minimum requirements for Adjacent Balancing Authorities to agree upon the hourly MW amounts of scheduled and actual Interchange between them, which reinforces that errors in coordination or process will be identified, the PRT recommends that the SDT revise the Purpose statement to be consistent with the Requirements as further developed under the SAR posted with this proposed redline.

B. Requirements

~~**R1.** Each Balancing Authority shall calculate and record hourly Inadvertent Interchange. (*Violation Risk Factor: Lower*)~~

~~**R2.** Each Balancing Authority shall include all AC tie lines that connect to its Adjacent Balancing Authority Areas in its Inadvertent Interchange account. The Balancing Authority shall take into account interchange served by jointly owned generators. (*Violation Risk Factor: Lower*)~~

~~**R3.** Each Balancing Authority shall ensure all of its Balancing Authority Area interconnection points are equipped with common megawatt-hour meters, with readings provided hourly to the control centers of Adjacent Balancing Authorities. (*Violation Risk Factor: Lower*)~~

~~**R4.** Adjacent Balancing Authority Areas shall operate to a common Net Interchange Schedule and Actual Net Interchange value and shall record these hourly quantities, with like values but opposite sign. Each Balancing Authority shall compute its Inadvertent Interchange based on the following: (*Violation Risk Factor: Lower*)~~

~~**R5.**~~**R1.** Each Balancing Authority~~, by the end of the next business day,~~ shall agree with its Adjacent Balancing Authorities by the end of the next business day ~~to~~on: (*Violation Risk Factor: Lower*)

~~**R5.1.**~~**R1.1.** The hourly values of Net Interchange Schedule. (*Violation Risk Factor: Lower*)

~~**R5.2.**~~**R1.2.** The hourly integrated megawatt-hour values of Net Actual Interchange. (*Violation Risk Factor: Lower*)

~~**R6.**~~**R2.** Each Balancing Authority shall use the agreed-to daily and monthly accounting data to compile its monthly accumulated Inadvertent Interchange for the On-Peak and Off-Peak hours of the month. (*Violation Risk Factor: Lower*)

~~**R7.**~~**R3.** ~~A~~Each Balancing Authority shall make after-the-fact corrections to the agreed-to daily and monthly accounting data only as needed to reflect actual operating conditions (e.g. a meter being used for control was sending bad data). Changes or corrections based on non-reliability considerations shall not be reflected in the Balancing Authority's Inadvertent Interchange. After-the-fact corrections to scheduled or actual values will not be accepted without agreement of the Adjacent Balancing Authority(ies). (*Violation Risk Factor: Lower*)

R4. Adjacent Balancing Authorities that cannot mutually agree upon their respective Net Actual Interchange or Net Scheduled Interchange quantities by the 15th calendar day of the following month shall, for the purposes of dispute resolution, submit a report to their respective Regional Reliability Organization Survey Contact.

~~R7.1.~~R4.1. The report shall describe the nature and the cause of the dispute as well as a process for correcting the discrepancy. (*Violation Risk Factor: Lower*)

C. Measures

None specified.

D. Compliance

1. Compliance Monitoring Process

1.1. Each Balancing Authority shall submit a monthly summary of Inadvertent Interchange. These summaries shall not include any after-the-fact changes that were not agreed to by the Source Balancing Authority, Sink Balancing Authority and all Intermediate Balancing Authority(ies).

1.2. Inadvertent Interchange summaries shall include at least the previous accumulation, net accumulation for the month, and final net accumulation, for both the On-Peak and Off-Peak periods.

1.3. Each Balancing Authority shall submit its monthly summary report to its Regional Reliability Organization Survey Contact by the 15th calendar day of the following month.

1.4. Each Balancing Authority shall perform an Area Interchange Error (AIE) Survey as requested by the NERC Operating Committee to determine the Balancing Authority's Interchange error(s) due to equipment failures or improper scheduling operations, or improper AGC performance.

1.5. Each Regional Reliability Organization shall prepare a monthly Inadvertent Interchange summary to monitor the Balancing Authorities' monthly Inadvertent Interchange and all-time accumulated Inadvertent Interchange. Each Regional Reliability Organization shall submit a monthly accounting to NERC by the 22nd day following the end of the month being summarized.

2. Violation Severity Levels

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	N/A	N/A	N/A	Each Balancing Authority failed to calculate and record hourly Inadvertent Interchange.
R2.	N/A	N/A	The Balancing Authority failed to include all AC tie lines that connect to its Adjacent Balancing Authority Areas in its Inadvertent Interchange account. Dispersed Generation Resources Project

Action

Authorize the posting of two of three Project 2014-01 Dispersed Generation Resources "high priority" Reliability Standards (PRC-005-2(X), PRC-005-3(X), PRC-005-X(X), VAR-002-2b(X), and VAR-002-4)[1] and Implementation Plans for an initial 45-day formal comment period with ballot pool formation during the first 30 days and initial during the last 10 days of the comment period.

Background

On January 29, 2014, the Standards Committee (SC) seated 11 members to the Project 2014-01 Standard Drafting Team (SDT). The roster is available here. The goal of the NERC Project 2014-01 Standards Applicability for Dispersed Power Producing Resources SDT is to ensure that the Generator Owners (GOs) and Generator Operators (GOPs) of dispersed generation resources are appropriately assigned responsibility for requirements that impact the reliability of the Bulk Power System (BPS), as the characteristics of operating dispersed generation resources can be unique. In light of the revised BES definition approved by the Federal Energy Regulatory Commission (FERC) in 2014, the intent of this effort is generally to maintain the status quo for applicability of the standards as they have been applied over time with respect to dispersed generation resources, where the status quo does not create a reliability gap.

The SDT performed a review of all standards that apply to GOs and/or GOPs and categorized how each standard should be applied to dispersed generation resources to accomplish the reliability purpose of the standard. The SDT developed a draft white paper to explain its approach, and the white paper was posted on April 17, 2014 for an informal comment period. The feedback received on the whitepaper allowed the SDT to refine its approach and finalize revisions to the standards. As explained in the white paper, the team placed standards in the following categories:

- The existing standard language was appropriate when applied to dispersed generating resources and does not need to be addressed;
- The existing standard language was appropriate when applied to dispersed generating resources but additional NERC guidance documentation is needed to clarify how to implement the requirements for dispersed generating resources; and
- The existing standard language needs to be modified in order to account for the unique characteristics of dispersed generation resources. This could be accomplished through the applicability section of the standard in most cases or, if required, through changes to the individual requirements.

[1] The SDT has prepared applicability revisions for relevant versions of PRC-004 – the third high-priority standard – which will be quality reviewed separately and sent to the Standards Committee to authorize posting after the current comment period and ballot of that standard in Project 2010-05.1 ends.

The SDT further categorized revisions to standards as high, medium, or low priority on the basis of how necessary clarifying the applicability to dispersed generation resources was to support timely implementation of the revised definition of Bulk Electric System. The standards included in this authorization are those the team has designated as high priority. Further evaluation is needed of the medium and l.

Because the revisions to the standards are very limited, NERC staff and the PMOS liaison for the project conducted a narrowly focused quality review, focused on consistency and clarity of language that was added or changed to address applicability of the standard to dispersed generation resources. Please also note that no VRFs or VSLs were revised in the standards, so non-binding polls will not be conducted.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment November 20 – December 19, 2013.

Description of Current Draft

This version of PRC-005 contains revisions to thea pplicability of the Standard intended to clarify application of its Requirements to Bulk Electric System dispersed power producing resources. PRC-005-3, a subsequent version of PRC-005, has been adopted by the NERC Board of Trustees and is pending regulatory approval. Depending on the timing of regulatory approval, this interim version, which has been labeled PRC-005-2(X) for balloting purposes, may be filed for regulatory approval. The Protection System Maintenance and Testing Standard Drafting Team (PSMT SDT) is concurrently making technical revisions to PRC-005 in Project 2007-17.3 to address FERC directives. Project 2014-01 does not have in its scope any technical content changes beyond revising the applicability to ensure consistent application of the Requirements of PRC-005 to dispersed power-producing resources.

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with Initial Ballot	June – July 2014
45-day Additional Formal Comment Period with Additional Ballot (if necessary)	August – September 2014
Final ballot	October 2014
BOT adoption	November 2014

When this standard has received ballot approval, the text boxes within the Applicability section of the Standard will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: **Protection System Maintenance**

2. Number: PRC-005- X

3. Purpose: To document and implement programs for the maintenance of all Protection Systems affecting the reliability of the Bulk Electric System (BES) so that these Protection Systems are kept in working order.

4. Applicability:

4.1. Functional Entities:

4.1.1 Transmission Owner

4.1.2 Generator Owner

4.1.3 Distribution Provider

4.2. Facilities:

4.2.1 Protection Systems that are installed for the purpose of detecting Faults on BES Elements (lines, buses, transformers, etc.)

4.2.2 Protection Systems used for underfrequency load-shedding systems installed per ERO underfrequency load-shedding requirements.

4.2.3 Protection Systems used for undervoltage load-shedding systems installed to prevent system voltage collapse or voltage instability for BES reliability.

4.2.4 Protection Systems installed as a Special Protection System (SPS) for BES reliability.

The only revisions made to this version of PRC-005 are revisions to section 4.2, to clarify applicability of the Requirements of the standard at generator Facilities. These applicability revisions are intended to clarify and provide for consistent application of the Requirements to BES generator Facilities included in the BES through Inclusion I4 – Dispersed Power Producing Resources.

This version is labeled PRC-005-2(X) for balloting purposes. The 'X' indicates that a version number will be applied at a later time, because multiple versions of PRC-005 are in development to reflect the fact that applicability changes need apply for versions of the standard that are approved (PRC-005-2), pending regulatory approval (PRC-005-3), and in development in Project 2007-17.3. Depending on the timing of approvals of other versions, NERC may file this interim version to provide regulatory certainty for entities as the revised BES definition is implemented.

4.2.5 Protection Systems for the following BES generator Facilities for generators not identified through Inclusion I4 of the BES definition:

4.2.5.1 Protection Systems that act to trip the generator either directly or via lockout or auxiliary tripping relays.

4.2.5.2 Protection Systems for generator step-up transformers for generators that are part of the BES.

Rationale for 4.2.5: In order to differentiate between typical BES generator Facilities and BES generators at dispersed power producing facilities, section 4.2.5 was separated into two sections (4.2.5 and 4.2.6). The applicability to non-dispersed power producing Facilities has been maintained and can be found in 4.2.5. The applicability to dispersed power producing Facilities has been modified and relocated from 4.2.5 to 4.2.6.

4.2.5.3 Protection Systems for station service or excitation transformers connected to the generator bus of generators which are part of the BES, that act to trip the generator either directly or via lockout or tripping auxiliary relays.

4.2.6 Protection Systems for the following BES generator Facilities for dispersed power producing resources identified through Inclusion I4 of the BES definition:

4.2.6.1 Protection Systems for Facilities used in aggregating dispersed BES generation from the point where those resources aggregate to greater than 75 MVA to a common point of connection at 100 kV or above.

Rationale for 4.2.6: Applicability of the Requirements of PRC-005-2 to dispersed power producing resources is separated out in section 4.2.6. The intent is that for such resources, the Requirements would applyonly to Protection Systems on equipment used in aggregating the BES dispersed power producing resources from the point where those resources aggregate to greater than 75 MVA to a common point of connection at 100 kV or higher including the Protection Systems for those transformers used in aggregating generation.

5. Effective Date: See Implementation Plan.

B. Requirements

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a Protection System Maintenance Program (PSMP) for its Protection Systems identified in Section 4.2. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

The PSMP shall:

1.1. Identify which maintenance method (time-based, performance-based per PRC-005 Attachment A, or a combination) is used to address each Protection System Component Type. All batteries associated with the station dc supply Component Type of a Protection System shall be included in a time-based program as described in Table 1-4 and Table 3.

1.2. Include the applicable monitored Component attributes applied to each Protection System Component Type consistent with the maintenance intervals specified in Tables 1-1 through 1-5, Table 2, and Table 3 where monitoring is used to extend the maintenance intervals beyond those specified for unmonitored Protection System Components.

R2. Each Transmission Owner, Generator Owner, and Distribution Provider that uses performance-based maintenance intervals in its PSMP shall follow the procedure established in PRC-005 Attachment A to establish and maintain its performance-based intervals. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

R3. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes time-based maintenance program(s) shall maintain its Protection System Components that are included within the time-based maintenance program in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3. *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

R4. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes performance-based maintenance program(s) in accordance with Requirement R2 shall implement and follow its PSMP for its Protection System Components that are included within the performance-based program(s). *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

R5. Each Transmission Owner, Generator Owner, and Distribution Provider shall demonstrate efforts to correct identified Unresolved Maintenance Issues. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

C. Measures

M1. Each Transmission Owner, Generator Owner and Distribution Provider shall have a documented Protection System Maintenance Program in accordance with Requirement R1.

For each Protection System Component Type, the documentation shall include the type of maintenance method applied (time-based, performance-based, or a combination of these maintenance methods), and shall include all batteries associated with the station dc supply Component Types in a time-based program as described in Table 1-4 and Table 3. (Part 1.1)

For Component Types that use monitoring to extend the maintenance intervals, the responsible entity(s) shall have evidence for each protection Component Type (such as manufacturer's specifications or engineering drawings) of the appropriate monitored Component attributes as specified in Tables 1-1 through 1-5, Table 2, and Table 3. (Part 1.2)

M2. Each Transmission Owner, Generator Owner, and Distribution Provider that uses performance-based maintenance intervals shall have evidence that its current performance-based maintenance program(s) is in accordance with Requirement R2, which may include but is not limited to Component lists, dated maintenance records, and dated analysis records and results.

M3. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes time-based maintenance program(s) shall have evidence that it has maintained its Protection System Components included within its time-based program in accordance with Requirement R3. The evidence may include but is not limited to dated maintenance records, dated maintenance summaries, dated check-off lists, dated inspection records, or dated work orders.

M4. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes performance-based maintenance intervals in accordance with Requirement R2 shall have evidence that it has implemented the Protection System Maintenance Program for the Protection System Components included in its performance-based program in accordance with Requirement R4. The evidence may include but is not limited to dated maintenance records, dated maintenance summaries, dated check-off lists, dated inspection records, or dated work orders.

M5. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence that it has undertaken efforts to correct identified Unresolved Maintenance Issues in accordance with Requirement R5. The evidence may include but is not limited to work orders, replacement Component orders, invoices, project schedules with completed milestones, return material authorizations (RMAs) or purchase orders.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards

1.2. Compliance Monitoring and Enforcement Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.3. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, and Distribution Provider shall each keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

For Requirement R1, the Transmission Owner, Generator Owner, and Distribution Provider shall each keep its current dated Protection System Maintenance Program, as well as any superseded versions since the preceding compliance audit, including the documentation that specifies the type of maintenance program applied for each Protection System Component Type.

For Requirement R2, Requirement R3, Requirement R4, and Requirement R5, the Transmission Owner, Generator Owner, and Distribution Provider shall each keep documentation of the two most recent performances of each distinct maintenance activity for the Protection System Component, or all performances of each distinct maintenance activity for the Protection System Component since the previous scheduled audit date, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

2. Violation Severity Levels

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The responsible entity's PSMP failed to specify whether one Component Type is being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1) OR The responsible entity's PSMP failed to include applicable station batteries in a time-based program. (Part 1.1)	The responsible entity's PSMP failed to specify whether two Component Types are being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1)	The responsible entity's PSMP failed to include the applicable monitoring attributes applied to each Protection System Component Type consistent with the maintenance intervals specified in Tables 1-1 through 1-5, Table 2, and Table 3 where monitoring is used to extend the maintenance intervals beyond those specified for unmonitored Protection System Components. (Part 1.2).	The responsible entity failed to establish a PSMP. OR The responsible entity failed to specify whether three or more Component Types are being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1).
R2	The responsible entity uses performance-based maintenance intervals in its PSMP but failed to reduce Countable Events to no more than 4% within three years.	NA	The responsible entity uses performance-based maintenance intervals in its PSMP but failed to reduce Countable Events to no more than 4% within four years.	The responsible entity uses performance-based maintenance intervals in its PSMP but: 1) Failed to establish the technical justification described within Requirement R2 for the initial use of the performance-based PSMP OR 2) Failed to reduce Countable Events to no more than 4% within five years OR 3) Maintained a Segment with less than 60 Components OR 4) Failed to: • Annually update the list of Components, OR

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
				• Annually perform maintenance on the greater of 5% of the segment population or 3 Components, OR • Annually analyze the program activities and results for each Segment.
R3	For Protection System Components included within a time-based maintenance program, the responsible entity failed to maintain 5% or less of the total Components included within a specific Protection System Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3.	For Protection System Components included within a time-based maintenance program, the responsible entity failed to maintain more than 5% but 10% or less of the total Components included within a specific Protection System Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3.	For Protection System Components included within a time-based maintenance program, the responsible entity failed to maintain more than 10% but 15% or less of the total Components included within a specific Protection System Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3.	For Protection System Components included within a time-based maintenance program, the responsible entity failed to maintain more than 15% of the total Components included within a specific Protection System Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3.
R4	For Protection System Components included within a performance-based maintenance program, the responsible entity failed to maintain 5% or less of the annual scheduled maintenance for a specific Protection System Component Type in accordance with their performance-based PSMP.	For Protection System Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 5% but 10% or less of the annual scheduled maintenance for a specific Protection System Component Type in accordance with their performance-based PSMP.	For Protection System Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 10% but 15% or less of the annual scheduled maintenance for a specific Protection System Component Type in accordance with their performance-based PSMP.	For Protection System Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 15% of the annual scheduled maintenance for a specific Protection System Component Type in accordance with their performance-based PSMP.
R5	The responsible entity failed to undertake efforts to correct 5 or	The responsible entity failed to undertake efforts to correct greater than 5, but less than or equal to 10	The responsible entity failed to undertake efforts to correct greater than 10, but less than or equal to 15	The responsible entity failed to undertake efforts to correct greater

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
	fewer identified Unresolved Maintenance Issues.	identified Unresolved Maintenance Issues.	identified Unresolved Maintenance Issues.	than 15 identified Unresolved Maintenance Issues.

E. Regional Variances

None

F. Supplemental Reference Document

The following documents present a detailed discussion about determination of maintenance intervals and other useful information regarding establishment of a maintenance program.

1. PRC-005-2 Protection System Maintenance Supplementary Reference and FAQ — July 2012.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
1	December 1, 2005	1. Changed incorrect use of certain hyphens (-) to "en dash" (–) and "em dash (—)." 2. Added "periods" to items where appropriate. 3. Changed "Timeframe" to "Time Frame" in item D, 1.2.	01/20/05
1a	February 17, 2011	Added Appendix 1 - Interpretation regarding applicability of standard to protection of radially connected transformers	Project 2009-17 interpretation
1a	February 17, 2011	Adopted by Board of Trustees	
1a	September 26, 2011	FERC Order issued approving interpretation of R1 and R2 (FERC's Order is effective as of September 26, 2011)	
1.1a	February 1, 2012	Errata change: Clarified inclusion of generator interconnection Facility in Generator Owner's responsibility	Revision under Project 2010-07
1b	February 3, 2012	FERC Order issued approving interpretation of R1, R1.1, and R1.2 (FERC's Order dated March 14, 2012). Updated version from 1a to 1b.	Project 2009-10 Interpretation
1.1b	April 23, 2012	Updated standard version to 1.1b to reflect FERC approval of PRC-005-1b.	Revision under Project 2010-07

Version	Date	Action	Change Tracking
1.1b	May 9, 2012	PRC-005-1.1b was adopted by the Board of Trustees as part of Project 2010-07 (GOTO).	
2	November 7, 2012	Adopted by Board of Trustees	Complete revision, absorbing maintenance requirements from PRC-005-1b, PRC-008-0, PRC-011-0, PRC-017-0
2	October 17, 2013	Errata Change: The Standards Committee approved an errata change to the implementation plan for PRC-005-2 to add the phrase "or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities;" to the second sentence under the "Retirement of Existing Standards" section.	
2	December 19, 2013	FERC Order issued approving PRC-005-2. (The enforcement date for PRC-005-2 will be April 1, 2015, which is the first date entities must be compliant with part of the standard. The implementation plan for PRC-005-2 includes specific compliance dates and timeframes for each of the Requirements. The regulatory approval date in the U.S. is February 24, 2014.	
TBD (balloted as 2(X)	TBD	Standard revised in Project 2014-01	Applicability section revised to clarify application of Requirements to BES dispersed power producing resources

Table 1-1 Component Type - Protective Relay Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval[1]**	**Maintenance Activities**
Any unmonitored protective relay not having all the monitoring attributes of a category below.	6 calendar years	For all unmonitored relays: • Verify that settings are as specified For non-microprocessor relays: • Test and, if necessary calibrate For microprocessor relays: • Verify operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Verify acceptable measurement of power system input values.
Monitored microprocessor protective relay with the following: • Internal self-diagnosis and alarming (see Table 2). • Voltage and/or current waveform sampling three or more times per power cycle, and conversion of samples to numeric values for measurement calculations by microprocessor electronics. • Alarming for power supply failure (see Table 2).	12 calendar years	Verify: • Settings are as specified. • Operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Acceptable measurement of power system input values.

[1] For the tables in this standard, a calendar year starts on the first day of a new year (January 1) after a maintenance activity has been completed. For the tables in this standard, a calendar month starts on the first day of the first month after a maintenance activity has been completed.

Table 1-1 Component Type - Protective Relay Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval[1]**	**Maintenance Activities**
Monitored microprocessor protective relay with preceding row attributes and the following: • Ac measurements are continuously verified by comparison to an independent ac measurement source, with alarming for excessive error (See Table 2). • Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2). • Alarming for change of settings (See Table 2).	12 calendar years	Verify only the unmonitored relay inputs and outputs that are essential to proper functioning of the Protection System.

Table 1-2 Component Type - Communications Systems Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any unmonitored communications system necessary for correct operation of protective functions, and not having all the monitoring attributes of a category below.	4 calendar months	Verify that the communications system is functional.
	6 calendar years	Verify that the communications system meets performance criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate). Verify operation of communications system inputs and outputs that are essential to proper functioning of the Protection System.
Any communications system with continuous monitoring or periodic automated testing for the presence of the channel function, and alarming for loss of function (See Table 2).	12 calendar years	Verify that the communications system meets performance criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate). Verify operation of communications system inputs and outputs that are essential to proper functioning of the Protection System.
Any communications system with all of the following: • Continuous monitoring or periodic automated testing for the performance of the channel using criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate, and alarming for excessive performance degradation). (See Table 2) • Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2).	12 calendar years	Verify only the unmonitored communications system inputs and outputs that are essential to proper functioning of the Protection System

Table 1-3 Component Type - Voltage and Current Sensing Devices Providing Inputs to Protective Relays Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any voltage and current sensing devices not having monitoring attributes of the category below.	12 calendar years	Verify that current and voltage signal values are provided to the protective relays.
Voltage and Current Sensing devices connected to microprocessor relays with AC measurements are continuously verified by comparison of sensing input value, as measured by the microprocessor relay, to an independent ac measurement source, with alarming for unacceptable error or failure (see Table 2).	No periodic maintenance specified	None.

Table 1-4(a) Component Type – Protection System Station dc Supply Using Vented Lead-Acid (VLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Protection System Station dc supply using **Vented Lead-Acid (VLA) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • Electrolyte level • For unintentional grounds
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Cell condition of all individual battery cells where cells are visible – or measure battery cell/unit internal ohmic values where the cells are not visible • Physical condition of battery rack
	18 Calendar Months -or- 6 Calendar Years	Verify that the station battery can perform as manufactured by evaluating cell/unit measurements indicative of battery performance (e.g. internal ohmic values or float current) against the station battery baseline. -or- Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(b)

Component Type – Protection System Station dc Supply Using Valve-Regulated Lead-Acid (VRLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3)

Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).

Component Attributes	Maximum Maintenance Interval	Maintenance Activities
Protection System Station dc supply **with Valve Regulated Lead-Acid (VRLA) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • For unintentional grounds
	6 Calendar Months	Inspect: • Condition of all individual units by measuring battery cell/unit internal ohmic values.
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Physical condition of battery rack
	6 Calendar Months -or- 3 Calendar Years	Verify that the station battery can perform as manufactured by evaluating cell/unit measurements indicative of battery performance (e.g. internal ohmic values or float current) against the station battery baseline. -or- Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(c) Component Type – Protection System Station dc Supply Using Nickel-Cadmium (NiCad) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS system, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Protection System Station dc supply **Nickel-Cadmium (NiCad) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • Electrolyte level • For unintentional grounds
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Cell condition of all individual battery cells. • Physical condition of battery rack
	6 Calendar Years	Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(d) Component Type – Protection System Station dc Supply Using Non Battery Based Energy Storage Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS system, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any Protection System station dc supply not using a battery and not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • For unintentional grounds
	18 Calendar Months	Inspect: Condition of non-battery based dc supply
	6 Calendar Years	Verify that the dc supply can perform as manufactured when ac power is not present.

Table 1-4(e) Component Type – Protection System Station dc Supply for non-BES Interrupting Devices for SPS, non-distributed UFLS, and non-distributed UVLS systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any Protection System dc supply used for tripping only non-BES interrupting devices as part of a SPS, non-distributed UFLS, or non-distributed UVLS system and not having monitoring attributes of Table 1-4(f).	When control circuits are verified (See Table 1-5)	Verify Station dc supply voltage.

Table 1-4(f) Exclusions for Protection System Station dc Supply Monitoring Devices and Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any station dc supply with high and low voltage monitoring and alarming of the battery charger voltage to detect charger overvoltage and charger failure (See Table 2).	No periodic maintenance specified	No periodic verification of station dc supply voltage is required.
Any battery based station dc supply with electrolyte level monitoring and alarming in every cell (See Table 2).		No periodic inspection of the electrolyte level for each cell is required.
Any station dc supply with unintentional dc ground monitoring and alarming (See Table 2).		No periodic inspection of unintentional dc grounds is required.
Any station dc supply with charger float voltage monitoring and alarming to ensure correct float voltage is being applied on the station dc supply (See Table 2).		No periodic verification of float voltage of battery charger is required.
Any battery based station dc supply with monitoring and alarming of battery string continuity (See Table 2).		No periodic verification of the battery continuity is required.
Any battery based station dc supply with monitoring and alarming of the intercell and/or terminal connection detail resistance of the entire battery (See Table 2).		No periodic verification of the intercell and terminal connection resistance is required.
Any Valve Regulated Lead-Acid (VRLA) or Vented Lead-Acid (VLA) station battery with internal ohmic value or float current monitoring and alarming, and evaluating present values relative to baseline internal ohmic values for every cell/unit (See Table 2).		No periodic evaluation relative to baseline of battery cell/unit measurements indicative of battery performance is required to verify the station battery can perform as manufactured.
Any Valve Regulated Lead-Acid (VRLA) or Vented Lead-Acid (VLA) station battery with monitoring and alarming of each cell/unit internal ohmic value (See Table 2).		No periodic inspection of the condition of all individual units by measuring battery cell/unit internal ohmic values of a station VRLA or Vented Lead-Acid (VLA) battery is required.

Table 1-5 Component Type - Control Circuitry Associated With Protective Functions Excluding distributed UFLS and distributed UVLS (see Table 3) **Note:** Table requirements apply to all Control Circuitry Components of Protection Systems, and SPSs except as noted.		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Trip coils or actuators of circuit breakers, interrupting devices, or mitigating devices (regardless of any monitoring of the control circuitry).	6 calendar years	Verify that each trip coil is able to operate the circuit breaker, interrupting device, or mitigating device.
Electromechanical lockout devices which are directly in a trip path from the protective relay to the interrupting device trip coil (regardless of any monitoring of the control circuitry).	6 calendar years	Verify electrical operation of electromechanical lockout devices.
Unmonitored control circuitry associated with SPS.	12 calendar years	Verify all paths of the control circuits essential for proper operation of the SPS.
Unmonitored control circuitry associated with protective functions inclusive of all auxiliary relays.	12 calendar years	Verify all paths of the trip circuits inclusive of all auxiliary relays through the trip coil(s) of the circuit breakers or other interrupting devices.
Control circuitry associated with protective functions and/or SPS whose integrity is monitored and alarmed (See Table 2).	No periodic maintenance specified	None.

Table 2 – Alarming Paths and Monitoring In Tables 1-1 through 1-5 and Table 3, alarm attributes used to justify extended maximum maintenance intervals and/or reduced maintenance activities are subject to the following maintenance requirements		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any alarm path through which alarms in Tables 1-1 through 1-5 and Table 3 are conveyed from the alarm origin to the location where corrective action can be initiated, and not having all the attributes of the "Alarm Path with monitoring" category below. Alarms are reported within 24 hours of detection to a location where corrective action can be initiated.	12 Calendar Years	Verify that the alarm path conveys alarm signals to a location where corrective action can be initiated.
Alarm Path with monitoring: The location where corrective action is taken receives an alarm within 24 hours for failure of any portion of the alarming path from the alarm origin to the location where corrective action can be initiated.	No periodic maintenance specified	None.

Table 3 Maintenance Activities and Intervals for distributed UFLS and distributed UVLS Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any unmonitored protective relay not having all the monitoring attributes of a category below.	6 calendar years	Verify that settings are as specified For non-microprocessor relays: • Test and, if necessary calibrate For microprocessor relays: • Verify operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Verify acceptable measurement of power system input values.
Monitored microprocessor protective relay with the following: • Internal self diagnosis and alarming (See Table 2). • Voltage and/or current waveform sampling three or more times per power cycle, and conversion of samples to numeric values for measurement calculations by microprocessor electronics. Alarming for power supply failure (See Table 2).	12 calendar years	Verify: • Settings are as specified. • Operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Acceptable measurement of power system input values
Monitored microprocessor protective relay with preceding row attributes and the following: • Ac measurements are continuously verified by comparison to an independent ac measurement source, with alarming for excessive error (See Table 2). • Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2). Alarming for change of settings (See Table 2).	12 calendar years	Verify only the unmonitored relay inputs and outputs that are essential to proper functioning of the Protection System.

Table 3 Maintenance Activities and Intervals for distributed UFLS and distributed UVLS Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Voltage and/or current sensing devices associated with UFLS or UVLS systems.	12 calendar years	Verify that current and/or voltage signal values are provided to the protective relays.
Protection System dc supply for tripping non-BES interrupting devices used only for a UFLS or UVLS system.	12 calendar years	Verify Protection System dc supply voltage.
Control circuitry between the UFLS or UVLS relays and electromechanical lockout and/or tripping auxiliary devices (excludes non-BES interrupting device trip coils).	12 calendar years	Verify the path from the relay to the lockout and/or tripping auxiliary relay (including essential supervisory logic).
Electromechanical lockout and/or tripping auxiliary devices associated only with UFLS or UVLS systems (excludes non-BES interrupting device trip coils).	12 calendar years	Verify electrical operation of electromechanical lockout and/or tripping auxiliary devices.
Control circuitry between the electromechanical lockout and/or tripping auxiliary devices and the non-BES interrupting devices in UFLS or UVLS systems, or between UFLS or UVLS relays (with no interposing electromechanical lockout or auxiliary device) and the non-BES interrupting devices (excludes non-BES interrupting device trip coils).	No periodic maintenance specified	None.
Trip coils of non-BES interrupting devices in UFLS or UVLS systems.	No periodic maintenance specified	None.

PRC-005 — Attachment A

Criteria for a Performance-Based Protection System Maintenance Program

Purpose: To establish a technical basis for initial and continued use of a performance-based Protection System Maintenance Program (PSMP).

To establish the technical justification for the initial use of a performance-based PSMP:

1. Develop a list with a description of Components included in each designated Segment of the Protection System Component population, with a minimum **Segment** population of 60 Components.
2. Maintain the Components in each Segment according to the time-based maximum allowable intervals established in Tables 1-1 through 1-5 and Table 3 until results of maintenance activities for the Segment are available for a minimum of 30 individual Components of the Segment.
3. Document the maintenance program activities and results for each Segment, including maintenance dates and Countable Events for each included Component.
4. Analyze the maintenance program activities and results for each Segment to determine the overall performance of the Segment and develop maintenance intervals.
5. Determine the maximum allowable maintenance interval for each Segment such that the Segment experiences **Countable Events** on no more than 4% of the Components within the Segment, for the greater of either the last 30 Components maintained or all Components maintained in the previous year.

To maintain the technical justification for the ongoing use of a performance-based PSMP:

1. At least annually, update the list of Protection System Components and Segments and/or description if any changes occur within the Segment.
2. Perform maintenance on the greater of 5% of the Components (addressed in the performance based PSMP) in each Segment or 3 individual Components within the Segment in each year.
3. For the prior year, analyze the maintenance program activities and results for each Segment to determine the overall performance of the Segment.
4. Using the prior year's data, determine the maximum allowable maintenance interval for each Segment such that the Segment experiences Countable Events on no more than 4% of the Components within the Segment, for the greater of either the last 30 Components maintained or all Components maintained in the previous year.
5. If the Components in a Protection System Segment maintained through a performance-based PSMP experience 4% or more Countable Events, develop, document, and implement an action plan to reduce the Countable Events to less than 4% of the Segment population within 3 years.

Implementation Plan

Project 2014-01 Standards Applicability for Dispersed Power Producing Resources
PRC-005-2(X)

The standard numbers currently include an (X) to indicate the version numbering will be updated. Some standards are open in current projects and others are pending with governmental authorities. As a result, NERC will assign the appropriate version number prior to Board of Trustees adoption.

Standards Involved

Approval:

- PRC-005-2(X) – Protection System Maintenance

Retirement:

- PRC-005-2 – Protection System Maintenance

Prerequisite Approvals:

N/A

Background:

In light of the adoption of a revised "Bulk Electric System" definition by the Board of Trustees (Board), changes to the applicability sections of certain Reliability Standards, including PRC-005, are necessary to align with the implementation of the revised "Bulk Electric System" definition. The Standard Drafting Team (SDT) for Project 2014-01 – Standards Applicability for Dispersed Power Producing Resources has modified the applicability section of certain Generator Owner/Generator Operator requirements to recognize the unique technical and reliability aspects of dispersed generation in order to ensure the applicability of the standards is consistent with the reliable operation of the Bulk-Power System.

Reliability Standard PRC-005-2, with its associated Implementation Plan, was adopted by the NERC Board on November 7, 2012. The SDT has revised the applicability section of PRC-005-2 to align with the revised definition of "Bulk Electric System" in the event that this version of PRC-005 is mandatory and enforceable on the effective date of the revised definition of "Bulk Electric System."

General Considerations:

PRC-005-2(X) is proposed for approval to align the applicability section of PRC-005-2 with the revised definition of "Bulk Electric System." PRC-005-2 may already be retired pursuant to an implementation plan of a successor version of PRC-005 by the time the revised definition of "Bulk Electric System" becomes effective. If this occurs, PRC-005-2(X) will not go into effect.

Effective Date

PRC-005-2(X) shall become effective on the later of the effective date of the revised definition of Bulk Electric System or the first day following the effective date of PRC-005-2.

Retirement of Existing Standards:

PRC-005-2 shall be retired at midnight of the day immediately prior to the effective date of PRC-005-2(X) in the particular jurisdiction in which the revised standard is becoming effective.

Implementation Plan

All aspects of the Implementation Plan for PRC-005-2 will remain applicable to PRC-005-2(X) and are incorporated here by reference.

Cross References

The Implementation Plan for the revised definition of "Bulk Electric System" is available here.

The Implementation Plan for PRC-005-2 is available here.

Standard PRC-005-3(X) — Protection System and Automatic Reclosing Maintenance

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment November 20 – December 19, 2013.

Description of Current Draft

~~The Protection System Maintenance and Testing Standard Drafting Team (PSMT SDT) is posting draft 1 of PRC-005-X for a 45-day comment period and ballot in the last ten days of the comment period under the new Standards Process Manual (Effective: June 26, 2013).~~

~~This draft contains the technical content of the standard.~~ ~~A parallel effort in the~~ The Project 2014-01, Standards Applicability for Dispersed Generation Resources Standards Drafting Team (DGR SDT)~~,~~ ~~will~~ is posting proposed ~~an~~ applicability changes to ~~PRC-005-2 and~~ PRC-005-3 for comment and ballot. This draft contains the DGR SDT's recommended changes within ~~technical content of~~ the standard. Project 2014-01 does not have in its scope any technical content changes beyond revising the applicability to ensure consistent application of the Requirements of PRC-005 to dispersed power-producing resources.

In a parallel effort, the Protection System Maintenance and Testing Standard Drafting Team (PSMT SDT) has posted draft 1 of PRC-005-X for a 45-day comment period, and ballot in the last ten days of the comment period under the new Standards Process Manual (Effective: June 26, 2013).

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with Initial Ballot	June – July 2014
45-day Additional Formal Comment Period with Additional Ballot (if necessary)	August – September 2014
Final ballot	October 2014
BOT adoption	November 2014

When this standard has received ballot approval, the text boxes within the Applicability section of the Standard will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: **Protection System and Automatic Reclosing Maintenance**

2. Number: PRC-005-3(X)

3. Purpose: To document and implement programs for the maintenance of all Protection Systems and Automatic Reclosing affecting the reliability of the Bulk Electric System (BES) so that they are kept in working order.

4. Applicability:

4.1. Functional Entities:

4.1.1 Transmission Owner

4.1.2 Generator Owner

4.1.3 Distribution Provider

4.2. Facilities:

4.2.1 Protection Systems that are installed for the purpose of detecting Faults on BES Elements (lines, buses, transformers, etc.)

4.2.2 Protection Systems used for underfrequency load-shedding systems installed per ERO underfrequency load-shedding requirements.

4.2.3 Protection Systems used for undervoltage load-shedding systems installed to prevent system voltage collapse or voltage instability for BES reliability.

4.2.4 Protection Systems installed as a Special Protection System (SPS) for BES reliability.

The only revisions made to this version of PRC-005 are revisions to section 4.2, to clarify applicability of the Requirements of the standard at generator Facilities. These applicability revisions are intended to clarify and provide for consistent application of the Requirements to BES generator Facilities included in the BES through Inclusion I4 – Dispersed Power Producing Resources.

This version is labeled PRC-005-3(X) for balloting purposes. The 'X' indicates that a version number will be applied at a later time, because multiple versions of PRC-005 are in development to reflect the fact that applicability changes need apply for versions of the standard that are approved (PRC-005-2), pending regulatory approval (PRC-005-3), and in development in Project 2007-17.3.

4.2.5 Protection Systems for the following BES generator Facilities ~~that are part of the BES, including~~ for generators not identified through Inclusion I4 of the BES definition:

4.2.5.1 Protection Systems that act to trip the generator either directly or via lockout or auxiliary tripping relays.

4.2.5.2 Protection Systems for generator step-up transformers for generators that are part of the BES.

~~**4.2.5.3** Protection Systems for transformers connecting aggregated generation, where the aggregated generation is part of the BES (e.g., transformers connecting facilities such as wind farms to the BES).~~

~~**4.2.5.4**~~**4.2.5.3** Protection Systems for station service or excitation transformers connected to the generator bus of generators which are part of the BES, that act to trip the generator either directly or via lockout or tripping auxiliary relays.

Rationale for 4.2.5: In order to differentiate between typical BES generator Facilities and BES generators at dispersed power producing facilities, section 4.2.5 was separated into two sections (4.2.5 and 4.2.6). The applicability to non-dispersed power producing Facilities has been maintained and can be found in 4.2.5. The applicability to dispersed power producing Facilities has been modified and relocated from 4.2.5 to 4.2.6.

4.2.6 Protection Systems for the following BES generator Facilities for dispersed power producing resources identified through Inclusion I4 of the BES definition:

4.2.6.1 Protection Systems for ~~electrical equipment~~Facilities used in aggregating dispersed BES generation from the point where those resources aggregate to greater than 75 MVA to a common point of connection at 100 kV or above.

Rationale for 4.2.6: Applicability of the Requirements of PRC-005-2 to dispersed power producing resources is separated out in section 4.2.6. The intent is that for such resources, the Requirements would apply ~~-~~only to Protection Systems on equipment used in aggregating the BES dispersed power producing resources from the point where those resources aggregate to greater than 75 MVA to a common point of connection at 100 kV or higher including the Protection Systems for those transformers used in aggregating generation.

~~4.2.6~~4.2.7 Automatic Reclosing[1], including:

~~4.2.6.1~~4.2.7.1 Automatic Reclosing applied on the terminals of Elements connected to the BES bus located at generating plant substations where the total installed gross generating plant capacity is greater than the gross capacity of the largest BES generating unit within the Balancing Authority Area.

~~4.2.6.2~~4.2.7.2 Automatic Reclosing applied on the terminals of all BES Elements at substations one bus away from generating plants specified in Section 4.2.6.1 when the substation is less than 10 circuit-miles from the generating plant substation.

~~4.2.6.3~~4.2.7.3 Automatic Reclosing applied as an integral part of an SPS specified in Section 4.2.4.

5. Effective Date: See Implementation Plan.

6. Definitions Used in this Standard: The following terms are defined for use only within PRC-005-3, and should remain with the standard upon approval rather than being moved to the Glossary of Terms.

Automatic Reclosing – Includes the following Components:

- Reclosing relay
- Control circuitry associated with the reclosing relay.

Unresolved Maintenance Issue – A deficiency identified during a maintenance activity that causes the component to not meet the intended performance, cannot be corrected during the maintenance interval, and requires follow-up corrective action.

Segment – Components of a consistent design standard, or a particular model or type from a single manufacturer that typically share other common elements. Consistent performance is expected across the entire population of a Segment. A Segment must contain at least sixty (60) individual Components.

Component Type – Either any one of the five specific elements of the Protection System definition or any one of the two specific elements of the Automatic Reclosing definition.

Component – A Component is any individual discrete piece of equipment included in a Protection System or in Automatic Reclosing, including but not limited to a protective relay, reclosing relay, or current sensing device. The designation of what constitutes a control circuit

[1] Automatic Reclosing addressed in Section 4.2.6.1 and 4.2.6.2 may be excluded if the equipment owner can demonstrate that a close-in three-phase fault present for twice the normal clearing time (capturing a minimum trip-close-trip time delay) does not result in a total loss of gross generation in the Interconnection exceeding the gross capacity of the largest BES generating unit within the Balancing Authority Area where the Automatic Reclosing is applied.

Component is dependent upon how an entity performs and tracks the testing of the control circuitry. Some entities test their control circuits on a breaker basis whereas others test their circuitry on a local zone of protection basis. Thus, entities are allowed the latitude to designate their own definitions of control circuit Components. Another example of where the entity has some discretion on determining what constitutes a single Component is the voltage and current sensing devices, where the entity may choose either to designate a full three-phase set of such devices or a single device as a single Component.

Countable Event – A failure of a Component requiring repair or replacement, any condition discovered during the maintenance activities in Tables 1-1 through 1-5, Table 3, and Tables 4-1 through 4-2 which requires corrective action or a Protection System Misoperation attributed to hardware failure or calibration failure. Misoperations due to product design errors, software errors, relay settings different from specified settings, Protection System Component or Automatic Reclosing configuration or application errors are not included in Countable Events.

B. Requirements

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a Protection System Maintenance Program (PSMP) for its Protection Systems and Automatic Reclosing identified in Facilities Section 4.2. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

The PSMP shall:

1.1. Identify which maintenance method (time-based, performance-based per PRC-005 Attachment A, or a combination) is used to address each Protection System and Automatic Reclosing Component Type. All batteries associated with the station dc supply Component Type of a Protection System shall be included in a time-based program as described in Table 1-4 and Table 3.

1.2. Include the applicable monitored Component attributes applied to each Protection System and Automatic Reclosing Component Type consistent with the maintenance intervals specified in Tables 1-1 through 1-5, Table 2, Table 3, and Table 4-1 through 4-2 where monitoring is used to extend the maintenance intervals beyond those specified for unmonitored Protection System and Automatic Reclosing Components.

R2. Each Transmission Owner, Generator Owner, and Distribution Provider that uses performance-based maintenance intervals in its PSMP shall follow the procedure established in PRC-005 Attachment A to establish and maintain its performance-based intervals. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

R3. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes time-based maintenance program(s) shall maintain its Protection System and Automatic Reclosing Components that are included within the time-based maintenance program in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, and Table 4-1 through 4-2. *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

R4. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes performance-based maintenance program(s) in accordance with Requirement R2 shall implement and follow its PSMP for its Protection System and Automatic Reclosing Components that are included within the performance-based program(s). *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

R5. Each Transmission Owner, Generator Owner, and Distribution Provider shall demonstrate efforts to correct identified Unresolved Maintenance Issues. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

C. Measures

M1. Each Transmission Owner, Generator Owner and Distribution Provider shall have a documented Protection System Maintenance Program in accordance with Requirement R1.

For each Protection System and Automatic Reclosing Component Type, the documentation shall include the type of maintenance method applied (time-based, performance-based, or a combination of these maintenance methods), and shall include all batteries associated with the station dc supply Component Types in a time-based program as described in Table 1-4 and Table 3. (Part 1.1)

For Component Types that use monitoring to extend the maintenance intervals, the responsible entity(s) shall have evidence for each Protection System and Automatic Reclosing Component Type (such as manufacturer's specifications or engineering drawings) of the appropriate

monitored Component attributes as specified in Tables 1-1 through 1-5, Table 2, Table 3, and Table 4-1 through 4-2. (Part 1.2)

M2. Each Transmission Owner, Generator Owner, and Distribution Provider that uses performance-based maintenance intervals shall have evidence that its current performance-based maintenance program(s) is in accordance with Requirement R2, which may include but is not limited to Component lists, dated maintenance records, and dated analysis records and results.

M3. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes time-based maintenance program(s) shall have evidence that it has maintained its Protection System and Automatic Reclosing Components included within its time-based program in accordance with Requirement R3. The evidence may include but is not limited to dated maintenance records, dated maintenance summaries, dated check-off lists, dated inspection records, or dated work orders.

M4. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes performance-based maintenance intervals in accordance with Requirement R2 shall have evidence that it has implemented the Protection System Maintenance Program for the Protection System and Automatic Reclosing Components included in its performance-based program in accordance with Requirement R4. The evidence may include but is not limited to dated maintenance records, dated maintenance summaries, dated check-off lists, dated inspection records, or dated work orders.

M5. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence that it has undertaken efforts to correct identified Unresolved Maintenance Issues in accordance with Requirement R5. The evidence may include but is not limited to work orders, replacement Component orders, invoices, project schedules with completed milestones, return material authorizations (RMAs) or purchase orders.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and Enforcement Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.3. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, and Distribution Provider shall each keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

For Requirement R1, the Transmission Owner, Generator Owner, and Distribution Provider shall each keep its current dated Protection System Maintenance Program, as well as any superseded versions since the preceding compliance audit, including the documentation that specifies the type of maintenance program applied for each Protection System Component Type.

For Requirement R2, Requirement R3, Requirement R4, and Requirement R5, the Transmission Owner, Generator Owner, and Distribution Provider shall each keep documentation of the two most recent performances of each distinct maintenance activity for the Protection System or Automatic Reclosing Component, or all performances of each distinct maintenance activity for the Protection System or Automatic Reclosing Component since the previous scheduled audit date, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

2. Violation Severity Levels

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The responsible entity's PSMP failed to specify whether one Component Type is being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1) OR The responsible entity's PSMP failed to include applicable station batteries in a time-based program. (Part 1.1)	The responsible entity's PSMP failed to specify whether two Component Types are being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1)	The responsible entity's PSMP failed to specify whether three Component Types are being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1). OR The responsible entity's PSMP failed to include the applicable monitoring attributes applied to each Component Type consistent with the maintenance intervals specified in Tables 1-1 through 1-5, Table 2, Table 3, and Tables 4-1 through 4-2 where monitoring is used to extend the maintenance intervals beyond those specified for unmonitored Components. (Part 1.2).	The responsible entity failed to establish a PSMP. OR The responsible entity's PSMP failed to specify whether four or more Component Types are being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1).
R2	The responsible entity uses performance-based maintenance intervals in its PSMP but failed to reduce Countable Events to no more than 4% within three years.	NA	The responsible entity uses performance-based maintenance intervals in its PSMP but failed to reduce Countable Events to no more than 4% within four years.	The responsible entity uses performance-based maintenance intervals in its PSMP but: 1) Failed to establish the technical justification described within Requirement R2 for the initial use of the performance-based PSMP OR 2) Failed to reduce Countable Events to no more than 4% within five years OR

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
				3) Maintained a Segment with less than 60 Components OR 4) Failed to: • Annually update the list of Components, OR • Annually perform maintenance on the greater of 5% of the Segment population or 3 Components, OR • Annually analyze the program activities and results for each Segment.
R3	For Components included within a time-based maintenance program, the responsible entity failed to maintain 5% or less of the total Components included within a specific Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, and Tables 4-1 through 4-2.	For Components included within a time-based maintenance program, the responsible entity failed to maintain more than 5% but 10% or less of the total Components included within a specific Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, and Tables 4-1 through 4-2.	For Components included within a time-based maintenance program, the responsible entity failed to maintain more than 10% but 15% or less of the total Components included within a specific Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, and Tables 4-1 through 4-2.	For Components included within a time-based maintenance program, the responsible entity failed to maintain more than 15% of the total Components included within a specific Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, and Tables 4-1 through 4-2.
R4	For Components included within a performance-based maintenance program, the responsible entity failed to maintain 5% or less of the annual scheduled maintenance for a specific	For Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 5% but 10% or less of the annual scheduled	For Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 10% but 15% or less of the annual	For Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 15% of the annual scheduled

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
	Component Type in accordance with their performance-based PSMP.	maintenance for a specific Component Type in accordance with their performance-based PSMP.	scheduled maintenance for a specific Component Type in accordance with their performance-based PSMP.	maintenance for a specific Component Type in accordance with their performance-based PSMP.
R5	The responsible entity failed to undertake efforts to correct 5 or fewer identified Unresolved Maintenance Issues.	The responsible entity failed to undertake efforts to correct greater than 5, but less than or equal to 10 identified Unresolved Maintenance Issues.	The responsible entity failed to undertake efforts to correct greater than 10, but less than or equal to 15 identified Unresolved Maintenance Issues.	The responsible entity failed to undertake efforts to correct greater than 15 identified Unresolved Maintenance Issues.

E. Regional Variances

None

F. Supplemental Reference Document

The following documents present a detailed discussion about determination of maintenance intervals and other useful information regarding establishment of a maintenance program.

1. PRC-005-2 Protection System Maintenance Supplementary Reference and FAQ — March 2013.
2. Considerations for Maintenance and Testing of Autoreclosing Schemes — November 2012.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
1	December 1, 2005	1. Changed incorrect use of certain hyphens (-) to "en dash" (–) and "em dash (—)." 2. Added "periods" to items where appropriate. 3. Changed "Timeframe" to "Time Frame" in item D, 1.2.	01/20/05
1a	February 17, 2011	Added Appendix 1 - Interpretation regarding applicability of standard to protection of radially connected transformers	Project 2009-17 interpretation
1a	February 17, 2011	Adopted by Board of Trustees	
1a	September 26, 2011	FERC Order issued approving interpretation of R1 and R2 (FERC's Order is effective as of September 26, 2011)	
1.1a	February 1, 2012	Errata change: Clarified inclusion of generator interconnection Facility in Generator Owner's responsibility	Revision under Project 2010-07
1b	February 3, 2012	FERC Order issued approving interpretation of R1, R1.1, and R1.2 (FERC's Order dated March 14, 2012). Updated version from 1a to 1b.	Project 2009-10 Interpretation
1.1b	April 23, 2012	Updated standard version to 1.1b to reflect FERC approval of PRC-005-1b.	Revision under Project 2010-07

Version	Date	Action	Change Tracking
1.1b	May 9, 2012	PRC-005-1.1b was adopted by the Board of Trustees as part of Project 2010-07 (GOTO).	
2	November 7, 2012	Adopted by Board of Trustees	Project 2007-17 - Complete revision, absorbing maintenance requirements from PRC-005-1.1b, PRC-008-0, PRC-011-0, PRC-017-0
2	October 17, 2013	Errata Change: The Standards Committee approved an errata change to the implementation plan for PRC-005-2 to add the phrase "or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities;" to the second sentence under the "Retirement of Existing	
3	November 7, 2013	Adopted by the NERC Board of Trustees	Revised to address the FERC directive in Order No.758 to include Automatic Reclosing in maintenance programs.

Table 1-1 Component Type - Protective Relay Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval[2]**	**Maintenance Activities**
Any unmonitored protective relay not having all the monitoring attributes of a category below.	6 Calendar Years	For all unmonitored relays: • Verify that settings are as specified For non-microprocessor relays: • Test and, if necessary calibrate For microprocessor relays: • Verify operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Verify acceptable measurement of power system input values.
Monitored microprocessor protective relay with the following: • Internal self-diagnosis and alarming (see Table 2). • Voltage and/or current waveform sampling three or more times per power cycle, and conversion of samples to numeric values for measurement calculations by microprocessor electronics. • Alarming for power supply failure (see Table 2).	12 Calendar Years	Verify: • Settings are as specified. • Operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Acceptable measurement of power system input values.

[2] For the tables in this standard, a calendar year starts on the first day of a new year (January 1) after a maintenance activity has been completed. For the tables in this standard, a calendar month starts on the first day of the first month after a maintenance activity has been completed.

Table 1-1 Component Type - Protective Relay Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval[2]**	**Maintenance Activities**
Monitored microprocessor protective relay with preceding row attributes and the following: • Ac measurements are continuously verified by comparison to an independent ac measurement source, with alarming for excessive error (See Table 2). • Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2). • Alarming for change of settings (See Table 2).	12 Calendar Years	Verify only the unmonitored relay inputs and outputs that are essential to proper functioning of the Protection System.

Table 1-2 Component Type - Communications Systems Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any unmonitored communications system necessary for correct operation of protective functions, and not having all the monitoring attributes of a category below.	4 Calendar Months	Verify that the communications system is functional.
	6 Calendar Years	Verify that the communications system meets performance criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate). Verify operation of communications system inputs and outputs that are essential to proper functioning of the Protection System.
Any communications system with continuous monitoring or periodic automated testing for the presence of the channel function, and alarming for loss of function (See Table 2).	12 Calendar Years	Verify that the communications system meets performance criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate). Verify operation of communications system inputs and outputs that are essential to proper functioning of the Protection System.
Any communications system with all of the following: • Continuous monitoring or periodic automated testing for the performance of the channel using criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate, and alarming for excessive performance degradation). (See Table 2) • Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2).	12 Calendar Years	Verify only the unmonitored communications system inputs and outputs that are essential to proper functioning of the Protection System

Table 1-3 Component Type - Voltage and Current Sensing Devices Providing Inputs to Protective Relays Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any voltage and current sensing devices not having monitoring attributes of the category below.	12 Calendar Years	Verify that current and voltage signal values are provided to the protective relays.
Voltage and Current Sensing devices connected to microprocessor relays with AC measurements are continuously verified by comparison of sensing input value, as measured by the microprocessor relay, to an independent ac measurement source, with alarming for unacceptable error or failure (see Table 2).	No periodic maintenance specified	None.

Table 1-4(a) Component Type – Protection System Station dc Supply Using Vented Lead-Acid (VLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Protection System Station dc supply using **Vented Lead-Acid (VLA) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • Electrolyte level • For unintentional grounds
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Cell condition of all individual battery cells where cells are visible – or measure battery cell/unit internal ohmic values where the cells are not visible • Physical condition of battery rack

Table 1-4(a) Component Type – Protection System Station dc Supply Using Vented Lead-Acid (VLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
	18 Calendar Months -or- 6 Calendar Years	Verify that the station battery can perform as manufactured by evaluating cell/unit measurements indicative of battery performance (e.g. internal ohmic values or float current) against the station battery baseline. -or- Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(b) Component Type – Protection System Station dc Supply Using Valve-Regulated Lead-Acid (VRLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Protection System Station dc supply **with Valve Regulated Lead-Acid (VRLA) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • For unintentional grounds
	6 Calendar Months	Inspect: • Condition of all individual units by measuring battery cell/unit internal ohmic values.
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Physical condition of battery rack

Table 1-4(b) Component Type – Protection System Station dc Supply Using Valve-Regulated Lead-Acid (VRLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
	6 Calendar Months -or- 3 Calendar Years	Verify that the station battery can perform as manufactured by evaluating cell/unit measurements indicative of battery performance (e.g. internal ohmic values or float current) against the station battery baseline. -or- Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(c) Component Type – Protection System Station dc Supply Using Nickel-Cadmium (NiCad) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS system, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Protection System Station dc supply **Nickel-Cadmium (NiCad) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • Electrolyte level • For unintentional grounds
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Cell condition of all individual battery cells. • Physical condition of battery rack
	6 Calendar Years	Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(d) Component Type – Protection System Station dc Supply Using Non Battery Based Energy Storage Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS system, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any Protection System station dc supply not using a battery and not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • For unintentional grounds
	18 Calendar Months	Inspect: Condition of non-battery based dc supply
	6 Calendar Years	Verify that the dc supply can perform as manufactured when ac power is not present.

Table 1-4(e) Component Type – Protection System Station dc Supply for non-BES Interrupting Devices for SPS, non-distributed UFLS, and non-distributed UVLS systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any Protection System dc supply used for tripping only non-BES interrupting devices as part of a SPS, non-distributed UFLS, or non-distributed UVLS system and not having monitoring attributes of Table 1-4(f).	When control circuits are verified (See Table 1-5)	Verify Station dc supply voltage.

Table 1-4(f) Exclusions for Protection System Station dc Supply Monitoring Devices and Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any station dc supply with high and low voltage monitoring and alarming of the battery charger voltage to detect charger overvoltage and charger failure (See Table 2).	No periodic maintenance specified	No periodic verification of station dc supply voltage is required.
Any battery based station dc supply with electrolyte level monitoring and alarming in every cell (See Table 2).		No periodic inspection of the electrolyte level for each cell is required.
Any station dc supply with unintentional dc ground monitoring and alarming (See Table 2).		No periodic inspection of unintentional dc grounds is required.
Any station dc supply with charger float voltage monitoring and alarming to ensure correct float voltage is being applied on the station dc supply (See Table 2).		No periodic verification of float voltage of battery charger is required.
Any battery based station dc supply with monitoring and alarming of battery string continuity (See Table 2).		No periodic verification of the battery continuity is required.
Any battery based station dc supply with monitoring and alarming of the intercell and/or terminal connection detail resistance of the entire battery (See Table 2).		No periodic verification of the intercell and terminal connection resistance is required.
Any Valve Regulated Lead-Acid (VRLA) or Vented Lead-Acid (VLA) station battery with internal ohmic value or float current monitoring and alarming, and evaluating present values relative to baseline internal ohmic values for every cell/unit (See Table 2).		No periodic evaluation relative to baseline of battery cell/unit measurements indicative of battery performance is required to verify the station battery can perform as manufactured.
Any Valve Regulated Lead-Acid (VRLA) or Vented Lead-Acid (VLA) station battery with monitoring and alarming of each cell/unit internal ohmic value (See Table 2).		No periodic inspection of the condition of all individual units by measuring battery cell/unit internal ohmic values of a station VRLA or Vented Lead-Acid (VLA) battery is required.

Table 1-5 Component Type - Control Circuitry Associated With Protective Functions Excluding distributed UFLS and distributed UVLS (see Table 3) Note: Table requirements apply to all Control Circuitry Components of Protection Systems, and SPSs except as noted.		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Trip coils or actuators of circuit breakers, interrupting devices, or mitigating devices (regardless of any monitoring of the control circuitry).	6 Calendar Years	Verify that each trip coil is able to operate the circuit breaker, interrupting device, or mitigating device.
Electromechanical lockout devices which are directly in a trip path from the protective relay to the interrupting device trip coil (regardless of any monitoring of the control circuitry).	6 Calendar Years	Verify electrical operation of electromechanical lockout devices.
Unmonitored control circuitry associated with SPS. (See Table 4-2(b) for SPS which include Automatic Reclosing.)	12 Calendar Years	Verify all paths of the control circuits essential for proper operation of the SPS.
Unmonitored control circuitry associated with protective functions inclusive of all auxiliary relays.	12 Calendar Years	Verify all paths of the trip circuits inclusive of all auxiliary relays through the trip coil(s) of the circuit breakers or other interrupting devices.
Control circuitry associated with protective functions and/or SPSs whose integrity is monitored and alarmed (See Table 2).	No periodic maintenance specified	None.

Table 2 – Alarming Paths and Monitoring In Tables 1-1 through 1-5, Table 3, and Tables 4-1 through 4-2, alarm attributes used to justify extended maximum maintenance intervals and/or reduced maintenance activities are subject to the following maintenance requirements		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any alarm path through which alarms in Tables 1-1 through 1-5, Table 3, and Tables 4-1 through 4-2 are conveyed from the alarm origin to the location where corrective action can be initiated, and not having all the attributes of the "Alarm Path with monitoring" category below. Alarms are reported within 24 hours of detection to a location where corrective action can be initiated.	12 Calendar Years	Verify that the alarm path conveys alarm signals to a location where corrective action can be initiated.
Alarm Path with monitoring: The location where corrective action is taken receives an alarm within 24 hours for failure of any portion of the alarming path from the alarm origin to the location where corrective action can be initiated.	No periodic maintenance specified	None.

Table 3 Maintenance Activities and Intervals for distributed UFLS and distributed UVLS Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any unmonitored protective relay not having all the monitoring attributes of a category below.	6 Calendar Years	Verify that settings are as specified. For non-microprocessor relays: • Test and, if necessary calibrate. For microprocessor relays: • Verify operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Verify acceptable measurement of power system input values.
Monitored microprocessor protective relay with the following: • Internal self diagnosis and alarming (See Table 2). • Voltage and/or current waveform sampling three or more times per power cycle, and conversion of samples to numeric values for measurement calculations by microprocessor electronics. Alarming for power supply failure (See Table 2).	12 Calendar Years	Verify: • Settings are as specified. • Operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Acceptable measurement of power system input values
Monitored microprocessor protective relay with preceding row attributes and the following: • Ac measurements are continuously verified by comparison to an independent ac measurement source, with alarming for excessive error (See Table 2). • Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2). Alarming for change of settings (See Table 2).	12 Calendar Years	Verify only the unmonitored relay inputs and outputs that are essential to proper functioning of the Protection System.

Table 3 Maintenance Activities and Intervals for distributed UFLS and distributed UVLS Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Voltage and/or current sensing devices associated with UFLS or UVLS systems.	12 Calendar Years	Verify that current and/or voltage signal values are provided to the protective relays.
Protection System dc supply for tripping non-BES interrupting devices used only for a UFLS or UVLS system.	12 Calendar Years	Verify Protection System dc supply voltage.
Control circuitry between the UFLS or UVLS relays and electromechanical lockout and/or tripping auxiliary devices (excludes non-BES interrupting device trip coils).	12 Calendar Years	Verify the path from the relay to the lockout and/or tripping auxiliary relay (including essential supervisory logic).
Electromechanical lockout and/or tripping auxiliary devices associated only with UFLS or UVLS systems (excludes non-BES interrupting device trip coils).	12 Calendar Years	Verify electrical operation of electromechanical lockout and/or tripping auxiliary devices.
Control circuitry between the electromechanical lockout and/or tripping auxiliary devices and the non-BES interrupting devices in UFLS or UVLS systems, or between UFLS or UVLS relays (with no interposing electromechanical lockout or auxiliary device) and the non-BES interrupting devices (excludes non-BES interrupting device trip coils).	No periodic maintenance specified	None.
Trip coils of non-BES interrupting devices in UFLS or UVLS systems.	No periodic maintenance specified	None.

Table 4-1 Maintenance Activities and Intervals for Automatic Reclosing Components Component Type – Reclosing Relay		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any unmonitored reclosing relay not having all the monitoring attributes of a category below.	6 Calendar Years	Verify that settings are as specified. For non-microprocessor relays: • Test and, if necessary calibrate For microprocessor relays: • Verify operation of the relay inputs and outputs that are essential to proper functioning of the Automatic Reclosing.
Monitored microprocessor reclosing relay with the following: • Internal self diagnosis and alarming (See Table 2). • Alarming for power supply failure (See Table 2).	12 Calendar Years	Verify: • Settings are as specified. • Operation of the relay inputs and outputs that are essential to proper functioning of the Automatic Reclosing.

Table 4-2(a) Maintenance Activities and Intervals for Automatic Reclosing Components Component Type – Control Circuitry Associated with Reclosing Relays that are NOT an Integral Part of an SPS		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Unmonitored Control circuitry associated with Automatic Reclosing that is not an integral part of an SPS.	12 Calendar Years	Verify that Automatic Reclosing, upon initiation, does not issue a premature closing command to the close circuitry.
Control circuitry associated with Automatic Reclosing that is not part of an SPS and is monitored and alarmed for conditions that would result in a premature closing command. (See Table 2)	No periodic maintenance specified	None.

Table 4-2(b) Maintenance Activities and Intervals for Automatic Reclosing Components Component Type – Control Circuitry Associated with Reclosing Relays that ARE an Integral Part of an SPS		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Close coils or actuators of circuit breakers or similar devices that are used in conjunction with Automatic Reclosing as part of an SPS (regardless of any monitoring of the control circuitry).	6 Calendar Years	Verify that each close coil or actuator is able to operate the circuit breaker or mitigating device.
Unmonitored close control circuitry associated with Automatic Reclosing used as an integral part of an SPS.	12 Calendar Years	Verify all paths of the control circuits associated with Automatic Reclosing that are essential for proper operation of the SPS.
Control circuitry associated with Automatic Reclosing that is an integral part of an SPS whose integrity is monitored and alarmed. (See Table 2)	No periodic maintenance specified	None.

PRC-005 — Attachment A

Criteria for a Performance-Based Protection System Maintenance Program

Purpose: To establish a technical basis for initial and continued use of a performance-based Protection System Maintenance Program (PSMP).

To establish the technical justification for the initial use of a performance-based PSMP:

1. Develop a list with a description of Components included in each designated Segment, with a minimum **Segment** population of 60 Components.
2. Maintain the Components in each Segment according to the time-based maximum allowable intervals established in Tables 1-1 through 1-5, Table 3, and Tables 4-1 through 4-2 until results of maintenance activities for the Segment are available for a minimum of 30 individual Components of the Segment.
3. Document the maintenance program activities and results for each Segment, including maintenance dates and Countable Events for each included Component.
4. Analyze the maintenance program activities and results for each Segment to determine the overall performance of the Segment and develop maintenance intervals.
5. Determine the maximum allowable maintenance interval for each Segment such that the Segment experiences **Countable Events** on no more than 4% of the Components within the Segment, for the greater of either the last 30 Components maintained or all Components maintained in the previous year.

To maintain the technical justification for the ongoing use of a performance-based PSMP:

1. At least annually, update the list of Components and Segments and/or description if any changes occur within the Segment.
2. Perform maintenance on the greater of 5% of the Components (addressed in the performance based PSMP) in each Segment or 3 individual Components within the Segment in each year.
3. For the prior year, analyze the maintenance program activities and results for each Segment to determine the overall performance of the Segment.
4. Using the prior year's data, determine the maximum allowable maintenance interval for each Segment such that the Segment experiences Countable Events on no more than 4% of the Components within the Segment, for the greater of either the last 30 Components maintained or all Components maintained in the previous year.
5. If the Components in a Segment maintained through a performance-based PSMP experience 4% or more Countable Events, develop, document, and implement an action plan to reduce the Countable Events to less than 4% of the Segment population within 3 years.

Implementation Plan

Project 2014-01 Standards Applicability for Dispersed Power Producing Resources
PRC-005-3(X)

The standard numbers currently include an (X) to indicate the version numbering will be updated. Some standards are open in current projects and others are pending with governmental authorities. As a result, NERC will assign the appropriate version number prior to Board of Trustees adoption.

Standards Involved

Approval:

- PRC-005-3(X) – Protection System and Automatic Reclosing Maintenance

Retirement:

- PRC-005-2(X) – Protection System Maintenance
- PRC-005-3 – Protection System and Automatic Reclosing Maintenance

Prerequisite Approvals

N/A

Background

In light of the adoption of a revised "Bulk Electric System" definition by the Board of Trustees (Board), changes to the applicability sections of certain Reliability Standards, including PRC-005, are necessary to align with the implementation of the revised "Bulk Electric System" definition. The Standard Drafting Team (SDT) for Project 2014-01 – Standards Applicability for Dispersed Power Producing Resources has modified the applicability section of certain Generator Owner/Generator Operator requirements to recognize the unique technical and reliability aspects of dispersed generation in order to ensure the applicability of the standards is consistent with the reliable operation of the Bulk-Power System.

Reliability Standard PRC-005-3, with its associated Implementation Plan, was adopted by the NERC Board on November 7, 2013. The SDT has revised the applicability section of PRC-005-3 to align with the revised definition of "Bulk Electric System" in the event that this version of PRC-005 is mandatory and enforceable on the effective date of the revised definition of "Bulk Electric System."

General Considerations

PRC-005-3(X) is proposed for approval to align the applicability section of PRC-005-3 with the revised definition of "Bulk Electric System." PRC-005-3 may already be retired pursuant to an Implementation Plan of a successor version of PRC-005 by the time the revised definition of "Bulk Electric System" becomes effective. If this occurs, PRC-005-3(X) will not go into effect.

Effective Date

PRC-005-3(X) shall become effective on the later of the effective date of the revised definition of Bulk Electric System or the first day following the effective date of PRC-005-3.

Retirement of Existing Standards

PRC-005-3 shall be retired at midnight of the day immediately prior to the effective date of PRC-005-3(X) in the particular jurisdiction in which the revised standard is becoming effective.

Implementation Plan

PRC-005-3(X) only modifies the applicability for PRC-005-3. All aspects of the Implementation Plan for PRC-005-3 will remain applicable to PRC-005-3(X) and are incorporated here by reference.

Cross References

The Implementation Plan for the revised definition of "Bulk Electric System" is available here.

The Implementation Plan for PRC-005-3 is available here.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment November 20 – December 19, 2013.

Description of Current Draft

The Project 2014-01, Standards Applicability for Dispersed Generation Resources Standards Drafting Team (DGR SDT) is posting proposed applicability changes to PRC-005-3 for comment and ballot. This draft contains the DGR SDT's recommended changes within the standard, which are intended to clarify application of the Requirements to Bulk Electric System (BES) dispersed power producing resources. Project 2014-01 does not have in its scope any technical content changes beyond revising the applicability to ensure consistent application of the Requirements of PRC-005 to dispersed power-producing resources.

In a parallel effort, the Protection System Maintenance and Testing Standard Drafting Team (PSMT SDT) has posted draft 1 of PRC-005-X for a 45-day comment period, and ballot in the last ten days of the comment period under the new Standards Process Manual (Effective: June 26, 2013).

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with Initial Ballot	June – July 2014
45-day Additional Formal Comment Period with Additional Ballot (if necessary)	August – September 2014
Final ballot	October 2014
BOT adoption	November 2014

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms (Glossary) are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, this defined term will be removed from the individual standard and added to the Glossary.

Protection System Maintenance Program (PSMP) — An ongoing program by which Protection System, Automatic Reclosing, and Sudden Pressure Relaying Components are kept in working order and proper operation of malfunctioning components is restored. A maintenance program for a specific Component includes one or more of the following activities:

- Verify — Determine that the Component is functioning correctly.
- Monitor — Observe the routine in-service operation of the Component.
- Test — Apply signals to a Component to observe functional performance or output behavior, or to diagnose problems.
- Inspect — Examine for signs of Component failure, reduced performance or degradation.
- Calibrate — Adjust the operating threshold or measurement accuracy of a measuring element to meet the intended performance requirement.

See Section A.6, Definitions Used in this Standard, for additional definitions that are new or modified for use within this standard.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** **Protection System, Automatic Reclosing, and Sudden Pressure Relaying Maintenance**
2. **Number:** **PRC-005-X**
3. **Purpose:** To document and implement programs for the maintenance of all Protection Systems, Automatic Reclosing, and Sudden Pressure Relaying affecting the reliability of the Bulk Electric System (BES) so that they are kept in working order.
4. **Applicability:**
   - **4.1. Functional Entities:**
     - **4.1.1** Transmission Owner
     - **4.1.2** Generator Owner
     - **4.1.3** Distribution Provider
     - **4.1.4** Balancing Authority
   - **4.2. Facilities:**
     - **4.2.1** Protection Systems and Sudden Pressure Relaying that are installed for the purpose of detecting Faults on BES Elements (lines, buses, transformers, etc.)
     - **4.2.2** Protection Systems used for underfrequency load-shedding systems installed per ERO underfrequency load-shedding requirements.
     - **4.2.3** Protection Systems used for undervoltage load-shedding systems installed to prevent system voltage collapse or voltage instability for BES reliability.
     - **4.2.4** Protection Systems installed as a Special Protection System (SPS) for BES reliability.
     - **4.2.5** Protection Systems for the following BES generator Facilities ~~that are part of the BES, including~~ for generators not identified through Inclusion I4 of the BES definition:

The only revisions made to this version of PRC-005 are revisions to section 4.2, to clarify applicability of the Requirements of the standard at generator Facilities. These applicability revisions are intended to clarify and provide for consistent application of the Requirements to BES generator Facilities included in the BES through Inclusion I4 – Dispersed Power Producing Resources.

This version is labeled PRC-005-~~2(~~X~~)~~ for balloting purposes. The 'X' indicates that a version number will be applied at a later time, because multiple versions of PRC-005 are in development to reflect the fact that applicability changes need applied~~y~~ for versions of the standard that are approved (PRC-005-2), pending regulatory approval (PRC-005-3), and in development in Project 2007-17.3. ~~-~~Depending on the timing of approvals of other versions, NERC may file this interim version to provide regulatory certainty for entities as the revised BES definition is implemented.

4.2.5.1 Protection Systems that act to trip the generator either directly or via lockout or auxiliary tripping relays.

4.2.5.2 Protection Systems and Sudden Pressure Relaying for generator step-up transformers for generators that are part of the BES.

~~**4.2.5.3** Protection Systems for transformers connecting aggregated generation, where the aggregated generation is part of the BES (e.g., transformers connecting facilities such as wind farms to the BES).~~

4.2.5.3 Protection Systems and Sudden Pressure Relaying for station service or excitation transformers connected to the generator bus of generators which are part of the BES, that act to trip the generator either directly or via lockout or tripping auxiliary relays.

Rationale for 4.2.5: In order to differentiate between typical BES generator Facilities and BES generators at dispersed power producing facilities, section 4.2.5 was separated into two sections (4.2.5 and 4.2.6). The applicability to non-dispersed power producing facilities has been maintained and can be found in 4.2.5. The applicability to dispersed power producing Facilities has been modified and relocated from 4.2.5 to 4.2.6.

4.2.6 Protection Systems for the following BES generator Facilities for dispersed power producing resources identified through Inclusion I4 of the BES definition:

4.2.6.1 Protection Systems for ~~electrical equipment~~Facilities~~-~~ used in aggregating dispersed BES generation from the point where those resources aggregate to greater than 75 MVA to a common point of connection at 100 kV or above.

Rationale for 4.2.6: The Facilities listed that are applicable to dispersed power producing facilities are covered within 4.2.6. The intent is to NOT include the individual generating resources in the Protection System Maintenance Program, and as such the Protection Systems within the individual generating resources would not be within the scope of PRC-005. Only Protection Systems on equipment used in aggregating the dispersed BES generation from the point where those resources aggregate to greater than 75MVA to a common point of connection at 100kV would be included in the Protection System Maintenance Program, including the Protection Systems for those transformers used in aggregating generation.

~~4.2.6~~4.2.7 Automatic Reclosing[1], including:

~~4.2.6.1~~4.2.7.1 Automatic Reclosing applied on the terminals of Elements connected to the BES bus located at generating plant substations where the total installed gross generating plant capacity is greater than the gross capacity of the largest BES generating unit within the Balancing Authority Area.

~~4.2.6.2~~4.2.7.2 Automatic Reclosing applied on the terminals of all BES Elements at substations one bus away from generating plants specified in Section 4.2.6.1 when the substation is less than 10 circuit-miles from the generating plant substation.

4.2.6.3. Automatic Reclosing applied as an integral part of an SPS specified in Section 4.2.4.

[1] Automatic Reclosing addressed in Section 4.2.7.1 and 4.2.7.2 may be excluded if the equipment owner can demonstrate that a close-in three-phase fault present for twice the normal clearing time (capturing a minimum trip-close-trip time delay) does not result in a total loss of gross generation in the Interconnection exceeding the gross capacity of the largest BES generating unit within the Balancing Authority Area where the Automatic Reclosing is applied.

5. **Effective Date:** See Implementation Plan.

6. **Definitions Used in this Standard:**

Automatic Reclosing – Includes the following Components:

- Reclosing relay
- Control circuitry associated with the reclosing relay.

Sudden Pressure Relaying – A system that trips an interrupting device(s) to isolate the equipment it is monitoring and includes the following Components:

- Fault pressure relay – a mechanical relay or device that detects rapid changes in gas pressure, oil pressure, or oil flow that are indicative of Faults within liquid-filled, wire-wound equipment
- Control circuitry associated with a fault pressure relay

Unresolved Maintenance Issue – A deficiency identified during a maintenance activity that causes the Component to not meet the intended performance, cannot be corrected during the maintenance interval, and requires follow-up corrective action.

Segment – Components of a consistent design standard, or a particular model or type from a single manufacturer that typically share other common elements. Consistent performance is expected across the entire population of a Segment. A Segment must contain at least sixty (60) individual Components.

Component Type –

- Any one of the five specific elements of a Protection System.
- Any one of the two specific elements of Automatic Reclosing.
- Any one of the two specific elements of Sudden Pressure Relaying.

Rationale for the deletion of part of the definition of Component: The SDT determined that it was explanatory in nature and adequately addressed in the Supplementary Reference and FAQ Document.

Component – Any individual discrete piece of equipment included in a Protection System, Automatic Reclosing, or Sudden Pressure Relaying.

Countable Event – A failure of a Component requiring repair or replacement, any condition discovered during the maintenance activities in Tables 1-1 through 1-5, Table 3, Tables 4-1 through 4-2, and Table 5, which requires corrective action or a Protection System Misoperation attributed to hardware failure or calibration failure. Misoperations due to product design errors, software errors, relay settings different from specified settings, Protection System Component, Automatic Reclosing, or Sudden

Pressure Relaying configuration or application errors are not included in Countable Events.

B. Requirements and Measures

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a Protection System Maintenance Program (PSMP) for its Protection Systems, Automatic Reclosing, and Sudden Pressure Relaying identified in Section 4.2, Facilities. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning*]

The PSMP shall:

1.1. Identify which maintenance method (time-based, performance-based per PRC-005 Attachment A, or a combination) is used to address each Protection System, Automatic Reclosing, and Sudden Pressure Relaying Component Type. All batteries associated with the station dc supply Component Type of a Protection System shall be included in a time-based program as described in Table 1-4 and Table 3.

1.2. Include the applicable monitored Component attributes applied to each Protection System, Automatic Reclosing, and Sudden Pressure Relaying Component Type consistent with the maintenance intervals specified in Tables 1-1 through 1-5, Table 2, Table 3, Table 4-1 through 4-2, and Table 5 where monitoring is used to extend the maintenance intervals beyond those specified for unmonitored Protection System, Automatic Reclosing, and Sudden Pressure Relaying Components.

M1. Each Transmission Owner, Generator Owner and Distribution Provider shall have a documented Protection System Maintenance Program in accordance with Requirement R1.

For each Protection System, Automatic Reclosing, and Sudden Pressure Relaying Component Type, the documentation shall include the type of maintenance method applied (time-based, performance-based, or a combination of these maintenance methods), and shall include all batteries associated with the station dc supply Component Types in a time-based program as described in Table 1-4 and Table 3. (Part 1.1)

For Component Types that use monitoring to extend the maintenance intervals, the responsible entity(s) shall have evidence for each Protection System, Automatic Reclosing, and Sudden Pressure Relaying Component Type (such as manufacturer's specifications or engineering drawings) of the appropriate monitored Component attributes as specified in Tables 1-1 through 1-5, Table 2, Table 3, Table 4-1 through 4-2, and Table 5. (Part 1.2)

R2. Each Transmission Owner, Generator Owner, and Distribution Provider that uses performance-based maintenance intervals in its PSMP shall follow the procedure

established in PRC-005 Attachment A to establish and maintain its performance-based intervals. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M2. Each Transmission Owner, Generator Owner, and Distribution Provider that uses performance-based maintenance intervals shall have evidence that its current performance-based maintenance program(s) is in accordance with Requirement R2, which may include, but is not limited to, Component lists, dated maintenance records, and dated analysis records and results.

Rationale for R3 part 3.1 and 3.1.1.: The SDT, upon further reflection, determined that the PRC-005-3 Implementation Plan actually included a requirement that entities with newly-identified Automatic Reclosing Components implement its PSMP for those Components, and therefore determined that it was more appropriate to include this information in the standard rather than the implementation plan.

R3. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes time-based maintenance program(s) shall, except as provided in part 3.1, maintain its Protection System, Automatic Reclosing, and Sudden Pressure Relaying Components that are included within the time-based maintenance program in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, Table 4-1 through 4-2, and Table 5. *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

3.1. For each newly-identified Automatic Reclosing Component following a notification under Requirement R6, each Transmission Owner, Generator Owner, and Distribution Provider shall perform maintenance activities or provide documentation of prior maintenance activities according to either 3.1.1 or 3.1.2.

3.1.1. Complete the maintenance activities prescribed within Tables 4-1, 4-2(a), and 4-2(b) for the newly-identified Automatic Reclosing Component prior to the end of the third calendar year following the notification under Requirement R6; or

3.1.2. Provide documentation that the Automatic Reclosing Component was last maintained in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 4-1, 4-2(a), and 4-2(b).

M3. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes time-based maintenance program(s) shall have evidence that it has maintained its Protection System, Automatic Reclosing, and Sudden Pressure Relaying Components included within its time-based program in accordance with Requirement R3. The evidence may include, but is not limited to, dated maintenance records, dated

maintenance summaries, dated check-off lists, dated inspection records, or dated work orders.

Rationale for R4 part 4.1 and 4.1.1.: The SDT, upon further reflection, determined that the PRC-005-3 Implementation Plan actually included a requirement that entities with newly-identified Automatic Reclosing Components implement its PSMP for those Components, and therefore determined that it was more appropriate to include this information in the standard rather than the implementation plan.

R4. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes performance-based maintenance program(s) in accordance with Requirement R2 shall, except as provided in part 4.1, implement and follow its PSMP for its Protection System, Automatic Reclosing, and Sudden Pressure Relaying Components that are included within the performance-based program(s). *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

4.1. For each newly-identified Automatic Reclosing Component following a notification under Requirement R6, each Transmission Owner, Generator Owner, and Distribution Provider shall perform maintenance activities or provide documentation of prior maintenance activities according to either 4.1.1 or 4.1.2.

4.1.1. Complete the maintenance activities prescribed within Tables 4-1, 4-2(a), and 4-2(b) for the newly-identified Automatic Reclosing Component prior to the end of the third calendar year following the notification under Requirement R6; or

4.1.2. Provide documentation that the Automatic Reclosing Component was last maintained in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 4-1, 4-2(a), and 4-2(b).

M4. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes performance-based maintenance intervals in accordance with Requirement R2 shall have evidence that it has implemented the Protection System Maintenance Program for the Protection System, Automatic Reclosing, and Sudden Pressure Relaying Components included in its performance-based program in accordance with Requirement R4. The evidence may include, but is not limited to, dated maintenance records, dated maintenance summaries, dated check-off lists, dated inspection records, or dated work orders.

R5. Each Transmission Owner, Generator Owner, and Distribution Provider shall demonstrate efforts to correct identified Unresolved Maintenance Issues. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M5. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence that it has undertaken efforts to correct identified Unresolved Maintenance

Issues in accordance with Requirement R5. The evidence may include, but is not limited to, work orders, replacement Component orders, invoices, project schedules with completed milestones, return material authorizations (RMAs) or purchase orders.

Rationale for R6: The information addressed in Requirement R6 is necessary for Transmission Owners, Generator Owners, and Distribution Provides to accurately apply Section 4.2.7, Applicability. The Balancing Authority is the entity that maintains the information and should have the responsibility to provide this information to the applicable entities. The drafting team reconsidered the inclusion of the Balancing Authority and determined it is appropriate to include the requirement the standard. This requirement may be relocated to another standard during future reviews of standards for quality and content.

The periodicity was chosen to balance the needs of the Transmission Owner, Generator Owner, and Distribution Provider to obtain the information with the needs of the Balancing Authority to provide an accurate gross capacity (considering retirement or installation of generating units and/or changes in its Balancing Authority Area) in order to properly include Automatic Reclosing in a PSMP.

R6. Each Balancing Authority shall, at least once every calendar year with not more than 15 calendar months between notifications, notify each Transmission Owner, Generator Owner, and Distribution Provider within its Balancing Authority Area of the gross capacity, in MW or MVA, of the largest BES generating unit within the Balancing Authority Area. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M6. Each Balancing Authority shall have dated documentation that it notified each Transmission Owner, Generator Owner, and Distribution Provider in accordance with Requirement R6. Examples of evidence may include, but are not limited to, copies of correspondence, such as e-mails or memoranda.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time

since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, Distribution Provider, and Balancing Authority shall each keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

For Requirement R1, the Transmission Owner, Generator Owner, and Distribution Provider shall each keep its current dated Protection System Maintenance Program, as well as any superseded versions since the preceding compliance audit, including the documentation that specifies the type of maintenance program applied for each Protection System Component Type.

For Requirement R2, Requirement R3, Requirement R4, and Requirement R5, the Transmission Owner, Generator Owner, and Distribution Provider shall each keep documentation of the most recent performance of each distinct maintenance activity for the Protection System, Automatic Reclosing, or Sudden Pressure Relaying Component, or all performances of each distinct maintenance activity for the Protection System, Automatic Reclosing, or Sudden Pressure Relaying Component since the previous scheduled audit date, whichever is longer.

For Requirement R6, the Balancing Authority shall keep documentation for three calendar years that it provided information identifying the largest BES generating unit to the Transmission Owners, Generator Owners, and Distribution Providers in its Balancing Authority Area.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Additional Compliance Information

None

Table of Compliance Elements

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The entity's PSMP failed to specify whether one Component Type is being addressed by time-based or performance-based maintenance, or a combination of both (part 1.1).	The entity's PSMP failed to specify whether two Component Types are being addressed by time-based or performance-based maintenance, or a combination of both (part 1.1).	The entity's PSMP failed to specify whether three Component Types are being addressed by time-based or performance-based maintenance, or a combination of both. (part 1.1). OR The entity's PSMP failed to include the applicable monitoring attributes applied to each Component Type consistent with the maintenance intervals specified in Tables 1-1 through 1-5, Table 2, Table 3, Tables 4-1 through 4-2, and Table 5 where monitoring is used to extend the maintenance intervals beyond those specified for unmonitored Components (part 1.2).	The entity failed to establish a PSMP. OR The entity's PSMP failed to specify whether four or more Component Types are being addressed by time-based or performance-based maintenance, or a combination of both (part 1.1). OR The entity's PSMP failed to include applicable station batteries in a time-based program (part 1.1).
R2	The entity uses performance-based maintenance intervals in its PSMP but failed to reduce Countable Events to no more than 4% within three years.	NA	The entity uses performance-based maintenance intervals in its PSMP but failed to reduce Countable Events to no more than 4% within four years.	The entity uses performance-based maintenance intervals in its PSMP but: 1) Failed to establish the technical justification described within Requirement R2 for the initial use of the performance-based PSMP OR 2) Failed to reduce Countable Events to no more than 4% within five years OR

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
				3) Maintained a Segment with less than 60 Components OR 4) Failed to: • Annually update the list of Components, OR • Annually perform maintenance on the greater of 5% of the Segment population or 3 Components, OR • Annually analyze the program activities and results for each Segment.
R3	For Components included within a time-based maintenance program, the entity failed to maintain 5% or less of the total Components included within a specific Component Type in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, Tables 4-1 through 4-2, and Table 5. For Automatic Reclosing Components added to a time-based maintenance program per information from the Balancing	For Components included within a time-based maintenance program, the entity failed to maintain more than 5% but 10% or less of the total Components included within a specific Component Type in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, Tables 4-1 through 4-2, and Table 5. For Automatic Reclosing Components added to a time-based maintenance program per	For Components included within a time-based maintenance program, the entity failed to maintain more than 10% but 15% or less of the total Components included within a specific Component Type in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, Tables 4-1 through 4-2, and Table 5. For Automatic Reclosing Components added to a time-based maintenance program per	For Components included within a time-based maintenance program, the entity failed to maintain more than 15% of the total Components included within a specific Component Type in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, Tables 4-1 through 4-2, and Table 5. For Automatic Reclosing Components added to a time-

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
	Authority, the entity failed to maintain 5% or less of the total Components in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 4-1 through 4-2.	information from the Balancing Authority, the entity failed to maintain more than 5% but 10% or less of the total Components in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 4-1 through 4-2.	information from the Balancing Authority, the entity failed to maintain more than 10% but 15% or less of the total Components in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 4-1 through 4-2.	based maintenance program per information from the Balancing Authority, the entity failed to maintain more than 15% of the total Components in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 4-1 through 4-2.
R4	For Components included within a performance-based maintenance program, the entity failed to maintain 5% or less of the annual scheduled maintenance for a specific Component Type in accordance with their performance-based PSMP. For Automatic Reclosing Components added to a performance-based maintenance program per information from the Balancing Authority, the entity failed to maintain 5% or less of the total Components in accordance with their performance-based PSMP.	For Components included within a performance-based maintenance program, the entity failed to maintain more than 5% but 10% or less of the annual scheduled maintenance for a specific Component Type in accordance with their performance-based PSMP. For Automatic Reclosing Components added to a performance-based maintenance program per information from the Balancing Authority, the entity failed to maintain more than 5% but 10% or less of the total Components in accordance with their performance-based PSMP.	For Components included within a performance-based maintenance program, the entity failed to maintain more than 10% but 15% or less of the annual scheduled maintenance for a specific Component Type in accordance with their performance-based PSMP. For Automatic Reclosing Components added to a performance-based maintenance program per information from the Balancing Authority, the entity failed to maintain more than 10% but 15% or less of the total Components in accordance with their performance-based PSMP.	For Components included within a performance-based maintenance program, the entity failed to maintain more than 15% of the annual scheduled maintenance for a specific Component Type in accordance with their performance-based PSMP. For Automatic Reclosing Components added to a performance-based maintenance program per information from the Balancing Authority, the entity failed to maintain more than 15% of the total Components in accordance with their performance-based PSMP.

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
R5	The entity failed to undertake efforts to correct 5 or fewer identified Unresolved Maintenance Issues.	The entity failed to undertake efforts to correct greater than 5 but less than or equal to 10 identified Unresolved Maintenance Issues.	The entity failed to undertake efforts to correct greater than 10 but less than or equal to 15 identified Unresolved Maintenance Issues.	The entity failed to undertake efforts to correct greater than 15 identified Unresolved Maintenance Issues.
R6				The entity failed to notify each Transmission Owner, Generator Owner, and Distribution Provider within its Balancing Authority Area at least once every calendar year of the gross capacity, in MW or MVA, of the largest BES generating unit within the Balancing Authority Area. OR The entity had more than 15 calendar months between notifications to each Transmission Owner, Generator Owner, and Distribution Provider of the gross capacity, in MW or MVA, of the largest BES generating unit within the Balancing Authority Area.

D. Regional Variances

None.

E. Interpretations

None.

F. Supplemental Reference Documents

The following documents present a detailed discussion about determination of maintenance intervals and other useful information regarding establishment of a maintenance program.

1. *Supplementary Reference and FAQ - PRC-005-X Protection System Maintenance,* Protection System Maintenance and Testing Standard Drafting Team (April 2014)
2. *Considerations for Maintenance and Testing of Auto-reclosing Schemes*, NERC System Analysis and Modeling Subcommittee, and NERC System Protection and Control Subcommittee (November 2012)

Sudden Pressure Relays and Other Devices that Respond to Non-Electrical Quantities – SPCS Input for Standard Development in Response to FERC Order No. 758, NERC System Protection and Control Subcommittee (December 2013)

Version History

(X) – Protection System, Automatic Reclosing, and Sudden Pressure Relaying Maintenance

Table 1-1 Component Type - Protective Relay Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval[2]**	**Maintenance Activities**
tive relay not having all the monitoring attributes	6 Calendar Years	For all unmonitored relays: • Verify that settings are as specified For non-microprocessor relays: • Test and, if necessary calibrate For microprocessor relays: • Verify operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Verify acceptable measurement of power system input values.
or protective relay with the following: is and alarming (see Table 2). ent waveform sampling three or more times per nversion of samples to numeric values for ations by microprocessor electronics. supply failure (see Table 2).	12 Calendar Years	Verify: • Settings are as specified. • Operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Acceptable measurement of power system input values.

dard, a calendar year starts on the first day of a new year (January 1) after a maintenance activity has been completed

Table 1-1 Component Type - Protective Relay Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval**[2]	**Maintenance Activities**
Monitored microprocessor protective relay with preceding row attributes and the following: • Ac measurements are continuously verified by comparison to an independent ac measurement source, with alarming for excessive error (See Table 2). • Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2). • Alarming for change of settings (See Table 2).	12 Calendar Years	Verify only the unmonitored relay inputs and outputs that are essential to proper functioning of the Protection System.

Table 1-2 Component Type - Communications Systems Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any unmonitored communications system necessary for correct operation of protective functions, and not having all the monitoring attributes of a category below.	4 Calendar Months	Verify that the communications system is functional.
	6 Calendar Years	Verify that the communications system meets performance criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate). Verify operation of communications system inputs and outputs that are essential to proper functioning of the Protection System.
Any communications system with continuous monitoring or periodic automated testing for the presence of the channel function, and alarming for loss of function (See Table 2).	12 Calendar Years	Verify that the communications system meets performance criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate). Verify operation of communications system inputs and outputs that are essential to proper functioning of the Protection System.
Any communications system with all of the following: • Continuous monitoring or periodic automated testing for the performance of the channel using criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate, and alarming for excessive performance degradation). (See Table 2) • Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2).	12 Calendar Years	Verify only the unmonitored communications system inputs and outputs that are essential to proper functioning of the Protection System

Table 1-3 Component Type - Voltage and Current Sensing Devices Providing Inputs to Protective Relays Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any voltage and current sensing devices not having monitoring attributes of the category below.	12 Calendar Years	Verify that current and voltage signal values are provided to the protective relays.
Voltage and Current Sensing devices connected to microprocessor relays with AC measurements are continuously verified by comparison of sensing input value, as measured by the microprocessor relay, to an independent ac measurement source, with alarming for unacceptable error or failure (see Table 2).	No periodic maintenance specified	None.

Table 1-4(a) Component Type – Protection System Station dc Supply Using Vented Lead-Acid (VLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Protection System Station dc supply using **Vented Lead-Acid (VLA) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • Electrolyte level • For unintentional grounds
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Cell condition of all individual battery cells where cells are visible – or measure battery cell/unit internal ohmic values where the cells are not visible • Physical condition of battery rack

Table 1-4(a) Component Type – Protection System Station dc Supply Using Vented Lead-Acid (VLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
	18 Calendar Months -or- 6 Calendar Years	Verify that the station battery can perform as manufactured by evaluating cell/unit measurements indicative of battery performance (e.g. internal ohmic values or float current) against the station battery baseline. -or- Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(b) Component Type – Protection System Station dc Supply Using Valve-Regulated Lead-Acid (VRLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Protection System Station dc supply **with Valve Regulated Lead-Acid (VRLA) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • For unintentional grounds
	6 Calendar Months	Inspect: • Condition of all individual units by measuring battery cell/unit internal ohmic values.
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Physical condition of battery rack

Table 1-4(b) Component Type – Protection System Station dc Supply Using Valve-Regulated Lead-Acid (VRLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
	6 Calendar Months -or- 3 Calendar Years	Verify that the station battery can perform as manufactured by evaluating cell/unit measurements indicative of battery performance (e.g. internal ohmic values or float current) against the station battery baseline. -or- Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(c) Component Type – Protection System Station dc Supply Using Nickel-Cadmium (NiCad) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS system, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Protection System Station dc supply **Nickel-Cadmium (NiCad) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • Electrolyte level • For unintentional grounds
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Cell condition of all individual battery cells. • Physical condition of battery rack

Table 1-4(c) Component Type – Protection System Station dc Supply Using Nickel-Cadmium (NiCad) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS system, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
	6 Calendar Years	Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(d) Component Type – Protection System Station dc Supply Using Non Battery Based Energy Storage Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS system, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any Protection System station dc supply not using a battery and not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • For unintentional grounds
	18 Calendar Months	Inspect: Condition of non-battery based dc supply
	6 Calendar Years	Verify that the dc supply can perform as manufactured when ac power is not present.

Table 1-4(e) Component Type – Protection System Station dc Supply for non-BES Interrupting Devices for SPS, non-distributed UFLS, and non-distributed UVLS systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any Protection System dc supply used for tripping only non-BES interrupting devices as part of a SPS, non-distributed UFLS, or non-distributed UVLS system and not having monitoring attributes of Table 1-4(f).	When control circuits are verified (See Table 1-5)	Verify Station dc supply voltage.

Table 1-4(f) Exclusions for Protection System Station dc Supply Monitoring Devices and Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any station dc supply with high and low voltage monitoring and alarming of the battery charger voltage to detect charger overvoltage and charger failure (See Table 2).	No periodic maintenance specified	No periodic verification of station dc supply voltage is required.
Any battery based station dc supply with electrolyte level monitoring and alarming in every cell (See Table 2).		No periodic inspection of the electrolyte level for each cell is required.
Any station dc supply with unintentional dc ground monitoring and alarming (See Table 2).		No periodic inspection of unintentional dc grounds is required.
Any station dc supply with charger float voltage monitoring and alarming to ensure correct float voltage is being applied on the station dc supply (See Table 2).		No periodic verification of float voltage of battery charger is required.
Any battery based station dc supply with monitoring and alarming of battery string continuity (See Table 2).		No periodic verification of the battery continuity is required.
Any battery based station dc supply with monitoring and alarming of the intercell and/or terminal connection detail resistance of the entire battery (See Table 2).		No periodic verification of the intercell and terminal connection resistance is required.
Any Valve Regulated Lead-Acid (VRLA) or Vented Lead-Acid (VLA) station battery with internal ohmic value or float current monitoring and alarming, and evaluating present values relative to baseline internal ohmic values for every cell/unit (See Table 2).		No periodic evaluation relative to baseline of battery cell/unit measurements indicative of battery performance is required to verify the station battery can perform as manufactured.
Any Valve Regulated Lead-Acid (VRLA) or Vented Lead-Acid (VLA) station battery with monitoring and alarming of each cell/unit internal ohmic value (See Table 2).		No periodic inspection of the condition of all individual units by measuring battery cell/unit internal ohmic values of a station VRLA or Vented Lead-Acid (VLA) battery is required.

Table 1-5 Component Type - Control Circuitry Associated With Protective Functions Excluding distributed UFLS and distributed UVLS (see Table 3) Note: Table requirements apply to all Control Circuitry Components of Protection Systems, and SPSs except as noted.		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Trip coils or actuators of circuit breakers, interrupting devices, or mitigating devices (regardless of any monitoring of the control circuitry).	6 Calendar Years	Verify that each trip coil is able to operate the circuit breaker, interrupting device, or mitigating device.
Electromechanical lockout devices which are directly in a trip path from the protective relay to the interrupting device trip coil (regardless of any monitoring of the control circuitry).	6 Calendar Years	Verify electrical operation of electromechanical lockout devices.
Unmonitored control circuitry associated with SPS. (See Table 4-2(b) for SPS which include Automatic Reclosing.)	12 Calendar Years	Verify all paths of the control circuits essential for proper operation of the SPS.
Unmonitored control circuitry associated with protective functions inclusive of all auxiliary relays.	12 Calendar Years	Verify all paths of the trip circuits inclusive of all auxiliary relays through the trip coil(s) of the circuit breakers or other interrupting devices.
Control circuitry associated with protective functions and/or SPSs whose integrity is monitored and alarmed (See Table 2).	No periodic maintenance specified	None.

Table 2 – Alarming Paths and Monitoring In Tables 1-1 through 1-5, Table 3, and Tables 4-1 through 4-2, alarm attributes used to justify extended maximum maintenance intervals and/or reduced maintenance activities are subject to the following maintenance requirements		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any alarm path through which alarms in Tables 1-1 through 1-5, Table 3, and Tables 4-1 through 4-2 are conveyed from the alarm origin to the location where corrective action can be initiated, and not having all the attributes of the "Alarm Path with monitoring" category below. Alarms are reported within 24 hours of detection to a location where corrective action can be initiated.	12 Calendar Years	Verify that the alarm path conveys alarm signals to a location where corrective action can be initiated.
Alarm Path with monitoring: The location where corrective action is taken receives an alarm within 24 hours for failure of any portion of the alarming path from the alarm origin to the location where corrective action can be initiated.	No periodic maintenance specified	None.

Table 3 Maintenance Activities and Intervals for distributed UFLS and distributed UVLS Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any unmonitored protective relay not having all the monitoring attributes of a category below.	6 Calendar Years	Verify that settings are as specified. For non-microprocessor relays: • Test and, if necessary calibrate. For microprocessor relays: • Verify operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Verify acceptable measurement of power system input values.
Monitored microprocessor protective relay with the following: • Internal self-diagnosis and alarming (See Table 2). • Voltage and/or current waveform sampling three or more times per power cycle, and conversion of samples to numeric values for measurement calculations by microprocessor electronics. Alarming for power supply failure (See Table 2).	12 Calendar Years	Verify: • Settings are as specified. • Operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Acceptable measurement of power system input values
Monitored microprocessor protective relay with preceding row attributes and the following: • Ac measurements are continuously verified by comparison to an independent ac measurement source, with alarming for excessive error (See Table 2).	12 Calendar Years	Verify only the unmonitored relay inputs and outputs that are essential to proper functioning of the Protection System.

Table 3 Maintenance Activities and Intervals for distributed UFLS and distributed UVLS Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
• Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2). Alarming for change of settings (See Table 2).		
Voltage and/or current sensing devices associated with UFLS or UVLS systems.	12 Calendar Years	Verify that current and/or voltage signal values are provided to the protective relays.
Protection System dc supply for tripping non-BES interrupting devices used only for a UFLS or UVLS system.	12 Calendar Years	Verify Protection System dc supply voltage.
Control circuitry between the UFLS or UVLS relays and electromechanical lockout and/or tripping auxiliary devices (excludes non-BES interrupting device trip coils).	12 Calendar Years	Verify the path from the relay to the lockout and/or tripping auxiliary relay (including essential supervisory logic).
Electromechanical lockout and/or tripping auxiliary devices associated only with UFLS or UVLS systems (excludes non-BES interrupting device trip coils).	12 Calendar Years	Verify electrical operation of electromechanical lockout and/or tripping auxiliary devices.
Control circuitry between the electromechanical lockout and/or tripping auxiliary devices and the non-BES interrupting devices in UFLS or UVLS systems, or between UFLS or UVLS relays (with no interposing electromechanical lockout or auxiliary device) and the non-BES interrupting devices (excludes non-BES interrupting device trip coils).	No periodic maintenance specified	None.
Trip coils of non-BES interrupting devices in UFLS or UVLS systems.	No periodic maintenance specified	None.

Table 4-1 Maintenance Activities and Intervals for Automatic Reclosing Components Component Type – Reclosing Relay		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any unmonitored reclosing relay not having all the monitoring attributes of a category below.	6 Calendar Years	Verify that settings are as specified. For non-microprocessor relays: • Test and, if necessary calibrate For microprocessor relays: • Verify operation of the relay inputs and outputs that are essential to proper functioning of the Automatic Reclosing.
Monitored microprocessor reclosing relay with the following: • Internal self-diagnosis and alarming (See Table 2). • Alarming for power supply failure (See Table 2).	12 Calendar Years	Verify: • Settings are as specified. • Operation of the relay inputs and outputs that are essential to proper functioning of the Automatic Reclosing.

Table 4-2(a) Maintenance Activities and Intervals for Automatic Reclosing Components Component Type – Control Circuitry Associated with Reclosing Relays that are NOT an Integral Part of an SPS		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Unmonitored Control circuitry associated with Automatic Reclosing that is not an integral part of an SPS.	12 Calendar Years	Verify that Automatic Reclosing, upon initiation, does not issue a premature closing command to the close circuitry.
Control circuitry associated with Automatic Reclosing that is not part of an SPS and is monitored and alarmed for conditions that would result in a premature closing command. (See Table 2)	No periodic maintenance specified	None.

Table 4-2(b) Maintenance Activities and Intervals for Automatic Reclosing Components Component Type – Control Circuitry Associated with Reclosing Relays that ARE an Integral Part of an SPS		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Close coils or actuators of circuit breakers or similar devices that are used in conjunction with Automatic Reclosing as part of an SPS (regardless of any monitoring of the control circuitry).	6 Calendar Years	Verify that each close coil or actuator is able to operate the circuit breaker or mitigating device.
Unmonitored close control circuitry associated with Automatic Reclosing used as an integral part of an SPS.	12 Calendar Years	Verify all paths of the control circuits associated with Automatic Reclosing that are essential for proper operation of the SPS.
Control circuitry associated with Automatic Reclosing that is an integral part of an SPS whose integrity is monitored and alarmed. (See Table 2)	No periodic maintenance specified	None.

Table 5 Maintenance Activities and Intervals for Sudden Pressure Relaying		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any fault pressure relay.	6 Calendar Years	Verify the pressure or flow sensing mechanism is operable.
Control circuitry associated with Sudden Pressure Relaying from the fault pressure relay to the interrupting device trip coil(s).	12 Calendar Years	Verify all paths of the control circuits that are essential for proper operation of the Sudden Pressure Relaying.

PRC-005 — Attachment A

Criteria for a Performance-Based Protection System Maintenance Program

Purpose: To establish a technical basis for initial and continued use of a performance-based Protection System Maintenance Program (PSMP).

To establish the technical justification for the initial use of a performance-based PSMP:

1. Develop a list with a description of Components included in each designated Segment, with a minimum **Segment** population of 60 Components.
2. Maintain the Components in each Segment according to the time-based maximum allowable intervals established in Tables 1-1 through 1-5, Table 3, Tables 4-1 through 4-2, and Table 5 until results of maintenance activities for the Segment are available for a minimum of 30 individual Components of the Segment.
3. Document the maintenance program activities and results for each Segment, including maintenance dates and Countable Events for each included Component.
4. Analyze the maintenance program activities and results for each Segment to determine the overall performance of the Segment and develop maintenance intervals.
5. Determine the maximum allowable maintenance interval for each Segment such that the Segment experiences **Countable Events** on no more than 4% of the Components within the Segment, for the greater of either the last 30 Components maintained or all Components maintained in the previous year.

To maintain the technical justification for the ongoing use of a performance-based PSMP:

1. At least annually, update the list of Components and Segments and/or description if any changes occur within the Segment.
2. Perform maintenance on the greater of 5% of the Components (addressed in the performance based PSMP) in each Segment or 3 individual Components within the Segment in each year.
3. For the prior year, analyze the maintenance program activities and results for each Segment to determine the overall performance of the Segment.
4. Using the prior year's data, determine the maximum allowable maintenance interval for each Segment such that the Segment experiences Countable Events on no more than 4% of the Components within the Segment, for the greater of either the last 30 Components maintained or all Components maintained in the previous year.

If the Components in a Segment maintained through a performance-based PSMP experience 4% or more Countable Events, develop, document, and implement an action plan to reduce the Countable Events to less than 4% of the Segment population within 3 years.

Implementation Plan

Project 2014-01 Standards Applicability for Dispersed Power Producing Resources
PRC-005-X(X)

The standard numbers currently include an (X) to indicate the version numbering will be updated. Some standards are open in current projects and others are pending with governmental authorities. As a result, NERC will assign the appropriate version number prior to BOT adoption.

Standards Involved
Approval:

- PRC-005-X(X) – Protection System, Automatic Reclosing, and Sudden Pressure Relaying Maintenance

Retirement:

- PRC-005-3(X) – Protection System and Automatic Reclosing Maintenance
- PRC-005-X – Protection System, Automatic Reclosing, and Sudden Pressure Relaying Maintenance

Prerequisite Approvals:
N/A

Background:
In light of the adoption of a revised "Bulk Electric System" definition by the Board of Trustees, changes to the applicability sections of certain Reliability Standards, including PRC-005, are necessary to align with the implementation of the revised "Bulk Electric System" definition. The Standard Drafting Team (SDT) for Project 2014-01 – Standards Applicability for Dispersed Power Producing Resources has modified the applicability section of certain Generator Owner/Generator Operator requirements to recognize the unique technical and reliability aspects of dispersed generation in order to ensure the applicability of the standards is consistent with the reliable operation of the Bulk-Power System.

Reliability Standard PRC-005-X has concluded a 45-day comment and ballot period to address sudden pressure relays. The SDT has revised the applicability section of PRC-005-X to align with the revised definition of "Bulk Electric System" in the event that this version of PRC-005 is mandatory and enforceable on the effective date of the revised definition of "Bulk Electric System."

General Considerations:
PRC-005-X(X) is proposed for approval to align the applicability section of PRC-005-X with the revised definition of "Bulk Electric System." PRC-005-X may already be retired pursuant to an Implementation

Plan of a successor version of PRC-005 by the time the revised definition of "Bulk Electric System" becomes effective. If this occurs, PRC-005-X(X) will not go into effect.

Effective Date

PRC-005-X(X) shall become effective on the later of the effective date of the revised definition of Bulk Electric System or the first day following the effective date of PRC-005-X.

Retirement of Existing Standards

PRC-005-X shall be retired at midnight of the day immediately prior to the effective date of PRC-005-X(X) in the particular jurisdiction in which the revised standard is becoming effective.

Implementation Plan

PRC-005-X(X) only modifies the applicability for PRC-005-X. All aspects of the Implementation Plan for PRC-005-X will remain applicable to PRC-005-X(X) and are incorporated here by reference.

Cross References

The Implementation Plan for the revised definition of "Bulk Electric System" is available here.

The Implementation Plan for PRC-005-X is available here.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment November 20 – December 19, 2013.

Description of Current Draft

The Project 2014-01 Dispersed Power Producing Resources drafting team is posting minor applicability revisions to VAR-002-2b. The standard previously was adopted by the NERC Board of Trustees on August 16, 2012, and approved by FERC on April 16, 2013. The intent of the revisions is to clarify application of Requirements R4 and R5 to BES Bulk Electric Systems (BES) dispersed power producing resources included in the BES though Inclusion I4 of the BES definition.

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with Initial Ballot	June – July 2014
45-day Additional Formal Comment Period with Additional Ballot (if necessary)	August – September 2014
Final ballot	October 2014
BOT adoption	November 2014

DRAFT

When this standard has received ballot approval, the text boxes within the Applicability section of the Standard will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: **Generator Operation for Maintaining Network Voltage Schedules**

2. Number: VAR-002-2b(X)

3. Purpose: To ensure generators provide reactive and voltage control necessary to ensure voltage levels, reactive flows, and reactive resources are maintained within applicable Facility Ratings to protect equipment and the reliable operation of the Interconnection.

4. Applicability

4.1. Generator Operator.

4.2. Generator Owner.

5. Effective Date: The standard shall become effective on the date the standard is approved by an applicable government authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction~~In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after applicable regulatory approval or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after Board of Trustees approval~~.

The only revisions made to this version of VAR-002 are revisions to Requirements R3 and R4, to clarify applicability of the Requirements of the standard at generator Facilities. These applicability revisions are intended to clarify and provide for consistent application of the Requirements to BES generator Facilities included in the BES through Inclusion I4 – Dispersed Power Producing Resources.

The revisions to the two Requirements were made to VAR-002-2b, which is the currently enforceable version of VAR-002. VAR-002-3 is pending regulatory approval, and depending on the timing of the approval of VAR-002-3, NERC may request approval of this interim version of the standard in order to provide regulatory certainty for entities as the revised definition of BES is being implemented. This interim version is labeled VAR-002-2b(X) for balloting purposes.

B. Requirements

R1. The Generator Operator shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (automatic voltage regulator in service and controlling voltage) unless the Generator Operator has notified the Transmission Operator of one of the following: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

- That the generator is being operated in start-up[1] or shutdown[2] mode pursuant to a Real-time communication or a procedure that was previously provided to the Transmission Operator; or
- That the generator is not being operated in the automatic voltage control mode for a reason other than start-up or shutdown.

R2. Unless exempted by the Transmission Operator, each Generator Operator shall maintain the generator voltage or Reactive Power schedule[3] (within applicable Facility Ratings[4]) as directed by the Transmission Operator. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

2.1. When a generator's automatic voltage regulator is out of service, the Generator Operator shall use an alternative method to control the generator voltage and reactive output to meet the voltage or Reactive Power schedule directed by the Transmission Operator.

2.2. When directed to modify voltage, the Generator Operator shall comply or provide an explanation of why the schedule cannot be met.

R3. Each Generator Operator shall notify its associated Transmission Operator as soon as practical, but within 30 minutes of any of the following: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

3.1. A status or capability change on any generator Reactive Power resource, including the status of each automatic voltage regulator and power system stabilizer and the expected duration of the change in status or capability.

- Reporting of status or capability changes is not applicable to the individual dispersed power producing resources identified through Inclusion I4 of the Bulk Electric System definition.

3.2. A status or capability change on any other Reactive Power resources under the Generator Operator's control and the expected duration of the change in status or capability.

Rationale for R3 Exclusion:

VAR-002 addresses control and management of reactive resources and provides voltage control where it has an impact on the BES. For dispersed power producing resources as identified in Inclusion I4, Requirement R3.1 should not apply at the individual generator level due to the unique characteristics and small scale of individual dispersed power producing resources. In addition, other standards such as proposed TOP-003 require the Generator Operator to provide real time data as directed by the TOP.

[1] Start-up is deemed to have ended when the generator is ramped up to its minimum continuously sustainable load and the generator is prepared for continuous operation.

[2] Shutdown is deemed to begin when the generator is ramped down to its minimum continuously sustainable load and the generator is prepared to go offline.

[3] The voltage or Reactive Power schedule is a target value communicated by the Transmission Operator to the Generator Operator establishing a tolerance band within which the target value is to be maintained during a specified period.

[4] When a Generator is operating in manual control, reactive power capability may change based on stability considerations and this may lead to a change in the associated Facility Ratings.

R4. The Generator Owner shall provide the following to its associated Transmission Operator and Transmission Planner within 30 calendar days of a request. *[Violation Risk Factor: Lower] [Time Horizon: Real-time Operations]*

4.1. For generator step-up transformers and auxiliary transformers[5] with primary voltages equal to or greater than the generator terminal voltage:

4.1.1. Tap settings.

4.1.2. Available fixed tap ranges.

4.1.3. Impedance data.

4.1.4. The +/- voltage range with step-change in % for load-tap changing transformers.

Rationale for Footnote 5 in Requirement R4, Part 4.1:

The Transmission Operator / Transmission Provider needs to review tap settings on the main transformers that connect the generation to the high voltage system. The Transmission Operator / Transmission Provider must assure that the collector system (typically 34.5 kV) voltage coordinates with the voltage set-points and tolerance bands established by the Transmission Operator / Transmission. The portion of the collector system that aggregates 75 MVA or less of resources is excluded under I4 and the individual unit step-up transformers primarily affect the collector system, so it should also be excluded and left to the Generator Owner to design and manage based on the secondary voltages expected on the collector system.

R5. After consultation with the Transmission Operator regarding necessary step-up transformer tap changes, the Generator Owner shall ensure that transformer tap positions are changed according to the specifications provided by the Transmission Operator, unless such action would violate safety, an equipment rating, a regulatory requirement, or a statutory requirement. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

5.1. If the Generator Operator can't comply with the Transmission Operator's specifications, the Generator Operator shall notify the Transmission Operator and shall provide the technical justification.

C. Measures

M1. The Generator Operator shall have evidence to show that it notified its associated Transmission Operator any time it failed to operate a generator in the automatic voltage control mode as specified in Requirement 1. If a generator is being started up or shut down with the automatic voltage control off and no notification of the automatic voltage regulator status is made to the Transmission Operator, the Generator Operator will have evidence that it notified the Transmission Operator of its procedure for placing the unit into automatic voltage control mode. Such evidence must include, but is not limited to, dated evidence of transmittal of the procedure such as an electronic message or a transmittal letter with the procedure included or attached.

M2. The Generator Operator shall have evidence to show that it controlled its generator voltage and reactive output to meet the voltage or Reactive Power schedule provided by its associated Transmission Operator as specified in Requirement 2.

[5] For dispersed power producing resources identified through Inclusion I4 of the Bulk Electric System definition, this requirement applies only to those transformers that have at least one winding at a voltage of 100 kV or above.

M3. The Generator Operator shall have evidence to show that it responded to the Transmission Operator's direction as identified in Requirement 2.1 and Requirement 2.2.

M4. The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of any of the changes identified in Requirement 3.

M5. The Generator Owner shall have evidence it provided its associated Transmission Operator and Transmission Planner with information on its step-up transformers and auxiliary transformers as required in Requirements 4.1.1 through 4.1.4

M6. The Generator Owner shall have evidence that its step-up transformer taps were modified per the Transmission Operator's documentation as identified in Requirement 5.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

~~For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.~~

~~For functional entities that work for their Regional Entity, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority~~.

1.2. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Operator shall maintain evidence needed for Measure 1 through Measure 4 and Measure 7 for the current and previous calendar year.

The Generator Owner shall keep its latest version of documentation on its step-up and auxiliary transformers. (Measures 5 and 6)

The Compliance Monitor shall retain any audit data for three years.

1.3. Compliance Monitoring and Enforcement Processes:

The following processes may be used:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

None

DRAFT

2. Violation Severity Levels

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	N/A	N/A	N/A	The responsible entity did not operate each generator in the automatic voltage control mode and failed to notify the Transmission Operator as identified in R1.
R2.	When directed by the Transmission Operator to maintain the generator voltage or reactive power schedule the Generator Operator failed to meet the directed values for up to and including 45 minutes.	When directed by the Transmission Operator to maintain the generator voltage or reactive power schedule the Generator Operator failed to meet the directed values for more than 45 minutes up to and including 60 minutes. OR When a generator's automatic voltage regulator is out of service, the Generator Operator failed to use an alternative method to control the generator voltage and reactive output to meet the voltage or Reactive Power schedule directed by the Transmission Operator. OR The Generator Operator failed to provide an explanation of why the voltage schedule could not be met.	When directed by the Transmission Operator to maintain the generator voltage or reactive power schedule the Generator Operator failed to meet the directed values for more than 60 minutes up to and including 75 minutes.	When directed by the Transmission Operator to maintain the generator voltage or reactive power schedule the Generator Operator failed to meet the directed values for more than 75 minutes. OR When a generator's automatic voltage regulator is out of service, the Generator Operator failed to use an alternative method to control the generator voltage and reactive output to meet the voltage or Reactive Power schedule directed by the Transmission Operator and the Generator Operator failed to provide an explanation of why the voltage schedule could not be met.
R3.	N/A	N/A	The Generator Operator failed to notify the Transmission Operator within 30 minutes of the information as specified in either R3.1 or R3.2	The Generator Operator failed to notify the Transmission Operator within 30 minutes of the information as specified in both R3.1 and R3.2

DRAFT

R4.	The Responsible entity failed to provide to its associated Transmission Operator and Transmission Planner one of the types of data as specified in R4.1.1 or R 4.1.2 or 4.1.3 or 4.1.4 OR The information was provided in more than 30, but less than or equal to 35 calendar days of the request.	The Responsible entity failed to provide to its associated Transmission Operator and Transmission Planner two of the types of data as specified in R4.1.1 or R 4.1.2 or 4.1.3 or 4.1.4 OR The information was provided in more than 35, but less than or equal to 40 calendar days of the request.	The Responsible entity failed to provide to its associated Transmission Operator and Transmission Planner three of the types of data as specified in R4.1.1 or R 4.1.2 or 4.1.3 or 4.1.4 OR The information was provided in more than 40, but less than or equal to 45 calendar days of the request.	The Responsible entity failed to provide to its associated Transmission Operator and Transmission Planner any of the types of data as specified in R4.1.1 and R 4.1.2 and 4.1.3 and 4.1.4 OR The information was provided in more than 45 calendar days of the request.
R5.	N/A	N/A	N/A	The responsible entity failed to ensure that transformer tap positions were changed according to the specifications provided by the Transmission Operator when said actions would not have violated safety, an equipment rating, a regulatory requirement, or a statutory requirement.
R5.1.	N/A	N/A	N/A	The responsible entity failed to notify the Transmission Operator and to provide technical justification.

Version History

Version	Date	Action	Change Tracking
1	May 15, 2006	Added "(R2)" to the end of levels on non-compliance 2.1.2, 2.2.2, 2.3.2, and 2.4.3.	July 5, 2006
1a	December 19, 2007	Added Appendix 1 – Interpretation of R1 and R2 approved by BOT on August 1, 2007	Revised
1a	January 16, 2007	In Section A.2., Added "a" to end of standard number. Section F: added "1."; and added date.	Errata
1.1a	October 29, 2008	BOT adopted errata changes; updated version number to "1.1a"	Errata
1.1b	March 3, 2009	Added Appendix 2 – Interpretation of VAR-002-1.1a approved by BOT on February 10, 2009	Revised
2b	TBD	Revised R1 to address an Interpretation Request. Also added previously approved VRFs, Time Horizons and VSLs. Revised R2 to address consistency issue with VAR-001-2, R4.	Revised
2b	August 16, 2012	Adopted by Board of Trustees	
2b	April 16, 2013	FERC Order issued approving VAR-002-2b	
2b(X)	TBD	Interim version to clarify applicability of two Requirements to BES dispersed power producing resources. Revised in Project 2014-01.	Revised

DRAFT

Appendix 1

Interpretation of Requirements R1 and R2

Request:

Requirement R1 of Standard VAR-002-1 states that Generation Operators shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (***automatic voltage regulator in service and controlling voltage***) unless the Generator Operator has notified the Transmission Operator.

Requirement R2 goes on to state that each Generation Operator shall maintain the generator voltage ***or Reactive Power output*** as directed by the Transmission Operator.

The two underlined phrases are the reasons for this interpretation request.

Most generation excitation controls include a device known as the Automatic Voltage Regulator, or AVR. This is the device which is referred to by the R1 requirement above. Most AVR's have the option of being set in various operating modes, such as constant voltage, constant power factor, and constant Mvar.

In the course of helping members of the WECC insure that they are in full compliance with NERC Reliability Standards, I have discovered both Transmission Operators and Generation Operators who have interpreted this standard to mean that AVR operation in the constant power factor or constant Mvar modes complies with the R1 and R2 requirements cited above. Their rational is as follows:

- The AVR is clearly in service because it is operating in one of its operating modes
- The AVR is clearly controlling voltage because to maintain constant PF or constant Mvar, it controls the generator terminal voltage
- R2 clearly gives the Transmission Operator the option of directing the Generation Operator to maintain a constant reactive power output rather than a constant voltage.

Other parties have interpreted this standard to require operation in the constant voltage mode only. Their rational stems from the belief that the purpose of the VAR-002-1 standard is to insure the automatic delivery of additional reactive to the system whenever a voltage decline begins to occur.

The material impact of misinterpretation of these standards is twofold.

- First, misinterpretation may result in reduced reactive response during system disturbances, which in turn may contribute to voltage collapse.
- Second, misinterpretation may result in substantial financial penalties imposed on generation operators and transmission operators who believe that they are in full compliance with the standard.

In accordance with the NERC Reliability Standards Development Procedure, I am requesting that a formal interpretation of the VAR-002-1 standard be provided. Two specific questions need to be answered.

- First, does AVR operation in the constant PF or constant Mvar modes comply with R1?
- Second, does R2 give the Transmission Operator the option of directing the Generation Owner to operate the AVR in the constant Pf or constant Mvar modes rather than the constant voltage mode?

Interpretation:

1. First, does AVR operation in the constant PF or constant Mvar modes comply with R1?

   Interpretation: No, only operation in constant voltage mode meets this requirement. This answer is predicated on the assumption that the generator has the physical equipment that will allow such operation and that the Transmission Operator has not directed the generator to run in a mode other than constant voltage.

2. Second, does R2 give the Transmission Operator the option of directing the Generation Owner (sic) to operate the AVR in the constant Pf or constant Mvar modes rather than the constant voltage mode?

   Interpretation: Yes, if the Transmission Operator specifically directs a Generator Operator to operate the AVR in a mode other than constant voltage mode, then that directed mode of AVR operation is allowed.

DRAFT

Appendix 2

Interpretation of VAR-002-1a

Request:

VAR-002 — Generator Operation for Maintaining Network Voltage Schedules, addresses the generator's provision of voltage and VAR control. Confusion exists in the industry and regions as to which requirements in this standard apply to Generator Operators that operate generators that do not have automatic voltage regulation capability.

The Standard's requirements do not identify the subset of generator operators that need to comply – forcing some generator operators that do not have any automatic voltage regulation capability to demonstrate how they complied with the requirements, even when they aren't physically able to comply with the requirements. Generator owners want clarification to verify that they are not expected to acquire AVR devices to comply with the requirements in this standard.

Many generators do not have automatic voltage regulators and do not receive voltage schedules. These entities are at a loss as to how to comply with these requirements and are expending resources attempting to demonstrate compliance with these requirements. A clarification will avoid challenges and potential litigation stemming from sanctions and penalties applied to entities that are being audited for compliance with this standard, but who do not fall within the scope or intent of the standard itself.

Please identify which requirements apply to generators that do not operate generators equipped with AVRs.

Response: All the requirements and associated subrequirements in VAR-002-1a apply to Generator Owners and Generator Operators that own or operate generators whether equipped with an automatic voltage regulator or not. The standard is predicated on the assumption that the generator has the physical equipment (automatic voltage regulator) that is capable of automatic operation. A generator that is not equipped with an automatic voltage regulator results in a functionally equivalent condition to a generator equipped with an automatic voltage regulator that is out of service due to maintenance or failure.

There are no requirements in the standard that require a generator to have an automatic voltage regulator, nor are there any requirements for a Generator Owner to modify its generator to add an automatic voltage regulator. Unless exempted by the Transmission Operator, each Generator Operator shall maintain the generator voltage or Reactive Power output (within applicable Facility Ratings) as directed by the Transmission Operator.

DRAFT

Implementation Plan

Dispersed Generation Resources
VAR-002-2b(X)

Standards Involved

Approval:

- VAR-002-2b(X) – Generator Operation for Maintaining Network Voltage Schedules

Retirement or Supersede:

- VAR-002-2b – Generator Operation for Maintaining Network Voltage Schedules

Prerequisite Approvals:

N/A

Background

In light of the adoption of a revised "Bulk Electric System" definition by the Board of Trustees (Board), changes to the applicability sections of certain Reliability Standards, including VAR-002, are necessary to align with the implementation of the revised "Bulk Electric System" definition. The Standard Drafting Team (SDT) for Project 2014-01 – Standards Applicability for Dispersed Power Producing Resources has modified the applicability section of certain Generator Owner/Generator Operator requirements to recognize the unique technical and reliability aspects of dispersed generation in order to ensure the applicability of the standards is consistent with the reliable operation of the Bulk-Power System.

Effective Date

VAR-002-2b(X) shall become effective on the date the standard is approved by an applicable government authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter after the date the standard is adopted by the NERC Board or as otherwise provided for in that jurisdiction.

Retirement of Existing Standards:

The existing standard VAR-002-2b shall be retired at midnight of the day immediately prior to the effective date of VAR-002-2b(X).

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment November 20 – December 19~~,~~ 2013.

Description of Current Draft

The Project 2014-01 Dispersed Power Producing Resources drafting team is posting minor applicability revisions to VAR-002-3. The standard previously ~~, which~~ was adopted by the NERC Board of Trustees in May 2014 and is pending regulatory approval. The intent of the revisions is to clarify application of Requirements R4 and R5 to ~~BES~~ Bulk Electric Systems (BES) dispersed power producing resources included in the BES though Inclusion I4 of the BES definition.

45-day Formal Comment Period with Initial Ballot	June – July 2014
45-day Additional Formal Comment Period with Additional Ballot (if necessary)	August – September 2014
Final ballot	October 2014
BOT adoption	November 2014

DRAFT

Version History

Version	Date	Action	Change Tracking
1	5/1/2006	Added "(R2)" to the end of levels on non-compliance 2.1.2, 2.2.2, 2.3.2, and 2.4.3.	July 5, 2006
1a	12/19/2007	Added Appendix 1 – Interpretation of R1 and R2 approved by BOT on August 1, 2007	Revised
1a	1/16/2007	In Section A.2., Added "a" to end of standard number. Section F: added "1."; and added date.	Errata
1.1a	10/29/2008	BOT adopted errata changes; updated version number to "1.1a"	Errata
1.1b	3/3/2009	Added Appendix 2 – Interpretation of VAR-002-1.1a approved by BOT on February 10, 2009	Revised
2b	4/16/2013	Revised R1 to address an Interpretation Request. Also added previously approved VRFs, Time Horizons and VSLs. Revised R2 to address consistency issue with VAR-001-2, R4. FERC Order issued approving VAR-002-2b.	Revised
3	5/5/2014	Revised under Project 2013-04 to address outstanding Order 693 directives.	Revised
3	5/7/2014	Adopted by NERC Board of Trustees	
4	TBD	Revised under Project 2014-01 to clarify applicability of Requirements to BES dispersed power producing resources.	Revised

DRAFT

Definitions of Terms Used in the Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the NERC Glossary of Terms used in Reliability Standards (Glossary) are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None.

DRAFT

When this standard has received ballot approval, the text boxes within the Standard will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** **Generator Operation for Maintaining Network Voltage Schedules**

2. **Number:** VAR-002-4

3. **Purpose:** To ensure generators provide reactive support and voltage control, within generating Facility capabilities, in order to protect equipment and maintain reliable operation of the Interconnection.

4. **Applicability:**

   4.1. Generator Operator

   4.2. Generator Owner

5. **Effective Dates**

   The standard shall become effective on the later of the effective date of VAR-002-3, or the date the standard VAR-002-4 is approved by an applicable government authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction~~on the first day of the first calendar quarter after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, VAR-002-3 shall become effective on the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction~~.

The only revisions made to this version of VAR-002 are revisions to Requirements R4 and R5, to clarify applicability of the Requirements of the standard at generator Facilities. These applicability revisions are intended to clarify and provide for consistent application of the Requirements to BES generator Facilities included in the BES through Inclusion I4 – Dispersed Power Producing Resources.

The revisions to the two Requirements were made to VAR-002-3, which was approved by its ballot pool and adopted by the NERC Board in May 2014, VAR-002-3 is currently pending regulatory approval.

DRAFT

B. Requirements and Measures
