R1. The Generator Operator shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) in service and controlling voltage) or in a different control mode as instructed by the Transmission Operator unless: 1) the generator is exempted by the Transmission Operator, or 2) the Generator Operator has notified the Transmission Operator of one of the following: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

- That the generator is being operated in start-up,[1] shutdown,[2] or testing mode pursuant to a Real-time communication or a procedure that was previously provided to the Transmission Operator; or
- That the generator is not being operated in automatic voltage control mode or in the control mode that was instructed by the Transmission Operator for a reason other than start-up, shutdown, or testing.

M1. The Generator Operator shall have evidence to show that it notified its associated Transmission Operator any time it failed to operate a generator in the automatic voltage control mode or in a different control mode as specified in Requirement R1. If a generator is being started up or shut down with the automatic voltage control off, or is being tested, and no notification of the AVR status is made to the Transmission Operator, the Generator Operator will have evidence that it notified the Transmission Operator of its procedure for placing the unit into automatic voltage control mode as required in Requirement R1. Such evidence may include, but is not limited to, dated evidence of transmittal of the procedure such as an electronic message or a transmittal letter with the procedure included or attached. If a generator is exempted, the Generator Operator shall also have evidence that the generator is exempted from being in automatic voltage control mode (with its AVR in service and controlling voltage).

R2. Unless exempted by the Transmission Operator, each Generator Operator shall maintain the generator voltage or Reactive Power schedule[3] (within each generating Facility's capabilities[4]) provided by the Transmission Operator, or otherwise shall meet the conditions of notification for deviations from the voltage or Reactive Power schedule provided by the Transmission Operator. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

2.1. When a generator's AVR is out of service or the generator does not have an AVR, the Generator Operator shall use an alternative method to control the generator reactive

[1] Start-up is deemed to have ended when the generator is ramped up to its minimum continuously sustainable load and the generator is prepared for continuous operation.

[2] Shutdown is deemed to begin when the generator is ramped down to its minimum continuously sustainable load and the generator is prepared to go offline.

[3] The voltage or Reactive Power schedule is a target value with a tolerance band or a voltage or Reactive Power range communicated by the Transmission Operator to the Generator Operator.

[4] Generating Facility capability may be established by test or other means, and may not be sufficient at times to pull the system voltage within the schedule tolerance band. Also, when a generator is operating in manual control, reactive power capability may change based on stability considerations.

output to meet the voltage or Reactive Power schedule provided by the Transmission Operator.

2.2. When instructed to modify voltage, the Generator Operator shall comply or provide an explanation of why the schedule cannot be met.

2.3. Generator Operators that do not monitor the voltage at the location specified in their voltage schedule shall have a methodology for converting the scheduled voltage specified by the Transmission Operator to the voltage point being monitored by the Generator Operator.

M2. In order to identify when a generator is deviating from its schedule, the Generator Operator will monitor voltage based on existing equipment at its Facility. The Generator Operator shall have evidence to show that the generator maintained the voltage or Reactive Power schedule provided by the Transmission Operator, or shall have evidence of meeting the conditions of notification for deviations from the voltage or Reactive Power schedule provided by the Transmission Operator. Evidence may include, but is not limited to, operator logs, SCADA data, phone logs, and any other notifications that would alert the Transmission Operator or otherwise demonstrate that the Generator Operator complied with the Transmission Operator's instructions for addressing deviations from the voltage or Reactive Power schedule.

For Part 2.1, when a generator's AVR is out of service or the generator does not have an AVR, a Generator Operator shall have evidence to show an alternative method was used to control the generator reactive output to meet the voltage or Reactive Power schedule provided by the Transmission Operator.

For Part 2.2, the Generator Operator shall have evidence that it complied with the Transmission Operator's instructions to modify its voltage or provided an explanation to the Transmission Operator of why the Generator Operator was unable to comply with the instruction. Evidence may include, but is not limited to, operator logs, SCADA data, and phone logs.

For Part 2.3, for Generator Operators that do not monitor the voltage at the location specified on the voltage schedule, the Generator Operator shall demonstrate the methodology for converting the scheduled voltage specified by the Transmission Operator to the voltage point being monitored by the Generator Operator.

~~**R7.**~~

R3. Each Generator Operator shall notify its associated Transmission Operator of a status change on the AVR, power system stabilizer, or alternative voltage controlling device within 30 minutes of the change. If the status has been restored within 30 minutes of such change, then the Generator Operator is not required to notify the Transmission Operator of the status change *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

M3. The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of any status change identified in Requirement R3. If the status has been restored within the first 30 minutes, no notification is necessary.

R4. Each Generator Operator shall notify its associated Transmission Operator within 30 minutes of becoming aware of a change in reactive capability due to factors other than a status change described in Requirement R3. If the capability has been restored within 30 minutes of the Generator Operator becoming aware of such change, then the Generator Operator is not required to notify the Transmission Operator of the change in reactive capability. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

- Reporting of reactive capability changes is not applicable to the individual for dispersed power producing resources identified through Inclusion I4 of the Bulk Electric System definition.

Rationale for Exclusion in R4:

VAR-002 addresses control and management of reactive resources and provides voltage control where it has an impact on the BES. For dispersed power producing resources as identified in Inclusion I4, Requirement R4 should not apply at the individual generator level due to the unique characteristics and small scale of individual dispersed power producing resources. In addition, other standards such as proposed TOP-003 require the Generator Operator to provide real time data as directed by the TOP.

M4. The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of becoming aware of a change in reactive capability in accordance with Requirement R4. If the capability has been restored within the first 30 minutes, no notification is necessary.

~~R4.~~R5. Each Generator Operator shall notify its associated Transmission Operator within 30 minutes of becoming aware of a change in reactive capability due to factors other than a status change described in Requirement R3. If the capability has been restored within 30 minutes of the Generator Operator becoming aware of such change, then the Generator Operator is not required to notify the Transmission Operator of the change in reactive capability. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

~~4.1.~~5.1. For generator step-up transformers and auxiliary transformers[5] with primary

Rationale for Footnote 5 in Requirement R5, Part 5.1: The Transmission Operator / Transmission Provider needs to review tap settings on the main transformers that connect the generation to the high voltage system. The Transmission Operator / Transmission Provider must assure that the collector system (typically 34.5 kV) voltage coordinates with the voltage set-points and tolerance bands established by the Transmission Operator / Transmission. The portion of the collector system that aggregates 75 MVA or less of resources is excluded under I4 and the individual unit step-up transformers primarily affect the collector system, so it should also be excluded and left to the Generator Owner to design and manage based on the secondary voltages expected on the collector system.

[5] For dispersed power producing resources identified through Inclusion I4 of the Bulk Electric System definition, this requirement applies only to those transformers that have at least one winding at a voltage of 100 kV or above.

voltages equal to or greater than the generator terminal voltage:

~~4.1.1.~~5.1.1. Tap settings.

~~4.1.2.~~5.1.2. Available fixed tap ranges.

~~4.1.3.~~5.1.3. Impedance data.

M5. The Generator Owner shall have evidence it provided its associated Transmission Operator and Transmission Planner with information on its step-up transformers and auxiliary transformers as required in Requirement R5, Part 5.1.1 through Part 5.1.3 within 30 calendar days.

~~R5.~~R6. After consultation with the Transmission Operator regarding necessary step-up transformer tap changes, the Generator Owner shall ensure that transformer tap positions are changed according to the specifications provided by the Transmission Operator, unless such action would violate safety, an equipment rating, a regulatory requirement, or a statutory requirement. *[Violation Risk Factor: Lower] [Time Horizon: Real-time Operations]*

~~5.1.~~6.1. If the Generator Owner cannot comply with the Transmission Operator's specifications, the Generator Owner shall notify the Transmission Operator and shall provide the technical justification.

~~R8.~~R7. The Generator Owner shall have evidence that its step-up transformer taps were modified per the Transmission Operator's documentation in accordance with Requirement R6. The Generator Owner shall have evidence that it notified its associated Transmission Operator when it could not comply with the Transmission Operator's step-up transformer tap specifications in accordance with Requirement R6, Part 6.1.

DRAFT

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" refers to NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner shall keep its latest version of documentation on its step-up and auxiliary transformers. The Generator Operator shall maintain all other evidence for the current and previous calendar year.

The Compliance Monitor shall retain any audit data for three years.

1.3. Compliance Monitoring and Assessment Processes:

"Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.4. Additional Compliance Information:

None.

Guidelines and Technical Basis

For technical basis for each requirement, please review the rationale provided for each requirement.

Implementation Plan

Dispersed Generation Resources
VAR-002-4

Standards Involved
Approval:

- VAR-002-4 – Generator Operation for Maintaining Network Voltage Schedules

Retirement or Supersede:

- VAR-002-3 – Generator Operation for Maintaining Network Voltage Schedules

Prerequisite Approvals:
N/A

Background:
In light of the adoption of a revised "Bulk Electric System" definition by the Board of Trustees (Board), changes to the applicability sections of certain Reliability Standards, including VAR-002, are necessary to align with the implementation of the revised "Bulk Electric System" definition. The Standard Drafting Team (SDT) for Project 2014-01 – Standards Applicability for Dispersed Power Producing Resources has modified the applicability section of certain Generator Owner/Generator Operator requirements to recognize the unique technical and reliability aspects of dispersed generation in order to ensure the applicability of the standards is consistent with the reliable operation of the Bulk-Power System.

Effective Date
VAR-002-4 shall become effective on the later of the effective date of VAR-002-3, or the date the VAR-002-4 is approved by an applicable government authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter after the date the standard is adopted by the NERC Board or as otherwise provided for in that jurisdiction.

Retirement of Existing Standards:
Proposed VAR-002-3, shall be retired at midnight of the day immediately prior to the effective date of VAR-002-4.

Standards Committee Project Management Oversight Subcommittee (PMOS) Update

Action

None requested. Update Only.

Background

The PMOS met in person on June 10, 2014. A verbal update of the items discussed will be provided at the SC meeting.

Agenda Item 9b
Standards Committee
June 10-11, 2014

Standards Committee Process Subcommittee Update

Action

Information only

Background

The Standards Committee Process Subcommittee (SCPS) continues to work on several projects. Detailed scope documents for the Consensus Building and SAR Development initiative and the Review of Standards Processes and Procedures task will be presented for endorsement. A report has been prepared as part of the Ballot Pool Management initiative. The SCPS and NERC Standards Information staff will present a resource package containing the active Standards resource documents on a common template to accompany the Drafting Team Guidelines at the July Standards Committee call. The SCPS also continues to work on the Cost Effective Analysis Process with NERC staff.

Addressing Failure to Achieve Quorum in Balloting Standards

Action

Informational update only

Background

Development or modification of a Reliability Standard requires industry balloting of the new Standard or modification. Per the current Standards Process Manual ballot pool approval requires a quorum, which is established by at least 75% of the members of a ballot pool submitting a response in addition to a two-thirds majority of the weighted Segments votes being affirmative. Several ballots have recently experienced failure to achieve the required quorum by the end of the specified voting window, necessitating extension of the voting window. In light of the recent challenges in reaching quorum at the end of the announced voting window, the Standards Committee Process Subcommittee (SCPS) and NERC staff have been "exploring options to create and maintain an effective ballot pool and strategies to address situations where a quorum is not reached by the time a ballot period is scheduled to close." November 2013 SC Agenda item 13 (a) iii. This effort has coincided with development and implementation of the new Standards Balloting System (SBS). This update contains steps taken to date to facilitate reaching quorum in a timely manner, actions being taken on ballots using the original (current) balloting system, enhancements and features of the new Standards Balloting System that are anticipated to improve the reaching quorum, and future plans for analysis and action.

Steps Taken to Date

NERC Standards Information staff has taken the following actions in 2012 and 2013 to address identified challenges to gaining quorum for ballots.

1. The Registered Ballot Body (RBB) was reviewed for members with no activity on their voting records for one year or longer. Members were sent a letter, emailed and/or called. Non-responsive members were removed from the RBB. 41 members were contacted, with seven RBB members removed and nine proxy pool members removed. This review will be performed annually.
2. Segment 8 of the RBB (Small Electricity Users) was reviewed to ensure members were accurately registered.
3. A review of the RBB's Segment representation, as directed in the Appendix 3D Registered Ballot Body Criteria of the NERC Rules of Procedure was performed. Based on the registration responses, the RBB was reviewed and updated.
4. Members of ballot pools who are no longer able to vote due to company mergers were removed from ballot pools and from the RBB.
5. A comparison between RBB and ballot pools to remove members in older ballot pools that are no longer voting members was initiated.

Actions Currently Being Taken

Several actions are being taken with the current ballot pools to encourage reaching a quorum before the voting window closes. Some of these are interim measures necessary at least until projects are transitioned to the new SBS, at which time longer term management can be evaluated.

1. The cleanup of ballot pools mentioned above is continuing prior to the ballot start date. This includes consideration of the effects of company mergers and the comparison of ballot pool membership to the RBB.
2. A contractor has been working with Standards Information staff to perform queries on ballot pools from September 2013 to March 2014 for further analysis. A preliminary query was performed on Segment 10 (Regional Entities) and is being used to refine the specifications for future queries. NERC is developing the capability to perform the queries and will be using the results along with the SCPS members to inform future strategies.
3. Analysis of ballot pools that have been extended is being performed by NERC Standards Information staff. A table containing the balloted projects in 2014 is included.
4. NERC Standards Information staff is communicating to industry voters the importance of abstaining when ballot pools are joined and they do not intend to vote in a particular ballot. These communications included a "Balloting 101" email and reminders at the Standards and Compliance Workshop.
5. An annual review of the RBB's Segment representation will be performed.
6. Reminders are being sent to individuals who have not voted and/or others in their company near the end of a voting window if quorum has not been achieved. Standards Committee leadership has also been assisting with contacting ballot pool members and the Trades to encourage voting.

Potential Improvements in new Software Balloting System (SBS)

Certain enhancements and features that have been built into the new SBS are anticipated to generate improvement in reaching quorum, both during initialization of the system and on an ongoing basis. Examples include:

1. New registration will be required for accessing voting in the new system, improving the cleanup of the RBB.
2. Proxies can be designated until the close of the ballot voting window making voting more accessible. Currently proxy designation can only be accomplished during ballot pool formation.
3. The "My Ballot Activity" section provides a single page view to join, vote and designate proxies, making managing voting activities easier.
4. The Replacement Voter feature allows a voter representing a segment to exit the RBB and be replaced by a new voter who can assume voting activities in the ballot pools.

Future Plans for Analysis and Action

The SCPS and NERC Standards Information staff will monitor the results of both the management strategies being implemented and the enhancements contained in the new SBS. NERC Standards Information staff will also continue the analysis already initiated into the causes of difficulties in achieving quorum in ballot pools. Based on the information gathered, the SCPS and NERC Standards Information staff will evaluate whether additional measures are necessary. An initial list of strategies for consideration has been developed to serve as a starting point if the problem persists. This list is for consideration only and has not been evaluated for practicality or effectiveness.

Suggestions/Ideas

Consider changes to proxy process – allow for multiple proxies, associate proxies with RBB Registered Entity rather than each individual standard.

Ballot pool (or ballot body) members who demonstrate poor voting performance should be replaced if they miss a defined number of votes.

Put an expiration date on a ballot pool – if the pool expires it will have to be "reinitialized", or ballot pool members could be asked to confirm their intent to remain in the pool.

Look at lowering the quorum % to address lack of quorum due to "poor performance".

Allow multiple individuals from a Registered Entity to join the RBB according to their specialty and then only allow one to join the ballot pool (for example an operations person or a CIP person).

Draft agreement for RBB Members defining responsibilities.

Have voters voluntarily notify NERC when they join the ballot pool that in the event they fail to vote by the voting deadline that their vote should be recorded as an abstention.

Analysis of Issues Achieving a Quorum (Jan 1-May 22, 2014)

Project Name and Number	Standard	Ballot Type	Ballot Start Date	Ballot End Date	# of Days Extended
Project 2007-02 - Operating Personnel Communications Protocols	COM-002-4	Additional Ballot	01/22/14	02/04/14	2
Project 2008-12 - Coordinate Interchange Standards	Definitions	Additional Ballot	01/16/14	01/29/14	2
Project 2008-12 - Coordinate Interchange Standards	INT-004-3 and INT-010-2	Additional Ballot	01/10/14	01/22/14	0
Project 2010-01 - Training	PER-005-2	Additional Ballot	01/08/14	01/21/14	1
Project 2010-02 - Connecting Facilities to the Grid	FAC-001-2 and FAC-002-2	Initial Ballot	05/06/14	05/16/14	1
Project 2010-03 - Modeling Data (MOD B)	MOD-033-1	Additional Ballot	01/10/14	01/22/14	1

Project 2013-04 - Voltage and Reactive Control	VAR-002-3	Additional Ballot	04/04/14	04/16/14	2
Project 2014-04 - Physical Security	CIP-014-1	Initial Ballot	04/20/14	04/24/14	0

Agenda Item 9b ii
Standards Committee
June 10-11, 2014

Consensus Building and SAR Development

Action

Discuss and endorse the attached proposed scope for the development of a holistic process on consensus building and SAR development associated with proposed standard development projects.

Background

In early 2013, the Standards Committee Process Subcommittee (SCPS) proposed a concept and drafted a process document to improve SAR development with a focus on obtaining sufficient technical information to support SAR posting. The Standards Committee supported the concept, and directed the SCSP to provide further details on the proposed process. By September 2013, the SCPS developed a final draft process document but decided to withhold presenting it to the SC for approval pending the completion of a parallel effort to develop the concept and process to improve consensus building for standard projects through informal outreach.

At the December 2013 meeting, the SC adopted a preferred option (Option C) to enhance consensus building. In view of the interrelationship between consensus building and SAR development, the SC, SCPS and PMOS leadership proposed that a combined task be undertaken to develop a holistic process that will improve the effectiveness and efficiency of consensus building for standard projects starting at or before the initial project proposal stage and continuing to the acceptance/approval of the SAR by the Standards Committee. The SCPS volunteered to take the lead for this task.

The attached scope document on consensus building and SAR development has been reviewed and commented by the SC leadership, the SCPS and PMOS, and NERC staff. The SCPS is seeking the SC's approval of the proposed scope document, and to add this task to the SCPS work plan.

Date: May 22, 2014

Scope of NERC SCPS Project
Consensus Building for Standard Authorization Request (SAR) Development

Need for Project:

To develop a process which will facilitate the effective and efficient development of technical information and building of industry consensus leading to the Standards Committee's acceptance/approval of the SAR for proposed standard projects.

Project Scope Statement:

The objective of this task is to develop a new or revised process which will improve the effectiveness and efficiency of consensus building tasks for standard projects starting at or before the initial project proposal stage and continuing to the acceptance/approval of the SAR by the Standards Committee.

A standard project can be initiated by any one of the following means:

a. Recommendation by the Reliability Issues Steering Committee (RISC) to address an emerging reliability risk/issue;

b. Compliance with, or a response to, directives by regulatory authorities or the NERC Board of Trustees;

c. A review/revision or need identified in the Standards Committee's Reliability Standards Development Plan (RSDP);

d. A request by industry participants through the submission of a SAR;

e. Input by a stakeholder into the Single Portal for a potential reliability related issue.

This project will require a comprehensive review of the existing SAR and Informal development processes and proposing changes- , where appropriate, to improve effectiveness and efficiency in consensus building activities leading to the posting and acceptance/approval of the SAR. The project also will have to be fully coordinated with the RISC, PMOS and other SC activities and SCPS projects. The project is to be conducted in 2 stages.

<u>Stage 1</u> (March 2014 to September 2014)

Develop a revised process that covers the following key activities:

- Collection of technical information needed to support the proposal for a standard project;
- Informal outreach and consensus building on the need and scope of the project;
- Drafting/revising the SAR to achieve clarity with sufficient technical information that supports the proposed purpose and scope of project;

- Posting of SAR and responding to public comments, and revising SAR to address industry comments;
- Consider conducting a Cost Impact Analysis (CIA) as outlined in the NERC Cost Effective Analysis Process Phase 1 to determine potential cost impacts of potential proposed solutions;
- Recommending acceptance/approval/rejection of the SAR to the SC with due consideration given to industry input.

The role of the RISC throughout these activities should be considered and clearly stated as appropriate.

Stage 2 (Latter Part of 2014 to Early 2015)

Revise the Standard Processes Manual to incorporate pertinent elements of the revised process.

Resources:
A small team comprising of 4-5 SCPS members, 1-2 PMOS members and 1-2 NERC Standards and NERC Legal staff.

Stage 1 is expected to start in March 2014 ending September 2014; Stage 2 is expected to start in the latter part of 2014 in conjunction with other SPM changes following the completion of another SCPS task to improve the effectiveness and efficiency of standards development, including balloting.

Standards Committee Strategic Work Plan 2013-2015, Task No. 2: Review of the Standards Processes and Procedures

Action
Endorse.

Background
Task No. 2: Review of the Standards Processes and Procedures:
Implement revisions needed to NERC's Rules of Procedure/SPM and SC processes and procedures to enhance SC and SDT accountability to timely deliver high quality Reliability Standards and execute the Strategic Plan, including the completion of Standards Process Input Group (SPIG) recommendations. All revisions, creation or elimination of processes and procedures provisions shall be presented to the SC for adoption, prior to presenting to the NERC Board of Trustees (BOT) for approval.

Steps Taken to Date:
Two questionnaires were sent seeking feedback in the early part of 2013. The first questionnaire was sent to standards drafting teams to determine areas for improvement in the standard development process. Although a few suggestions were made regarding legal representation on the standard drafting teams, there were no substantive improvements identified for process improvement.

A second questionnaire was sent to a broader audience which focused on asking for a "single biggest issue" with all aspects of the standard development process. This also concluded with no centralized issue to be identified.

Future Plans for Action:
The Task #2 Team noted a limited number of NERC Projects that have been through the revision of the current Standard Process Manual; those that were completed under the new manual were either informal development or were expedited due to FERC directives (MODs, VARs, PER-005, GMD, and CIP-014). The task team felt that evaluating additional projects which undergo formal development with the current Process Manual would allow a more comprehensive review. Additionally, it was noted that polling industry at this time would be deemed problematic due to the number of Project postings.

The recommendation of the task group was unanimous; "keep the scoping document but postpone any actions". The group noted that an outreach plan other than a survey should be considered. The task team also makes the following suggestions: 1) standing committees be solicited for outreach options, and 2) include outreach for this task as an agenda topic during compliance workshops.

A proposed starting time for Task #2 is second quarter of 2015.

Agenda Item 10
Standards Committee
June 10-11, 2014

Standards Committee Communications Updates and Activities

Action
Information only.

Background
Mallory Huggins of NERC Staff and Scott Miller will provide an update on NERC and Standards Committee communication activities in the last month.

Project 2013-03 Geomagnetic Disturbance Mitigation

Action

Authorize posting draft TPL-007-1 – Transmission System Planned Performance for Geomagnetic Disturbance (GMD) Events, Violation Risk Factors/Violation Severity Levels, and associated implementation plan for 45-day comment and initial ballot (and a non-binding poll for VRFs and VSLs), with ballot pool formation during the first 30 days and initial ballot and non-binding poll during the last 10 days of the 45-day period.

Background

On May 16, 2013, FERC issued Order No. 779 directing NERC to develop Reliability Standards addressing the potential impact of GMDs in two stages:

- Stage 1 Standard requiring applicable entities to implement Operating Procedures. EOP-010-1 – GMD Operations was adopted by the Board of Trustees and filed at FERC in November 2013.
- Stage 2 Standard(s) requiring applicable entities to conduct assessments of the impacts of benchmark GMD events on their systems and requiring the development and implementation of a plan to mitigate the risk of instability, uncontrolled separation, or cascading, if impacts are identified. FERC established a filing deadline of January 21, 2015 for Stage 2.

The Standard Drafting Team (SDT) developed proposed standard TPL-007-1, the Benchmark GMD Event Description white paper, and the Transformer Thermal Impact Assessment white paper to meet the stage 2 directives. The proposed standard is applicable to Planning Coordinators, Transmission Planners, Transmission Owners, and Generator Owners with areas or transformers connected at 200 kV or higher. It includes requirements for planning entities to assess GMD impacts from a 1-in-100 year benchmark GMD event and develop mitigation plans to address identified issues. The standard also includes requirements for owners to assess the thermal impact of a benchmark event on applicable transformers.

The benchmark GMD event was developed through statistical analysis and can be tailored to the specific location of the system being studied as described in the white paper.

After obtaining initial feedback from the GMD Task Force (GMDTF) during the GMDTF meeting in February 2014, drafts were posted for informal comment from April 22 – May 21, 2014. During the informal comment period, the SDT conducted a webinar, technical conference, and participated in several calls with various stakeholder groups.

The draft standard includes revisions to address concerns raised by stakeholders, including clarifying responsibilities within the standard as well as clarifying the sequence of required performance to address interdependent Requirements. On June 2, 2014, NERC staff from Standards, Legal, and Compliance conducted a quality review (QR) of the draft standard and Implementation Plan. Following the QR, the SDT made numerous revisions responsive to the QR feedback.

Given the newness of tools and analysis capabilities for assessing GMD impacts and the timeframe in which NERC has been provided to develop the Stage 2 GMD Standard, the SDT has a proactive communication plan underway to inform and educate stakeholders. This plan

includes additional webinars, a technical conference during the comment period, and communication with NERC, region, and trade group committees.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. The Standards Committee accepted the Standard Authorization Request (SAR) submitted by the Geomagnetic Disturbance Task Force (GMD TF) and approved Project 2013-03 (Geomagnetic Disturbance Mitigation) on June 5, 2013.
2. The SAR was posted for informal comment from June 26, 2013 through August 12, 2013.

Description of Current Draft

This is the first draft of the proposed Reliability Standard. It is posted for 45-day comment and initial ballot.

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with Initial Ballot	June 2014
45-day Formal Comment Period with Additional Ballot	August 2014
Final ballot	October 2014
BOT adoption	November 2014

Effective Dates

The definition shall become effective on the first day of the first calendar quarter after the date that this standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the definition shall become effective on the first day of the first calendar quarter after the date this standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

The Requirements shall become effective as described in the Implementation Plan beginning on the first day of the first calendar quarter that is 12 months after the date that this standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the Requirements shall become effective as described in the Implementation Plan beginning on the first day of the first calendar quarter that is 12 months after the date this standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Compliance shall be implemented over a 4-year period as described in the Implementation Plan.

Version History

Version	Date	Action	Change Tracking
1	TBD	Project 2013-03 (Phase 2)	N/A

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Geomagnetic Disturbance Vulnerability Assessment or GMD Vulnerability Assessment: Documented evaluation of potential susceptibility to voltage collapse, Cascading, or localized damage of equipment due to geomagnetic disturbances.

A. Introduction

1. **Title: Transmission System Planned Performance for Geomagnetic Disturbance Events**

2. **Number:** TPL-007-1

3. **Purpose:** Establish requirements for Transmission system planned performance during geomagnetic disturbance (GMD) events.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Planning Coordinator with a planning area that includes a Facility or Facilities specified in 4.2;
   4.1.2 Transmission Planner with a planning area that includes a Facility or Facilities specified in 4.2;
   4.1.3 Transmission Owner who owns a Facility or Facilities specified in 4.2;
   4.1.4 Generator Owner who owns a Facility or Facilities specified in 4.2.

   4.2. Facilities:

   4.2.1 Facilities that include power transformer(s) with high side, wye-grounded winding with terminal voltage greater than 200 kV.

Rationale: Instrumentation transformers and station service transformers do not have significant impact on GIC flows; therefore, they are not included in the applicability for this standard.

5. **Background:**

During a GMD event, geomagnetically-induced currents (GIC) may cause transformer hot-spot heating or damage, loss of Reactive Power sources, increased Reactive Power demand, and Misoperation, the combination of which may result in voltage collapse and blackout.

B. Requirements and Measures

R1. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall identify the individual and joint responsibilities of the Planning Coordinator and each of the Transmission Planners in the Planning Coordinator's planning area for maintaining models and performing the studies needed to complete GMD Vulnerability Assessment(s). *[Violation Risk Factor: Low] [Time Horizon: Long-term Planning]*

M1. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide documentation on roles and responsibilities, such as meeting minutes,

agreements, and email correspondence that identifies that agreement has been reached on individual and joint responsibilities for maintaining models and performing the studies needed to complete GMD Vulnerability Assessment(s) in accordance with Requirement R1.

R2. Responsible entities, as determined in Requirement R1, shall maintain System models and geomagnetically-induced current (GIC) System models of the responsible entity's planning area for performing the studies needed to complete GMD Vulnerability Assessment(s). *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M2. A responsible entity, as determined in Requirement R1, shall have evidence in either electronic or hard copy format that it is maintaining System models and GIC System models of the responsible entity's planning area for performing the studies needed to complete GMD Vulnerability Assessment(s).

Rationale for Requirement R2:

A GMD Vulnerability Assessment requires a GIC System model to calculate GIC flow which is used to determine transformer Reactive Power absorption and transformer thermal response. Guidance for developing the GIC System model are provided in the GIC Application Guide developed by the NERC GMD Task Force and available at: http://www.nerc.com/comm/PC/Geomagnetic%20Disturbance%20Task%20Force%20GMDTF%202013/GIC%20Application%20Guide%202013_approved.pdf

The System model specified in Requirement R2 is used in conducting steady state power flow analysis that accounts for the Reactive Power absorption of transformers due to GIC in the System.

The projected System condition for GMD planning may include adjustments to the System that are executable in response to space weather information. These adjustments could include recalling or postponing maintenance outages, for example.

R3. Responsible entities, as determined in Requirement R1, shall complete a GMD Vulnerability Assessment of the Near-Term Transmission Planning Horizon once every 60 calendar months. This GMD Vulnerability Assessment shall use studies based on models identified in Requirement R2, document assumptions, and document summarized results of the steady state analysis. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

3.1. Studies shall include the following conditions:

3.1.1. System peak Load for at least one year within the Near-Term Transmission Planning Horizon; and

3.1.2. System Off-Peak Load for at least one year within the Near-Term Transmission Planning Horizon.

3.2. Studies shall be conducted based on the benchmark GMD event described in Attachment 1 to determine whether the system meets the performance requirements in Table 1.

3.3. The GMD Vulnerability Assessment shall be provided within 90 days of completion to the responsible entity's Reliability Coordinator, adjacent Planning Coordinators, adjacent Transmission Planners, and to any functional entity that submits a written request and has a reliability related need.

3.3.1 If a recipient of the GMD Vulnerability Assessment provides documented comments on the results, the responsible entity shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.

M3. A responsible entity, as determined in Requirement R1, shall have dated evidence such as electronic or hard copies of its GMD Vulnerability Assessment that meet all of the requirements in Requirement R3. A Responsible entity, as determined in Requirement R1, shall also provide evidence, such as email records, web postings with an electronic notice of posting, or postal receipts showing recipient and date that it has distributed its GMD Vulnerability Assessment within 90 calendar days of completion to its Reliability Coordinator, adjacent Planning Coordinators, adjacent Transmission Planners, and to any functional entity who has submitted a written request indicating a reliability related need as specified in Requirement R3. A responsible entities, as determined in Requirement R1, shall also provide evidence, such as email notices or postal receipts showing recipient and date that it has provided a documented response to comments received on its GMD Vulnerability Assessment within 90 calendar days of receipt of those comments in accordance with Requirement R3.

Rationale for Requirement R3:

The GMD Vulnerability Assessment includes steady state power flow analysis and supporting studies using the models specified in Requirement R2 that account for the effects of GIC. Performance criteria are specified in Table 1.

System peak Load and Off-peak Load must be examined in the analysis.

Distribution of GMD Vulnerability Assessment results provides a means for sharing relevant information with other entities responsible for planning reliability. Results of GIC studies may affect neighboring systems and should be taken into account by planners.

The GMD Planning Guide developed by the NERC GMD Task Force provides technical information on GMD-specific considerations for planning studies. It is available at:

http://www.nerc.com/comm/PC/Geomagnetic%20Disturbance%20Task%20Force%20GMDTF%202013/GMD%20Planning%20Guide_approved.pdf

R4. Responsible entities, as determined in Requirement R1, shall have criteria for acceptable System steady state voltage limits for its System during the benchmark GMD event described in Attachment 1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M4. A responsible entity, as determined in Requirement R1, shall have evidence such as electronic or hard copies of the criteria for acceptable System steady state voltage limits for its System in accordance with Requirement R4.

Rationale for Requirement R4:

System steady state voltage limits for GMD Vulnerability Assessment may by different from the limits used in the TPL-001 Planning Assessment. The planner must adhere to established limits that ensure the planned System achieves the performance requirements in Table 1.

R5. Responsible entities, as determined in Requirement R1, shall provide geomagnetically-induced current (GIC) flow information to be used for the transformer thermal impact assessment specified in Requirement R6 to each Transmission Owner and Generator Owner in the planning area that owns an applicable power transformer. The GIC flow information shall include for each applicable power transformer: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

5.1 Maximum effective GIC value for the worst case geoelectric field orientation for the benchmark GMD event described in Attachment 1; and

5.2 Effective GIC time series, GIC(t), calculated using the benchmark GMD event described in Attachment 1 for each applicable power transformer where the Maximum effective GIC value for the worst case geoelectric field orientation exceeds 15 Amperes per phase.

M5. A Responsible entity, as determined in Requirement R1, shall provide evidence, such as email records, web postings with an electronic notice of posting, or postal receipts showing recipient and date that it has provided GIC flow information to each Transmission Owner and Generator Owner that owns an applicable power transformer as specified in Requirement R5.

Rationale for Requirement R5:

This GIC information is necessary for determining the thermal impact of GIC on transformers in the planning area and must be provided to entities responsible for performing the thermal impact assessment so that they can accurately perform the assessment.

The GIC flows provided in part 5.1 are used to screen the transformer fleet such that only those transformers that experience an effective GIC flow of 15A or greater are evaluated.

The GIC flows provided by part 5.2 and 5.3 are used to convert the steady-state GIC flows to time-series GIC data used for transformer thermal impact assessment. Additional guidance is available in the Thermal Impact Assessment white paper:

http://www.nerc.com/pa/Stand/Pages/Project-2013-03-Geomagnetic-Disturbance-Mitigation.aspx

R6. Each Transmission Owner and Generator Owner shall conduct a thermal impact assessment for each of its solely and jointly owned applicable power transformers where

the maximum effective geomagnetically-induced current (GIC) value provided in Requirement R5 part 5.1 is 15 Amperes or greater per phase. The thermal impact assessment shall: *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

6.1. Be based on the effective GIC flow information provided in Requirement R5;
6.2. Document assumptions used in the analysis;
6.3. Describe suggested actions and supporting analysis to mitigate the impact of GICs, if any; and
6.4. Be performed and provided to the responsible entities, as determined in Requirement R1, within 12 calendar months of receiving GIC flow information specified in Requirement R5.

M6. Each Transmission Owner and Generator Owner shall have evidence such as electronic or hard copies of thermal impact assessment for all of its applicable solely and jointly owned power transformers where maximum effective GIC value provided in Requirement R5 part 5.1 is 15 Amperes or greater per phase as specified in Requirement R6.

Rationale for Requirement R6:

The thermal impact assessment may be based on manufacturer-provided GIC capability curves, thermal response simulation, or other technically justified means. A process for conducting the assessment is presented in the Transformer Thermal Impact Assessment white paper posted on the project page.

http://www.nerc.com/pa/Stand/Pages/Project-2013-03-Geomagnetic-Disturbance-Mitigation.aspx

R7. Responsible entities, as determined in Requirement R1, that conclude through the GMD Vulnerability Assessment conducted in Requirement R3 that their System does not meet the performance requirements of Table 1 shall develop a Corrective Action Plan addressing how the performance requirements will be met. The Corrective Action Plan shall: *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

7.1. List System deficiencies and the associated actions needed to achieve required System performance. Examples of such actions include:

- Installation, modification, retirement, or removal of Transmission and generation Facilities and any associated equipment.
- Installation, modification, or removal of Protection Systems or Special Protection Systems.
- Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan.
- Use of Demand-Side Management, new technologies, or other initiatives.

7.2. Be reviewed in subsequent GMD Vulnerability Assessments until it is determined that the System meets the performance requirements contained in Table 1; and

7.3. Be provided within 90 days of completion to the responsible entity's Reliability Coordinator, adjacent Planning Coordinators, adjacent Transmission Planners,

and to any functional entity that submits a written request and has a reliability related need.

7.3.1. If a recipient of the Corrective Action Plan provides documented comments on the results, the responsible entity shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.

M7. A Responsible entity, as determined in Requirement R1, that concludes through the GMD Vulnerability Assessment conducted in Requirement R3 that the responsible entity's System does not meet the performance requirements of Table 1 shall have evidence, such as electronic or hard copies of its Corrective Action Plan as specified in Requirement R7. A responsible entity, as determined in Requirement R1, shall also provide evidence, such as email records, web postings with an electronic notice of posting, or postal receipts showing recipient and date that it has distributed any developed Corrective Action Plan within 90 calendar days of its completion to its Reliability Coordinator, adjacent Planning Coordinators, adjacent Transmission Planners, and to any functional entity who has indicated a reliability related need as specified in Requirement R7. A responsible entity, as determined in Requirement R1, shall also provide evidence, such as email notices or postal receipts showing recipient and date that it has provided a documented response to comments received on its Corrective Action Plan within 90 calendar days of receipt of those comments in accordance with Requirement R7.

Table 1 –Steady State Planning Events

Steady State:

a. The System shall remain stable. Cascading and uncontrolled islanding shall not occur.

b. Load loss as well as generation loss is acceptable as a consequence of the planning event.

c. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.

d. System steady state voltages shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner in accordance with Requirement R4.

Category	Initial Condition	Event	Interruption of Firm Transmission Service Allowed	Load Loss Allowed
GMD GMD Event with Outages	1. System as may be postured in response to space weather information[1], and then 2. GMD event[2]	Reactive Power compensation devices and other Transmission Facilities removed as a result of Protection System operation during the GMD event[3]	Yes[4]	Yes[4]

Table 1 – Steady State Performance Footnotes

1. The System condition for GMD planning may include adjustments to posture the System that are executable in response to space weather information.
2. The GMD conditions for the planning event are described in Attachment 1 (Benchmark GMD Event).
3. Protection Systems may trip due to the effects of harmonics. GMD planning analysis shall consider removal of equipment that the planner determines may be susceptible.
4. The objective of the GMD Vulnerability Assessment is to prevent instability, uncontrolled separation, Cascading and uncontrolled islanding of the System during a GMD event. Load loss and/or curtailment of Firm Transmission Service may be needed to meet BES performance requirements during studied GMD conditions but should not be used as the primary method of achieving required performance. GMD Operating Procedures should be based on predetermined triggers from studied GMD conditions so that the likelihood and magnitude of Load loss or curtailment of Firm Transmission Service is minimized during a GMD event.

Attachment 1

Calculating Geoelectric Fields for the Benchmark GMD Event

The benchmark GMD event[1] defines the geoelectric field values used to compute geomagnetically-induced current (GIC) flows that are needed to conduct a GMD Vulnerability Assessment. It is composed of the following elements: (1) a reference peak geoelectric field amplitude of 8 V/km derived from statistical analysis of historical magnetometer data; (2) scaling factors to account for local geomagnetic latitude; (3) scaling factors to account for local earth conductivity; and (4) a reference geomagnetic field time series or waveshape to facilitate time-domain analysis of GMD impact on equipment.

The regional geoelectric field peak amplitude to be used in GMD Vulnerability Assessment, E_{peak}, can be obtained from the reference geoelectric field value of 8 V/km using the following relationship

$$E_{peak} = 8 \times \alpha \times \beta \text{ (V/km)}$$

where α is the scaling factor to account for local geomagnetic latitude, and β is a scaling factor to account for the local earth conductivity structure.

Scaling the Geomagnetic Field

The benchmark GMD event is defined for geomagnetic latitude of 60° and it must be scaled to account for regional differences based on geomagnetic latitude. Table 2 provides a scaling factor correlating peak geoelectric field to geomagnetic latitude. Alternatively, the scaling factor α can be computed with the empirical expression

$$\alpha = 0.001 \cdot e^{(0.115 \cdot L)}$$

where L is the geomagnetic latitude in degrees and $0.1 \leq \alpha \leq 1$

For large planning areas that cover more than one scaling factor from Table 2, the most conservative (largest) value for α should be used in scaling the geomagnetic field. Alternatively, a planner could use a tool that is capable of performing analysis using a non-uniform or piecewise uniform geomagnetic field.

[1] The benchmark GMD event description is available on the Project 2013-03 Geomagnetic Disturbance Mitigation project page:http://www.nerc.com/pa/Stand/Pages/Project-2013-03-Geomagnetic-Disturbance-Mitigation.aspx

≥ 60	1.0

Scaling the Geoelectric Field

The benchmark GMD event is defined for the reference Quebec earth model described in Table 4. The peak geoelectric field, E_{peak}, to be used in a GMD Vulnerability Assessment may be obtained by either

- Calculating the geoelectric field for the ground conductivity in the planning area and the reference geomagnetic field time series scaled according to geomagnetic latitude, using a procedure such as the plane wave method described in the NERC GMD Task Force GIC Application Guide[2]; or
- Using the earth conductivity scaling factor β from Table 3 that correlates to the ground conductivity map in Figure 1 or Figure 2. Along with the scaling factor α, β is applied to the reference geolectric field using the following equation to obtain the regional geoelectric field peak amplitude E_{peak} to be used in GMD Vulnerability Assessment. When a ground conductivity model is not available the planning entity should use a β factor of 1 or a technically-justified value.

$$E_{peak} = 8 \times \alpha \times \beta \text{ (V/km)}$$

The earth models used to calculate Table 3 for the United States were obtained from publicly available magnetotelluric data that is published on the U. S. Geological Survey website[3]. The models used to calculate Table 3 for Canada were obtained from Natural Resources Canada (NRCan) and reflect the average structure for large regions. NRCan also has developed some models for sub-regions which should be used when available. Because all models in Table 3 are approximations, a planner can substitute a technically justified earth model for its planning area when available.

[2] Available at the NERC GMD Task Force project page: http://www.nerc.com/comm/PC/Pages/Geomagnetic-Disturbance-Task-Force-(GMDTF)-2013.aspx

[3] Available at http://geomag.usgs.gov/conductivity/

For large planning areas that cover more than one scaling factor from Table 3, the most conservative (largest) value for β should be used in scaling the geoelectric field. Alternatively, a planner could use a tool that is capable of performing analysis using a non-uniform or piecewise uniform geoelectric field.

Reference Geomagnetic Field Time Series or Waveshape[5]

The geomagnetic field measurement record of the March 13-14 1989 GMD event, measured at NRCan's Ottawa geomagnetic observatory is the basis for the reference geomagnetic field waveshape to be used to calculate the GIC time series, GIC(t), required for transformer thermal impact assessment.

The geomagnetic latitude of the Ottawa geomagnetic observatory is 55°; therefore, the amplitude of the geomagnetic field measurement data were scaled up to the 60° reference geomagnetic latitude (see Figure 3) such that the resulting peak geoelectric field amplitude computed using the reference earth model was 8 V/km (see Figs. 4 and 5). Sampling rate for the geomagnetic field waveshape is 10 seconds.[6] To use this geoelectric field time series where a different earth model is applicable, it should be scaled with the appropriate conductivity scaling factor β.

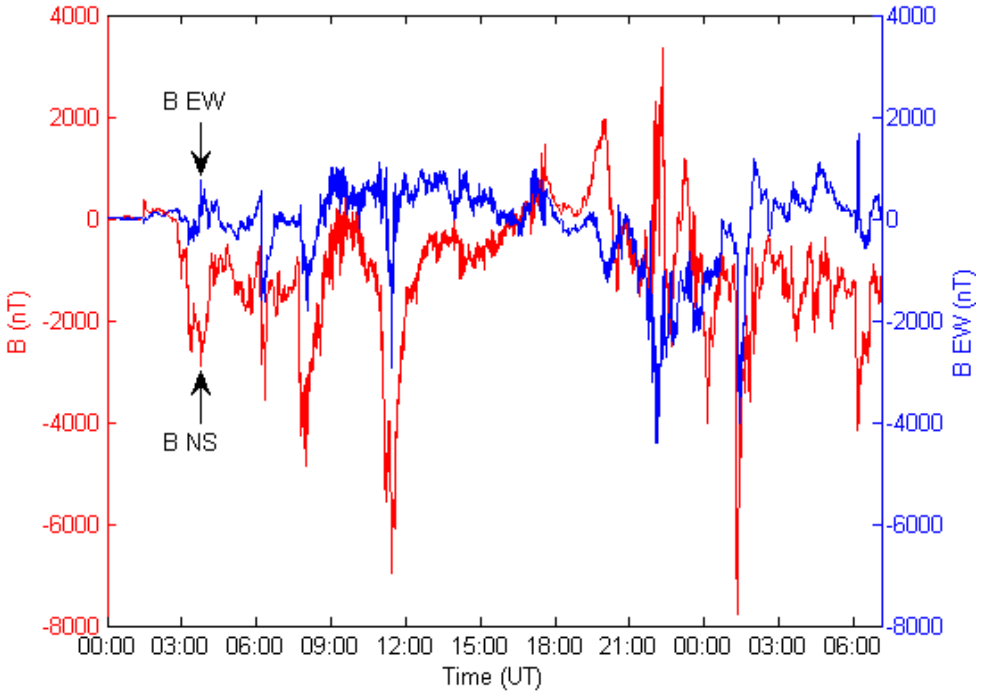

Figure 3: Benchmark Geomagnetic Field Waveshape. Red B_n (Northward), Blue B_e (Eastward)

[5] Refer to the Benchmark GMD Event Description for details on the determination of the reference geomagnetic field waveshape: http://www.nerc.com/pa/Stand/Pages/Project-2013-03-Geomagnetic-Disturbance-Mitigation.aspx

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Planning Coordinator, Transmission Planner, Transmission Owner, and Generator Owner shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The responsible entities shall retain documentation as evidence for five years.

If a Planning Coordinator, Transmission Planner, Transmission Owner, or Generator Owner is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints Text

1.4. Additional Compliance Information

None

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Long-term Planning	Low	N/A	N/A	N/A	The Planning Coordinator, in conjunction with each of its Transmission Planners, failed to determine and identify individual or joint responsibilities of the Planning Coordinator and each of the Transmission Planners in the Planning Coordinator's planning area for maintaining models and performing the studies needed to complete GMD Vulnerability Assessment(s).
R2	Long-term Planning	Medium	N/A	N/A	N/A	The responsible entity did not maintain System models and geomagnetically-induced current (GIC) System models of the responsible entity's planning area for performing the studies needed to complete

						GMD Vulnerability Assessment(s).
R3	Long-term Planning	High	The responsible entity completed a GMD Vulnerability Assessment but it was more than 60 calendar months and less than or equal to 64 calendar months since the last GMD Vulnerability Assessment.	The responsible entity completed a GMD Vulnerability Assessment but it was more than 64 calendar months and less than or equal to 68 calendar months since the last GMD Vulnerability Assessment; OR The responsible entity's completed GMD Vulnerability Assessment failed to satisfy one of elements listed in Requirement R3 Parts 3.1 through 3.3.	The responsible entity's completed GMD Vulnerability Assessment failed to satisfy two of the elements listed in Requirement R3 Parts 3.1 through 3.3; OR The responsible entity completed a GMD Vulnerability Assessment but it was more than 68 calendar months and less than or equal to 72 calendar months since the last GMD Vulnerability Assessment.	The responsible entity's completed GMD Vulnerability Assessment failed to satisfy three of the elements listed in Requirement R3 Parts 3.1 through 3.3; OR The responsible entity completed a GMD Vulnerability Assessment but it was more than 72 calendar months since the last GMD Vulnerability Assessment; OR The responsible entity does not have a completed GMD Vulnerability Assessment.
R4	Long-term Planning	Medium	N/A	N/A	N/A	The responsible entity did not have criteria for acceptable System steady state voltage limits for its System during the benchmark GMD event described in

						Attachment 1 as required.
R5	Long-term Planning	Medium	N/A	N/A	The responsible entity failed to provide one of the elements listed in Requirement R5 parts 5.1 to 5.2 to each Transmission Owner and Generator Owner in the planning area that owns an applicable power transformer.	The responsible entity failed to provide two of the elements listed in Requirement R5 parts 5.1 to 5.2 to each Transmission Owner and Generator Owner in the planning area that owns an applicable power transformer; OR The responsible entity did not provide geomagnetically-induced current (GIC) flow information to be used for the transformer thermal impact assessment specified in Requirement R6 to each Transmission Owner and Generator Owner in the planning area that owns an applicable power transformer.

Guidelines and Technical Basis

Benchmark GMD Event (Attachment 1)

The benchmark GMD event defines the geoelectric field values used to compute GIC flows that are needed to conduct a GMD Vulnerability Assessment. A white paper that includes the event description, analysis, and example calculations is available on the Project 2013-03 Geomagnetic Disturbance Mitigation project page:

http://www.nerc.com/pa/Stand/Pages/Project-2013-03-Geomagnetic-Disturbance-Mitigation.aspx

Requirement R2

A GMD Vulnerability Assessment requires a GIC System model, which is a dc representation of the System, to calculate GIC flow. In a GMD Vulnerability Assessment, GIC simulations are used to determine transformer Reactive Power absorption and transformer thermal response. Details for developing the GIC System model are provided in the NERC GMD Task Force guide: Application Guide for Computing Geomagnetically-Induced Current in the Bulk Power System. The guide is available at:

http://www.nerc.com/comm/PC/Geomagnetic%20Disturbance%20Task%20Force%20GMDTF%202013/GIC%20Application%20Guide%202013_approved.pdf

Requirement R3

The GMD Planning Guide developed by the NERC GMD Task Force provides technical information on GMD-specific considerations for planning studies. It is available at:

http://www.nerc.com/comm/PC/Geomagnetic%20Disturbance%20Task%20Force%20GMDTF%202013/GMD%20Planning%20Guide_approved.pdf

Requirement R5

The transformer thermal impact assessment specified in Requirement R6 is based on GIC time series information for the Benchmark GMD Event. This GIC information is determined by the planning entity through simulation of the GIC system model and must be provided to the entity responsible for conducting the thermal impact assessment.

The maximum effective GIC value provided in part 5.1 is used to screen the transformer fleet such that only those transformers that experience an effective GIC flow of 15A or greater are evaluated.

The effective GIC time series, GIC(t), provided in part 5.2 is used to conduct the transformer thermal impact assessment (see white paper for details).

The peak GIC value of 15 amps per phase has been shown through thermal modeling to be a conservative threshold below which the risk of exceeding known temperature limits established by technical organizations is low. Additional information is available in the transformer thermal impact assessment white paper:

http://www.nerc.com/pa/Stand/Pages/Project-2013-03-Geomagnetic-Disturbance-Mitigation.aspx

Requirement R6

The thermal impact assessment of a power transformer may be based on manufacturer-provided GIC capability curves, thermal response simulation, or other technically justified means. A process for conducting the assessment is presented in the white paper posted on the project page.

http://www.nerc.com/pa/Stand/Pages/Project-2013-03-Geomagnetic-Disturbance-Mitigation.aspx

The threshold criteria and transformer thermal impact must be evaluated on the basis of effective GIC. Refer to the white paper for additional information.

Requirement R7

Technical considerations for GMD mitigation planning are available in Chapter 5 of the GMD Planning Guide. Additional information is available in the 2012 Special Reliability Assessment Interim Report: Effects of Geomagnetic Disturbances on the Bulk-Power System:

http://www.nerc.com/pa/RAPA/ra/Reliability%20Assessments%20DL/2012GMD.pdf

Implementation Plan

Project 2013-03 Geomagnetic Disturbance Mitigation

Implementation Plan for TPL-007-1 – Transmission System Planned Performance During Geomagnetic Disturbances

Approvals Required

TPL-007-1 – Transmission System Planned Performance for Geomagnetic Disturbance Events

Prerequisite Approvals

None

Retirements

None

Revisions to Glossary Terms

There is one new definition in the proposed standard, which shall become effective when TPL-007-1 is approved by the applicable governmental authority:

> **Geomagnetic Disturbance Vulnerability Assessment or GMD Vulnerability Assessment:** *Documented evaluation of potential susceptibility to voltage collapse, Cascading, or localized damage of equipment due to geomagnetic disturbances.*

Applicable Entities

Planning Coordinator with a Planning Coordinator planning area that includes an applicable power transformer as listed in *section 4.2 Facilities* of the standard;

Transmission Planner with a Transmission Planning area that includes an applicable power transformer as listed in *section 4.2 Facilities* of the standard;

Transmission Owner who owns a power transformer(s) as listed in *section 4.2 Facilities* of the standard; and

Generator Owner who owns a power transformer(s) as listed in *section 4.2 Facilities* of the standard.

Applicable Facilities

Facilities that include power transformer(s) with high side, wye-grounded winding with terminal voltage greater than 200 kV.

Conforming Changes to Other Standards

None

Effective Dates

Compliance with TPL-007-1 shall be implemented over a 4-year period as follows. Phased implementation provides:

- Necessary time for entities to develop the required models.
- Proper sequencing of assessments. The assessment of thermal impact on transformers is dependent upon geomagnetically-induced current (GIC) flow calculations that are determined in by the responsible planning entity.
- Necessary time for development of viable Corrective Action Plans, which may require entities to develop, perform, and or validate new and/or modified studies, assessments, procedures, etc., to meet the TPL-007-1 requirements. Some mitigation measures may have significant budget, siting, or construction planning requirements.

Requirement R1 shall become effective on the first day of the first calendar quarter that is 60 calendar days after the date that this standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirement R1 shall become effective on the first day of the first calendar quarter that is 60 calendar days after the date this standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Requirement R2 shall become effective on the first day of the first calendar quarter that is 14 calendar months after the date that this standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirement R2 shall become effective on the first day of the first calendar quarter that is 14 calendar months after the date this standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Requirement R5 shall become effective on the first day of the first calendar quarter that is 18 calendar months after the date that this standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirement R5 shall become effective on the first day of the first calendar quarter that is 18 calendar months after the date this standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Requirement R6 shall become effective on the first day of the first calendar quarter that is 36 calendar months after the date that this standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is

required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirement R6 shall become effective on the first day of the first calendar quarter that is 36 calendar months after the date this standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Requirement R3, Requirement R4, and **Requirement R7** shall become effective on the first day of the first calendar quarter that is 48 calendar months after the date that this standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirement R3, Requirement R4, and Requirement R7 shall become effective on the first day of the first calendar quarter that is 48 calendar months after the date this standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Project 2013-03 Geomagnetic Disturbance Mitigation

Update to Background Information Distributed on June 4, 2014

During the standard drafting team's (SDT) supporting document review at the conclusion of their meeting on June 4, 2014, the SDT determined that a deletion and wording change to Table 1 in proposed standard TPL-007-1 would clarify the performance criteria to reflect the SDT's intent. The change is also consistent with feedback received from stakeholders during informal comments. The revised Table 1 no longer refers to criteria that some stakeholders indicated went beyond the steady state analysis explicitly called for in the requirements. A redlined version of Table 1 is attached and included in the agenda package.

Table 1 –Steady State Planning Events

Steady State:

a. ~~The System shall remain stable.~~ Voltage collapse, Cascading and uncontrolled islanding shall not occur.

b. Load loss as well as generation loss is acceptable as a consequence of the planning event.

c. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.

d. System steady state voltages shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner in accordance with Requirement R4.

Category	Initial Condition	Event	Interruption of Firm Transmission Service Allowed	Load Loss Allowed
GMD GMD Event with Outages	1. System as may be postured in response to space weather information[1], and then 2. GMD event[2]	Reactive Power compensation devices and other Transmission Facilities removed as a result of Protection System operation during the GMD event[3]	Yes[4]	Yes[4]

Table 1 – Steady State Performance Footnotes

1. The System condition for GMD planning may include adjustments to posture the System that are executable in response to space weather information.
2. The GMD conditions for the planning event are described in Attachment 1 (Benchmark GMD Event).
3. Protection Systems may trip due to the effects of harmonics. GMD planning analysis shall consider removal of equipment that the planner determines may be susceptible.
4. ~~The objective of the GMD Vulnerability Assessment is to prevent instability, uncontrolled separation, Cascading and uncontrolled islanding of the System during a GMD event.~~ Load loss and/or curtailment of Firm Transmission Service may be needed to meet BES performance requirements during studied GMD conditions but should not be used as the primary method of achieving required performance. GMD Operating Procedures should be based on predetermined triggers from studied GMD conditions so that the likelihood and magnitude of Load loss or curtailment of Firm Transmission Service is minimized during a GMD event.

Standards Committee Expectations

Approved by Standards Committee January 12, 2012

Background

Standards Committee (SC) members are elected by members of their segment of the Registered Ballot Body, to help the SC fulfill its purpose. According to the Standards Committee Charter, the SC's purpose is:

> *In compliance with the NERC Reliability Standards Development Procedure, the Standards Committee manages the NERC standards development process for the North American-wide reliability standards with the support of the NERC staff to achieve broad bulk power system reliability goals for the industry. The Standards Committee protects the integrity and credibility of the standards development process.*

The purpose of this document is to outline the key considerations that each member of the SC must make in fulfilling his or her duties. Each member is accountable to the members of the Segment that elected them, other members of the SC, and the NERC Board of Trustees for carrying out their responsibilities in accordance with this document.

Expectations of Standards Committee Members

1. SC Members represent their segment, not their organization or personal views. Each member is expected to identify and use mechanisms for being in contact with members of the segment in order to maintain a current perspective of the views, concerns, and input from that segment. NERC can provide mechanisms to support communications if an SC member requests such assistance.

2. SC Members base their decisions on what is best for reliability and must consider not only what is best for their segment, but also what is in the best interest of the broader industry and reliability.

3. SC Members should make every effort to attend scheduled meetings, and when not available are required to identify and brief a proxy from the same segment. Standards Committee business cannot be conducted in the absence of a quorum, and it is essential that each Standards Committee make a commitment to being present.

4. SC Members should not leverage or attempt to leverage their position on the SC to influence the outcome of standards projects.

5. The role of the Standards Committee is to manage the standards process and the quality of the output, not the technical content of standards.

Standards Committee Meeting Dates and Locations for 2014

Face-to-face meetings are typically conducted from 1-5 p.m. on Tuesday and 8 a.m.-12 p.m. on Wednesday, except for the March 2014 face-to-face meeting, which will be held from 1-5 p.m. on Wednesday and 8 a.m.-12 p.m. on Thursday due to space availability. Also, the January 2014 meeting will be a half-day face-to-face meeting. Conference calls are held each month on a Wednesday from 1-5 p.m. Eastern where the SC does not have a face-to-face meeting. The time for face-to-face meetings is based on the 'local' time zone. The time specified for all conference calls is based on the Eastern time zone.

- January 15, 2014 – Atlanta, GA from 1-5 p.m.
- February 12, 2014 – conference call from 1-5 p.m.
- March 12-13, 2014 – Atlanta, GA (1-5 p.m. March 12; 8 a.m.-12 p.m. March 13) **(Wed.-Thurs.)**
- April 9, 2014 – conference call from 1-5 p.m.
- May 14, 2014 – conference call from 1-5 p.m.
- June 10-11, 2014 – Denver, CO (1-5 p.m. June 10; 8 a.m.-12 p.m. June 11)
- July 16, 2014 – conference call from 1-5 p.m.
- August 20, 2014 – conference call from 1-5 p.m.
- September 30, 2014- October 1, 2014 – Portland, OR (1-5 p.m. September 30; 8 a.m.-12 p.m. October 1)
- October 22, 2014 – conference call from 1-5 p.m.
- November 19, 2014 – conference call from 1-5 p.m.
- December 9-10, 2014 – Atlanta, GA (1-5 p.m. December 9; 8 a.m.-12 p.m. December 10)

The Standards Committee has two subcommittees (Project Management and Oversight Committee (PMOS) and Process Subcommittee (SCPS)) which will schedule face-to-face meetings in Atlanta and Portland and conference calls as they deem necessary. They may choose to meet the morning (8 a.m.-12 p.m.) of the first day of the Standards Committee's face-to-face meetings.

Standards Committee
2014 Segment Representatives

Segment and Term	Representative	Organization
Chairman **2014-15**	Brian Murphy Manager, NERC Reliability Standards	NextEra Energy, Inc.
Vice-chairman **2014-15**	Scott Miller Manager Regulatory Policy	MEAG Power
Segment 1-2013-14	Lou Oberski Managing Director, NERC Compliance Policy	Dominion Resources Services, Inc.
Segment 1-2014-15	Laura Lee Manager of ERO Support and Event Analysis, System Operations	Duke Energy
Segment 2-2013-14	Charles Yeung Executive Director Interregional Affairs	Southwest Power Pool
Segment 2-2014-15	Ben Li Consultant	Independent Electric System Operator
Segment 3-2013-14	Jennifer Sterling Director, Exelon NERC Compliance Program	Exelon
Segment 3-2014-15	Ron Parsons General Manager of Transmission Interconnections and Operations	Alabama Power Company
Segment 4-2013-14	Joseph Tarantino Regulatory Compliance Coordinator	Sacramento Municipal Utility District
Segment 4-2014-15	Frank Gaffney Assistant General Manager of and Officer of Regulatory Compliance	Florida Municipal Power Authority
Segment 5-2013-14	Gary Kruempel Compliance Director, Energy Supply	MidAmerican Energy Company

Segment and Term	Representative	Organization
Segment 5-2014-15	Randy Crissman Vice President – Technical Compliance	New York Power Authority
Segment 6-2013-14	Brenda Hampton Regulatory Policy	Energy Future Holdings – Luminant Energy Company LLC
Segment 6-2014-15	Andrew Gallo Director, Reliability Compliance	City of Austin dba Austin Energy
Segment 7-2013-14	John A. Anderson President & CEO	Electricity Consumers Resource Council
Segment 7-2014-15	Frank McElvain Senior Consulting Manager	Siemens Energy, Inc.
Segment 8-2013-14	Robert Blohm Managing Director	Keen Resources Asia Ltd.
Segment 8-2014-15	Frederick Plett Utility Analyst	Massachusetts Attorney General
Segment 9-2014	Klaus Lambeck Chief Facilities, Siting and Environmental Analysis	Public Utilities Commission of Ohio/the Ohio Power Siting Board
Segment 9-2014-15	Jason Woodruff Electrical Engineer	Public Utilities Commission of Nevada
Segment 10-2013-14	Steve Rueckert Director of Standards	Western Electricity Coordinating Council
Segment 10-2014-15	Guy Zito Assistant Vice President of Standards	Northeast Power Coordinating Council

Parliamentary Procedures

Based on Robert's Rules of Order, Newly Revised, 10th Edition, plus "Organization and Procedures Manual for the NERC Standing Committees"

Motions

Unless noted otherwise, all procedures require a "second" to enable discussion.

When you want to…	Procedure	Debatable	Comments
Raise an issue for discussion	Move	Yes	The main action that begins a debate.
Revise a Motion currently under discussion	Amend	Yes	Takes precedence over discussion of main motion. Motions to amend an amendment are allowed, but not any further. The amendment must be germane to the main motion, and can not reverse the intent of the main motion.
Reconsider a Motion already approved	Reconsider	Yes	Allowed only by member who voted on the prevailing side of the original motion.
End debate	Call for the Question *or* End Debate	Yes	If the Chair senses that the committee is ready to vote, he may say "if there are no objections, we will now vote on the Motion." Otherwise, this motion is debatable and subject to 2/3 majority approval.
Record each member's vote on a Motion	Request a Roll Call Vote	No	Takes precedence over main motion. No debate allowed, but the members must approve by 2/3 majority.
Postpone discussion until later in the meeting	Lay on the Table	Yes	Takes precedence over main motion. Used only to postpone discussion until later in the meeting.
Postpone discussion until a future date	Postpone until	Yes	Takes precedence over main motion. Debatable only regarding the date (and time) at which to bring the Motion back for further discussion.
Remove the motion for any further consideration	Postpone indefinitely	Yes	Takes precedence over main motion. Debate can extend to the discussion of the main motion. If approved, it effectively "kills" the motion. Useful for disposing of a badly chosen motion that can not be adopted or rejected without undesirable consequences.
Request a review of procedure	Point of order	No	Second not required. The Chair or secretary shall review the parliamentary procedure used during the discussion of the Motion.

Notes on Motions

Seconds. A Motion must have a second to ensure that at least two members wish to discuss the issue. The "seconder" is not recorded in the minutes. Neither are motions that do not receive a second.

Announcement by the Chair. The Chair should announce the Motion before debate begins. This ensures that the wording is understood by the membership. Once the Motion is announced and seconded, the Committee "owns" the motion, and must deal with it according to parliamentary procedure.

Voting

Voting Method	When Used	How Recorded in Minutes
Unanimous Consent	When the Chair senses that the Committee is substantially in agreement, and the Motion needed little or no debate. No actual vote is taken.	The minutes show "by unanimous consent."
Vote by Voice	The standard practice.	The minutes show Approved or Not Approved (or Failed).
Vote by Show of Hands (tally)	To record the number of votes on each side when an issue has engendered substantial debate or appears to be divisive. Also used when a Voice Vote is inconclusive. (The Chair should ask for a Vote by Show of Hands when requested by a member).	The minutes show both vote totals, and then Approved or Not Approved (or Failed).
Vote by Roll Call	To record each member's vote. Each member is called upon by the Secretary,, and the member indicates either "Yes," "No," or "Present" if abstaining.	The minutes will include the list of members, how each voted or abstained, and the vote totals. Those members for which a "Yes," "No," or "Present" is not shown are considered absent for the vote.

Notes on Voting

(Recommendations from DMB, not necessarily Mr. Robert)

Abstentions. When a member abstains, he is not voting on the Motion, and his abstention is not counted in determining the results of the vote. The Chair should not ask for a tally of those who abstained.

Determining the results. The results of the vote (other than Unanimous Consent) are determined by dividing the votes in favor by the total votes cast. Abstentions are not counted in the vote and shall not be assumed to be on either side.

"Unanimous Approval." Can only be determined by a Roll Call vote because the other methods do not determine whether every member attending the meeting was actually present when the vote was taken, or whether there were abstentions.

Majorities. Robert's Rules use a simple majority (one more than half) as the default for most motions. NERC uses 2/3 majority for all motions.

Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and subgroups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost information and participants' expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.
- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

- Any other matters that do not clearly fall within these guidelines should be reviewed with NERC's General Counsel before being discussed.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and subgroups) may have a negative impact on particular entities and thus in that sense adversely impact competition. Decisions and actions by NERC (including its committees and subgroups) should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation, Bylaws, and Rules of Procedure are followed in conducting NERC business.

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or subgroup, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on electricity markets, and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.

Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and employment matters; and procedural matters such as planning and scheduling meetings.

CIP Version 5 Revisions Project

Action

Authorize the posting of Project 2014-02 CIP Version 5 Revisions Reliability Standards, Implementation Plan, and VSLs/VRFs for an initial 45-day formal comment period with ballot pool formation during the first 30 days and initial ballots and non-binding polls during the last 10 days of the comment period.

Background

On November 22, 2013, the Federal Energy Regulatory Commission (FERC) issued Order No. 791, Version 5 Critical Infrastructure Protection Reliability Standards, in which FERC approved Version 5 of the Critical Infrastructure Protection (CIP) standards and directed several modifications, including the following for standards development:

1. Modify or remove the "identify, assess, and correct" (IAC) language found in 17 of the 32 CIP Version 5 requirements;
2. Develop modifications to the CIP standards to address security controls for low impact assets;
3. Develop requirements that protect transient electronic devices; and
4. Create a definition of "communication networks" and develop new or modified Reliability Standards that address the protection of communication networks.

NERC must submit new or revised standards responding to the directives related to the IAC language and communication networks by February 3, 2015, one year from the effective date of Order No. 791. FERC did not place a timeframe on responding to the other directives.

On January 16, 2014, the Standards Committee (SC) accepted the Project 2014-02 Standard Authorization Request (SAR) to post for a 30-day informal comment period from January 17 - February 18, 2014. NERC staff made minor revisions to the SAR based on submitted comments and posted the revised SAR to the project page on March 20, 2014.

On January 29, 2014, the SC seated 10 members to the Project 2014-02 Standard Drafting Team (SDT). The roster is available here. The SDT's drafting activity followed an aggressive meeting schedule, including four face-to-face meetings in Washington, DC, Sacramento, CA, Atlanta, GA, and Columbus, OH. When not meeting in person, the SDT held weekly full-team conference calls as well as weekly calls for subgroups. There were four subgroups, each one focusing on one of the four main directives, and the SDT designated two SDT members to lead each call. In total, the SDT held 10 hours of calls each week. As a result of these open meetings and calls, the SDT received input from a variety of stakeholders participating in drafting activity.

The SDT also focused on quality of the revisions to the standards throughout development, and incorporated quality review as part of the fabric of standards development activities. The SDT sought regular and meaningful input from a variety of sources over the past few months. For instance, various stakeholders participated in standards drafting activity and provided their viewpoints for the SDT's consideration through direct participation, email, in-person outreach opportunities, and other means. These stakeholders included participants from a variety of industry segments, trade association representatives, governmental authority staff, members of the Standards Committee and the SDT's Project Management Oversight Subcommittee (PMOS) liaison, and other interested participants. In addition, the SDT coordinated extensively with NERC Technical, Compliance, Legal, and Enforcement staffs to garner a comprehensive view of the revisions' effects once approved. Finally, the SDT considered other relevant input, such as the P 81 criteria, throughout development to ensure the quality of the proposed revisions.

In addition to a focus on quality during development, NERC staff coordinated a quality review prior to the posting of the Reliability Standards, Implementation Plan, Violation Risk Factors, and Violation Severity Levels. During this check, reviewers, including the SDT's PMOS liaison, focused on consistency and clarity in language.

As a complement to incorporating quality review, NERC staff and the SDT focused heavily on outreach during standards development and will continue to focus on outreach during the proposed comment and ballot period. In January, NERC staff conducted two technical conferences to gather input from industry on the directives from Order No. 791. Once the SDT was seated, the SDT's weekly calls and monthly meetings had active participation from observers. Members of the SDT met with trade association representatives at NERC's office mid-way through development to update the trade associations' members on the drafting activity and to receive feedback. In late April, the SDT hosted a webinar to introduce the revisions to a broad audience. Furthermore, NERC staff provided updates to the NERC Board of Trustees and the SC as appropriate. Finally, once the standards are approved to post as proposed, NERC staff and the SDT have several outreach events planned, such as speaking at regional CIP working groups and a webinar on June 19.

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

BES Cyber Asset (BCA): A Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its required operation, misoperation, or non-operation, adversely impact one or more Facilities, systems, or equipment, which, if destroyed, degraded, or otherwise rendered unavailable when needed, would affect the reliable operation of the Bulk Electric System (BES). Redundancy of affected Facilities, systems, and equipment shall not be considered when determining adverse impact. Each BES Cyber Asset is included in one or more BES Cyber Systems. A Transient Cyber Asset is not a BES Cyber Asset.

Protected Cyber Assets (PCA): One or more Cyber Assets connected using a routable protocol within or on an Electronic Security Perimeter that is not part of the highest impact BES Cyber System within the same Electronic Security Perimeter. The impact rating of Protected Cyber Assets is equal to the highest rated BES Cyber System in the same ESP. A Transient Cyber Asset is not a Protected Cyber Asset.

Removable Media: Portable media, connected for 30 consecutive calendar days or less, that can be used to copy, move and/or access data. Examples include, but are not limited to, floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory. A Cyber Asset is not Removable Media.

Transient Cyber Asset: A Cyber Asset directly connected for 30 consecutive calendar days or less, to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. Examples include, but are not limited to, Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

BES Cyber Asset (BCA): A Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its required operation, misoperation, or non-operation, adversely impact one or more Facilities, systems, or equipment, which, if destroyed, degraded, or otherwise rendered unavailable when needed, would affect the reliable operation of the Bulk Electric System. Redundancy of affected Facilities, systems, and equipment shall not be considered when determining adverse impact. Each BES Cyber Asset is included in one or more BES Cyber Systems. ~~(~~A Transient Cyber Asset is not a BES Cyber Asset. ~~if, for 30 consecutive calendar days or less, it is directly connected to a network within an ESP, a Cyber Asset within an ESP, or to a BES Cyber Asset, and it is used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.)~~

Protected Cyber Assets (PCA): One or more Cyber Assets connected using a routable protocol within or on an Electronic Security Perimeter that is not part of the highest impact BES Cyber System within the same Electronic Security Perimeter. The impact rating of Protected Cyber Assets is equal to the highest rated BES Cyber System in the same ESP. A Transient Cyber Asset is not a Protected Cyber Asset. ~~if, for 30 consecutive calendar days or less, it is connected either to a Cyber Asset within the ESP or to the network within the ESP, and it is used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.~~

Removable Media: Portable media, connected for 30 consecutive calendar days or less, that can be used to copy, move and/or access data. Examples include, but are not limited to, floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory. A Cyber Asset is not Removable Media.

Transient Cyber Asset: A Cyber Asset directly connected for 30 consecutive calendar days or less, to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. Examples include, but are not limited to, Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014

Description of Current Draft

This draft standard is being posted for an initial comment and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
First 45-Day Comment Period Opens	June 2014
Additional 45-Day Comment Period (if necessary)	August 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-003-5.	
6	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Security Management Controls

2. Number: CIP-003-6

3. Purpose: To specify consistent and sustainable security management controls that establish responsibility and accountability to protect BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-003-6:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

5. Effective Dates:

Reliability Standard CIP-003-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Requirement R2 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

6. Background:

Standard CIP-003 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures provide examples of evidence to show documentation and implementation of the requirement. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

B. Requirements and Measures

Rationale for Requirement R1:

One or more security policies enable effective implementation of the standard's requirements. The purpose of policies is to provide a management and governance foundation for all requirements that apply to personnel who have authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems. The Responsible Entity can demonstrate through its policies that its management supports the accountability and responsibility necessary for effective implementation of the standard's requirements.

Annual review and approval of the cyber security policy ensures that the policy is kept-up-to-date and periodically reaffirms management's commitment to the protection of its BES Cyber Systems.

R1. Each Responsible Entity, for its high impact and medium impact BES Cyber Systems, shall review and obtain CIP Senior Manager approval at least once every 15 calendar months for one or more documented cyber security policies that collectively address the following topics: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

- **1.1** Personnel & training (CIP-004);
- **1.2** Electronic Security Perimeters (CIP-005) including Interactive Remote Access;
- **1.3** Physical security of BES Cyber Systems (CIP-006);
- **1.4** System security management (CIP-007);
- **1.5** Incident reporting and response planning (CIP-008);
- **1.6** Recovery plans for BES Cyber Systems (CIP-009);
- **1.7** Configuration change management and vulnerability assessments (CIP-010);
- **1.8** Information protection (CIP-011); and
- **1.9** Declaring and responding to CIP Exceptional Circumstances.

M1. Examples of evidence may include, but are not limited to, policy documents; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.

Rationale for Requirement R2:

One or more security policies enable effective implementation of the standard's requirements. The purpose of policies is to provide a management and governance foundation for all requirements that apply to personnel who have authorized electronic access and/or authorized unescorted physical access to low impact BES Cyber Systems. The Responsible Entity can demonstrate through its policies that its management supports the accountability and responsibility necessary for effective implementation of the standard's requirements by CIP Senior Manager approval of the policies specified in Part 2.1.

The language in Requirement R2, Part 2.4 "external routable protocol paths" and "Dial-up Connectivity" was included to acknowledge the support given in FERC Order No. 761, paragraph 87, for electronic security perimeter protections "of some form" to be applied to all BES Cyber Systems, regardless of impact. Part 2.4 uses the phrase "external routable protocol paths" instead of the defined term "External Routable Connectivity," because the latter term has very specific connotations relating to Electronic Security Perimeters and high and medium impact BES Cyber Systems. Using the glossary term "External Routable Connectivity" in the context of Requirement R2 would not be appropriate because Requirement R2 is limited in scope to low impact BES Cyber Systems. The Standard Drafting Team (SDT) intent in using the phrase "external routable protocol paths" is to focus only on the paths to the low impact BES Cyber Systems and not the paths to other networks (e.g., corporate paths).

The additions to Requirement R2, in particular the processes required under Parts 2.2-2.6, address FERC Order No. 791 paragraphs 106-110, which require the standard to address the lack of objective criteria against which NERC and the Commission can evaluate the sufficiency of an entity's protections for low impact assets. The SDT pulled language and concepts from CIP-004, CIP-005, CIP-006, and CIP-008 in order to add objective criteria to each of the previous policy topic areas in CIP-003, Requirement R2.

In FERC Order No. 791 paragraphs 111-112, FERC upheld that creating and maintaining an inventory of low impact assets for audit purposes would be unduly burdensome, so the inventory statements remain unchanged.

R2. Each Responsible Entity for its assets containing low impact BES Cyber Systems shall perform each of the applicable requirement parts in *CIP-003-6 Table R2 – Low Impact Assets*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

Note: An inventory, list, or discrete identification of low impact BES Cyber Systems or their BES Cyber Assets is not required. Lists of authorized users are not required.

M2. Evidence must include each of the applicable documented policies and processes that collectively include each of the applicable requirement parts in *CIP-003-6 Table R2 – Low Impact Assets* and any additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-003-6 Table R2 – Low Impact Assets			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	Low Impact BES Cyber Systems	Review and obtain CIP Senior Manager approval at least once every 15 calendar months for one or more documented cyber security policies that collectively address the topics in CIP-003-6, Requirement R2, Parts 2.2 – 2.6.	An example of evidence may include, but is not limited to, one or more documented cyber security policies that address each of the areas in Requirement R2, Parts 2.2 – 2.6 and includes evidence of review and CIP Senior Manager approval at least every 15 calendar months.
2.2	Low Impact BES Cyber Systems	Implement one or more documented processes that include operational or procedural control(s) to restrict physical access.	An example of evidence may include, but is not limited to, documentation of the operational or procedural control(s).
2.3	Low Impact BES Cyber Systems at Control Centers	Implement one or more documented processes that collectively include the following: 2.3.1. Escorted access of visitors; and 2.3.2. For Control Centers with external routable protocol paths, monitoring physical access point(s).	Examples of evidence may include, but are not limited to: • For 2.3.1, documentation of visitor escort procedure(s) at Control Centers. • For 2.3.2, documentation describing how the Responsible Entity monitors physical access points into Control Centers that have external routable protocol paths.

CIP-003-6 Table R2 – Low Impact Assets			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.4	Low Impact BES Cyber Systems	Implement one or more documented processes that collectively include the following: 2.4.1. All external routable protocol paths, if any, must be through one or more identified access point(s). 2.4.2. For each identified access point, if any, require inbound and outbound access permissions, including the reason for granting access, and deny all other access by default. 2.4.3. Authentication when establishing Dial-up Connectivity, per Cyber Asset capability.	Examples of evidence may include, but are not limited to: • For 2.4.1, documentation of external routable protocol paths through identified access points. • For 2.4.2, a representative sample of a list of restrictions (e.g., firewall rules, access control lists, data diode, etc.) that demonstrates that only permitted access is allowed and that each access rule has a reason documented individually or by group. • For 2.4.3, documentation of authentication controls applied to dial-up access connections.

CIP-003-6 Table R2 – Low Impact Assets			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.5	Low Impact BES Cyber Systems	Implement one or more Cyber Security Incident response plan(s) that collectively include the following: 2.5.1. Identification, classification, and response to Cyber Security Incidents. 2.5.2. Determination of whether an identified Cyber Security Incident is a Reportable Cyber Security Incident. 2.5.3. Notification of Reportable Cyber Security Incidents to the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), unless prohibited by law. 2.5.4. The roles and responsibilities of Cyber Security Incident response groups or individuals. 2.5.5. Incident handling procedures for Cyber Security Incidents. 2.5.6. Testing of the plan(s) at least once per 36 calendar months, either through a paper drill, tabletop exercise, or a response to an actual Reportable Cyber Security Incident.	Examples of evidence may include, but are not limited to: • One or more documented cyber security incident response plans that include the requirement parts. • Dated evidence that shows the testing or execution of the plan(s) at least once per 36 calendar months, either through a paper drill, tabletop exercise, or a response to an actual Reportable Cyber Security Incident.

CIP-003-6 Table R2 – Low Impact Assets			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.6	Low Impact BES Cyber Systems	Implement a security awareness program that reinforces cyber security practices at least quarterly. Once every 15 calendar months, the program shall reinforce Parts 2.2, 2.3, 2.4, and 2.5 above.	An example of evidence may include, but is not limited to, one or more documents describing how the Responsible Entity is implementing its cyber security awareness program per 2.6.

Rationale for Requirement R3:

The identification and documentation of the single CIP Senior Manager ensures that there is clear authority and ownership for the CIP program within an organization, as called for in Blackout Report Recommendation 43. The language that identifies CIP Senior Manager responsibilities is included in the *Glossary of Terms used in NERC Reliability Standards* so that it may be used across the body of CIP standards without an explicit cross-reference.

FERC Order No. 706, Paragraph 296, requests consideration of whether the single senior manager should be a corporate officer or equivalent. As implicated through the defined term, the senior manager has "the overall authority and responsibility for leading and managing implementation of the requirements within this set of standards" which ensures that the senior manager is of sufficient position in the Responsible Entity to ensure that cyber security receives the prominence that is necessary. In addition, given the range of business models for responsible entities, from municipal, cooperative, federal agencies, investor owned utilities, privately owned utilities, and everything in between, the SDT believes that requiring the senior manager to be a "corporate officer or equivalent" would be extremely difficult to interpret and enforce on a consistent basis.

R3. Each Responsible Entity shall identify a CIP Senior Manager by name and document any change within 30 calendar days of the change. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. An example of evidence may include, but is not limited to, a dated and approved document from a high level official designating the name of the individual identified as the CIP Senior Manager.

Rationale for Requirement R4:

The intent of the requirement is to ensure clear accountability within an organization for certain security matters. It also ensures that delegations are kept up-to-date and that individuals do not assume undocumented authority.

In FERC Order No. 706, Paragraphs 379 and 381, the Commission notes that Recommendation 43 of the 2003 Blackout Report calls for "clear lines of authority and ownership for security matters." With this in mind, the Standard Drafting Team has sought to provide clarity in the requirement for delegations so that this line of authority is clear and apparent from the documented delegations.

R4. The Responsible Entity shall implement a documented process to delegate authority, unless no delegations are used. Where allowed by the CIP Standards, the CIP Senior Manager may delegate authority for specific actions to a delegate or delegates. These

delegations shall be documented, including the name or title of the delegate, the specific actions delegated, and the date of the delegation; approved by the CIP Senior Manager; and updated within 30 days of any change to the delegation. Delegation changes do not need to be reinstated with a change to the delegator. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. An example of evidence may include, but is not limited to, a dated document, approved by the CIP Senior Manager, listing individuals (by name or title) who are delegated the authority to approve or authorize specifically identified items.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints Text

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-003-6)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Medium**	The Responsible Entity documented and implemented one or more cyber security policies for its high impact and medium impact BES Cyber Systems, but did not address one of the nine topics required by R1. (R1) OR The Responsible Entity did not complete its review of the one or more documented cyber security policies for its high impact and medium impact BES Cyber Systems as required by R1 within 15 calendar months but did complete this review	The Responsible Entity documented and implemented one or more cyber security policies for its high impact and medium impact BES Cyber Systems, but did not address two of the nine topics required by R1. Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section “4. Applicability” of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section “4.1. Functional Entities” is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section “4.2. Facilities” defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term “Facilities” already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The number of policies and their specific language are guided by a Responsible Entity's management structure and operating conditions. Policies might be included as part of a general information security program for the entire organization, or as components of specific programs. The cyber security policy must cover in sufficient detail the nine topical areas required by CIP-003-6, Requirement R1. The Responsible Entity has the flexibility to develop a single comprehensive cyber security policy covering these topics, or it may choose to develop a single high-level umbrella policy and provide additional policy detail in lower level documents in its documentation hierarchy. In the case of a high-level umbrella policy, the Responsible Entity would be expected to provide the high-level policy as well as the additional documentation in order to demonstrate compliance with CIP-003-6, Requirement R1. Implementation of the cyber security policy is not specifically included in CIP-003-6, Requirement R1 as it is envisioned that the implementation of this policy is evidenced through successful implementation of CIP-004 through CIP-011. However, Responsible Entities are encouraged not to limit the scope of their cyber security policies to only those requirements from CIP-004 through CIP-011, but rather to put together a holistic cyber security policy appropriate to its organization. The assessment through the Compliance Monitoring and Enforcement Program of policy items that extend beyond the scope of CIP-004 through CIP-011 should not be considered candidates for potential violations. The Responsible Entity should consider the following for each of the required topics in its cyber security policy:

1.1 Personnel & training (CIP-004)

- Organization position on acceptable background investigations
- Identification of possible disciplinary action for violating this policy
- Account management

1.2 Electronic Security Perimeters (CIP-005) including Interactive Remote Access

- Organization stance on use of wireless networks
- Identification of acceptable authentication methods
- Identification of trusted and untrusted resources
- Monitoring and logging of ingress and egress at Electronic Access Points
- Maintaining up-to-date anti-malware software before initiating Interactive Remote Access
- Maintaining up-to-date patch levels for operating systems and applications used to initiate Interactive Remote Access
- Disabling VPN "split-tunneling" or "dual-homed" workstations before initiating Interactive Remote Access
- For vendors, contractors, or consultants: include language in contracts that requires adherence to the Responsible Entity's Interactive Remote Access controls

1.3 Physical security of BES Cyber Systems (CIP-006)

- Strategy for protecting Cyber Assets from unauthorized physical access
- Acceptable physical access control methods
- Monitoring and logging of physical ingress

1.4 System security management (CIP-007)

- Strategies for system hardening
- Acceptable methods of authentication and access control
- Password policies including length, complexity, enforcement, prevention of brute force attempts
- Monitoring and logging of BES Cyber Systems

1.5 Incident reporting and response planning (CIP-008)

- Recognition of Cyber Security Incidents
- Appropriate notifications upon discovery of an incident
- Obligations to report Cyber Security Incidents

1.6 Recovery plans for BES Cyber Systems (CIP-009)

- Availability of spare components

- Availability of system backups

1.7 Configuration change management and vulnerability assessments (CIP-010)

- Initiation of change requests
- Approval of changes
- Break-fix processes

1.8 Information protection (CIP-011)

- Information access control methods
- Notification of unauthorized information disclosure
- Information access on a need-to-know basis

1.9 Declaring and responding to CIP Exceptional Circumstances

- Processes to invoke special procedures in the event of a CIP Exceptional Circumstance
- Processes to allow for exceptions to policy that do not violate CIP requirements

The Standard Drafting Team (SDT) has removed requirements relating to exceptions to a Responsible Entity's security policies since it is a general management issue that is not within the scope of a reliability requirement. The SDT considers it to be an internal policy requirement and not a reliability requirement. However, the SDT encourages Responsible Entities to continue this practice as a component of its cyber security policy.

In this and all subsequent required approvals in the NERC CIP Standards, the Responsible Entity may elect to use hardcopy or electronic approvals to the extent that there is sufficient evidence to ensure the authenticity of the approving party.

Requirement R2:

The intent of the requirement is to outline a set of protections designed for all low impact BES Cyber Systems. The SDT is balancing the fact that low impact BES Cyber Systems are indeed low impact to the BES, but they do meet the definition of having a 15-minute adverse impact so some protections are needed. The intent is that such protections are part of a program that covers the low impact BES Cyber Systems collectively either at a programmatic or site level, not an individual device or system level.

There are four main areas that must be covered by this security program: physical security, electronic access controls for all external routable protocol paths or Dial-up Connectivity, a security awareness program, and cyber security incident response plans.

The SDT intends that demonstration of this requirement can be reasonably accomplished through providing evidence of related processes, procedures, or plans. While the audit staff may choose to review an example low impact BES Cyber System, the SDT believes strongly that the current method (as of this writing) of reviewing a statistical sample of systems is not necessary.

2.1 - As with Requirement R1, the number of policies and the specific language used in them would be guided by a Responsible Entity's management structure and operating conditions. Policies might be included as part of a general information security program for the entire organization or as components of specific programs. The cyber security policy must cover in sufficient detail the four topical areas in CIP-003-6, Requirement R2, Parts 2.2 through 2.6. The Responsible Entity has flexibility in the number and structure of its policies to meet its needs and organization. Examples include developing a single comprehensive cyber security policy covering these topics for all in-scope assets, several comprehensive cyber security policies based on asset type, or a single high-level umbrella policy with additional policy detail in lower level documents in its documentation hierarchy.

2.2 – The Responsible Entity must document and implement processes that include the physical security of the low impact BES Cyber Systems at a BES asset. The Responsible Entity has flexibility in the controls used and the granularity of those controls. The entity is to document its operational or physical controls that restrict access to the low impact BES Cyber Systems at the asset. Entities may utilize perimeter controls (fences with locked gates, guards, site access policies, etc.) and/or more granular areas of access control in areas where low impact BES Cyber Systems are located, such as control rooms or control houses. Lists of authorized users are not required.

2.3 – The Responsible Entity must document and implement processes that include the physical security of the low impact BES Cyber Systems at Control Centers. For Control Centers, the entity should further describe the process for handling escorted access of visitors. For Control Centers that have external routable connectivity, monitoring of physical access points is also required. Monitoring does not imply logging and maintaining logs, but monitoring that access has been granted through an access point (door alarm, etc.). The monitoring does not need to be per low impact BES Cyber System but should be at the level as determined by the entity’s controls.

2.4 – The Responsible Entity must have implemented processes that include the external routable protocol and Dialup connectivity paths to the BES asset such that the low impact BES Cyber Systems located at the BES asset are protected. The electronic access controls should address the risk of using the asset’s external connectivity to gain access to the low impact BES Cyber Systems. The entity should be able to describe how its electronic access controls on the external connectivity paths protect the collection of low impact BES Cyber Systems at the site. The intent is to reduce the risk of aggregation of numerous low impact BES Cyber Systems at the site or across multiple sites through external connectivity.

Examples of sufficient access controls may include:

- All the external routable protocol connectivity paths to the asset pass through a firewall that denies all traffic by default with explicit inbound and outbound access permissions defined, or equivalent method by which both inbound and outbound connections are shielded from or to the world-wide-web (e.g. IP addresses, ports, services, and data diode) for scenarios representative of the Responsible Entity's sites having Low Impact BES Cyber Systems.

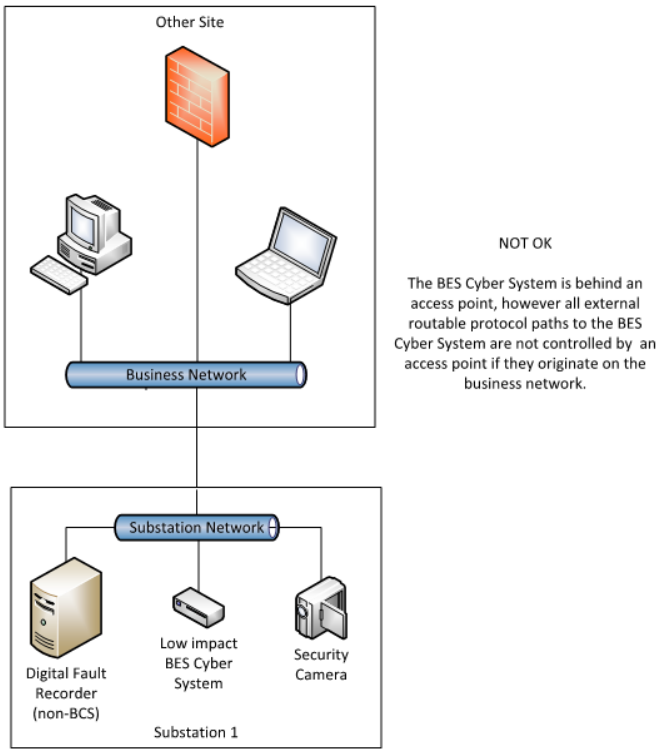
- Dialup Connectivity to a low impact BES Cyber System is set to dial out only (no autoanswer) to a preprogrammed number to deliver data. Incoming Dialup Connectivity is to a dialback modem, a modem that must be remotely controlled by the control center or control room, has some form of access control, or the low impact BES Cyber System has access control.

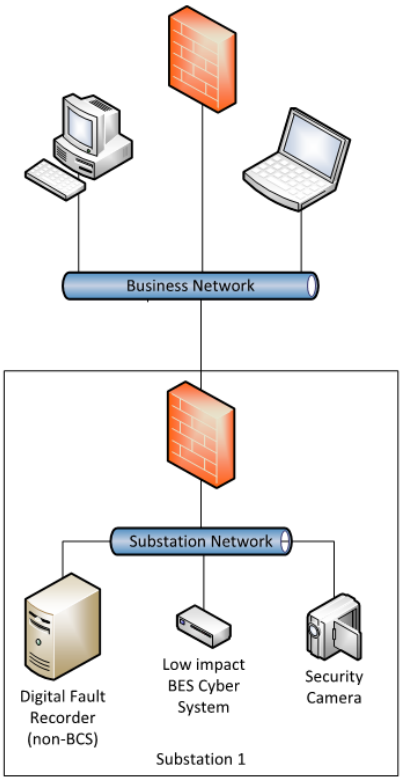
Some examples of situations that would lack sufficient access controls to meet the intent of this requirement include:

- An asset has dialup connectivity and a low impact BES Cyber System is reachable via an auto-answer modem that connects any caller to the Cyber Asset which has a default password. There is no access control in this instance.
- An asset has external routable connectivity due to a BES Cyber System within it having a 3G/4G wireless card on a public carrier which allows the BES Cyber System to be reachable via a public IP address. In essence, low impact BES Cyber Systems should not be accessible from the Internet and search engines such as Shodan.

The SDT also notes that in topic 2.4, the SDT uses the term “electronic access control” in the general sense, i.e., to control access, and not in the specific technical sense requiring authentication, authorization, and auditing.

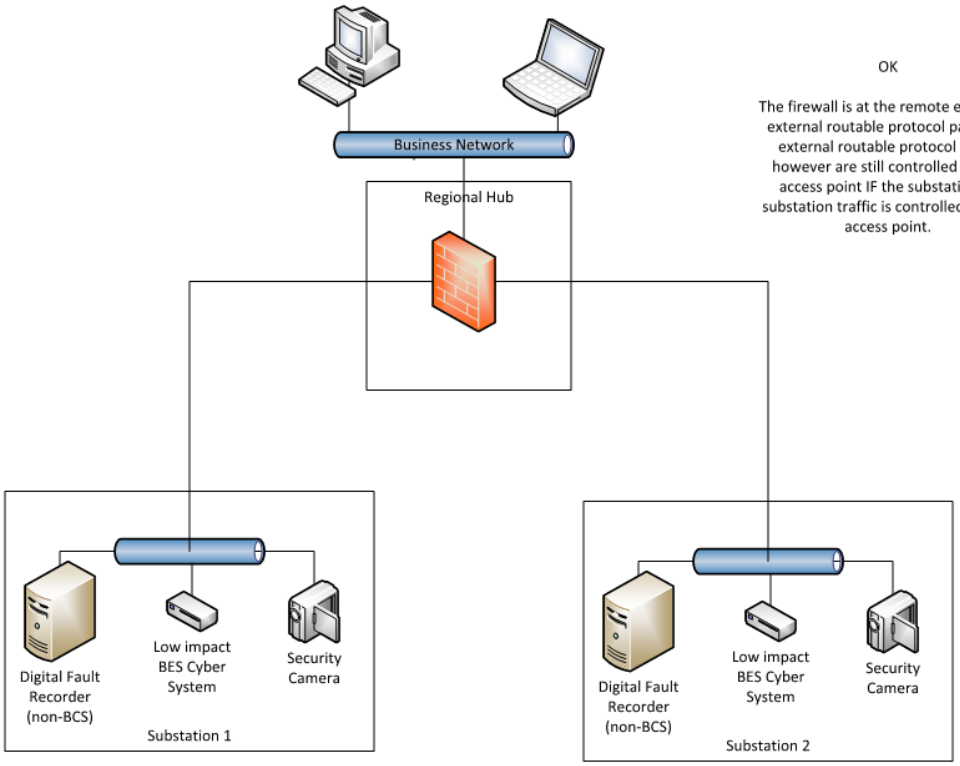
The following diagrams explain the SDT’s rationale.





OK

All the external traffic to the BES Cyber System is controlled by an access point.



OK

The firewall is at the remote end of an external routable protocol path. All external routable protocol paths however are still controlled by the access point IF the substation to substation traffic is controlled via the access point.

2.5 - The entity should have a documented cyber security incident response plan that includes each of the topics listed. For assets that have limited or no connectivity, it is not the intent to increase their risk by increasing the level of connectivity in order to have real-time monitoring. The intent is if in the normal course of business suspicious activities are noted at an asset containing low impact BES Cyber Systems, there is a cyber security incident response plan that will guide the entity through responding to the incident and reporting the incident if it rises to the level of a Reportable Cyber Security Incident. The plan(s) must be tested once every 36 months. This is not an exercise per low impact BES Cyber Asset or per type of BES Cyber Asset but an exercise of each incident response plan the entity created to meet this requirement. An actual Reportable Cyber Security Incident counts as an exercise as well as other forms of tabletop exercises or paper drills. NERC-led exercises such as GridEx participation would also count as an exercise if the entity's response plan is followed.

For low impact BES Cyber Systems, the only portion of the definition of Cyber Security Incident that would apply is, "A malicious act or suspicious event that disrupts, or was an attempt to disrupt, the operation of a BES Cyber System." The other portion of that definition is not to be used to require ESPs and PSPs for low impact BES Cyber Systems.

2.6 - The intent of the security awareness program is for entities to reinforce good cyber security practices with their personnel on at least a quarterly basis. The physical security, electronic access controls, and the cyber security incident response plan should be covered at least every 15 months. It is up to the entity as to the topics and how it schedules these topics. It should be sufficient for an entity to produce the awareness material that it delivered quarterly and the delivery method(s) (posters, emails, topics at staff meetings, etc.). The intent is that tracking of reception of the messages by personnel is not required.

Requirement R3:

The intent of CIP-003-6, Requirement R3 is effectively unchanged since prior versions of the standard. The specific description of the CIP Senior Manager has now been included as a defined term rather than clarified in the Standard itself to prevent any unnecessary cross-reference to this standard. It is expected that this CIP Senior Manager play a key role in ensuring proper strategic planning, executive/board-level awareness, and overall program governance.

Requirement R4:

As indicated in the rationale for CIP-003-6, Requirement R4, this requirement is intended to demonstrate a clear line of authority and ownership for security matters. The intent of the SDT was not to impose any particular organizational structure, but, rather, the Responsible Entity should have significant flexibility to adapt this requirement to their existing organizational structure. A Responsible Entity may satisfy this requirement through a single delegation document or through multiple delegation documents. The Responsible Entity can make use of the delegation of the delegation authority itself to increase the flexibility in how this applies to its organization. In such a case, delegations may exist in numerous documentation records as long as the collection of these documentation records provides a clear line of authority back to

the CIP Senior Manager. In addition, the CIP Senior Manager could also choose not to delegate any authority and meet this requirement without such delegation documentation.

The Responsible Entity must keep its documentation of the CIP Senior Manager and any delegations up to date. This is to ensure that individuals do not assume any undocumented authority. However, delegations do not have to be re-instated if the individual who delegated the task changes roles or is replaced. For instance, assume that John Doe is named the CIP Senior Manager and he delegates a specific task to the Substation Maintenance Manager. If John Doe is replaced as the CIP Senior Manager, the CIP Senior Manager documentation must be updated within the specified timeframe, but the existing delegation to the Substation Maintenance Manager remains in effect as approved by the previous CIP Senior Manager, John Doe.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014

Description of Current Draft

This draft standard is being posted for an initial comment and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
First 45-Day Comment Period Opens	June 2014
Additional 45-Day Comment Period (if necessary)	August 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-003-5.	
6	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** Cyber Security — Security Management Controls

2. **Number:** CIP-003-~~5~~6

3. **Purpose:** To specify consistent and sustainable security management controls that establish responsibility and accountability to protect BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. **Applicability:**

4.1. **Functional Entities:** For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 **Balancing Authority**

4.1.2 **Distribution Provider** that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 **Generator Operator**

4.1.4 **Generator Owner**

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-003-~~5~~6:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

5. Effective Dates:

Reliability Standard CIP-003-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Requirement R2 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

6. Background:

Standard CIP-003~~-5~~ exists as part of a suite of CIP Standards related to cyber security, which ~~. CIP-002-5.1~~ require~~s~~ the initial identification and categorization of BES Cyber Systems~~. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1, and CIP-011-1~~ and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.~~ This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.~~

~~The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:~~

~~Each Responsible Entity shall implement~~ **~~in a manner that identifies, assesses, and corrects deficiencies, . . .~~**

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in ~~their~~ its documented processes,

but ~~they~~ it must address the applicable requirements. ~~The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities.~~

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures provide examples of evidence to show documentation and implementation of the requirement. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

B. Requirements and Measures

Rationale for Requirement R1:

One or more security policies enable effective implementation of the standard's requirements. The purpose of policies is to provide a management and governance foundation for all requirements that apply to personnel who have authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems. The Responsible Entity can demonstrate through its policies that its management supports the accountability and responsibility necessary for effective implementation of the standard's requirements.

Annual review and approval of the cyber security policy ensures that the policy is kept-up-to-date and periodically reaffirms management's commitment to the protection of its BES Cyber Systems.

R1. Each Responsible Entity, for its high impact and medium impact BES Cyber Systems, shall review and obtain CIP Senior Manager approval at least once every 15 calendar months for one or more documented cyber security policies that collectively address the following topics: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

- **1.1** Personnel & training (CIP-004);
- **1.2** Electronic Security Perimeters (CIP-005) including Interactive Remote Access;
- **1.3** Physical security of BES Cyber Systems (CIP-006);
- **1.4** System security management (CIP-007);
- **1.5** Incident reporting and response planning (CIP-008);
- **1.6** Recovery plans for BES Cyber Systems (CIP-009);
- **1.7** Configuration change management and vulnerability assessments (CIP-010);
- **1.8** Information protection (CIP-011); and
- **1.9** Declaring and responding to CIP Exceptional Circumstances.

M1. Examples of evidence may include, but are not limited to, policy documents; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.

Rationale for Requirement R2:

One or more security policies enable effective implementation of the standard's requirements. The purpose of policies is to provide a management and governance foundation for all requirements that apply to personnel who have authorized electronic access and/or authorized unescorted physical access to ~~its~~ low impact BES Cyber Systems. The Responsible Entity can demonstrate through its policies that its management supports the accountability and responsibility necessary for effective implementation of the standard's requirements by CIP Senior Manager approval of the policies specified in Part 2.1.

The language in Requirement R2, Part 2.~~3~~ 4 "~~. . . for~~ external routable protocol ~~connections~~ paths" and "Dial-up Connectivity~~. . .~~" was included to acknowledge the support given in FERC Order No. 761, paragraph 87, for electronic security perimeter protections "of some form" to be applied to all BES Cyber Systems, regardless of impact. Part 2.~~3~~ 4 uses the phrase "external routable protocol ~~connections~~paths" instead of the defined term "External Routable Connectivity," because the latter term has very specific connotations relating to Electronic Security Perimeters and high and medium impact BES Cyber Systems. Using the glossary term "External Routable Connectivity" in the context of Requirement R2 would not be appropriate because Requirement R2 is limited in scope to low impact BES Cyber Systems. The Standard Drafting Team (SDT) intent in using the phrase "external routable protocol paths" is to focus only on the paths to the low impact BES Cyber Systems and not the paths to other networks (e.g., corporate paths).

The additions to Requirement R2, in particular the processes required under Parts 2.2-2.6, address FERC Order No. 791 paragraphs 106-110, which require the standard to address the lack of objective criteria against which NERC and the Commission can evaluate the sufficiency of an entity's protections for low impact assets. The SDT pulled language and concepts from CIP-004, CIP-005, CIP-006, and CIP-008 in order to add objective criteria to each of the previous policy topic areas in CIP-003, Requirement R2.

In FERC Order No. 791 paragraphs 111-112, FERC upheld that creating and maintaining an inventory of low impact assets for audit purposes would be unduly burdensome, so the inventory statements remain unchanged.

R2. Each Responsible Entity for its assets ~~identified in CIP-002-5, Requirement R1, Part R1.3~~containing low impact BES Cyber Systems~~),~~ shall perform each of the applicable requirement parts in *CIP-003-6 Table R2 – Low Impact Assets* ~~implement, in a manner that identifies, assesses, and corrects deficiencies, one or more documented cyber security policies that collectively address the following topics, and review and obtain CIP Senior Manager approval for those policies at least once every 15 calendar months:~~. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

~~Cyber security awareness;~~

~~Physical security controls;~~

~~Electronic access controls for external routable protocol connections and Dial-up Connectivity; and~~

~~Incident response to a Cyber Security Incident.~~

Note: An inventory, list, or discrete identification of low impact BES Cyber Systems or their BES Cyber Assets is not required. Lists of authorized users are not required.

M2. Evidence must include each of the applicable documented policies and processes that collectively include each of the applicable requirement parts in *CIP-003-6 Table R2 – Low Impact Assets* and any additional evidence to demonstrate implementation as described in the Measures column of the table~~. If any asset locations have been identified per R2 of this Standard, then the following bulleted evidence may be included~~.

~~Examples of evidence may include, but are not limited to, one or more documented cyber security policies and evidence of processes, procedures, or plans that demonstrate the implementation of the required topics; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.~~

CIP-003-6 Table R2 – Low Impact Assets			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	Low Impact BES Cyber Systems	Review and obtain CIP Senior Manager approval at least once every 15 calendar months for one or more documented cyber security policies that collectively address the topics in CIP-003-6, Requirement R2, Parts 2.2 – 2.6.	An example of evidence may include, but is not limited to, one or more documented cyber security policies that address each of the areas in Requirement R2, Parts 2.2 – 2.6 and includes evidence of review and CIP Senior Manager approval at least every 15 calendar months.
2.2	Low Impact BES Cyber Systems	Implement one or more documented processes that include operational or procedural control(s) to restrict physical access.	An example of evidence may include, but is not limited to, documentation of the operational or procedural control(s).
2.3	Low Impact BES Cyber Systems at Control Centers	Implement one or more documented processes that collectively include the following: 2.3.1. Escorted access of visitors; and 2.3.2. For Control Centers with external routable protocol paths, monitoring physical access point(s).	Examples of evidence may include, but are not limited to: • For 2.3.1, documentation of visitor escort procedure(s) at Control Centers. • For 2.3.2, documentation describing how the Responsible Entity monitors physical access points into Control Centers that have

CIP-003-6 Table R2 – Low Impact Assets			
Part	**Applicable Systems**	**Requirements**	**Measures**
			external routable protocol paths.
2.4	Low Impact BES Cyber Systems	Implement one or more documented processes that collectively include the following: 2.4.1. All external routable protocol paths, if any, must be through one or more identified access point(s). 2.4.2. For each identified access point, if any, require inbound and outbound access permissions, including the reason for granting access, and deny all other access by default. 2.4.3. Authentication when establishing Dial-up Connectivity, per Cyber Asset capability.	Examples of evidence may include, but are not limited to: • For 2.4.1, documentation of external routable protocol paths through identified access points. • For 2.4.2, a representative sample of a list of restrictions (e.g., firewall rules, access control lists, data diode, etc.) that demonstrates that only permitted access is allowed and that each access rule has a reason documented individually or by group. • For 2.4.3, documentation of authentication controls applied to dial-up access connections.

CIP-003-6 Table R2 – Low Impact Assets			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.5	Low Impact BES Cyber Systems	Implement one or more Cyber Security Incident response plan(s) that collectively include the following: 2.5.1. Identification, classification, and response to Cyber Security Incidents. 2.5.2. Determination of whether an identified Cyber Security Incident is a Reportable Cyber Security Incident. 2.5.3. Notification of Reportable Cyber Security Incidents to the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), unless prohibited by law. 2.5.4. The roles and responsibilities of Cyber Security Incident response groups or individuals. 2.5.5. Incident handling procedures for Cyber Security Incidents. 2.5.6. Testing of the plan(s) at least once per 36 calendar months, either through a paper drill, tabletop exercise, or a response to an actual Reportable Cyber Security Incident.	Examples of evidence may include, but are not limited to: • One or more documented cyber security incident response plans that include the requirement parts. • Dated evidence that shows the testing or execution of the plan(s) at least once per 36 calendar months, either through a paper drill, tabletop exercise, or a response to an actual Reportable Cyber Security Incident.

CIP-003-6 Table R2 – Low Impact Assets			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.6	Low Impact BES Cyber Systems	Implement a security awareness program that reinforces cyber security practices at least quarterly. Once every 15 calendar months, the program shall reinforce Parts 2.2, 2.3, 2.4, and 2.5 above.	An example of evidence may include, but is not limited to, one or more documents describing how the Responsible Entity is implementing its cyber security awareness program per 2.6.

Rationale for Requirement R3:

The identification and documentation of the single CIP Senior Manager ensures that there is clear authority and ownership for the CIP program within an organization, as called for in Blackout Report Recommendation 43. The language that identifies CIP Senior Manager responsibilities is included in the *Glossary of Terms used in NERC Reliability Standards* so that it may be used across the body of CIP standards without an explicit cross-reference.

FERC Order No. 706, Paragraph 296, requests consideration of whether the single senior manager should be a corporate officer or equivalent. As implicated through the defined term, the senior manager has "the overall authority and responsibility for leading and managing implementation of the requirements within this set of standards" which ensures that the senior manager is of sufficient position in the Responsible Entity to ensure that cyber security receives the prominence that is necessary. In addition, given the range of business models for responsible entities, from municipal, cooperative, federal agencies, investor owned utilities, privately owned utilities, and everything in between, the SDT believes that requiring the senior manager to be a "corporate officer or equivalent" would be extremely difficult to interpret and enforce on a consistent basis.

R3. Each Responsible Entity shall identify a CIP Senior Manager by name and document any change within 30 calendar days of the change. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. An example of evidence may include, but is not limited to, a dated and approved document from a high level official designating the name of the individual identified as the CIP Senior Manager.

Rationale for Requirement R4:

The intent of the requirement is to ensure clear accountability within an organization for certain security matters. It also ensures that delegations are kept up-to-date and that individuals do not assume undocumented authority.

In FERC Order No. 706, Paragraphs 379 and 381, the Commission notes that Recommendation 43 of the 2003 Blackout Report calls for "clear lines of authority and ownership for security matters." With this in mind, the Standard Drafting Team has sought to provide clarity in the requirement for delegations so that this line of authority is clear and apparent from the documented delegations.

R4. The Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ a documented process to delegate authority, unless no delegations are used. Where allowed by the CIP Standards, the CIP Senior Manager

may delegate authority for specific actions to a delegate or delegates. These delegations shall be documented, including the name or title of the delegate, the specific actions delegated, and the date of the delegation; approved by the CIP Senior Manager; and updated within 30 days of any change to the delegation. Delegation changes do not need to be reinstated with a change to the delegator. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. An example of evidence may include, but is not limited to, a dated document, approved by the CIP Senior Manager, listing individuals (by name or title) who are delegated the authority to approve or authorize specifically identified items.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

~~The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.~~

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints Text

1.4. Additional Compliance Information:

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The number of policies and their specific language are guided by a Responsible Entity's management structure and operating conditions. Policies might be included as part of a general information security program for the entire organization, or as components of specific programs. The cyber security policy must cover in sufficient detail the nine topical areas required by CIP-003-6~~5~~, Requirement R1. The Responsible Entity has the flexibility to develop a single comprehensive cyber security policy covering these topics, or it may choose to develop a single high-level umbrella policy and provide additional policy detail in lower level documents in its documentation hierarchy. In the case of a high-level umbrella policy, the Responsible Entity would be expected to provide the high-level policy as well as the additional documentation in order to demonstrate compliance with CIP-003-6~~5~~, Requirement R1. Implementation of the cyber security policy is not specifically included in CIP-003-6~~5~~, Requirement R1 as it is envisioned that the implementation of this policy is evidenced through successful implementation of CIP-004 through CIP-011. However, Responsible Entities are encouraged not to limit the scope of their cyber security policies to only those requirements from CIP-004 through CIP-011, but rather to put together a holistic cyber security policy appropriate to its organization. The assessment through the Compliance Monitoring and Enforcement Program of policy items that extend beyond the scope of CIP-004 through CIP-011 should not be considered candidates for potential violations. The Responsible Entity should consider the following for each of the required topics in its cyber security policy:

1.1 Personnel & training (CIP-004)

- Organization position on acceptable background investigations
- Identification of possible disciplinary action for violating this policy
- Account management

1.2 Electronic Security Perimeters (CIP-005) including Interactive Remote Access

- Organization stance on use of wireless networks
- Identification of acceptable authentication methods
- Identification of trusted and untrusted resources
- Monitoring and logging of ingress and egress at Electronic Access Points
- Maintaining up-to-date anti-malware software before initiating Interactive Remote Access
- Maintaining up-to-date patch levels for operating systems and applications used to initiate Interactive Remote Access
- Disabling VPN "split-tunneling" or "dual-homed" workstations before initiating Interactive Remote Access
- For vendors, contractors, or consultants: include language in contracts that requires adherence to the Responsible Entity's Interactive Remote Access controls

1.3 Physical security of BES Cyber Systems (CIP-006)

- Strategy for protecting Cyber Assets from unauthorized physical access
- Acceptable physical access control methods
- Monitoring and logging of physical ingress

1.4 System security management (CIP-007)

- Strategies for system hardening
- Acceptable methods of authentication and access control
- Password policies including length, complexity, enforcement, prevention of brute force attempts
- Monitoring and logging of BES Cyber Systems

1.5 Incident reporting and response planning (CIP-008)

- Recognition of Cyber Security Incidents
- Appropriate notifications upon discovery of an incident
- Obligations to report Cyber Security Incidents

1.6 Recovery plans for BES Cyber Systems (CIP-009)

- Availability of spare components

- Availability of system backups

1.7 Configuration change management and vulnerability assessments (CIP-010)

- Initiation of change requests
- Approval of changes
- Break-fix processes

1.8 Information protection (CIP-011)

- Information access control methods
- Notification of unauthorized information disclosure
- Information access on a need-to-know basis

1.9 Declaring and responding to CIP Exceptional Circumstances

- Processes to invoke special procedures in the event of a CIP Exceptional Circumstance
- Processes to allow for exceptions to policy that do not violate CIP requirements

The Standard Drafting Team (SDT) has removed requirements relating to exceptions to a Responsible Entity's security policies since it is a general management issue that is not within the scope of a reliability requirement. The SDT considers it to be an internal policy requirement and not a reliability requirement. However, the SDT encourages Responsible Entities to continue this practice as a component of its cyber security policy.

In this and all subsequent required approvals in the NERC CIP Standards, the Responsible Entity may elect to use hardcopy or electronic approvals to the extent that there is sufficient evidence to ensure the authenticity of the approving party.

Requirement R2:

~~As with Requirement R1, the number of policies and their specific language would be guided by a Responsible Entity's management structure and operating conditions. Policies might be included as part of a general information security program for the entire organization or as components of specific programs. The cyber security policy must cover in sufficient detail the four topical areas required by CIP-003-5, Requirement R2. The Responsible Entity has flexibility to develop a single comprehensive cyber security policy covering these topics, or it may choose to develop a single high-level umbrella policy and provide additional policy detail in lower level documents in its documentation hierarchy. In the case of a high-level umbrella policy, the Responsible Entity would be expected to provide the high-level policy as well as the additional documentation in order to demonstrate compliance with CIP-003-5, Requirement R2. The intent of the requirement is to outline a set of basic protections that all low impact BES Cyber Systems should receive without requiring a significant administrative and compliance overhead. The SDT intends that demonstration of this requirement can be reasonably accomplished through providing evidence of related processes, procedures, or plans. While the audit staff may choose to review an example low impact BES Cyber System, the SDT believes strongly that the current method (as of this writing) of reviewing a statistical sample of systems is not~~

~~necessary. The SDT also notes that in topic 2.3, the SDT uses the term "electronic access control" in the general sense, i.e., to control access, and not in the specific technical sense requiring authentication, authorization, and auditing.~~

The intent of the requirement is to outline a set of protections designed for all low impact BES Cyber Systems. The SDT is balancing the fact that low impact BES Cyber Systems are indeed low impact to the BES, but they do meet the definition of having a 15-minute adverse impact so some protections are needed. The intent is that such protections are part of a program that covers the low impact BES Cyber Systems collectively either at a programmatic or site level, not an individual device or system level.

There are four main areas that must be covered by this security program: physical security, electronic access controls for all external routable protocol paths or Dial-up Connectivity, a security awareness program, and cyber security incident response plans.

The SDT intends that demonstration of this requirement can be reasonably accomplished through providing evidence of related processes, procedures, or plans. While the audit staff may choose to review an example low impact BES Cyber System, the SDT believes strongly that the current method (as of this writing) of reviewing a statistical sample of systems is not necessary.

2.1 - As with Requirement R1, the number of policies and the specific language used in them would be guided by a Responsible Entity's management structure and operating conditions. Policies might be included as part of a general information security program for the entire organization or as components of specific programs. The cyber security policy must cover in sufficient detail the four topical areas in CIP-003-6, Requirement R2, Parts 2.2 through 2.6. The Responsible Entity has flexibility in the number and structure of its policies to meet its needs and organization. Examples include developing a single comprehensive cyber security policy covering these topics for all in-scope assets, several comprehensive cyber security policies based on asset type, or a single high-level umbrella policy with additional policy detail in lower level documents in its documentation hierarchy.

2.2 – The Responsible Entity must document and implement processes that include the physical security of the low impact BES Cyber Systems at a BES asset. The Responsible Entity has flexibility in the controls used and the granularity of those controls. The entity is to document its operational or physical controls that restrict access to the low impact BES Cyber Systems at the asset. Entities may utilize perimeter controls (fences with locked gates, guards, site access policies, etc.) and/or more granular areas of access control in areas where low impact BES Cyber Systems are located, such as control rooms or control houses. Lists of authorized users are not required.

2.3 – The Responsible Entity must document and implement processes that include the physical security of the low impact BES Cyber Systems at Control Centers. For Control Centers, the entity should further describe the process for handling escorted access of visitors. For Control Centers that have external routable connectivity, monitoring of physical access points is also required. Monitoring does not imply logging and maintaining logs, but monitoring that access has been

granted through an access point (door alarm, etc.). The monitoring does not need to be per low impact BES Cyber System but should be at the level as determined by the entity's controls.

2.4 – The Responsible Entity must have implemented processes that include the external routable protocol and Dialup connectivity paths to the BES asset such that the low impact BES Cyber Systems located at the BES asset are protected. The electronic access controls should address the risk of using the asset's external connectivity to gain access to the low impact BES Cyber Systems. The entity should be able to describe how its electronic access controls on the external connectivity paths protect the collection of low impact BES Cyber Systems at the site. The intent is to reduce the risk of aggregation of numerous low impact BES Cyber Systems at the site or across multiple sites through external connectivity.

Examples of sufficient access controls may include:

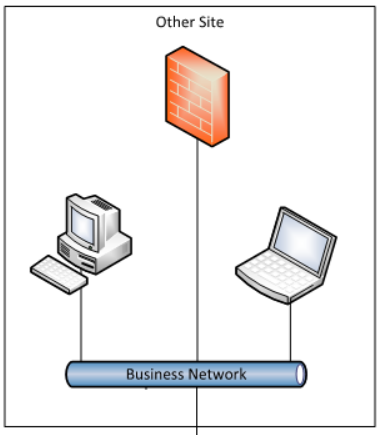
- All the external routable protocol connectivity paths to the asset pass through a firewall that denies all traffic by default with explicit inbound and outbound access permissions defined, or equivalent method by which both inbound and outbound connections are shielded from or to the world-wide-web (e.g. IP addresses, ports, services, and data diode) for scenarios representative of the Responsible Entity's sites having Low Impact BES Cyber Systems.
- Dialup Connectivity to a low impact BES Cyber System is set to dial out only (no auto-answer) to a preprogrammed number to deliver data. Incoming Dialup Connectivity is to a dialback modem, a modem that must be remotely controlled by the control center or control room, has some form of access control, or the low impact BES Cyber System has access control.

Some examples of situations that would lack sufficient access controls to meet the intent of this requirement include:

- An asset has dialup connectivity and a low impact BES Cyber System is reachable via an auto-answer modem that connects any caller to the Cyber Asset which has a default password. There is no access control in this instance.
- An asset has external routable connectivity due to a BES Cyber System within it having a 3G/4G wireless card on a public carrier which allows the BES Cyber System to be reachable via a public IP address. In essence, low impact BES Cyber Systems should not be accessible from the Internet and search engines such as Shodan.

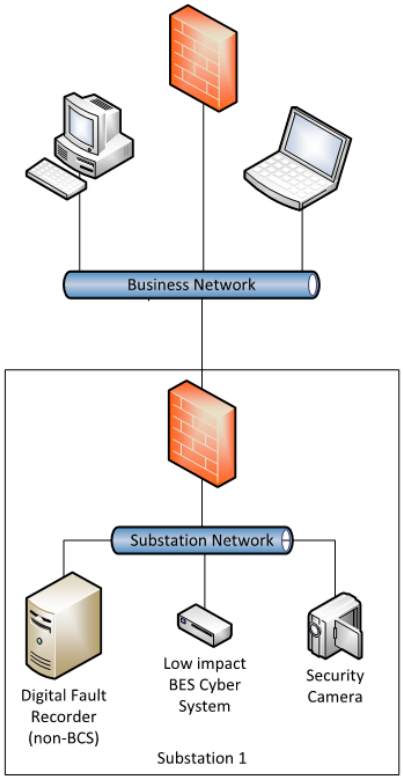
The SDT also notes that in topic 2.4, the SDT uses the term "electronic access control" in the general sense, i.e., to control access, and not in the specific technical sense requiring authentication, authorization, and auditing.

The following diagrams explain the SDT's rationale.



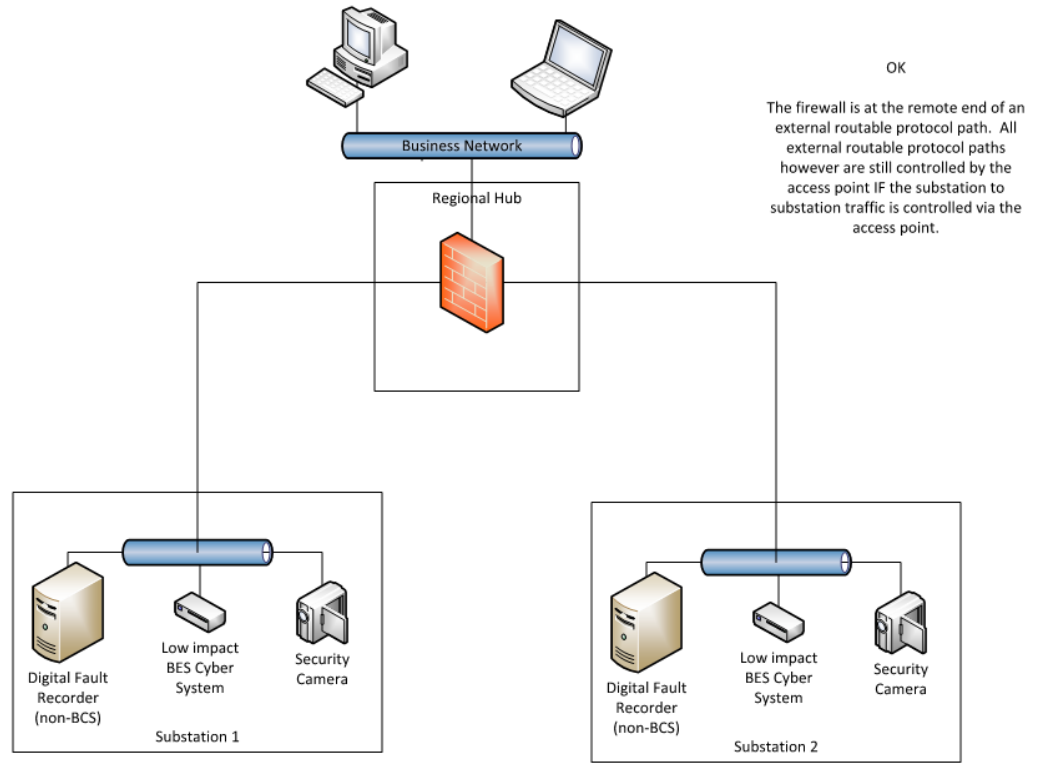
NOT OK

The BES Cyber System is behind an access point, however all external routable protocol paths to the BES Cyber System are not controlled by an access point if they originate on the business network.



OK

All the external traffic to the BES Cyber System is controlled by an access point.



2.5 - The entity should have a documented cyber security incident response plan that includes each of the topics listed. For assets that have limited or no connectivity, it is not the intent to increase their risk by increasing the level of connectivity in order to have real-time monitoring. The intent is if in the normal course of business suspicious activities are noted at an asset containing low impact BES Cyber Systems, there is a cyber security incident response plan that will guide the entity through responding to the incident and reporting the incident if it rises to the level of a Reportable Cyber Security Incident. The plan(s) must be tested once every 36 months. This is not an exercise per low impact BES Cyber Asset or per type of BES Cyber Asset but an exercise of each incident response plan the entity created to meet this requirement. An actual Reportable Cyber Security Incident counts as an exercise as well as other forms of tabletop exercises or paper drills. NERC-led exercises such as GridEx participation would also count as an exercise if the entity's response plan is followed.

For low impact BES Cyber Systems, the only portion of the definition of Cyber Security Incident that would apply is, "A malicious act or suspicious event that disrupts, or was an attempt to disrupt, the operation of a BES Cyber System." The other portion of that definition is not to be used to require ESPs and PSPs for low impact BES Cyber Systems.

2.6 - The intent of the security awareness program is for entities to reinforce good cyber security practices with their personnel on at least a quarterly basis. The physical security, electronic access controls, and the cyber security incident response plan should be covered at least every 15 months. It is up to the entity as to the topics and how it schedules these topics. It should be sufficient for an entity to produce the awareness material that it delivered quarterly and the delivery method(s) (posters, emails, topics at staff meetings, etc.). The intent is that tracking of reception of the messages by personnel is not required.

Requirement R3:

The intent of CIP-003-6~~5~~, Requirement R3 is effectively unchanged since prior versions of the standard. The specific description of the CIP Senior Manager has now been included as a defined term rather than clarified in the Standard itself to prevent any unnecessary cross-reference to this standard. It is expected that this CIP Senior Manager play a key role in ensuring proper strategic planning, executive/board-level awareness, and overall program governance.

Requirement R4:

As indicated in the rationale for CIP-003-6~~5~~, Requirement R4, this requirement is intended to demonstrate a clear line of authority and ownership for security matters. The intent of the SDT was not to impose any particular organizational structure, but, rather, the Responsible Entity should have significant flexibility to adapt this requirement to their existing organizational structure. A Responsible Entity may satisfy this requirement through a single delegation document or through multiple delegation documents. The Responsible Entity can make use of the delegation of the delegation authority itself to increase the flexibility in how this applies to its organization. In such a case, delegations may exist in numerous documentation records as long as the collection of these documentation records provides a clear line of authority back to the CIP Senior Manager. In addition, the CIP Senior Manager could also choose not to delegate any authority and meet this requirement without such delegation documentation.

The Responsible Entity must keep its documentation of the CIP Senior Manager and any delegations up to date. This is to ensure that individuals do not assume any undocumented authority. However, delegations do not have to be re-instated if the individual who delegated the task changes roles or is replaced. For instance, assume that John Doe is named the CIP Senior Manager and he delegates a specific task to the Substation Maintenance Manager. If John Doe is replaced as the CIP Senior Manager, the CIP Senior Manager documentation must be updated within the specified timeframe, but the existing delegation to the Substation Maintenance Manager remains in effect as approved by the previous CIP Senior Manager, John Doe.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014

Description of Current Draft

This draft standard is being posted for an initial comment and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
First 45-Day Comment Period Opens	June 2014
Additional 45-Day Comment Period (if necessary)	August 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-004-5.	
6	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** Cyber Security — Personnel & Training

2. **Number:** CIP-004-6

3. **Purpose:** To minimize the risk against compromise that could lead to misoperation or instability in the BES from individuals accessing BES Cyber Systems by requiring an appropriate level of personnel risk assessment, training, and security awareness in support of protecting BES Cyber Systems.

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1. Balancing Authority

   4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2. Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

   4.1.3. Generator Operator

   4.1.4. Generator Owner

4.1.5. Interchange Coordinator or Interchange Authority

4.1.6. Reliability Coordinator

4.1.7. Transmission Operator

4.1.8. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-004-6:

4.2.3.1. Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5. Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-004-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is six calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

6. Background:

Standard CIP-004 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.

- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.

- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.

- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.

- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.

B. Requirements and Measures

Rationale for Requirement R1:

Ensures that Responsible Entities with personnel who have authorized electronic or authorized unescorted physical access to BES Cyber Assets take action so that those personnel with such authorized electronic or authorized unescorted physical access maintain awareness of the Responsible Entity's security practices.

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in *CIP-004-6 Table R1 – Security Awareness Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-004-6Table R1 – Security Awareness Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-6 Table R1 – Security Awareness Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Security awareness that, at least once each calendar quarter, reinforces cyber security practices (which may include associated physical security practices) for the Responsible Entity's personnel who have authorized electronic or authorized unescorted physical access to BES Cyber Systems.	An example of evidence may include, but is not limited to, documentation that the quarterly reinforcement has been provided. Examples of evidence of reinforcement may include, but are not limited to, dated copies of information used to reinforce security awareness, as well as evidence of distribution, such as: • direct communications (for example, e-mails, memos, computer-based training); or

CIP-004-6 Table R1 – Security Awareness Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
			• indirect communications (for example, posters, intranet, or brochures); or • management support and reinforcement (for example, presentations or meetings).

Rationale for Requirement R2:

To ensure that the Responsible Entity's training program for personnel who need authorized electronic access and/or authorized unescorted physical access to BES Cyber Systems covers the proper policies, access controls, and procedures to protect BES Cyber Systems and are trained before access is authorized.

R2. Each Responsible Entity shall implement one or more cyber security training program(s) appropriate to individual roles, functions, or responsibilities that collectively includes each of the applicable requirement parts in *CIP-004-6 Table R2 – Cyber Security Training Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M2. Evidence must include the training program that includes each of the applicable requirement parts in *CIP-004-6 Table R2 – Cyber Security Training Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-6 Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Training content on: 2.1.1. Cyber security policies; 2.1.2. Physical access controls; 2.1.3. Electronic access controls; 2.1.4. The visitor control program; 2.1.5. Handling of BES Cyber System Information and its storage; 2.1.6. Identification of a Cyber Security Incident and initial notifications in accordance with the entity's incident response plan; 2.1.7. Recovery plans for BES Cyber Systems; 2.1.8. Response to Cyber Security Incidents; and 2.1.9. Cyber security risks associated with a BES Cyber System's electronic interconnectivity and interoperability with other Cyber Assets, including Transient Cyber Assets, and with Removable Media.	Examples of evidence may include, but are not limited to, training material such as power point presentations, instructor notes, student notes, handouts, or other training materials.

CIP-004-6 Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Require completion of the training specified in Part 2.1 prior to granting authorized electronic access and authorized unescorted physical access to applicable Cyber Assets, except during CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, training records and documentation of when CIP Exceptional Circumstances were invoked.
2.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Require completion of the training specified in Part 2.1 at least once every 15 calendar months.	Examples of evidence may include, but are not limited to, dated individual training records.

Rationale for Requirement R3:

To ensure that individuals who need authorized electronic or authorized unescorted physical access to BES Cyber Systems have been assessed for risk. Whether initial access or maintaining access, those with access must have had a personnel risk assessment completed within the last 7 years.

R3. Each Responsible Entity shall implement one or more documented personnel risk assessment program(s) to attain and retain authorized electronic or authorized unescorted physical access to BES Cyber Systems that collectively include each of the applicable requirement parts in *CIP-004-6 Table R3 – Personnel Risk Assessment Program*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M3. Evidence must include the documented personnel risk assessment programs that collectively include each of the applicable requirement parts in *CIP-004-6 Table R3 – Personnel Risk Assessment Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-6 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to confirm identity.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to confirm identity.

CIP-004-6 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to perform a seven year criminal history records check as part of each personnel risk assessment that includes: 3.2.1. current residence, regardless of duration; and 3.2.2. other locations where, during the seven years immediately prior to the date of the criminal history records check, the subject has resided for six consecutive months or more. If it is not possible to perform a full seven year criminal history records check, conduct as much of the seven year criminal history records check as possible and document the reason the full seven year criminal history records check could not be performed.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to perform a seven year criminal history records check.

CIP-004-6 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Criteria or process to evaluate criminal history records checks for authorizing access.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to evaluate criminal history records checks.
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Criteria or process for verifying that personnel risk assessments performed for contractors or service vendors are conducted according to Parts 3.1 through 3.3.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's criteria or process for verifying contractors or service vendors personnel risk assessments.

CIP-004-6 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.5	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to ensure that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed according to Parts 3.1 to 3.4 within the last seven years.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process for ensuring that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed within the last seven years.

Rationale for Requirement R4:

To ensure that individuals with access to BES Cyber Systems and the physical and electronic locations where BES Cyber System Information is stored by the Responsible Entity have been properly authorized for such access. "Authorization" should be considered to be a grant of permission by a person or persons empowered by the Responsible Entity to perform such grants and included in the delegations referenced in CIP-003-6. "Provisioning" should be considered the actions to provide access to an individual.

Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (i.e., physical access control system, remote access system, directory services).

CIP Exceptional Circumstances are defined in a Responsible Entity's policy from CIP-003-6 and allow an exception to the requirement for authorization to BES Cyber Systems and BES Cyber System Information.

Quarterly reviews in Part 4.5 are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to access the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

If the results of quarterly or annual account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that the error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

R4. Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in *CIP-004-6 Table R4 – Access Management Program. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning and Same Day Operations].*

M4. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-004-6 Table R4 – Access Management Program* and additional evidence to demonstrate that the access management program was implemented as described in the Measures column of the table.

CIP-004-6 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to authorize based on need, as determined by the Responsible Entity, except for CIP Exceptional Circumstances: 4.1.1. Electronic access; 4.1.2. Unescorted physical access into a Physical Security Perimeter; and 4.1.3. Access to designated storage locations, whether physical or electronic, for BES Cyber System Information.	An example of evidence may include, but is not limited to, dated documentation of the process to authorize electronic access, unescorted physical access in a Physical Security Perimeter, and access to designated storage locations, whether physical or electronic, for BES Cyber System Information.

CIP-004-6 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Verify at least once each calendar quarter that individuals with active electronic access or unescorted physical access have authorization records.	Examples of evidence may include, but are not limited to: • Dated documentation of the verification between the system generated list of individuals who have been authorized for access (i.e., workflow database) and a system generated list of personnel who have access (i.e., user account listing), or • Dated documentation of the verification between a list of individuals who have been authorized for access (i.e., authorization forms) and a list of individuals provisioned for access (i.e., provisioning forms or shared account listing).

CIP-004-6 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For electronic access, verify at least once every 15 calendar months that all user accounts, user account groups, or user role categories, and their specific, associated privileges are correct and are those that the Responsible Entity determines are necessary.	An example of evidence may include, but is not limited to, documentation of the review that includes all of the following: 1. A dated listing of all accounts/account groups or roles within the system; 2. A summary description of privileges associated with each group or role; 3. Accounts assigned to the group or role; and 4. Dated evidence showing verification of the privileges for the group are authorized and appropriate to the work function performed by people assigned to each account.

CIP-004-6 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Verify at least once every 15 calendar months that access to the designated storage locations for BES Cyber System Information, whether physical or electronic, are correct and are those that the Responsible Entity determines are necessary for performing assigned work functions.	An example of evidence may include, but is not limited to, the documentation of the review that includes all of the following: 1. A dated listing of authorizations for BES Cyber System information; 2. Any privileges associated with the authorizations; and 3. Dated evidence showing a verification of the authorizations and any privileges were confirmed correct and the minimum necessary for performing assigned work functions.

Rationale for Requirement R5:

The timely revocation of electronic access to BES Cyber Systems is an essential element of an access management regime. When an individual no longer requires access to a BES Cyber System to perform his or her assigned functions, that access should be revoked. This is of particular importance in situations where a change of assignment or employment is involuntary, as there is a risk the individual(s) involved will react in a hostile or destructive manner.

In considering how to address directives in FERC Order No. 706 directing "immediate" revocation of access for involuntary separation, the SDT chose not to specify hourly time parameters in the requirement (e.g., revoking access within 1 hour). The point in time at which an organization terminates a person cannot generally be determined down to the hour. However, most organizations have formal termination processes, and the timeliest revocation of access occurs in concurrence with the initial processes of termination.

Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (e.g., physical access control system, remote access system, directory services).

R5. Each Responsible Entity shall implement one or more documented access revocation program(s) that collectively include each of the applicable requirement parts in *CIP-004-6 Table R5 – Access Revocation*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning].*

M5. Evidence must include each of the applicable documented programs that collectively include each of the applicable requirement parts in *CIP-004-6 Table R5 – Access Revocation* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-6 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	A process to initiate removal of an individual's ability for unescorted physical access and Interactive Remote Access upon a termination action, and complete the removals within 24 hours of the termination action (Removal of the ability for access may be different than deletion, disabling, revocation, or removal of all access rights).	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form verifying access removal associated with the termination action; and 2. Logs or other demonstration showing such persons no longer have access.

CIP-004-6 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For reassignments or transfers, revoke the individual's authorized electronic access to individual accounts and authorized unescorted physical access that the Responsible Entity determines are not necessary by the end of the next calendar day following the date that the Responsible Entity determines that the individual no longer requires retention of that access.	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form showing a review of logical and physical access; and 2. Logs or other demonstration showing such persons no longer have access that the Responsible Entity determines is not necessary.

CIP-004-6 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For termination actions, revoke the individual's access to the designated storage locations for BES Cyber System Information, whether physical or electronic (unless already revoked according to Requirement R5.1), by the end of the next calendar day following the effective date of the termination action.	An example of evidence may include, but is not limited to, workflow or sign-off form verifying access removal to designated physical areas or cyber systems containing BES Cyber System Information associated with the terminations and dated within the next calendar day of the termination action.

CIP-004-6 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.4	High Impact BES Cyber Systems and their associated: • EACMS	For termination actions, revoke the individual's non-shared user accounts (unless already revoked according to Parts 5.1 or 5.3) within 30 calendar days of the effective date of the termination action.	An example of evidence may include, but is not limited to, workflow or sign-off form showing access removal for any individual BES Cyber Assets and software applications as determined necessary to completing the revocation of access and dated within thirty calendar days of the termination actions.

CIP-0046 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.5	High Impact BES Cyber Systems and their associated: • EACMS	For termination actions, change passwords for shared account(s) known to the user within 30 calendar days of the termination action. For reassignments or transfers, change passwords for shared account(s) known to the user within 30 calendar days following the date that the Responsible Entity determines that the individual no longer requires retention of that access. If the Responsible Entity determines and documents that extenuating operating circumstances require a longer time period, change the password(s) within 10 calendar days following the end of the operating circumstances.	Examples of evidence may include, but are not limited to: • Workflow or sign-off form showing password reset within 30 calendar days of the termination; • Workflow or sign-off form showing password reset within 30 calendar days of the reassignments or transfers; or • Documentation of the extenuating operating circumstance and workflow or sign-off form showing password reset within 10 calendar days following the end of the operating circumstance.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints Text

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-004-6)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The security awareness program is intended to be an informational program, not a formal training program. It should reinforce security practices to ensure that personnel maintain awareness of best practices for both physical and electronic security to protect its BES Cyber Systems. The Responsible Entity is not required to provide records that show that each individual received or understood the information, but they must maintain documentation of the program materials utilized in the form of posters, memos, and/or presentations.

Examples of possible mechanisms and evidence, when dated, which can be used are:

- Direct communications (e.g., emails, memos, computer based training, etc.);
- Indirect communications (e.g., posters, intranet, brochures, etc.);
- Management support and reinforcement (e.g., presentations, meetings, etc.).

Requirement R2:

Training shall cover the policies, access controls, and procedures as developed for the BES Cyber Systems and include, at a minimum, the required items appropriate to personnel roles and responsibilities from Table R2. The Responsible Entity has the flexibility to define the training program and it may consist of multiple modules and multiple delivery mechanisms, but

a single training program for all individuals needing to be trained is acceptable. The training can focus on functions, roles or responsibilities at the discretion of the Responsible Entity.

One new element in the training content is intended to encompass networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber Systems as per FERC Order No. 706, Paragraph 434. Additionally, training should address the risk posed when connecting and using Transient Cyber Assets and Removable Media with BES Cyber Systems or within an Electronic Security Perimeter. As noted in FERC Order No. 791, Paragraph 135, Transient Cyber Assets and Removable Media have been the source of incidents where malware was introduced into electric generation industrial control systems in real-world situations. Training on their use is a key element in protecting BES Cyber Systems. This is not intended to provide technical training to individuals supporting networking hardware and software, but educating system users of the cyber security risks associated with the interconnectedness of these systems. The users, based on their function, role, or responsibility, should have a basic understanding of which systems can be accessed from other systems and how the actions they take can affect cyber security.

Each Responsible Entity shall ensure all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, complete cyber security training prior to their being granted authorized access, except for CIP Exceptional Circumstances. To retain the authorized accesses, individuals must complete the training at least one every 15 months.

Requirement R3:

Each Responsible Entity shall ensure a personnel risk assessment is performed for all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, prior to their being granted authorized access, except for program specified exceptional circumstances that are approved by the single senior management official or their delegate and impact the reliability of the BES or emergency response. Identity should be confirmed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. Identity only needs to be confirmed prior to initially granting access and only requires periodic confirmation according to the entity's process during the tenure of employment, which may or may not be the same as the initial verification action.

A seven year criminal history check should be performed for those locations where the individual has resided for at least six consecutive months. This check should also be performed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. When it is not possible to perform a full seven year criminal history check, documentation must be made of what criminal history check was performed, and the reasons a full seven-year check could not be performed. Examples of this could include individuals under the age of 25 where a juvenile criminal history may be protected by law, individuals who may have resided in locations from where it is not possible to obtain a criminal history records check, violates the law or is not allowed under the existing collective bargaining agreement. The Responsible Entity should consider the absence of information for the full seven years when assessing the risk of granting access during the process to evaluate the

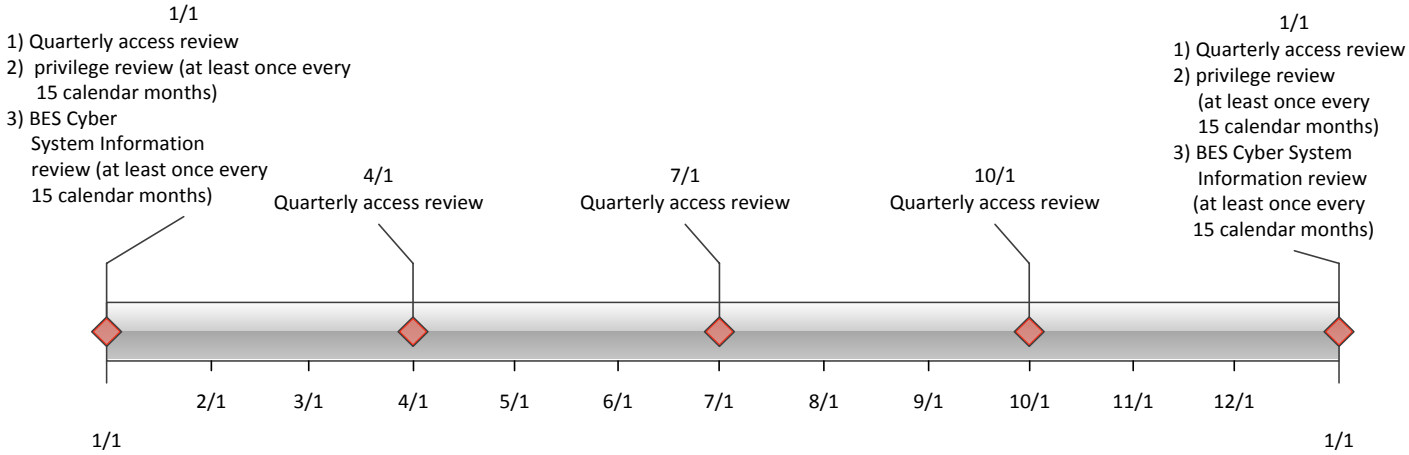
criminal history check. There needs to be a personnel risk assessment that has been completed within the last seven years for each individual with access. A new criminal history records check must be performed as part of the new PRA. Individuals who have been granted access under a previous version of these standards need a new PRA within seven years of the date of their last PRA. The clarifications around the seven year criminal history check in this version do not require a new PRA be performed by the implementation date.

Requirement R4:

Authorization for electronic and unescorted physical access and access to BES Cyber System Information must be on the basis of necessity in the individual performing a work function. Documentation showing the authorization should have some justification of the business need included. To ensure proper segregation of duties, access authorization and provisioning should not be performed by the same person where possible.

This requirement specifies both quarterly reviews and reviews at least once every 15 calendar months. Quarterly reviews are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

The privilege review at least once every 15 calendar months is more detailed to ensure an individual's associated privileges are the minimum necessary to perform their work function (i.e., least privilege). Entities can more efficiently perform this review by implementing role-based access. This involves determining the specific roles on the system (e.g., system operator, technician, report viewer, administrator, etc.) then grouping access privileges to the role and assigning users to the role. Role-based access does not assume any specific software and can be implemented by defining specific provisioning processes for each role where access group



assignments cannot be performed. Role-based access permissions eliminate the need to perform the privilege review on individual accounts. An example timeline of all the reviews in Requirement R4 is included below.

Separation of duties should be considered when performing the reviews in Requirement R4. The person reviewing should be different than the person provisioning access.

If the results of quarterly or at least once every 15 calendar months account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that this error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

Requirement R5:

The requirement to revoke access at the time of the termination action includes procedures showing revocation of access concurrent with the termination action. This requirement recognizes that the timing of the termination action may vary depending on the circumstance. Some common scenarios and possible processes on when the termination action occurs are provided in the following table. These scenarios are not an exhaustive list of all scenarios, but are representative of several routine business practices.

Scenario	Possible Process
Immediate involuntary termination	Human resources or corporate security escorts the individual off site and the supervisor or human resources personnel notify the appropriate personnel to begin the revocation process.
Scheduled involuntary termination	Human resources personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Voluntary termination	Human resources personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Retirement where the last working day is several weeks prior to the termination date	Human resources personnel coordinate with manager to determine the final date access is no longer needed and schedule the revocation of access on the determined day.
Death	Human resources personnel are notified of the death and work with appropriate personnel to begin the revocation process.

Revocation of electronic access should be understood to mean a process with the end result that electronic access to BES Cyber Systems is no longer possible using credentials assigned to or known by the individual(s) whose access privileges are being revoked. Steps taken to accomplish this outcome may include deletion or deactivation of accounts used by the individual(s), but no specific actions are prescribed. Entities should consider the ramifications of deleting an account may include incomplete event log entries due to an unrecognized account or system services using the account to log on.

The initial revocation required in Requirement R5.1 includes unescorted physical access and Interactive Remote Access. These two actions should prevent any further access by the individual after termination. If an individual still has local access accounts (i.e., accounts on the Cyber Asset itself) on BES Cyber Assets, then the Responsible Entity has 30 days to complete the revocation process for those accounts. However, nothing prevents a Responsible Entity from performing all of the access revocation at the time of termination.

For transferred or reassigned individuals, a review of access privileges should be performed. This review could entail a simple listing of all authorizations for an individual and working with the respective managers to determine which access will still be needed in the new position. For instances in which the individual still needs to retain access as part of a transitory period, the entity should schedule a time to review these access privileges or include the privileges in the quarterly account review or annual privilege review.

Revocation of access to shared accounts is called out separately to prevent the situation where passwords on substation and generation devices are constantly changed due to staff turnover.

Requirement 5.5 specified that passwords for shared account are to the changed within 30 calendar days of the termination action or when the Responsible Entity determines an individual no longer requires access to the account as a result of a reassignment or transfer. The 30 days applies under normal operating conditions. However, circumstances may occur where this is not possible. Some systems may require an outage or reboot of the system in order to complete the password change. In periods of extreme heat or cold, many Responsible Entities may prohibit system outages and reboots in order to maintain reliability of the BES. When these circumstances occur, the Responsible Entity must document these circumstances and prepare to change the password within 10 calendar days following the end of the operating circumstances. Records of activities must be retained to show that the Responsible Entity followed the plan they created.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014

Description of Current Draft

This draft standard is being posted for an initial comment and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
First 45-Day Comment Period Opens	June 2014
Additional 45-Day Comment Period (if necessary)	August 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-004-5.	
6	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** Cyber Security — Personnel & Training

2. **Number:** CIP-004-~~5.1~~6

3. **Purpose:** To minimize the risk against compromise that could lead to misoperation or instability in the BES from individuals accessing BES Cyber Systems by requiring an appropriate level of personnel risk assessment, training, and security awareness in support of protecting BES Cyber Systems.

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1. Balancing Authority

   4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2. Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

   4.1.3. Generator Operator

   4.1.4. Generator Owner

4.1.5. Interchange Coordinator or Interchange Authority

4.1.6. Reliability Coordinator

4.1.7. Transmission Operator

4.1.8. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-004-~~5.1~~6:

4.2.3.1. Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5. Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-004-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is six calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

6. Background:

Standard CIP-004 ~~5.1~~ exists as part of a suite of CIP Standards related to cyber security, which ~~CIP-002-5~~ requires the initial identification and categorization of BES Cyber Systems ~~CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1 and CIP-011-1~~ and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems. ~~This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards.*~~

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

~~The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:~~

~~Each Responsible Entity shall implement **in a manner that identifies, assesses, and corrects deficiencies, . . .~~

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in ~~their~~ its documented processes, but ~~they~~ it must address the applicable requirements in the table. ~~The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements~~

~~described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities.~~

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.

- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.

- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.

- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.

- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.

B. Requirements and Measures

Rationale for Requirement R1:

Ensures that Responsible Entities with personnel who have authorized electronic or authorized unescorted physical access to BES Cyber Assets take action so that those personnel with such authorized electronic or authorized unescorted physical access maintain awareness of the Responsible Entity's security practices.

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~6 Table R1 – Security Awareness Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~ 6Table R1 – Security Awareness Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-~~5.1~~6 Table R1 – Security Awareness Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Security awareness that, at least once each calendar quarter, reinforces cyber security practices (which may include associated physical security practices) for the Responsible Entity's personnel who have authorized electronic or authorized unescorted physical access to BES Cyber Systems.	An example of evidence may include, but is not limited to, documentation that the quarterly reinforcement has been provided. Examples of evidence of reinforcement may include, but are not limited to, dated copies of information used to reinforce security awareness, as well as evidence of distribution, such as: • direct communications (for example, e-mails, memos, computer-based training); or

CIP-004-~~5.1~~6 Table R1 – Security Awareness Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
			• indirect communications (for example, posters, intranet, or brochures); or • management support and reinforcement (for example, presentations or meetings).

Rationale for Requirement R2:

To ensure that the Responsible Entity's training program for personnel who need authorized electronic access and/or authorized unescorted physical access to BES Cyber Systems covers the proper policies, access controls, and procedures to protect BES Cyber Systems and are trained before access is authorized.

R2. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ ~~a~~ one or more cyber security training program(s) appropriate to individual roles, functions, or responsibilities that collectively includes each of the applicable requirement parts in *CIP-004-~~5.1~~6 Table R2 – Cyber Security Training Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M2. Evidence must include the training program that includes each of the applicable requirement parts in *CIP-004-~~5.1~~6 Table R2 – Cyber Security Training Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-~~5.1~~6 Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Training content on: 2.1.1. Cyber security policies; 2.1.2. Physical access controls; 2.1.3. Electronic access controls; 2.1.4. The visitor control program; 2.1.5. Handling of BES Cyber System Information and its storage; 2.1.6. Identification of a Cyber Security Incident and initial notifications in accordance with the entity's incident response plan; 2.1.7. Recovery plans for BES Cyber Systems; 2.1.8. Response to Cyber Security Incidents; and 2.1.9. Cyber security risks associated with a BES Cyber System's electronic interconnectivity and interoperability with other Cyber Assets, including Transient Cyber Assets, and with Removable Media.	Examples of evidence may include, but are not limited to, training material such as power point presentations, instructor notes, student notes, handouts, or other training materials.

CIP-004-~~5.1~~6 Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Require completion of the training specified in Part 2.1 prior to granting authorized electronic access and authorized unescorted physical access to applicable Cyber Assets, except during CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, training records and documentation of when CIP Exceptional Circumstances were invoked.
2.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Require completion of the training specified in Part 2.1 at least once every 15 calendar months.	Examples of evidence may include, but are not limited to, dated individual training records.

Rationale for Requirement R3:

To ensure that individuals who need authorized electronic or authorized unescorted physical access to BES Cyber Systems have been assessed for risk. Whether initial access or maintaining access, those with access must have had a personnel risk assessment completed within the last 7 years.

R3. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented personnel risk assessment program(s) to attain and retain authorized electronic or authorized unescorted physical access to BES Cyber Systems that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~6 Table R3 – Personnel Risk Assessment Program*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M3. Evidence must include the documented personnel risk assessment programs that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~6 Table R3 – Personnel Risk Assessment Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-~~5.1~~6 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to confirm identity.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to confirm identity.

CIP-004-~~5.1~~6 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to perform a seven year criminal history records check as part of each personnel risk assessment that includes: 3.2.1. current residence, regardless of duration; and 3.2.2. other locations where, during the seven years immediately prior to the date of the criminal history records check, the subject has resided for six consecutive months or more. If it is not possible to perform a full seven year criminal history records check, conduct as much of the seven year criminal history records check as possible and document the reason the full seven year criminal history records check could not be performed.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to perform a seven year criminal history records check.

CIP-004-~~5.1~~6 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Criteria or process to evaluate criminal history records checks for authorizing access.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to evaluate criminal history records checks.
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Criteria or process for verifying that personnel risk assessments performed for contractors or service vendors are conducted according to Parts 3.1 through 3.3.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's criteria or process for verifying contractors or service vendors personnel risk assessments.

CIP-004-~~5.1~~6 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.5	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to ensure that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed according to Parts 3.1 to 3.4 within the last seven years.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process for ensuring that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed within the last seven years.

Rationale for Requirement R4:

To ensure that individuals with access to BES Cyber Systems and the physical and electronic locations where BES Cyber System Information is stored by the Responsible Entity have been properly authorized for such access. "Authorization" should be considered to be a grant of permission by a person or persons empowered by the Responsible Entity to perform such grants and included in the delegations referenced in CIP-003-~~5~~6. "Provisioning" should be considered the actions to provide access to an individual.

Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (i.e., physical access control system, remote access system, directory services).

CIP Exceptional Circumstances are defined in a Responsible Entity's policy from CIP-003-~~5~~ 6 and allow an exception to the requirement for authorization to BES Cyber Systems and BES Cyber System Information.

Quarterly reviews in Part 4.5 are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to access the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

If the results of quarterly or annual account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that the error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

R4. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented access management program(s) that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~6 Table R4 – Access Management Program. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning and Same Day Operations].*

M4. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~6 Table R4 – Access Management Program* and additional evidence to demonstrate that the access management program was implemented as described in the Measures column of the table.

CIP-004-~~5.1~~6 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to authorize based on need, as determined by the Responsible Entity, except for CIP Exceptional Circumstances: 4.1.1. Electronic access; 4.1.2. Unescorted physical access into a Physical Security Perimeter; and 4.1.3. Access to designated storage locations, whether physical or electronic, for BES Cyber System Information.	An example of evidence may include, but is not limited to, dated documentation of the process to authorize electronic access, unescorted physical access in a Physical Security Perimeter, and access to designated storage locations, whether physical or electronic, for BES Cyber System Information.

CIP-004-~~5.1~~6 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Verify at least once each calendar quarter that individuals with active electronic access or unescorted physical access have authorization records.	Examples of evidence may include, but are not limited to: • Dated documentation of the verification between the system generated list of individuals who have been authorized for access (i.e., workflow database) and a system generated list of personnel who have access (i.e., user account listing), or • Dated documentation of the verification between a list of individuals who have been authorized for access (i.e., authorization forms) and a list of individuals provisioned for access (i.e., provisioning forms or shared account listing).

CIP-004-~~5.1~~6 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For electronic access, verify at least once every 15 calendar months that all user accounts, user account groups, or user role categories, and their specific, associated privileges are correct and are those that the Responsible Entity determines are necessary.	An example of evidence may include, but is not limited to, documentation of the review that includes all of the following: 1. A dated listing of all accounts/account groups or roles within the system; 2. A summary description of privileges associated with each group or role; 3. Accounts assigned to the group or role; and 4. Dated evidence showing verification of the privileges for the group are authorized and appropriate to the work function performed by people assigned to each account.

CIP-004-~~5.1~~6 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Verify at least once every 15 calendar months that access to the designated storage locations for BES Cyber System Information, whether physical or electronic, are correct and are those that the Responsible Entity determines are necessary for performing assigned work functions.	An example of evidence may include, but is not limited to, the documentation of the review that includes all of the following: 1. A dated listing of authorizations for BES Cyber System information; 2. Any privileges associated with the authorizations; and 3. Dated evidence showing a verification of the authorizations and any privileges were confirmed correct and the minimum necessary for performing assigned work functions.

Rationale for Requirement R5:

The timely revocation of electronic access to BES Cyber Systems is an essential element of an access management regime. When an individual no longer requires access to a BES Cyber System to perform his or her assigned functions, that access should be revoked. This is of particular importance in situations where a change of assignment or employment is involuntary, as there is a risk the individual(s) involved will react in a hostile or destructive manner.

In considering how to address directives in FERC Order No. 706 directing "immediate" revocation of access for involuntary separation, the SDT chose not to specify hourly time parameters in the requirement (e.g., revoking access within 1 hour). The point in time at which an organization terminates a person cannot generally be determined down to the hour. However, most organizations have formal termination processes, and the timeliest revocation of access occurs in concurrence with the initial processes of termination.

Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (e.g., physical access control system, remote access system, directory services).

R5. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented access revocation program(s) that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~6 Table R5 – Access Revocation*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning].*

M5. Evidence must include each of the applicable documented programs that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~6 Table R5 – Access Revocation* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-~~5.1~~6 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	A process to initiate removal of an individual's ability for unescorted physical access and Interactive Remote Access upon a termination action, and complete the removals within 24 hours of the termination action (Removal of the ability for access may be different than deletion, disabling, revocation, or removal of all access rights).	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form verifying access removal associated with the termination action; and 2. Logs or other demonstration showing such persons no longer have access.

CIP-004-~~5.1~~6 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For reassignments or transfers, revoke the individual's authorized electronic access to individual accounts and authorized unescorted physical access that the Responsible Entity determines are not necessary by the end of the next calendar day following the date that the Responsible Entity determines that the individual no longer requires retention of that access.	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form showing a review of logical and physical access; and 2. Logs or other demonstration showing such persons no longer have access that the Responsible Entity determines is not necessary.

CIP-004-~~5.1~~6 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For termination actions, revoke the individual's access to the designated storage locations for BES Cyber System Information, whether physical or electronic (unless already revoked according to Requirement R5.1), by the end of the next calendar day following the effective date of the termination action.	An example of evidence may include, but is not limited to, workflow or sign-off form verifying access removal to designated physical areas or cyber systems containing BES Cyber System Information associated with the terminations and dated within the next calendar day of the termination action.

CIP-004-~~5.1~~6 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.4	High Impact BES Cyber Systems and their associated: • EACMS	For termination actions, revoke the individual's non-shared user accounts (unless already revoked according to Parts 5.1 or 5.3) within 30 calendar days of the effective date of the termination action.	An example of evidence may include, but is not limited to, workflow or sign-off form showing access removal for any individual BES Cyber Assets and software applications as determined necessary to completing the revocation of access and dated within thirty calendar days of the termination actions.

CIP-004-~~5.1~~6 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.5	High Impact BES Cyber Systems and their associated: • EACMS	For termination actions, change passwords for shared account(s) known to the user within 30 calendar days of the termination action. For reassignments or transfers, change passwords for shared account(s) known to the user within 30 calendar days following the date that the Responsible Entity determines that the individual no longer requires retention of that access. If the Responsible Entity determines and documents that extenuating operating circumstances require a longer time period, change the password(s) within 10 calendar days following the end of the operating circumstances.	Examples of evidence may include, but are not limited to: • Workflow or sign-off form showing password reset within 30 calendar days of the termination; • Workflow or sign-off form showing password reset within 30 calendar days of the reassignments or transfers; or • Documentation of the extenuating operating circumstance and workflow or sign-off form showing password reset within 10 calendar days following the end of the operating circumstance.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

~~The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.~~

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints Text

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-004-~~5.1~~6)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Lower**	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so less than 10 calendar days after the start of a subsequent calendar quarter. (1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so between 10 and 30 calendar days after the start of a subsequent calendar quarter. (1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so within the subsequent quarter but beyond 30 calendar days after the start of that calendar quarter. (1.1)	The Responsible Entity did not document or implement any security awareness process(es) to reinforce cyber security practices. (R1) OR The Responsible Entity did not reinforce cyber security practices and associated physical security practices for at least two consecutive calendar quarters. (1.1)
R2	**Operations Planning**	**Lower**	The Responsible Entity implemented a cyber security training program but failed to include one of the training	The Responsible Entity implemented a cyber security training program but failed to include two of the training content topics in Requirement Parts 2.1.1 through 2.1.9~~, and did not identify, assess~~	The Responsible Entity implemented a cyber security training program but failed to include three of the training content topics in Requirement Parts 2.1.1 through 2.1.9~~, and did not identify, assess~~	The Responsible Entity did not implement a cyber security training program appropriate to individual roles, functions, or responsibilities. Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. ~~Furthermore,~~

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The security awareness program is intended to be an informational program, not a formal training program. It should reinforce security practices to ensure that personnel maintain awareness of best practices for both physical and electronic security to protect its BES Cyber Systems. The Responsible Entity is not required to provide records that show that each individual received or understood the information, but they must maintain documentation of the program materials utilized in the form of posters, memos, and/or presentations.

Examples of possible mechanisms and evidence, when dated, which can be used are:

- Direct communications (e.g., emails, memos, computer based training, etc.);
- Indirect communications (e.g., posters, intranet, brochures, etc.);
- Management support and reinforcement (e.g., presentations, meetings, etc.).

Requirement R2:

Training shall cover the policies, access controls, and procedures as developed for the BES Cyber Systems and include, at a minimum, the required items appropriate to personnel roles and responsibilities from Table R2. The Responsible Entity has the flexibility to define the training program and it may consist of multiple modules and multiple delivery mechanisms, but

a single training program for all individuals needing to be trained is acceptable. The training can focus on functions, roles or responsibilities at the discretion of the Responsible Entity.

One new element in the training content is intended to encompass networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber Systems as per FERC Order No. 706, Paragraph 434. Additionally, training should address the risk posed when connecting and using Transient Cyber Assets and Removable Media with BES Cyber Systems or within an Electronic Security Perimeter. As noted in FERC Order No. 791, Paragraph 135, Transient Cyber Assets and Removable Media have been the source of incidents where malware was introduced into electric generation industrial control systems in real-world situations. Training on their use is a key element in protecting BES Cyber Systems. This is not intended to provide technical training to individuals supporting networking hardware and software, but educating system users of the cyber security risks associated with the interconnectedness of these systems. The users, based on their function, role, or responsibility, should have a basic understanding of which systems can be accessed from other systems and how the actions they take can affect cyber security.

Each Responsible Entity shall ensure all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, complete cyber security training prior to their being granted authorized access, except for CIP Exceptional Circumstances. To retain the authorized accesses, individuals must complete the training at least one every 15 months.

Requirement R3:

Each Responsible Entity shall ensure a personnel risk assessment is performed for all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, prior to their being granted authorized access, except for program specified exceptional circumstances that are approved by the single senior management official or their delegate and impact the reliability of the BES or emergency response. Identity should be confirmed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. Identity only needs to be confirmed prior to initially granting access and only requires periodic confirmation according to the entity's process during the tenure of employment, which may or may not be the same as the initial verification action.

A seven year criminal history check should be performed for those locations where the individual has resided for at least six consecutive months. This check should also be performed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. When it is not possible to perform a full seven year criminal history check, documentation must be made of what criminal history check was performed, and the reasons a full seven-year check could not be performed. Examples of this could include individuals under the age of 25 where a juvenile criminal history may be protected by law, individuals who may have resided in locations from where it is not possible to obtain a criminal history records check, violates the law or is not allowed under the existing collective bargaining agreement. The Responsible Entity should consider the absence of information for the full seven years when assessing the risk of granting access during the process to evaluate the

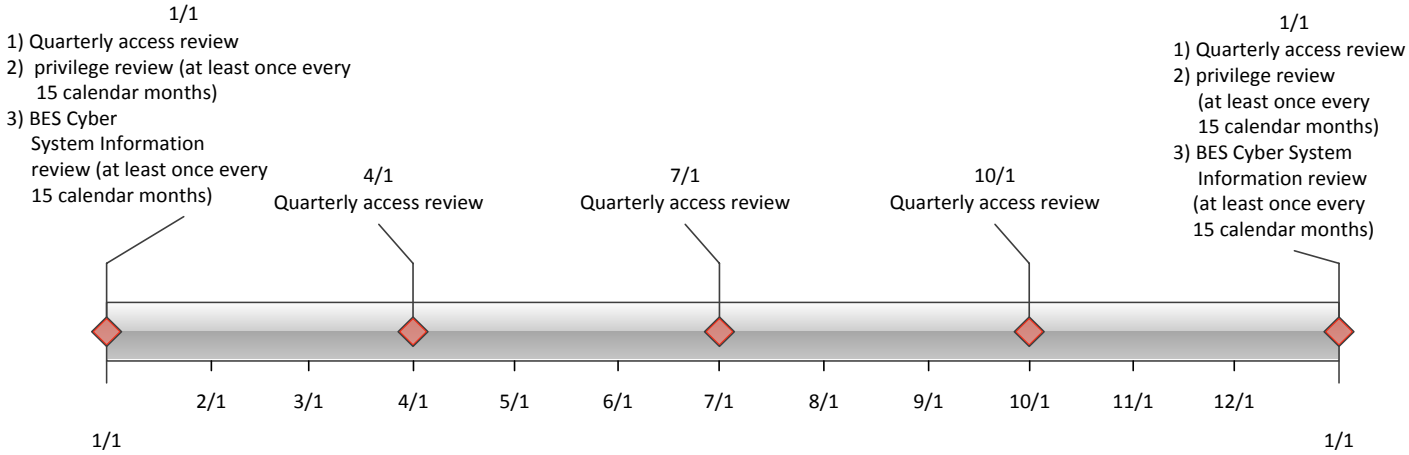
criminal history check. There needs to be a personnel risk assessment that has been completed within the last seven years for each individual with access. A new criminal history records check must be performed as part of the new PRA. Individuals who have been granted access under a previous version of these standards need a new PRA within seven years of the date of their last PRA. The clarifications around the seven year criminal history check in this version do not require a new PRA be performed by the implementation date.

Requirement R4:

Authorization for electronic and unescorted physical access and access to BES Cyber System Information must be on the basis of necessity in the individual performing a work function. Documentation showing the authorization should have some justification of the business need included. To ensure proper segregation of duties, access authorization and provisioning should not be performed by the same person where possible.

This requirement specifies both quarterly reviews and reviews at least once every 15 calendar months. Quarterly reviews are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

The privilege review at least once every 15 calendar months is more detailed to ensure an individual's associated privileges are the minimum necessary to perform their work function (i.e., least privilege). Entities can more efficiently perform this review by implementing role-based access. This involves determining the specific roles on the system (e.g., system operator, technician, report viewer, administrator, etc.) then grouping access privileges to the role and assigning users to the role. Role-based access does not assume any specific software and can be implemented by defining specific provisioning processes for each role where access group



assignments cannot be performed. Role-based access permissions eliminate the need to perform the privilege review on individual accounts. An example timeline of all the reviews in Requirement R4 is included below.

Separation of duties should be considered when performing the reviews in Requirement R4. The person reviewing should be different than the person provisioning access.

If the results of quarterly or at least once every 15 calendar months account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that this error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

Requirement R5:

The requirement to revoke access at the time of the termination action includes procedures showing revocation of access concurrent with the termination action. This requirement recognizes that the timing of the termination action may vary depending on the circumstance. Some common scenarios and possible processes on when the termination action occurs are provided in the following table. These scenarios are not an exhaustive list of all scenarios, but are representative of several routine business practices.

Scenario	Possible Process
Immediate involuntary termination	Human resources or corporate security escorts the individual off site and the supervisor or human resources personnel notify the appropriate personnel to begin the revocation process.
Scheduled involuntary termination	Human resources personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Voluntary termination	Human resources personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Retirement where the last working day is several weeks prior to the termination date	Human resources personnel coordinate with manager to determine the final date access is no longer needed and schedule the revocation of access on the determined day.
Death	Human resources personnel are notified of the death and work with appropriate personnel to begin the revocation process.

Revocation of electronic access should be understood to mean a process with the end result that electronic access to BES Cyber Systems is no longer possible using credentials assigned to or known by the individual(s) whose access privileges are being revoked. Steps taken to accomplish this outcome may include deletion or deactivation of accounts used by the individual(s), but no specific actions are prescribed. Entities should consider the ramifications of deleting an account may include incomplete event log entries due to an unrecognized account or system services using the account to log on.

The initial revocation required in Requirement R5.1 includes unescorted physical access and Interactive Remote Access. These two actions should prevent any further access by the individual after termination. If an individual still has local access accounts (i.e., accounts on the Cyber Asset itself) on BES Cyber Assets, then the Responsible Entity has 30 days to complete the revocation process for those accounts. However, nothing prevents a Responsible Entity from performing all of the access revocation at the time of termination.

For transferred or reassigned individuals, a review of access privileges should be performed. This review could entail a simple listing of all authorizations for an individual and working with the respective managers to determine which access will still be needed in the new position. For instances in which the individual still needs to retain access as part of a transitory period, the entity should schedule a time to review these access privileges or include the privileges in the quarterly account review or annual privilege review.

Revocation of access to shared accounts is called out separately to prevent the situation where passwords on substation and generation devices are constantly changed due to staff turnover.

Requirement 5.5 specified that passwords for shared account are to the changed within 30 calendar days of the termination action or when the Responsible Entity determines an individual no longer requires access to the account as a result of a reassignment or transfer. The 30 days applies under normal operating conditions. However, circumstances may occur where this is not possible. Some systems may require an outage or reboot of the system in order to complete the password change. In periods of extreme heat or cold, many Responsible Entities may prohibit system outages and reboots in order to maintain reliability of the BES. When these circumstances occur, the Responsible Entity must document these circumstances and prepare to change the password within 10 calendar days following the end of the operating circumstances. Records of activities must be retained to show that the Responsible Entity followed the plan they created.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014

Description of Current Draft

This draft standard is being posted for an initial comment and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
First 45-Day Comment Period Opens	June 2014
Additional 45-Day Comment Period (if necessary)	August 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-006-5.	
6	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Physical Security of BES Cyber Systems

2. Number: CIP-006-6

3. Purpose: To manage physical access to BES Cyber Systems by specifying a physical security plan in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-006-6:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-006-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

For new high or medium impact BES Cyber Systems at Control Centers identified by CIP-002-5.1 which were not identified as Critical Cyber Assets in CIP Version 3, Registered Entities shall not be required to comply with Reliability Standard CIP-006-6, Requirement R1, Part 1.10 until nine calendar months after the effective date of Reliability Standard CIP-006-6.

6. Background:

Standard CIP-006 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.

- **Medium Impact BES Cyber Systems without External Routable Connectivity** – Only applies to medium impact BES Cyber Systems without External Routable Connectivity.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Locally mounted hardware or devices at the Physical Security Perimeter –** Applies to the locally mounted hardware or devices (e.g. such as motion sensors, electronic lock control mechanisms, and badge readers) at a Physical Security Perimeter associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity, and that does not contain or store access control information or independently perform access authentication. These hardware and devices are excluded in the definition of Physical Access Control Systems.

B. Requirements and Measures

Rationale for Requirement R1:

Each Responsible Entity shall ensure that physical access to all BES Cyber Systems is restricted and appropriately managed. Entities may choose for certain PACS to reside in a PSP controlling access to applicable BES Cyber Systems. For these PACS, there is no additional obligation to comply with Requirement R1, Parts 1.1, 1.6 and 1.7 beyond what is already required for the PSP.

Regarding Requirement R1, Part 1.10, when cabling and other nonprogrammable components of a Control Center's communication network cannot be secured in a PSP, steps must be taken to ensure the integrity of the BES Cyber Systems. Exposed communication pathways outside of a PSP necessitate that physical or logical protections be installed to reduce the likelihood that man-in-the-middle attacks could compromise the integrity of their connected BES Cyber Assets or PCAs that are required to reside within PSPs. While it is anticipated that priority consideration will be given to physically securing the cabling and nonprogrammable communications components, the SDT understands that configurations arise when physical access restrictions are not ideal and Responsible Entities are able to reasonably defend their physically exposed communications components through specific additional logical protections.

R1. Each Responsible Entity shall implement one or more documented physical security plan(s) that collectively include all of the applicable requirement parts in *CIP-006-6 Table R1 – Physical Security Plan*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning and Same Day Operations].*

M1. Evidence must include each of the documented physical security plans that collectively include all of the applicable requirement parts in *CIP-006-6 Table R1 – Physical Security Plan* and additional evidence to demonstrate implementation of the plan or plans as described in the Measures column of the table.

CIP-006-6 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	Medium Impact BES Cyber Systems without External Routable Connectivity Physical Access Control Systems (PACS) associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity	Define operational or procedural controls to restrict physical access.	An example of evidence may include, but is not limited to, documentation that operational or procedural controls exist.

CIP-006-6 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Utilize at least one physical access control to allow unescorted physical access into each applicable Physical Security Perimeter to only those individuals who have authorized unescorted physical access.	An example of evidence may include, but is not limited to, language in the physical security plan that describes each Physical Security Perimeter and how unescorted physical access is controlled by one or more different methods and proof that unescorted physical access is restricted to only authorized individuals, such as a list of authorized individuals accompanied by access logs.

CIP-006-6 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Where technically feasible, utilize two or more different physical access controls (this does not require two completely independent physical access control systems) to collectively allow unescorted physical access into Physical Security Perimeters to only those individuals who have authorized unescorted physical access.	An example of evidence may include, but is not limited to, language in the physical security plan that describes the Physical Security Perimeters and how unescorted physical access is controlled by two or more different methods and proof that unescorted physical access is restricted to only authorized individuals, such as a list of authorized individuals accompanied by access logs.

CIP-006-6 Table R1– Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Monitor for unauthorized access through a physical access point into a Physical Security Perimeter.	An example of evidence may include, but is not limited to, documentation of controls that monitor for unauthorized access through a physical access point into a Physical Security Perimeter.

CIP-006-6 Table R1– Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Issue an alarm or alert in response to detected unauthorized access through a physical access point into a Physical Security Perimeter to the personnel identified in the BES Cyber Security Incident response plan within 15 minutes of detection.	An example of evidence may include, but is not limited to, language in the physical security plan that describes the issuance of an alarm or alert in response to unauthorized access through a physical access control into a Physical Security Perimeter and additional evidence that the alarm or alert was issued and communicated as identified in the BES Cyber Security Incident Response Plan, such as manual or electronic alarm or alert logs, cell phone or pager logs, or other evidence that documents that the alarm or alert was generated and communicated.
1.6	Physical Access Control Systems (PACS) associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity	Monitor each Physical Access Control System for unauthorized physical access to a Physical Access Control System.	An example of evidence may include, but is not limited to, documentation of controls that monitor for unauthorized physical access to a PACS.

CIP-006-6 Table R1– Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.7	Physical Access Control Systems (PACS) associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity	Issue an alarm or alert in response to detected unauthorized physical access to a Physical Access Control System to the personnel identified in the BES Cyber Security Incident response plan within 15 minutes of the detection.	An example of evidence may include, but is not limited to, language in the physical security plan that describes the issuance of an alarm or alert in response to unauthorized physical access to Physical Access Control Systems and additional evidence that the alarm or alerts was issued and communicated as identified in the BES Cyber Security Incident Response Plan, such as alarm or alert logs, cell phone or pager logs, or other evidence that the alarm or alert was generated and communicated.

CIP-006-6 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.8	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Log (through automated means or by personnel who control entry) entry of each individual with authorized unescorted physical access into each Physical Security Perimeter, with information to identify the individual and date and time of entry.	An example of evidence may include, but is not limited to, language in the physical security plan that describes logging and recording of physical entry into each Physical Security Perimeter and additional evidence to demonstrate that this logging has been implemented, such as logs of physical access into Physical Security Perimeters that show the individual and the date and time of entry into Physical Security Perimeter.

CIP-006-6 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.9	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Retain physical access logs of entry of individuals with authorized unescorted physical access into each Physical Security Perimeter for at least ninety calendar days.	An example of evidence may include, but is not limited to, dated documentation such as logs of physical access into Physical Security Perimeters that show the date and time of entry into Physical Security Perimeter.

CIP-006-5 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.10	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems at Control Centers and their associated: • PCA	Restrict physical access to cabling and other nonprogrammable communication components used for connection between applicable Cyber Assets within the same Electronic Security Perimeter in those instances when such cabling and components are located outside of a Physical Security Perimeter. Where physical access restrictions to such cabling and components are not implemented, the Responsible Entity shall document and implement one or more of the following: • encryption of data that transits such cabling and components; or • monitoring the status of the communication link composed of such cabling and components and issuing an alarm or alert in response to detected communication failures to the personnel identified in the BES Cyber Security Incident response plan within 15 minutes of detection; or • an equally effective logical protection.	An example of evidence may include, but is not limited to, records of the Responsible Entity's implementation of the physical access restrictions (e.g., cabling and components secured through conduit or secured cable trays) encryption, monitoring, or equally effective logical protections.

Rationale for Requirement R2:

To control when personnel without authorized unescorted physical access can be in any Physical Security Perimeters protecting BES Cyber Systems or Electronic Access Control or Monitoring Systems, as applicable in Table R2.

R2. Each Responsible Entity shall implement one or more documented visitor control program(s) that include each of the applicable requirement parts in *CIP-006-6 Table R2 – Visitor Control Program. [Violation Risk Factor: Medium] [Time Horizon: Same Day Operations.]*

M2. Evidence must include one or more documented visitor control programs that collectively include each of the applicable requirement parts in *CIP-006-6 Table R2 – Visitor Control Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-006-6 Table R2 – Visitor Control Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Require continuous escorted access of visitors (individuals who are provided access but are not authorized for unescorted physical access) within each Physical Security Perimeter, except during CIP Exceptional Circumstances.	An example of evidence may include, but is not limited to, language in a visitor control program that requires continuous escorted access of visitors within Physical Security Perimeters and additional evidence to demonstrate that the process was implemented, such as visitor logs.

CIP-006-6 Table R2 – Visitor Control Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Require manual or automated logging of visitor entry into and exit from the Physical Security Perimeter that includes date and time of the initial entry and last exit, the visitor's name, and the name of an individual point of contact responsible for the visitor, except during CIP Exceptional Circumstances.	An example of evidence may include, but is not limited to, language in a visitor control program that requires continuous escorted access of visitors within Physical Security Perimeters and additional evidence to demonstrate that the process was implemented, such as dated visitor logs that include the required information.
2.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Retain visitor logs for at least ninety calendar days.	An example of evidence may include, but is not limited to, documentation showing logs have been retained for at least ninety calendar days.

Rationale for Requirement R3:

To ensure all Physical Access Control Systems and devices continue to function properly.

R3. Each Responsible Entity shall implement one or more documented Physical Access Control System maintenance and testing program(s) that collectively include each of the applicable requirement parts in *CIP-006-6 Table R3 – Maintenance and Testing Program*. *[Violation Risk Factor: Lower] [Time Horizon: Long Term Planning].*

M3. Evidence must include each of the documented Physical Access Control System maintenance and testing programs that collectively include each of the applicable requirement parts in *CIP-006-6 Table R3 – Maintenance and Testing Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-006-6 Table R3 – Physical Access Control System Maintenance and Testing Program			
Part	**Applicable Systems**	**Requirement**	**Measures**
3.1	Physical Access Control Systems (PACS) associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity Locally mounted hardware or devices at the Physical Security Perimeter associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity	Maintenance and testing of each Physical Access Control System and locally mounted hardware or devices at the Physical Security Perimeter at least once every 24 calendar months to ensure they function properly.	An example of evidence may include, but is not limited to, a maintenance and testing program that provides for testing each Physical Access Control System and locally mounted hardware or devices associated with each applicable Physical Security Perimeter at least once every 24 calendar months and additional evidence to demonstrate that this testing was done, such as dated maintenance records, or other documentation showing testing and maintenance has been performed on each applicable device or system at least once every 24 calendar months.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

General:

While the focus is shifted from the definition and management of a completely enclosed "six-wall" boundary, it is expected in many instances this will remain a primary mechanism for controlling, alerting, and logging access to BES Cyber Systems. Taken together, these controls will effectively constitute the physical security plan to manage physical access to BES Cyber Systems.

Requirement R1:

Methods of physical access control include:

- Card Key: A means of electronic access where the access rights of the card holder are predefined in a computer database. Access rights may differ from one perimeter to another.
- Special Locks: These include, but are not limited to, locks with "restricted key" systems, magnetic locks that can be operated remotely, and "man-trap" systems.
- Security Personnel: Personnel responsible for controlling physical access who may reside on-site or at a monitoring station.

- Other Authentication Devices: Biometric, keypad, token, or other equivalent devices that control physical access into the Physical Security Perimeter.

Methods to monitor physical access include:

- Alarm Systems: Systems that alarm to indicate interior motion or when a door, gate, or window has been opened without authorization. These alarms must provide for notification within 15 minutes to individuals responsible for response.
- Human Observation of Access Points: Monitoring of physical access points by security personnel who are also controlling physical access.

Methods to log physical access include:

- Computerized Logging: Electronic logs produced by the Responsible Entity's selected access control and alerting method.
- Video Recording: Electronic capture of video images of sufficient quality to determine identity.
- Manual Logging: A log book or sign-in sheet, or other record of physical access maintained by security or other personnel authorized to control and monitor physical access.

The FERC Order No. 706, Paragraph 572, directive discussed utilizing two or more different and complementary physical access controls to provide defense in depth. It does not require two or more Physical Security Perimeters, nor does it exclude the use of layered perimeters. Use of two-factor authentication would be acceptable at the same entry points for a non-layered single perimeter. For example, a sole perimeter's controls could include either a combination of card key and pin code (something you know and something you have), or a card key and biometric scanner (something you have and something you are), or a physical key in combination with a guard-monitored remote camera and door release, where the "guard" has adequate information to authenticate the person they are observing or talking to prior to permitting access (something you have and something you are). The two-factor authentication could be implemented using a single Physical Access Control System but more than one authentication method must be utilized. For physically layered protection, a locked gate in combination with a locked control-building could be acceptable, provided no single authenticator (e.g., key or card key) would provide access through both.

Entities may choose for certain PACS to reside in a PSP controlling access to applicable BES Cyber Systems. For these PACS, there is no additional obligation to comply with Requirement Parts 1.1, 1.6 and 1.7 beyond what is already required for the PSP.

The new requirement part CIP-006-6, Requirement R1, Part 1.10 responds to the directive found in FERC Order No. 791, Paragraph 150. The requirement intends to protect cabling and nonprogrammable communication components that are within an ESP, but extend outside of a PSP. This protection, similar to the FERC Approved NERC Petition on the interpretation on CIP-006-3 from PacifiCorp, must be accomplished either by physically protecting the cabling and components that leave a PSP (such as by conduit or secured cable trays) or through data encryption, circuit monitoring, or equally effective logical protections. It is intended that the

physical protections reduce the possibility of tampering or allowing direct access to the nonprogrammable devices. Conduit, secured cable trays, and secured communication closets are examples of these types of protections. Alternatively, this protection may also be accomplished through the use of armored cabling or via the stainless steel or aluminum tube protecting the fiber inside an optical ground wire (OPGW) cable. In using any of these methods, care should be taken to protect the entire length of the cabling including any termination points that may be outside of a defined PSP.

In addition to the cabling, the components in scope of this requirement part are those components outside of a PSP that could otherwise be considered a BES Cyber Asset or Protected Cyber Asset except that they do not meet the definition of Cyber Asset because they are nonprogrammable. Examples of these nonprogrammable components include, but are not limited to, unmanaged switches, hubs, patch panels, media converters, port savers, and couplers.

Requirement R2:

The logging of visitors should capture each visit of the individual and does not need to capture each entry or exit during that visit. This is meant to allow a visitor to temporarily exit the Physical Security Perimeter to obtain something they left in their vehicle or outside the area without requiring a new log entry for each and every entry during the visit.

The SDT also determined that a point of contact should be documented who can provide additional details about the visit if questions arise in the future. The point of contact could be the escort, but there is no need to document everyone that acted as an escort for the visitor.

Requirement R3:

This includes the testing of locally mounted hardware or devices used in controlling, alerting or logging access to the Physical Security Perimeter. This includes motion sensors, electronic lock control mechanisms, and badge readers which are not deemed to be part of the Physical Access Control System but are required for the protection of the BES Cyber Systems.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014

Description of Current Draft

This draft standard is being posted for an initial comment and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
First 45-Day Comment Period Opens	June 2014
Additional 45-Day Comment Period (if necessary)	August 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-006-5.	
6	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Physical Security of BES Cyber Systems

2. Number: CIP-006-56

3. Purpose: To manage physical access to BES Cyber Systems by specifying a physical security plan in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 **Distribution Provider**: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 **Responsible Entities listed in 4.1 other than Distribution Providers**:

All BES Facilities.

4.2.3 **Exemptions:** The following are exempt from Standard CIP-006-~~5~~6:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-006-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

For new high or medium impact BES Cyber Systems at Control Centers identified by CIP-002-5.1 which were not identified as Critical Cyber Assets in CIP Version 3, Registered Entities shall not be required to comply with Reliability Standard CIP-006-6, Requirement R1, Part 1.10 until nine calendar months after the effective date of Reliability Standard CIP-006-6.

6. Background:

Standard CIP-006-5 exists as part of a suite of CIP Standards related to cyber security, which ~~, CIP-002-5~~ requires the initial identification and categorization of BES Cyber Systems~~, CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1, and CIP-011-1~~ and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems. ~~This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.~~

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

~~The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:~~

~~Each Responsible Entity shall implement, in a manner that identifies, assesses, and corrects deficiencies, . . .~~

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in ~~their~~ its documented processes, but ~~they~~ it must address the applicable requirements in the table. ~~The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities.~~

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of

300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems without External Routable Connectivity** – Only applies to medium impact BES Cyber Systems without External Routable Connectivity.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Locally mounted hardware or devices at the Physical Security Perimeter –** Applies to the locally mounted hardware or devices (e.g. such as motion sensors, electronic lock control mechanisms, and badge readers) at a Physical Security Perimeter associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity, and that does not contain or store access control information or independently perform access

authentication. These hardware and devices are excluded in the definition of Physical Access Control Systems.

B. Requirements and Measures

Rationale for Requirement R1:

Each Responsible Entity shall ensure that physical access to all BES Cyber Systems is restricted and appropriately managed. Entities may choose for certain PACS to reside in a PSP controlling access to applicable BES Cyber Systems. For these PACS, there is no additional obligation to comply with Requirement R1, Parts 1.1, 1.6~~7~~ and 1.7~~8~~ beyond what is already required for the PSP.

Regarding Requirement R1, Part 1.10, when cabling and other nonprogrammable components of a Control Center's communication network cannot be secured in a PSP, steps must be taken to ensure the integrity of the BES Cyber Systems. Exposed communication pathways outside of a PSP necessitate that physical or logical protections be installed to reduce the likelihood that man-in-the-middle attacks could compromise the integrity of their connected BES Cyber Assets or PCAs that are required to reside within PSPs. While it is anticipated that priority consideration will be given to physically securing the cabling and nonprogrammable communications components, the SDT understands that configurations arise when physical access restrictions are not ideal and Responsible Entities are able to reasonably defend their physically exposed communications components through specific additional logical protections.

R1. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented physical security plan(s) that collectively include all of the applicable requirement parts in *CIP-006-~~5~~ 6 Table R1 – Physical Security Plan*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning and Same Day Operations].*

M1. Evidence must include each of the documented physical security plans that collectively include all of the applicable requirement parts in *CIP-006-~~5~~ 6 Table R1 – Physical Security Plan* and additional evidence to demonstrate implementation of the plan or plans as described in the Measures column of the table.

CIP-006-5 6 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	Medium Impact BES Cyber Systems without External Routable Connectivity Physical Access Control Systems (PACS) associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity	Define operational or procedural controls to restrict physical access.	An example of evidence may include, but is not limited to, documentation that operational or procedural controls exist.

CIP-006-~~5~~ 6 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Utilize at least one physical access control to allow unescorted physical access into each applicable Physical Security Perimeter to only those individuals who have authorized unescorted physical access.	An example of evidence may include, but is not limited to, language in the physical security plan that describes each Physical Security Perimeter and how unescorted physical access is controlled by one or more different methods and proof that unescorted physical access is restricted to only authorized individuals, such as a list of authorized individuals accompanied by access logs.

CIP-006-~~5~~ 6 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Where technically feasible, utilize two or more different physical access controls (this does not require two completely independent physical access control systems) to collectively allow unescorted physical access into Physical Security Perimeters to only those individuals who have authorized unescorted physical access.	An example of evidence may include, but is not limited to, language in the physical security plan that describes the Physical Security Perimeters and how unescorted physical access is controlled by two or more different methods and proof that unescorted physical access is restricted to only authorized individuals, such as a list of authorized individuals accompanied by access logs.

CIP-006-~~5~~ 6 Table R1– Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Monitor for unauthorized access through a physical access point into a Physical Security Perimeter.	An example of evidence may include, but is not limited to, documentation of controls that monitor for unauthorized access through a physical access point into a Physical Security Perimeter.

CIP-006-~~5~~ 6 Table R1– Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Issue an alarm or alert in response to detected unauthorized access through a physical access point into a Physical Security Perimeter to the personnel identified in the BES Cyber Security Incident response plan within 15 minutes of detection.	An example of evidence may include, but is not limited to, language in the physical security plan that describes the issuance of an alarm or alert in response to unauthorized access through a physical access control into a Physical Security Perimeter and additional evidence that the alarm or alert was issued and communicated as identified in the BES Cyber Security Incident Response Plan, such as manual or electronic alarm or alert logs, cell phone or pager logs, or other evidence that documents that the alarm or alert was generated and communicated.
1.6	Physical Access Control Systems (PACS) associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity	Monitor each Physical Access Control System for unauthorized physical access to a Physical Access Control System.	An example of evidence may include, but is not limited to, documentation of controls that monitor for unauthorized physical access to a PACS.

CIP-006-~~5~~ 6 Table R1– Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.7	Physical Access Control Systems (PACS) associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity	Issue an alarm or alert in response to detected unauthorized physical access to a Physical Access Control System to the personnel identified in the BES Cyber Security Incident response plan within 15 minutes of the detection.	An example of evidence may include, but is not limited to, language in the physical security plan that describes the issuance of an alarm or alert in response to unauthorized physical access to Physical Access Control Systems and additional evidence that the alarm or alerts was issued and communicated as identified in the BES Cyber Security Incident Response Plan, such as alarm or alert logs, cell phone or pager logs, or other evidence that the alarm or alert was generated and communicated.

CIP-006-~~5~~ 6 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.8	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Log (through automated means or by personnel who control entry) entry of each individual with authorized unescorted physical access into each Physical Security Perimeter, with information to identify the individual and date and time of entry.	An example of evidence may include, but is not limited to, language in the physical security plan that describes logging and recording of physical entry into each Physical Security Perimeter and additional evidence to demonstrate that this logging has been implemented, such as logs of physical access into Physical Security Perimeters that show the individual and the date and time of entry into Physical Security Perimeter.

CIP-006-~~5~~ 6 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.9	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Retain physical access logs of entry of individuals with authorized unescorted physical access into each Physical Security Perimeter for at least ninety calendar days.	An example of evidence may include, but is not limited to, dated documentation such as logs of physical access into Physical Security Perimeters that show the date and time of entry into Physical Security Perimeter.

CIP-006-5 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.10	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems at Control Centers and their associated: • PCA	Restrict physical access to cabling and other nonprogrammable communication components used for connection between applicable Cyber Assets within the same Electronic Security Perimeter in those instances when such cabling and components are located outside of a Physical Security Perimeter. Where physical access restrictions to such cabling and components are not implemented, the Responsible Entity shall document and implement one or more of the following: • encryption of data that transits such cabling and components; or • monitoring the status of the communication link composed of such cabling and components and issuing an alarm or alert in response to detected communication failures to the personnel identified in the BES Cyber Security Incident response plan within 15 minutes of detection; or • an equally effective logical protection.	An example of evidence may include, but is not limited to, records of the Responsible Entity's implementation of the physical access restrictions (e.g., cabling and components secured through conduit or secured cable trays) encryption, monitoring, or equally effective logical protections.

Rationale for Requirement R2:

To control when personnel without authorized unescorted physical access can be in any Physical Security Perimeters protecting BES Cyber Systems or Electronic Access Control or Monitoring Systems, as applicable in Table R2.

R2. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented visitor control program(s) that include each of the applicable requirement parts in *CIP-006-~~5~~ 6 Table R2 – Visitor Control Program. [Violation Risk Factor: Medium] [Time Horizon: Same Day Operations.]*

M2. Evidence must include one or more documented visitor control programs that collectively include each of the applicable requirement parts in *CIP-006-~~5~~ 6 Table R2 – Visitor Control Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-006-~~5~~ 6 Table R2 – Visitor Control Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Require continuous escorted access of visitors (individuals who are provided access but are not authorized for unescorted physical access) within each Physical Security Perimeter, except during CIP Exceptional Circumstances.	An example of evidence may include, but is not limited to, language in a visitor control program that requires continuous escorted access of visitors within Physical Security Perimeters and additional evidence to demonstrate that the process was implemented, such as visitor logs.

CIP-006-~~5~~6 Table R2 – Visitor Control Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Require manual or automated logging of visitor entry into and exit from the Physical Security Perimeter that includes date and time of the initial entry and last exit, the visitor's name, and the name of an individual point of contact responsible for the visitor, except during CIP Exceptional Circumstances.	An example of evidence may include, but is not limited to, language in a visitor control program that requires continuous escorted access of visitors within Physical Security Perimeters and additional evidence to demonstrate that the process was implemented, such as dated visitor logs that include the required information.
2.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Retain visitor logs for at least ninety calendar days.	An example of evidence may include, but is not limited to, documentation showing logs have been retained for at least ninety calendar days.

Rationale for Requirement R3:

To ensure all Physical Access Control Systems and devices continue to function properly.

R3. Each Responsible Entity shall implement one or more documented Physical Access Control System maintenance and testing program(s) that collectively include each of the applicable requirement parts in *CIP-006-~~5~~ 6 Table R3 – Maintenance and Testing Program*. *[Violation Risk Factor: Lower] [Time Horizon: Long Term Planning].*

M3. Evidence must include each of the documented Physical Access Control System maintenance and testing programs that collectively include each of the applicable requirement parts in *CIP-006-~~5~~ 6 Table R3 – Maintenance and Testing Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-006-~~5~~ 6 Table R3 – Physical Access Control System Maintenance and Testing Program			
Part	**Applicable Systems**	**Requirement**	**Measures**
3.1	Physical Access Control Systems (PACS) associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity Locally mounted hardware or devices at the Physical Security Perimeter associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity	Maintenance and testing of each Physical Access Control System and locally mounted hardware or devices at the Physical Security Perimeter at least once every 24 calendar months to ensure they function properly.	An example of evidence may include, but is not limited to, a maintenance and testing program that provides for testing each Physical Access Control System and locally mounted hardware or devices associated with each applicable Physical Security Perimeter at least once every 24 calendar months and additional evidence to demonstrate that this testing was done, such as dated maintenance records, or other documentation showing testing and maintenance has been performed on each applicable device or system at least once every 24 calendar months.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

~~The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.~~

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. ~~Furthermore,~~

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

General:

While the focus is shifted from the definition and management of a completely enclosed "six-wall" boundary, it is expected in many instances this will remain a primary mechanism for controlling, alerting, and logging access to BES Cyber Systems. Taken together, these controls will effectively constitute the physical security plan to manage physical access to BES Cyber Systems.

Requirement R1:

Methods of physical access control include:

- Card Key: A means of electronic access where the access rights of the card holder are predefined in a computer database. Access rights may differ from one perimeter to another.
- Special Locks: These include, but are not limited to, locks with "restricted key" systems, magnetic locks that can be operated remotely, and "man-trap" systems.
- Security Personnel: Personnel responsible for controlling physical access who may reside on-site or at a monitoring station.

- Other Authentication Devices: Biometric, keypad, token, or other equivalent devices that control physical access into the Physical Security Perimeter.

Methods to monitor physical access include:

- Alarm Systems: Systems that alarm to indicate interior motion or when a door, gate, or window has been opened without authorization. These alarms must provide for notification within 15 minutes to individuals responsible for response.
- Human Observation of Access Points: Monitoring of physical access points by security personnel who are also controlling physical access.

Methods to log physical access include:

- Computerized Logging: Electronic logs produced by the Responsible Entity's selected access control and alerting method.
- Video Recording: Electronic capture of video images of sufficient quality to determine identity.
- Manual Logging: A log book or sign-in sheet, or other record of physical access maintained by security or other personnel authorized to control and monitor physical access.

The FERC Order No. 706, Paragraph 572, directive discussed utilizing two or more different and complementary physical access controls to provide defense in depth. It does not require two or more Physical Security Perimeters, nor does it exclude the use of layered perimeters. Use of two-factor authentication would be acceptable at the same entry points for a non-layered single perimeter. For example, a sole perimeter's controls could include either a combination of card key and pin code (something you know and something you have), or a card key and biometric scanner (something you have and something you are), or a physical key in combination with a guard-monitored remote camera and door release, where the "guard" has adequate information to authenticate the person they are observing or talking to prior to permitting access (something you have and something you are). The two-factor authentication could be implemented using a single Physical Access Control System but more than one authentication method must be utilized. For physically layered protection, a locked gate in combination with a locked control-building could be acceptable, provided no single authenticator (e.g., key or card key) would provide access through both.

Entities may choose for certain PACS to reside in a PSP controlling access to applicable BES Cyber Systems. For these PACS, there is no additional obligation to comply with Requirement Parts 1.1, 1.6~~7~~ and 1.7~~8~~ beyond what is already required for the PSP.

The new requirement part CIP-006-6, Requirement R1, Part 1.10 responds to the directive found in FERC Order No. 791, Paragraph 150. The requirement intends to protect cabling and nonprogrammable communication components that are within an ESP, but extend outside of a PSP. This protection, similar to the FERC Approved NERC Petition on the interpretation on CIP-006-3 from PacifiCorp, must be accomplished either by physically protecting the cabling and components that leave a PSP (such as by conduit or secured cable trays) or through data encryption, circuit monitoring, or equally effective logical protections. It is intended that the

physical protections reduce the possibility of tampering or allowing direct access to the nonprogrammable devices. Conduit, secured cable trays, and secured communication closets are examples of these types of protections. Alternatively, this protection may also be accomplished through the use of armored cabling or via the stainless steel or aluminum tube protecting the fiber inside an optical ground wire (OPGW) cable. In using any of these methods, care should be taken to protect the entire length of the cabling including any termination points that may be outside of a defined PSP.

In addition to the cabling, the components in scope of this requirement part are those components outside of a PSP that could otherwise be considered a BES Cyber Asset or Protected Cyber Asset except that they do not meet the definition of Cyber Asset because they are nonprogrammable. Examples of these nonprogrammable components include, but are not limited to, unmanaged switches, hubs, patch panels, media converters, port savers, and couplers.

Requirement R2:

The logging of visitors should capture each visit of the individual and does not need to capture each entry or exit during that visit. This is meant to allow a visitor to temporarily exit the Physical Security Perimeter to obtain something they left in their vehicle or outside the area without requiring a new log entry for each and every entry during the visit.

The SDT also determined that a point of contact should be documented who can provide additional details about the visit if questions arise in the future. The point of contact could be the escort, but there is no need to document everyone that acted as an escort for the visitor.

Requirement R3:

This includes the testing of locally mounted hardware or devices used in controlling, alerting or logging access to the Physical Security Perimeter. This includes motion sensors, electronic lock control mechanisms, and badge readers which are not deemed to be part of the Physical Access Control System but are required for the protection of the BES Cyber Systems.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014

Description of Current Draft

This draft standard is being posted for an initial comment and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
First 45-Day Comment Period Opens	June 2014
Additional 45-Day Comment Period (if necessary)	August 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-007-5.	
6	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — System Security Management

2. Number: CIP-007-6

3. Purpose: To manage system security by specifying select technical, operational, and procedural requirements in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-007-6:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-007-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Registered Entities shall not be required to comply with the elements of Reliability Standard CIP-007-6, Requirement R1, Parts 1.2 and Parts 1.3 that apply to PCAs and nonprogrammable communication components located inside a PSP and inside an ESP and associated with High and Medium Impact BES Cyber Systems until six calendar months after the effective date of Reliability Standard CIP-007-6.

6. Background:

Standard CIP-007 exists as part of a suite of CIP Standards related to cyber security, which requires the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to medium impact BES Cyber Systems located at a Control Center.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System in the applicability column. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The requirement is intended to minimize the attack surface of BES Cyber Systems through disabling or limiting access to unnecessary network accessible logical ports and services and physical I/O ports.

In response to FERC Order No. 791, specifically FERC's reference to NIST 800-53 rev. 3 security control PE-4 in paragraph 149, Part 1.2 has been expanded to include PCAs and nonprogrammable communications components. This increase in applicability expands the scope of devices that receive the protection afforded by the defense-in-depth control included in Requirement R1, Part 1.2.

The applicability is limited to those nonprogrammable communications components located both inside a PSP and an ESP in order to allow for a scenario in which a Responsible Entity may implement an extended ESP (with corresponding logical protections identified in CIP-006, Requirement R1, Part 1.10). In this scenario, nonprogrammable components of the communication network may exist out of the Responsible Entity's control (i.e. as part of the telecommunication carrier's network).

R1. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-6 Table R1 – Ports and Services*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations.]*

M1. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-007-6 Table R1 – Ports and Services* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-6 Table R1– Ports and Services			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA	Where technically feasible, enable only logical network accessible ports that have been determined to be needed by the Responsible Entity, including port ranges or services where needed to handle dynamic ports. If a device has no provision for disabling or restricting logical ports on the device then those ports that are open are deemed needed.	Examples of evidence may include, but are not limited to: • Documentation of the need for all enabled ports on all applicable Cyber Assets and Electronic Access Points, individually or by group. • Listings of the listening ports on the Cyber Assets, individually or by group, from either the device configuration files, command output (such as netstat), or network scans of open ports; or • Configuration files of host-based firewalls or other device level mechanisms that only allow needed ports and deny all others.

CIP-007-6 Table R1– Ports and Services			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. PCA; and 2. Nonprogrammable communication components located inside both a PSP and an ESP. Medium Impact BES Cyber Systems at Control Centers and their associated: 1. PCA; and 2. Nonprogrammable communication components located inside both a PSP and an ESP.	Protect against the use of unnecessary physical input/output ports used for network connectivity, console commands, or Removable Media.	An example of evidence may include, but is not limited to, documentation showing types of protection of physical input/output ports, either logically through system configuration or physically using a port lock or signage.

Rationale for Requirement R2:

Security patch management is a proactive way of monitoring and addressing known security vulnerabilities in software before those vulnerabilities can be exploited in a malicious manner to gain control of or render a BES Cyber Asset or BES Cyber System inoperable.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-6 Table R2 – Security Patch Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-007-6 Table R2 – Security Patch Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-6 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	A patch management process for tracking, evaluating, and installing cyber security patches for applicable Cyber Assets. The tracking portion shall include the identification of a source or sources that the Responsible Entity tracks for the release of cyber security patches for applicable Cyber Assets that are updateable and for which a patching source exists.	An example of evidence may include, but is not limited to, documentation of a patch management process and documentation or lists of sources that are monitored, whether on an individual BES Cyber System or Cyber Asset basis.

CIP-007-6 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	At least once every 35 calendar days, evaluate security patches for applicability that have been released since the last evaluation from the source or sources identified in Part 2.1.	An example of evidence may include, but is not limited to, an evaluation conducted by, referenced by, or on behalf of a Responsible Entity of security-related patches released by the documented sources at least once every 35 calendar days.

CIP-007-6 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For applicable patches identified in Part 2.2, within 35 calendar days of the evaluation completion, take one of the following actions: • Apply the applicable patches; or • Create a dated mitigation plan; or • Revise an existing mitigation plan. Mitigation plans shall include the Responsible Entity's planned actions to mitigate the vulnerabilities addressed by each security patch and a timeframe to complete these mitigations.	Examples of evidence may include, but are not limited to: • Records of the installation of the patch (e.g., exports from automated patch management tools that provide installation date, verification of BES Cyber System Component software revision, or registry exports that show software has been installed); or • A dated plan showing when and how the vulnerability will be addressed, to include documentation of the actions to be taken by the Responsible Entity to mitigate the vulnerabilities addressed by the security patch and a timeframe for the completion of these mitigations.

CIP-007-6 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For each mitigation plan created or revised in Part 2.3, implement the plan within the timeframe specified in the plan, unless a revision to the plan or an extension to the timeframe specified in Part 2.3 is approved by the CIP Senior Manager or delegate.	An example of evidence may include, but is not limited to, records of implementation of mitigations.

Rationale for Requirement R3:

Malicious code prevention has the purpose of limiting and detecting the addition of malicious code onto the applicable Cyber Assets of a BES Cyber System. Malicious code (viruses, worms, botnets, targeted code such as Stuxnet, etc.) may compromise the availability or integrity of the BES Cyber System.

R3. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-6 Table R3 – Malicious Code Prevention*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations].*

M3. Evidence must include each of the documented processes that collectively include each of the applicable requirement parts in *CIP-007-6 Table R3 – Malicious Code Prevention* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-6 Table R3 – Malicious Code Prevention			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Deploy method(s) to deter, detect, or prevent malicious code.	An example of evidence may include, but is not limited to, records of the Responsible Entity's performance of these processes (e.g., through traditional antivirus, system hardening, policies, etc.).

CIP-007-6 Table R3 – Malicious Code Prevention			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Mitigate the threat of detected malicious code.	Examples of evidence may include, but are not limited to: • Records of response processes for malicious code detection • Records of the performance of these processes when malicious code is detected.
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For those methods identified in Part 3.1 that use signatures or patterns, have a process for the update of the signatures or patterns. The process must address testing and installing the signatures or patterns.	An example of evidence may include, but is not limited to, documentation showing the process used for the update of signatures or patterns.

Rationale for Requirement R4:

Security event monitoring has the purpose of detecting unauthorized access, reconnaissance and other malicious activity on BES Cyber Systems, and comprises of the activities involved with the collection, processing, alerting and retention of security-related computer logs. These logs can provide both (1) the detection of an incident and (2) useful evidence in the investigation of an incident. The retention of security-related logs is intended to support post-event data analysis.

Audit processing failures are not penalized in this requirement. Instead, the requirement specifies processes which must be in place to monitor for and notify personnel of audit processing failures.

R4. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-6 Table R4 – Security Event Monitoring*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Assessment.]*

M4. Evidence must include each of the documented processes that collectively include each of the applicable requirement parts in *CIP-007-6 Table R4 – Security Event Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-6 Table R4 – Security Event Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Log events at the BES Cyber System level (per BES Cyber System capability) or at the Cyber Asset level (per Cyber Asset capability) for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a minimum, each of the following types of events: 4.1.1. Detected successful login attempts; 4.1.2. Detected failed access attempts and failed login attempts; 4.1.3. Detected malicious code.	Examples of evidence may include, but are not limited to, a paper or system generated listing of event types for which the BES Cyber System is capable of detecting and, for generated events, is configured to log. This listing must include the required types of events.
4.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA	Generate alerts for security events that the Responsible Entity determines necessitates an alert, that includes, as a minimum, each of the following types of events (per Cyber Asset or BES Cyber System capability): 4.2.1. Detected malicious code from Part 4.1; and 4.2.2. Detected failure of Part 4.1 event logging.	Examples of evidence may include, but are not limited to, paper or system-generated listing of security events that the Responsible Entity determined necessitate alerts, including paper or system generated list showing how alerts are configured.

CIP-007-6 Table R4 – Security Event Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; 2. PACS; and 3. PCA	Where technically feasible, retain applicable event logs identified in Part 4.1 for at least the last 90 consecutive calendar days except under CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, documentation of the event log retention process and paper or system generated reports showing log retention configuration set at 90 days or greater.
4.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Review a summarization or sampling of logged events as determined by the Responsible Entity at intervals no greater than 15 calendar days to identify undetected Cyber Security Incidents.	Examples of evidence may include, but are not limited to, documentation describing the review, any findings from the review (if any), and dated documentation showing the review occurred.

Rationale for Requirement R5:

To help ensure that no authorized individual can gain electronic access to a BES Cyber System until the individual has been authenticated, i.e., until the individual's logon credentials have been validated. Requirement R5 also seeks to reduce the risk that static passwords, where used as authenticators, may be compromised.

Requirement Part 5.1 ensures the BES Cyber System or Cyber Asset authenticates individuals that can modify configuration information. This requirement addresses the configuration of authentication. The authorization of individuals is addressed elsewhere in the CIP Cyber Security Standards. Interactive user access does not include read-only information access in which the configuration of the Cyber Asset cannot change (e.g. front panel displays, web-based reports, etc.). For devices that cannot technically or for operational reasons perform authentication, an entity may demonstrate all interactive user access paths, both remote and local, are configured for authentication. Physical security suffices for local access configuration if the physical security can record who is in the Physical Security Perimeter and at what time.

Requirement Part 5.2 addresses default and other generic account types. Identifying the use of default or generic account types that could introduce vulnerabilities has the benefit ensuring entities understand the possible risk these accounts pose to the BES Cyber System. The Requirement Part avoids prescribing an action to address these accounts because the most effective solution is situation specific, and in some cases, removing or disabling the account could have reliability consequences.

Requirement Part 5.3 addresses identification of individuals with access to shared accounts. This Requirement Part has the objective of mitigating the risk of unauthorized access through shared accounts. This differs from other CIP Cyber Security Standards Requirements to authorize access. An entity can authorize access and still not know who has access to a shared account. Failure to identify individuals with access to shared accounts would make it difficult to revoke access when it is no longer needed. The term “authorized” is used in the requirement to make clear that individuals storing, losing, or inappropriately sharing a password is not a violation of this requirement.

Requirement 5.4 addresses default passwords. Changing default passwords closes an easily exploitable vulnerability in many systems and applications. Pseudo-randomly system generated passwords are not considered default passwords.

For password-based user authentication, using strong passwords and changing them periodically helps mitigate the risk of successful password cracking attacks and the risk of accidental password disclosure to unauthorized individuals. In these requirements, the drafting team considered multiple approaches to ensuring this requirement was both effective and flexible enough to allow Responsible Entities to make good security decisions. One of the approaches considered involved requiring minimum password entropy, but the calculation for true information entropy is more highly complex and makes several assumptions in the passwords users choose. Users can pick poor passwords well below the calculated minimum entropy.

Rationale for Requirement R5 (continued):

The drafting team also chose to not require technical feasibility exceptions for devices that cannot meet the length and complexity requirements in password parameters. The objective of this requirement is to apply a measurable password policy to deter password cracking attempts, and replacing devices to achieve a specified password policy does not meet this objective. At the same time, this requirement has been strengthened to require account lockout or alerting for failed login attempts, which in many instances better meets the requirement objective.

The requirement to change passwords exists to address password cracking attempts if an encrypted password were somehow attained and also to refresh passwords which may have been accidentally disclosed over time. The requirement permits the entity to specify the periodicity of change to accomplish this objective. Specifically, the drafting team felt determining the appropriate periodicity based on a number of factors is more effective than specifying the period for every BES Cyber System in the Standard. In general, passwords for user authentication should be changed at least annually. The periodicity may increase in some cases. For example, application passwords that are long and pseudo-randomly generated could have a very long periodicity. Also, passwords used only as a weak form of application authentication, such as accessing the configuration of a relay may only need to be changed as part of regularly scheduled maintenance.

The Cyber Asset should automatically enforce the password policy for individual user accounts. However, for shared accounts in which no mechanism exists to enforce password policies, the Responsible Entity can enforce the password policy procedurally and through internal assessment and audit.

Requirement Part 5.7 assists in preventing online password attacks by limiting the number of guesses an attacker can make. This requirement allows either limiting the number of failed authentication attempts or alerting after a defined number of failed authentication attempts. Entities should take caution in choosing to limit the number of failed authentication attempts for all accounts because this would allow the possibility for a denial of service attack on the BES Cyber System.

R5. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-6 Table R5 – System Access Controls*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M5. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-007-6 Table 5 – System Access Controls* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-6 Table R5 – System Access Control			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA	Have a method(s) to enforce authentication of interactive user access, where technically feasible.	An example of evidence may include, but is not limited to, documentation describing how access is authenticated.

CIP-007-6 Table R5 – System Access Control			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Identify and inventory all known enabled default or other generic account types, either by system, by groups of systems, by location, or by system type(s).	An example of evidence may include, but is not limited to, a listing of accounts by account types showing the enabled or generic account types in use for the BES Cyber System.

CIP-007-6 Table R5 – System Access Control			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA	Identify individuals who have authorized access to shared accounts.	An example of evidence may include, but is not limited to, listing of shared accounts and the individuals who have authorized access to each shared account.

CIP-007-6 Table R5 – System Access Control			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Change known default passwords, per Cyber Asset capability	Examples of evidence may include, but are not limited to: • Records of a procedure that passwords are changed when new devices are in production; or • Documentation in system manuals or other vendor documents showing default vendor passwords were generated pseudo-randomly and are thereby unique to the device.

CIP-007-6 Table R5 – System Access Control			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.5	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For password-only authentication for interactive user access, either technically or procedurally enforce the following password parameters: 5.5.1. Password length that is, at least, the lesser of eight characters or the maximum length supported by the Cyber Asset; and 5.5.2. Minimum password complexity that is the lesser of three or more different types of characters (e.g., uppercase alphabetic, lowercase alphabetic, numeric, non-alphanumeric) or the maximum complexity supported by the Cyber Asset.	Examples of evidence may include, but are not limited to: • System-generated reports or screen-shots of the system-enforced password parameters, including length and complexity; or • Attestations that include a reference to the documented procedures that were followed.

Examples of evidence may include, but are not limited to: • Documentation of the account-lockout parameters; or • Rules in the alerting configuration showing how the system notified individuals after a determined number of unsuccessful login attempts.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Requirement R1 exists to reduce the attack surface of Cyber Assets by requiring entities to disable known unnecessary ports. The SDT intends for the entity to know what network accessible ("listening") ports and associated services are accessible on their assets and systems, whether they are needed for that Cyber Asset's function, and disable or restrict access to all other ports.

1.1. This requirement is most often accomplished by disabling the corresponding service or program that is listening on the port or configuration settings within the Cyber Asset. It can also be accomplished through using host-based firewalls, TCP_Wrappers, or other means on the Cyber Asset to restrict access. Note that the requirement is applicable at the Cyber Asset level. The Cyber Assets are those which comprise the applicable BES Cyber Systems and their associated Cyber Assets. This control is another layer in the defense against network-based attacks, therefore the SDT intends that the control be on the device itself, or positioned inline in a non-bypassable manner. Blocking ports at the ESP border does not substitute for this device level requirement. If a device has no provision for disabling or restricting logical ports on the device (example - purpose built devices that run from firmware with no port configuration available) then those ports that are open are deemed 'needed.'

1.2. Examples of physical I/O ports include network, serial and USB ports external to the device casing. BES Cyber Systems should exist within a Physical Security Perimeter in which

case the physical I/O ports have protection from unauthorized access, but it may still be possible for accidental use such as connecting a modem, connecting a network cable that bridges networks, or inserting a USB drive. Ports used for 'console commands' primarily means serial ports on Cyber Assets that provide an administrative interface.

The protection of these ports can be accomplished in several ways including, but not limited to:

- Disabling all unneeded physical ports within the Cyber Asset's configuration
- Prominent signage, tamper tape, or other means of conveying that the ports should not be used without proper authorization
- Physical port obstruction through removable locks

The network ports included in the scope of this requirement part are not limited to those on the BES Cyber System itself. The scope of physical network ports includes those ports that may exist on nonprogrammable devices such as unmanaged switches, hubs, or patch panels.

This is a 'defense in depth' type control and it is acknowledged that there are other layers of control (the PSP for one) that prevent unauthorized personnel from gaining physical access to these ports. Even with physical access, it has been pointed out there are other ways to circumvent the control. This control, with its inclusion of means such as signage, is not meant to be a preventative control against intruders. Signage is indeed a directive control, not a preventative one. However, with a defense-in-depth posture, different layers and types of controls are required throughout the standard with this providing another layer for depth in Control Center environments. Once physical access has been achieved through the other preventative and detective measures by authorized personnel, a directive control that outlines proper behavior as a last line of defense are appropriate in these highest risk areas. In essence, signage would be used to remind authorized users to "think before you plug anything into one of these systems" which is the intent. This control is not designed primarily for intruders, but for example the authorized employee who intends to plug his possibly infected smartphone into an operator console USB port to charge the battery.

Requirement R2:

The SDT's intent of Requirement R2 is to require entities to know, track, and mitigate the known software vulnerabilities associated with their BES Cyber Assets. It is not strictly an "install every security patch" requirement; the main intention is to "be aware of in a timely manner and manage all known vulnerabilities" requirement.

Patch management is required for BES Cyber Systems that are accessible remotely as well as standalone systems. Stand alone systems are vulnerable to intentional or unintentional introduction of malicious code. A sound defense-in-depth security strategy employs additional measures such as physical security, malware prevention software, and software patch management to reduce the introduction of malicious code or the exploit of known vulnerabilities.

One or multiple processes could be utilized. An overall assessment process may exist in a top tier document with lower tier documents establishing the more detailed process followed for

individual systems. Lower tier documents could be used to cover BES Cyber System nuances that may occur at the system level.

2.1. The Responsible Entity is to have a patch management program that covers tracking, evaluating, and installing cyber security patches. The requirement applies to patches only, which are fixes released to handle a specific vulnerability in a hardware or software product. The requirement covers only patches that involve cyber security fixes and does not cover patches that are purely functionality related with no cyber security impact. Tracking involves processes for notification of the availability of new cyber security patches for the Cyber Assets. Documenting the patch source in the tracking portion of the process is required to determine when the assessment timeframe clock starts. This requirement handles the situation where security patches can come from an original source (such as an operating system vendor), but must be approved or certified by another source (such as a control system vendor) before they can be assessed and applied in order to not jeopardize the availability or integrity of the control system. The source can take many forms. The National Vulnerability Database, Operating System vendors, or Control System vendors could all be sources to monitor for release of security related patches, hotfixes, and/or updates. A patch source is not required for Cyber Assets that have no updateable software or firmware (there is no user accessible way to update the internal software or firmware executing on the Cyber Asset), or those Cyber Assets that have no existing source of patches such as vendors that no longer exist. The identification of these sources is intended to be performed once unless software is changed or added to the Cyber Asset's baseline.

2.2. Responsible Entities are to perform an assessment of security related patches within 35 days of release from their monitored source. An assessment should consist of determination of the applicability of each patch to the entity's specific environment and systems. Applicability determination is based primarily on whether the patch applies to a specific software or hardware component that the entity does have installed in an applicable Cyber Asset. A patch that applies to a service or component that is not installed in the entity's environment is not applicable. If the patch is determined to be non-applicable, that is documented with the reasons why and the entity is compliant. If the patch is applicable, the assessment can include a determination of the risk involved, how the vulnerability can be remediated, the urgency and timeframe of the remediation, and the steps the entity has previously taken or will take. Considerable care must be taken in applying security related patches, hotfixes, and/or updates or applying compensating measures to BES Cyber System or BES Cyber Assets that are no longer supported by vendors. It is possible security patches, hotfixes, and updates may reduce the reliability of the system, and entities should take this into account when determining the type of mitigation to apply. The Responsible Entities can use the information provided in the Department of Homeland Security "Quarterly Report on Cyber Vulnerabilities of Potential Risk to Control Systems" as a source. The DHS document "Recommended Practice for Patch Management of Control Systems" provides guidance on an evaluative process. It uses severity levels determined using the Common Vulnerability Scoring System Version 2. Determination that a security related patch, hotfix, and/or update poses too great a risk to install on a system or is not applicable due to the system configuration should not require a TFE.

When documenting the remediation plan measures it may not be necessary to document them on a one to one basis. The remediation plan measures may be cumulative. A measure to address a software vulnerability may involve disabling a particular service. That same service may be exploited through other software vulnerabilities. Therefore disabling the single service has addressed multiple patched vulnerabilities.

2.3. The requirement handles the situations where it is more of a reliability risk to patch a running system than the vulnerability presents. In all cases, the entity either installs the patch or documents (either through the creation of a new or update of an existing mitigation plan) what they are going to do to mitigate the vulnerability and when they are going to do so. There are times when it is in the best interest of reliability to not install a patch, and the entity can document what they have done to mitigate the vulnerability. For those security related patches that are determined to be applicable, the Responsible Entity must within 35 days either install the patch, create a dated mitigation plan which will outline the actions to be taken or those that have already been taken by the Responsible Entity to mitigate the vulnerabilities addressed by the security patch, or revise an existing mitigation plan. Timeframes do not have to be designated as a particular calendar day but can have event designations such as “at next scheduled outage of at least two days duration.” “Mitigation plans” in the standard refers to internal documents and are not to be confused with plans that are submitted to Regional Entities in response to violations.

2.4. The entity has been notified of, has assessed, and has developed a plan to remediate the known risk and that plan must be implemented. Remediation plans that only include steps that have been previously taken are considered implemented upon completion of the documentation. Remediation plans that have steps to be taken to remediate the vulnerability must be implemented by the timeframe the entity documented in their plan. There is no maximum timeframe in this requirement as patching and other system changes carries its own risk to the availability and integrity of the systems and may require waiting until a planned outage. In periods of high demand or threatening weather, changes to systems may be curtailed or denied due to the risk to reliability.

Requirement R3:

3.1. Due to the wide range of equipment comprising the BES Cyber Systems and the wide variety of vulnerability and capability of that equipment to malware as well as the constantly evolving threat and resultant tools and controls, it is not practical within the standard to prescribe how malware is to be addressed on each Cyber Asset. Rather, the Responsible Entity determines on a BES Cyber System basis which Cyber Assets have susceptibility to malware intrusions and documents their plans and processes for addressing those risks and provides evidence that they follow those plans and processes. There are numerous options available including traditional antivirus solutions for common operating systems, white-listing solutions, network isolation techniques, Intrusion Detection/Prevention (IDS/IPS) solutions, etc. If an entity has numerous BES Cyber Systems or Cyber Assets that are of identical architecture, they may provide one process that describes how all the like Cyber Assets are covered. If a specific Cyber Asset has no updateable software and its executing code cannot be altered, then that Cyber Asset is considered to have its own internal method of deterring malicious code.

Entities should also have awareness of malware protection requirements for Transient Cyber Assets and Removable Media ("transient devices") in CIP-010-2. The protections required here in CIP-007-6, Requirement R3 complement but do not meet the additional obligations for transient devices.

3.2. When malicious code is detected on a Cyber Asset within the applicability of this requirement, the threat posed by that code must be mitigated. In situations where traditional antivirus products are used, they may be configured to automatically remove or quarantine the malicious code. In white-listing situations, the white-listing tool itself can mitigate the threat as it will not allow the code to execute, however steps should still be taken to remove the malicious code from the Cyber Asset. In some instances, it may be in the best interest of reliability to not immediately remove or quarantine the malicious code, such as when availability of the system may be jeopardized by removal while operating and a rebuild of the system needs to be scheduled. In that case, monitoring may be increased and steps taken to insure the malicious code cannot communicate with other systems. In some instances the entity may be working with law enforcement or other governmental entities to closely monitor the code and track the perpetrator(s). For these reasons, there is no maximum timeframe or method prescribed for the removal of the malicious code, but the requirement is to mitigate the threat posed by the now identified malicious code.

3.3. In instances where malware detection technologies depend on signatures or patterns of known attacks, the effectiveness of these tools against evolving threats is tied to the ability to keep these signatures and patterns updated in a timely manner. The entity is to have a documented process that includes the testing and installation of signature or pattern updates. In a BES Cyber System, there may be some Cyber Assets that would benefit from the more timely installation of the updates where availability of that Cyber Asset would not jeopardize the availability of the BES Cyber System's ability to perform its function. For example, some HMI workstations where portable media is utilized may benefit from having the very latest updates at all times with minimal testing. Other Cyber Assets should have any updates thoroughly tested before implementation where the result of a 'false positive' could harm the availability of the BES Cyber System. The testing should not negatively impact the reliability of the BES. The testing should be focused on the update itself and if it will have an adverse impact on the BES Cyber System. Testing in no way implies that the entity is testing to ensure that malware is indeed detected by introducing malware into the environment. It is strictly focused on ensuring that the update does not negatively impact the BES Cyber System before those updates are placed into production.

Requirement R4:

Refer to NIST 800-92 and 800-137 for additional guidance in security event monitoring.

4.1. In a complex computing environment and faced with dynamic threats and vulnerabilities, it is not practical within the standard to enumerate all security-related events necessary to support the activities for alerting and incident response. Rather, the Responsible Entity determines which computer generated events are necessary to log, provide alerts and monitor for their particular BES Cyber System environment.

Specific security events already required in Version 4 of the CIP Standards carry forward in this version. This includes access attempts at the Electronic Access Points, if any have been identified for a BES Cyber Systems. Examples of access attempts include: (i) blocked network access attempts, (ii) successful and unsuccessful remote user access attempts, (iii) blocked network access attempts from a remote VPN, and (iv) successful network access attempts or network flow information.

User access and activity events include those events generated by Cyber Assets within the Electronic Security Perimeter that have access control capability. These types of events include: (i) successful and unsuccessful authentication, (ii) account management, (iii) object access, and (iv) processes started and stopped.

It is not the intent of the SDT that if a device cannot log a particular event that a TFE must be generated. The SDT's intent is that if any of the items in the bulleted list (for example, user logouts) can be logged by the device then the entity must log that item. If the device does not have the capability of logging that event, the entity remains compliant.

4.2. Real-time alerting allows the cyber system to automatically communicate events of significance to designated responders. This involves configuration of a communication mechanism and log analysis rules. Alerts can be configured in the form of an email, text message, or system display and alarming. The log analysis rules can exist as part of the operating system, specific application or a centralized security event monitoring system. On one end, a real-time alert could consist of a set point on an RTU for a login failure, and on the other end, a security event monitoring system could provide multiple alerting communications options triggered on any number of complex log correlation rules.

The events triggering a real-time alert may change from day to day as system administrators and incident responders better understand the types of events that might be indications of a cyber-security incident. Configuration of alerts also must balance the need for responders to know an event occurred with the potential inundation of insignificant alerts. The following list includes examples of events a Responsible Entity should consider in configuring real-time alerts:

- Detected known or potential malware or malicious activity
- Failure of security event logging mechanisms
- Login failures for critical accounts
- Interactive login of system accounts
- Enabling of accounts
- Newly provisioned accounts
- System administration or change tasks by an unauthorized user
- Authentication attempts on certain accounts during non-business hours
- Unauthorized configuration changes
- Insertion of Removable Media in violation of a policy

4.3 Logs that are created under Part 4.1 are to be retained on the applicable Cyber Assets or BES Cyber Systems for at least 90 days. This is different than the evidence retention period

called for in the CIP standards used to prove historical compliance. For such audit purposes, the entity should maintain evidence that shows that 90 days were kept historically. One example would be records of disposition of event logs beyond 90 days up to the evidence retention period.

4.4. Reviewing logs at least every 15 days (approximately every two weeks) can consist of analyzing a summarization or sampling of logged events. NIST SP800-92 provides a lot of guidance in periodic log analysis. If a centralized security event monitoring system is used, log analysis can be performed top-down starting with a review of trends from summary reports. The log review can also be an extension of the exercise in identifying those events needing real-time alerts by analyzing events that are not fully understood or could possibly inundate the real-time alerting.

Requirement R5:

Account types referenced in this guidance typically include:

- Shared user account: An account used by multiple users for normal business functions by employees or contractors. Usually on a device that does not support Individual User Accounts.
- Individual user account: An account used by a single user.
- Administrative account: An account with elevated privileges for performing administrative or other specialized functions. These can be individual or shared accounts.
- System account: Accounts used to run services on a system (web, DNS, mail etc). No users have access to these accounts.
- Application account: A specific system account, with rights granted at the application level often used for access into a Database.
- Guest account: An individual user account not typically used for normal business functions by employees or contractors and not associated with a specific user. May or may not be shared by multiple users.
- Remote access account: An individual user account only used for obtaining Interactive Remote Access to the BES Cyber System.
- Generic account: A group account set up by the operating system or application to perform specific operations. This differs from a shared user account in that individual users do not receive authorization for access to this account type.

5.1 Reference the Requirement's rationale.

5.2 Where possible, default and other generic accounts provided by a vendor should be removed, renamed, or disabled prior to production use of the Cyber Asset or BES Cyber System. If this is not possible, the passwords must be changed from the default provided by the vendor. Default and other generic accounts remaining enabled must be documented. For common

configurations, this documentation can be performed at a BES Cyber System or more general level.

5.3 Entities may choose to identify individuals with access to shared accounts through the access authorization and provisioning process, in which case the individual authorization records suffice to meet this Requirement Part. Alternatively, entities may choose to maintain a separate listing for shared accounts. Either form of evidence achieves the end result of maintaining control of shared accounts.

5.4. Default passwords can be commonly published in vendor documentation that is readily available to all customers using that type of equipment and possibly published online.

The requirement option to have unique password addresses cases where the Cyber Asset generates or has assigned pseudo-random default passwords at the time of production or installation. In these cases, the default password does not have to change because the system or manufacturer created it specific to the Cyber Asset.

5.5. Interactive user access does not include read-only information access in which the configuration of the Cyber Asset cannot change (e.g. front panel displays, web-based reports, etc.). For devices that cannot technically or for operational reasons perform authentication, an entity may demonstrate all interactive user access paths, both remote and local, are configured for authentication. Physical security suffices for local access configuration if the physical security can record who is in the Physical Security Perimeter and at what time.

Technical or procedural enforcement of password parameters are required where passwords are the only credential used to authenticate individuals. Technical enforcement of the password parameters means a Cyber Asset verifies an individually selected password meets the required parameters before allowing the account to authenticate with the selected password. Technical enforcement should be used in most cases when the authenticating Cyber Asset supports enforcing password parameters. Likewise, procedural enforcement means requiring the password parameters through procedures. Individuals choosing the passwords have the obligation of ensuring the password meets the required parameters.

Password complexity refers to the policy set by a Cyber Asset to require passwords to have one or more of the following types of characters: (1) lowercase alphabetic, (2) uppercase alphabetic, (3) numeric, and (4) non-alphanumeric or “special” characters (e.g. #, $, @, &), in various combinations.

5.6 Technical or procedural enforcement of password change obligations are required where passwords are the only credential used to authenticate individuals. Technical enforcement of password change obligations means the Cyber Asset requires a password change after a specified timeframe prior to allowing access. In this case, the password is not required to change by the specified time as long as the Cyber Asset enforces the password change after the next successful authentication of the account. Procedural enforcement means manually changing passwords used for interactive user access after a specified timeframe.

5.7 Configuring an account lockout policy or alerting after a certain number of failed authentication attempts serves to prevent unauthorized access through an online password

guessing attack. The threshold of failed authentication attempts should be set high enough to avoid false-positives from authorized users failing to authenticate. It should also be set low enough to account for online password attacks occurring over an extended period of time. This threshold may be tailored to the operating environment over time to avoid unnecessary account lockouts.

Entities should take caution when configuring account lockout to avoid locking out accounts necessary for the BES Cyber System to perform a BES reliability task. In such cases, entities should configure authentication failure alerting.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014

Description of Current Draft

This draft standard is being posted for an initial comment and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
First 45-Day Comment Period Opens	June 2014
Additional 45-Day Comment Period (if necessary)	August 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-007-5.	
6	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — System Security Management

2. Number: CIP-007-~~5~~6

3. Purpose: To manage system security by specifying select technical, operational, and procedural requirements in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-007-~~5~~6:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-007-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Registered Entities shall not be required to comply with the elements of Reliability Standard CIP-007-6, Requirement R1, Parts 1.2 and Parts 1.3 that apply to PCAs and nonprogrammable communication components located inside a PSP and inside an ESP and associated with High and Medium Impact BES Cyber Systems until six calendar months after the effective date of Reliability Standard CIP-007-6.

6. Background:

Standard CIP-007 ~~-5~~ exists as part of a suite of CIP Standards related to cyber security, which~~. CIP-002-5.1~~ requires the initial identification and categorization of BES Cyber Systems~~. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1, and CIP-011-1~~ 2~~ and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems. ~~This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.~~

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.~~The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on~~

~~*whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:~~

~~Each Responsible Entity shall implement, **in a manner that identifies, assesses, and corrects deficiencies,** . . .~~

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in ~~their~~ its documented processes, but ~~they~~ it must address the applicable requirements in the table. ~~The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities.~~

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is

specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to medium impact BES Cyber Systems located at a Control Center.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System in the applicability column. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The requirement is intended to minimize the attack surface of BES Cyber Systems through disabling or limiting access to unnecessary network accessible logical ports and services and physical I/O ports.

In response to FERC Order No. 791, specifically FERC's reference to NIST 800-53 rev. 3 security control PE-4 in paragraph 149, Part 1.2 has been expanded to include PCAs and nonprogrammable communications components. This increase in applicability expands the scope of devices that receive the protection afforded by the defense-in-depth control included in Requirement R1, Part 1.2.

The applicability is limited to those nonprogrammable communications components located both inside a PSP and an ESP in order to allow for a scenario in which a Responsible Entity may implement an extended ESP (with corresponding logical protections identified in CIP-006, Requirement R1, Part 1.10). In this scenario, nonprogrammable components of the communication network may exist out of the Responsible Entity's control (i.e. as part of the telecommunication carrier's network).

R1. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~5~~ 6 Table R1 – Ports and Services*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations.]*

M1. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~5~~ 6 Table R1 – Ports and Services* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-~~5~~ 6 Table R1– Ports and Services			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA	Where technically feasible, enable only logical network accessible ports that have been determined to be needed by the Responsible Entity, including port ranges or services where needed to handle dynamic ports. If a device has no provision for disabling or restricting logical ports on the device then those ports that are open are deemed needed.	Examples of evidence may include, but are not limited to: • Documentation of the need for all enabled ports on all applicable Cyber Assets and Electronic Access Points, individually or by group. • Listings of the listening ports on the Cyber Assets, individually or by group, from either the device configuration files, command output (such as netstat), or network scans of open ports; or • Configuration files of host-based firewalls or other device level mechanisms that only allow needed ports and deny all others.

CIP-007-~~5~~ 6 Table R1– Ports and Services			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. PCA; and 2. Nonprogrammable communication components located inside both a PSP and an ESP. Medium Impact BES Cyber Systems at Control Centers and their associated: 1. PCA; and 2. Nonprogrammable communication components located inside both a PSP and an ESP.	Protect against the use of unnecessary physical input/output ports used for network connectivity, console commands, or ~~removable~~ Removable ~~media~~Media.	An example of evidence may include, but is not limited to, documentation showing types of protection of physical input/output ports, either logically through system configuration or physically using a port lock or signage.

Rationale for Requirement R2:

Security patch management is a proactive way of monitoring and addressing known security vulnerabilities in software before those vulnerabilities can be exploited in a malicious manner to gain control of or render a BES Cyber Asset or BES Cyber System inoperable.

R2. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~5~~ 6 Table R2 – Security Patch Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~5~~ 6 Table R2 – Security Patch Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-~~5~~ 6 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	A patch management process for tracking, evaluating, and installing cyber security patches for applicable Cyber Assets. The tracking portion shall include the identification of a source or sources that the Responsible Entity tracks for the release of cyber security patches for applicable Cyber Assets that are updateable and for which a patching source exists.	An example of evidence may include, but is not limited to, documentation of a patch management process and documentation or lists of sources that are monitored, whether on an individual BES Cyber System or Cyber Asset basis.

CIP-007-~~5~~ 6 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	At least once every 35 calendar days, evaluate security patches for applicability that have been released since the last evaluation from the source or sources identified in Part 2.1.	An example of evidence may include, but is not limited to, an evaluation conducted by, referenced by, or on behalf of a Responsible Entity of security-related patches released by the documented sources at least once every 35 calendar days.

CIP-007-~~5~~ 6 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For applicable patches identified in Part 2.2, within 35 calendar days of the evaluation completion, take one of the following actions: • Apply the applicable patches; or • Create a dated mitigation plan; or • Revise an existing mitigation plan. Mitigation plans shall include the Responsible Entity's planned actions to mitigate the vulnerabilities addressed by each security patch and a timeframe to complete these mitigations.	Examples of evidence may include, but are not limited to: • Records of the installation of the patch (e.g., exports from automated patch management tools that provide installation date, verification of BES Cyber System Component software revision, or registry exports that show software has been installed); or • A dated plan showing when and how the vulnerability will be addressed, to include documentation of the actions to be taken by the Responsible Entity to mitigate the vulnerabilities addressed by the security patch and a timeframe for the completion of these mitigations.

CIP-007-~~5~~ 6 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For each mitigation plan created or revised in Part 2.3, implement the plan within the timeframe specified in the plan, unless a revision to the plan or an extension to the timeframe specified in Part 2.3 is approved by the CIP Senior Manager or delegate.	An example of evidence may include, but is not limited to, records of implementation of mitigations.

Rationale for Requirement R3:

Malicious code prevention has the purpose of limiting and detecting the addition of malicious code onto the applicable Cyber Assets of a BES Cyber System. Malicious code (viruses, worms, botnets, targeted code such as Stuxnet, etc.) may compromise the availability or integrity of the BES Cyber System.

R3. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~5~~ 6 Table R3 – Malicious Code Prevention*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations].*

M3. Evidence must include each of the documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~5~~ 6 Table R3 – Malicious Code Prevention* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-~~5~~ 6 Table R3 – Malicious Code Prevention			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Deploy method(s) to deter, detect, or prevent malicious code.	An example of evidence may include, but is not limited to, records of the Responsible Entity's performance of these processes (e.g., through traditional antivirus, system hardening, policies, etc.).

CIP-007-~~5~~ 6 Table R3 – Malicious Code Prevention			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Mitigate the threat of detected malicious code.	Examples of evidence may include, but are not limited to: • Records of response processes for malicious code detection • Records of the performance of these processes when malicious code is detected.
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For those methods identified in Part 3.1 that use signatures or patterns, have a process for the update of the signatures or patterns. The process must address testing and installing the signatures or patterns.	An example of evidence may include, but is not limited to, documentation showing the process used for the update of signatures or patterns.

Rationale for Requirement R4:

Security event monitoring has the purpose of detecting unauthorized access, reconnaissance and other malicious activity on BES Cyber Systems, and comprises of the activities involved with the collection, processing, alerting and retention of security-related computer logs. These logs can provide both (1) the detection of an incident and (2) useful evidence in the investigation of an incident. The retention of security-related logs is intended to support post-event data analysis.

Audit processing failures are not penalized in this requirement. Instead, the requirement specifies processes which must be in place to monitor for and notify personnel of audit processing failures.

R4. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~5~~ 6 Table R4 – Security Event Monitoring*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Assessment.]*

M4. Evidence must include each of the documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~5~~ 6 Table R4 – Security Event Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-~~5~~ 6 Table R4 – Security Event Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Log events at the BES Cyber System level (per BES Cyber System capability) or at the Cyber Asset level (per Cyber Asset capability) for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a minimum, each of the following types of events: 4.1.1. Detected successful login attempts; 4.1.2. Detected failed access attempts and failed login attempts; 4.1.3. Detected malicious code.	Examples of evidence may include, but are not limited to, a paper or system generated listing of event types for which the BES Cyber System is capable of detecting and, for generated events, is configured to log. This listing must include the required types of events.
4.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA	Generate alerts for security events that the Responsible Entity determines necessitates an alert, that includes, as a minimum, each of the following types of events (per Cyber Asset or BES Cyber System capability): 4.2.1. Detected malicious code from Part 4.1; and 4.2.2. Detected failure of Part 4.1 event logging.	Examples of evidence may include, but are not limited to, paper or system-generated listing of security events that the Responsible Entity determined necessitate alerts, including paper or system generated list showing how alerts are configured.

CIP-007-~~5~~ 6 Table R4 – Security Event Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; 2. PACS; and 3. PCA	Where technically feasible, retain applicable event logs identified in Part 4.1 for at least the last 90 consecutive calendar days except under CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, documentation of the event log retention process and paper or system generated reports showing log retention configuration set at 90 days or greater.
4.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Review a summarization or sampling of logged events as determined by the Responsible Entity at intervals no greater than 15 calendar days to identify undetected Cyber Security Incidents.	Examples of evidence may include, but are not limited to, documentation describing the review, any findings from the review (if any), and dated documentation showing the review occurred.

Rationale for Requirement R5:

To help ensure that no authorized individual can gain electronic access to a BES Cyber System until the individual has been authenticated, i.e., until the individual's logon credentials have been validated. Requirement R5 also seeks to reduce the risk that static passwords, where used as authenticators, may be compromised.

Requirement Part 5.1 ensures the BES Cyber System or Cyber Asset authenticates individuals that can modify configuration information. This requirement addresses the configuration of authentication. The authorization of individuals is addressed elsewhere in the CIP Cyber Security Standards. Interactive user access does not include read-only information access in which the configuration of the Cyber Asset cannot change (e.g. front panel displays, web-based reports, etc.). For devices that cannot technically or for operational reasons perform authentication, an entity may demonstrate all interactive user access paths, both remote and local, are configured for authentication. Physical security suffices for local access configuration if the physical security can record who is in the Physical Security Perimeter and at what time.

Requirement Part 5.2 addresses default and other generic account types. Identifying the use of default or generic account types that could introduce vulnerabilities has the benefit ensuring entities understand the possible risk these accounts pose to the BES Cyber System. The Requirement Part avoids prescribing an action to address these accounts because the most effective solution is situation specific, and in some cases, removing or disabling the account could have reliability consequences.

Requirement Part 5.3 addresses identification of individuals with access to shared accounts. This Requirement Part has the objective of mitigating the risk of unauthorized access through shared accounts. This differs from other CIP Cyber Security Standards Requirements to authorize access. An entity can authorize access and still not know who has access to a shared account. Failure to identify individuals with access to shared accounts would make it difficult to revoke access when it is no longer needed. The term “authorized” is used in the requirement to make clear that individuals storing, losing, or inappropriately sharing a password is not a violation of this requirement.

Requirement 5.4 addresses default passwords. Changing default passwords closes an easily exploitable vulnerability in many systems and applications. Pseudo-randomly system generated passwords are not considered default passwords.

For password-based user authentication, using strong passwords and changing them periodically helps mitigate the risk of successful password cracking attacks and the risk of accidental password disclosure to unauthorized individuals. In these requirements, the drafting team considered multiple approaches to ensuring this requirement was both effective and flexible enough to allow Responsible Entities to make good security decisions. One of the approaches considered involved requiring minimum password entropy, but the calculation for true information entropy is more highly complex and makes several assumptions in the passwords users choose. Users can pick poor passwords well below the calculated minimum entropy.

Rationale for Requirement R5 (continued):

The drafting team also chose to not require technical feasibility exceptions for devices that cannot meet the length and complexity requirements in password parameters. The objective of this requirement is to apply a measurable password policy to deter password cracking attempts, and replacing devices to achieve a specified password policy does not meet this objective. At the same time, this requirement has been strengthened to require account lockout or alerting for failed login attempts, which in many instances better meets the requirement objective.

The requirement to change passwords exists to address password cracking attempts if an encrypted password were somehow attained and also to refresh passwords which may have been accidentally disclosed over time. The requirement permits the entity to specify the periodicity of change to accomplish this objective. Specifically, the drafting team felt determining the appropriate periodicity based on a number of factors is more effective than specifying the period for every BES Cyber System in the Standard. In general, passwords for user authentication should be changed at least annually. The periodicity may increase in some cases. For example, application passwords that are long and pseudo-randomly generated could have a very long periodicity. Also, passwords used only as a weak form of application authentication, such as accessing the configuration of a relay may only need to be changed as part of regularly scheduled maintenance.

The Cyber Asset should automatically enforce the password policy for individual user accounts. However, for shared accounts in which no mechanism exists to enforce password policies, the Responsible Entity can enforce the password policy procedurally and through internal assessment and audit.

Requirement Part 5.7 assists in preventing online password attacks by limiting the number of guesses an attacker can make. This requirement allows either limiting the number of failed authentication attempts or alerting after a defined number of failed authentication attempts. Entities should take caution in choosing to limit the number of failed authentication attempts for all accounts because this would allow the possibility for a denial of service attack on the BES Cyber System.

R5. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~5~~ 6 Table R5 – System Access Controls*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M5. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~5~~ 6 Table 5 – System Access Controls* and additional evidence to demonstrate implementation as described in the Measures column of the table.

5.7	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; 2. PACS; and 3. PCA	Where technically feasible, either: • Limit the number of unsuccessful authentication attempts; or • Generate alerts after a threshold of unsuccessful authentication attempts.	Examples of evidence may include, but are not limited to: • Documentation of the account-lockout parameters; or • Rules in the alerting configuration showing how the system notified individuals after a determined number of unsuccessful login attempts.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

~~The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.~~

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. ~~Furthermore,~~

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Requirement R1 exists to reduce the attack surface of Cyber Assets by requiring entities to disable known unnecessary ports. The SDT intends for the entity to know what network accessible ("listening") ports and associated services are accessible on their assets and systems, whether they are needed for that Cyber Asset's function, and disable or restrict access to all other ports.

1.1. This requirement is most often accomplished by disabling the corresponding service or program that is listening on the port or configuration settings within the Cyber Asset. It can also be accomplished through using host-based firewalls, TCP_Wrappers, or other means on the Cyber Asset to restrict access. Note that the requirement is applicable at the Cyber Asset level. The Cyber Assets are those which comprise the applicable BES Cyber Systems and their associated Cyber Assets. This control is another layer in the defense against network-based attacks, therefore the SDT intends that the control be on the device itself, or positioned inline in a non-bypassable manner. Blocking ports at the ESP border does not substitute for this device level requirement. If a device has no provision for disabling or restricting logical ports on the device (example - purpose built devices that run from firmware with no port configuration available) then those ports that are open are deemed 'needed.'

1.2. Examples of physical I/O ports include network, serial and USB ports external to the device casing. BES Cyber Systems should exist within a Physical Security Perimeter in which

case the physical I/O ports have protection from unauthorized access, but it may still be possible for accidental use such as connecting a modem, connecting a network cable that bridges networks, or inserting a USB drive. Ports used for 'console commands' primarily means serial ports on Cyber Assets that provide an administrative interface.

The protection of these ports can be accomplished in several ways including, but not limited to:

- Disabling all unneeded physical ports within the Cyber Asset's configuration
- Prominent signage, tamper tape, or other means of conveying that the ports should not be used without proper authorization
- Physical port obstruction through removable locks

The network ports included in the scope of this requirement part are not limited to those on the BES Cyber System itself. The scope of physical network ports includes those ports that may exist on nonprogrammable devices such as unmanaged switches, hubs, or patch panels.

This is a 'defense in depth' type control and it is acknowledged that there are other layers of control (the PSP for one) that prevent unauthorized personnel from gaining physical access to these ports. Even with physical access, it has been pointed out there are other ways to circumvent the control. This control, with its inclusion of means such as signage, is not meant to be a preventative control against intruders. Signage is indeed a directive control, not a preventative one. However, with a defense-in-depth posture, different layers and types of controls are required throughout the standard with this providing another layer for depth in Control Center environments. Once physical access has been achieved through the other preventative and detective measures by authorized personnel, a directive control that outlines proper behavior as a last line of defense are appropriate in these highest risk areas. In essence, signage would be used to remind authorized users to "think before you plug anything into one of these systems" which is the intent. This control is not designed primarily for intruders, but for example the authorized employee who intends to plug his possibly infected smartphone into an operator console USB port to charge the battery.

Requirement R2:

The SDT's intent of Requirement R2 is to require entities to know, track, and mitigate the known software vulnerabilities associated with their BES Cyber Assets. It is not strictly an "install every security patch" requirement; the main intention is to "be aware of in a timely manner and manage all known vulnerabilities" requirement.

Patch management is required for BES Cyber Systems that are accessible remotely as well as standalone systems. Stand alone systems are vulnerable to intentional or unintentional introduction of malicious code. A sound defense-in-depth security strategy employs additional measures such as physical security, malware prevention software, and software patch management to reduce the introduction of malicious code or the exploit of known vulnerabilities.

One or multiple processes could be utilized. An overall assessment process may exist in a top tier document with lower tier documents establishing the more detailed process followed for

individual systems. Lower tier documents could be used to cover BES Cyber System nuances that may occur at the system level.

2.1. The Responsible Entity is to have a patch management program that covers tracking, evaluating, and installing cyber security patches. The requirement applies to patches only, which are fixes released to handle a specific vulnerability in a hardware or software product. The requirement covers only patches that involve cyber security fixes and does not cover patches that are purely functionality related with no cyber security impact. Tracking involves processes for notification of the availability of new cyber security patches for the Cyber Assets. Documenting the patch source in the tracking portion of the process is required to determine when the assessment timeframe clock starts. This requirement handles the situation where security patches can come from an original source (such as an operating system vendor), but must be approved or certified by another source (such as a control system vendor) before they can be assessed and applied in order to not jeopardize the availability or integrity of the control system. The source can take many forms. The National Vulnerability Database, Operating System vendors, or Control System vendors could all be sources to monitor for release of security related patches, hotfixes, and/or updates. A patch source is not required for Cyber Assets that have no updateable software or firmware (there is no user accessible way to update the internal software or firmware executing on the Cyber Asset), or those Cyber Assets that have no existing source of patches such as vendors that no longer exist. The identification of these sources is intended to be performed once unless software is changed or added to the Cyber Asset's baseline.

2.2. Responsible Entities are to perform an assessment of security related patches within 35 days of release from their monitored source. An assessment should consist of determination of the applicability of each patch to the entity's specific environment and systems. Applicability determination is based primarily on whether the patch applies to a specific software or hardware component that the entity does have installed in an applicable Cyber Asset. A patch that applies to a service or component that is not installed in the entity's environment is not applicable. If the patch is determined to be non-applicable, that is documented with the reasons why and the entity is compliant. If the patch is applicable, the assessment can include a determination of the risk involved, how the vulnerability can be remediated, the urgency and timeframe of the remediation, and the steps the entity has previously taken or will take. Considerable care must be taken in applying security related patches, hotfixes, and/or updates or applying compensating measures to BES Cyber System or BES Cyber Assets that are no longer supported by vendors. It is possible security patches, hotfixes, and updates may reduce the reliability of the system, and entities should take this into account when determining the type of mitigation to apply. The Responsible Entities can use the information provided in the Department of Homeland Security "Quarterly Report on Cyber Vulnerabilities of Potential Risk to Control Systems" as a source. The DHS document "Recommended Practice for Patch Management of Control Systems" provides guidance on an evaluative process. It uses severity levels determined using the Common Vulnerability Scoring System Version 2. Determination that a security related patch, hotfix, and/or update poses too great a risk to install on a system or is not applicable due to the system configuration should not require a TFE.

When documenting the remediation plan measures it may not be necessary to document them on a one to one basis. The remediation plan measures may be cumulative. A measure to address a software vulnerability may involve disabling a particular service. That same service may be exploited through other software vulnerabilities. Therefore disabling the single service has addressed multiple patched vulnerabilities.

2.3. The requirement handles the situations where it is more of a reliability risk to patch a running system than the vulnerability presents. In all cases, the entity either installs the patch or documents (either through the creation of a new or update of an existing mitigation plan) what they are going to do to mitigate the vulnerability and when they are going to do so. There are times when it is in the best interest of reliability to not install a patch, and the entity can document what they have done to mitigate the vulnerability. For those security related patches that are determined to be applicable, the Responsible Entity must within 35 days either install the patch, create a dated mitigation plan which will outline the actions to be taken or those that have already been taken by the Responsible Entity to mitigate the vulnerabilities addressed by the security patch, or revise an existing mitigation plan. Timeframes do not have to be designated as a particular calendar day but can have event designations such as "at next scheduled outage of at least two days duration." "Mitigation plans" in the standard refers to internal documents and are not to be confused with plans that are submitted to Regional Entities in response to violations.

2.4. The entity has been notified of, has assessed, and has developed a plan to remediate the known risk and that plan must be implemented. Remediation plans that only include steps that have been previously taken are considered implemented upon completion of the documentation. Remediation plans that have steps to be taken to remediate the vulnerability must be implemented by the timeframe the entity documented in their plan. There is no maximum timeframe in this requirement as patching and other system changes carries its own risk to the availability and integrity of the systems and may require waiting until a planned outage. In periods of high demand or threatening weather, changes to systems may be curtailed or denied due to the risk to reliability.

Requirement R3:

3.1. Due to the wide range of equipment comprising the BES Cyber Systems and the wide variety of vulnerability and capability of that equipment to malware as well as the constantly evolving threat and resultant tools and controls, it is not practical within the standard to prescribe how malware is to be addressed on each Cyber Asset. Rather, the Responsible Entity determines on a BES Cyber System basis which Cyber Assets have susceptibility to malware intrusions and documents their plans and processes for addressing those risks and provides evidence that they follow those plans and processes. There are numerous options available including traditional antivirus solutions for common operating systems, white-listing solutions, network isolation techniques, ~~portable storage media policies,~~ Intrusion Detection/Prevention (IDS/IPS) solutions, etc. If an entity has numerous BES Cyber Systems or Cyber Assets that are of identical architecture, they may provide one process that describes how all the like Cyber Assets are covered. If a specific Cyber Asset has no updateable software and its executing code

cannot be altered, then that Cyber Asset is considered to have its own internal method of deterring malicious code.

Entities should also have awareness of malware protection requirements for Transient Cyber Assets and Removable Media ("transient devices") in CIP-010-2. The protections required here in CIP-007-6, Requirement R3 complement but do not meet the additional obligations for transient devices.

3.2. When malicious code is detected on a Cyber Asset within the applicability of this requirement, the threat posed by that code must be mitigated. In situations where traditional antivirus products are used, they may be configured to automatically remove or quarantine the malicious code. In white-listing situations, the white-listing tool itself can mitigate the threat as it will not allow the code to execute, however steps should still be taken to remove the malicious code from the Cyber Asset. In some instances, it may be in the best interest of reliability to not immediately remove or quarantine the malicious code, such as when availability of the system may be jeopardized by removal while operating and a rebuild of the system needs to be scheduled. In that case, monitoring may be increased and steps taken to insure the malicious code cannot communicate with other systems. In some instances the entity may be working with law enforcement or other governmental entities to closely monitor the code and track the perpetrator(s). For these reasons, there is no maximum timeframe or method prescribed for the removal of the malicious code, but the requirement is to mitigate the threat posed by the now identified malicious code.

3.3. In instances where malware detection technologies depend on signatures or patterns of known attacks, the effectiveness of these tools against evolving threats is tied to the ability to keep these signatures and patterns updated in a timely manner. The entity is to have a documented process that includes the testing and installation of signature or pattern updates. In a BES Cyber System, there may be some Cyber Assets that would benefit from the more timely installation of the updates where availability of that Cyber Asset would not jeopardize the availability of the BES Cyber System's ability to perform its function. For example, some HMI workstations where portable media is utilized may benefit from having the very latest updates at all times with minimal testing. Other Cyber Assets should have any updates thoroughly tested before implementation where the result of a 'false positive' could harm the availability of the BES Cyber System. The testing should not negatively impact the reliability of the BES. The testing should be focused on the update itself and if it will have an adverse impact on the BES Cyber System. Testing in no way implies that the entity is testing to ensure that malware is indeed detected by introducing malware into the environment. It is strictly focused on ensuring that the update does not negatively impact the BES Cyber System before those updates are placed into production.

Requirement R4:

Refer to NIST 800-92 and 800-137 for additional guidance in security event monitoring.

4.1. In a complex computing environment and faced with dynamic threats and vulnerabilities, it is not practical within the standard to enumerate all security-related events necessary to support the activities for alerting and incident response. Rather, the Responsible

Entity determines which computer generated events are necessary to log, provide alerts and monitor for their particular BES Cyber System environment.

Specific security events already required in Version 4 of the CIP Standards carry forward in this version. This includes access attempts at the Electronic Access Points, if any have been identified for a BES Cyber Systems. Examples of access attempts include: (i) blocked network access attempts, (ii) successful and unsuccessful remote user access attempts, (iii) blocked network access attempts from a remote VPN, and (iv) successful network access attempts or network flow information.

User access and activity events include those events generated by Cyber Assets within the Electronic Security Perimeter that have access control capability. These types of events include: (i) successful and unsuccessful authentication, (ii) account management, (iii) object access, and (iv) processes started and stopped.

It is not the intent of the SDT that if a device cannot log a particular event that a TFE must be generated. The SDT's intent is that if any of the items in the bulleted list (for example, user logouts) can be logged by the device then the entity must log that item. If the device does not have the capability of logging that event, the entity remains compliant.

4.2. Real-time alerting allows the cyber system to automatically communicate events of significance to designated responders. This involves configuration of a communication mechanism and log analysis rules. Alerts can be configured in the form of an email, text message, or system display and alarming. The log analysis rules can exist as part of the operating system, specific application or a centralized security event monitoring system. On one end, a real-time alert could consist of a set point on an RTU for a login failure, and on the other end, a security event monitoring system could provide multiple alerting communications options triggered on any number of complex log correlation rules.

The events triggering a real-time alert may change from day to day as system administrators and incident responders better understand the types of events that might be indications of a cyber-security incident. Configuration of alerts also must balance the need for responders to know an event occurred with the potential inundation of insignificant alerts. The following list includes examples of events a Responsible Entity should consider in configuring real-time alerts:

- Detected known or potential malware or malicious activity
- Failure of security event logging mechanisms
- Login failures for critical accounts
- Interactive login of system accounts
- Enabling of accounts
- Newly provisioned accounts
- System administration or change tasks by an unauthorized user
- Authentication attempts on certain accounts during non-business hours
- Unauthorized configuration changes
- Insertion of R~~r~~emovable M~~m~~edia in violation of a policy

4.3 Logs that are created under Part 4.1 are to be retained on the applicable Cyber Assets or BES Cyber Systems for at least 90 days. This is different than the evidence retention period called for in the CIP standards used to prove historical compliance. For such audit purposes, the entity should maintain evidence that shows that 90 days were kept historically. One example would be records of disposition of event logs beyond 90 days up to the evidence retention period.

4.4. Reviewing logs at least every 15 days (approximately every two weeks) can consist of analyzing a summarization or sampling of logged events. NIST SP800-92 provides a lot of guidance in periodic log analysis. If a centralized security event monitoring system is used, log analysis can be performed top-down starting with a review of trends from summary reports. The log review can also be an extension of the exercise in identifying those events needing real-time alerts by analyzing events that are not fully understood or could possibly inundate the real-time alerting.

Requirement R5:

Account types referenced in this guidance typically include:

- Shared user account: An account used by multiple users for normal business functions by employees or contractors. Usually on a device that does not support Individual User Accounts.
- Individual user account: An account used by a single user.
- Administrative account: An account with elevated privileges for performing administrative or other specialized functions. These can be individual or shared accounts.
- System account: Accounts used to run services on a system (web, DNS, mail etc). No users have access to these accounts.
- Application account: A specific system account, with rights granted at the application level often used for access into a Database.
- Guest account: An individual user account not typically used for normal business functions by employees or contractors and not associated with a specific user. May or may not be shared by multiple users.
- Remote access account: An individual user account only used for obtaining Interactive Remote Access to the BES Cyber System.
- Generic account: A group account set up by the operating system or application to perform specific operations. This differs from a shared user account in that individual users do not receive authorization for access to this account type.

5.1 Reference the Requirement's rationale.

5.2 Where possible, default and other generic accounts provided by a vendor should be removed, renamed, or disabled prior to production use of the Cyber Asset or BES Cyber System. If this is not possible, the passwords must be changed from the default provided by the vendor.

Default and other generic accounts remaining enabled must be documented. For common configurations, this documentation can be performed at a BES Cyber System or more general level.

5.3 Entities may choose to identify individuals with access to shared accounts through the access authorization and provisioning process, in which case the individual authorization records suffice to meet this Requirement Part. Alternatively, entities may choose to maintain a separate listing for shared accounts. Either form of evidence achieves the end result of maintaining control of shared accounts.

5.4. Default passwords can be commonly published in vendor documentation that is readily available to all customers using that type of equipment and possibly published online.

The requirement option to have unique password addresses cases where the Cyber Asset generates or has assigned pseudo-random default passwords at the time of production or installation. In these cases, the default password does not have to change because the system or manufacturer created it specific to the Cyber Asset.

5.5. Interactive user access does not include read-only information access in which the configuration of the Cyber Asset cannot change (e.g. front panel displays, web-based reports, etc.). For devices that cannot technically or for operational reasons perform authentication, an entity may demonstrate all interactive user access paths, both remote and local, are configured for authentication. Physical security suffices for local access configuration if the physical security can record who is in the Physical Security Perimeter and at what time.

Technical or procedural enforcement of password parameters are required where passwords are the only credential used to authenticate individuals. Technical enforcement of the password parameters means a Cyber Asset verifies an individually selected password meets the required parameters before allowing the account to authenticate with the selected password. Technical enforcement should be used in most cases when the authenticating Cyber Asset supports enforcing password parameters. Likewise, procedural enforcement means requiring the password parameters through procedures. Individuals choosing the passwords have the obligation of ensuring the password meets the required parameters.

Password complexity refers to the policy set by a Cyber Asset to require passwords to have one or more of the following types of characters: (1) lowercase alphabetic, (2) uppercase alphabetic, (3) numeric, and (4) non-alphanumeric or “special” characters (e.g. #, $, @, &), in various combinations.

5.6 Technical or procedural enforcement of password change obligations are required where passwords are the only credential used to authenticate individuals. Technical enforcement of password change obligations means the Cyber Asset requires a password change after a specified timeframe prior to allowing access. In this case, the password is not required to change by the specified time as long as the Cyber Asset enforces the password change after the next successful authentication of the account. Procedural enforcement means manually changing passwords used for interactive user access after a specified timeframe.

5.7 Configuring an account lockout policy or alerting after a certain number of failed authentication attempts serves to prevent unauthorized access through an online password guessing attack. The threshold of failed authentication attempts should be set high enough to avoid false-positives from authorized users failing to authenticate. It should also be set low enough to account for online password attacks occurring over an extended period of time. This threshold may be tailored to the operating environment over time to avoid unnecessary account lockouts.

Entities should take caution when configuring account lockout to avoid locking out accounts necessary for the BES Cyber System to perform a BES reliability task. In such cases, entities should configure authentication failure alerting.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014

Description of Current Draft

This draft standard is being posted for an initial comment and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
First 45-Day Comment Period Opens	June 2014
Additional 45-Day Comment Period (if necessary)	August 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-009-5.	
6	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Recovery Plans for BES Cyber Systems

2. Number: CIP-009-6

3. Purpose: To recover reliability functions performed by BES Cyber Systems by specifying recovery plan requirements in support of the continued stability, operability, and reliability of the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-009-6:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-009-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

6. Background:

Standard CIP-009 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in their documented processes, but they must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the

standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to BES Cyber Systems located at a Control Center and categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.

- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples include, but are not limited to firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.

B. Requirements and Measures

Rationale for Requirement R1:

Preventative activities can lower the number of incidents, but not all incidents can be prevented. A preplanned recovery capability is, therefore, necessary for rapidly recovering from incidents, minimizing loss and destruction, mitigating the weaknesses that were exploited, and restoring computing services so that planned and consistent recovery action to restore BES Cyber System functionality occurs.

R1. Each Responsible Entity shall have one or more documented recovery plan(s) that collectively include each of the applicable requirement parts in *CIP-009-6 Table R1 – Recovery Plan Specifications*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning].*

M1. Evidence must include the documented recovery plan(s) that collectively include the applicable requirement parts in *CIP-009-6 Table R1 – Recovery Plan Specifications*.

CIP-009-6 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Conditions for activation of the recovery plan(s).	An example of evidence may include, but is not limited to, one or more plans that include language identifying conditions for activation of the recovery plan(s).

CIP-009-6 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Roles and responsibilities of responders.	An example of evidence may include, but is not limited to, one or more recovery plans that include language identifying the roles and responsibilities of responders.
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	One or more processes for the backup and storage of information required to recover BES Cyber System functionality.	An example of evidence may include, but is not limited to, documentation of specific processes for the backup and storage of information required to recover BES Cyber System functionality.

CIP-009-6 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	One or more processes to verify the successful completion of the backup processes in Part 1.3 and to address any backup failures.	An example of evidence may include, but is not limited to, logs, workflow or other documentation confirming that the backup process completed successfully and backup failures, if any, were addressed.
1.5	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	One or more processes to preserve data, per Cyber Asset capability, for determining the cause of a Cyber Security Incident that triggers activation of the recovery plan(s). Data preservation should not impede or restrict recovery.	An example of evidence may include, but is not limited to, procedures to preserve data, such as preserving a corrupted drive or making a data mirror of the system before proceeding with recovery.

Rationale for Requirement R2:

The implementation of an effective recovery plan mitigates the risk to the reliable operation of the BES by reducing the time to recover from various hazards affecting BES Cyber Systems. This requirement ensures continued implementation of the response plans.

Requirement Part 2.2 provides further assurance in the information (e.g. backup tapes, mirrored hot-sites, etc.) necessary to recover BES Cyber Systems. A full test is not feasible in most instances due to the amount of recovery information, and the Responsible Entity must determine a sampling that provides assurance in the usability of the information.

R2. Each Responsible Entity shall implement its documented recovery plan(s) to collectively include each of the applicable requirement parts in *CIP-009-6 Table R2 – Recovery Plan Implementation and Testing. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning and Real-time Operations.]*

M2. Evidence must include, but is not limited to, documentation that collectively demonstrates implementation of each of the applicable requirement parts in *CIP-009-65 Table R2 – Recovery Plan Implementation and Testing.*

CIP-009-6 Table R2 – Recovery Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	Test each of the recovery plans referenced in Requirement R1 at least once every 15 calendar months: • By recovering from an actual incident; • With a paper drill or tabletop exercise; or • With an operational exercise.	An example of evidence may include, but is not limited to, dated evidence of a test (by recovering from an actual incident, with a paper drill or tabletop exercise, or with an operational exercise) of the recovery plan at least once every 15 calendar months. For the paper drill or full operational exercise, evidence may include meeting notices, minutes, or other records of exercise findings.

CIP-009-6 Table R2 – Recovery Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	Test a representative sample of information used to recover BES Cyber System functionality at least once every 15 calendar months to ensure that the information is useable and is compatible with current configurations. An actual recovery that incorporates the information used to recover BES Cyber System functionality substitutes for this test.	An example of evidence may include, but is not limited to, operational logs or test results with criteria for testing the usability (e.g. sample tape load, browsing tape contents) and compatibility with current system configurations (e.g. manual or automated comparison checkpoints between backup media contents and current configuration).
2.3	High Impact BES Cyber Systems	Test each of the recovery plans referenced in Requirement R1 at least once every 36 calendar months through an operational exercise of the recovery plans in an environment representative of the production environment. An actual recovery response may substitute for an operational exercise.	Examples of evidence may include, but are not limited to, dated documentation of: • An operational exercise at least once every 36 calendar months between exercises, that demonstrates recovery in a representative environment; or • An actual recovery response that occurred within the 36 calendar month timeframe that exercised the recovery plans.

Rationale for Requirement R3:

To improve the effectiveness of BES Cyber System recovery plan(s) following a test, and to ensure the maintenance and distribution of the recovery plan(s). Responsible Entities achieve this by (i) performing a lessons learned review in 3.1 and (ii) revising the plan in 3.2 based on specific changes in the organization or technology that would impact plan execution. In both instances when the plan needs to change, the Responsible Entity updates and distributes the plan.

R3. Each Responsible Entity shall maintain each of its recovery plan(s) in accordance with each of the applicable requirement parts in *CIP-009-6 Table R3 – Recovery Plan Review, Update and Communication*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Assessment].*

M3. Acceptable evidence includes, but is not limited to, each of the applicable requirement parts in *CIP-009-6 Table R3 – Recovery Plan Review, Update and Communication.*

CIP-009-6 Table R3 – Recovery Plan Review, Update and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	No later than 90 calendar days after completion of a recovery plan test or actual recovery: 3.1.1. Document any lessons learned associated with a recovery plan test or actual recovery or document the absence of any lessons learned; 3.1.2. Update the recovery plan based on any documented lessons learned associated with the plan; and 3.1.3. Notify each person or group with a defined role in the recovery plan of the updates to the recovery plan based on any documented lessons learned.	An example of evidence may include, but is not limited to, all of the following: 1. Dated documentation of identified deficiencies or lessons learned for each recovery plan test or actual incident recovery or dated documentation stating there were no lessons learned; 2. Dated and revised recovery plan showing any changes based on the lessons learned; and 3. Evidence of plan update distribution including, but not limited to: • Emails; • USPS or other mail service; • Electronic distribution system; or • Training sign-in sheets.

CIP-009-6 Table R3 – Recovery Plan Review, Update and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	No later than 60 calendar days after a change to the roles or responsibilities, responders, or technology that the Responsible Entity determines would impact the ability to execute the recovery plan: 3.2.1. Update the recovery plan; and 3.2.2. Notify each person or group with a defined role in the recovery plan of the updates.	An example of evidence may include, but is not limited to, all of the following: 1. Dated and revised recovery plan with changes to the roles or responsibilities, responders, or technology; and 2. Evidence of plan update distribution including, but not limited to: • Emails; • USPS or other mail service; • Electronic distribution system; or • Training sign-in sheets.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints Text

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-009-6)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Long-term Planning**	**Medium**	N/A	The Responsible Entity has developed recovery plan(s), but the plan(s) do not address one of the requirements included in Parts 1.2 through 1.5.	The Responsible Entity has developed recovery plan(s), but the plan(s) do not address two of the requirements included in Parts 1.2 through 1.5.	The Responsible Entity has not created recovery plan(s) for BES Cyber Systems. OR The Responsible Entity has created recovery plan(s) for BES Cyber Systems, but the plan(s) does not address the conditions for activation in Part 1.1. OR The Responsible Entity has created recovery plan(s) for BES Cyber Systems, but the plan(s) does not address three or more of the requirements in Parts 1.2 through 1.5.

R #	Time Horizon	VRF	Violation Severity Levels (CIP-009-6)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R2	**Operations Planning** **Real-time Operations**	**Lower**	The Responsible Entity has not tested the recovery plan(s) according to R2 Part 2.1 within 15 calendar months, not exceeding 16 calendar months between tests of the plan. (2.1) OR The Responsible Entity has not tested a representative sample of the information used in the recovery of BES Cyber System functionality according to R2 Part 2.2 within 15 calendar months, not exceeding 16 calendar months between tests. (2.2) OR The Responsible Entity has not tested	The Responsible Entity has not tested the recovery plan(s) within 16 calendar months, not exceeding 17 calendar months between tests of the plan. Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The following guidelines are available to assist in addressing the required components of a recovery plan:

- NERC, Security Guideline for the Electricity Sector: Continuity of Business Processes and Operations Operational Functions, September 2011, online at http://www.nerc.com/docs/cip/sgwg/Continuity%20of%20Business%20and%20Operational%20Functions%20FINAL%20102511.pdf
- National Institute of Standards and Technology, Contingency Planning Guide for Federal Information Systems, Special Publication 800-34 revision 1, May 2010, online at http://csrc.nist.gov/publications/nistpubs/800-34-rev1/sp800-34-rev1_errata-Nov11-2010.pdf

The term recovery plan is used throughout this Standard to refer to a documented set of instructions and resources needed to recover reliability functions performed by BES Cyber Systems. The recovery plan may exist as part of a larger business continuity or disaster recovery plan, but the term does not imply any additional obligations associated with those disciplines outside of the Requirements.

A documented recovery plan may not be necessary for each applicable BES Cyber System. For example, the short-term recovery plan for a BES Cyber System in a specific substation may be

managed on a daily basis by advanced power system applications such as state estimation, contingency and remedial action, and outage scheduling. One recovery plan for BES Cyber Systems should suffice for several similar facilities such as those found in substations or power plants' facilities.

For Part 1.1, the conditions for activation of the recovery plan should consider viable threats to the BES Cyber System such as natural disasters, computing equipment failures, computing environment failures, and Cyber Security Incidents. A business impact analysis for the BES Cyber System may be useful in determining these conditions.

For Part 1.2, entities should identify the individuals required for responding to a recovery operation of the applicable BES Cyber System.

For Part 1.3, entities should consider the following types of information to recover BES Cyber System functionality:

1. Installation files and media;
2. Current backup tapes and any additional documented configuration settings;
3. Documented build or restoration procedures; and
4. Cross site replication storage.

For Part 1.4, the processes to verify the successful completion of backup processes should include checking for: (1) usability of backup media, (2) logs or inspection showing that information from current, production system could be read, and (3) logs or inspection showing that information was written to the backup media. Test restorations are not required for this Requirement Part. The following backup scenarios provide examples of effective processes to verify successful completion and detect any backup failures:

- Periodic (e.g. daily or weekly) backup process – Review generated logs or job status reports and set up notifications for backup failures.
- Non-periodic backup process– If a single backup is provided during the commissioning of the system, then only the initial and periodic (every 15 months) testing must be done. Additional testing should be done as necessary and can be a part of the configuration change management program.
- Data mirroring – Configure alerts on the failure of data transfer for an amount of time specified by the entity (e.g. 15 minutes) in which the information on the mirrored disk may no longer be useful for recovery.
- Manual configuration information – Inspect the information used for recovery prior to storing initially and periodically (every 15 months). Additional inspection should be done as necessary and can be a part of the configuration change management program.

The plan must also include processes to address backup failures. These processes should specify the response to failure notifications or other forms of identification.

For Part 1.5, the recovery plan must include considerations for preservation of data to determine the cause of a Cyber Security Incident. Because it is not always possible to initially

know if a Cyber Security Incident caused the recovery activation, the data preservation procedures should be followed until such point a Cyber Security Incident can be ruled out. CIP-008 addresses the retention of data associated with a Cyber Security Incident.

Requirement R2:

A Responsible Entity must exercise each BES Cyber System recovery plan every 15 months. However, this does not necessarily mean that the entity must test each plan individually. BES Cyber Systems that are numerous and distributed, such as those found at substations, may not require an individual recovery plan and the associated redundant facilities since reengineering and reconstruction may be the generic response to a severe event. Conversely, there is typically one control center per bulk transmission service area that requires a redundant or backup facility. Because of these differences, the recovery plans associated with control centers differ a great deal from those associated with power plants and substations.

A recovery plan test does not necessarily cover all aspects of a recovery plan and failure scenarios, but the test should be sufficient to ensure the plan is up to date and at least one restoration process of the applicable cyber systems is covered.

Entities may use an actual recovery as a substitute for exercising the plan every 15 months. Otherwise, entities must exercise the plan with a paper drill, tabletop exercise, or operational exercise. For more specific types of exercises, refer to the FEMA Homeland Security Exercise and Evaluation Program (HSEEP). It lists the following four types of discussion-based exercises: seminar, workshop, tabletop, and games. In particular, it defines that, "A tabletop exercise involves key personnel discussing simulated scenarios in an informal setting. [Table top exercises (TTX)] can be used to assess plans, policies, and procedures."

The HSEEP lists the following three types of operations-based exercises: Drill, functional exercise, and full-scale exercise. It defines that, "[A] full-scale exercise is a multi-agency, multi-jurisdictional, multi-discipline exercise involving functional (e.g., joint field office, Emergency operation centers, etc.) and 'boots on the ground' response (e.g., firefighters decontaminating mock victims)."

For Part 2.2, entities should refer to the backup and storage of information required to recover BES Cyber System functionality in Requirement Part 1.3. This provides additional assurance that the information will actually recover the BES Cyber System as necessary. For most complex computing equipment, a full test of the information is not feasible. Entities should determine the representative sample of information that provides assurance in the processes for Requirement Part 1.3. The test must include steps for ensuring the information is useable and current. For backup media, this can include testing a representative sample to make sure the information can be loaded, and checking the content to make sure the information reflects the current configuration of the applicable Cyber Assets.

Requirement R3:

This requirement ensures entities maintain recovery plans. There are two requirement parts that trigger plan updates: (1) lessons learned and (2) organizational or technology changes.

The documentation of lessons learned is associated with each recovery activation, and it involves the activities as illustrated in Figure 1, below. The deadline to document lessons learned starts after the completion of the recovery operation in recognition that complex recovery activities can take a few days or weeks to complete. The process of conducting lessons learned can involve the recovery team discussing the incident to determine gaps or areas of improvement within the plan. It is possible to have a recovery activation without any documented lessons learned. In such cases, the entity must retain documentation of the absence of any lessons learned associated with the recovery activation.

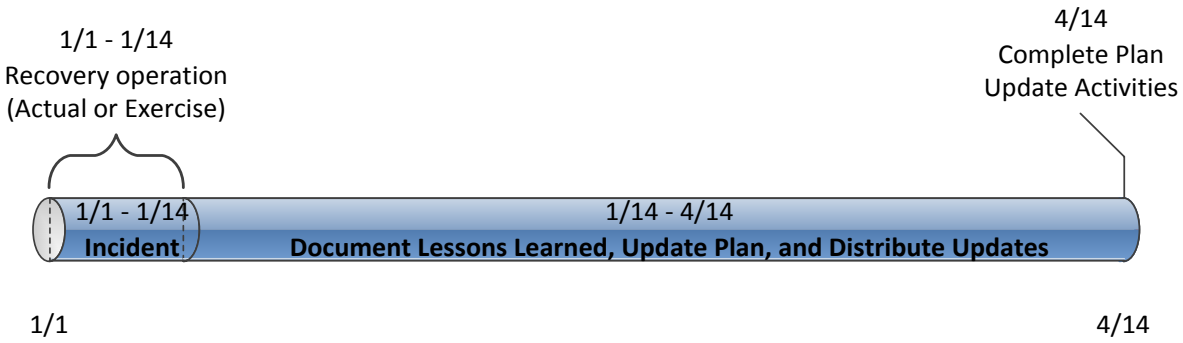

Figure 1: CIP-009-6 R3 Timeline

The activities necessary to complete the lessons learned include updating the plan and distributing those updates. Entities should consider meeting with all of the individuals involved in the recovery and documenting the lessons learned as soon after the recovery activation as possible. This allows more time for making effective updates to the plan, obtaining any necessary approvals, and distributing those updates to the recovery team.

The plan change requirement is associated with organization and technology changes referenced in the plan and involves the activities illustrated in Figure 2, below. Organizational changes include changes to the roles and responsibilities people have in the plan or changes to the response groups or individuals. This may include changes to the names or contact information listed in the plan. Technology changes affecting the plan may include referenced information sources, communication systems, or ticketing systems.

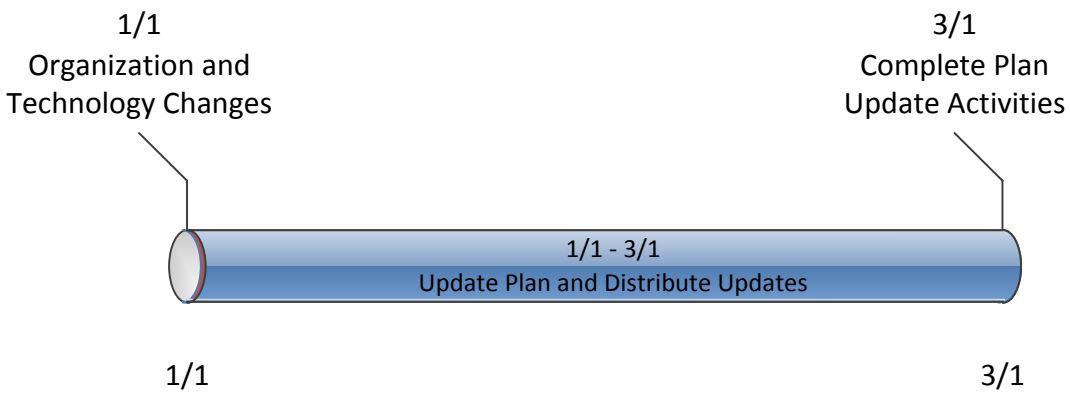

Figure 2: Timeline for Plan Changes in 3.2

When notifying individuals of response plan changes, entities should keep in mind that recovery plans may be considered BES Cyber System Information, and they should take the appropriate measures to prevent unauthorized disclosure of recovery plan information. For example, the recovery plan itself, or other sensitive information about the recovery plan, should be redacted from Email or other unencrypted transmission.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014

Description of Current Draft

This draft standard is being posted for an initial comment and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
First 45-Day Comment Period Opens	June 2014
Additional 45-Day Comment Period (if necessary)	August 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-009-5.	
6	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Recovery Plans for BES Cyber Systems

2. Number: CIP-009-~~5~~6

3. Purpose: To recover reliability functions performed by BES Cyber Systems by specifying recovery plan requirements in support of the continued stability, operability, and reliability of the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-009-~~5~~6:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-009-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

6. Background:

Standard CIP-009~~-5~~ exists as part of a suite of CIP Standards related to cyber security, which~~. CIP-002-5.1~~ require~~s~~ the initial identification and categorization of BES Cyber Systems~~. CIP-003-5~~6, CIP-004-56, CIP-005-5, CIP-006-56, CIP-007-56, CIP-008-5, CIP-009-56, CIP-010-12, and CIP-011-1 2 and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems. ~~This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.~~

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

~~The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:~~

~~Each Responsible Entity shall implement, **in a manner that identifies, assesses, and corrects deficiencies,** . . .~~

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in their documented processes, but they must address the applicable requirements in the table. ~~The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities.~~

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to BES Cyber Systems located at a Control Center and categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples include, but are not limited to firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.

B. Requirements and Measures

Rationale for Requirement R1:

Preventative activities can lower the number of incidents, but not all incidents can be prevented. A preplanned recovery capability is, therefore, necessary for rapidly recovering from incidents, minimizing loss and destruction, mitigating the weaknesses that were exploited, and restoring computing services so that planned and consistent recovery action to restore BES Cyber System functionality occurs.

R1. Each Responsible Entity shall have one or more documented recovery plan(s) that collectively include each of the applicable requirement parts in *CIP-009-~~5~~ 6 Table R1 – Recovery Plan Specifications*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning].*

M1. Evidence must include the documented recovery plan(s) that collectively include the applicable requirement parts in *CIP-009-~~5~~ 6 Table R1 – Recovery Plan Specifications*.

CIP-009-~~5~~ 6 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Conditions for activation of the recovery plan(s).	An example of evidence may include, but is not limited to, one or more plans that include language identifying conditions for activation of the recovery plan(s).

CIP-009-~~5~~ 6 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Roles and responsibilities of responders.	An example of evidence may include, but is not limited to, one or more recovery plans that include language identifying the roles and responsibilities of responders.
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	One or more processes for the backup and storage of information required to recover BES Cyber System functionality.	An example of evidence may include, but is not limited to, documentation of specific processes for the backup and storage of information required to recover BES Cyber System functionality.

CIP-009-~~5~~ 6 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	One or more processes to verify the successful completion of the backup processes in Part 1.3 and to address any backup failures.	An example of evidence may include, but is not limited to, logs, workflow or other documentation confirming that the backup process completed successfully and backup failures, if any, were addressed.
1.5	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	One or more processes to preserve data, per Cyber Asset capability, for determining the cause of a Cyber Security Incident that triggers activation of the recovery plan(s). Data preservation should not impede or restrict recovery.	An example of evidence may include, but is not limited to, procedures to preserve data, such as preserving a corrupted drive or making a data mirror of the system before proceeding with recovery.

Rationale for Requirement R2:

The implementation of an effective recovery plan mitigates the risk to the reliable operation of the BES by reducing the time to recover from various hazards affecting BES Cyber Systems. This requirement ensures continued implementation of the response plans.

Requirement Part 2.2 provides further assurance in the information (e.g. backup tapes, mirrored hot-sites, etc.) necessary to recover BES Cyber Systems. A full test is not feasible in most instances due to the amount of recovery information, and the Responsible Entity must determine a sampling that provides assurance in the usability of the information.

R2. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ its documented recovery plan(s) to collectively include each of the applicable requirement parts in *CIP-009-~~5~~ 6 Table R2 – Recovery Plan Implementation and Testing. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning and Real-time Operations.]*

M2. Evidence must include, but is not limited to, documentation that collectively demonstrates implementation of each of the applicable requirement parts in *CIP-009-6~~5~~ Table R2 – Recovery Plan Implementation and Testing.*

CIP-009-~~5~~ 6 Table R2 – Recovery Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	Test each of the recovery plans referenced in Requirement R1 at least once every 15 calendar months: • By recovering from an actual incident; • With a paper drill or tabletop exercise; or • With an operational exercise.	An example of evidence may include, but is not limited to, dated evidence of a test (by recovering from an actual incident, with a paper drill or tabletop exercise, or with an operational exercise) of the recovery plan at least once every 15 calendar months. For the paper drill or full operational exercise, evidence may include meeting notices, minutes, or other records of exercise findings.

CIP-009-~~5~~ 6 Table R2 – Recovery Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	Test a representative sample of information used to recover BES Cyber System functionality at least once every 15 calendar months to ensure that the information is useable and is compatible with current configurations. An actual recovery that incorporates the information used to recover BES Cyber System functionality substitutes for this test.	An example of evidence may include, but is not limited to, operational logs or test results with criteria for testing the usability (e.g. sample tape load, browsing tape contents) and compatibility with current system configurations (e.g. manual or automated comparison checkpoints between backup media contents and current configuration).
2.3	High Impact BES Cyber Systems	Test each of the recovery plans referenced in Requirement R1 at least once every 36 calendar months through an operational exercise of the recovery plans in an environment representative of the production environment. An actual recovery response may substitute for an operational exercise.	Examples of evidence may include, but are not limited to, dated documentation of: • An operational exercise at least once every 36 calendar months between exercises, that demonstrates recovery in a representative environment; or • An actual recovery response that occurred within the 36 calendar month timeframe that exercised the recovery plans.

Rationale for Requirement R3:

To improve the effectiveness of BES Cyber System recovery plan(s) following a test, and to ensure the maintenance and distribution of the recovery plan(s). Responsible Entities achieve this by (i) performing a lessons learned review in 3.1 and (ii) revising the plan in 3.2 based on specific changes in the organization or technology that would impact plan execution. In both instances when the plan needs to change, the Responsible Entity updates and distributes the plan.

R3. Each Responsible Entity shall maintain each of its recovery plan(s) in accordance with each of the applicable requirement parts in *CIP-009-~~5~~ 6 Table R3 – Recovery Plan Review, Update and Communication*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Assessment].*

M3. Acceptable evidence includes, but is not limited to, each of the applicable requirement parts in *CIP-009-~~5~~ 6 Table R3 – Recovery Plan Review, Update and Communication.*

CIP-009-~~5~~ 6 Table R3 – Recovery Plan Review, Update and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	No later than 90 calendar days after completion of a recovery plan test or actual recovery: 3.1.1. Document any lessons learned associated with a recovery plan test or actual recovery or document the absence of any lessons learned; 3.1.2. Update the recovery plan based on any documented lessons learned associated with the plan; and 3.1.3. Notify each person or group with a defined role in the recovery plan of the updates to the recovery plan based on any documented lessons learned.	An example of evidence may include, but is not limited to, all of the following: 1. Dated documentation of identified deficiencies or lessons learned for each recovery plan test or actual incident recovery or dated documentation stating there were no lessons learned; 2. Dated and revised recovery plan showing any changes based on the lessons learned; and 3. Evidence of plan update distribution including, but not limited to: • Emails; • USPS or other mail service; • Electronic distribution system; or • Training sign-in sheets.

CIP-009-~~5~~ 6 Table R3 – Recovery Plan Review, Update and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	No later than 60 calendar days after a change to the roles or responsibilities, responders, or technology that the Responsible Entity determines would impact the ability to execute the recovery plan: 3.2.1. Update the recovery plan; and 3.2.2. Notify each person or group with a defined role in the recovery plan of the updates.	An example of evidence may include, but is not limited to, all of the following: 1. Dated and revised recovery plan with changes to the roles or responsibilities, responders, or technology; and 2. Evidence of plan update distribution including, but not limited to: • Emails; • USPS or other mail service; • Electronic distribution system; or • Training sign-in sheets.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

~~The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.~~

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints Text

1.4. Additional Compliance Information:

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. ~~Furthermore,~~

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The following guidelines are available to assist in addressing the required components of a recovery plan:

- NERC, Security Guideline for the Electricity Sector: Continuity of Business Processes and Operations Operational Functions, September 2011, online at http://www.nerc.com/docs/cip/sgwg/Continuity%20of%20Business%20and%20Operational%20Functions%20FINAL%20102511.pdf
- National Institute of Standards and Technology, Contingency Planning Guide for Federal Information Systems, Special Publication 800-34 revision 1, May 2010, online at http://csrc.nist.gov/publications/nistpubs/800-34-rev1/sp800-34-rev1_errata-Nov11-2010.pdf

The term recovery plan is used throughout this Standard to refer to a documented set of instructions and resources needed to recover reliability functions performed by BES Cyber Systems. The recovery plan may exist as part of a larger business continuity or disaster recovery plan, but the term does not imply any additional obligations associated with those disciplines outside of the Requirements.

A documented recovery plan may not be necessary for each applicable BES Cyber System. For example, the short-term recovery plan for a BES Cyber System in a specific substation may be

managed on a daily basis by advanced power system applications such as state estimation, contingency and remedial action, and outage scheduling. One recovery plan for BES Cyber Systems should suffice for several similar facilities such as those found in substations or power plants' facilities.

For Part 1.1, the conditions for activation of the recovery plan should consider viable threats to the BES Cyber System such as natural disasters, computing equipment failures, computing environment failures, and Cyber Security Incidents. A business impact analysis for the BES Cyber System may be useful in determining these conditions.

For Part 1.2, entities should identify the individuals required for responding to a recovery operation of the applicable BES Cyber System.

For Part 1.3, entities should consider the following types of information to recover BES Cyber System functionality:

1. Installation files and media;
2. Current backup tapes and any additional documented configuration settings;
3. Documented build or restoration procedures; and
4. Cross site replication storage.

For Part 1.4, the processes to verify the successful completion of backup processes should include checking for: (1) usability of backup media, (2) logs or inspection showing that information from current, production system could be read, and (3) logs or inspection showing that information was written to the backup media. Test restorations are not required for this Requirement Part. The following backup scenarios provide examples of effective processes to verify successful completion and detect any backup failures:

- Periodic (e.g. daily or weekly) backup process – Review generated logs or job status reports and set up notifications for backup failures.
- Non-periodic backup process– If a single backup is provided during the commissioning of the system, then only the initial and periodic (every 15 months) testing must be done. Additional testing should be done as necessary and can be a part of the configuration change management program.
- Data mirroring – Configure alerts on the failure of data transfer for an amount of time specified by the entity (e.g. 15 minutes) in which the information on the mirrored disk may no longer be useful for recovery.
- Manual configuration information – Inspect the information used for recovery prior to storing initially and periodically (every 15 months). Additional inspection should be done as necessary and can be a part of the configuration change management program.

The plan must also include processes to address backup failures. These processes should specify the response to failure notifications or other forms of identification.

For Part 1.5, the recovery plan must include considerations for preservation of data to determine the cause of a Cyber Security Incident. Because it is not always possible to initially

know if a Cyber Security Incident caused the recovery activation, the data preservation procedures should be followed until such point a Cyber Security Incident can be ruled out. CIP-008 addresses the retention of data associated with a Cyber Security Incident.

Requirement R2:

A Responsible Entity must exercise each BES Cyber System recovery plan every 15 months. However, this does not necessarily mean that the entity must test each plan individually. BES Cyber Systems that are numerous and distributed, such as those found at substations, may not require an individual recovery plan and the associated redundant facilities since reengineering and reconstruction may be the generic response to a severe event. Conversely, there is typically one control center per bulk transmission service area that requires a redundant or backup facility. Because of these differences, the recovery plans associated with control centers differ a great deal from those associated with power plants and substations.

A recovery plan test does not necessarily cover all aspects of a recovery plan and failure scenarios, but the test should be sufficient to ensure the plan is up to date and at least one restoration process of the applicable cyber systems is covered.

Entities may use an actual recovery as a substitute for exercising the plan every 15 months. Otherwise, entities must exercise the plan with a paper drill, tabletop exercise, or operational exercise. For more specific types of exercises, refer to the FEMA Homeland Security Exercise and Evaluation Program (HSEEP). It lists the following four types of discussion-based exercises: seminar, workshop, tabletop, and games. In particular, it defines that, "A tabletop exercise involves key personnel discussing simulated scenarios in an informal setting. [Table top exercises (TTX)] can be used to assess plans, policies, and procedures."

The HSEEP lists the following three types of operations-based exercises: Drill, functional exercise, and full-scale exercise. It defines that, "[A] full-scale exercise is a multi-agency, multi-jurisdictional, multi-discipline exercise involving functional (e.g., joint field office, Emergency operation centers, etc.) and 'boots on the ground' response (e.g., firefighters decontaminating mock victims)."

For Part 2.2, entities should refer to the backup and storage of information required to recover BES Cyber System functionality in Requirement Part 1.3. This provides additional assurance that the information will actually recover the BES Cyber System as necessary. For most complex computing equipment, a full test of the information is not feasible. Entities should determine the representative sample of information that provides assurance in the processes for Requirement Part 1.3. The test must include steps for ensuring the information is useable and current. For backup media, this can include testing a representative sample to make sure the information can be loaded, and checking the content to make sure the information reflects the current configuration of the applicable Cyber Assets.

Requirement R3:

This requirement ensures entities maintain recovery plans. There are two requirement parts that trigger plan updates: (1) lessons learned and (2) organizational or technology changes.

The documentation of lessons learned is associated with each recovery activation, and it involves the activities as illustrated in Figure 1, below. The deadline to document lessons learned starts after the completion of the recovery operation in recognition that complex recovery activities can take a few days or weeks to complete. The process of conducting lessons learned can involve the recovery team discussing the incident to determine gaps or areas of improvement within the plan. It is possible to have a recovery activation without any documented lessons learned. In such cases, the entity must retain documentation of the absence of any lessons learned associated with the recovery activation.

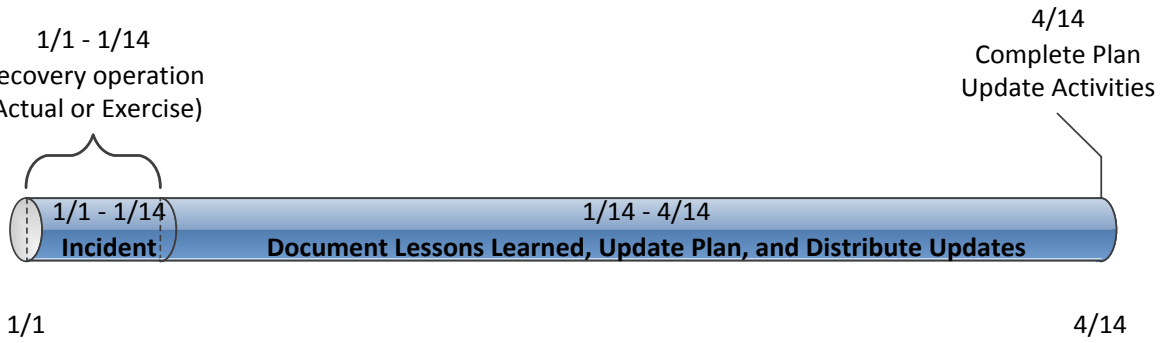

Figure 1: CIP-009-~~5~~ 6 R3 Timeline

The activities necessary to complete the lessons learned include updating the plan and distributing those updates. Entities should consider meeting with all of the individuals involved in the recovery and documenting the lessons learned as soon after the recovery activation as possible. This allows more time for making effective updates to the plan, obtaining any necessary approvals, and distributing those updates to the recovery team.

The plan change requirement is associated with organization and technology changes referenced in the plan and involves the activities illustrated in Figure 2, below. Organizational changes include changes to the roles and responsibilities people have in the plan or changes to the response groups or individuals. This may include changes to the names or contact information listed in the plan. Technology changes affecting the plan may include referenced information sources, communication systems, or ticketing systems.

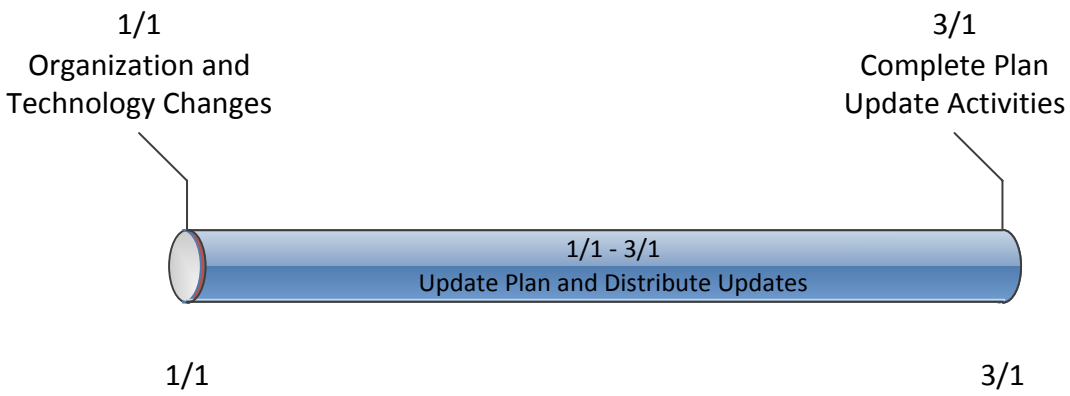

Figure 2: Timeline for Plan Changes in 3.2

When notifying individuals of response plan changes, entities should keep in mind that recovery plans may be considered BES Cyber System Information, and they should take the appropriate measures to prevent unauthorized disclosure of recovery plan information. For example, the recovery plan itself, or other sensitive information about the recovery plan, should be redacted from Email or other unencrypted transmission.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014

Description of Current Draft

This draft standard is being posted for an initial comment and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
First 45-Day Comment Period Opens	June 2014
Additional 45-Day Comment Period (if necessary)	August 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the configuration change management and vulnerability assessment requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-010-1. (Order becomes effective on 2/3/14.)	
2	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Configuration Change Management and Vulnerability Assessments

2. Number: CIP-010-2

3. Purpose: To prevent and detect unauthorized changes to BES Cyber Systems by specifying configuration change management and vulnerability assessment requirements in support of protecting BES Cyber Systems from compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-010-2:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-010-2 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Registered Entities shall not be required to comply with Reliability Standard CIP-010-2, Requirement R4 until nine calendar months after the effective date of Reliability Standard CIP-010-2.

6. Background:

Standard CIP-010 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The configuration change management processes are intended to prevent unauthorized modifications to BES Cyber Systems.

R1. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-2 Table R1 – Configuration Change Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-2 Table R1 – Configuration Change Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Develop a baseline configuration, individually or by group, which shall include the following items: 1.1.1. Operating system(s) (including version) or firmware where no independent operating system exists; 1.1.2. Any commercially available or open-source application software (including version) intentionally installed; 1.1.3. Any custom software installed; 1.1.4. Any logical network accessible ports; and 1.1.5. Any security patches applied.	Examples of evidence may include, but are not limited to: • A spreadsheet identifying the required items of the baseline configuration for each Cyber Asset, individually or by group; or • A record in an asset management system that identifies the required items of the baseline configuration for each Cyber Asset, individually or by group.

CIP-010-2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Authorize and document changes that deviate from the existing baseline configuration.	Examples of evidence may include, but are not limited to: • A change request record and associated electronic authorization (performed by the individual or group with the authority to authorize the change) in a change management system for each change; or • Documentation that the change was performed in accordance with the requirement.

CIP-010-2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration, update the baseline configuration as necessary within 30 calendar days of completing the change.	An example of evidence may include, but is not limited to, updated baseline documentation with a date that is within 30 calendar days of the date of the completion of the change.
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration: 1.4.1. Prior to the change, determine required cyber security controls in CIP-005 and CIP-007 that could be impacted by the change; 1.4.2. Following the change, verify that required cyber security controls determined in 1.4.1 are not adversely affected; and 1.4.3. Document the results of the verification.	An example of evidence may include, but is not limited to, a list of cyber security controls verified or tested along with the dated test results.

CIP-010-2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	High Impact BES Cyber Systems	Where technically feasible, for each change that deviates from the existing baseline configuration: 1.5.1. Prior to implementing any change in the production environment, test the changes in a test environment or test the changes in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration to ensure that required cyber security controls in CIP-005 and CIP-007 are not adversely affected; and 1.5.2. Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a list of cyber security controls tested along with successful test results and a list of differences between the production and test environments with descriptions of how any differences were accounted for, including of the date of the test.

Rationale for Requirement R2:

The configuration monitoring processes are intended to detect unauthorized modifications to BES Cyber Systems.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-2 Table R2 – Configuration Monitoring. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-2 Table R2 – Configuration Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-2 Table R2 – Configuration Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Monitor at least once every 35 calendar days for changes to the baseline configuration (as described in Requirement R1, Part 1.1). Document and investigate detected unauthorized changes.	An example of evidence may include, but is not limited to, logs from a system that is monitoring the configuration along with records of investigation for any unauthorized changes that were detected.

Rationale for Requirement R3:

The vulnerability assessment processes are intended to act as a component in an overall program to periodically ensure the proper implementation of cyber security controls as well as to continually improve the security posture of BES Cyber Systems.

The vulnerability assessment performed for this requirement may be a component of deficiency identification, assessment, and correction.

R3. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-2 Table R3– Vulnerability Assessments*. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M3. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-2 Table R3 – Vulnerability Assessments* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	At least once every 15 calendar months, conduct a paper or active vulnerability assessment.	Examples of evidence may include, but are not limited to: • A document listing the date of the assessment (performed at least once every 15 calendar months), the controls assessed for each BES Cyber System along with the method of assessment,; or • A document listing the date of the assessment and the output of any tools used to perform the assessment.

CIP-010-2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems	Where technically feasible, at least once every 36 calendar months: 3.2.1 Perform an active vulnerability assessment in a test environment, or perform an active vulnerability assessment in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration of the BES Cyber System in a production environment; and 3.2.2 Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed at least once every 36 calendar months), the output of the tools used to perform the assessment, and a list of differences between the production and test environments with descriptions of how any differences were accounted for in conducting the assessment.

CIP-010-2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PCA	Prior to adding a new applicable Cyber Asset to a production environment, perform an active vulnerability assessment of the new Cyber Asset, except for CIP Exceptional Circumstances and like replacements of the same type of Cyber Asset with a baseline configuration that models an existing baseline configuration of the previous or other existing Cyber Asset.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed prior to the commissioning of the new Cyber Asset) and the output of any tools used to perform the assessment.
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Document the results of the assessments conducted according to Parts 3.1, 3.2, and 3.3 and the action plan to remediate or mitigate vulnerabilities identified in the assessments including the planned date of completing the action plan and the execution status of any remediation or mitigation action items.	An example of evidence may include, but is not limited to, a document listing the results or the review or assessment, a list of action items, documented proposed dates of completion for the action plan, and records of the status of the action items (such as minutes of a status meeting, updates in a work order system, or a spreadsheet tracking the action items).

Rationale for R4:

Requirement R4 is to address FERC Order No. 791 Paragraphs 6 and 136, which require the standards to address security-related issues associated with tools specifically used for data transfer, vulnerability assessment, maintenance, or troubleshooting. These tools are potential vehicles for transporting malicious code into a facility and subsequently into Cyber Assets or BES Cyber Systems. To that end, the requirement goals are as follows:

(1) Preventing unauthorized access or malware propagation to BES Cyber Systems through Transient Cyber Assets or Removable Media; and

(2) Preventing unauthorized access to BES Cyber System Information through Transient Cyber Assets or Removable Media.

The SDT has incorporated the concepts of other requirements from FERC-approved CIP-010-1 and CIP-007-5 to help define the requirements for Transient Cyber Assets and Removable Media.

Summary of Changes: This is a new requirement. All requirements related to Transient Devices and Removable Media are included within a single standard, CIP-010. Due to the newness of the requirements and definition of asset types, the SDT determined that placing the requirements in a single standard would help ensure that entities were able to quickly identify the requirements for these asset types. While the requirements are similar, they are not to the same rigor of those found in CIP-007 protecting the permanent assets identified by an entity. A separate standard was considered for these requirements. However, the SDT determined that these types of assets would be used in relation to change management and vulnerability assessment processes and should, therefore, be placed in the same standard as those processes.

R4. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection*. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M4. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	Authorize the usage of Transient Cyber Assets prior to initial use, except for CIP Exceptional Circumstances. Authorization shall include: 4.1.1. Users, individually or by group/role; 4.1.2. Locations, individually or by group/role; 4.1.3. Defined acceptable use; and 4.1.4. Operating system, firmware, and intentionally installed software on Transient Cyber Assets (per Cyber Asset capability).	Examples of evidence may include, but are not limited to: • A spreadsheet identifying the authorized software for each Transient Cyber Asset, individually or by group; or • A record in an asset management system that identifies the authorized configuration for each Transient Cyber Asset individually or by group.
4.2	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	Use method(s) to deter, detect, or prevent malicious code on Transient Cyber Assets (per Cyber Asset capability).	An example of evidence may include, but is not limited to, records of the Responsible Entity's performance of these processes (e.g., through traditional antivirus hardening, policies, verification of method(s) employed by vendors, etc.).

CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	Use method(s) to detect malicious code on Removable Media prior to use on applicable systems.	An example of evidence may include, but is not limited to, records of the Responsible Entity's performance of these processes (e.g., through traditional antivirus scanning techniques, verification of method(s) employed by vendors, etc.).
4.4	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	Mitigate the threat of detected malicious code for Transient Cyber Assets and Removable Media.	Examples of evidence may include, but are not limited to: • Records of response processes for malicious code detection • Records of the performance of these processes when malicious code is detected.
4.5	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	Update signatures or patterns for those methods identified in Parts 4.2 and 4.3 that use signatures or patterns.	An example of evidence may include, but is not limited to, documentation showing the process used for the update of signatures or patterns.

CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.6	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems at Control Centers and their associated: • PCA	Evaluate Transient Cyber Assets, prior to use, for modifications that deviate from Part 4.1.4. For a modification that deviates from the state in Part 4.1.4, either: • Remediate by returning the Transient Cyber Asset to the state in Part 4.1.4; or • Update Part 4.1.4.	An example of evidence may include but is not limited to, updated documentation with the date, evaluation results, and status of any remediation activities.
4.7	High Impact BES Cyber Systems and associated: • PCA Medium Impact BES Cyber Systems at Control Centers and their associated: • PCA	Evaluate Transient Cyber Assets, within 35 calendar days prior to use, to ensure security patches are up-to-date. For security patches that are not up-to-date, take one of the following actions: • Apply the applicable patches; • Create a dated mitigation plan; or • Revise an existing mitigation plan. Mitigation plans shall include the Responsible Entity's planned actions to mitigate the vulnerabilities addressed by each security patch.	An example of evidence may include but is not limited to, updated documentation with the date, evaluation results, and status of any mitigation activities.

C. Compliance

1. Compliance Monitoring Process:

a. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

b. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

c. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigation

Self-Reporting

Complaints Text

d. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-010-2)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Medium**	The Responsible Entity has documented and implemented a configuration change management process(es) that includes only four of the required baseline items listed in 1.1.1 through 1.1.5. (1.1)	The Responsible Entity has documented and implemented a configuration change management process(es) that includes only three of the required baseline items listed in 1.1.1 through 1.1.5. (1.1)	The Responsible Entity has documented and implemented a configuration change management process(es) that includes only two of the required baseline items listed in 1.1.1 through 1.1.5. (1.1)	The Responsible Entity has not documented or implemented any configuration change management process(es). (R1) OR The Responsible Entity has documented and implemented a configuration change management process(es) that includes only one of the required baseline items listed in 1.1.1 through 1.1.5. (1.1) OR The Responsible Entity does not have a process(es) that

R #	Time Horizon	VRF	Violation Severity Levels (CIP-010-2)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						requires authorization and documentation of changes that deviate from the existing baseline configuration. (1.2) OR The Responsible Entity does not have a process(es) to update baseline configurations within 30 calendar days of completing a change(s) that deviates from the existing baseline configuration.(1.3) OR The Responsible Entity does not have a process(es) to determine required security controls in CIP-005 and CIP-007

R #	Time Horizon	VRF	Violation Severity Levels (CIP-010-2)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						that could be impacted by a change(s) that deviates from the existing baseline configuration. (1.4.1) OR The Responsible Entity has a process(es) to determine required security controls in CIP-005 and CIP-007 that could be impacted by a change(s) that deviates from the existing baseline configuration but did not verify and document that the required controls were not adversely affected following the change. (1.4.2 & 1.4.3)

R #	Time Horizon	VRF	Violation Severity Levels (CIP-010-2)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						OR The Responsible Entity does not have a process for testing changes in an environment that models the baseline configuration prior to implementing a change that deviates from baseline configuration. (1.5.1) OR The Responsible Entity does not have a process to document the test results and, if using a test environment, document the differences between the test and production environments. (1.5.2)

R #	Time Horizon	VRF	Violation Severity Levels (CIP-010-2)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R2	**Operations Planning**	**Medium**	N/A	N/A	N/A	The Responsible Entity has not documented or implemented a process(es) to monitor for, investigate, and document detected unauthorized changes to the baseline at least once every 35 calendar days. (2.1)
R3	**Long-term Planning and Operations Planning**	**Medium**	The Responsible Entity has implemented one or more documented vulnerability assessment processes for each of its applicable BES Cyber Systems, but has performed a vulnerability assessment more than 15 months, but less than 18 months,	The Responsible Entity has implemented one or more documented vulnerability assessment processes for each of its applicable BES Cyber Systems, but has performed a vulnerability assessment more than 18 months, but less than 21, months	The Responsible Entity has implemented one or more documented vulnerability assessment processes for each of its applicable BES Cyber Systems, but has performed a vulnerability assessment more than 21 months, but less than 24 months,	The Responsible Entity has not implemented any vulnerability assessment processes for one of its applicable BES Cyber Systems. (R3) OR The Responsible Entity has implemented one or more documented

R #	Time Horizon	VRF	Violation Severity Levels (CIP-010-2)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
			since the last assessment on one of its applicable BES Cyber Systems. (3.1) OR The Responsible Entity has implemented one or more documented active vulnerability assessment processes for Applicable Systems, but has performed an active vulnerability assessment more than 36 months, but less than 39 months, since the last active assessment on one of its applicable BES Cyber Systems. (3.2)	since the last assessment on one of its applicable BES Cyber Systems. (3.1) OR The Responsible Entity has implemented one or more documented active vulnerability assessment processes for Applicable Systems, but has performed an active vulnerability assessment more than 39 months, but less than 42 months, since the last active assessment on one of its applicable BES Cyber Systems. (3.2)	since the last assessment on one of its applicable BES Cyber Systems. (3.1) OR The Responsible Entity has implemented one or more documented active vulnerability assessment processes for Applicable Systems, but has performed an active vulnerability assessment more than 42 months, but less than 45 months, since the last active assessment on one of its applicable BES Cyber Systems. (3.2)	vulnerability assessment processes for each of its applicable BES Cyber Systems, but has performed a vulnerability assessment more than 24 months since the last assessment on one of its applicable BES Cyber Systems. (3.1) OR The Responsible Entity has implemented one or more documented active vulnerability assessment processes for Applicable Systems, but has performed an active vulnerability assessment more than 45 months since the last active

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Baseline Configuration

The concept of establishing a Cyber Asset's baseline configuration is meant to provide clarity on requirement language found in previous CIP standard versions. Modification of any item within an applicable Cyber Asset's baseline configuration provides the triggering mechanism for when entities must apply change management processes.

Baseline configurations in CIP-010 consist of five different items: Operating system/firmware, commercially available software or open-source application software, custom software, logical network accessible port identification, and security patches. Operating system information identifies the software and version that is in use on the Cyber Asset. In cases where an independent operating system does not exist (such as for a protective relay), then firmware information should be identified. Commercially available or open-source application software identifies applications that were intentionally installed on the cyber asset. The use of the term "intentional" was meant to ensure that only software applications that were determined to be necessary for Cyber Asset use should be included in the baseline configuration. The SDT does not intend for notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software to be

included. Custom software installed may include scripts developed for local entity functions or other custom software developed for a specific task or function for the entity's use. If additional software was intentionally installed and is not commercially available or open-source, then this software could be considered custom software. If a specific device needs to communicate with another device outside the network, communications need to be limited to only the devices that need to communicate per the requirement in CIP-007-6. Those ports which are accessible need to be included in the baseline. Security patches applied would include all historical and current patches that have been applied on the cyber asset. While CIP-007-6 Requirement R2, Part 2.1 requires entities to track, evaluate, and install security patches, CIP-010 Requirement R1, Part 1.1.5 requires entities to list all applied historical and current patches.

Further guidance can be understood with the following example that details the baseline configuration for a serial-only microprocessor relay:

Asset #051028 at Substation Alpha

- R1.1.1 – Firmware: [MANUFACTURER]-[MODEL]-XYZ-1234567890-ABC
- R1.1.2 – Not Applicable
- R1.1.3 – Not Applicable
- R1.1.4 – Not Applicable
- R1.1.5 – Patch 12345, Patch 67890, Patch 34567, Patch 437823

Also, for a typical IT system, the baseline configuration could reference an IT standard that includes configuration details. An entity would be expected to provide that IT standard as part of their compliance evidence.

Cyber Security Controls

The use of cyber security controls refers specifically to controls referenced and applied according to CIP-005 and CIP-007. The concept presented in the relevant requirement sub-parts in CIP-010 R1 is that an entity is to identify/verify controls from CIP-005 and CIP-007 that could be impacted for a change that deviates from the existing baseline configuration. The SDT does not intend for Responsible Entities to identify/verify all controls located within CIP-005 and CIP-007 for each change. The Responsible Entity is only to identify/verify those control(s) that could be affected by the baseline configuration change. For example, changes that affect logical network ports would only involve CIP-007 R1 (Ports and Services), while changes that affect security patches would only involve CIP-007 R2 (Security Patch Management). The SDT chose not to identify the specific requirements from CIP-005 and CIP-007 in CIP-010 language as the intent of the related requirements is to be able to identify/verify any of the controls in those standards that are affected as a result of a change to the baseline configuration. The SDT

believes it possible that all requirements from CIP-005 and CIP-007 may be identified for a major change to the baseline configuration, and therefore, CIP-005 and CIP-007 was cited at the standard-level versus the requirement-level.

Test Environment

The Control Center test environment (or production environment where the test is performed in a manner that minimizes adverse effects) should model the baseline configuration, but may have a different set of components. For instance, an entity may have a BES Cyber System that runs a database on one component and a web server on another component. The test environment may have the same operating system, security patches, network accessible ports, and software, but have both the database and web server running on a single component instead of multiple components.

Additionally, the Responsible Entity should note that wherever a test environment (or production environment where the test is performed in a manner that minimizes adverse effects) is mentioned, the requirement is to "model" the baseline configuration and not duplicate it exactly. This language was chosen deliberately in order to allow for individual elements of a BES Cyber System at a Control Center to be modeled that may not otherwise be able to be replicated or duplicated exactly; such as, but not limited to, a legacy map-board controller or the numerous data communication links from the field or to other Control Centers (such as by ICCP).

Requirement R2:

The SDT's intent of R2 is to require automated monitoring of the BES Cyber System. However, the SDT understands that there may be some Cyber Assets where automated monitoring may not be possible (such as a GPS time clock). For that reason, automated technical monitoring was not explicitly required, and a Responsible Entity may choose to accomplish this requirement through manual procedural controls.

Requirement R3:

The Responsible Entity should note that the requirement provides a distinction between paper and active vulnerability assessments. The justification for this distinction is well-documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking. In developing their vulnerability assessment processes, Responsible Entities are strongly encouraged to include at least the following elements, several of which are referenced in CIP-005 and CIP-007:

Paper Vulnerability Assessment:

1. Network Discovery - A review of network connectivity to identify all Electronic Access Points to the Electronic Security Perimeter.

2. Network Port and Service Identification - A review to verify that all enabled ports and services have an appropriate business justification.
3. Vulnerability Review - A review of security rule-sets and configurations including controls for default accounts, passwords, and network management community strings.
4. Wireless Review - Identification of common types of wireless networks (such as 802.11a/b/g/n) and a review of their controls if they are in any way used for BES Cyber System communications.

Active Vulnerability Assessment:

1. Network Discovery - Use of active discovery tools to discover active devices and identify communication paths in order to verify that the discovered network architecture matches the documented architecture.
2. Network Port and Service Identification – Use of active discovery tools (such as Nmap) to discover open ports and services.
3. Vulnerability Scanning – Use of a vulnerability scanning tool to identify network accessible ports and services along with the identification of known vulnerabilities associated with services running on those ports.
4. Wireless Scanning – Use of a wireless scanning tool to discover wireless signals and networks in the physical perimeter of a BES Cyber System. Serves to identify unauthorized wireless devices within the range of the wireless scanning tool.

In addition, Responsible Entities are strongly encouraged to review NIST SP800-115 for additional guidance on how to conduct a vulnerability assessment.

Requirement R4:

This Requirement applies to any transient devices (i.e. Transient Cyber Assets and Removable Media) that will be connected temporarily to an applicable system. Examples of these devices include, but are not limited to:

- Hardware/software diagnostic test equipment
- Hardware/software packet sniffers
- Hardware/software used for BES Cyber System maintenance
- Hardware/software used for BES Cyber System configuration
- Hardware/software used to perform vulnerability assessments

Transient Cyber Assets can be in the form of a laptop, desktop, or tablet. Removable Media in scope of this requirement can be in the form of floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.

This requirement does not cover hardware/software components that may support information system maintenance yet are a part of the system, for example the software implementing “ping,” “ls,” “ipconfig,” or the hardware and software implementing the monitoring port of a switch.

Requirement Parts 4.1, 4.3, 4.6, and 4.7 refer to the term “prior to use” related to when specific actions must occur. For purposes of this standard, "use" is considered to be the interaction between transient devices and applicable systems. The interaction between transient devices and multiple applicable systems within the same ESP or PSP would be considered a single use. For example, a technician would need to have a laptop evaluated only once according to Part 4.6 when working in the same PSP. The technician would not need to have the evaluation performed each time it connects to a different Cyber Asset.

Requirement Part 4.1:

Requirement Part 4.1 requires the entity to document and implement its process to authorize the use of Transient Cyber Assets. This allows entities the flexibility to either pre-authorize an inventory of devices or authorize devices at the time of connection. The Transient Cyber Assets may be listed individually or by asset type. To meet this requirement part, the entity is to document the following:

1. User(s), individually or by group/role, allowed to use Transient Cyber Assets. This is intended to provide assurance around who has physical proximity to the Transient Cyber Assets. These user(s) must have authorized electronic and unescorted physical access to the applicable system in accordance with CIP-004.
2. Locations where the Transient Cyber Assets may be used. This can be done by listing a specific location or a group/role of locations. Attention should be paid to Transient Cyber Assets that may be used for assets in differing impact areas (i.e. high impact, medium impact, low impact). These impact areas have differing levels of protection under the CIP Requirements, and measures should be taken to prevent the introduction of malicious code from a lower impact area. It may be reasonable to have separate Transient Cyber Assets for each impact level.
3. The intended or approved use of each Transient Cyber Asset. Activities not specifically listed as acceptable should be considered as prohibited. It may be beneficial to educate individuals on the activities or uses that are not allowed (e.g., using the device to browse the Internet or to check email or using the device to access wireless networks in hotels or retail locations).
4. The operating system, firmware, and intentionally installed software. All of this information may not be available or relevant to each Transient Cyber Asset. Having this information facilitates the review in Part 4.6. The use of the term “intentional” was meant to ensure that only software applications that were determined to be necessary for Cyber Asset use should be included in the baseline configuration. The Standard Drafting Team does not intend for notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software to be included.

CAUTION: Entities should exercise caution when using Transient Cyber Assets and ensure they do not have wireless or Bluetooth features enabled in a manner that would allow the device to bridge an outside network to an applicable system. Doing so would cause the Transient Cyber

Asset to become an unauthorized Electronic Access Point in violation of CIP-005, Requirement R1.

Requirement Parts 4.2, 4.3, 4.4, and 4.5:

Requirement Parts 4.2 and 4.3 address the protection against the introduction of malicious code by Transient Cyber Assets or Removable Media. For Transient Cyber Assets, the entity may either pre-authorize an inventory of Cyber Assets or authorize devices at the time of connection. Pre-authorized Transient Cyber Assets may have the malicious code prevention maintained on the device and do not require specific actions for each use.

It is the responsibility of the entity to ensure that the Transient Cyber Assets it owns and manages have methods deployed to deter, detect, or prevent malicious code. It is also the entity's responsibility to ensure that methods have been deployed to deter, detect, or prevent malicious code on Transient Cyber Assets it does not own or manage, including vendor assets.

For Removable Media and Transient Cyber Assets authorized at the time of connection, the detection of malicious code must be addressed prior to use. This can be performed by scanning the Transient Cyber Assets or Removable Media in an environment outside of the Electronic Security Perimeter (ESP). Entities should use caution not to place kiosks or other scanning devices used to comply with this Requirement inside the ESP.

For Requirement R4, Part 4.4, if malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident.

Part 4.5 requires a process to update signatures or patterns, where applicable. This process is to be documented in the overarching program. As with CIP-007-6, Requirement R3, the process is to include testing and installing of updated signatures or patterns.

Requirement Parts 4.6 and 4.7:

Requirement R4, Part 4.6 requires the entity to evaluate Transient Cyber Assets to ensure that no unauthorized modifications have been made to the operating system, firmware, or software. This is a review of the current state against what is currently documented pursuant to Part 4.1.4. If there are differences, the modified code may be removed or the documentation updated to align to the authorized or current state.

Similarly, Requirement R4, Part 4.7 requires the entity to evaluate Transient Cyber Assets to ensure that patches are up-to-date. This is a review of the patches currently installed against what is currently documented. If there are missing patches, these should be tested and applied or a mitigation plan should be created to mitigate the vulnerabilities addressed by each uninstalled security patch. This should be performed prior to connecting the Transient Cyber Asset to an applicable system. For a device that the entity does not manage (i.e. vendor laptop), this can be performed immediately prior to connecting the Transient Cyber Asset to an applicable system. For an entity-managed device, the entity can evaluate and apply the patches monthly and not have to evaluate prior to each use.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014

Description of Current Draft

This draft standard is being posted for an initial comment and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
First 45-Day Comment Period Opens	June 2014
Additional 45-Day Comment Period (if necessary)	August 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the configuration change management and vulnerability assessment requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-010-1. (Order becomes effective on 2/3/14.)	
2	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Configuration Change Management and Vulnerability Assessments

2. Number: CIP-010-~~1~~2

3. Purpose: To prevent and detect unauthorized changes to BES Cyber Systems by specifying configuration change management and vulnerability assessment requirements in support of protecting BES Cyber Systems from compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 **Distribution Provider**: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 **Responsible Entities listed in 4.1 other than Distribution Providers**:

All BES Facilities.

4.2.3 **Exemptions:** The following are exempt from Standard CIP-010-~~1~~2:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-010-2 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Registered Entities shall not be required to comply with Reliability Standard CIP-010-2, Requirement R4 until nine calendar months after the effective date of Reliability Standard CIP-010-2.

6. Background:

Standard CIP-010 ~~-1~~ exists as part of a suite of CIP Standards related to cyber security, which~~. CIP-002-5~~ require~~s~~ the initial identification and categorization of BES Cyber Systems~~. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1, and CIP-011-1~~ and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.~~ This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.~~

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.~~The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to~~

~~change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:~~

~~Each Responsible Entity shall implement~~**~~, in a manner that identifies, assesses, and corrects deficiencies,~~** ~~. . .~~

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in ~~their~~ its documented processes, but ~~they~~ it must address the applicable requirements in the table. ~~The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities.~~

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The configuration change management processes are intended to prevent unauthorized modifications to BES Cyber Systems.

R1. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-~~1~~ 2 Table R1 – Configuration Change Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-~~1~~ 2 Table R1 – Configuration Change Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-~~1~~ 2 Table R1 – Configuration Change Management

Part	Applicable Systems	Requirements	Measures
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Develop a baseline configuration, individually or by group, which shall include the following items: 1.1.1. Operating system(s) (including version) or firmware where no independent operating system exists; 1.1.2. Any commercially available or open-source application software (including version) intentionally installed; 1.1.3. Any custom software installed; 1.1.4. Any logical network accessible ports; and 1.1.5. Any security patches applied.	Examples of evidence may include, but are not limited to: • A spreadsheet identifying the required items of the baseline configuration for each Cyber Asset, individually or by group; or • A record in an asset management system that identifies the required items of the baseline configuration for each Cyber Asset, individually or by group.

CIP-010-~~1~~ 2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Authorize and document changes that deviate from the existing baseline configuration.	Examples of evidence may include, but are not limited to: • A change request record and associated electronic authorization (performed by the individual or group with the authority to authorize the change) in a change management system for each change; or • Documentation that the change was performed in accordance with the requirement.

CIP-010-~~1~~ 2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration, update the baseline configuration as necessary within 30 calendar days of completing the change.	An example of evidence may include, but is not limited to, updated baseline documentation with a date that is within 30 calendar days of the date of the completion of the change.
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration: 1.4.1. Prior to the change, determine required cyber security controls in CIP-005 and CIP-007 that could be impacted by the change; 1.4.2. Following the change, verify that required cyber security controls determined in 1.4.1 are not adversely affected; and 1.4.3. Document the results of the verification.	An example of evidence may include, but is not limited to, a list of cyber security controls verified or tested along with the dated test results.

CIP-010-~~1~~2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	High Impact BES Cyber Systems	Where technically feasible, for each change that deviates from the existing baseline configuration: 1.5.1. Prior to implementing any change in the production environment, test the changes in a test environment or test the changes in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration to ensure that required cyber security controls in CIP-005 and CIP-007 are not adversely affected; and 1.5.2. Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a list of cyber security controls tested along with successful test results and a list of differences between the production and test environments with descriptions of how any differences were accounted for, including of the date of the test.

Rationale for Requirement R2:

The configuration monitoring processes are intended to detect unauthorized modifications to BES Cyber Systems.

R2. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-~~1~~ 2 Table R2 – Configuration Monitoring. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-~~1~~ 2 Table R2 – Configuration Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-~~1~~ 2 Table R2 – Configuration Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Monitor at least once every 35 calendar days for changes to the baseline configuration (as described in Requirement R1, Part 1.1). Document and investigate detected unauthorized changes.	An example of evidence may include, but is not limited to, logs from a system that is monitoring the configuration along with records of investigation for any unauthorized changes that were detected.

Rationale for Requirement R3:

The vulnerability assessment processes are intended to act as a component in an overall program to periodically ensure the proper implementation of cyber security controls as well as to continually improve the security posture of BES Cyber Systems.

The vulnerability assessment performed for this requirement may be a component of deficiency identification, assessment, and correction.

R3. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-~~1~~ 2 Table R3– Vulnerability Assessments*. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M3. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-~~1~~ 2 Table R3 – Vulnerability Assessments* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-~~1~~ 2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	At least once every 15 calendar months, conduct a paper or active vulnerability assessment.	Examples of evidence may include, but are not limited to: • A document listing the date of the assessment (performed at least once every 15 calendar months), the controls assessed for each BES Cyber System along with the method of assessment,; or • A document listing the date of the assessment and the output of any tools used to perform the assessment.

CIP-010-~~1~~ 2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems	Where technically feasible, at least once every 36 calendar months: 3.2.1 Perform an active vulnerability assessment in a test environment, or perform an active vulnerability assessment in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration of the BES Cyber System in a production environment; and 3.2.2 Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed at least once every 36 calendar months), the output of the tools used to perform the assessment, and a list of differences between the production and test environments with descriptions of how any differences were accounted for in conducting the assessment.

CIP-010-~~1~~ 2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PCA	Prior to adding a new applicable Cyber Asset to a production environment, perform an active vulnerability assessment of the new Cyber Asset, except for CIP Exceptional Circumstances and like replacements of the same type of Cyber Asset with a baseline configuration that models an existing baseline configuration of the previous or other existing Cyber Asset.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed prior to the commissioning of the new Cyber Asset) and the output of any tools used to perform the assessment.
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Document the results of the assessments conducted according to Parts 3.1, 3.2, and 3.3 and the action plan to remediate or mitigate vulnerabilities identified in the assessments including the planned date of completing the action plan and the execution status of any remediation or mitigation action items.	An example of evidence may include, but is not limited to, a document listing the results or the review or assessment, a list of action items, documented proposed dates of completion for the action plan, and records of the status of the action items (such as minutes of a status meeting, updates in a work order system, or a spreadsheet tracking the action items).

Rationale for R4:

Requirement R4 is to address FERC Order No. 791 Paragraphs 6 and 136, which require the standards to address security-related issues associated with tools specifically used for data transfer, vulnerability assessment, maintenance, or troubleshooting. These tools are potential vehicles for transporting malicious code into a facility and subsequently into Cyber Assets or BES Cyber Systems. To that end, the requirement goals are as follows:

(1) Preventing unauthorized access or malware propagation to BES Cyber Systems through Transient Cyber Assets or Removable Media; and

(2) Preventing unauthorized access to BES Cyber System Information through Transient Cyber Assets or Removable Media.

The SDT has incorporated the concepts of other requirements from FERC-approved CIP-010-1 and CIP-007-5 to help define the requirements for Transient Cyber Assets and Removable Media.

Summary of Changes: This is a new requirement. All requirements related to Transient Devices and Removable Media are included within a single standard, CIP-010. Due to the newness of the requirements and definition of asset types, the SDT determined that placing the requirements in a single standard would help ensure that entities were able to quickly identify the requirements for these asset types. While the requirements are similar, they are not to the same rigor of those found in CIP-007 protecting the permanent assets identified by an entity. A separate standard was considered for these requirements. However, the SDT determined that these types of assets would be used in relation to change management and vulnerability assessment processes and should, therefore, be placed in the same standard as those processes.

R4. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection*. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M4. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	Authorize the usage of Transient Cyber Assets prior to initial use, except for CIP Exceptional Circumstances. Authorization shall include: 4.1.1. Users, individually or by group/role; 4.1.2. Locations, individually or by group/role; 4.1.3. Defined acceptable use; and 4.1.4. Operating system, firmware, and intentionally installed software on Transient Cyber Assets (per Cyber Asset capability).	Examples of evidence may include, but are not limited to: • A spreadsheet identifying the authorized software for each Transient Cyber Asset, individually or by group; or • A record in an asset management system that identifies the authorized configuration for each Transient Cyber Asset individually or by group.
4.2	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	Use method(s) to deter, detect, or prevent malicious code on Transient Cyber Assets (per Cyber Asset capability).	An example of evidence may include, but is not limited to, records of the Responsible Entity's performance of these processes (e.g., through traditional antivirus hardening, policies, verification of method(s) employed by vendors, etc.).

CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	Use method(s) to detect malicious code on Removable Media prior to use on applicable systems.	An example of evidence may include, but is not limited to, records of the Responsible Entity's performance of these processes (e.g., through traditional antivirus scanning techniques, verification of method(s) employed by vendors, etc.).
4.4	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	Mitigate the threat of detected malicious code for Transient Cyber Assets and Removable Media.	Examples of evidence may include, but are not limited to: • Records of response processes for malicious code detection • Records of the performance of these processes when malicious code is detected.
4.5	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	Update signatures or patterns for those methods identified in Parts 4.2 and 4.3 that use signatures or patterns.	An example of evidence may include, but is not limited to, documentation showing the process used for the update of signatures or patterns.

CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.6	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems at Control Centers and their associated: • PCA	Evaluate Transient Cyber Assets, prior to use, for modifications that deviate from Part 4.1.4. For a modification that deviates from the state in Part 4.1.4, either: • Remediate by returning the Transient Cyber Asset to the state in Part 4.1.4; or • Update Part 4.1.4.	An example of evidence may include but is not limited to, updated documentation with the date, evaluation results, and status of any remediation activities.
4.7	High Impact BES Cyber Systems and associated: • PCA Medium Impact BES Cyber Systems at Control Centers and their associated: • PCA	Evaluate Transient Cyber Assets, within 35 calendar days prior to use, to ensure security patches are up-to-date. For security patches that are not up-to-date, take one of the following actions: • Apply the applicable patches; • Create a dated mitigation plan; or • Revise an existing mitigation plan. Mitigation plans shall include the Responsible Entity's planned actions to mitigate the vulnerabilities addressed by each security patch.	An example of evidence may include but is not limited to, updated documentation with the date, evaluation results, and status of any mitigation activities.

C. Compliance

1. Compliance Monitoring Process:

a. Compliance Enforcement Authority:

~~The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.~~

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

b. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

c. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigation

Self-Reporting

Complaints Text

d. Additional Compliance Information:

None

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. ~~Furthermore,~~

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Baseline Configuration

The concept of establishing a Cyber Asset's baseline configuration is meant to provide clarity on requirement language found in previous CIP standard versions. Modification of any item within an applicable Cyber Asset's baseline configuration provides the triggering mechanism for when entities must apply change management processes.

Baseline configurations in CIP-010 consist of five different items: Operating system/firmware, commercially available software or open-source application software, custom software, logical network accessible port identification, and security patches. Operating system information identifies the software and version that is in use on the Cyber Asset. In cases where an independent operating system does not exist (such as for a protective relay), then firmware information should be identified. Commercially available or open-source application software identifies applications that were intentionally installed on the cyber asset. The use of the term "intentional" was meant to ensure that only software applications that were determined to be necessary for Cyber Asset use should be included in the baseline configuration. The SDT does not intend for notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software to be

included. Custom software installed may include scripts developed for local entity functions or other custom software developed for a specific task or function for the entity's use. If additional software was intentionally installed and is not commercially available or open-source, then this software could be considered custom software. If a specific device needs to communicate with another device outside the network, communications need to be limited to only the devices that need to communicate per the requirement in CIP-007-~~5~~6. Those ports which are accessible need to be included in the baseline. Security patches applied would include all historical and current patches that have been applied on the cyber asset. While CIP-007-~~5~~ 6 Requirement R2, Part 2.1 requires entities to track, evaluate, and install security patches, CIP-010 Requirement R1, Part 1.1.5 requires entities to list all applied historical and current patches.

Further guidance can be understood with the following example that details the baseline configuration for a serial-only microprocessor relay:

Asset #051028 at Substation Alpha

- R1.1.1 – Firmware: [MANUFACTURER]-[MODEL]-XYZ-1234567890-ABC
- R1.1.2 – Not Applicable
- R1.1.3 – Not Applicable
- R1.1.4 – Not Applicable
- R1.1.5 – Patch 12345, Patch 67890, Patch 34567, Patch 437823

Also, for a typical IT system, the baseline configuration could reference an IT standard that includes configuration details. An entity would be expected to provide that IT standard as part of their compliance evidence.

Cyber Security Controls

The use of cyber security controls refers specifically to controls referenced and applied according to CIP-005 and CIP-007. The concept presented in the relevant requirement sub-parts in CIP-010 R1 is that an entity is to identify/verify controls from CIP-005 and CIP-007 that could be impacted for a change that deviates from the existing baseline configuration. The SDT does not intend for Responsible Entities to identify/verify all controls located within CIP-005 and CIP-007 for each change. The Responsible Entity is only to identify/verify those control(s) that could be affected by the baseline configuration change. For example, changes that affect logical network ports would only involve CIP-007 R1 (Ports and Services), while changes that affect security patches would only involve CIP-007 R2 (Security Patch Management). The SDT chose not to identify the specific requirements from CIP-005 and CIP-007 in CIP-010 language as the intent of the related requirements is to be able to identify/verify any of the controls in those standards that are affected as a result of a change to the baseline configuration. The SDT

believes it possible that all requirements from CIP-005 and CIP-007 may be identified for a major change to the baseline configuration, and therefore, CIP-005 and CIP-007 was cited at the standard-level versus the requirement-level.

Test Environment

The Control Center test environment (or production environment where the test is performed in a manner that minimizes adverse effects) should model the baseline configuration, but may have a different set of components. For instance, an entity may have a BES Cyber System that runs a database on one component and a web server on another component. The test environment may have the same operating system, security patches, network accessible ports, and software, but have both the database and web server running on a single component instead of multiple components.

Additionally, the Responsible Entity should note that wherever a test environment (or production environment where the test is performed in a manner that minimizes adverse effects) is mentioned, the requirement is to "model" the baseline configuration and not duplicate it exactly. This language was chosen deliberately in order to allow for individual elements of a BES Cyber System at a Control Center to be modeled that may not otherwise be able to be replicated or duplicated exactly; such as, but not limited to, a legacy map-board controller or the numerous data communication links from the field or to other Control Centers (such as by ICCP).

Requirement R2:

The SDT's intent of R2 is to require automated monitoring of the BES Cyber System. However, the SDT understands that there may be some Cyber Assets where automated monitoring may not be possible (such as a GPS time clock). For that reason, automated technical monitoring was not explicitly required, and a Responsible Entity may choose to accomplish this requirement through manual procedural controls.

Requirement R3:

The Responsible Entity should note that the requirement provides a distinction between paper and active vulnerability assessments. The justification for this distinction is well-documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking. In developing their vulnerability assessment processes, Responsible Entities are strongly encouraged to include at least the following elements, several of which are referenced in CIP-005 and CIP-007:

Paper Vulnerability Assessment:

1. Network Discovery - A review of network connectivity to identify all Electronic Access Points to the Electronic Security Perimeter.

2. Network Port and Service Identification - A review to verify that all enabled ports and services have an appropriate business justification.
3. Vulnerability Review - A review of security rule-sets and configurations including controls for default accounts, passwords, and network management community strings.
4. Wireless Review - Identification of common types of wireless networks (such as 802.11a/b/g/n) and a review of their controls if they are in any way used for BES Cyber System communications.

Active Vulnerability Assessment:

1. Network Discovery - Use of active discovery tools to discover active devices and identify communication paths in order to verify that the discovered network architecture matches the documented architecture.
2. Network Port and Service Identification – Use of active discovery tools (such as Nmap) to discover open ports and services.
3. Vulnerability Scanning – Use of a vulnerability scanning tool to identify network accessible ports and services along with the identification of known vulnerabilities associated with services running on those ports.
4. Wireless Scanning – Use of a wireless scanning tool to discover wireless signals and networks in the physical perimeter of a BES Cyber System. Serves to identify unauthorized wireless devices within the range of the wireless scanning tool.

In addition, Responsible Entities are strongly encouraged to review NIST SP800-115 for additional guidance on how to conduct a vulnerability assessment.

Requirement R4:

This Requirement applies to any transient devices (i.e. Transient Cyber Assets and Removable Media) that will be connected temporarily to an applicable system. Examples of these devices include, but are not limited to:

- Hardware/software diagnostic test equipment
- Hardware/software packet sniffers
- Hardware/software used for BES Cyber System maintenance
- Hardware/software used for BES Cyber System configuration
- Hardware/software used to perform vulnerability assessments

Transient Cyber Assets can be in the form of a laptop, desktop, or tablet. Removable Media in scope of this requirement can be in the form of floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.

This requirement does not cover hardware/software components that may support information system maintenance yet are a part of the system, for example the software implementing "ping," "ls," "ipconfig," or the hardware and software implementing the monitoring port of a switch.

Requirement Parts 4.1, 4.3, 4.6, and 4.7 refer to the term “prior to use” related to when specific actions must occur. For purposes of this standard, "use" is considered to be the interaction between transient devices and applicable systems. The interaction between transient devices and multiple applicable systems within the same ESP or PSP would be considered a single use. For example, a technician would need to have a laptop evaluated only once according to Part 4.6 when working in the same PSP. The technician would not need to have the evaluation performed each time it connects to a different Cyber Asset.

Requirement Part 4.1:

Requirement Part 4.1 requires the entity to document and implement its process to authorize the use of Transient Cyber Assets. This allows entities the flexibility to either pre-authorize an inventory of devices or authorize devices at the time of connection. The Transient Cyber Assets may be listed individually or by asset type. To meet this requirement part, the entity is to document the following:

1. User(s), individually or by group/role, allowed to use Transient Cyber Assets. This is intended to provide assurance around who has physical proximity to the Transient Cyber Assets. These user(s) must have authorized electronic and unescorted physical access to the applicable system in accordance with CIP-004.
2. Locations where the Transient Cyber Assets may be used. This can be done by listing a specific location or a group/role of locations. Attention should be paid to Transient Cyber Assets that may be used for assets in differing impact areas (i.e. high impact, medium impact, low impact). These impact areas have differing levels of protection under the CIP Requirements, and measures should be taken to prevent the introduction of malicious code from a lower impact area. It may be reasonable to have separate Transient Cyber Assets for each impact level.
3. The intended or approved use of each Transient Cyber Asset. Activities not specifically listed as acceptable should be considered as prohibited. It may be beneficial to educate individuals on the activities or uses that are not allowed (e.g., using the device to browse the Internet or to check email or using the device to access wireless networks in hotels or retail locations).
4. The operating system, firmware, and intentionally installed software. All of this information may not be available or relevant to each Transient Cyber Asset. Having this information facilitates the review in Part 4.6. The use of the term “intentional” was meant to ensure that only software applications that were determined to be necessary for Cyber Asset use should be included in the baseline configuration. The Standard Drafting Team does not intend for notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software to be included.

CAUTION: Entities should exercise caution when using Transient Cyber Assets and ensure they do not have wireless or Bluetooth features enabled in a manner that would allow the device to bridge an outside network to an applicable system. Doing so would cause the Transient Cyber

Asset to become an unauthorized Electronic Access Point in violation of CIP-005, Requirement R1.

Requirement Parts 4.2, 4.3, 4.4, and 4.5:

Requirement Parts 4.2 and 4.3 address the protection against the introduction of malicious code by Transient Cyber Assets or Removable Media. For Transient Cyber Assets, the entity may either pre-authorize an inventory of Cyber Assets or authorize devices at the time of connection. Pre-authorized Transient Cyber Assets may have the malicious code prevention maintained on the device and do not require specific actions for each use.

It is the responsibility of the entity to ensure that the Transient Cyber Assets it owns and manages have methods deployed to deter, detect, or prevent malicious code. It is also the entity's responsibility to ensure that methods have been deployed to deter, detect, or prevent malicious code on Transient Cyber Assets it does not own or manage, including vendor assets.

For Removable Media and Transient Cyber Assets authorized at the time of connection, the detection of malicious code must be addressed prior to use. This can be performed by scanning the Transient Cyber Assets or Removable Media in an environment outside of the Electronic Security Perimeter (ESP). Entities should use caution not to place kiosks or other scanning devices used to comply with this Requirement inside the ESP.

For Requirement R4, Part 4.4, if malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident.

Part 4.5 requires a process to update signatures or patterns, where applicable. This process is to be documented in the overarching program. As with CIP-007-6, Requirement R3, the process is to include testing and installing of updated signatures or patterns.

Requirement Parts 4.6 and 4.7:

Requirement R4, Part 4.6 requires the entity to evaluate Transient Cyber Assets to ensure that no unauthorized modifications have been made to the operating system, firmware, or software. This is a review of the current state against what is currently documented pursuant to Part 4.1.4. If there are differences, the modified code may be removed or the documentation updated to align to the authorized or current state.

Similarly, Requirement R4, Part 4.7 requires the entity to evaluate Transient Cyber Assets to ensure that patches are up-to-date. This is a review of the patches currently installed against what is currently documented. If there are missing patches, these should be tested and applied or a mitigation plan should be created to mitigate the vulnerabilities addressed by each uninstalled security patch. This should be performed prior to connecting the Transient Cyber Asset to an applicable system. For a device that the entity does not manage (i.e. vendor laptop), this can be performed immediately prior to connecting the Transient Cyber Asset to an applicable system. For an entity-managed device, the entity can evaluate and apply the patches monthly and not have to evaluate prior to each use.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014

Description of Current Draft

This draft standard is being posted for an initial comment and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
First 45-Day Comment Period Opens	June 2014
Additional 45-Day Comment Period (if necessary)	August 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the information protection requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-011-1. (Order becomes effective on 2/3/14.)	
2	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Information Protection

2. Number: CIP-011-2

3. Purpose: To prevent unauthorized access to BES Cyber System Information by specifying information protection requirements in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-011-2:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-011-2 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

6. Background:

Standard CIP-011 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the

standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:
Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples

may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.

- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The SDT's intent of the information protection program is to prevent unauthorized access to BES Cyber System Information.

R1. Each Responsible Entity shall implement one or more documented information protection program(s) that collectively includes each of the applicable requirement parts in *CIP-011-2 Table R1 – Information Protection*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence for the information protection program must include the applicable requirement parts in *CIP-011-2 Table R1 – Information Protection* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-2 Table R1 – Information Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Method(s) to identify information that meets the definition of BES Cyber System Information.	Examples of acceptable evidence include, but are not limited to: • Documented method to identify BES Cyber System Information from entity's information protection program; or • Indications on information (e.g., labels or classification) that identify BES Cyber System Information as designated in the entity's information protection program; or • Training materials that provide personnel with sufficient knowledge to recognize BES Cyber System Information; or • Repository or electronic and physical location designated for housing BES Cyber System Information in the entity's information protection program.

CIP-011-2 Table R1 – Information Protection			
Part	**Applicable Systems**	**Requirement**	**Measure**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	Examples of acceptable evidence include, but are not limited to: • Procedures for protecting and securely handling, which include topics such as storage, security during transit, and use of BES Cyber System Information; or • Records indicating that BES Cyber System Information is handled in a manner consistent with the entity's documented procedure(s).

Rationale for Requirement R2:

The intent of the BES Cyber Asset reuse and disposal process is to prevent the unauthorized dissemination of BES Cyber System Information upon reuse or disposal.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include the applicable requirement parts in *CIP-011-2 Table R2 – BES Cyber Asset Reuse and Disposal*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-011-2 Table R2 – BES Cyber Asset Reuse and Disposal* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-2 Table R2 – BES Cyber Asset Reuse and Disposal			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Prior to the release for reuse of applicable Cyber Assets that contain BES Cyber System Information (except for reuse within other systems identified in the "Applicable Systems" column), the Responsible Entity shall take action to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset data storage media.	Examples of acceptable evidence include, but are not limited to: • Records tracking sanitization actions taken to prevent unauthorized retrieval of BES Cyber System Information such as clearing, purging, or destroying; or • Records tracking actions such as encrypting, retaining in the Physical Security Perimeter or other methods used to prevent unauthorized retrieval of BES Cyber System Information.

CIP-011-2 Table R2 – BES Cyber Asset Reuse and Disposal			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Prior to the disposal of applicable Cyber Assets that contain BES Cyber System Information, the Responsible Entity shall take action to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset or destroy the data storage media.	Examples of acceptable evidence include, but are not limited to: • Records that indicate that data storage media was destroyed prior to the disposal of an applicable Cyber Asset; or • Records of actions taken to prevent unauthorized retrieval of BES Cyber System Information prior to the disposal of an applicable Cyber Asset.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Responsible Entities are free to utilize existing change management and asset management systems. However, the information contained within those systems must be evaluated, as the information protection requirements still apply.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

This requirement mandates that BES Cyber System Information be identified. The Responsible Entity has flexibility in determining how to implement the requirement. The Responsible Entity should explain the method for identifying the BES Cyber System Information in their information protection program. For example, the Responsible Entity may decide to mark or label the documents. Identifying separate classifications of BES Cyber System Information is not specifically required. However, a Responsible Entity maintains the flexibility to do so if they desire. As long as the Responsible Entity's information protection program includes all applicable items, additional classification levels (e.g., confidential, public, internal use only, etc.) can be created that go above and beyond the requirements. If the entity chooses to use classifications, then the types of classifications used by the entity and any associated labeling should be documented in the entity's BES Cyber System Information Program.

The Responsible Entity may store all of the information about BES Cyber Systems in a separate repository or location (physical and/or electronic) with access control implemented. For example, the Responsible Entity's program could document that all information stored in an identified repository is considered BES Cyber System Information, the program may state that all information contained in an identified section of a specific repository is considered BES Cyber System Information, or the program may document that all hard copies of information are stored in a secured area of the building. Additional methods for implementing the requirement are suggested in the measures section. However, the methods listed in measures are not meant to be an exhaustive list of methods that the entity may choose to utilize for the identification of BES Cyber System Information.

The SDT does not intend that this requirement cover publicly available information, such as vendor manuals that are available via public websites or information that is deemed to be publicly releasable.

Information protection pertains to both digital and hardcopy information. R1.2 requires one or more procedures for the protection and secure handling BES Cyber System Information, including storage, transit, and use. This includes information that may be stored on Transient Cyber Assets or Removable Media.

The entity's written Information Protection Program should explain how the entity handles aspects of information protection including specifying how BES Cyber System Information is to be securely handled during transit in order to protect against unauthorized access, misuse, or corruption and to protect confidentiality of the communicated BES Cyber System Information. For example, the use of a third-party communication service provider instead of organization-owned infrastructure may warrant the use of encryption to prevent unauthorized disclosure of information during transmission. The entity may choose to establish a trusted communications path for transit of BES Cyber System Information. The trusted communications path would utilize a logon or other security measures to provide secure handling during transit. The entity may employ alternative physical protective measures, such as the use of a courier or locked container for transmission of information. It is not the intent of this standard to mandate the use of one particular format for secure handling during transit.

A good Information Protection Program will document the circumstances under which BES Cyber System Information can be shared with or used by third parties. The organization should distribute or share information on a need-to-know basis. For example, the entity may specify that a confidentiality agreement, non-disclosure arrangement, contract, or written agreement of some kind concerning the handling of information must be in place between the entity and the third party. The entity's Information Protection Program should specify circumstances for sharing of BES Cyber System Information with and use by third parties, for example, use of a non-disclosure agreement. The entity should then follow their documented program. These requirements do not mandate one specific type of arrangement.

Requirement R2:

This requirement allows for BES Cyber Systems to be removed from service and analyzed with their media intact, as that should not constitute a release for reuse. However, following the

analysis, if the media is to be reused outside of a BES Cyber System or disposed of, the entity must take action to prevent the unauthorized retrieval of BES Cyber System Information from the media.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

If an applicable Cyber Asset, Transient Cyber Asset, or Removable Media is removed from the Physical Security Perimeter prior to action taken to prevent the unauthorized retrieval of BES Cyber System Information or destroying the data storage media, the responsible entity should maintain documentation that identifies the custodian for the data storage media while the data storage media is outside of the Physical Security Perimeter prior to actions taken by the entity as required in R2.

Media sanitization is the process used to remove information from system media such that reasonable assurance exists that the information cannot be retrieved or reconstructed. Media sanitization is generally classified into four categories: Disposal, clearing, purging, and destroying. For the purposes of this requirement, disposal by itself, with the exception of certain special circumstances, such as the use of strong encryption on a drive used in a SAN or other media, should never be considered acceptable. The use of clearing techniques may provide a suitable method of sanitization for media that is to be reused, whereas purging techniques may be more appropriate for media that is ready for disposal.

The following information from NIST SP800-88 provides additional guidance concerning the types of actions that an entity might take to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset data storage media:

> Clear: One method to sanitize media is to use software or hardware products to overwrite storage space on the media with non-sensitive data. This process may include overwriting not only the logical storage location of a file(s) (e.g., file allocation table) but also may include all addressable locations. The security goal of the overwriting process is to replace written data with random data. Overwriting cannot be used for media that are damaged or not rewriteable. The media type and size may also influence whether overwriting is a suitable sanitization method [SP 800-36].
>
> Purge: Degaussing and executing the firmware Secure Erase command (for ATA drives only) are acceptable methods for purging. Degaussing is exposing the magnetic media to a strong magnetic field in order to disrupt the recorded magnetic domains. A degausser is a device that generates a magnetic field used to sanitize magnetic media. Degaussers are rated based on the type (i.e., low energy or high energy) of magnetic media they can purge. Degaussers operate using either a strong permanent magnet or an electromagnetic coil. Degaussing can be an effective method for purging damaged or inoperative media, for purging media with exceptionally large storage capacities, or for quickly purging diskettes. [SP 800-36] Executing the firmware Secure Erase command (for ATA drives only) and degaussing are examples of acceptable methods for purging.

Degaussing of any hard drive assembly usually destroys the drive as the firmware that manages the device is also destroyed.

Destroy: There are many different types, techniques, and procedures for media destruction. Disintegration, Pulverization, Melting, and Incineration are sanitization methods designed to completely destroy the media. They are typically carried out at an outsourced metal destruction or licensed incineration facility with the specific capabilities to perform these activities effectively, securely, and safely. Optical mass storage media, including compact disks (CD, CD-RW, CD-R, CD-ROM), optical disks (DVD), and MO disks, must be destroyed by pulverizing, crosscut shredding or burning.

In some cases such as networking equipment, it may be necessary to contact the manufacturer for proper sanitization procedure.

It is critical that an organization maintain a record of its sanitization actions to prevent unauthorized retrieval of BES Cyber System Information. Entities are strongly encouraged to review NIST SP800-88 for guidance on how to develop acceptable media sanitization processes.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014

Description of Current Draft

This draft standard is being posted for an initial comment and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
First 45-Day Comment Period Opens	June 2014
Additional 45-Day Comment Period (if necessary)	August 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the information protection requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-011-1. (Order becomes effective on 2/3/14.)	
2	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Information Protection

2. Number: CIP-011-~~1~~2

3. Purpose: To prevent unauthorized access to BES Cyber System Information by specifying information protection requirements in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-011-~~1~~2:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-011-2 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

6. Background:

Standard CIP-011 ~~-1~~ exists as part of a suite of CIP Standards related to cyber security, which~~. CIP-002-5~~ require~~s~~ the initial identification and categorization of BES Cyber Systems~~. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1, and CIP-011-1~~ and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems. ~~This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.~~

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

~~The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:~~

~~Each Responsible Entity shall implement, **in a manner that identifies, assesses, and corrects deficiencies,** . . .~~

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it~~-~~ believes necessary in ~~their~~ its documented processes, but ~~they~~ it must address the applicable requirements in the table. ~~The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities.~~

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:
Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The SDT's intent of the information protection program is to prevent unauthorized access to BES Cyber System Information.

R1. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented information protection program(s) that collectively includes each of the applicable requirement parts in *CIP-011-~~1~~ 2 Table R1 – Information Protection*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence for the information protection program must include the applicable requirement parts in *CIP-011-~~1~~ 2 Table R1 – Information Protection* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-~~1~~ 2 Table R1 – Information Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Method(s) to identify information that meets the definition of BES Cyber System Information.	Examples of acceptable evidence include, but are not limited to: • Documented method to identify BES Cyber System Information from entity's information protection program; or • Indications on information (e.g., labels or classification) that identify BES Cyber System Information as designated in the entity's information protection program; or • Training materials that provide personnel with sufficient knowledge to recognize BES Cyber System Information; or • Repository or electronic and physical location designated for housing BES Cyber System Information in the entity's information protection program.

CIP-011-~~1~~ 2 Table R1 – Information Protection			
Part	**Applicable Systems**	**Requirement**	**Measure**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	Examples of acceptable evidence include, but are not limited to: • Procedures for protecting and securely handling, which include topics such as storage, security during transit, and use of BES Cyber System Information; or • Records indicating that BES Cyber System Information is handled in a manner consistent with the entity's documented procedure(s).

Rationale for Requirement R2:

The intent of the BES Cyber Asset reuse and disposal process is to prevent the unauthorized dissemination of BES Cyber System Information upon reuse or disposal.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include the applicable requirement parts in *CIP-011-~~1~~ 2 Table R2 – BES Cyber Asset Reuse and Disposal*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-011-~~1~~ 2 Table R2 – BES Cyber Asset Reuse and Disposal* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-~~1~~ 2 Table R2 – BES Cyber Asset Reuse and Disposal			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Prior to the release for reuse of applicable Cyber Assets that contain BES Cyber System Information (except for reuse within other systems identified in the "Applicable Systems" column), the Responsible Entity shall take action to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset data storage media.	Examples of acceptable evidence include, but are not limited to: • Records tracking sanitization actions taken to prevent unauthorized retrieval of BES Cyber System Information such as clearing, purging, or destroying; or • Records tracking actions such as encrypting, retaining in the Physical Security Perimeter or other methods used to prevent unauthorized retrieval of BES Cyber System Information.

CIP-011-~~1~~ 2 Table R2 – BES Cyber Asset Reuse and Disposal			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Prior to the disposal of applicable Cyber Assets that contain BES Cyber System Information, the Responsible Entity shall take action to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset or destroy the data storage media.	Examples of acceptable evidence include, but are not limited to: • Records that indicate that data storage media was destroyed prior to the disposal of an applicable Cyber Asset; or • Records of actions taken to prevent unauthorized retrieval of BES Cyber System Information prior to the disposal of an applicable Cyber Asset.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

~~The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.~~

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints Text

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-011-~~1~~2)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Medium**	N/A	N/A	N/A ~~The Responsible Entity has implemented a BES Cyber System Information protection program which includes one or more methods to identify BES Cyber System Information and has identified deficiencies but did not assess or correct the deficiencies. (1.1)~~ ~~OR~~ ~~The Responsible Entity has implemented a BES Cyber System Information protection program which includes one or more methods to identify BES Cyber System Information but did not identify,~~	The Responsible Entity has not documented or implemented a BES Cyber System Information protection program (R1).

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. ~~Furthermore,~~

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Responsible Entities are free to utilize existing change management and asset management systems. However, the information contained within those systems must be evaluated, as the information protection requirements still apply.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

This requirement mandates that BES Cyber System Information be identified. The Responsible Entity has flexibility in determining how to implement the requirement. The Responsible Entity should explain the method for identifying the BES Cyber System Information in their information protection program. For example, the Responsible Entity may decide to mark or label the documents. Identifying separate classifications of BES Cyber System Information is not specifically required. However, a Responsible Entity maintains the flexibility to do so if they desire. As long as the Responsible Entity's information protection program includes all applicable items, additional classification levels (e.g., confidential, public, internal use only, etc.) can be created that go above and beyond the requirements. If the entity chooses to use classifications, then the types of classifications used by the entity and any associated labeling should be documented in the entity's BES Cyber System Information Program.

The Responsible Entity may store all of the information about BES Cyber Systems in a separate repository or location (physical and/or electronic) with access control implemented. For example, the Responsible Entity's program could document that all information stored in an identified repository is considered BES Cyber System Information, the program may state that all information contained in an identified section of a specific repository is considered BES Cyber System Information, or the program may document that all hard copies of information are stored in a secured area of the building. Additional methods for implementing the requirement are suggested in the measures section. However, the methods listed in measures are not meant to be an exhaustive list of methods that the entity may choose to utilize for the identification of BES Cyber System Information.

The SDT does not intend that this requirement cover publicly available information, such as vendor manuals that are available via public websites or information that is deemed to be publicly releasable.

Information protection pertains to both digital and hardcopy information. R1.2 requires one or more procedures for the protection and secure handling BES Cyber System Information, including storage, transit, and use. This includes information that may be stored on Transient Cyber Assets or Removable Media.

The entity's written Information Protection Program should explain how the entity handles aspects of information protection including specifying how BES Cyber System Information is to be securely handled during transit in order to protect against unauthorized access, misuse, or corruption and to protect confidentiality of the communicated BES Cyber System Information. For example, the use of a third-party communication service provider instead of organization-owned infrastructure may warrant the use of encryption to prevent unauthorized disclosure of information during transmission. The entity may choose to establish a trusted communications path for transit of BES Cyber System Information. The trusted communications path would utilize a logon or other security measures to provide secure handling during transit. The entity may employ alternative physical protective measures, such as the use of a courier or locked container for transmission of information. It is not the intent of this standard to mandate the use of one particular format for secure handling during transit.

A good Information Protection Program will document the circumstances under which BES Cyber System Information can be shared with or used by third parties. The organization should distribute or share information on a need-to-know basis. For example, the entity may specify that a confidentiality agreement, non-disclosure arrangement, contract, or written agreement of some kind concerning the handling of information must be in place between the entity and the third party. The entity's Information Protection Program should specify circumstances for sharing of BES Cyber System Information with and use by third parties, for example, use of a non-disclosure agreement. The entity should then follow their documented program. These requirements do not mandate one specific type of arrangement.

Requirement R2:

This requirement allows for BES Cyber Systems to be removed from service and analyzed with their media intact, as that should not constitute a release for reuse. However, following the

analysis, if the media is to be reused outside of a BES Cyber System or disposed of, the entity must take action to prevent the unauthorized retrieval of BES Cyber System Information from the media.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

If an applicable Cyber Asset, Transient Cyber Asset, or Removable Media is removed from the Physical Security Perimeter prior to action taken to prevent the unauthorized retrieval of BES Cyber System Information or destroying the data storage media, the responsible entity should maintain documentation that identifies the custodian for the data storage media while the data storage media is outside of the Physical Security Perimeter prior to actions taken by the entity as required in R2.

Media sanitization is the process used to remove information from system media such that reasonable assurance exists that the information cannot be retrieved or reconstructed. Media sanitization is generally classified into four categories: Disposal, clearing, purging, and destroying. For the purposes of this requirement, disposal by itself, with the exception of certain special circumstances, such as the use of strong encryption on a drive used in a SAN or other media, should never be considered acceptable. The use of clearing techniques may provide a suitable method of sanitization for media that is to be reused, whereas purging techniques may be more appropriate for media that is ready for disposal.

The following information from NIST SP800-88 provides additional guidance concerning the types of actions that an entity might take to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset data storage media:

> Clear: One method to sanitize media is to use software or hardware products to overwrite storage space on the media with non-sensitive data. This process may include overwriting not only the logical storage location of a file(s) (e.g., file allocation table) but also may include all addressable locations. The security goal of the overwriting process is to replace written data with random data. Overwriting cannot be used for media that are damaged or not rewriteable. The media type and size may also influence whether overwriting is a suitable sanitization method [SP 800-36].
>
> Purge: Degaussing and executing the firmware Secure Erase command (for ATA drives only) are acceptable methods for purging. Degaussing is exposing the magnetic media to a strong magnetic field in order to disrupt the recorded magnetic domains. A degausser is a device that generates a magnetic field used to sanitize magnetic media. Degaussers are rated based on the type (i.e., low energy or high energy) of magnetic media they can purge. Degaussers operate using either a strong permanent magnet or an electromagnetic coil. Degaussing can be an effective method for purging damaged or inoperative media, for purging media with exceptionally large storage capacities, or for quickly purging diskettes. [SP 800-36] Executing the firmware Secure Erase command (for ATA drives only) and degaussing are examples of acceptable methods for purging.

Degaussing of any hard drive assembly usually destroys the drive as the firmware that manages the device is also destroyed.

Destroy: There are many different types, techniques, and procedures for media destruction. Disintegration, Pulverization, Melting, and Incineration are sanitization methods designed to completely destroy the media. They are typically carried out at an outsourced metal destruction or licensed incineration facility with the specific capabilities to perform these activities effectively, securely, and safely. Optical mass storage media, including compact disks (CD, CD-RW, CD-R, CD-ROM), optical disks (DVD), and MO disks, must be destroyed by pulverizing, crosscut shredding or burning.

In some cases such as networking equipment, it may be necessary to contact the manufacturer for proper sanitization procedure.

It is critical that an organization maintain a record of its sanitization actions to prevent unauthorized retrieval of BES Cyber System Information. Entities are strongly encouraged to review NIST SP800-88 for guidance on how to develop acceptable media sanitization processes.

Implementation Plan

Project 2014-02 CIP Version 5 Revisions

May 30, 2014

Requested Approvals

- CIP-003-6 — Cyber Security — Security Management Controls
- CIP-004-6 — Cyber Security — Personnel and Training
- CIP-006-6 — Cyber Security — Physical Security
- CIP-007-6 — Cyber Security — Systems Security Management
- CIP-009–6 — Cyber Security — Recovery Plans for BES Cyber Systems
- CIP-010-2 — Cyber Security — Configuration Change Management
- CIP-011-2 — Cyber Security — Information Protection

Requested Retirements

- CIP-003-5 — Cyber Security — Security Management Controls
- CIP-004-5 — Cyber Security — Personnel and Training
- CIP-006-5 — Cyber Security — Physical Security
- CIP-007-5 — Cyber Security — Systems Security Management
- CIP-009-5 — Cyber Security — Recovery Plans for BES Cyber Systems
- CIP-010-1 — Cyber Security — Configuration Change Management
- CIP-011-1 — Cyber Security — Information Protection

Prerequisite Approvals

None

Revisions to Defined Terms in the NERC Glossary

The standards drafting team proposes modifying the following defined terms in the NERC Glossary:

BES Cyber Asset (BCA)	A Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its required operation, misoperation, or non-operation, adversely impact one or more Facilities, systems, or equipment, which, if destroyed, degraded, or otherwise rendered unavailable when needed, would affect the reliable operation of the Bulk Electric System. Redundancy of affected Facilities, systems, and equipment shall not be considered when determining adverse impact. Each BES Cyber Asset is included in one or more BES Cyber Systems. A Transient Cyber Asset is not a BES Cyber Asset.
Protected Cyber Asset (PCA)	One or more Cyber Assets connected using a routable protocol within or on an Electronic Security Perimeter that is not part of the highest impact BES Cyber System within the same Electronic Security Perimeter. The impact rating of Protected Cyber Assets is equal to the highest rated BES Cyber System in the same ESP. A Transient Cyber Asset is not a Protected Cyber Asset.

The standards drafting team proposes the following new defined terms for incorporation into the NERC Glossary:

Removable Media	Portable media, connected for 30 consecutive calendar days or less, that can be used to copy, move and/or access data. Examples include, but are not limited to, floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory. A Cyber Asset is not Removable Media.
Transient Cyber Asset	A Cyber Asset directly connected for 30 consecutive calendar days or less, to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. Examples include, but are not limited to, Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.

Effective Dates

The effective dates for each of the proposed Reliability Standards and NERC Glossary terms are provided below. Where the standard drafting team identified the need for a longer implementation period for compliance with a particular element (i.e., an entire Requirement or a portion thereof) of a proposed Reliability Standard, the additional time for compliance with that element is specified below. The compliance date for those particular elements represents the date that entities must begin to comply that particular element of the Reliability Standard, even where the Reliability Standard goes into effect at an earlier date.

1. CIP-003-6 — Cyber Security — Security Management Controls

   Reliability Standard CIP-003-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

   Compliance Date for CIP-003-6, Requirement R2

   Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Requirement R2 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

2. CIP-004-6 — Cyber Security — Personnel and Training

   Reliability Standard CIP-004-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is six calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

3. CIP-006-6 — Cyber Security — Physical Security

Reliability Standard CIP-006-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for CIP-006-6, Requirement R1, Part 1.10

For new high or medium impact BES Cyber Systems at Control Centers identified by CIP-002-5.1 which were not identified as Critical Cyber Assets in CIP Version 3, Registered Entities shall not be required to comply with Reliability Standard CIP-006-6, Requirement R1, Part 1.10 until nine calendar months after the effective date of Reliability Standard CIP-006-6.

4. CIP-007-6 —Cyber Security — Systems Security Management

Reliability Standard CIP-007-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for CIP-007-6, Requirement R1, Parts 1.2 and 1.3

Registered Entities shall not be required to comply with the elements of Reliability Standard CIP-007-6, Requirement R1, Parts 1.2 and Parts 1.3 that apply to PCAs and nonprogrammable communication components located inside a PSP and inside an ESP and associated with High and Medium Impact BES Cyber Systems until six calendar months after the effective date of Reliability Standard CIP-007-6.

5. CIP-009-6 — Cyber Security — Recovery Plans for BES Cyber Systems

   Reliability Standard CIP–009-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

6. CIP-010-2 — Cyber Security — Configuration Change Management

   Reliability Standard CIP-010-2 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

   Compliance Date for CIP-010-2, Requirement R4

   Registered Entities shall not be required to comply with Reliability Standard CIP-010-2, Requirement R4 until nine calendar months after the effective date of Reliability Standard CIP-010-2.

7. CIP-011-2 — Cyber Security — Information Protection

   Reliability Standard CIP-011-2 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

8. New and Modified NERC Glossary Terms

   The new and modified NERC Glossary Terms BES Cyber Asset, Protected Cyber Asset, Removable Media, and Transient Cyber Asset shall become effective on the same compliance date as when Reliability Standard CIP-010-2, Requirement R4 is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the same compliance date as when Reliability Standard CIP-010-2, Requirement R4 is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

9. Standards for Retirement

   Midnight of the day immediately prior to the Effective Date in the particular jurisdiction in which the new standard or definition is becoming effective.

Certain Compliance Dates in the Implementation Plan for Version 5 CIP Cyber Security Standards Remain the Same

The following sections of the Implementation Plan for Version 5 CIP Cyber Security Standards[1] (Version 5 Plan) remain the same:

- *Initial Performance of Certain Periodic Requirements*
  - For those requirements with recurring periodic obligations, refer to the Version 5 Plan for compliance dates. These compliance dates are not extended by the effective date of CIP Version 5 Revisions.
- *Previous Identity Verification*
  - The same concept in this section applies for CIP Version 5 Revisions. A documented identity verification performed pursuant to a previous version of the CIP Cyber Security Standards does not need to be repeated under CIP-004-6, Requirement R3, Part 3.1.
- *Planned or Unplanned Changes Resulting in a Higher Categorization*
  - The same concept applies for CIP Version 5 Revisions.

[1] Implementation Plan for Version 5 CIP Cyber Security Standards, October 26, 2012, available online at http://www.nerc.com/pa/Stand/CIP00251RD/Implementation_Plan_clean_4_(2012-1024-1352).pdf

Notes of Standards Committee Meeting (in Italic)

June 10, 2014 | 1:00 – 5:00 p.m. Mountain
June 11, 2014 | 8:00 – Noon Mountain

Xcel Energy
1800 Larimer Street
Denver, CO 80212

1. **Review of Agenda — (Approve)** (5 minutes)

   SC waived the 5-day rule to allow it taking action on the proposed Phase 2 GMD standard (Item 12). Relevant materials were distributed on June 4, less than 5 days before this meeting. Staff wanted to post these standard for commenting/balloting before end of this week.

2. ***Consent Agenda — (Approve)*** *(5 minutes)*

   a. May 14, 2014 Meeting Minutes*- **(Approve)**

   b. May 16, 2014 Meeting Minutes*- **(Approve)**

   Both sets approved, with slight amendment to the May 14 minutes. The issue with showing names of subcommittee members or SDT members approved by the SC continued to be tabled until the July CS meeting.

3. **Three-Month Outlook on Upcoming Standard Projects or Issues*— (Update)** (V. Agnew, S. Miller) (10 minutes)

   There is a typo in the July posting. The standard to be posted is PRC-006-1, not PRC-010-1.

4. **Projects Under Development — (Review)**

   a. Project Tracking Spreadsheet (R. Parsons, V. Agnew, L. Hussey, S. Noess) (15 minutes)

      Jennifer Sterling presented. No issues.

   b. Projected Posting Schedule (B. Nutter) (5 minutes)

      Staff presented. No issues.

5. **Project 2008-02 Undervoltage Load Shedding*— (Authorize)** (V. Agnew) (15 minutes)

   Raised a concern issue that a revised SAR for this project is being posted for commenting. Posting the revised standards for commenting and balloting before closure of the SAR commenting period is premature, and sends a message to the industry that we ignore industry comments on the revised SAR and just move ahead with the changes we have in mind.

Also raised the issue on PRC-004-2 where the UVLS was excluded by UFLS was included. Staff's response was that misoperations of both UFLS and UVLS will be addressed by the PRC-004-2 project.

Made a motion to approve posting of the draft standard after the SAR commenting period is closed. Motion was approved unanimously.

6. **Project 2010-05.2 Special Protection Systems*— (Authorize)** (V. Agnew) (15 minutes)

   Approved to post the revised definition of "Remedial Action Scheme" ("RAS"), the affected Reliability Standards (43 of them) revised to reflect use of the single term RAS, and the associated Implementation Plan for an initial 45-day formal comment period.

7. **Project 2010-14.2 Periodic Review of BAL Standards*— (Accept, Appoint)** (L. Hussey) (15 minutes)

   Suggested to extract one of the recommendations: "Appoint the BAL PRT as the standard drafting team for the new Project 2010-14.2 Implementation of BAL Periodic Review Recommendations." To be placed under a separate motion for discussion.

   Raised the issue that regardless of how good the PRT members are and how many of them are recommended to stay on with the SDT, there needs to be public solicitation to at least add some new members if not to open all seats for potential candidates. If the recommendation is approved as is, we are sending a message to the industry that: if you are not with us during the informal development/outreach stage, you won't be able to join us in standard drafting.

   Most members shared this concern. Made a motion to openly solicit nominations. Existing PRT members are encouraged to submit their names. Motion was approved unanimously.

8. **Project 2014-01 Dispersed Generation Resources*— (Authorize)** (L. Hussey) (15 minutes)

   Approved to post the following revised sets of standards for commenting and balloting to avoid generating resource owners having to incur in unnecessary cost to comply with existing VAR-002 and PRC-005 standards only to be excluded from applicability when the proposed standard revisions are approved:

   - *VAR-002-2b(X), and VAR-002-4);*
   - *PRC-005-2(X), PRC-005-3(X), PRC-005-X(X)*

   The reasons for posting more than one version of each standard is to manage the uncertainties with FERC's final decisions on the industry-approved VAR-002-3 and PRC-005-3, both already filed with FERC, and the proposed PRC-005-X standard which is being developed and to be balloted soon. Having the (x) versions commenting and approved by the industry will allow NERC to file the appropriate version depending on FERC's action or inaction.

9. **Subcommittee Reports**

   a. **PMOS Update*** - **(Update)** (J. Sterling) (10 Minutes)

      Ron Parson provided an update. No issues.

b. **Process Subcommittee*— (Update)** (L. Lee) (15 minutes)

i. **Ballot Pool Management*** - **(Informational)** (L. Lee) (15 minutes)

Laura provided an update. No issues.

ii. **Consensus Building and SAR Development*** - **(Endorse)** (B. Li) (15 minutes)

SC approved the scope of task. Task to be initiated soon.

iii. **Review of Standards Processes and Procedures*** - **(Endorse)** (L. Lee) (15 minutes)

Laura provided an update. No issues.

10. **Communication Updates and Activities* — (Update)** (S. Miller, M. Huggins) (10 minutes)

Mallory Huggins provided an update. Starting next week or the week after, the NERC Standards Bulletin will cover both standards and compliance matters.

11. **Upcoming Standards Filings* — (Review)** (S. Tyrewala) (10 minutes)

NERC Legal provided an update. Some recently approved standards have been filed with FERC for approval (e.g. MOD-031, VAR-001-4).

Agenda Items for June 11, 2014

12. **Project 2013-03 Geomagnetic Disturbance Mitigation* — (Authorize)** (L. Hussey) (15 minutes)

Laura Hussey presented. Approved to post the draft standards (TPL-007-1) for commenting and balloting.

13. **Informational Items — (Enclosed)**

a. SC Expectations*

b. 2014 Meeting Dates and Locations*

c. 2014 Standards Committee Roster*

d. Highlights of Parliamentary Procedure*

14. **Adjourn**

Background materials included in agenda package.

Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and subgroups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost information and participants' expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.
- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

- Any other matters that do not clearly fall within these guidelines should be reviewed with NERC's General Counsel before being discussed.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and subgroups) may have a negative impact on particular entities and thus in that sense adversely impact competition. Decisions and actions by NERC (including its committees and subgroups) should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation, Bylaws, and Rules of Procedure are followed in conducting NERC business.

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or subgroup, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on electricity markets, and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.

Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and employment matters; and procedural matters such as planning and scheduling meetings.

REMINDER FOR USE AT BEGINNING OF MEETINGS AND CONFERENCE CALLS THAT HAVE BEEN PUBLICLY NOTICED AND ARE OPEN TO THE PUBLIC

Conference call version:
Participants are reminded that this conference call is public. The access number was posted on the NERC website and widely distributed. Speakers on the call should keep in mind that the listening audience may include members of the press and representatives of various governmental authorities, in addition to the expected participation by industry stakeholders.

Draft Minutes
Standards Committee Meeting

April 9, 2014 | 1:00-4:00 p.m. Eastern

NERC Antitrust Compliance Guidelines and Public Announcement*

S.J. Kim started the meeting and determined there was a quorum. She reviewed the NERC Antitrust Compliance Guidelines and reminded participants that the meeting is public and that notice of the meeting had been widely distributed.

Introductions and Chair's Remarks

B. Murphy informed the Standards Committee (SC) that the Executive Committee (SCEC) did meet to authorize posting a BES reference document, NUC, and FAC standards. He also informed the SC that he expected the SCEC to convene prior to the May 2014 SC call to authorize the posting of PRC-005 and PRC-023.

M. Lauby also addressed the SC and said thank you for working so diligently on the various Standards activities. He also updated the SC that the new balloting system was being implemented, and that a team was working diligently to address any outstanding issues. M. Lauby ended by noting that a new Standards Developer would be joining NERC. The new developer is both an engineer and a lawyer.

Agenda Items

1. **Review of Agenda — (Approve)**

   -The Committee approved the motion with no objections or abstentions.

2. **Consent Agenda — (Approve)**

   -G.Zito motioned to approve the consent agenda. F. McElvain seconded the motion.

   -The Committee approved the motion with no objections or abstentions.

   a. March 12, 2014 Meeting Minutes*- **(Approve)**

   b. March 21, 2014 Meeting Minutes*- **(Approve)**

3. **Three-Month Outlook on Upcoming Standard Projects or Issues*— (Update)** M. Lauby announced that the outlook was updated and reflects some of the updates from the project plan and RSDP.

4. **Projects Under Development — (Review)**

   a. Project Tracking Spreadsheet

B. Hampton asked if the spreadsheet can track issues that are preventing projects from moving forward, or is this an item that the PMOS representative should bring forward. B. Murphy replied this information should be brought forward by PMOS representatives, and R. Parsons noted the PMOS representative should also highlight the positive attributes of the projects. B. Hampton then posed the general question of whether any PMOS representatives had anything to report. B. Murphy noted that CIP is moving forward with a projected posting date of early June 2014 and, as well, that the meetings he attended on TOP/IRO were going well. R. Crissman announced that COM-002 passed, and that standard will be going to the BOT in May 2014.

R. Crissman asked whether Project 2014-02 CIP Version 5 was back on schedule. S. Noess stated the project was back on track, and that the team is actively discussing the "identify, assess, and correct" language a lot. B. Murphy confirmed that the team was working on that issue, and that everyone is trying to assist with the project.

b. Projected Posting Schedule

B. Murphy commented that the updates on Mondays worked well. R. Crissman asked when the schedule was posted, and B. Nutter said that the schedule is updated typically by 10 a.m. Eastern. B. Murphy clarified that SC members should expect the posting on Tuesday if the Monday is a holiday.

5. **Project 2014-04 Initial Formal Comment and Ballot*- (Authorize)**

R. Crissman motioned to approve the agenda item as written. J. Sterling seconded the motion.

B. Murphy reminded everyone that FERC's ex parte rules have been invoked and this would be an appropriate time for non-approved Commission staff to step away. L. Oberski provided an overview of the drafting efforts. He explained that the 11 team members have been working diligently since the April 1, 2014 Technical Conference at which 130 stakeholders attended in person, while over 500 individuals attended via the phone and webinar. He went on to state the drafting team closely followed the FERC order, and the drafting team did not expand the scope of the project. He also said the drafting team was being responsive to all directives.

S. Noess also explained that the drafting team was very concerned about putting out a high quality standard, and the team had implemented several quality review processes. He went further to explain there was extensive input from NERC legal, in addition to other NERC departments. He anticipated posting the documents immediately, but the official ballot would run from April 10-24. 2014.

L. Oberski commended the work of the drafting team. He noted that FERC-designated staff member have been heavily involved in this project. F. McElvain complimented the team on the excellent product, but did recommend adding in sub-sections under Requirement R1. P. Brown stated the team did excellent work, but asked if the current draft was addressing FERC's concern on third party verifications. L. Oberski answered by stating the draft standard addresses this in two ways. The standard ensures the list of critical assets is correct and that there is an assessment of threat vulnerabilities. The drafting team had several

conversations around this topic, and that was the basis for Requirements R6.1 and R6.4. P. Brown then asked for clarification on whether the quality of the risk assessment mattered. L. Oberski answered the verifying party will serve a tradition auditing role. The verifying party will ensure the review took place and that the underlying assumptions are correct. F. Plett then asked how the confidentiality with regard to facilities will be maintained; he asked that it go further than CEII data. L. Oberski replied a procedure and plan will need to be in place to maintain such confidential data. S. Noess also explained that Compliance will have a counterpart in this process to maintain confidentiality. G. Kruempel asked if the RSAW would also be posted along with a timeline. L. Oberski and S. Noess confirmed both would be posted.

-The Committee approved the motion with no objections or abstentions.

Before moving to the next topic L. Oberski thanked the SC for the support and commented on the number of hours put into this effort. S. Noess added that the ballot body is growing, and he asked everyone to remember to vote so the ballot reaches a quorum. Further, he added that two webinars will be held in the following week. The details of both are listed on the project page.

J. Tarantino raised a concern that FERC may request more projects to be completed in 90 days. He asked if this project was setting a precedent. R. Crissman echoed his concern. L. Oberski stated that he does not recommend the same timeframe for future projects. B. Murphy announced that he would convey this concern to both NERC and FERC staff to assure 90 days does not become a normal timeframe for completing standards.

6. **Report on Assessing the Need to Introduce Demand Response Functions and Entities to the NERC Reliability Functional Model*- (Approve)**

F. Plett motioned to approve the agenda item as written. G. Zito seconded the motion.

J. Cyrulewski provided an update on the project, and introduced S. Knapp from the Functional Model Demand Response Action Team (FMDRAT). He also provided a background on this effort, and he explained that the report took a few years to complete. The Planning Committee took issue with some technical points, and both groups met to discuss the concerns. S. Knapp explained that since 2010, when the original report was drafted, technology has changed greatly, and FMDRAT concluded the penalties and markets out there today are enough to not require adding the entities to the Functional Model. Both groups agreed that there will be a time in the future where it is likely Demand Response (DR) providers should be added to the Functional Model. M. Lauby added that this is a very difficult project, and it is very hard for entities to plan down to their reserves. A. Gallo asked if markets and penalties apply to generators today. S. Knapp reiterated that there will be a time in the future to revisit adding DR to the Functional Model. A. Gallo if a threshold or a trigger has been established. S. Knapp said there is no threshold now, and DR does not currently comprise more than 20% of the market. J. Seelke and P. Heidrich added they believe this issue is something the technical committees should address in the future.

P. Heidrich asked whether there should be a concern if Reliability Standards were to be created for DR. He further added that he believed DR should be added to the Functional Model. J. Cyrulewski said that in that scenario it would have to come back the advisory group. S. Knapp acknowledged that there will eventually be a time when aggregators will likely need to be added to the Functional Model. J. Seelke asked who actually controls DR, and who will determine if DR providers have to be registered. F. Plett asked if there is a threshold trigger for another review of DR being added to the FM. J. Cyrulewski stated that would be an advisory group decision. B. Murphy called the item for a vote.

-The Committee approved the motion with no objections or abstentions.

7. **Subcommittee Reports**

   a. **No PMOS Update**

   b. **Process Subcommittee*— (Update)**

L. Lee provided a brief introduction, and explained there are several initiatives outlined in the supporting materials. L. Lee was leading the first item, and B. Li will discuss consensus building at a future meeting. She added that K. Porterfield has met with NERC staff to review QR goals. She also reported that J. Tarantino is currently working on a scope document to present shortly. Finally, she noted that E. Chanzes is drafting an announcement on the solicitation of committee members.

B. Murphy added that there is a RISC triage document that will be disseminated with the consensus building documents.

   i. **Resource Document Project, Action, and Status* – (Approve)**

E. Skiba (proxy for B. Li) motioned to approve the agenda item as written. A. Gallo seconded the motion.

-The Committee approved the motion with no objections or abstentions.

   ii. **Cost Effective Analysis Process (CEAP) Pilot Status and 2014 implementation* – (Endorse and Approve)**

F. Plett motioned to approve the agenda item as written. R. Crissman seconded the motion.

G. Zito explained that the pilot has concluded. B. Murphy asked if the pilot report has been shared. G. Zito responded that alternative approaches have been shared, and the results can be added to project pages. F. Gaffney commented that on page 8 of there was a paragraph he could not support because the paragraph implies that costs do not outweigh benefits. G. Zito explained this language was reviewed by individual not on a drafting team, and it was softened to show there were some inequities with regard to sufficient equipment. This language was crafted with RISC. F. Gaffney responded by questioning the quantifiable benefit for one installation and whether the SC should be justifying the standard based on cost. G. Zito explained there is room to transfer items to RISC. B. Murphy suggested discussing this item

on a separate call. S. Miller stated that CEAP is not an evaluation of the projects, and this is an endorsement of the methodology. F. Gaffney offered a friendly amendment to modify the paragraph that G. Zito was comfortable with. F. Plett and R. Crissman accepted the friendly amendment.

-The Committee approved the motion with the friendly amendment with no objections or abstentions.

iii. **Guidance Document for Management of Remanded Interpretations* – (Endorse)** (K. Smith)

G. Zito moved to approve the agenda item as written. R. Crissman seconded the motion.

K. Smith explained this project started with CIP and went on to provide an overview of the process for how remanded interpretations will be evaluated later. F. Gaffney opposed the requester having to decide whether a remand should move forward again. He suggested that the SC should be the appropriate action to determine any follow-up actions. K. Smith agreed to this, if NERC legal also supported this process change. S. Tyrewala stated she did not oppose making the change to the proposed process, but she did clarify the SC must make a new request if the standards have been remanded to have the project move forward in the Standards process. G. Zito and R. Crissman accepted F. Gaffney's friendly amendment.

-The Committee approved the motion with the friendly amendment with no objections or abstentions.

8. **Communication Updates and Activities* — (Update)**
9. **Upcoming Standards Filings* — (Review)**
10. **Informational Items — (Enclosed)**
    a. SC Expectations*
    b. 2014 Meeting Dates and Locations*
    c. 2014 Standards Committee Roster*
    d. Highlights of Parliamentary Procedure*
11. **Adjourn**

*Background materials included.

Drafting Team Appointments

- May 2014
  - Project 2008-02- Undervoltage Load shedding expansion of the team to address UFLS

Authorize Posting

- May 2014:
  - Project 2014-03: Revisions to Transmission Operations/Interconnection Reliability Operations and Coordination Reliability Standards (TBD) (High)
  - Project 2008-02- Undervoltage Load shedding revised SAR to include UFLS

Authorize Posting

- June 2014:
  - Project 2013-03: GMD Stage 2 (45-day comment and initial ballot of 1 standard) (High)
  - Project 2009-03: Emergency Operations (45-day comment and initial ballot of 1 standard) (High)
  - Project 2008-02: Undervoltage Load shedding (45-day comment and initial ballot for PRC-010-1) (High)
  - Project 2010-05.2: Protection Systems (Special Protection Systems) (45-day comment and initial ballot of one revised definition) (Medium)
  - Project 2014-01: Standards Applicability for Dispersed Power Producing Resources (45-day comment and ballot of high-priority standards) (High)

Authorize Posting

- July 2014:
  - Project 2012-09: Implementation of Interconnection Reliability Operations and Coordination: Five-year Review (Medium)

Questions and Answers

Draft 2015-2017 Reliability Standards Development Plan and Enhanced Periodic Review

Action

1. Authorize the posting of the draft 2015-2017 Reliability Standards Development Plan (RSDP) for 30 days stakeholder comment. Concurrently, the Chair of the SC will present the draft 2015-2017 RSDP to the Reliability Issues Steering Committee (RISC) for its review and input on the Standard projects and prioritization. Thereafter, the Standards Committee Executive Committee (SECE) will work with NERC Staff on any changes to the draft 2015-2017 RSDP, based on stakeholder comments and RISC input, and, afterwards, present a final draft to the SC for approval.
2. Authorize the posting of draft Enhanced Periodic Review for 30 day stakeholder comment; Thereafter, the SECE will work with NERC Staff on any changes to the draft Enhanced Periodic Review, based on stakeholder comments and RISC input, and, afterwards, present a final draft to the SC for approval.

   It is intended that the documents related to Actions 1 and 2 (attached) would be posted at the same time, so stakeholders can consider their interrelationship.

Background

Draft 2015-2017 RSDP

The draft 2015-2017 RSDP continues the 2014-2016 RSDP progress towards Steady-State.[1] As can be viewed in the draft 2015-2017 RSDP, the number of active projects will dramatically decrease on or before the end of 2015, providing for the transition to a predominate format of enhanced periodic reviews (discussed next). The draft 2015-2017 appears to be a straightforward extension of the 2014-2016 RSDP, and was briefly reviewed by the Chair and Vice Chair of the SC prior to placing on the agenda. Given the apparent straightforward nature of the draft 2015-2017 RSDP, it is thought that it would be best to send out for stakeholder comment at this time, rather than assembling an SC task force to review prior to sending to stakeholders or otherwise delaying its posting.

Draft Enhanced Periodic Review

The below background was developed by the SCEC, Chairs of PMOS, SCPS and NERC Staff, and will also be used in the enhanced periodic review comment form to provide stakeholders with an overview of the enhanced periodic review.

At the February 6, 2014 Board of Trustees (Board) meeting, the Board requested that NERC management and the leadership of the SC work together to develop a mutually acceptable metric for 2015-2017, including a content and quality grading system for the Reliability Standards as part of the metric. Jointly, the following approach was developed, which was

[1] As stated in the 2014-2016 RSDP and 2014-2016 Standards Committee Strategic Work Plan, Steady State means a set of clear, concise, high quality and technically sound Reliability Standards that are results-based, while retiring requirements that do little to promote reliability.

endorsed by the SC on March 12, 2014, and, in summary form, adopted by Corporate Governance and Human Resources Subcommittee of the Board on March 20, 2014:

2014 and 2015 metric

The metric for 2014 and 2015 focuses on ensuring certain Reliability Standard projects are timely completed. For 2014, the Standard projects are all high priority Standard projects, many with regulatory deadlines.

2016 and 2017 metric

The implementation of an enhanced Reliability Standard periodic review for quality and content that takes into consideration the following issues: (1) folding the enhanced quality and content periodic review into the period review required by Section 13 of the Standards Processes Manual; (2) a quality and content review of the steady state Standards developed, considering the use of, or adaptation of, the 2013 Independent Expert Review Team's quality and content scoring system; (3) the formation of a cross-functional task force to conduct, periodic reviews of steady state Reliability Standards, potentially consisting of Committee chairs, NERC management, NERC and stakeholder subject matter experts (all task force meetings shall be open to the public); (4) the task force to use the quality and content system developed in response to 2), above, to identify needed enhancements to steady state standards for inclusion in a Standards Authorization Request (SAR) processed through the standards development process and completed within a year from the date of posting of the SAR, unless technical review and study is needed (To the extent possible, the inclusion of identified enhancements in a SAR shall be limited focusing enhancements rather than re-opening an entire Standard(s); and (5) the development of an annual task force review timeline starting with the cross-functional task force being operational no later than mid-2015, so it can identify which standards will undergo the enhanced period review for inclusion in the 2016-2018 Reliability Standards Development Plan.

The above summary of the metric approach shows a focus on the completion of transforming NERC's Reliability Standards to a steady state by the end of 2015,[2] and, thereafter, the initiation of an enhanced periodic review to address quality and content issues related to the steady state Reliability Standards. It is contemplated that approximately 25 percent of the steady state Reliability Standards will undergo the enhanced period review in 2016, and another 25 percent in 2017.

At its March meeting, the SC appointed a periodic review development team (consisting of the SC Executive Committee and the Project Management and Oversight and Process Subcommittees chairs) to work with NERC Staff and Legal to develop the attributes of the enhanced quality and content periodic review. This team developed an approach to address the Board's direction summarized below and set forth in the attached template, along with a stakeholder comment form. The approach has been preliminarily reviewed by the SC and

[2] Steady state as set forth in the 2014-2016 Reliability Standards Development Plan and 2014-2016 Standards Committee Strategic Work Plan is a set of clear, concise, high quality and technically sound Reliability Standards that are results-based, while retiring requirements that do little to promote reliability.

approved for posting for stakeholder comment. Based on stakeholder comments, the SC will consider if the proposed approach should be enhanced, prior to its endorsement and requesting NERC's Board consideration.

Summary of draft enhanced periodic review approach

- The enhanced periodic review approach will satisfy NERC's obligations under Section 13 of the Standard Processes Manual, and will be conducted in accordance with that section.
- The SC shall appoint a standing cross-functional team including NERC staff and the NERC standing committee representatives to work with the Section 13 *"review team of subject matter experts."* This team will be appointed by the SC, who will review and adopt the results of the team's deliberations.
- The cross-functional team shall be operational no later than beginning of 2015 making recommendations to the SC on the Reliability Standards that should undergo the enhanced periodic review in 2016-2018, and to be included 2016-2018 Reliability Standards Development Plan.
- NERC's five-year periodic review template that was successfully employed for number of standards in 2013 and 2014 has been revised and adapted to include quality and content questions developed by the Independent Expert Review Panel not already included. The template was further adapted to eliminate duplicative questions, and to provide the cross-functional review team with a clear framework to conduct the periodic reviews.
    - A new question was added to consider whether the applicability section or requirements can be revised for smaller entities, provided that there is technical justification to support the enhanced applicability.
    - A dashboard will be developed for each reviewed Standard indicating if whether it has a score of Green, Yellow or Red Green, according to the following grading system:
        - Green = no quality and content changes needed – Standard confirmed as steady state;
        - Yellow = quality and content issues identified, but those identified are not sufficient to justify revising Standard at this time – i.e., continue to monitor; and
        - Red = Standard needs to be revised to address identified quality and content issues.
- Standards graded as "Red" by the cross-functional review team will be revised consistent with applicable sections of the Standards Processes Manual.

Alternative

As an alternative to the proposed actions in 1 and 2, the Standards Committee could decide to review the draft documents for a period of time if there was a concern the documents are not ready for posting, and then convene a call to discuss and authorize the posting.

Executive Summary

The 2015-2017 Reliability Standards Development Plan (2015-2017 RSDP) is another bold step toward transforming the NERC Reliability Standards. During 2015, the NERC Reliability Standards will reach Steady-State[1] and the number of active projects will dramatically decrease. Concurrently, to begin the final transition in the transformation process, the industry-endorsed criteria for evaluating the content and quality of standards will be applied to standards or standard families during enhanced periodic reviews, focused on continuous improvement.

With the support from the Standards Committee and industry stakeholders, NERC Reliability Standards have made great strides over the last two years. By the end of 2015, the majority of the Paragraph 81 candidates,[2] the Independent Expert Review Panel's (IERP) recommendations for requirement retirement, and Federal Energy Regulatory Commission (FERC) directives issued prior to December 2012 will be addressed. Projects that were languishing for years, as well as five-year reviews will be completed. The industry will also have completed large projects to respond to FERC orders, including, for example, Geomagnetic Disturbances, CIP Version 5 Revisions, and CIP-014 Physical Security, revised the TOP and IRO standards to address concerns identified in FERC's proposed remand, and will have addressed the majority of FERC directives issued after December 2012. This is a significant achievement – the Standards Committee worked diligently with NERC to determine project schedules and manage industry workload. Stakeholders engaged throughout North America to provide expertise during standard development ensuring projects could reach completion.

Now, in the 2015-2017 RSDP, the number of projects necessary to reach Steady-State by 2015 is reduced and the pace of the work will likely become more deliberate. Six projects that began during 2014 will be completed in 2015, while four new projects will be initiated in 2015, with one focused on aligning the Glossary of Terms used in NERC Reliability Standards with the Definitions used in the Rules of Procedure (Rules of Procedure, Appendix 2). This reduction in planned projects provides a bandwidth for projects required to respond to emerging risks, if any, to reliability, establish a quality and content enhanced periodic review, as well as any new FERC orders or directives. Also, given the increased focus on quality during the standard development process as well as active engagement of FERC Office of Electric Reliability staff during the standards development process, FERC directives and orders on existing standards are expected to trend lower.

Arriving to Steady-State provides an opportunity for critical assessment of the existing reliability standards through enhanced periodic reviews, and following the reviews to implement recommendations for quality, content, or alignment with other standards using industry-developed criteria,[3] building on the foundation established by the IERP.[4] Over the last 7 years, the Electric Reliability Organization (ERO) and industry have gained experience in understanding the characteristics of quality, results-based standards, while targeting their applicability based on risk to achieve a reliability benefit without creating undue burden on industry.

---

[1] As stated in the 2014-2016 RSDP and 2014-2016 Standards Committee Strategic Work Plan, Steady State means a set of clear, concise, high quality and technically sound Reliability Standards that are results-based, while retiring requirements that do little to promote reliability.

[2] There are 6 P81 candidates that will be addressed during the enhanced periodic reviews.

[3] The Independent Experts developed criteria is described in their final report, Standards Independent Experts Review Project, however this criteria was not vetted with industry.

[4] The North American Electric Reliability Corporation (NERC) retained five industry experts to independently review the NERC Reliability Standards, setting the foundation for a plan that will result in a set of clear, concise and sustainable body of Reliability Standards. The primary scope was an assessment of the content and quality of the Reliability Standards, including identification of potential Bulk-Power System (BPS) risks that were not adequately mitigated.

The NERC model is unique in the realm of regulation and, with the participation by stakeholders, the Standards Committee, and applicable regulatory authorities, we are demonstrating that this regulatory model works.

Steady-State

The NERC Reliability Standards will reach Steady-State in 2015.

This section provides information on the status of FERC directives, Paragraph 81 candidates, and the IERP's recommendations for retirement. Completion of projects is discussed in the next section, "2014 Status Report."

Directives

In 2013, NERC set out to address the 191 FERC directives that were issued and unaddressed prior to December 2012:

	2012 Directives	2013/2014 Directives	Total
Issued prior to year-end 2012	191		
Issued in 2013/2014		46	
Resolved as of March 1, 2014	122	11	
Remaining	**69**	**35**	**104**
Projected to be resolved in 2014	45	29	74
Projected to be remaining at year-end 2014	**24**	**6**	**30**

*Does not include non-standards' related directives

Table 1. Completion of Directives

While this is one benchmark, it is also imperative to address the FERC directives issued post-December 2012 in a timely fashion. As noted in the footnote to the chart above, FERC issued some directives that require work from groups outside of standards, such as the NERC technical committees, or another internal NERC department, such as Reliability Assessment and Performance Analysis (RAPA). These directives, as they cannot be resolved through a Standards process, are not included in the above numbers.

As depicted in Chart 1, the majority of the 191 Directives (115 or 60%) were addressed in 2013. Depending upon project completion, 171 will be addressed at yearend 2014.

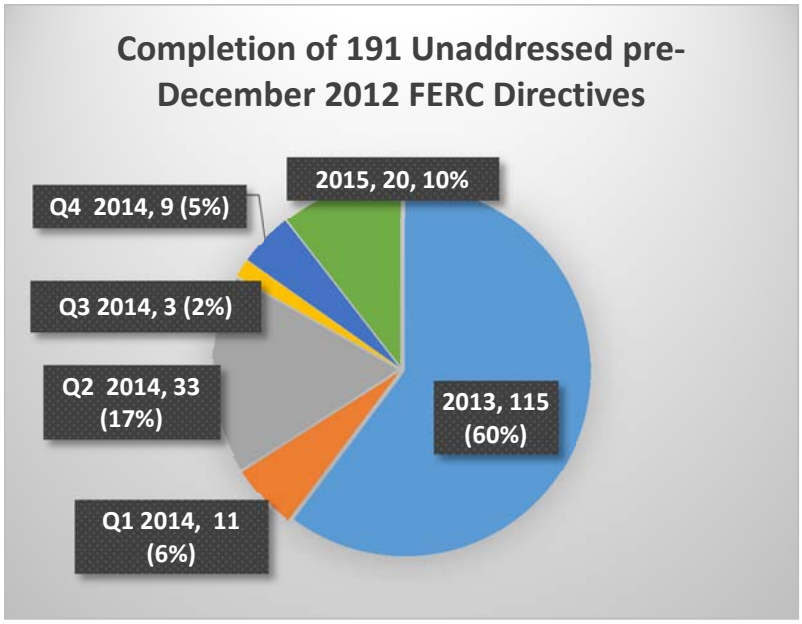

Chart 1. Completion of 191 Directives

FERC has issued 55 directives since December 2012. Nine of those pertain to areas outside of standards. Eleven have been addressed. Of the remaining 35, 29 are projected to be addressed in 2014 and 6 in 2015, as shown in Chart 3.

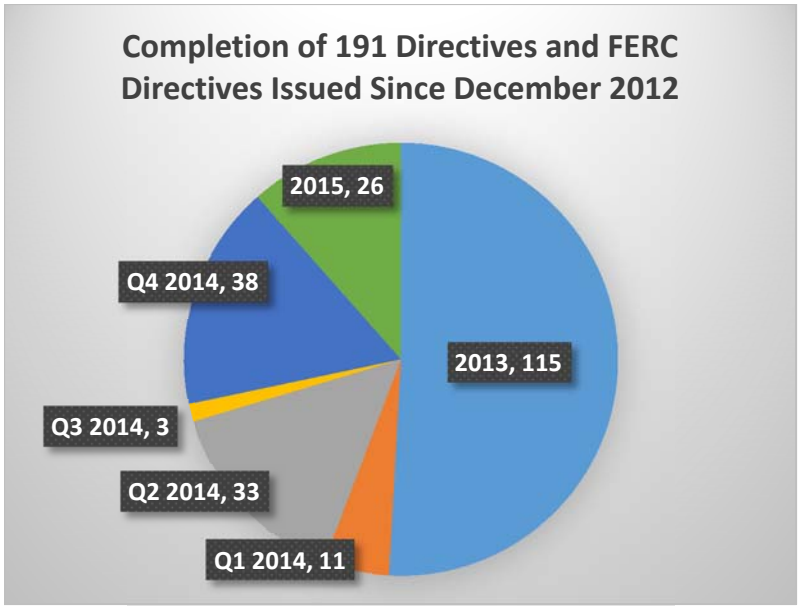

Chart 3. Completion of Remaining Directives

Paragraph 81 Candidates and IERP Recommendations for Retirement

The Paragraph 81 (or P81) project was initiated in response to paragraph 81 of FERC's March 15, 2012 Order.[5,6] Candidate requirements in a Phase 1 of the project were approved by FERC in Order 788, issued on November 21, 2013.[7] In addition to candidates requirements filed in Phase 1, stakeholders identified 217 additional candidates for consideration. These candidates were addressed through standard development projects for each standard rather than in one project for efficiency. Further, the IERP recommended 147 candidates for retirement.[8]

There was some overlap in the 217 candidate requirements identified as part of the Paragraph 81 project, and the 147 recommended for retirement by the IERP. When combined, a total of 281 unique requirements were identified and have been or are projected for standard development team consideration as follows:

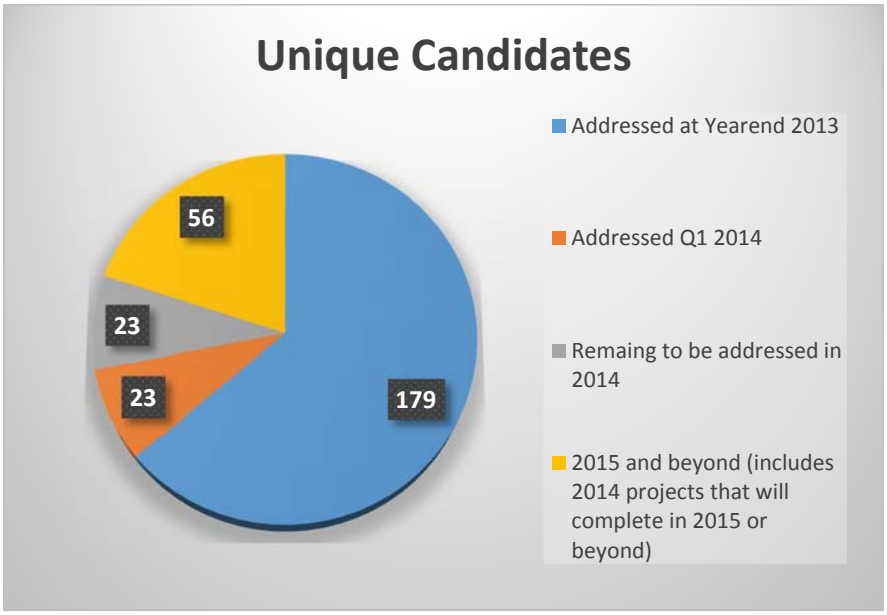

Chart 4. Candidates Unique for P81 and IERP

[5] 138 FERC 61,193, Order Accepting with Conditions the Electric Reliability Organization's Petition Requesting Approval of New Enforcement Mechanisms and Requiring Compliance Filing, March 15, 2012.

[6] Id., p. 81:

> …The Commission is interested in obtaining views on whether such requirements could be removed from the Reliability Standards with little effect on reliability and an increase in efficiency of the ERO compliance program. If NERC believes that specific Reliability Standards or specific requirements within certain Standards should be revised or removed, we invite NERC to make specific proposals to the Commission identifying the Standards or requirements and setting forth in detail the technical basis for its belief. In addition, or in the alternative, we invite NERC, the Regional Entities and other interested entities to propose appropriate mechanisms to identify and remove from the Commission-approved Reliability Standards unnecessary or redundant requirements. We will not impose a deadline on when these comments should be submitted, but ask that to the extent such comments are submitted NERC, the Regional Entities, and interested entities coordinate to submit their respective comments concurrently.

[7] FERC Order No. 788, 145 FERC 61,147, Electric Reliability Organization Proposal to Retire Requirements in Reliability Standards, November 21, 2013.

[8] See Appendix E of the Independent Experts Review Project.

Resolution

Recommendations for retirement are tracked at the requirement level. If the entire requirement was recommended for retirement, drafting teams may have considered one action (or part of a requirement) suitable for retirement, but determined that another action within a requirement should be retained. In conducting the analysis to determine whether the drafting team followed a recommendation for retirement, if the intent of the recommendation was met or if the majority of the requirement was retired, this analysis considers the recommendation addressed. With those considerations, the status of the resolution for 179 candidates addressed as of the second quarter of 2014 is:

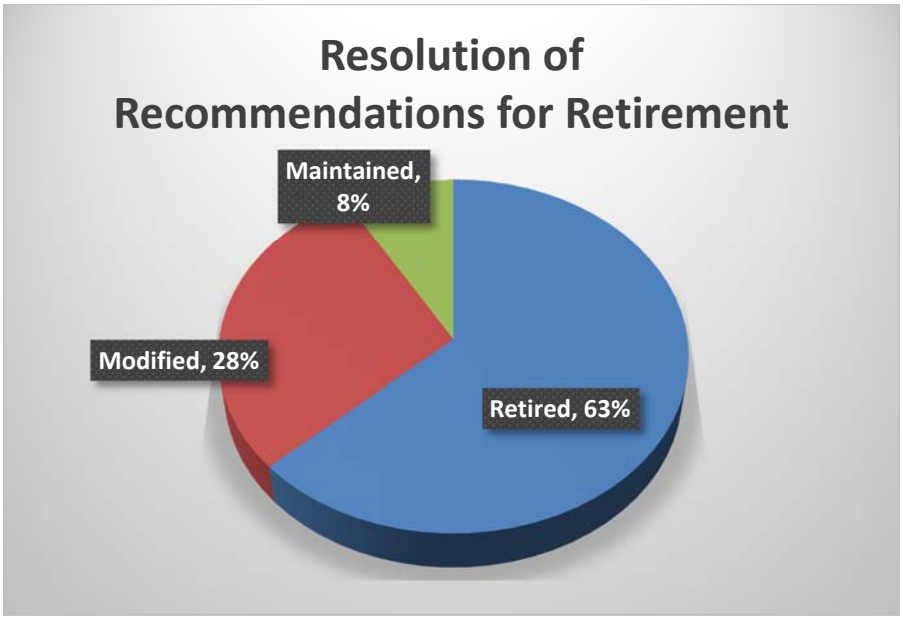

Chart 5. Resolution of Recommendation for Retirement

2014 Progress Report

The 2014-2016 RSDP identified 13 active projects to be conducted over the three-year period, of which 8 are projected to be completed by yearend 2014. There are 10 additional projects that have continued development from the 2013-2015 RSDP, all of which are scheduled to be completed in 2014. Finally, there are 4 projects that were initiated in 2014 as a result of a reliability need or to respond to a FERC order or directive.

Projects that were listed in the 2014–2016 RSDP that are scheduled to be completed in 2014:

- Project 2008-02 Undervoltage Load Shedding and Underfrequency Load Shedding
- Project 2007-11 Disturbance Monitoring
- Project 2009-02 Real-Time Reliability Monitoring and Analysis Capabilities (consolidated into Project 2014-03 TOP/IRO Revisions)[9]
- Project 2009-03 Emergency Operations
- Project 2010-02 Connecting New Facilities to the Grid
- Project 2010-05.2 Phase 2 of Protection System Misoperations: SPS/RAS
- Project 2010-08 Functional Model Glossary Revisions
- Project 2010-14.2 Periodic Review and Revisions of BAL-004, -005, and -006
- Project 2012-09 Implementation of IRO Five-year Review Recommendations
- Project 2012-13 NUC Review and Implementation
- Project 2013-03 Geomagnetic Disturbance Mitigation Measures (Stage 2)

Two projects were listed as pending technical committee input and initiated in the first quarter of 2014:

- Project 2007-17.3 Protection System Maintenance and Testing Auxiliary Relays
- Project 2010-13.3 Generator Relay Loadability Stable Power Swings

The following projects are 2013 projects that were (or are anticipated to be) completed in 2014, and all have been completed or are scheduled to be completed by the end of 2014:

- Project 2007-02 Operating Personnel Communications Protocol
- Project 2007-06 System Protection Coordination
- Project 2008-12 Coordinate Interchange Standards
- Project 2010-01 Operations Personnel Training
- Project 2010-03 Modeling Data – MOD B
- Project 2010-04 Demand Data – MOD C
- Project 2010-05.1 Phase 1 of Protection Systems: Misoperations
- Project 2010-14.1 Phase 1 of Balancing Authority Reliability-Based Control: Reserves
- Project 2012-05 ATC Revisions – MOD A
- Project 2013-04 Voltage and Reactive Control

The following projects were identified as either an emerging issue or developed in response to a FERC order or directive:

- Project 2014-02 CIP Version 5 Revisions

[9] The issues and directives assigned to Project 2009-02 are being addressed in Project 2014-03 Revisions to TOP/IRO Reliability Standards, which has a filing deadline of January 31, 2015, subject to the outcome of balloting in that project.

- Project 2014-01 Standards Applicability for Dispersed Generation Resources
- Project 2014-03 Revisions to TOP/IRO Standards
- Project 2014-04 Physical Security

Of the above projects, all are on track to be completed in 2014, except several projects that were either withdrawn or have a longer timeline due to 1) coordination with other projects, or 2) a significant overlap in drafting team membership with projects being completed in 2013.

- Project 2010-08 Functional Model Glossary Revisions - withdrawn because it was determined that the project was not needed for reliability.
- Project 2012-09 Implementation of IRO Review - put on hold to facilitate coordination with Project 2014-03 Revisions to TOP and IRO Reliability Standards.
- Project 2008-02 Undervoltage Load Shedding and Underfrequency Load Shedding - being coordinated with Project 2009-03 Emergency Operations and the definition of Special Protection System being revised in Project 2010-05.2 Phase 2 of Protection System Misoperations: SPS/RAS
- Project 2009-03 Emergency Operations - being coordinated with Project 2008-02 Undervoltage Load Shedding and Underfrequency Load Shedding, which is being coordinated with the definition of Special Protection Systems.
- Project 2010-05.2 Phase 2 of Protection System Misoperations: SPS/RAS - being coordinated with Project 2008-02 Undervoltage Load Shedding and Underfrequency Load Shedding.
- Project 2010-14.2 Phase 2 of BAL-004, -005, and -006 – a periodic review of the three standards in this project was delayed because of significant drafting team membership overlap with other BAL projects that were not completed as soon as anticipated.

2015 Projects

As discussed in the prior section, there are 6 projects that were in progess in 2014 that are projected to continue into 2015. Three of these projects, Project 2008-02 Undervoltage Load Shedding and Underfrequency Load Shedding, Project 2009-03 Emergency Operations, and Project 2010-14.2 Revisions of BAL-004, BAL-005 and BAL-006, may complete in 2014, reducing the number of projects continuing to 2.

Two of the projects that are identified below as new are directly related to resolving remaining FERC Directives, one is to complete the review of the FAC standards from the 2013 periodic reviews, and the remaining project is being conducted to align the Glossary of Terms used in the NERC Reliability Standards and the Definitions used in the Rules of Procedure. The project to complete the FAC standards review may be included with the 2015 Periodic Review.

Additionally, the IERP identified three high level gaps that were reviewed by the NERC Operating Committee in 2014. It is anticipated that two of the issues, Outage Coordination and Situational Awareness, will be addressed by the TOP/IRO Revisions project. Depending upon the outcome of that project, additional work may be necessary. The third issue, Governor Frequency Response, was determined by the Operating Committee as a potential area of concern, but one that is being monitored. Depending upon the findings of the Operating Committee on this issue, more work may be necessary for this concern as well.

Projects continuing from 2014 into 2015

As stated above, the following projects will continue from 2014:

- Project 2012-09 Implementation of IRO Review (on hold pending completion of the TOP/IRO Revisions)
- Project 2008-02 Undervoltage Load Shedding and Underfrequency Load Shedding
- Project 2009-03 Emergency Operations
- Project 2010-05.2 Phase 2 of Protection System Misoperations: SPS/RAS
- Project 2010-14.2 Phase 2 of BAL-004, BAL-005, and BAL-006

New Projects for 2015[10]

To achieve Steady-State, the following projects will be initiated in 2015. The EOP and FAC periodic review projects planned for initiation in 2015 complete reviews that were deferred by review teams in 2013, either due to interdependencies with standards that were pending regulatory approval, or to gain compliance experience prior to conducting the review.

Consistent with the approach applied to prioritize projects in the 2014-2014 RSDP and used by the SC for new projects such as Project 2014-01 Standards Applicability for Dispersed Generation Resources, new projects for 2015 have been assigned a prioritization of High, Medium, Low, or Pending Technical Committee input. Specific elements considered in prioritization include: (1) RISC Category Rankings; (2) regulatory directives; (3) regulatory deadlines; (4) Reliability Standard requirement candidates for retirement; (5) the IERP content and quality assessments; and (6) additional considerations (fill-in-the-blank status and five-year assessment commitments). The prioritization gave primary consideration to RISC Category Rankings, regulatory directives, and regulatory deadlines, which was further informed by the other prioritization elements. Based on the application of these

[10] See Appendix 1 for new project detail.

elements, this section prioritizes each Reliability Standard project as High, Medium, Low, or Pending Technical Committee input.

The prioritization in this RSDP does not include projects in progress at yearend 2014, since those projects have been previously prioritized.

Prioritization Considerations for 2015 Projects:

Medium Priority

- Project 2015-01 TPL Directives (prioritized by SC in 2014)
  - 2 FERC directives
  - RISC: high priority area
  - IERP considerations: minor quality and content
- Project 2015-02 Periodic Review of EOP-004, EOP-005, EOP-006 and EOP-008
  - 1 FERC directive
  - RISC: high priority area
  - IERP considerations: some content and some quality
  - 3 Paragraph 81 Candidates
- Project 2015-03 Periodic Review of System Operating Limit Standards (FAC-010, -011, and -014)
  - RISC: low priority area
  - IERP: content and quality issues
  - 2 Paragraph 81 candidates

Low Priority

- Project 2015-04 Alignment of Glossary of Terms used in NERC Reliability Standards and the Definitions used in the Rules of Procedure (Rules of Procedure Appendix 2)

Sustainable Approach to Periodic Reviews[11]

At the February 6, 2014 Board of Trustees (Board) meeting, the Board requested that NERC management and the leadership of the Standards Committee (SC) work together to develop a mutually acceptable metric for 2015-2017, including a content and quality grading system for the Reliability Standards as part of the metric. Jointly, the following approach was developed, which was endorsed by the SC on March 12, 2014 and, in summary form, adopted by Corporate Governance and Human Resources Subcommittee of the Board on March 20, 2014.

2014 and 2015 Metric

The metric for 2014 and 2015 focuses on ensuring certain Reliability Standard projects are timely completed. For 2014, the Standard projects are all high priority Standard projects, many with regulatory deadlines.

2016 and 2017 metric

[11] During 2014 this framework is being presented for stakeholder comment, and then Board approval, so the final framework may differ in some respects to the approach outlined here.

> The implementation of an enhanced Reliability Standard periodic review for quality and content that takes into consideration the following issues: (1) folding the enhanced quality and content periodic review into the period review required by Section 13 of the Standards Processes Manual; (2) a quality and content review of the steady state Standards developed, considering the use of, or adaptation of, the 2013 Independent Expert Review Team's quality and content scoring system; (3) the formation of a cross-functional task force to conduct, periodic reviews of steady state Reliability Standards, potentially consisting of Committee chairs, NERC management, NERC and stakeholder subject matter experts (all task force meetings shall be open to the public); (4) the task force to use the quality and content system developed in response to 2), above, to identify needed enhancements to steady state standards for inclusion in a Standards Authorization Request (SAR) processed through the standards development process and completed within a year from the date of posting of the SAR, unless technical review and study is needed (to the extent possible, the inclusion of identified enhancements in a SAR shall be limited to focusing enhancements rather than re-opening an entire Standard(s)); and (5) the development of an annual task force review timeline starting with the cross-functional task force being operational no later than mid-2015, so it can identify which standards will undergo the enhanced period review for inclusion in the 2016-2018 Reliability Standards Development Plan.

The above summary of the metric approach shows a focus on the completion of transforming NERC's Reliability Standards to a steady state by the end of 2015[12] and, thereafter, the initiation of an enhanced periodic review to address quality and content issues related to the steady state Reliability Standards. It is contemplated that approximately 25 percent of the steady state Reliability Standards will undergo the enhanced period review in 2016, and another 25 percent in 2017.

At its March 2014 meeting, the SC appointed a periodic review development team (consisting of the SC Executive Committee and the Project Management and Oversight and Process Subcommittees chairs) to work with NERC Staff and Legal to develop the attributes of the enhanced quality and content periodic review. This team developed an approach to address the Board's direction, as summarized below.

Summary of draft enhanced periodic review approach

- The enhanced periodic review approach will satisfy NERC's obligations under Section 13 of the *Standard Processes Manual*, and will be conducted in accordance with that section.

- The SC shall appoint a standing cross-functional team including NERC staff and the NERC standing committee representatives to work with the Section 13 *"review team of subject matter experts."* This team will be appointed by the SC, who will review and adopt the results of the team's deliberations.

- The cross-functional team shall be operational no later than beginning of 2015 making recommendations to the SC on the Reliability Standards that should undergo the enhanced periodic review in 2016-2018, and to be included 2016-2018 Reliability Standards Development Plan.

- NERC's five-year periodic review template that was successfully employed for number of standards in 2013 and 2014 has been revised and adapted to include quality and content questions developed by the

[12] Steady state as set forth in the 2014-2016 Reliability Standards Development Plan and 2014-2016 Standards Committee Strategic Work Plan is a set of clear, concise, high quality and technically sound Reliability Standards that are results-based, while retiring requirements that do little to promote reliability.

Independent Expert Review Panel not already included. The template was further adapted to eliminate duplicative questions, and to provide the cross-functional review team with a clear framework to conduct the periodic reviews. A new question was added to consider whether the applicability section or requirements can be revised for smaller entities, provided that there is technical justification to support tailoring the applicability.

- A dashboard will be developed for each reviewed Standard indicating whether it has a score of Green, Yellow, or Red, according to the following grading system:
  - Green = no quality and content changes needed – Standard confirmed as steady state;
  - Yellow = quality and content issues identified, but those identified are not sufficient to justify revising Standard at this time – i.e., continue to monitor; and
  - Red = Standard needs to be revised to address identified quality and content issues.

- Standards graded as "Red" by the cross-functional review team will be revised consistent with applicable sections of the Standards Processes Manual.

In 2015, the cross-functional Review Team appointed by the Standards Committee will prioritize families or groups of standards for review in 2015 and beyond. As resources permit, reviews of standards may begin in 2015.

Appendix 1 – New Projects for 2015

Project 2015-01 TPL Directives

Total: 2

This project will address two directives and consider other improvements to TPL-001-4 -- Transmission System Planning Performance Requirements.

Order 678:

- Para 40 - Direct NERC to modify Reliability Standard TPL-001-4 to address the concern that the six month threshold could exclude planned maintenance outages of significant facilities from future planning assessments.
- Para 89 - Directs NERC to consider a similar spare equipment strategy for stability analysis upon the next review cycle of Reliability Standard TPL-001-4.

Project 2015-02 Periodic Review of EOP-004, EOP-005, EOP-006 and EOP-008

Total: 1

This periodic review project will review four EOP standards for which the review was delayed to allow the ERO and industry to gain compliance experience with revisions to the standards that became enforceable in 2013 and early 2014. The review team will also consider one directive and, as part of its recommendation on EOP-006, recommend whether a guideline should be developed.

Order 749:

- Para 24 - (EOP-006) once the standard is effective, if industry determines that ambiguity with the term arises, it would be appropriate for NERC to consider its proposal to develop a guideline to aid entities in their compliance obligations.

Project 2015-03 Periodic Review of System Operating Limit Standards (FAC-010, -011, and -014)

Total: 0

The three NERC Standards in this periodic review project concern methodologies for determining and communicating System Operating Limits. In 2013, a five-year review team (FYRT) assigned to review the FAC family of standards recommended review of these three standards be delayed until shortly after approval of the TPL, TOP, and IRO standards, which were pending regulatory approval at the time of the FAC five-year review. TPL-001-4 was approved by FERC in October 2013; the TOP and IRO standards are being revised in 2014 for filing with applicable regulators in early 2015.

Project 2015-04 Alignment of Definitions in *Glossary of Terms used in NERC Reliability Standards* and NERC *Rules of Procedure*, Appendix 2

Total: 0

This project will review the NERC *Glossary of Terms Used in Reliability Standards* (Glossary) to determine what changes are necessary to align the Glossary definitions with definitions of the same terms used in the NERC Rules of Procedure, Appendix 2.

Periodic Review Template: [Insert Standard Number/Name]
Updated April, 2014

Introduction

The North American Electric Reliability Corporation (NERC) is required to conduct a periodic review of each NERC Reliability Standard at least once every ten years, or once every five years for Reliability Standards approved by the American National Standards Institute as an American National Standard.[1] The Reliability Standard identified below has been included in the current cycle of periodic reviews. The Review Team shall consist of two subgroups, a standing review team which is appointed annually by the Standards Committee for periodic reviews, and a stakeholder SME team, solicited and appointed by the Standards Committee for expertise specific to the standards being reviewed. The standing review team will be comprised of the chairs of the Standards Committee, (Operating Committee and Planning Committee for non CIP-Standards and CIPC for CIP cyber security Standards), NERC management of Standards and RAPA, and NERC SMEs familiar with the Standard(s) to be reviewed. Together, the standing review team and SME stakeholder team is the Review Team for a particular periodic review project.

The Review Team will use the background information and the questions below, along with any associated worksheets or reference documents, to guide a comprehensive review that results in a recommendation from one of the following three choices:

1. Recommend reaffirming the Standard as steady state (Green); or
2. Recommend that the standard could be revised, but revisions are not necessary for reliability (Yellow); or
3. Recommend that the standard needs revision or retirement (Red).,

If the team recommends a revision to or a retirement of the Reliability Standard, it must also submit a Standard Authorization Request (SAR) outlining the proposed scope and technical justification for the revision or retirement.

A completed Periodic Review Template and any associated documentation should be submitted by email to [insert NERC contact for project].

[1] NERC Standard Processes Manual 45 (2013), posted at http://www.nerc.com/pa/Stand/Documents/Appendix_3A_StandardsProcessesManual.pdf.

Applicable Reliability Standard: standard and version
Team Members (include name and organization): 1. name, Company 2. name (Standard Developer)
Date Review Completed:

Background Information *(to be completed initially by NERC staff)*

1. Are there any outstanding Federal Energy Regulatory Commission (FERC) directives associated with the Reliability Standard? (*If so, NERC staff will attach a list of the directives with citations to associated FERC orders for inclusion in a SAR.)*

   ☐ Yes

   ☐ No

2. Have stakeholders requested clarity on the Reliability Standard in the form of an Interpretation (outstanding, in progress, or approved) or Compliance Application Notice (CAN) (outstanding, in progress, or approved)? (*If there are, NERC staff will include a list of the Interpretation(s), CAN(s), or other stakeholder-identified issue(s) that apply to the Reliability Standard*.)

   ☐ Yes

   ☐ No

   Please explain:

3. Is the Reliability Standard one of the most violated Reliability Standards? If so, does the cause of the frequent violation appear to be a lack of clarity in the language?

   ☐ Yes

   ☐ No

   Please explain:

Questions for the Review Team

If NERC staff answered "Yes" to any of the questions above, the Reliability Standard probably requires revision. The questions below are intended to further guide your review. Some of the questions reference documents provided by NERC staff as indicated in the Background questions above.

I. Quality

1. **Reliability Need, Paragraph 81:** Does one or more of the requirements in the Reliability Standard meet criteria for retirement or modification based on Paragraph 81 concepts? *Use Attachment 2: Paragraph 81 Criteria to make this determination.*

   ☐ Yes

   ☐ No

   Please summarize your application of Paragraph 81 Criteria, if any:

2. **Clarity:** From Background Information section of this template, has the Reliability Standard been the subject of an Interpretation, CAN, or issue associated with it, or is frequently violated because of ambiguity?
   a. Does the Reliability Standard have obviously ambiguous language?
   b. Does the Reliability Standards have language that requires performance that is not measurable?
   c. Are the requirements consistent with the purpose of the Reliability Standard?
   d. Does the requirement align with the purpose?
   e. Should the requirement stand alone as is or should it be consolidated with other standards?
   f. Is it complete and self-contained?
   g. Does it use consistent terminology?

   ☐ Yes

   ☐ No

   Please summarize your assessment:

3. **Definitions**: Do any of the defined terms used within the Reliability Standard need to be refined?

   ☐ Yes

   ☐ No

   Please explain:

4. **Compliance Elements:** Are the compliance elements associated with the requirements (Measures, Data Retention, Violation Risk Factors (VRF), and Violation Severity Levels (VSL)) consistent with the direction of the Reliability Assurance Initiative and FERC and NERC guidelines?

   ☐ Yes

   ☐ No

   If you answered "No," please identify which elements require revision, and why:

5. **Consistency with Other Reliability Standards:** Does the Reliability Standard need to be revised for formatting and language consistency among requirements within the Reliability Standard or consistency with other Reliability Standards?

   ☐ Yes

   ☐ No

   If you answered "Yes," please describe the changes needed to achieve formatting and language consistency:

6. **Changes in Technology, System Conditions, or other Factors:** Does the Reliability Standard need to be revised to account for changes in technology, system conditions, or other factors?

   ☐ Yes

   ☐ No

   If you answered "Yes," please describe the changes and specifically what the potential impact is to reliability if the Reliability Standard is not revised:

7. **Practicable**:
   a. Can the Reliability Standard be practically implemented?

      ☐ Yes

      ☐ No

   b. Is there a concern that it is not cost effective as drafted?

      ☐ Yes

      ☐ No

   Please summarize your assessment of the practicability of the standard:

8. **Consideration of Generator Interconnection Facilities:** Is responsibility for generator interconnection Facilities appropriately accounted for in the Reliability Standard?

   ☐ Yes

   ☐ No

   Guiding Questions:

   a. If the Reliability Standard is applicable to GOs/GOPs, is there any ambiguity about the inclusion of generator interconnection Facilities? (If generation interconnection Facilities could be perceived to be excluded, specific language referencing the Facilities should be introduced in the Reliability Standard.)

   b. If the Reliability Standard is not applicable to GOs/GOPs, is there a reliability-related need for treating generator interconnection Facilities as transmission lines for the purposes of this Reliability Standard? (If so, GOs and GOPs that own or operate relevant generator interconnection Facilities should be explicit in the applicability section of the Reliability Standard.)

9. **Results Based Standard:** Is the Reliability Standards drafted as a results-based standard (RBS) requirement (performance, risk (prevention) or capability) and does it follow the RBS format (e.g., sub-requirement structure? (*See Attachment 1: Results-based Standards*)

   ☐ Yes

   ☐ No

   If not, please summarize your assessment:

II. Content

10. **Technical accuracy:** Is the content of the Requirements technically correct, including identifying who does what and when?

    ☐ Yes

    ☐ No

    If not, please summarize your assessment:

11. **Functional Model:** Are the correct functional entities assigned to perform the requirements, consistent with the Functional Model?

    ☐ Yes

    ☐ No

    If not, please summarize your assessment:

12. **Applicability:** Is there a technical justification for revising the applicability of the Reliability Standard, or specific requirements within the standard, to account for differences in reliability risk?

    ☐ Yes

    ☐ No

    If so, please summarize your assessment:

13. **Reliability Gaps:** Are the appropriate actions, for which there should be accountability, included or is there a gap?

    ☐ Yes

    ☐ No

    If a gap is identified, please explain:

14. **Technical Quality:** Does the Reliability Standard have a technical basis in engineering and operations?

    ☐ Yes

    ☐ No

    If not, please summarize your assessment:

15. **Does the Reliability Standard reflect a higher solution than the lowest common denominator?**

    ☐ Yes

    ☐ No

    If not, please summarize your assessment:

RED, YELLOW GREEN GRADING

Using the questions above, the Review Team shall come to a consensus on whether the Standard is Green – i.e., affirm as steady state; Yellow – could be improved, but there is not a sufficient technical, content or quality issues to require revision at this time or Red but not necessary or Red – needs revision and thus a SAR should be developed to process the Standard through the Standards development process for revision. The reasons for the cross functional team conclusions of Green, Yellow, or Red shall be documented. If a consensus is not reached within the Review Team, minority reviews shall be posted for stakeholder comment, along with the majority opinion on whether the Standard is Green, Yellow or Red.

Recommendation

The answers to the questions above, along with its Red, Yellow, Green grading and the recommendation of the Review Team, will be posted for a 45-day comment period, and the comments publicly posted. The Review Team will review the comments to evaluate whether to modify its initial recommendation, and will document the final recommendation which will be presented to the Standards Committee.

Preliminary Recommendation (to be completed by the Review Team after its review and prior to posting the results of the review for industry comment):

- ☐ REAFFIRM (GREEN)
- ☐ REVISE (Indicate whether the revisions are necessary to support reliability (YELLOW), or discretionary (RED))
- ☐ RETIRE (RED)

Technical Justification *(If the Review Team recommends that the Reliability Standard be revised, a draft SAR may be included and the technical justification included in the SAR)*:

Preliminary Recommendation posted for industry comment (date):

Final Recommendation (to be completed by the Review Team after it has reviewed industry comments on the preliminary recommendation):

☐ REAFFIRM *(This should only be checked if there are no outstanding directives, interpretations or issues identified by stakeholders.) GREEN*

☐ REVISE RED

☐ RETIRE RED

Technical Justification *(If the Review Team recommends that the Reliability Standard be revised, a draft SAR may be included and the technical justification included in the SAR)*:

Date submitted to Standards Committee:

Attachment 1: Results-Based Standards

Question 9 for the Review Team asks if the Reliability Standard is results-based. The information below will be used by the Review Team in making this determination.

Transitioning the current body of standards into a clear, concise, and effective body will require a comprehensive application of the RBS concept. RBS concepts employ a defense-in-depth strategy for Reliability Standards development where each requirement has a role in preventing system failures, and the roles are complementary and reinforcing. Reliability Standards should be viewed as a portfolio of requirements designed to achieve an overall defense-in-depth strategy and comply with the quality objectives identified in the resource document titled, "Acceptance Criteria of a Reliability Standard."

Accordingly, the Review Team shall consider whether the Reliability Standard contains results-based requirements with sufficient clarity to hold entities accountable without being overly prescriptive as to how a specific reliability outcome is to be achieved. The RBS concept, properly applied, addresses the clarity and effectiveness aspects of a standard.

A Reliability Standard that adheres to the RBS format should strive to achieve a portfolio of performance-, risk-, and competency-based mandatory reliability requirements that support an effective defense-in-depth strategy. Each requirement should identify a clear and measurable expected outcome, such as: a) a stated level of reliability performance, b) a reduction in a specified reliability risk, or c) a necessary competency.

a. **Performance-Based**—defines a particular reliability objective or outcome to be achieved. In its simplest form, a results-based requirement has four components: who, under what conditions (if any), shall perform what action, to achieve what particular result or outcome?

b. **Risk-Based**—preventive requirements to reduce the risks of failure to acceptable tolerance levels. A risk-based reliability requirement should be framed as: who, under what conditions (if any), shall perform what action, to achieve what particular result or outcome that reduces a stated risk to the reliability of the bulk power system?

c. **Competency-Based**—defines a minimum set of capabilities an entity needs to have to demonstrate it is able to perform its designated reliability functions. A competency-based reliability requirement should be framed as: who, under what conditions (if any), shall have what capability, to achieve what particular result or outcome to perform an action to achieve a result or outcome or to reduce a risk to the reliability of the bulk power system?

Additionally, each RBS-adherent Reliability Standard should enable or support one or more of the eight reliability principles listed below. Each Reliability Standard should also be consistent with all of the reliability principles.

1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.

2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.

3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.

4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained, and implemented.

5. Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of interconnected bulk power systems.

6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.

7. The reliability of the interconnected bulk power systems shall be assessed, monitored, and maintained on a wide-area basis.

8. Bulk power systems shall be protected from malicious physical or cyber attacks.

If the Reliability Standard does not provide for a portfolio of performance-, risk-, and competency-based requirements or consistency with NERC's reliability principles, NERC staff and the Review Team should recommend that the Reliability Standard be revised or reformatted in accordance with the RBS format.

Attachment 2: Paragraph 81 Criteria

The first question for the Review Team asks if one or more of the requirements in the Reliability Standard meet(s) criteria for retirement or modification based on Paragraph 81 concepts.[2] Use the Paragraph 81 criteria explained below to make this determination. Document the justification for the decisions throughout and provide them in the final assessment in the Periodic Review Template.

For a Reliability Standard requirement to be proposed for retirement or modification based on Paragraph 81 concepts, it must satisfy **both**: (i) Criterion A (the overarching criterion); and (ii) at least one of the Criteria B listed below (identifying criteria). In addition, for each Reliability Standard requirement proposed for retirement or modification, the data and reference points set forth below in Criteria C should be considered for making a more informed decision.

Criterion A (Overarching Criterion)

The Reliability Standard requirement requires responsible entities ("entities") to conduct an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.

Section 215(a) (4) of the United States Federal Power Act defines "reliable operation" as: "… operating the elements of the bulk power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cybersecurity incident, or unanticipated failure of system elements."

Criteria B (Identifying Criteria)

B1. Administrative

The Reliability Standard requirement requires responsible entities to perform a function that is administrative in nature, does not support reliability and is needlessly burdensome.

This criterion is designed to identify requirements that can be retired or modified with little effect on reliability and whose retirement or modification will result in an increase in the efficiency of the ERO compliance program. Administrative functions may include a task that is related to developing procedures or plans, such as establishing communication contacts. Thus, for certain requirements, Criterion B1 is closely related to Criteria B2, B3 and B4. Strictly administrative functions do not inherently negatively impact reliability directly and, where possible, should be eliminated or modified for purposes of efficiency and to allow the ERO and entities to appropriately allocate resources.

[2] In most cases, satisfaction of the Paragraph 81 criteria will result in the retirement of a requirement. In some cases, however, there may be a way to modify a requirement so that it no longer satisfies Paragraph 81 criteria. Recognizing that, this document refers to both options.

B2. Data Collection/Data Retention
These are requirements that obligate responsible entities to produce and retain data which document prior events or activities, and should be collected via some other method under NERC's rules and processes.

This criterion is designed to identify requirements that can be retired or modified with little effect on reliability. The collection and/or retention of data do not necessarily have a reliability benefit and yet are often required to demonstrate compliance. Where data collection and/or data retention is unnecessary for reliability purposes, such requirements should be retired or modified in order to increase the efficiency of the ERO compliance program.

B3. Documentation
The Reliability Standard requirement requires responsible entities to develop a document (*e.g.,* plan, policy or procedure) which is not necessary to protect reliability of the bulk power system.

This criterion is designed to identify requirements that require the development of a document that is unrelated to reliability or has no performance or results-based function. In other words, the document is required, but no execution of a reliability activity or task is associated with or required by the document.

B4. Reporting
The Reliability Standard requirement obligates responsible entities to report to a Regional Entity, NERC or another party or entity. These are requirements that obligate responsible entities to report to a Regional Entity on activities which have no discernible impact on promoting the reliable operation of the BES and if the entity failed to meet this requirement there would be little reliability impact.

B5. Periodic Updates
The Reliability Standard requirement requires responsible entities to periodically update (*e.g.,* annually) documentation, such as a plan, procedure or policy without an operational benefit to reliability.

This criterion is designed to identify requirements that impose an updating requirement that is out of sync with the actual operations of the BES, unnecessary, or duplicative.

B6. Commercial or Business Practice
The Reliability Standard requirement is a commercial or business practice, or implicates commercial rather than reliability issues.

This criterion is designed to identify those requirements that require: (i) implementing a best or outdated business practice or (ii) implicating the exchange of or debate on commercially sensitive information while doing little, if anything, to promote the reliable operation of the BES.

B7. Redundant
The Reliability Standard requirement is redundant with: (i) another FERC-approved Reliability Standard requirement(s); (ii) the ERO compliance and monitoring program; or (iii) a governmental regulation (*e.g.,* Open Access Transmission Tariff, North American Energy Standards Board ("NAESB"), etc.).

This criterion is designed to identify requirements that are redundant with other requirements and are, therefore, unnecessary. Unlike the other criteria listed in Criterion B, in the case of redundancy, the task or activity itself may contribute to a reliable BES, but it is not necessary to have two duplicative requirements on the same or similar task or activity. Such requirements can be retired or modified with little or no effect on reliability and removal will result in an increase in efficiency of the ERO compliance program.

Criteria C (Additional data and reference points)
Use the following data and reference points to assist in the determination of (and justification for) whether to proceed with retirement or modification of a Reliability Standard requirement that satisfies both Criteria A and B:

C1. Was the Reliability Standard requirement part of a FFT filing?
The application of this criterion involves determining whether the requirement was included in a FFT filing.

C2. Is the Reliability Standard requirement being reviewed in an ongoing Standards Development Project?
The application of this criterion involves determining whether the requirement proposed for retirement or modification is part of an active Standards Development Project, with consideration for the status of the project. If the requirement has been approved by Registered Ballot Body and is scheduled to be presented to the NERC Board of Trustees, in most cases it will not need to be addressed in the periodic review. The exception would be a requirement, such as the Critical Information Protection (CIP) requirements for Version 3 and 4, that is not due to be retired for an extended period of time. Also, for informational purposes, whether the requirement is included in a future or pending Standards Development Project should be identified and discussed.

C3. What is the VRF of the Reliability Standard requirement?
The application of this criterion involves identifying the VRF of the requirement proposed for retirement or modification, with particular consideration of any requirement that has been assigned as having a Medium or High VRF. Also, the fact that a requirement has a Lower VRF is not dispositive that

it qualifies for retirement or modification. In this regard, Criterion C3 is considered in light of Criterion C5 (Reliability Principles) and C6 (Defense in Depth) to ensure that no reliability gap would be created by the retirement or modification of the Lower VRF requirement. For example, no requirement, including a Lower VRF requirement, should be retired or modified if doing so would harm the effectiveness of a larger scheme of requirements that are purposely designed to protect the reliable operation of the BES.

C4. In which tier of the most recent Actively Monitored List (AML) does the Reliability Standard requirement fall?
The application of this criterion involves identifying whether the requirement proposed for retirement or modification is on the most recent AML, with particular consideration for any requirement in the first tier of the AML.

C5. Is there a possible negative impact on NERC's published and posted reliability principles?
The application of this criterion involves consideration of the eight following reliability principles published on the NERC webpage.

Reliability Principles
NERC Reliability Standards are based on certain reliability principles that define the foundation of reliability for North American bulk power systems. Each reliability standard shall enable or support one or more of the reliability principles, thereby ensuring that each standard serves a purpose in support of reliability of the North American bulk power systems. Each reliability standard shall also be consistent with all of the reliability principles, thereby ensuring that no standard undermines reliability through an unintended consequence.

Principle 1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.

Principle 2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.

Principle 3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.

Principle 4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained, and implemented.

Principle 5. Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of interconnected bulk power systems.

Principle 6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.

Principle 7. The reliability of the interconnected bulk power systems shall be assessed, monitored, and maintained on a wide-area basis.

Principle 8. Bulk power systems shall be protected from malicious physical or cyber attacks. (footnote omitted).

C6. Is there any negative impact on the defense in depth protection of the BES?
The application of this criterion considers whether the requirement proposed for retirement or modification is part of a defense in depth protection strategy. In order words, the assessment is to verify whether other requirements rely on the requirement proposed for retirement or modification to protect the BES.

C7. Does the retirement or modification promote results or performance based Reliability Standards?
The application of this criterion considers whether the requirement, if retired or modified, will promote the initiative to implement results- and/or performance-based Reliability Standards.

Attachment 3: Independent Expert Evaluation Process

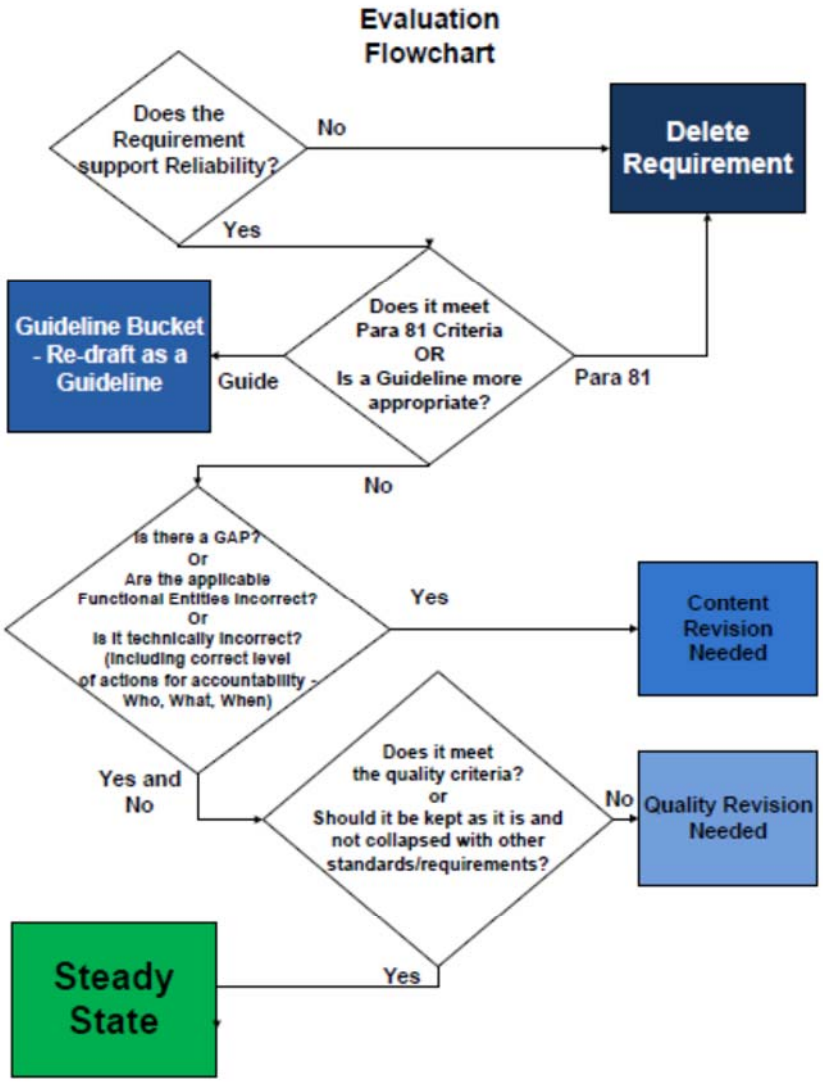

Figure 1: Evaluation Flow Chart

Background: Enhanced Period review for 2016, 2017 metric

At the February 6, 2014 Board of Trustees (Board) meeting, the Board requested that NERC management and the leadership of the Standards Committee (SC) work together to develop a mutually acceptable metric for 2015-2017, including a content and quality grading system for the Reliability Standards as part of the metric. Jointly, the following approach was developed, which was endorsed by the SC on March 12, 2014, and, in summary form, adopted by Corporate Governance and Human Resources Subcommittee of the Board on March 20, 2014:

2014 and 2015 metric

> The metric for 2014 and 2015 focuses on ensuring certain Reliability Standard projects are timely completed. For 2014, the Standard projects are all high priority Standard projects, many with regulatory deadlines.

2016 and 2017 metric

> The implementation of an enhanced Reliability Standard periodic review for quality and content that takes into consideration the following issues: (1) folding the enhanced quality and content periodic review into the period review required by Section 13 of the Standards Processes Manual; (2) a quality and content review of the steady state Standards developed, considering the use of, or adaptation of, the 2013 Independent Expert Review Team's quality and content scoring system; (3) the formation of a cross-functional task force to conduct, periodic reviews of steady state Reliability Standards, potentially consisting of Committee chairs, NERC management, NERC and stakeholder subject matter experts (all task force meetings shall be open to the public); (4) the task force to use the quality and content system developed in response to 2), above, to identify needed enhancements to steady state standards for inclusion in a Standards Authorization Request (SAR) processed through the standards development process and completed within a year from the date of posting of the SAR, unless technical review and study is needed (To the extent possible, the inclusion of identified enhancements in a SAR shall be limited focusing enhancements rather than re-opening an entire Standard(s); and (5) the development of an annual task force review timeline starting with the cross-functional task force being operational no later than mid-2015, so it can identify which standards will undergo the enhanced period review for inclusion in the 2016-2018 Reliability Standards Development Plan.

The above summary of the metric approach shows a focus on the completion of transforming NERC's Reliability Standards to a steady state by the end of 2015,[1] and, thereafter, the initiation of an enhanced periodic review to address quality and content issues related to the steady state Reliability Standards. It is contemplated that approximately 25 percent of the steady state Reliability Standards will undergo the enhanced period review in 2016, and another 25 percent in 2017.

[1] Steady state as set forth in the 2014-2016 Reliability Standards Development Plan and 2014-2016 Standards Committee Strategic Work Plan is a set of clear, concise, high quality and technically sound Reliability Standards that are results-based, while retiring requirements that do little to promote reliability.

At its March meeting, the SC appointed a periodic review development team (consisting of the SC Executive Committee and the Project Management and Oversight and Process Subcommittees chairs) to work with NERC Staff and Legal to develop the attributes of the enhanced quality and content periodic review. This team developed an approach to address the Board's direction summarized below and set forth in the attached template, along with a stakeholder comment form. The approach has been preliminarily reviewed by the SC and approved for posting for stakeholder comment. Based on stakeholder comments, the SC will consider if the proposed approach should be enhanced, prior to its endorsement and requesting NERC's Board consideration.

Summary of draft enhanced periodic review approach

- The enhanced periodic review approach will satisfy NERC's obligations under Section 13 of the Standard Processes Manual, and will be conducted in accordance with that section.

- The SC shall appoint a standing cross-functional team including NERC staff and the NERC standing committee representatives to work with the Section 13 *"review team of subject matter experts."* This team will be appointed by the SC, who will review and adopt the results of the team's deliberations.

- The cross-functional team shall be operational no later than beginning of 2015 making recommendations to the SC on the Reliability Standards that should undergo the enhanced periodic review in 2016-2018, and to be included 2016-2018 Reliability Standards Development Plan.

- NERC's five-year periodic review template that was successfully employed for number of standards in 2013 and 2014 has been revised and adapted to include quality and content questions developed by the Independent Expert Review Panel not already included. The template was further adapted to eliminate duplicative questions, andto provide the cross-functional review team with a clear framework to conduct the periodic reviews.

    - A new question was added to consider whether the applicability section or requirements can be revised for smaller entities, provided that there is technical justification to support the enhanced applicability.

    - A dashboard will be developed for each reviewed Standard indicating if whether it has a score of Green, Yellow or Red Green, according to the following grading system:
        - Green = no quality and content changes needed – Standard confirmed as steady state;
        - Yellow = quality and content issues identified, but those identified are not sufficient to justify revising Standard at this time – i.e., continue to monitor; and
        - Red = Standard needs to be revised to address identified quality and content issues.

- Standards graded as "Red" by the cross-functional review team will be revised consistent with applicable sections of the Standards Processes Manual.

Background Information for Draft Enhanced Periodic Review Process

At the February 6, 2014 Board of Trustees (Board) meeting, the Board requested that NERC management and the leadership of the Standards Committee (SC) work together to develop a mutually acceptable metric for 2015-2017, including a content and quality grading system for the Reliability Standards as part of the metric. Jointly, the following approach was developed, which was endorsed by the SC on March 12, 2014 and, in summary form, adopted by Corporate Governance and Human Resources Subcommittee of the Board on March 20, 2014:

2014 and 2015 metric

The metric for 2014 and 2015 focuses on ensuring certain Reliability Standard projects are timely completed. For 2014, the Standard projects are all high priority Standard projects, many with regulatory deadlines.

2016 and 2017 metric

The implementation of an enhanced Reliability Standard periodic review for quality and content that takes into consideration the following issues: (1) folding the enhanced quality and content periodic review into the period review required by Section 13 of the Standards Processes Manual; (2) a quality and content review of the steady state Standards developed, considering the use of, or adaptation of, the 2013 Independent Expert Review Team's quality and content scoring system; (3) the formation of a cross-functional task force to conduct, periodic reviews of steady state Reliability Standards, potentially consisting of Committee chairs, NERC management, NERC and stakeholder subject matter experts (all task force meetings shall be open to the public); (4) the task force to use the quality and content system developed in response to 2), above, to identify needed enhancements to steady state standards for inclusion in a Standards Authorization Request (SAR) processed through the standards development process and completed within a year from the date of posting of the

SAR, unless technical review and study is needed (to the extent possible, the inclusion of identified enhancements in a SAR shall be limited focusing enhancements rather than re-opening an entire Standard(s)); and (5) the development of an annual task force review timeline starting with the cross-functional task force being operational no later than mid-2015, so it can identify which standards will undergo the enhanced period review for inclusion in the 2016-2018 Reliability Standards Development Plan.

The above summary of the metric approach shows a focus on the completion of transforming NERC's Reliability Standards to a steady state by the end of 2015[1] and, thereafter, the initiation of an enhanced periodic review to address quality and content issues related to the steady state Reliability Standards. It is contemplated that approximately 25 percent of the steady state Reliability Standards will undergo the enhanced period review in 2016, and another 25 percent in 2017.

At its March meeting, the SC appointed a periodic review development team (consisting of the SC Executive Committee and the Project Management and Oversight and Process Subcommittees chairs) to work with NERC Staff and Legal to develop the attributes of the enhanced quality and content periodic review. This team developed an approach to address the Board's direction summarized below and set forth in the attached template, along with a stakeholder comment form. The approach has been preliminarily reviewed by the SC and approved for posting for stakeholder comment. Based on stakeholder comments, the SC will consider if the proposed approach should be enhanced prior to its endorsement and requesting NERC's Board consideration.

Summary of draft enhanced periodic review approach:

- The enhanced periodic review approach will satisfy NERC's obligations under Section 13 of the Standard Processes Manual, and will be conducted in accordance with that section.
- The SC shall appoint a standing cross-functional team including NERC staff and the NERC standing committee representatives to work with the Section 13 *"review team of subject matter experts."* This team will be appointed by the SC, who will review and adopt the results of the team's deliberations.
- The cross-functional team shall be operational no later than beginning of 2015, making recommendations to the SC on the Reliability Standards that should undergo the enhanced periodic review in 2016-2018 and to be included 2016-2018 Reliability Standards Development Plan.
- NERC's five-year periodic review template that was successfully employed for number of standards in 2013 and 2014 has been revised and adapted to include quality and content questions developed by the Independent Expert Review Panel not already included. The template was further adapted to eliminate duplicative questions, and to provide the cross-functional review

[1] Steady state as set forth in the 2014-2016 Reliability Standards Development Plan and 2014-2016 Standards Committee Strategic Work Plan is a set of clear, concise, high quality and technically sound Reliability Standards that are results-based, while retiring requirements that do little to promote reliability.

team with a clear framework to conduct the periodic reviews. A new question was added to consider whether the applicability section or requirements can be revised for smaller entities, provided that there is technical justification to support the enhanced applicability.

- A dashboard will be developed for each reviewed Standard indicating if whether it has a score of Green, Yellow or Red, according to the following grading system:
  - Green = no quality and content changes needed – Standard confirmed as steady state;
  - Yellow = quality and content issues identified, but those identified are not sufficient to justify revising Standard at this time – i.e., continue to monitor; and
  - Red = Standard needs to be revised to address identified quality and content issues.
- Standards graded as "Red" by the cross-functional review team will be revised consistent with applicable sections of the Standards Processes Manual.

You do not have to answer all questions. Enter comments in simple text format. Bullets, numbers, and special formatting will not be retained.

Questions

1. In order to provide both consistency in the approach to reviewing standards, as well as adequate subject matter expertise to thoroughly review specific standards, it is proposed the cross functional team reviewing and grading standards be comprised of the following: (i) a standing team made up of the Chairs of the Standards, Operating and Planning Committees (and CIPC for CIP Standards), and NERC's executive management of the Standards and RAPA groups; (ii) supplemented according to the standards being reviewed with specific subject matter experts (SMEs), including both stakeholder SMEs solicited by the standing team and NERC SMEs as assigned by NERC management.

   Do you agree with the composition of the cross functional review team? If not, please explain and suggest an alternative.

   ☐ Yes
   ☐ No
   Comments:

2. In 2013, representatives of the Standards Committee worked with NERC staff to develop a template to be used by five-year review teams. The template contained questions to ensure that review teams followed a consistent approach in reviewing standards and appendices for referencing the criteria developed by the Paragraph 81 standard drafting team to be used for

evaluating whether requirements should be retired because they do not contribute significantly to reliability. This template has been revised for use by the above-mentioned cross-functional review team, and is posted along with this comment form.

Do you agree with the questions in the template? If there are additional questions you believe should be added, please provide them in your comments.

☐ Yes
☐ No
Comments:

3. Do you agree with the grading system using Green, Yellow, and Red? If not, please explain and suggest improvements.

   ☐ Yes
   ☐ No
   Comments:

4. Do you believe that a question related to the cost effectiveness of the standard should be added to the template as a way to institutionalize considerations of cost effectiveness?

   ☐ Yes
   ☐ No
   Comments:

5. Are there any other comments you have on the template?

   ☐ Yes
   ☐ No
   Comments:

6. Chapter 4 of the 2013 Independent Experts' report recommends consolidating approximately 25 requirements and regrouping some requirements into a New Construct for clarity and simplification. NERC Staff and the Standards Committee is interested in whether you believe that consolidating and regrouping some of the requirements, either as recommended by the Independent Experts' or with modifications to the New Construct suggestion, would be beneficial? If you answered yes, please indicate in your comments whether the New Construct should be considered during the periodic reviews of standards or, if not, indicate when and how the New Construct should be initiated.

☐ Yes
☐ No
Comments:

7. If you have any other comments on the enhanced approach to periodic reviews that you haven't already mentioned above, please provide them here:

Background Information for Draft 2015-2017 Reliability Standards Development Plan

The 2015-2017 Reliability Standards Development Plan (2015-2017 RSDP) is another bold step toward transforming the NERC Reliability Standards. During 2015, the NERC Reliability Standards will reach Steady-State[2] and the number of active projects will dramatically decrease. Concurrently, to begin the final transition in the transformation process, the industry-endorsed criteria for evaluating the content and quality of standards will be applied to standards or standard families during enhanced periodic reviews, focused on continuous improvement.

With the support from the Standards Committee and industry stakeholders, NERC Reliability Standards have made great strides over the last two years. By the end of 2015, the majority of the Paragraph 81 candidates,[3] the Independent Expert Review Panel's (IERP) recommendations for requirement retirement, and Federal Energy Regulatory Commission (FERC) directives issued prior to December 2012 will be addressed. Projects that were languishing for years, as well as five-year reviews will be completed. The industry will also have completed large projects to respond to FERC orders, including, for example, Geomagnetic Disturbances, CIP Version 5 Revisions, and CIP-014 Physical Security, revised the TOP and IRO standards to address concerns identified in FERC's proposed remand, and will have addressed the majority of FERC directives issued after December 2012. This is a significant achievement – the Standards Committee worked diligently with NERC to determine project schedules and manage industry workload. Stakeholders engaged throughout North America to provide expertise during standard development ensuring projects could reach completion.

Now, in the 2015-2017 RSDP, the number of projects necessary to reach Steady-State by 2015 is reduced and the pace of the work will likely become more deliberate. Six projects that began during 2014 will be completed in 2015, while four new projects will be initiated in 2015, with one focused on aligning the Glossary of Terms used in NERC Reliability Standards with the Definitions used in the Rules of Procedure (Rules of Procedure, Appendix 2). This reduction in planned projects provides a bandwidth for projects

[2] As stated in the 2014-2016 RSDP and 2014-2016 Standards Committee Strategic Work Plan, Steady State means a set of clear, concise, high quality and technically sound Reliability Standards that are results-based, while retiring requirements that do little to promote reliability.
[3] There are 6 P81 candidates that will be addressed during the enhanced periodic reviews, starting in 2016.

required to respond to emerging risks, if any, to reliability, establish a quality and content enhanced periodic review, as well as any new FERC orders or directives. Also, given the increased focus on quality during the standard development process as well as active engagement of FERC Office of Electric Reliability staff during the standards development process, FERC directives and orders on existing standards are expected to trend lower.

Arriving to Steady-State provides an opportunity for critical assessment of the existing reliability standards through enhanced periodic reviews, and following the reviews to implement recommendations for quality, content, or alignment with other standards using industry-developed criteria,[4] building on the foundation established by the IERP.[5] Over the last 7 years, the Electric Reliability Organization (ERO) and industry have gained experience in understanding the characteristics of quality, results-based standards, while targeting their applicability based on risk to achieve a reliability benefit without creating undue burden on industry.

Questions

8. For the 2015-2017 RSDP, are there any outstanding reliability gaps or issues that are not addressed by the existing Standard projects that you believe need to be addressed by a new Standard project?

   ☐ Yes
   ☐ No
   Comments:

9. Do you agree with the prioritization ranking (high, medium, low) of the 2015 projects?

   ☐ Yes
   ☐ No
   Comments:

10. Please provide any other comments you have on the 2015-2017 RSDP.

    Comments:

[4] The Independent Experts developed criteria is described in their final report, Standards Independent Experts Review Project, however this criteria was not vetted with industry.

[5] The North American Electric Reliability Corporation (NERC) retained five industry experts to independently review the NERC Reliability Standards, setting the foundation for a plan that will result in a set of clear, concise and sustainable body of Reliability Standards. The primary scope was an assessment of the content and quality of the Reliability Standards, including identification of potential Bulk-Power System (BPS) risks that were not adequately mitigated.

Agenda Item 6
Standards Committee
May 14, 2014

SC Meetings in 2015

Action

Approve Brenda Hampton to work with NERC Staff on developing the meeting schedule (including locations of face-to-face meetings) for 2015 and present a mutually acceptable (Brenda and her team/NERC Staff) proposal to the Standards Committee for approval no later than its October 2014 call. Brenda will also seek out other interested Standards Committee members to work with her and NERC Staff on this matter.

Background

Brenda Hampton volunteered to proactively work with NERC Staff to develop a mutually acceptable meeting schedule (including locations of face-to-face meetings) for 2015. It seems in the interest of Standards Committee and NERC Staff to have a small team of Standard Committee members work with Staff on this matter and present a joint proposal for the Committee's consideration.

Agenda Item 7
Standards Committee
May 14, 2014

Detail of Minutes, Re: Appointment of Drafting Teams

Action

Approve one of the following approaches to capturing the appointment of drafting teams in the meeting minutes of the Standards Committee:

1. Add a hot link in the minutes to the Standards project page where the roster of the drafting team is maintained;
2. Include the names and organizations of appointed drafting team in the minutes; or
3. Maintain the status quo: the minutes only indicate that a drafting team was appointed for a certain Standard project.

Background

David Kiguel, a former member of the Standards Committee, brought the issue to the Chair and would like the Committee to consider adopting Option 2 to provide for greater transparency of Standard Committee activities. The Chair of the Standards Committee has worked with David to provide the Committee with the above options to consider.

According to David, reasons and advantages for adopting Option 2 are:

- Once appointed by the Standards Committee, the list of Standard Drafting Team members is no longer confidential.
- Minutes should reflect the fully approved motion.
- Meeting minutes, as approved by the Standards Committee, are the sole authoritative source of Standards Committee decisions, avoiding possible transcript inaccuracies.
- Posting of the Standard Drafting Team roster document in the project page may experience delays.

Reliability Issues Steering Committee Triage Diagram

Action

Informational update only

In the first quarter of 2013, the Standards Committee (SC) and the Reliability Issues Steering Committee (RISC) endorsed the use of "GUIDELINES FOR NERC STANDARDS COMMITTEE COORDINATION WITH THE RELIABILITY ISSUES STEERING COMMITTEE," which included, among other provisions, the following:

- The SC and NERC Staff will request RISC to review and provide recommendations on the next year's draft RSDP.
- Any Standards Authorization Request ("SAR") or proposed Reliability Standard submitted to the SC that implicates or identifies a new or emerging reliability risk may be sent by the SC through the SC Chair to RISC for its review and comment.

In addition, in the fourth quarter of 2013, the SC and RISC endorsed a consensus building approach (Option C) that indicated that RISC was in the best positioned to triage new problem statements on reliability, including recommending the appropriate tool (guideline, criteria, alert, standard) to address the new problem statement on reliability.

In light of the above, and for its own purposes, RISC developed and endorsed the attached diagram that illustrates the following:

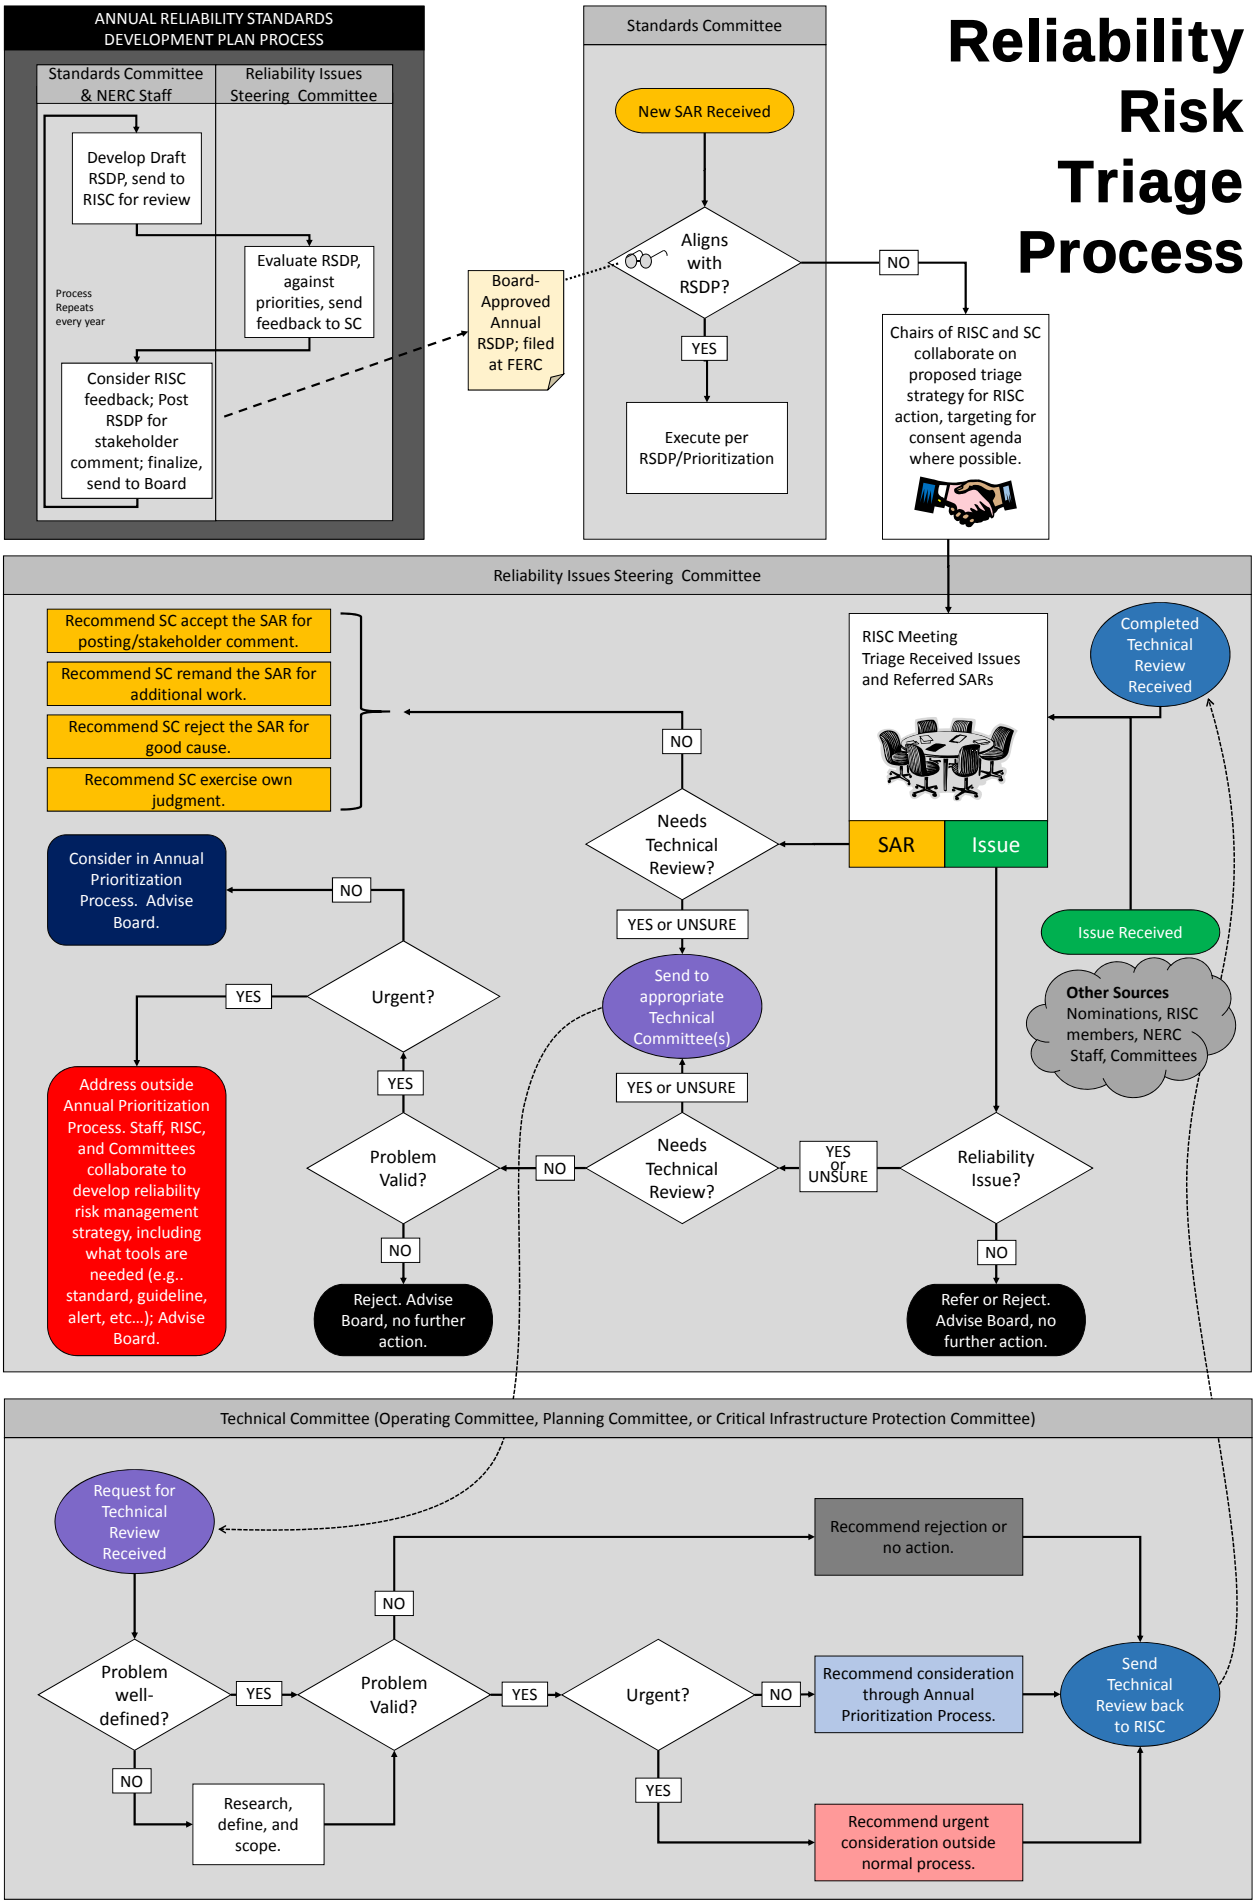
1. That it will review and provide recommendations on draft RSDPs, including recommendations on the need and prioritization for Standard projects (the same as it did in 2013);
2. That any Standard project that is identified in a Board of Trustees approved RSDP, the Standard project will not be reviewed by RISC when a SAR is drafted, posted, etc;
3. That if a SAR is submitted for a Standard project not identified in the approved RSDP, the Chair of the SC will request the SC's to endorse to invoke the following provision in Section 4.1 of the Standards processes Manual so that RISC may decide whether to review and make recommendations on the SAR:

   > SAR Delay action on the SAR pending one of the following: (i) development of a technical justification for the proposed project; or (ii) consultation with another NERC Committee to determine if there is another approach to addressing the issue raised in the SAR.

   If the SC endorses RISC review of a SAR, the Chair of the SC shall request the Chair of RISC to place it on RISC's next agenda for review and recommendations, which will likely include RISC requesting NERC technical committee input prior to RISC recommendations on the SAR.
4. How a new reliability problem statement on reliability issue can be presented to RISC via the technical committees or nominations.

The attached RISC diagram will be placed in the RISC handbook and used by RISC to guide the committee when presented with a SAR or a new problem statement on reliability issue.

Reliability Risk Triage Process



Process flow for new SARs, Nominations, Issues and problems identified by the technical committees during the course of their regular activities. Note that exceptions will be handled on an as-needed basis.

Update: Reaching Quorum for Standards Ballots

Action

Informational update only

In light of the recent challenges in reaching quorum at the end of the ballot period, the Standards Committee Process Subcommittee (SCPS) and NERC staff have been "exploring options to create and maintain an effective ballot pool and strategies to address situations where a quorum is not reached by the time a ballot period is scheduled to close." November 2013 SC Agenda item 13 (a) iii. Those efforts are ongoing. A report is being prepared for the June SC meeting detailing what NERC has done to date to address quorum issues, steps that are being executed for projects in the current standard balloting system and enhancements contained in the new standard balloting system that have the potential to improve reaching quorum. In the interim, the chair and vice chair of the Standards Committee (SC) have been assisting NERC Staff and sending emails asking voters who have not yet voted to vote. Also, NERC Staff will explore with the SCPS (and then the SC) the practicability and appropriateness of having voters voluntarily notify NERC when they join the ballot pool that in the event they fail to vote by the voting deadline that their vote should be recorded as an abstention.

Standards Committee Project Management Oversight Subcommittee (PMOS) Update

Action

None requested. Update Only.

Background

The PMOS met in person on April 17, 2014. The following items were discussed.

1. Per previous Standards Committee (SC) discussions, NERC Staff has added a column to the Project Tracking Spreadsheet to indicate whether a project is "consistent with the direction" of the Independent Experts Report. NERC Staff has populated the new column for each of the projects on the spreadsheet.
2. The PMOS Liaisons present provided a brief update on progress of assigned projects.
3. The role of the PMOS liaisons in participating in a Standard Drafting Team's response to stakeholder comments was discussed. The PMOS decided not to change or expand the liaison role for now.
4. Changes to the PMOS charter to conform to proposed changes to the Standards Committee Process Subcommittee (SCPS) charter were discussed. Any potential changes were put on hold pending further conversations between SC Leadership and the SCPS.
5. The SC Chair updated PMOS on the RISC Triage Diagram and will provide further updates at this SC meeting.
6. Finally, a schedule for future meetings was set: PMOS will meet at Xcel Energy in Denver, CO from 8 a.m. to 12 p.m. MST on June 10, 2014 and will meet at Bonneville Power Administration in Portland, OR from 8 a.m. to 12 p.m. PST on September 30, 2014.

Agenda Item 10b
Standards Committee
May 14, 2014

Standards Committee Process Subcommittee Membership

Action

Approve recommended slate of additional members.

Background

The Standards Committee Process Subcommittee (SCPS) has identified a need for new members. A solicitation for nominations was sent to the registered ballot body and the standards and NERC roster distribution lists. The SCPS Chair, Vice Chair, and NERC staff member reviewed the nominations and developed a slate of recommended additions to the roster. Both the current roster and the recommended additions are provided as supporting meeting documents. Two of the recommended additions are current Standards Committee (SC) members. They will provide the benefit of insight into SC views and direction. Two of the recommended additions are active SC and SCPS observers. These two members are familiar with the current work of the SC and SCPS, and have evidenced their ability to dedicate the time required to be active participants. The final recommended addition provides a fresh perspective due to not being an active SC or SCPS member or observer, and has also received positive recommendations from previous Standard Drafting Team work and Regional involvement.

Agenda Item 11
Standards Committee
May 14, 2014

Standards Committee Communications Updates and Activities

Action
Information only.

Background
Mallory Huggins of NERC Staff and Scott Miller will provide an update on NERC and Standards Committee communication activities in the last month, including plans for upcoming standards webinars and workshops.

NERC Legal and Regulatory Filings - Standards

Scheduled for BOT, May 2014 Projected Filing Date: Late-May 2014	Petition for Approval of Proposed Reliability Standards VAR-001-4 and VAR-002-3
Scheduled for BOT, May 2014 Projected Filing Date: June 5, 2014	Petition for Approval of Physical Security Standard

Standards Committee Expectations

Approved by Standards Committee January 12, 2012

Background

Standards Committee (SC) members are elected by members of their segment of the Registered Ballot Body, to help the SC fulfill its purpose. According to the Standards Committee Charter, the SC's purpose is:

> *In compliance with the NERC Reliability Standards Development Procedure, the Standards Committee manages the NERC standards development process for the North American-wide reliability standards with the support of the NERC staff to achieve broad bulk power system reliability goals for the industry. The Standards Committee protects the integrity and credibility of the standards development process.*

The purpose of this document is to outline the key considerations that each member of the SC must make in fulfilling his or her duties. Each member is accountable to the members of the Segment that elected them, other members of the SC, and the NERC Board of Trustees for carrying out their responsibilities in accordance with this document.

Expectations of Standards Committee Members

1. SC Members represent their segment, not their organization or personal views. Each member is expected to identify and use mechanisms for being in contact with members of the segment in order to maintain a current perspective of the views, concerns, and input from that segment. NERC can provide mechanisms to support communications if an SC member requests such assistance.

2. SC Members base their decisions on what is best for reliability and must consider not only what is best for their segment, but also what is in the best interest of the broader industry and reliability.

3. SC Members should make every effort to attend scheduled meetings, and when not available are required to identify and brief a proxy from the same segment. Standards Committee business cannot be conducted in the absence of a quorum, and it is essential that each Standards Committee make a commitment to being present.

4. SC Members should not leverage or attempt to leverage their position on the SC to influence the outcome of standards projects.

5. The role of the Standards Committee is to manage the standards process and the quality of the output, not the technical content of standards.

Standards Committee Meeting Dates and Locations for 2014

Face-to-face meetings are typically conducted from 1-5 p.m. on Tuesday and 8 a.m.-12 p.m. on Wednesday, except for the March 2014 face-to-face meeting, which will be held from 1-5 p.m. on Wednesday and 8 a.m.-12 p.m. on Thursday due to space availability. Also, the January 2014 meeting will be a half-day face-to-face meeting. Conference calls are held each month on a Wednesday from 1-5 p.m. Eastern where the SC does not have a face-to-face meeting. The time for face-to-face meetings is based on the 'local' time zone. The time specified for all conference calls is based on the Eastern time zone.

- January 15, 2014 – Atlanta, GA from 1-5 p.m.
- February 12, 2014 – conference call from 1-5 p.m.
- March 12-13, 2014 – Atlanta, GA (1-5 p.m. March 12; 8 a.m.-12 p.m. March 13) **(Wed.-Thurs.)**
- April 9, 2014 – conference call from 1-5 p.m.
- May 14, 2014 – conference call from 1-5 p.m.
- June 10-11, 2014 – Denver, CO (1-5 p.m. June 10; 8 a.m.-12 p.m. June 11)
- July 16, 2014 – conference call from 1-5 p.m.
- August 20, 2014 – conference call from 1-5 p.m.
- September 30, 2014- October 1, 2014 – Portland, OR (1-5 p.m. September 30; 8 a.m.-12 p.m. October 1)
- October 22, 2014 – conference call from 1-5 p.m.
- November 19, 2014 – conference call from 1-5 p.m.
- December 9-10, 2014 – Atlanta, GA (1-5 p.m. December 9; 8 a.m.-12 p.m. December 10)

The Standards Committee has two subcommittees (Project Management and Oversight Committee (PMOS) and Process Subcommittee (SCPS)) which will schedule face-to-face meetings in Atlanta and Portland and conference calls as they deem necessary. They may choose to meet the morning (8 a.m.-12 p.m.) of the first day of the Standards Committee's face-to-face meetings.

Standards Committee
2014 Segment Representatives

Segment and Term	Representative	Organization
Chairman **2014-15**	Brian Murphy Manager, NERC Reliability Standards	NextEra Energy, Inc.
Vice-chairman **2014-15**	Scott Miller Manager Regulatory Policy	MEAG Power
Segment 1-2013-14	Lou Oberski Managing Director, NERC Compliance Policy	Dominion Resources Services, Inc.
Segment 1-2014-15	Laura Lee Manager of ERO Support and Event Analysis, System Operations	Duke Energy
Segment 2-2013-14	Charles Yeung Executive Director Interregional Affairs	Southwest Power Pool
Segment 2-2014-15	Ben Li Consultant	Independent Electric System Operator
Segment 3-2013-14	Jennifer Sterling Director, Exelon NERC Compliance Program	Exelon
Segment 3-2014-15	Ron Parsons General Manager of Transmission Interconnections and Operations	Alabama Power Company
Segment 4-2013-14	Joseph Tarantino Regulatory Compliance Coordinator	Sacramento Municipal Utility District
Segment 4-2014-15	Frank Gaffney Assistant General Manager of and Officer of Regulatory Compliance	Florida Municipal Power Authority
Segment 5-2013-14	Gary Kruempel Compliance Director, Energy Supply	MidAmerican Energy Company

Segment and Term	Representative	Organization
Segment 5-2014-15	Randy Crissman Vice President – Technical Compliance	New York Power Authority
Segment 6-2013-14	Brenda Hampton Regulatory Policy	Energy Future Holdings – Luminant Energy Company LLC
Segment 6-2014-15	Andrew Gallo Director, Reliability Compliance	City of Austin dba Austin Energy
Segment 7-2013-14	John A. Anderson President & CEO	Electricity Consumers Resource Council
Segment 7-2014-15	Frank McElvain Senior Consulting Manager	Siemens Energy, Inc.
Segment 8-2013-14	Robert Blohm Managing Director	Keen Resources Asia Ltd.
Segment 8-2014-15	Frederick Plett Utility Analyst	Massachusetts Attorney General
Segment 9-2014	Klaus Lambeck Chief Facilities, Siting and Environmental Analysis	Public Utilities Commission of Ohio/the Ohio Power Siting Board
Segment 9-2014-15	Jason Woodruff Electrical Engineer	Public Utilities Commission of Nevada
Segment 10-2013-14	Steve Rueckert Director of Standards	Western Electricity Coordinating Council
Segment 10-2014-15	Guy Zito Assistant Vice President of Standards	Northeast Power Coordinating Council

Parliamentary Procedures

Based on Robert's Rules of Order, Newly Revised, 10th Edition, plus "Organization and Procedures Manual for the NERC Standing Committees"

Motions

Unless noted otherwise, all procedures require a "second" to enable discussion.

When you want to…	Procedure	Debatable	Comments
Raise an issue for discussion	Move	Yes	The main action that begins a debate.
Revise a Motion currently under discussion	Amend	Yes	Takes precedence over discussion of main motion. Motions to amend an amendment are allowed, but not any further. The amendment must be germane to the main motion, and can not reverse the intent of the main motion.
Reconsider a Motion already approved	Reconsider	Yes	Allowed only by member who voted on the prevailing side of the original motion.
End debate	Call for the Question *or* End Debate	Yes	If the Chair senses that the committee is ready to vote, he may say "if there are no objections, we will now vote on the Motion." Otherwise, this motion is debatable and subject to 2/3 majority approval.
Record each member's vote on a Motion	Request a Roll Call Vote	No	Takes precedence over main motion. No debate allowed, but the members must approve by 2/3 majority.
Postpone discussion until later in the meeting	Lay on the Table	Yes	Takes precedence over main motion. Used only to postpone discussion until later in the meeting.
Postpone discussion until a future date	Postpone until	Yes	Takes precedence over main motion. Debatable only regarding the date (and time) at which to bring the Motion back for further discussion.
Remove the motion for any further consideration	Postpone indefinitely	Yes	Takes precedence over main motion. Debate can extend to the discussion of the main motion. If approved, it effectively "kills" the motion. Useful for disposing of a badly chosen motion that can not be adopted or rejected without undesirable consequences.
Request a review of procedure	Point of order	No	Second not required. The Chair or secretary shall review the parliamentary procedure used during the discussion of the Motion.

Notes on Motions

Seconds. A Motion must have a second to ensure that at least two members wish to discuss the issue. The "seconder" is not recorded in the minutes. Neither are motions that do not receive a second.

Announcement by the Chair. The Chair should announce the Motion before debate begins. This ensures that the wording is understood by the membership. Once the Motion is announced and seconded, the Committee "owns" the motion, and must deal with it according to parliamentary procedure.

Voting

Voting Method	When Used	How Recorded in Minutes
Unanimous Consent	When the Chair senses that the Committee is substantially in agreement, and the Motion needed little or no debate. No actual vote is taken.	The minutes show "by unanimous consent."
Vote by Voice	The standard practice.	The minutes show Approved or Not Approved (or Failed).
Vote by Show of Hands (tally)	To record the number of votes on each side when an issue has engendered substantial debate or appears to be divisive. Also used when a Voice Vote is inconclusive. (The Chair should ask for a Vote by Show of Hands when requested by a member).	The minutes show both vote totals, and then Approved or Not Approved (or Failed).
Vote by Roll Call	To record each member's vote. Each member is called upon by the Secretary,, and the member indicates either "Yes," "No," or "Present" if abstaining.	The minutes will include the list of members, how each voted or abstained, and the vote totals. Those members for which a "Yes," "No," or "Present" is not shown are considered absent for the vote.

Notes on Voting

(Recommendations from DMB, not necessarily Mr. Robert)

Abstentions. When a member abstains, he is not voting on the Motion, and his abstention is not counted in determining the results of the vote. The Chair should not ask for a tally of those who abstained.

Determining the results. The results of the vote (other than Unanimous Consent) are determined by dividing the votes in favor by the total votes cast. Abstentions are not counted in the vote and shall not be assumed to be on either side.

"Unanimous Approval." Can only be determined by a Roll Call vote because the other methods do not determine whether every member attending the meeting was actually present when the vote was taken, or whether there were abstentions.

Majorities. Robert's Rules use a simple majority (one more than half) as the default for most motions. NERC uses 2/3 majority for all motions.

Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and subgroups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost information and participants' expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.
- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

- Any other matters that do not clearly fall within these guidelines should be reviewed with NERC's General Counsel before being discussed.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and subgroups) may have a negative impact on particular entities and thus in that sense adversely impact competition. Decisions and actions by NERC (including its committees and subgroups) should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation, Bylaws, and Rules of Procedure are followed in conducting NERC business.

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or subgroup, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on electricity markets, and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.

Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and employment matters; and procedural matters such as planning and scheduling meetings.

Draft Meeting Notes
Standards Committee Process Subcommittee

May 22, 2014 | 11:00 a.m.–1:00 p.m. ET

Conference Call with ReadyTalk Web Access

Administrative

1. **Introductions and Chair's Remarks**
   L. Lee brought the meeting to order on Thursday, May 22, 2014 at 11:02 a.m. ET. She welcomed the attendees and thanked them for their participation.

2. **NERC Antitrust Compliance Guidelines and Public Announcement**
   E. Chanzes reviewed the NERC Antitrust Compliance Guidelines and announced that the meeting was public.

3. **Approval of Meeting Notes from April 23, 2014 Conference Call**
   With the correction that the Standards Committee (SC) endorsed the Cost Effectiveness Analysis Process (CEAP) report for posting rather than approved the report for posting (Agenda item 2a), the meeting notes from the April 23, 2014 conference call were approved.

Agenda Items

1. **Update on Solicitation for New Members – L. Lee**
   L. Lee welcomed the five newly added members to the Standards Committee Process Subcommittee (SCPS), provided a brief overview of the subcommittee's processes and procedures, and asked new members to let a task group lead know if he or she is interested in being a part of that task group. L. Lee explained that these new members' terms would be for the 2014–2015 calendar years even though they were not added until mid-year. E. Chanzes noted that she would be adding each member's terms to the roster, and L. Lee asked all members to let her and E. Chanzes know if they plan to serve less than a two-year term.

   E. Chanzes will add each member's terms to the current SCPS roster.

2. **SCPS Activities**

   a. **Consolidate SC Resource Documents – G. Zito**
   G. Zito provided a brief history of this project for new members and reported that M. Benson has completed work on a "Resource Package" that will accompany the Drafting Team Reference Manual. This will be circulated to the SCPS for review prior to submitting the package to the SC for their July meeting.

   G. Zito will review the completed Resource Package and circulate to the SCPS for review.

   b. **Process to Improve the Effectiveness of Managing Ballot Pools – L. Lee**
   L. Lee provided a brief history on this project for the new members and reported that she has been working on an informational report to provide the SC for their June meeting. This report will explain the SCPS's current status on this task with respect to work with NERC staff to identify and communicate current NERC strategies for addressing issues with ballots achieving quorum. This includes what's been done to address issues in the past, what's being done currently, and anticipated improvements resulting from the roll-out of the new Standards Balloting System (SBS). The report will also include data points on recent ballots that failed to achieve quorum, and it will explain that the SCPS will be working with NERC staff to evaluate the results of the SBS enhancements and continued interim steps.

   L. Lee will finalize and circulate the informational report to the SCPS and submit for the June SC meeting.

   c. **Consensus Building and SAR Development – B. Li**
   B. Li provided a brief history on this task and reported that the task group met with NERC staff and agreed to the current scope doc with minor changes. The SCPS reviewed and agreed that the scope document was ready to submit to the SC for endorsement.

   B. Li will submit the scope document for the June SC meeting.

   d. **Review of Standards Processes and Procedures – J. Tarantino**
   J. Tarantino provided a brief history on this task and explained that the task group met with NERC staff and came to the conclusion that the SCPS should wait to fully launch this effort until active projects and Standards Process Manual (SPM) revisions have further matured. In the interim, informal outreach could be conducted to continue to identify standard development process issues. Looking forward, the plan would be to form a formal outreach plan to gather input on the standards development process during the first quarter of 2015, and then outreach would be implemented during the second quarter. This will hopefully converge with a more "steady state" of standards projects. It was also noted that NERC staff is in agreement with the scope document if there is the timing adjustment.

The SCPS agreed to provide the scope document with information about the new time frame to the SC for endorsement.

J. Tarantino will submit the scope document for the June SC meeting.

e. **Modify SC Quality Review (QR) Process – K. Porterfield (Added to agenda during meeting)**
The status of the work on the QR process was raised and added to the agenda. K. Porterfield and L. Lee explained that the SCPS had come to consensus during the April 23 call to move forward with submitting the task group's agreed-upon approach with NERC staff to the SC for endorsement. The proposal is that the NERC Coordination QR document can replace the QR process/template, provided that NERC staff commits to communicating the steps that were taken for QR prior to an initial posting. L. Lee explained that she is still working with B. Murphy to determine the best SC meeting for the discussion. Some SCPS members who had not been in attendance during the April 23 call requested to add this topic to the June SCPS meeting agenda for further discussion.

f. **CEAP Pilot – G. Zito (Added to agenda during meeting)**
G. Zito requested to provide an update on this task and it was added to the agenda. He noted that he had met with G. Cauley and M. Lauby about reworking the CEAP guidelines as necessary to move forward with applying CEAP to standards projects in 2014. He noted that the CEAP team is meeting at FRCC June 3–4 and that he would update the SCPS on the outcomes during the June SCPS meeting.

3. **Periodic Review Template – L. Lee (Added to agenda during meeting)**

A. Pusztai raised this topic and L. Lee requested that it be added to the agenda. L. Lee provided background, explaining that the "Enhanced Periodic Review" that was recently authorized for posting by the SC was a result of the development of a NERC company metric, which includes a focus on a periodic review after the end of 2015 to address quality and content issues related to the steady state of Reliability Standards. At its March meeting, the SC appointed the SC, SCPS, and PMOS chairs and NERC staff to develop the attributes of an enhanced quality and content periodic review. The result was the approach that was approved by the SC at its May meeting to be posted for stakeholder comment, which converges the existing five-year review process (now referred to as the periodic review) with an assessment of quality.

A. Pusztai noted that his concern was whether this process should have gone through the SCPS prior to going to the SC to authorize posting. It was explained that the Enhanced Periodic Review approach is a part of the 2015–2017 Reliability Standards Development Plan (RSDP), which follows the process of development by NERC staff, authorization by the SC to post for stakeholder comments, and then SC approval.

5. **Communication with Industry – L. Lee**
   L. Lee noted that the task group for the ballot pool management task should engage with NERC staff about further communications with industry once the report is delivered to the SC in June.

6. **Items Slated for Presentation at Next Standards Committee Meeting – L. Lee and E. Chanzes**

   Update on Ballot Pool Management efforts **(L. Lee)**
   Endorse Consensus Building for SAR Development scope **(B. Li)**
   Endorse Review of Standards Processes and Procedures scope **(J. Tarantino to provide materials; L. Lee to provide SC report)**

7. **Review of Actions/Assignments** – E. Chanzes

   Administrative

   Add membership terms to roster **(E. Chanzes)**
   Inform task group leads if interested in being part of task's group **(New Members)**

   Task-specific

   QR Process: Discuss with B. Murphy about which upcoming SC meeting to submit; Follow up with S. Miller about including QR review information on the project tracking spreadsheet **(L. Lee)**

   Consolidate SC Resource Documents: Circulate resource package to SCPS for review **(G. Zito)**

   Process to Improve the Effectiveness of Balloting: Finalize report/one-pager and submit for June SC meeting **(L. Lee)**

   Consensus Building for SAR Development: Submit scope document and one-pager for June SC meeting **(B. Li)**

   Review Standards Development Processes and Procedures: Submit scope document and one-pager for June SC meeting **(J. Tarantino)**

8. **Future Meetings**

   a. Meetings in coordination with Standards Committee:

      June 10–11, 2014 (8:00 a.m.–12:00 p.m.|1:00–5:00 p.m.) Denver
      September 30–October 1, 2014 (8:00 a.m.–12:00 p.m.|1:00–5:00 p.m.) Portland

December 9–10, 2014 (8:00 a.m.–12:00 p.m.|1:00–5:00 p.m.) Atlanta

b. Interim Meetings
A future interim conference call will be discussed during the June SCPS meeting.

9. **Adjourn**

L. Lee thanked members for their participation and adjourned the meeting.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

2014 Roster

Standards Committee Process Subcommittee

Term	Participant	Entity
2013–14	Laura Lee (Chair)	Duke Energy
2013–14	Peter Heidrich (Vice Chair)	Florida Reliability Coordinating Council
2014–15	Brian Buckley	Tampa Electric Co.
2014–15	Randy Crissman	New York Power Authority
2014–15	Brenda Hampton	Energy Future Holdings (Luminant)
2014–15	Lorissa Jones	Bonneville Power Administration
2014–15	P.S. (Ben) Li	Ben Li Associates, Inc.
2013–14	Linn Oelker	LGE&E and KU
2014–15	Keith Porterfield	Georgia Systems Operations Corporation
2013–14	Andrew Pusztai	American Transmission Company
2013–14	Robert Rhodes	Southwest Power Pool, Inc.
2013–14	Steve Rueckert	Western Electricity Coordinating Council
2014–15	Ed Skiba	MISO
2014–15	Joe Tarantino	Sacramento Municipal Utilities District
2013–14	Guy V. Zito	Northeast Power Coordinating Council, Inc.
N/A	Monica Benson (NERC Standards Advisor)	NERC
N/A	Erika Chanzes (NERC Standards Advisor)	NERC
N/A	Stacey Tyrewalla (NERC Legal Advisor)	NERC

Version	Date	Description
1.0	02/13/14	Initial posting
2.0	05/19/14	Added B. Buckley, R. Crissman, B. Hampton, L. Jones, and E. Skiba. Removed B. Walker (NERC).
3.0	06/03/14	Added terms

Standards Committee Process Subcommittee

Activity Status Overview – June 2014

Projects Approaching Close	Status	Team Lead and Members
Consolidate SC Resource Documents **(Phase 1 of Updating the Drafting Team Guidelines Completed)** **(This task also satisfies Task #5 from the 2014–2016 SC Strategic Work Plan)**	**Task Initiated: July 2012** **Current Target Completion: April 2014 SC Meeting (Complete) and July 2014 SC Meeting** The SC approved a finalized list of documents for retirement at the April 9 SC meeting, and the documents have been archived. Since, M. Benson has compiled a "Resource Package" that accompanies the Drafting Team Reference Manual. This will be circulated to the SCPS for review prior submitting for the July SC meeting.	**Guy Zito**; gzito@npcc.org Linn Oelker; linn.oelker@lge-ku.com Monica Benson (NERC); monica.benson@nerc.net
Modify SC Quality Review Process	**Task Initiated: October 2012; Revisited December 2013** **Current Target Completion: July SC meeting** During its April 23 call, the SCPS reviewed the write-up by the task group that proposes that the NERC Coordination QR document can replace the QR process/template, provided that NERC staff commits to communicating the steps that were taken for QR prior to an initial posting. The SCPS agreed that the next step is to take this proposal to the SC. S. Miller will also loop in PMOS about adding QR to the project tracking spreadsheet. L. Lee is following up on these steps.	**Keith Porterfield**; keith.porterfield@gasoc.com Andy Pusztai; apusztai@atcllc.com Ed Skiba; eskiba@misoenergy.org Pete Heidrich; pheidrich@frcc.com Guy Zito; gzito@npcc.org Brenda Hampton; Brenda.Hampton@energyfutureholdings.com Brian Murphy; Brian.J.Murphy@fpl.com Steve Noess (NERC); steven.noess@nerc.net Erika Chanzes (NERC); erika.chanzes@nerc.net Stacey Tyrewala (NERC); stacey.tyrewala@nerc.net
Develop Work Plan **(Task #6 from 2013–2015 SC Strategic Work Plan)**	**Task Initiated: December 2013** **Current Target Completion: July 2014 SC Meeting** The SCPS has fleshed out activities that did not have full consensus with NERC staff and will finalize the Work Plan during the June SCPS meeting to bring to the July SC meeting. In addition, work on the 2015 Work Plan will be added to the 2014 Work Plan.	**Ben Li**; ben@benli.ca Erika Chanzes (NERC); erika.chanzes@nerc.net

Active Projects	Status	Team Lead and Members
Charter Revisions	**Task Initiated: December 2013** **Current Target Completion: TBD** B. Li has drafted revisions to the SCPS Charter to include a communication piece, the role of the SCPS in training, and officer elections. Per S. Miller's effort to align the SCPS and PMOS Charters, he has been researching how other NERC subcommittee charters are handled. This information and a proposal is currently being shared with the SCPS chairs and B. Li, and will be further discussed with the entire SCPS, PMOS, and NERC staff.	**Ben Li;** ben@benli.ca Guy Zito; gzito@npcc.org Pete Heidrich; pheidrich@frcc.com Scott Miller; smiller@meagpower.org Erika Chanzes (NERC); erika.chanzes@nerc.net
CEAP Pilot **(Initial project pilots completed)**	**Task Initiated: April 2012** **Current Target Completion: December 2014 SC Meeting** The finalized Disturbance Monitoring CEAP report was endorsed by the SC for posting during the April SC meeting. The CEAP team is meeting at FRCC June 3–4 to discuss project selection criteria and how to best apply CEAP moving forward.	**Guy Zito**; gzito@npcc.org Pete Heidrich; pheidrich@frcc.com Andy Pusztai; apusztai@atcllc.com Steven Rueckert; steve@wecc.biz Laura Hussey (laura.hussey@nerc.net) is now NERC staff support. Additional committee resources and NERC resources needed.
Consensus Building for SAR Development	**Task Initiated: October 2012; Re-scoped March 2014** **Current Target Completion: Early 2015** The task group met with NERC staff and agreed on the scope with minor changes. The SCPS agreed to the scope as well during the May 22 SCPS call, and B. Li has submitted the scope document and one-pager for the SC to endorse at the June SC meeting.	**Ben Li;** ben@benli.ca Pete Heidrich; pheidrich@frcc.com Steven Rueckert; steve@wecc.biz Guy Zito; gzito@npcc.org Erika Chanzes (NERC); erika.chanzes@nerc.net

Ongoing Projects / On the Horizon	Status	Team Lead and Members
Develop a Process to Improve the Effectiveness of Balloting	**Task Initiated: December 2013** **Current Target Completion: Ongoing / TBD** L. Lee has composed and provided an informational report to the SC for the June SC meeting to include NERC strategies for addressing issues with achieving quorum (what's been done in the past and is being done currently, and SBS improvements). It also includes a proposal for how the SCPS will be working to evaluate the results of the SBS enhancements and continued interim steps.	**Laura Lee**; Laura.Lee@duke-energy.com Robert Rhodes; rrhodes@spp.org Pete Heidrich; pheidrich@frcc.com Steve Rueckert; steve@wecc.biz Brian Buckley; bsbuckley@tecoenergy.com Stacey Tyrewala (NERC); stacey.tyrewala@nerc.net Monica Benson (NERC); monica.benson@nerc.net
Improve Standards Development Processes and Procedures **(Task #2 from the 2013–2015 SC Strategic Work Plan)**	**Task Initiated: January 2013; On hold until early 2015** **Current Target Completion: TBD** During the May 22 SCPS call, J. Tarantino explained that the task group came to the conclusion that the SCPS should wait on this task until active projects and SPM revisions have further matured. In the interim, informal outreach will be conducted to continue to identify standard development process issues. Any identified issues should be communicated to J. Tarantino, L. Lee, and E. Chanzes to keep record of and respond to. A formal outreach plan to gather input on the standards development process will be formed during the first quarter of 2015 and implemented during the second quarter. This will hopefully converge with a more "steady state" of standards projects. The SCPS and NERC staff agreed to this plan with the current scope document. The scope document has been submitted to the SC for endorsement at their June meeting.	**Joe Tarantino**; joseph.tarantino@smud.org Brenda Hampton; Brenda.Hampton@energyfutureholdings.com Fred Plett; frederick.plett@state.ma.us Pete Heidrich; pheidrich@frcc.com Ed Skiba; eskiba@misoenergy.org Guy Zito; Guy Zito; gzito@npcc.org Erika Chanzes (NERC); erika.chanzes@nerc.net Stacey Tyrewala (NERC); stacey.tyrewala@nerc.net Jordan Mallory (NERC); Jordan.mallory@nerc.net

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Item 1C
Attachment A

Standards Committee Process Subcommittee

Scope

Purpose

The purpose of the Standards Committee Process Subcommittee (SCPS) is to develop, maintain and document processes and guidelines to aid the Standards Committee, Standards Drafting Teams, NERC staff and industry in developing clear, effective and enforceable Reliability Standards. It also works to ensure that the documents provide transparency to the industry to ensure understanding of the standard development process and to promote the efficient use of industry technical subject matter expertise.

The SCPS takes direction from the Standards Committee and collects information from all Standards Committee members to identify needed process improvements and modifications.

Activities

1. Ensure effectiveness of standard process documents and references.

2. Maintain a list of all the documents it has responsibility for and establishes a review cycle for each of the standards process documents, and conducts reviews of the documents at least once every three years.

3. Propose key subjects on standards development process documents and references, and coordinate with NERC staff to ensure effective communication of these subjects to the industry.

4. Provide technical support to NERC's Standard Development training activities.

5. Establish and maintain a work plan presenting individual tasks to Standards Committee for acceptance prior to active development.

6. Consensus proposals and recommendations will be presented to the Standards Committee for information or approval. When the SCPS cannot reach a consensus, majority and minority opinions may be presented to the Standards Committee for it to make the final decision.

Membership

1. SCPS membership and participation is open to SC members, observers and all interested parties.

2. Nominations for new members will be requested as needed.

Commented [A1]: New proposed language – Scott Miller

Commented [A2]: Reworded – Scott Miller

Commented [A3]: Reworded -- Scott Miller

3. The SCPS Chair and Vice Chair will provide the Standards Committee with a recommended slate of members for approval as needed.

4. The SC chair and vice chair may participate and support the SCPS as non-members.

5. Members will serve staggered two year terms with no term limits.

6. The SCPS size will be determined by the workload needs of the subcommittee.

7. A NERC staff member will be assigned as the non-voting Subcommittee Coordinator

Commented [A4]: Reworded – Scott Miller

Officers

The subcommittee chair and vice chair are appointed by the chair of the NERC Standards Committee for one two-year term. The vice chair should be available to succeed to the chair.

Commented [A5]: This is the primary approach used by the other Standing committee subgroups. – Scott Miller

OR

- The SCPS will have a Chair and Vice Chair that are elected by the SCPS and approved by the Standards Committee.
- At least one officer must also be a member of the SC.
- Officers will serve 2 year terms with no limits on terms.
- Officers shall recommend the members of the SCPS for approval by the SC
- Officers will prepare meeting agendas and manage SCPS meetings

Officer Selection

Prior to the annual election of SCPS members in odd numbered years, the members of the SCPS shall select a chair and vice chair from among its membership by majority vote of the members of the SCPS. A nominating committee consisting of three (3) members of existing SCPS members shall be formed to solicit nominations for chair and vice chair no less than 30 days prior to the election.

The SCPS officer election shall be conducted at the 3rd quarter SCPS meeting. The nominating committee shall provide to the SCPS members the qualifications of the chair and vice chair nominees proposed. Also, at the time of the election, the Subcommittee can accept nominations from the floor. Following the election, the successful candidates shall be presented to the SC for approval.

Commented [A6]: As currently proposed by B. Li in the new SCPS Scope – Scott Miller

Reporting

1. The SCPS reports and is accountable to the Standards Committee and this Scope is subject to Standards Committee approval.

2. The SCPS will report on its activities at regularly scheduled Standards Committee meetings and calls and between meetings as requested.

Commented [A7]: Reworked and reworded based on the other Standing Committee Scope language – Scott Miller

Meetings

1. The SCPS will generally follow the approach used by the Standards Committee.

2. Four to six open meetings per year, or as needed. Emphasis will be given to conference calls and web-based meetings.

Commented [A8]: This is specifically stated in other standing committee Scope – Scott Miller

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Item 1c
Attachment B

Project Management and Oversight Subcommittee

Scope

Approved by the Standards Committee December 12, 2013

Purpose

The Project Management and Oversight Subcommittee (Subcommittee) works closely with NERC staff and the standards drafting teams (SDTs) to aggressively manage the timely development and maintenance of a comprehensive set of world-class, results-based Reliability Standards. The Subcommittee reports to the full Standards Committee (SC).

Activities

The Subcommittee shall have, at a minimum, the following duties:

1) Work closely with NERC staff, and the SDTs to establish milestones and deadlines for all SC work activities relating to reliability standard development, up to and including BOT approval;

   a) Assist NERC Staff and SDTs with the development of an initial project schedule for approval by the SC as referenced in Standard Processes Manual Section 4.4.1; and

   b) Actively monitor and assist NERC staff in the oversight of SDT milestones and deadlines; and extend or expedite milestones and deadlines, as appropriate; and

   c) Work with NERC staff to develop and refine project management tools; such as dashboards, project charting for tracking projects and communicating the status of projects including the reasons for and plans to address any schedule deviations; and

   d) Track the status of all existing and pending Reliability Standards, including when a Reliability Standard is considered completed (i.e., is Results-based, and has had P81 concepts applied).

2) Work with NERC staff to develop preliminary project timelines to set the expectation prior to the solicitation of SDT so that prospective members of an SDT can understand and

commit to meeting the project timeline, including milestones, at the time of their nomination and appointment.

3) Support all SAR drafting teams and SDTs by providing any specialized resources as may be needed to resolve issues and increase productivity and quality as needed to reach consensus and/or meet its milestones and deadlines;

   a) Assign PMOS liaisons for each active Standard development project who will provide oversight and support and maintain regular contact with the SDT Chair and NERC Standard Developer;

   b) Facilitate SAR drafting teams and SDTs' use of stakeholder technical experts and NERC technical, standing and regional committees for consultation, comments and endorsement, as needed; and

   c) Work with the SC Chair, Vice Chair and NERC standards developer to ensure SAR drafting teams and SDTs use informal methods to actively gain consensus during both the informal development period, as well as during the formal project development period. These informal methods may include, but are not limited to, outreach to individual industry experts and trade associations, webinars and workshops.

Membership

1. Subcommittee membership is open to SC members and other interested parties.
2. The SC Chair and Vice Chair will participate in and support the Subcommittee as non-members.
3. Subcommittee members will serve two-year terms with no term limits.
4. Nominations for new members, will be requested at least every two years, or as needed to add or replace members.
5. Subcommittee members shall be selected by the Subcommittee Officers.
6. The Subcommittee size will be determined by the workload and needs of the Subcommittee.
7. A NERC staff member will be assigned as the non-voting Subcommittee Coordinator

Commented [A1]: Reworded – Scott Miller

Officers

1. The subcommittee chair and vice chair are appointed by the chair of the NERC Standards Committee for one two-year term. The vice chair should be available to succeed to the chair.

OR

The subcommittee chair and vice chare are elected by the NERC Standards Committee for one two-year term.

2. The Subcommittee Chair or Vice Chair will set the agenda and preside over the meetings and calls.

Reporting

1. The Subcommittee is accountable to the full SC and will report jointly with NERC staff on the status of all SDT activities and any issues at regularly scheduled SC meetings and calls.
2. The Subcommittee is accountable to the full SC and will report jointly with NERC staff on the status of all SDT activities and any issues at regularly scheduled SC meetings and calls.

Meetings

1. The SCPS will generally follow the approach used by the Standards Committee.
2. Four to six open meetings per year, or as needed. Emphasis will be given to conference calls and web-based meetings.
3. Members of the Subcommittee may not send a proxy.
4. Subcommittee meetings are open to any and all observers.

Commented [A2]: This is the primary approach used by the other Standing committee subgroups. – Scott Miller

Commented [A3]: This is the method currently used to select the PMOS chair and vice chair. – Scott Miller

Commented [A4]: This is specifically stated in other standing committee Scope – Scott Miller

NERC Quality Review

[SUGGESTED SC ACTION -- FOR SCPS CONSIDERATION AND DISCUSSION]

Action

Endorse the NERC Coordinating Quality Review document, accompanied by a commitment by NERC staff to communicate to the Standards Committee (SC) the Quality Review (QR) steps taken prior to each draft Reliability Standard's initial formal posting. These items would replace the NERC Reliability Standards Quality Review Process that was approved by the SC but has not yet been implemented.

Background

Following SC approval in September 2013 of the SC Process Subcommittee (SCPS)-proposed NERC Reliability Standards Quality Review Process and Revised Template for Quality Review of NERC Reliability Standard or Interpretation documents, NERC staff expressed concern regarding the ERO operational governance provisions stipulated in the process document. Since, the SCPS, the SC Chair and Vice Chair, members of PMOS, and NERC staff have engaged in discussion to reach consensus on the documentation of NERC QR attributes and procedures.

As a result, NERC staff drafted an informational document titled "Coordinating Quality Review," which outlines several attributes that NERC standards staff currently use in executing its obligation under the NERC Standards Process Manual (SPM) to coordinate QR of draft Reliability Standards. All parties agreed that this document is consistent with the principles relating to QR established in the SC Charter, the SPM, and the Revised Template for Quality Review of NERC Reliability Standard or Interpretation. It is noted that the Coordinating Quality Review document references the template as an excellent tool to facilitate a review.

To account for the needs and limitations of the respective groups, discussions led to a compromise between the SCPS and NERC staff that identifies the Coordinating Quality Review document as an appropriate replacement to the process document with respect to the fact that it accurately qualifies what QR should consist of but does not mandate NERC operational procedures. It was also agreed that this document should be coupled with a commitment from NERC staff to communicate to the SC what specific QR steps were conducted for a draft Reliability Standard when it is submitted to the SC for approval of its initial posting.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Item 1D
Attachment B

Coordinating Quality Review

March 1, 2014

This informational document outlines several attributes that NERC Reliability Standards Staff ("Standards Staff") currently use in executing its obligation under the NERC Standards Processes Manual[1] ("SPM") to coordinate Quality Review ("QR") of draft Reliability Standards.

As specified in section 3.5 of the SPM, "NERC Reliability Standards Staff works to ensure the integrity of the Reliability Standards processes and *consistency of quality and completeness* of the Reliability Standards." (Emphasis added). Section 4.6 of the SPM addresses "Quality Review," and it specifies that "NERC Reliability Standards Staff shall *coordinate a quality review* of the Reliability Standard, implementation plan, and VRFs and VSLs *in parallel with the development* of the Reliability Standard and implementation plan, to assess whether the documents are within the scope of the associated SAR, whether the Reliability Standard is clear and enforceable as written, and whether the Reliability Standard meets the criteria specified in NERC's Benchmarks for Excellent Standards and criteria for governmental approval of Reliability Standards." (Emphasis added).

Standards Staff continues to work collaboratively with stakeholders and Standards Committee ("SC") [2] in our equal interest to ensure the highest level of quality. Specifically, the following attributes guide Standards Staff in its coordination of QR:

1. QR is part of the fabric of standards development activities, from project inception through completion, with a focus on quality.
2. QR must be flexible; it must support and not detract from, hinder, or delay the development process.
3. QR input provides important feedback to drafting teams and will be made available to them for consideration in a timely manner before posting.
4. Each NERC Director of Standards Development will work with their associated Standards Developers to coordinate a collaborative QR. The QR scope will consider the facts, circumstances, and complexity associated with each project. This may include group calls, meetings, or email reviews with industry participants.

[1] http://www.nerc.com/pa/Stand/Documents/Appendix_3A_StandardsProcessesManual.pdf

[2] The SC charter similarly acknowledges the importance of quality in accomplishing these common goals. For example, an SC duty under the charter is to establish quality assurance and quality control processes, recognizing the important role of the SC under the SPM in accepting the work of drafting teams.

5. Each project has a primary and secondary standards developer, increasing support for QR throughout the standards development process. Standards Staff also coordinates input from NERC Technical, Compliance, Legal, and Enforcement staffs, further enhancing QR.
6. The template for use in QRs created by the SC Process Subcommittee is an excellent tool for assessing the attributes of quality, and Standards Staff will continue review the items from this template in coordinating QR.
7. Outside input (a.k.a. using "fresh eyes") from individuals not directly connected to the drafting team is important, and Standards Staff is committed to continuing to use and incorporate such input.
8. QR will seek diversity of perspectives, to include NERC, regional, or industry technical, compliance, enforcement, and/or legal expertise.
9. The SC Project Management Oversight Subcommittee ("PMOS") has assigned a liaison for each standard development project. Standards Staff and drafting teams work closely with the PMOS liaison as an additional source of input to support QR.
10. QR efforts will include consideration of Paragraph 81 criteria and assessment of the content and quality criteria from the 2013 Independent Experts Review Panel[3].
11. Standards Staff is committed to ensuring that any QR process considers the full spectrum of quality. Key topics include, but are not limited to, the following:
    a. Does the requirement (and any associated attachments) meet results-based criteria? Namely, does it identify "Who" (functional entity), under what conditions (if any), shall perform what action (including the word "shall"), to achieve what particular result or outcome (that reduces a stated risk to the reliability of the bulk power system)?
    b. Is the requirement stated with sufficient detail and in a clear and concise manner without using ambiguous words or unnecessary explanatory information?
    c. Does the standard satisfy applicable regulatory directives?
    d. If a specific performance can't be identified, is the acceptable performance qualified and bounded by measurable conditions/parameters?
    e. Quality of Measures.
    f. VRF and VSL consistency with guidelines.
    g. Consistency of the standard with the Standard Authorization Request (SAR).
    h. Resolution of relevant Interpretations or Compliance Application Notices (CANs).
    i. Consistency with the Ten Benchmarks of Excellent Reliability Standards[4].

Standards Committee Strategic Work Plan 2013-2015, Task No. 2: Review of the Standards Processes and Procedures

Action
Endorse.

Background
Task No. 2: Review of the Standards Processes and Procedures:
Implement revisions needed to NERC's Rules of Procedure/SMP and SC processes and procedures to enhance SC and SDT accountability to timely deliver high quality Reliability Standards and execute the Strategic Plan, including the completion of Standards Process Input Group (SPIG) recommendations. All revisions, creation or elimination of processes and procedures provisions shall be presented to the SC for adoption, prior to presenting to the NERC Board of Trustees (BOT) for approval.

Steps Taken to Date:
Two questionnaires were sent seeking feedback in the early part of 2013. The first questionnaire was sent to standards drafting teams to determine areas for improvement in the standard development process. Although a few suggestions were made regarding legal representation on the standard drafting teams, there were no substantive improvements identified for process improvement.

A second questionnaire was sent to a broader audience which focused on asking for a "single biggest issue" with all aspects of the standard development process. This also concluded with no centralized issue to be identified.

Future Plans for Action:
The Task #2 Team noted a limited number of NERC Projects that have been through the revision of the current Standard Process Manual; those that were completed under the new manual were either informal development or were expedited due to FERC directives (MODs, VARs, PER-005, GMD, and CIP-014). The task team felt that evaluating additional projects which undergo formal development with the current Process Manual would allow a more comprehensive review. Additionally, it was noted that polling industry at this time would be deemed problematic due to the number of Project postings.

The recommendation of the task group was unanimous; "keep the scoping document but postpone any actions". The group noted that an outreach plan other than a survey should be considered. The task team also makes the following suggestions: 1) standing committees be solicited for outreach options, and 2) include outreach for this task as an agenda topic during compliance workshops.

A proposed starting time for Task #2 is second quarter of 2015.

Date: May 22, 2014

Scope of NERC SCPS Project
Consensus Building for Standard Authorization Request (SAR) Development

Need for Project:

To develop a process which will facilitate the effective and efficient development of technical information and building of industry consensus leading to the Standards Committee's acceptance/approval of the SAR for proposed standard projects.

Project Scope Statement:

The objective of this task is to develop a new or revised process which will improve the effectiveness and efficiency of consensus building tasks for standard projects starting at or before the initial project proposal stage and continuing to the acceptance/approval of the SAR by the Standards Committee.

A standard project can be initiated by any one of the following means:

a. *Recommendation by the Reliability Issues Steering Committee (RISC) to address an emerging reliability risk/issue;*
b. *Compliance with, or a response to, directives by regulatory authorities or the NERC Board of Trustees;*
c. *A review/revision or need identified in the Standards Committee's Reliability Standards Development Plan (RSDP);*
d. *A request by industry participants through the submission of a SAR;*
e. *Input by a stakeholder into the Single Portal for a potential reliability related issue.*

This project will require a comprehensive review of the existing SAR and Informal development processes and proposing changes- , where appropriate, to improve effectiveness and efficiency in consensus building activities leading to the posting and acceptance/approval of the SAR. The project also will have to be fully coordinated with the RISC, PMOS and other SC activities and SCPS projects. The project is to be conducted in 2 stages.

<u>Stage 1</u> (March 2014 to September 2014)

Develop a revised process that covers the following key activities:

- *Collection of technical information needed to support the proposal for a standard project;*
- *Informal outreach and consensus building on the need and scope of the project;*
- *Drafting/revising the SAR to achieve clarity with sufficient technical information that supports the proposed purpose and scope of project;*
- *Posting of SAR and responding to public comments, and revising SAR to address industry comments;*
- *Consider conducting a Cost Impact Analysis (CIA) as outlined in the NERC Cost Effective Analysis Process Phase 1 to determine potential cost impacts of potential proposed solutions;*

- *Recommending acceptance/approval/rejection of the SAR to the SC with due consideration given to industry input.*

The role of the RISC throughout these activities should be considered and clearly stated as appropriate.

Stage 2 (Latter Part of 2014 to Early 2015)

Revise the Standard Processes Manual to incorporate pertinent elements of the revised process.

Resources:

A small team comprising of 4-5 SCPS members, 1-2 PMOS members and 1-2 NERC Standards and NERC Legal staff.

Stage 1 is expected to start in March 2014 ending September 2014; Stage 2 is expected to start in the latter part of 2014 in conjunction with other SPM changes following the completion of another SCPS task to improve the effectiveness and efficiency of standards development, including balloting.

Addressing Failure to Achieve Quorum in Balloting Standards

Action
Informational update only

Background
Development or modification of a Reliability Standard requires industry balloting of the new Standard or modification. Per the current Standards Process Manual ballot pool approval requires a quorum, which is established by at least 75% of the members of a ballot pool submitting a response in addition to a two-thirds majority of the weighted Segments votes being affirmative. Several ballots have recently experienced failure to achieve the required quorum by the end of the specified voting window, necessitating extension of the voting window. In light of the recent challenges in reaching quorum at the end of the announced voting window, the Standards Committee Process Subcommittee (SCPS) and NERC staff have been "exploring options to create and maintain an effective ballot pool and strategies to address situations where a quorum is not reached by the time a ballot period is scheduled to close." November 2013 SC Agenda item 13 (a) iii. This effort has coincided with development and implementation of the new Standards Balloting System (SBS). This update contains steps taken to date to facilitate reaching quorum in a timely manner, actions being taken on ballots using the original (current) balloting system, enhancements and features of the new Standards Balloting System that are anticipated to improve the reaching quorum, and future plans for analysis and action.

Steps Taken to Date
NERC Standards Information staff has taken the following actions in 2012 and 2013 to address identified challenges to gaining quorum for ballots.

1. The Registered Ballot Body (RBB) was reviewed for members with no activity on their voting records for one year or longer. Members were sent a letter, emailed and/or called. Non-responsive members were removed from the RBB. 41 members were contacted, with seven RBB members removed and nine proxy pool members removed. This review will be performed annually.
2. Segment 8 of the RBB (Small Electricity Users) was reviewed to ensure members were accurately registered.
3. A review of the RBB's Segment representation, as directed in the Appendix 3D Registered Ballot Body Criteria of the NERC Rules of Procedure was performed. Based on the registration responses, the RBB was reviewed and updated.
4. Members of ballot pools who are no longer able to vote due to company mergers were removed from ballot pools and from the RBB.
5. A comparison between RBB and ballot pools to remove members in older ballot pools that are no longer voting members was initiated.

Actions Currently Being Taken
Several actions are being taken with the current ballot pools to encourage reaching a quorum before the voting window closes. Some of these are interim measures necessary at least until projects are transitioned to the new SBS, at which time longer term management can be evaluated.

1. The cleanup of ballot pools mentioned above is continuing prior to the ballot start date. This includes consideration of the effects of company mergers and the comparison of ballot pool membership to the RBB.

2. A contractor has been working with Standards Information staff to perform queries on ballot pools from September 2013 to March 2014 for further analysis. A preliminary query was performed on Segment 10 (Regional Entities) and is being used to refine the specifications for future queries. NERC is developing the capability to perform the queries and will be using the results along with the SCPS members to inform future strategies.
3. Analysis of ballot pools that have been extended is being performed by NERC Standards Information staff. A table containing the balloted projects in 2014 is included.
4. NERC Standards Information staff is communicating to industry voters the importance of abstaining when ballot pools are joined and they do not intend to vote in a particular ballot. These communications included a "Balloting 101" email and reminders at the Standards and Compliance Workshop.
5. An annual review of the RBB's Segment representation will be performed.
6. Reminders are being sent to individuals who have not voted and/or others in their company near the end of a voting window if quorum has not been achieved. Standards Committee leadership has also been assisting with contacting ballot pool members and the Trades to encourage voting.

Potential Improvements in new Software Balloting System (SBS)

Certain enhancements and features that have been built into the new SBS are anticipated to generate improvement in reaching quorum, both during initialization of the system and on an ongoing basis. Examples include:

1. New registration will be required for accessing voting in the new system, improving the cleanup of the RBB.
2. Proxies can be designated until the close of the ballot voting window making voting more accessible. Currently proxy designation can only be accomplished during ballot pool formation.
3. The "My Ballot Activity" section provides a single page view to join, vote and designate proxies, making managing voting activities easier.
4. The Replacement Voter feature allows a voter representing a segment to exit the RBB and be replaced by a new voter who can assume voting activities in the ballot pools.

Future Plans for Analysis and Action

The SCPS and NERC Standards Information staff will monitor the results of both the management strategies being implemented and the enhancements contained in the new SBS. NERC Standards Information staff will also continue the analysis already initiated into the causes of difficulties in achieving quorum in ballot pools. Based on the information gathered, the SCPS and NERC Standards Information staff will evaluate whether additional measures are necessary. An initial list of strategies for consideration has been developed to serve as a starting point if the problem persists. This list is for consideration only and has not been evaluated for practicality or effectiveness.

Suggestions/Ideas

Consider changes to proxy process – allow for multiple proxies, associate proxies with RBB Registered Entity rather than each individual standard.

Ballot pool (or ballot body) members who demonstrate poor voting performance should be replaced if they miss a defined number of votes.

Put an expiration date on a ballot pool – if the pool expires it will have to be "reinitialized", or ballot pool members could be asked to confirm their intent to remain in the pool.

Look at lowering the quorum % to address lack of quorum due to "poor performance".

Allow multiple individuals from a Registered Entity to join the RBB according to their specialty and then only allow one to join the ballot pool (for example an operations person or a CIP person).

Draft agreement for RBB Members defining responsibilities.

Have voters voluntarily notify NERC when they join the ballot pool that in the event they fail to vote by the voting deadline that their vote should be recorded as an abstention.

Analysis of Issues Achieving a Quorum (Jan 1-May 22, 2014)

Project Name and Number	Standard	Ballot Type	Ballot Start Date	Ballot End Date	# of Days Extended
Project 2007-02 - Operating Personnel Communications Protocols	COM-002-4	Additional Ballot	01/22/14	02/04/14	2
Project 2008-12 - Coordinate Interchange Standards	Definitions	Additional Ballot	01/16/14	01/29/14	2
Project 2008-12 - Coordinate Interchange Standards	INT-004-3 and INT-010-2	Additional Ballot	01/10/14	01/22/14	0
Project 2010-01 - Training	PER-005-2	Additional Ballot	01/08/14	01/21/14	1
Project 2010-02 - Connecting Facilities to the Grid	FAC-001-2 and FAC-002-2	Initial Ballot	05/06/14	05/16/14	1
Project 2010-03 - Modeling Data (MOD B)	MOD-033-1	Additional Ballot	01/10/14	01/22/14	1
Project 2010-04 - Demand Data (MOD C)	MOD-031-1	Additional Ballot	04/01/14	04/14/14	2
Project 2010-05.1 - Protection System: Phase 1 (Misoperations)	PRC-004-3	Additional Ballot	02/21/14	03/11/14	6
Project 2012-13 - NUC - Nuclear Plant Interface Coordination	NUC-001-3	Initial Ballot	05/13/14	05/22/14	0
Project 2013-04 - Voltage and Reactive Control	VAR-002-3	Additional Ballot	04/04/14	04/16/14	2
Project 2014-04 - Physical Security	CIP-014-1	Initial Ballot	04/20/14	04/24/14	0

DRAFT SCPS 2014 Work Plan				
Task	**Scope of Task**	**Task Initiated**	**Target Completion**	**Status/Remarks**
1. Modification to SC Quality Review Process Document	Staff has suggested changes to the QR process document that was approved by the Standards Committee at its September 2013 meeting. The SCPS will review and implement the proposed changes, and seek the SC's approval of the revised QR process document to enable implementation of the QR process. **Placeholder for Link to Scope Document**	October 2012	May 2014 SC Meeting	Ongoing. A small team including reps from SCPS, PMOS and NERC staff to meet to collaborate on perspectives and develop a scope document to move forward with implementation.
2. Improving Consensus Building at the SAR stage	A draft document was developed in mid 2013. The document to be revised/refined pending finalization of the informal outreach process so that the improved SAR development process considers all activities leading to the formal development and posting of SARs for projects that are on or to be added to the RSDP. **Placeholder for Link to Scope Document**	October 2012 (Task revisited jointly with PMOS starting March 2014)	June 2014 SC Meeting	Task to be combined with consensus building proposal (currently led by PMOS)
3. Consolidate SC Resource Documents	There exist a number of resource documents some of which are being used by the Standards Committees and drafting teams while others are either not used or out of date. The SCPS thus will: a. Propose a list of documents to be retired, and	July 2012	April 2014 SC Meeting	Ongoing

DRAFT SCPS 2014 Work Plan				
Task	**Scope of Task**	**Task Initiated**	**Target Completion**	**Status/Remarks**
	b. Consolidate the remaining documents to arrive at a single or a set of standards resource documents that would serve to assist the SC and SDTs in discharging their respective tasks. c. Add in version control and template remaining documents **Placeholder for Link to Scope Document**		June 2014 SC Meeting June 2014 SC Meeting	
4. Improve standards development process (Assignment resulting from 2013 Strategic Work Plan – Task #2)	a. Review effectiveness of the revised Standard Processes Manual approved by the FERC in June 2013, and identify areas/changes that can further improve the efficiency and quality of standard development; b. Propose changes to the SPM as necessary, post for comments and finalize changes for balloting and BoT adoption. **Placeholder for Link to Scope Document**	January 2013	June SC Meeting December 2014 SC Meeting	Ongoing
5. CEAP Pilot Project	Conduct CEAP pilots: a. CEAP Subteam is conducting the CEA portion of the CEAP on the second project of the pilot. The Team will develop a report for the SC and the Industry. b. The CEAP Subteam will propose a list of	April 2012	March 2014 SC Meeting March 2014	Ongoing

DRAFT SCPS 2014 Work Plan				
Task	**Scope of Task**	**Task Initiated**	**Target Completion**	**Status/Remarks**
	standards development projects to conduct the CEAP on for 2014 and bring these to the SC and industry for approval and comment. c. Upon completion of the pilot, the current CEAP guideline document will be revised accordingly to reflect lessons learned during the pilot and to address potential "benefits" of standard projects. **Placeholder for Link to Scope Document**		SC Meeting December 2014 SC Meeting	
6. Managing FERC Remands of Interpretations	Develop a process to manage FERC remands of interpretations such that the original request for interpretation will be duly addressed. **Placeholder for Link to Scope Document**	June 2013	June 2014 SC Meeting	Ongoing
7. Process to improve the effectiveness of balloting	Develop a process aiming at: a. Maintain an effective ballot pool b. Managing situations where a quorum is not reached by the end of a ballot such that balloting can be conducted in the most effective and efficient manner. **Placeholder for Link to Scope Document**	December 2013	June 2014 SC Meeting September 2014 SC Meeting	Ongoing
8. Review SCPS Charter	Review current charter, and coordinate revisions with PMOS for consistent approach.	December 2013	April 2014 SC Meeting	Ongoing

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Meeting Notes
Project Management and Oversight Subcommittee (PMOS)

April 17, 2014 | 11:00 a.m. – 2:00 p.m. Eastern

NERC
3353 Peachtree Road NE
Suite 600, North Tower
Atlanta, GA 30326

NERC Antitrust Compliance Guidelines and Public Announcement
Agenda Items

1. **Project Tracking Spreadsheet**
   a. NERC Staff update on addition of IERP column
      i. NERC Staff has begun populating the IERP column and it is posted on nerc.com.
2. **Project Liaisons Updates**
   a. The PMOS liaisons provided a brief update on progress of assigned projects.
3. **Discussion on PMOS Role in SDTs' Responses to Comments**
   a. The PMOS members attending the meeting agreed to maintain current PMOS liaison interaction.
   b. The PMOS liaisons will continue their roles in monitoring Response to Comments as well as participating in QR sessions.
4. **Review the SCPS Charter changes for possible PMOS Charter revisions**
   a. The PMOS members did not make any revisions at this time until further SCPS discussions.
5. **Review the RISC Triage Diagram**
   a. The SC Chair updated PMOS on the RISC Triage Diagram and will provide further updates at the next SC meeting.
6. **2014 Meeting Dates Beyond July**
   a. Removed the May 30, 2014 and July 2, 2014 conference calls from the NERC Standards Calendar and sent cancellation notices to the PMOS team
   b. June 10, 2014- 8:00a.m. - 12:00p.m. MT in Denver (Xcel) (in-person)
   c. September 30, 2014- 8:00a.m. - 12:00p.m. PT in Portland (BPA) (in-person)
7. **Adjourn**

Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and subgroups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost information and participants' expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.
- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

- Any other matters that do not clearly fall within these guidelines should be reviewed with NERC's General Counsel before being discussed.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and subgroups) may have a negative impact on particular entities and thus in that sense adversely impact competition. Decisions and actions by NERC (including its committees and subgroups) should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation, Bylaws, and Rules of Procedure are followed in conducting NERC business.

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or subgroup, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on electricity markets, and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.

Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and employment matters; and procedural matters such as planning and scheduling meetings.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Agenda Item 1a

Draft Minutes
Member Representatives Committee Pre-Meeting Informational Session Conference Call and Webinar

April 9, 2014 | 11:00 a.m. Eastern

Introductions and Chair's Remarks

Chair John Anderson, with vice chair Sylvain Clermont present, convened a duly-noticed open meeting by conference call and webinar of the North American Electric Reliability Corporation (NERC) Member Representatives Committee (MRC) on April 9, 2014 at 11:02 a.m., Eastern. The meeting provided the MRC and other stakeholders an opportunity to preview proposed agenda topics for the MRC Board of Trustees (Board) and Board committee meetings scheduled to be held May 6-7, 2014 in Philadelphia, PA. The meeting announcement, agenda, and list of attendees are attached as **Exhibits A, B, and C**, respectively.

NERC Antitrust Compliance Guidelines and Public Meeting Notice

Kristin Iwanechko, committee secretary, directed the participants' attention to the NERC Antitrust Compliance Guidelines and the public meeting notice included in the agenda.

Schedule of Quarterly NERC Meetings and Conference Calls

The draft schedule of events for the upcoming meetings in Philadelphia was included in the agenda package for today's meeting. The MRC meeting is scheduled to begin at 1:00 p.m. on May 6.

Policy Input Reminder

Mr. Anderson announced that the Board's request for policy input is scheduled to be released today and responses are due by Tuesday, April 29 to Kristin Iwanechko, committee secretary. The topics included in the policy input letter are:

- Reliability Standard Audit Worksheet (RSAW) review and revision process;
- Risk-based registration assessment; and
- Potential alternative funding mechanism to support expanded cyber security information sharing and capabilities.

Review of Proposed Board and Board Committees' Meeting Agenda Items

Mark Rossi noted that the preliminary agenda items for the Board of Trustees and Board committee meetings scheduled for May 6-7 in Philadelphia are identified in the slide presentation included in the agenda package for today's call (**Exhibit D**). He also noted that the Board is considering scheduling a meeting on April 23 to understand the plan for the physical security standard and the potential path to closure for the standard by the June 5, 2014 filing deadline. Mr. Anderson encouraged MRC members to review all agenda materials for the Board and Board committee meetings, once posted and available

on April 21, and attend as many of these meetings as possible, in advance of the MRC's meeting on May 6.

Review of Proposed MRC Agenda Items for May 6

Mr. Anderson noted that the preliminary MRC agenda items for the upcoming May 6 meeting in Philadelphia are identified in the slide presentation included in the agenda package for today's call (**Exhibit D**). Topics include:

- Endorsement of a recommended slate of members for the Reliability Issues Steering Committee;
- Request for MRC members to serve on the Board nominating committee;
- Discussion of the responses submitted to the policy input request from the Board;
- Additional discussion of the issues presented at the Board committee meetings on May 6;
- Discussion on the 2015 business plan and budget;
- Plan for the 2014 long-term reliability assessment and emerging issues;
- Whitepaper for the Essential Reliability Services Task Force; and
- Update on the five-year performance assessment.

Informational Items

NERC staff provided updates on the following topics: Reliability Assurance Initiative (RAI) progress; critical infrastructure protection (CIP) version 5 implementation study; physical security standard project; 2015 business plan and budget and stakeholder input tracking; operating personnel communication protocols standard development; definition of bulk electric system; and the ERO Enterprise operating model.

Proxy Reminder

Proxy notifications for the May 6 meetings must be submitted in writing to Kristin Iwanechko, committee secretary.

Meeting Adjourned

There being no further business, the call was terminated at 12:42 p.m., Eastern.

Submitted by,

Kristin Iwanechko
Secretary

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Agenda Item 1b

Draft Minutes
Member Representatives Committee

February 5, 2014 | 1:00–5:00 p.m. Mountain

Arizona Grand Resort & Spa
8000 S. Arizona Grand Parkway
Phoenix, AZ 85044
602-659-6356

Outgoing Chair Carol Chinn, with incoming Chair John Anderson and incoming Vice Chair Sylvain Clermont present, called to order the North American Electric Reliability Corporation (NERC) Member Representatives Committee (MRC) meeting on February 5, 2014, at 1:00 p.m., Mountain. The meeting announcement, agenda, and list of attendees are attached as **Exhibits A**, **B** and **C**, respectively.

Introductions and Chair's Remarks

Mr. Anderson welcomed attendees and acknowledged the attendance of FERC staff, the NERC Board of Trustees (Board), Ken Quesnelle of the Canadian Association of Members of Public Utility Tribunals, and State Commissioners Asim Haque and David Clark. Mr. Anderson recognized the MRC responses to the January 8, 2013 policy input request from Fred Gorbet, chairman of the Board. He reminded attendees that full presentations were conducted at the committee meetings and will not be repeated during the MRC meeting.

NERC Antitrust Compliance Guidelines and Public Announcement

Kristin Iwanechko, committee secretary, called attention to the NERC antitrust compliance guidelines and the public meeting notice. Any questions should be addressed to NERC's general counsel, Charles Berardesco.

Ms. Iwanechko declared a quorum present with the following recognized proxies:

- Barry Lawson for Michael L. Smith – Cooperative Utility
- Ayesha Sabouba for Lam Chung – Federal/Provincial
- Martin Huang for Mike Penstone – Federal/Provincial
- Marion Lucas for Thomas Gianneschi – Large End-Use Electricity Customer
- Charles Acquard for Lawrence Nordell – Small End-Use Electricity Customer
- Asim Haque for Todd A. Snitchler – State Government

Minutes

The MRC approved, on a motion by Scott Helyer and seconded by Bruce Campbell, the draft minutes of its January 8, 2014 conference call and the draft minutes of its November 6, 2013 meeting in Atlanta (**Exhibits D** and **E**, respectively).

Election, Board of Trustees

Dave Goulding, chair of the Board's Nominating Committee, provided a report and recommendation for the election of four Board members for the class of 2017. The MRC approved, on a motion by Steve Whitley and seconded by Bill Gallagher, the re-election of Paul Barber, Janice Case, Fred Gorbet, and Roy Thilly for the class of 2017.

Mr. Goulding also noted that there have been questions regarding whether there should be more specific criteria for the nomination of Board members. Any comments should be provided to the next nominating committee.

Request for MRC Members to Serve on Nominating Committee for RISC Membership

Bob Schaffeld, chair of the Reliability Issues Steering Committee (RISC), noted that the RISC charter states that the Board and MRC would form a nominating committee to solicit a pool of candidates for membership in the RISC, and recommend a slate of members to the RISC for the Board's approval at the May meeting. Mr. Anderson asked for volunteers from the MRC interested in serving on the nominating committee or as a member of the RISC.

Mr. Schaffeld also noted that he would be asking the Board to approve the RISC's review of its charter and MRC input would be requested through the charter review process.

ERO Enterprise Three-Year Strategic Plan and 2014 Performance Metrics

Mr. Anderson reminded the MRC of the discussion on this item during the Corporate Governance and Human Resources Committee (CGHRC). Gerry Cauley, president and chief executive officer of NERC, noted that the metrics are an effort to define quantitative and measurable performance measures for the organization that will help drive the desired performance and outcomes. He highlighted the following takeaways on the metrics from the morning discussion and suggested to bring revised metrics to the CGHRC for approval during its March conference call:

1. The metric on Bulk Power System (BPS) outages should be better quantified.
2. The first metric should be reconciled with the comments submitted by the Standards Committee, and supported by many others, in response to the policy input letter.
3. The list of metrics regarding specific reliability risk initiatives should be revised to have more tangible and quantifiable outcomes.

Mr. Cauley suggested that the strategic plan be approved at the February meeting, recognizing that it will continue to be worked on based on inputs received. He recognized the collaborative effort with the Regional Executives and noted that it is an improvement from past strategic plans. He also proposed to create an accountability matrix to identify how comments are being considered and

addressed, and present the matrix at the May meetings. Mr. Cauley recognized that one of the challenges is showing clear prioritization and cost efficiencies.

Attendees shared comments related to this update:

- Many noted that a well-defined de-registration process should be identified in the strategic plan.
- Some MRC members are concerned over the interchangeable use of Bulk Power System and Bulk Electric System and requested that all instances in the strategic plan refer to the same term.
- An MRC member asked about the meaning of 'threshold' and 'target' and what is the unacceptable level. Mr. Cauley clarified that not meeting the threshold is the unacceptable level and partial credit is given for anything between threshold and target.
- NERC is urged to ensure transparency of the accountability matrix with industry.

2015 Business Plan and Budget Schedule

Mike Walker, senior vice president and chief financial and administrative officer at NERC, reported that a concerted effort is being made early in the process in coordination with the Regional Entities to draft the Business Plans and Budgets in a way to show a better linkage between the activities being undertaken to the strategic plan and the priorities set forth in the plan. He noted that there is a discussion on roles and responsibilities between NERC and the regions, with a clearer allocation of resources to accomplish the items set forth in the plan. There will also be a very clear focus on costs at the regional and NERC levels and a focus on forecasting capabilities.

Further, Mr. Walker highlighted the following changes to the schedule:

- More opportunities for input prior to posting the initial draft.
- Posting will be delayed to May 16, 2014, to provide more time for review and provide a complete picture so stakeholders are in a better position to provide informed feedback.
- Increased the time provided for comment on the initial draft to 45 days.

Many MRC members believe this schedule is a significant improvement from past schedules.

Responses to the Board's Request for Policy Input

Mr. Anderson acknowledged the MRC's responses to Fred Gorbet's January 8, 2014 letter requesting policy input on the operating personnel communication protocols standard development, 2014-2017 ERO Enterprise Strategic Plan and 2015 Business Plan and Budget Schedule, and critical infrastructure protection (CIP) Version 5 Order 791 Response Plan. The discussion on the 2014-2017 ERO Enterprise Strategic Plan and 2015 Business Plan and Budget Schedule took place during the previous agenda item. The following comments on the other two policy input topics are not all inclusive, but provide the general tenor and scope of the discussion:

Operating Personnel Communication Protocols Standard Development

- Some MRC members recommended that the applicability of COM-002-4 to the Distribution Provider function be restricted the same way as in the Version 4 and 5 Critical Infrastructure Protection standards.
- Fred Gorbet reiterated that this standard has been an important issue for the Board and they are pleased with the current status of the standard. He noted that if the standard drafting team determines that changes are needed in response to comments, the process should run its course.

Critical Infrastructure Protection (CIP) Version 5 Order 791 Response Plan

- MRC members recognized that the Reliability Assurance Initiative (RAI) is intended to be broad enough to cover all Reliability Standards, but one member suggested that there may be an opportunity with the CIP Version 5 standards to have a practical test on how RAI would be applied in place of the "identify, assess, and correct" language.
- Gerry Cauley noted that NERC recognizes the need for clarity and certainty on the transition and the need to demonstrate what success looks like with respect to RAI.
- Some MRC members are concerned that there will not be a clear enough understanding of RAI by the time the CIP standards are balloted.
- In response to questions from MRC members, it was clarified that the reference to the C2M2 model is meant only as a possible tool for industry to use and is not required for compliance.

Additional Policy Discussion from Board Committee Meetings

Attendees shared comments in response to the discussions from the Board committee meetings:

Finance and Audit Committee

- MRC members support the 2015 Business Plan and Budget schedule.
- A tentative meeting is scheduled with the MRC Business Plan and Budget Input Group in April and the group welcomes any comments in advance of that meeting.

Standards Oversight and Technology Committee

- MRC members suggested developing a process for revisions to Reliability Standard Audit Worksheets (RSAW) to be posted for industry comment and if adverse comments are submitted, the RSAW could be submitted to a Board committee for review.
- A small sub-group was formed with representation from the MRC, NERC staff, and the NERC Board to develop a proposal for an RSAW revision process to be presented at the May meetings. The scope of the sub-group is for revisions made, after a standard has been approved, to RSAWs that were posted concurrently with the standard.

- MRC members asked that the sub-group consider the effective date of RSAW changes and whether they would be applied retroactively or prospectively.
- Some MRC members are concerned that standards may be interpreted differently amongst industry and suggested that the sub-group could evaluate options to address those types of questions.

Corporate Governance and Human Resources Committee

- For the MRC Assessment of Board of Trustees Effectiveness, an MRC member suggested having the ability to review or edit comments prior to submitting in future surveys.

Compliance Committee

- A great deal of progress has been made on RAI, but it may be useful to provide a case study and to define some of the commonly used terms.
- MRC members raised questions about whether the controls would be entity specific and changed over time. They also raised questions about the timing of the FFT triage process.

Risk-based Registration Assessment Project

Mr. Cauley provided some history on the development of the current registration criteria, noting that the current registration framework does not differentiate between entities that present different levels of risk. He noted that, overall, the desire is to get the scope of work and programs so they can be efficiently applied to get reliability benefit without creating excess burden. The objective of this initiative is to gain clarity on whether there is a better design that will allow scope to be tailored based on risk and to benefit reliability.

This initiative was introduced at the January MRC Informational Session. A survey was distributed to industry with responses due by February 28, 2014. The near-term objective is to develop a whitepaper to be presented at the May meeting, which would identify the issues and lay out a potential framework. At the November meetings, a final proposal and transition plan would be presented.

Attendees shared comments related to this update:

- Industry strongly supports this initiative and how to address smaller entities that have minimal, if any, impact on the BPS in order to determine actual vulnerability. It was recommended to define minimal impact.
- Some suggested changes to the compliance registry document include consistent use of BES, BPS, or greater than 100 kV, define terms that may be interpreted differently across the regions, and include a formal de-registration process.
- NERC is recommended to review the applicability in all Reliability Standards to ensure appropriate applicability.

- NERC is encouraged to ensure that this initiative does not become too complex and tie up too many resources.
- A suggestion was made to do a search on whether there are good risk models used in other industries that could be used with this initiative.

Definition of BES Implementation Discussion

Tom Burgess provided a brief overview of this item, specifically the three-step process of applying the definition, considering inclusions, and considering exclusions, and processes for making exception requests and self-notifications. He noted that it is a bright-line approach and the goal is to have a stable foundation of understanding what the BES elements are to know standard applicability, compliance, and other functions that are important to ensure reliability. NERC staff is working towards making several reference documents available in a common location to address questions that have been raised and to assist industry in the implementation.

Mr. Burgess noted that questions were raised during the MRC informational session regarding dispersed generation individual units and large end-use customers. He noted that a Standard Authorization Request has been received that is directed at helping to provide long term certainty around the applicability of standards in the dispersed generation setting. With respect to large end-use customers, additional information was provided about how the 50kV threshold came about and what the implications are in terms of considering either industrial facilities or other situations where there are radials connected by systems that are below 100 kV.

The transition from work underway to deployment and implementation will be completed by July 1, 2014. NERC staff is conducting significant outreach and will make information available on processes and tools to reach consistent and uniform determinations on BES elements. NERC and ERO staff will receive training to ensure there is a common perspective, and Registered Entities will receive training to provide a good understanding of how to use the various reference materials and tools. NERC staff expects to complete most of the training for ERO staff in March and expects to begin training for industry in April.

Mr. Burgess reminded industry that the new definition becomes effective on July 1, 2014, and newly identified elements need to be in compliance by July 1, 2016.

Attendees shared comments related to this update:

- NERC is urged to be very clear on the expectations of the process for reporting self-determinations, including the expectations of the Regional Entities. Further, clarification is needed regarding the compliance status of an element that a Registered Entity submits as an exclusion where the Regional Entity disagrees with that determination.
- Clarification was given that notifications are required for any newly identified elements as a result of the new definition. For situations where more information is needed about particular application of the definition, there are specific provisions in the various processes to handle

these and it is expected that Regional Entities will work with the Registered Entities to resolve questions.

- There are some entities that don't know NERC and may have facilities that will get swept in with the bright-line definition. If any of these entities become registered, applicability begins at the time of registration and not retroactively.
- Some stakeholders asked for clarity on when the two-year "clock" begins. Mr. Burgess clarified that the two-year clock begins on July 1, 2014, for newly identified elements.
- There may be situations where an element that was previously classified as a BES element is determined to be excluded under the new definition and there is a question regarding how granular the support for the excluded element would need to be. This information will be included in the reference documents and in the various training sessions.
- An MRC member noted that dispersed power producing resources are not determined to be BES unless they aggregate to over 75 MW.

Five-Year Performance Assessment Update

Rebecca Michael, associate general counsel at NERC, reported that with respect to the instant survey the number of responses doubled as compared to responses for the previous performance assessment report. For this second performance assessment report, the survey was issued first and there will be an opportunity for industry to provide comments on the report, which will be due in April. The draft report will be reviewed at the May MRC and Board meetings with the final report expected to be filed with FERC in July. Ms. Michael reported on the highest and lowest average scores with respect to various areas, the lowest averages for enforcement, registration and certification, reliability assessments, and critical infrastructure protection. She highlighted nine overarching themes that will be addressed in the report.

Regulatory Update

Charles Berardesco, senior vice president and general counsel at NERC, invited questions or comments regarding the regulatory report which highlights Canadian affairs as well as past and future significant FERC filings.

Future Meetings

The following are future dates for the MRC Pre-Meeting and Informational Sessions:

- July 16, 2014
- October 15, 2014

The following are future NERC Board and MRC meeting dates and locations:

- May 6-7, 2014 – Philadelphia, PA
- August 13-14, 2014 – Vancouver, Canada
- November 12-13, 2014 – Atlanta, GA

- February 11-12, 2015 – San Diego, CA
- May 6-7, 2015 – Pentagon City, VA
- August 12-13, 2015 – Toronto, Canada
- November 4-5, 2015 – Atlanta, GA

Adjournment

There being no further business, the meeting terminated at 4:36 p.m., Mountain.

Submitted by,

Kristin Iwanechko
Secretary

May 6, 2014

Future Meetings

Action
Information

Summary
The following are the future meeting dates for 2014 and 2015. The dates for the 2014 Pre-Meeting and Informational Sessions conducted via conference call and webinar are also included below.

2014 Dates

July 16	Pre-Meeting and Informational Session
August 13-14	Vancouver, Canada
October 15	Pre-Meeting and Informational Session
November 12-13	Atlanta, GA

2015 Dates

February 11-12	San Diego, CA
May 6-7	Pentagon City, VA
August 12-13	Toronto, Canada
November 4-5	Atlanta, GA

Agenda Item 3
MRC Meeting
May 6, 2014

Recommended Slate of Stakeholder-based Members to the Reliability Issues Steering Committee

Action

Endorse slate of stakeholder-based members to serve on the Reliability Issues Steering Committee (RISC) for two-year terms.

Summary

The RISC charter states "In advance of their annual May meetings, the NERC Board and the MRC will form a nominating committee to solicit a pool of candidates… [a]t its May meeting each year, the MRC shall review and recommend to the Board a slate of stakeholder-based members to the RISC."

Pursuant to this language, a RISC nominating committee was formed, consisting of Sylvain Clermont, vice chair of the MRC; Gerry Cauley, president and CEO of NERC; Ken Peterson, chair of the Standards Oversight and Technology Committee; and Bob Schaffeld, chair of the RISC. Nominations were solicited in March 2014. The nominating committee reviewed a number of candidates and evaluated them based on general experience and qualifications, as well as diversity within the context of the entire membership of the RISC. The nominating committee recommends MRC endorsement of the following slate of stakeholder-based members to serve on the RISC for two-year terms ending May 2016.

Name	Title and Company
Daniel Froetscher, At-Large Member	Senior Vice President, Transmission, Distribution, and Customers, Arizona Public Service Company
Ray Gorman, At-Large Member	Chairman, New Brunswick Energy and Utilities Board
Scot Hathaway, At-Large Member	Vice President – Transmission, Dominion Virginia Power
Duane Highley, At-Large Member	President and CEO, Arkansas Electric Cooperative
Nabil Hitti, MRC Member	Vice President, Transmission Network Operations, National Grid
Steve Whitley, At-Large Member	President and CEO, New York ISO

Agenda Item 4
MRC Meeting
May 6, 2014

Request for MRC Members to Serve on the Board of Trustees Nominating Committee

Action

Request for MRC member volunteers to serve on the nominating committee for 2014.

Background

On May 6, 2014, Chair Anderson will ask the MRC for volunteers to serve on the Board of Trustees Nominating Committee (BOTNC) for 2014. The BOTNC will recommend nominees for election/re-election to the NERC Board of Trustees (Board) at the Member Representatives Committee meeting in February 2015. Janice Case will chair the BOTNC for 2014.

Agenda Item 5
MRC Meeting
May 6, 2014

Responses to the Board's Request for Policy Input

Action
Discussion

Background
The policy input letter is issued by the Chair of the NERC Board of Trustees (Board) four weeks in advance of the quarterly meetings and includes relevant materials necessary to inform discussion. Written input from the MRC and stakeholders is due one week before the meetings and is then revisited during a dedicated discussion time on the MRC's agenda, in the presence of the Board.

Status
On May 6, 2014, the MRC can expect to participate in further discussion of the responses received to the policy input request that was distributed on April 9, 2014.

Deadline for submitting policy input responses is **April 29, 2014** and should be sent to Kristin.Iwanechko@nerc.net

In addition to the information provided in the policy input letter on the Risk-Based Registration initiative, a supplemental update is also enclosed.

MRC Meeting
May 6, 2014

Risk-Based Registration Initiative Supplemental Update

Action
Information

Background
NERC launched the Risk-Based Registration (RBR) initiative in 2014 to ensure that a common approach to identifying and evaluating risks to reliability is used consistently throughout the ERO Enterprise. NERC has always included risk evaluation as part of its programs, procedures and policies, and over the last seven years, the risk evaluation has become more formalized and mature. This initiative will address industry registration and reduced industry compliance burden, while supporting NERC and Regional Entities to: 1) identify who should be registered and who should not be registered - according to their risk to reliability; and 2) refine the criteria needed to make decisions to register and a basis to determine the appropriate sub-lists of applicable Reliability Standard requirements.

Summary
The registration program is the key to what triggers mandatory compliance by an entity with Reliability Standard requirements and associated compliance monitoring and enforcement activities. NERC believes that the ultimate end-state vision for the registration program should be to ensure the right entities are subject to the right set of applicable Reliability Standards, using a consistent approach to risk assessment and registration across the ERO Enterprise.

Formation of Advisory Group
In 2014, NERC established a RBR Advisory Group (RBRAG) to provide input and advice on the RBR design and implementation plan. The RBRAG is comprised of representatives from NERC staff, Regional Entity staff, and Federal Energy Regulatory Commission staff, along with U.S. and Canadian industry representatives.

Status Update
The RBRAG has met for two full-group discussion and planning meetings. During the in-person meeting on March 28, 2014, the RBRAG agreed that some functions should remain untouched, while others required enhancement. RBRAG divided into working sub-groups, each group focused on specific registered functions, to review potential elimination or threshold enhancements. These sub-groups met during the first week of April 2014, in order to frame problems, outline possible solutions, and refine the criteria needed to make decisions to register for those functions. Based on the proposals developed during the sub-group meetings, the RBRAG developed a draft white paper of proposed enhancements to the NERC Registration program. The draft white paper was included in the NERC request to the Member Representatives Committee (MRC) for policy input.

After discussion during the MRC Informational Session and at the MRC meeting in May, a draft design and implementation plan will be posted for public comment. Taking into account public

comments on these two documents, the RBRAG will complete enhancement of the design and implementation plan by mid-July, will post these documents for MRC policy input and present the products for discussion at the Board of Trustees Compliance Committee (BOTCC) and MRC meetings in August.

The design will incorporate evaluation of the risks and benefits provided by a given entity to ensure reliability, and will identify a corresponding properly tailored set of NERC Reliability Standard requirements for certain functional categories, as warranted. The design will also include an implementation plan supporting a 2016 or sooner launch, along with business practice and IT requirements, with the possibility of early adoption options. These options result in addressing industry burden, while preserving reliability of the Bulk Power System. The second stage will address any remaining non-design issues or issues requiring a longer lead-time.

Existing flexibility in the application of threshold criteria, the Functional Model categories and scaled sets of applicable Reliability Standards may provide opportunities for accelerated reform within the existing NERC Rules of Procedure (ROP). However, possible modifications to the ROP are being assessed and will be pursued as necessary.

The final versions of registration criteria, implementation plan, and any necessary ROP changes will be presented to the BOTCC and MRC in November with an anticipated filing date at the end of that month.

Washington, DC 20036

Re: May 2014 Policy Input to NERC Board of Trustees

Dear John:

I would like to invite the Member Representatives Committee (MRC) to provide policy input on three issues of particular interest to the Board of Trustees (Board) as it prepares for the meetings on May 6-7, 2014, in Philadelphia, PA. We recognize many of those on the MRC are involved with numerous important NERC activities, including the development of the physical security standard, and would appreciate your thoughts on these additional matters of importance. Enclosed with this request is additional background information to help MRC members solicit inputs from their respective sectors. The three issues are:

Item 1: Reliability Standard Audit Worksheet (RSAW) Review and Revision Process
At the February MRC meeting, there was a discussion about developing a review and approval process for changes to RSAWs to ensure that a change does not materially change the scope or intent of a standard. A working group was formed with representation from the MRC, NERC staff, and the Board to develop a proposal to be presented at the May meetings. The working group developed a proposed process to vet proposed changes to an RSAW that is already in place for an existing standard (*see,* **Attachment A**). **The MRC is encouraged to provide feedback on the proposed process and, specifically, whether it addresses the concerns raised during the February meetings.**

Item 2: Risk-Based Registration Assessment
The April 9, 2014 MRC Informational Session agenda materials include an update on the Risk-Based Registration (RBR) Initiative launched in 2014 (*see* Agenda Item 4b). The RBR Initiative is assessing the current registration criteria and practices to ensure the right entities are subject to the right set of applicable Reliability Standards, using a consistent and common approach to risk assessment and registration across the ERO Enterprise. NERC has established a RBR Advisory Group (RBRAG) to provide input and advice for the RBR design and implementation plan. The RBRAG is comprised of representatives from NERC staff, Regional Entity staff, and Federal Energy Regulatory Commission staff, along with U.S.

and Canadian industry representatives. A whitepaper has been developed by the RBRAG to identify issues that need to be addressed in the ultimate design. **At this formative stage in the project, the MRC is encouraged to provide feedback on the draft whitepaper** (*see,* **Attachment B**), **specifically around the following questions:**

1. **The whitepaper sets out several objectives for this initiative. Do you agree with these objectives and are there any other considerations you would suggest?**
2. **Is the use of multiple thresholds, as discussed in the whitepaper, a prudent approach to determining whether an entity should be registered and do you believe this may cause any unintended consequences?**
3. **Are there any other considerations not identified in the whitepaper that you believe need to be factored into this initiative?**

The RBR design and implementation plan are targeted to be posted in late May 2014 for public comment. Further, based on the current plan, the Registration program redesign and implementation plan will be discussed at the MRC and Board committee meetings in May and August 2014, and approved at the Board's November 2014 meeting.

Item 3: Potential Alternative Funding Mechanism to Support Expanded Cyber Security Information Sharing and Capabilities

The Electricity Sector Information Sharing and Analysis Center (ES-ISAC) was formed in 1998 when the Secretary of Energy requested that NERC serve as the ISAC for the electricity sub-sector. ES-ISAC's primary function is the rapid and secure sharing of information with the electric industry and governmental entities regarding real and potential cyber-related threats to the electricity sector, as well as methods and tools to avoid or mitigate the potential impact from these threats.

During the final stages in the preparation of NERC's 2014 budget, a new opportunity was identified which would allow ES-ISAC to further improve its information sharing capability by participation alongside industry in a voluntary private sector funded cyber security communication and information sharing network. This project is known as the "Cyber Federated Model" (CFM) and "Cyber Risk Information Sharing Program" (CRISP), the purpose of which is to deliver a highly secure information sharing network utilized to identify, track and deploy fixes to emerging cyber security threats. It was initially funded by the Department of Energy, has been successfully piloted by several large investor owned utilities and is in the process of being transitioned to private-sector funding. NERC deferred a decision to participate in this program pending further investigation of the program structure and costs. Over the past six months NERC conducted further due diligence regarding both the structure and costs and believes there is merit in considering participation as part of NERC's upcoming draft 2015 business plan and budget. The primary value to NERC stakeholders of having ES-ISAC participation in CFM and CRISP is the ability to share additional timely information on threats and vulnerabilities with a broader segment of industry that is not directly participating in the program and therefore would not have access to this information. Issues and

trends discovered through CFM and CRISP participation would be shared without attribution. However, in light of the costs of participation in the program, which involves investments in hardware, additional secure communications capabilities and increased analytical resources and services, NERC is interested in exploring the potential for obtaining voluntarily direct funding from industry as a special project in order to mitigate assessment impacts from program participation. This would represent a new funding approach to a special reliability project which is designed to benefit the entire sector. **The Board requests input on this alternative funding approach.**

As a reminder, the full agenda packages for the Board, Board committees and MRC meetings will be available on April 21, 2014. I encourage the MRC to review the agenda materials for the May meetings, once available, and offer any additional input that is meaningful and timely to industry and stakeholders.

Written comments should be sent to Kristin Iwanechko, MRC Secretary (Kristin.Iwanechko@nerc.net) by **April 29, 2014** for the Board to review in advance of the meetings scheduled for Philadelphia.

Sincerely,

Fred W. Gorbet, Chair
NERC Board of Trustees

cc: NERC Board of Trustees
Member Representatives Committee

Reliability Standard Audit Worksheet (RSAW) Review and Revision Process

Objectives

There are several key principles that must be balanced in constructing the RSAW review process:

1. The RSAW is intended to be a tool to assist the ERO in conducting its audit field work and to enable a consistent approach throughout the ERO Enterprise.
2. The ERO is committed to making RSAWs publicly available to industry as part of the standards balloting process to provide a level of transparency about the compliance expectations for the standard.
3. The ERO must have the latitude to modify RSAWs as experience is gained in the field over time.
4. The purpose of the RSAW review process is to ensure that any proposed change to an RSAW does not effectuate a material change in the scope or intent of a standard.

Proposed Process

A simple process to achieve these objectives would be as follows. The process will be used to vet proposed changes to an RSAW that is already in place for an existing standard.

1. NERC will post any substantive revision to an RSAW for industry comment for a period of at least 15 business days before it becomes effective. The posting will state whether the changes are intended to apply to current open audits or only to audits commencing on or after the effective date. Comments should focus on whether industry believes the proposed changes to the RSAW are a material change in the scope of the standard, a technical error or a concern regarding the effective date.
2. NERC, along with the Regions, will review the comments and may propose additional revisions to the RSAW to address industry comments. If revisions are made, NERC will re-post the RSAW for industry comment for an additional 15 business days.
3. NERC will forward any remaining comments not accepted, along with its rationale, to the Chair of the Standards Oversight and Technology Committee (SOTC). The Chair of the SOTC will decide whether a review by the full SOTC is necessary and will take into consideration the following:
    a. Whether a technical error or inaccuracy is identified in the proposed change;
    b. the proposed change incorrectly expands what is required by the standard's requirements; or
    c. the effective date for the proposed changes increase compliance requirements retroactively.

4. The Chair of the SOTC will take one of the following actions:
    a. No action required. The RSAW will go into effect on its proposed effective date.
    b. Forward the proposed RSAW revisions for review by the full SOTC. The proposed revisions to the RSAW will not go into effect.
5. The SOTC will perform a similar review for any RSAW referred to it. NERC will implement the SOTC's findings as to whether additional changes to the RSAW are required or if the RSAW may go into effect as drafted.

Preface

This document sets forth recommendations for proposed enhancements to the North American Electric Reliability Corporation (NERC) Registration program for discussion purposes. Proposed changes to the NERC Statement of Registry Criteria[1] as outlined herein will not result in an automatic change to such functional categories in the Functional Model.[2]

Pursuant to the Energy Policy Act of 2005, NERC and the Federal Energy Regulatory Commission (FERC or Commission) have jurisdiction over users, owners and operators of the Bulk Power System (BPS). Section 215 of the Federal Power Act (FPA) defines BPS as the:

A) facilities and control systems necessary for operating an interconnected electric energy transmission network (or any portion thereof); and

B) electric energy from generation facilities needed to maintain transmission system reliability.

The term does not include facilities used in the local distribution of electric energy.

To date, FERC has not directly defined the limits of its jurisdiction under Section 215 of the FPA. However, FERC has recognized that users, owners and operators of the BPS are users, owners and operators of the Bulk Electric System (BES).[3] FERC recently approved NERC's new BES Definition.[4] Users, owners and operators of the BES are subject to compliance with NERC Reliability Standards. NERC's Registration program identifies specific entities that are responsible for compliance with NERC Reliability Standards.

Nothing in this document limits the jurisdictional authority of NERC and FERC pursuant to the Energy Policy Act of 2005 and Section 215 of the FPA.

[1] NERC Rules of Procedure at Appendix 5B, *NERC Statement of Registry Criteria* (Registry Criteria), available at http://www.nerc.com/FilingsOrders/us/RuleOfProcedureDL/Appendix_5B_RegistrationCriteria_20121220.pdf.

[2] The Implementation Plan associated with this effort will address issues related to the Functional Model.

[3] The term BES does not include facilities used in the local distribution of electric energy.

[4] *See* Appendix C hereto.

Executive Summary

NERC has launched the Risk-Based Registration (RBR) Initiative to ensure that the right entities are subject to the right set of applicable Reliability Standards, using a consistent approach to risk assessment and registration across the Electric Reliability Organization (ERO) Enterprise. The goal is to develop enhanced Registry Criteria, including the use of thresholds and specific Reliability Standards applicability, where appropriate, to better align compliance obligations with material risk to the BES reliability. The proposed enhancements reduce unnecessary burdens by all involved, while preserving BES reliability, and avoid causing or exacerbating instability, uncontrolled separation, or cascading failures. All reliability stakeholders should benefit from RBR.

NERC has established a Risk-Based Registration Advisory Group (RBRAG) to provide input and advice for the RBR design and implementation plan. This white paper is a starting point for discussion and includes input from the RBRAG. Conceptually, there appears to be general agreement on the need to have: (i) clearly defined terms, criteria and procedures that are risk-based and ensure reliability of the BES, (ii) refined thresholds, where warranted, based on sound technical analysis and support, and (iii) reduced Reliability Standard applicability, where warranted, based on sound technical analysis and support.

Taking into account experience to date and current practices, the white paper explores possible options for reform of the NERC Registration program. Other options may exist. The instant options would:

- eliminate up to two functional categories that may not be material to BES reliability;
- revise the thresholds for registration of two functions to better align with risk;
- for selected functions, move away from a "one-size-fits-all" approach by using risk-based criteria to define classes of Registered Entities for application of a properly scoped subset of applicable Reliability Standard requirements;
- develop a consistent approach to determining materiality and fine-tuning registration determinations to include or exclude entities where generally applicable thresholds do not accurately reflect the BES reliability risk posed by a particular entity, along with enhanced ERO-wide processes and procedures for registration and de-registration; and
- identify associated business practices and IT requirements.

There are several possible options, three of which were explored by the RBRAG, to facilitate the implementation of the RBR. These options may be used together or separately. These approaches need more discussion and analysis to consider the most effective and efficient way forward:

1. The Compliance Monitoring and Enforcement Program (CMEP) approach involves establishing that certain requirements do not apply to a Registered Entity, based on uniform characteristics.
2. A Materiality approach involves using the existing thresholds, at their current levels or revised as appropriate, but providing more specificity on the risk-based criteria an entity would use to demonstrate that it no longer needs to be registered for a given function.
3. Revising Reliability Standards is another option. Under the Reliability Standards approach, Reliability Standard requirement applicability classes refer to applying subsets of Reliability Standard requirements to subcategories of certain functions of Registered Entities, and not developing a custom tailoring of applicability for each individual registered entity.

This white paper also includes several "straw" proposals for RBR reforms to the Registry Criteria and Reliability Standard applicability for consideration and further evaluation. Technical analyses in accordance with Section 215 of the FPA will be required to identify any reliability implications or gaps resulting from these proposals. The new

BES Definition also will be central to the analysis to be conducted. Jurisdictional issues are presented by tariff, interconnection agreement and NAESB standard options, and reliance on these is not a substitute for the technical analysis to be conducted. An industry survey will be used to identify issues to be considered as part of the technical analysis.

Feedback on the concepts outlined within the white paper will help inform the ultimate RBR design and related implementation plan. The draft RBR design and implementation plan will be posted in May 2014 for public comment. Based on the current plan, the Registration program redesign and implementation plan will be discussed at the Member Representatives Committee's (MRC's) and NERC Board of Trustees' (Board's) committee meetings in May and August 2014, followed by approval at the Board's November 2014 meeting. The schedule allows for modifications to the NERC Rules of Procedure, as needed, in the third quarter of 2014. NERC requests that stakeholders consider the following questions as they develop comments on the white paper and provide input on the end-state Registration program reform and redesign.

- Have all RBR design elements been covered? If not, what are the other elements?
- Which options should be considered to best facilitate RBR implementation?
- Have appropriate modifications to the functions requiring registration and thresholds for Registry Criteria been identified for further examination? How should they be revised to achieve the risk-based objective while being complete, clear, not unduly complex, and repeatable?
- How should classes of Reliability Standard requirement applicability be set to achieve the risk-based objective, while being complete, clear, not unduly complex, and repeatable? Is the initial identification of Reliability Standard applicability for the lesser risk class appropriate to ensure BES reliability? Please explain.
- Are there other registration reforms that should be considered? If so, please elaborate.
- Are there additional detailed facts and circumstances that influence risk that support an entity's risk assessment in determinations that are above or below the thresholds?
- What technical studies should be completed to justify the threshold changes objectively?

Introduction

Background

NERC launched the RBR Initiative in early 2014, following on the heels of reform in the Reliability Standards program, as well as the Compliance Monitoring and Enforcement programs. The purpose of the Registration program is to identify those entities that are responsible for compliance with the FERC-approved Reliability Standards. NERC's Registration program is set forth in Section 500 of the NERC Rules of Procedure,[5] as well as Appendices 5A and 5B. Notably, NERC registers entities, not facilities. Approximately 1,900[6] entities are registered on NERC's Compliance Registry (NCR) for approximately 4,800 functions.

Pursuant to the NERC Rules of Procedure and its appendices, the Regional Entities identify candidates for registration. In addition, Regional Entities review and evaluate entity registration requests and changes and make recommendations to NERC when a request or change may affect the NCR.

Users, owners and operators of the BPS are required to register, and NERC and the Regional Entities may identify additional entities that should be registered. An entity may be registered in one or more appropriate functional categories and is responsible for complying with the Reliability Standards applicable to the functional categories in which it is registered.[7] If an entity is not listed on the NCR, it is not legally required to comply with Reliability Standards.[8]

The significant experience of NERC and the Regional Entities to date in implementing the Registration program will help inform enhancements to the Registration program.[9]

Purpose

NERC has launched the RBR Initiative to ensure that entities are properly registered and subject to the right set of applicable Reliability Standards to ensure reliability of the BPS. The RBR initiative uses a consistent approach to risk assessment and registration across the ERO Enterprise. The goal is to develop revised Registry Criteria and Reliability Standard applicability, where appropriate, to better align compliance obligations with risk to BES reliability. These enhancements are designed to reduce unnecessary burdens on all involved, while preserving BES reliability and avoid causing or exacerbating instability, uncontrolled separation, or cascading failures.

The goals of the NERC RBR Initiative are twofold. The first is to develop and deploy a sustainable Registration program design that incorporates evaluation of the reliability risks and benefits provided by an entity to ensure reliability, and where appropriate, define classes of Registered Entities for application of a properly scoped set of Reliability Standard requirements. The second goal lays a foundation for the first goal by creating an implementation plan that supports a 2016 or sooner launch, along with business practices and IT requirements, with the possibility of early adoption options that can address undue industry burden, while also preserving reliability.

---

[5] *See* http://www.nerc.com/FilingsOrders/us/RuleOfProcedureDL/NERC_ROP_Effective_20140130.pdf

[6] The number of unique Registered Entities is 1,652, and they are responsible for 4,427 registered functions. Because some Registered Entities are in multiple footprints, the total number of Registered Entities is 1,921, and they are responsible for 4,784 registered functions. This white paper will use 1,900 Registered Entities.

[7] *Mandatory Reliability Standards for the Bulk-Power System*, Order No. 693, FERC Stats. & Regs. ¶ 31,242 at P 96, *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

[8] Order No. 693 at P 97.

[9] *See* Appendix B for additional discussion of the current NERC Registration program, Functions, Functional Model, Regional Entity roles, and Thresholds.

The white paper will be released for public comment as part of the NERC request for MRC's policy input in April 2014. Further, based on the current plan, the Registration program redesign and implementation plan will be discussed at the MRC and Board committee meetings in May and August 2014, and will be approved at the Board's committee meeting in November 2014.

Benefits of deploying an RBR program include:

- aligning entity registration and compliance burden to its risks and contributions to BPS reliability;
- reducing the industry burden associated with registration, while sustaining continued BPS reliability;
- improving use of NERC, Regional Entity , and Registered Entity resources;
- providing feedback to Reliability Standards development to enhance the applicability of currently enforceable and future Reliability Standards; and
- increasing consistency in registration across the eight Regional Entities by developing a common and repeatable approach, along with improving registration and de-registration procedures.

In addition, coordination of this effort will enhance the ERO's ability to:

- evaluate risks to reliability for use across the ERO Enterprise; and
- align changes to the Registry Criteria with other NERC activities and the BES Definition.

RBR will include the use of consistent terminology, a common approach to criteria application, appropriate oversight and improved procedures.

Formation of an advisory group

In 2014, NERC established the RBRAG to provide input and advice for the RBR design and implementation plan. The RBRAG is comprised of representatives from NERC staff, Regional Entity staff and FERC staff, along with United States and Canadian industry representatives. This white paper was developed with input from the RBRAG, industry responses to a focused survey, and assessment of information about the current Registration program attributes.

Recommendations

Clarify terms and improve current procedures

Materiality

The issue of materiality arises in evaluating whether to register an entity that does not meet the criteria or to determine not to register an entity that meets the criteria. Further, materiality assessments can come into play in connection with assigning Registered Entities to appropriate classes of Reliability Standard applicability (discussed in more detail below). Thus, RBR recommends a consistent approach to assessing materiality.

The RBR design should take into account risk assessment considerations across the ERO Enterprise. Generally, the ERO risk assessment involves a review of individual and aggregate system-wide risks and considerations that include the inherent or structural risk to reliability of the BPS, as anchored in the new BES Definition.

BES references

The proposed changes include revising references from BPS to BES in specific threshold criteria; however, such changes would not apply when discussing NERC and FERC jurisdiction over the BPS. Moreover, flexibility to register entities that do not meet threshold criteria will be retained in the Registry Criteria, in recognition of the jurisdiction of NERC and FERC over users, owners and operators of the BPS.

General terms

As part of the RBR effort, NERC will ensure the terms used in the Registry Criteria are clear and defined.

De-registration

An entity seeking to modify its current registration, including de-registration for a particular function, must inform its applicable Regional Entity. The Regional Entity will evaluate the request and notify NERC of any resulting registration changes. The new BES Definition has raised general questions on the procedures and associated timelines for pursuing de-registration of a given function. RBR includes better visibility, clarity, instruction and feedback in this process, as well as additional, improved registration and de-registration procedures and timelines.

NERC oversight and guidance on registration practices

NERC retains responsibility and oversight to ensure that a Regional Entity implements the Registration program in a consistent manner. Towards this end, the RBR redesign should ensure that NERC is periodically performing programmatic reviews of the Regional Entities' registration activities to ensure uniformity in due process and consistency in application. This will include development of controls to ensure consistency.

Possible improvements to the program include, but are not limited to:

- sampling and auditing of Regional Entity application of RBR classes and individual entity application;
- using surveys to reach out to Registered Entities as a means of identifying that a given entity is registered for the proper functions;
- using ongoing outreach to Registered Entities on registration issues; and
- mapping entities within each Regional Entity footprint to ensure awareness of entities that may have a material impact on BEPS reliability.

One-time attestations

As the CMEP is currently implemented, a Registered Entity may be subject to a requirement that is nominally applicable based on functional entity registration, but inapplicable based on specific facts (e.g., a coordinated functional registration agreement, entity does not own that type of equipment, etc.), must attest (with full documentation and citations), at every contact with ERO compliance, that the requirement is still inapplicable. To

reduce undue administrative burdens on the many entities subject to compliance with particular requirements that are inapplicable to them, two improvements can be implemented in the short-term.

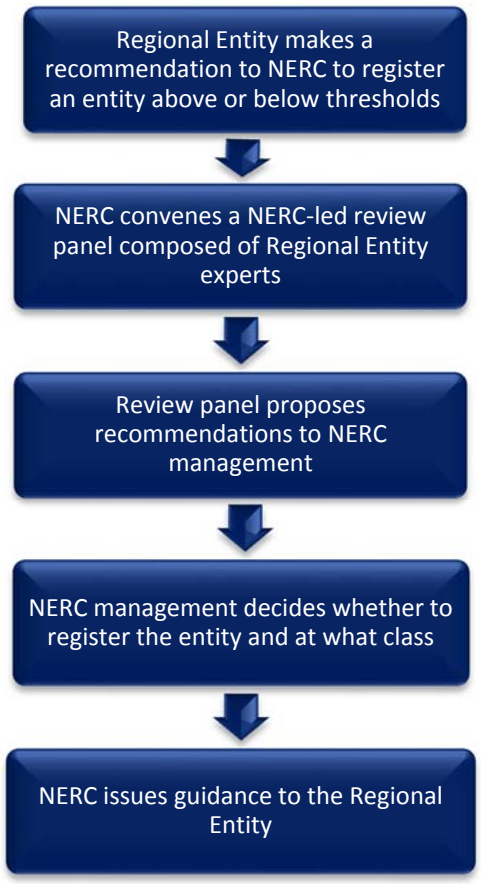
First, with respect to self-certifications and other compliance monitoring activities, Registered Entities should be permitted to record a one-time attestation of "Not applicable" to a given Reliability Standard requirement where there is an existing physical or technical limitation, or the requirement is not applicable for another reason, unless circumstances materially change requiring the need for the registered entity to notify the appropriate Regional Entity. For example, if the registered entity does not own or operate underfrequency load shedding (UFLS) or undervoltage load shedding (UVLS) assets, it should simply use the "Not applicable" designation. The Regional Entity will then carry forward this declaration from year-to-year, without requiring the registered entity to repeat the attestation each year. NERC or the Regional Entity would have the ability to audit to verify the recordation is correct, on an as needed basis, but this should be infrequent. In addition, NERC and the Regional Entities should allow Multi-Regional Registered Entities (MRRE) to use a single, one time attestation, updated as needed to reflect material changes, which would apply to all of its registration and compliance monitoring activities across North America, regardless of the Regional Entity footprint in which it operates. In such a case, NERC and the Regional Entities would have the opportunity to audit to verify the single attestation is true and correct.

Establish a centralized review process

NERC intends to establish a centralized, NERC-led review process to address questions or issues that arise with respect to threshold application, materiality, or Reliability Standard requirement applicability. This process will include a panel comprised of a NERC lead with Regional Entity participants. The review panel will vet the issues and provide recommendations to NERC. Once a decision is made, it will be shared throughout the ERO Enterprise. The RBRAG expects this to result in consistency across the ERO Enterprise with respect to threshold, materiality, or applicable Reliability Standard class determinations. In addition, improved procedures, with defined timelines, would be established for registration and de-registration, as well as Reliability Standard applicability class determinations and associated appeals.

The flow diagram (Figure 1) provides a high-level view of some of the steps that might be incorporated into the final RBR design. The goal is to provide a foundation for consistent decision-making and application of the criteria and thresholds.

Figure 1: Flow chart of High-Level Review



Entity risk assessment in a common registration form

The Registration and Certification Functional Group is currently developing a common registration form to help drive consistency in registration. The common registration form is pending consideration as part of the ERO Enterprise applications. The RBR provides an opportunity to finalize and implement the common registration form for use by NERC, Regional Entities, and Registered Entities. The use of a common form will facilitate uniformity in the information being collected from registration candidates regardless of where they are located in North America. The common form is intended is to capture, without undue complexity, key factors relevant to an assessment of an entity's inherent risk. Inherent risk is a function of an entity's various registrations and other relevant factors like its system design, configuration, size, etc.).

The RBR redesign must necessarily address potential impacts on business processes and tools needed to support RBR both within the ERO Enterprise and in industry. RBR recommends exploring use of a single, web-based design. In the interim, changes to the portals and various electronic forms used by NERC and the Regional Entities will need to be adapted to take into account Reliability Standard applicability classes. This will affect compliance monitoring and enforcement activities and will need to be addressed as part of the implementation plan.

In addition, entity risk assessments should take into account information from "neighbor" surveys that Regional Entities issue to Reliability Coordinators (RCs) as part of certification and other activities to ensure coordination with adjacent entities. This survey approach also may increase awareness and tracking by NERC, Regional Entities and RCs of entities within each RC's footprint and help identify needed revisions to an entity's registration.

New BES Definition as model and anchor for risk-based registration

The new BES Definition goes into effect on July 1, 2014 and includes processes for self-determined exclusions and inclusions, as well as exception requests to add elements to, or remove elements from, the BES on a case-by-case basis. The new BES Definition and exception process may resolve, to some extent, the treatment of facilities that are not necessary for the reliable operation of the BPS. However, the revised BES Definition does not eliminate NERC flexibility to decide that registration is not warranted in particular cases, or to restrict the applicability of standards to entities owning or operating limited BES Facilities, where appropriate.

The BES Definition is important to the RBR for two reasons. First, the structure of the BES Definition, approved by FERC, may prove to be a useful model for the RBR. It begins with a bright-line threshold that identifies most facilities that are part of the BES, and then layers on clear exclusions and inclusions that address the most common configurations not adequately captured by the bright-line threshold. Combined, the bright-line, exclusions, and inclusions address the vast majority of elements that should be part of the BES, but elements can be included or excluded from the BES through a case-by-case exception process. The reformed registration process should similarly include revised thresholds, with a case-by-case process to adjust registration (by inclusion or exclusion) where warranted based on a materiality determination that takes into account circumstances not captured by the revised thresholds.

Second, the new BES Definition serves as an anchor for Registry Criteria. While the statutory term BPS sets the outer limit of NERC authority, it has not been defined. Now that the BES is clearly defined, the term can be used to determine on a consistent basis the entities that warrant registration and assess material impact on reliability. For this reason, the straw proposals included as Appendix A for revising Registry Criteria incorporate the BES Definition.

Functional registration category elimination if not material to reliability

NERC reviewed information from various sources to determine if any of the functional categories could be eliminated as part of the RBR redesign. Three have been identified: 1) Regional Reliability Organizations,[10] 2) Purchasing-Selling Entities (PSEs), and 3) Interchange Authorities (IAs). As described in the Appendix A, based on an initial evaluation of risk to BES reliability, elimination of the PSE as a functional registration, which includes some 446 entities, appears promising, although further examination is required. In the event a particular function is determined not to be material to reliability going forward, NERC will evaluate the associated Reliability Standard requirements to determine if accountability for those requirements should be assigned to another function, or

[10] Currently, NERC is eliminating references to Regional Reliability Organization in the NERC Reliability Standards. As a result, the RBR redesign will not include this term.

consider elimination of the requirement with assessment with NERC's Standards Committee, similar to the Paragraph 81 effort.

Synchronize threshold revisions with BES Definition and align with risk

Another approach is to modify current registration thresholds for certain functions. Entities have contended that the current thresholds are too low and sweep in a large number of entities that pose little or no risk to reliability. In addition, the current Registry Criteria reference the BPS, rather than the new BES Definition, creating a lack of clarity and potential for inefficiency and confusion that has no place in a risk-based approach to registration.

Appendix A includes several straw proposals to revise the Registry Criteria for Distribution Provider (DP), Load-Serving Entity (LSE), Transmission Owners and Transmission Operators (TOs and TOPs), and Generator Owners and Generator Operators (GOs and GOPs), to more clearly anchor them in the new BES Definition. In addition, the straw proposals for DP, LSE, and TO/TOP include potential revisions to the registration thresholds to better align with risk. The revised thresholds would be subject to a case-by-case process (modeled after the BES exceptions process) to allow for registration of entities that do not meet the threshold criteria or de-registration of entities that satisfy those thresholds, based on a determination of materiality.

Reliability Standards / compliance and monitoring / risk-based criteria

There are several possible options, three of which were explored by the RBRAG, to facilitate the implementation of the RBR. These options may be used together or separately. These approaches need more discussion and analysis to consider the most effective and efficient way forward.

One option, a CMEP approach, involves establishing that certain requirements do not apply to a Registered Entity, based on uniform characteristics. A matrix could be added to the CMEP that adopts many of the Reliability Standard applicability classes set forth in Appendix A to this white paper. For example, for TOPs, the matrix would indicate the core requirements that apply no matter the uniform characteristics. In addition, the matrix would indicate that certain other requirements, such as load shedding requirements, only apply if the TOP is connected to load.

Another option, a materiality approach, involves using the existing thresholds, at their current levels or revised as appropriate, but providing more specificity on the risk-based criteria that an entity would use to demonstrate that it no longer needs to be registered for a given function. There are many smaller entities that do not believe they should be registered under the current criteria; however, at present, there are no uniform risk-based criteria in place for them to justify how and why they should be de-registered, as well as a timely commitment to address registration concerns. Large TOPs and/or the RC in the region should have an opportunity for input on deregistration decisions. The procedures for submitting a deregistration request also should be part of this RBR effort.

Revising Reliability Standards is another option. Under the Reliability Standards approach, Reliability Standard requirement applicability classes refer to applying subsets of Reliability Standard requirements to subcategories of certain functions of Registered Entities, and not developing a custom tailoring of applicability for each individual registered entity. The intent is to restrict the requirements applicable to Registered Entities that satisfy specified risk-based criteria to ensure the right entities are identified for compliance with appropriate Reliability Standard requirements, and avoid burdening such entities with compliance obligations disproportionate to their risk to BES reliability. Tailoring Reliability Standard obligations has been successfully implemented in both the registration appeal context and Project 2010-07: Generator Requirements at the Transmission Interface (the GO/TO project). In addition, historically, some Regional Entities have addressed the challenges of Reliability Standard applicability to entities through their compliance monitoring activities, such as adjusting the scope of audits. These experiences will help inform RBR efforts.

All three possible approaches set forth above can be further informed by the initial evaluation in Appendix A and additional technical analysis to be conducted. The straw proposals identify a category of entities that own or operate BES Facilities, but that also warrant application of a more limited set of requirements than the more typical TO/TOP and GO/GOP. The proposals suggest a starting point for evaluating the subset of Reliability Standards to be to applicable entities that fall within that lesser risk category. In addition, Appendix A identifies targeting requirements to entities that fall below the revised DP and LSE thresholds, but that are necessary participants in a BES protection program (e.g., UFLS or UVLS).

Particularly under the CMEP and the Reliability Standards approach, described above, once Reliability Standard applicability classes are established and applicable Reliability Standard requirement compliance obligations are aligned with the classes, a number of implementation approaches are available. Under the CMEP approach, a standardized compliance matrix can be maintained to identify which Reliability Standard requirements apply to a given class. Entities registered to the functions with Reliability Standard class applicability will be formally assigned to the appropriate class. Class assignment should be subject to a process that enables the entity to challenge inappropriate application of the criteria, as well as a process (modeled after the BES Exception Process) to assign outliers to the appropriate class, based on an individualized risk assessment and technical justification.

Under the Reliability Standards approach, class compliance responsibility may be reflected within the Applicability section of a given Reliability Standard. Alternatively, as in the GO/TO project, a class approach may be implemented through limited changes in the Reliability Standard applicability, along with associated registration modifications. The latter approach may be suitable to DPs with limited BES transmission facilities, eliminating the need to register such entities as TOs or TOPs. Either of these approaches will require modification of Reliability Standards through the Standards Development Process.

Status quo for other functional registration categories

As discussed above, recommendations for changes apply to eight of the fifteen functional categories, including PSEs, IAs, DPs, LSEs, GOs, GOPs, TOs and TOPs. At this time, there are no proposed recommendations with respect to the following seven functional categories:

> Balancing Authorities (BAs), Planning Authorities (PAs)/Planning Coordinators (PCs), Reliability Coordinators (RCs), Transmission Planners (TPs), Resource Planners (RPs), Reserve Sharing Groups (RSGs) and Transmission Service Provider (TSPs).

Task forces for risk criteria and Reliability Standard applicability classes

As part of RBR, NERC plans to form task forces to develop risk criteria to apply to: (i) entities that meet the thresholds but seek to make a case that they should not be registered because they do not have a material impact on reliability; and (ii) entities that do not meet the thresholds but the Regional Entity, NERC or a reliability entity, such as a BA, RC or TOP, asserts such entities need to be registered and subject to some or all of applicable Reliability Standard requirements.

In addition, NERC plans to form a task force, modeled on the GOTO Task Force, to identify a common set of Reliability Standards that need to be applied to BES resources owned and operated by certain TO/TOPs and GO/GOPs, as discussed in greater detail in Appendix A. This task force will also assess the merits of alternative approaches to targeting registration, standards applicability, and compliance monitoring and enforcement to entity risk.

The resulting analysis can then be used as the basis for establishing appropriate registration categories and making appropriate classes of Reliability Standard applicability.

Issues that require a longer time horizon

Possible rule changes have been identified with respect to the NERC Rules of Procedure Section 500, Appendix 5A, and Appendix 5B to implement risk-based registration. For example, the opportunities for change include modification of the Registry Criteria, and improving procedures, Reliability Standard requirement applicability classes, determinations and associated appeals. Other changes are appropriate to memorialize practices in place today because of FERC orders, and to implement other improvements to these sections. As also noted above, to the extent classes of applicable Reliability Standards are adopted for certain functions, long-term implementation is best achieved through modification of Reliability Standards through the Standards Development Process.

While these efforts can be launched, and interim implementation steps can be taken, as part of Phase 1, completion of these more formalized implementation efforts will likely extend into Phase 2. More details such as scope, outreach, and timing will be addressed in the RBR implementation plan.

Another longer-term related issue is ensuring that Standard Drafting Teams develop standard applicability language for new or revised standards that provides for the most granular applicability language possible.

Appendix A – Risk-Based Registration Threshold Reviews

Purchasing-Selling Entity (PSE)

Current Definition and/or Threshold in Statement of Compliance Registry Criteria

Definition

The entity that purchases, or sells, and takes title to, energy, capacity, and Interconnected Operations Services. The Purchasing-Selling Entity may be affiliated or unaffiliated merchants and may or may not own generating Facilities.

Threshold

N/A

Functional Model Description

The PSE arranges for and takes title to energy products (capacity, energy and reliability-related services) that it secures from a resource for delivery to a Load-Serving Entity. The Purchasing-Selling Entity also arranges for transmission service with the Transmission Service Provider that provide transmission service to the Load-Serving Entity under a tariff or market rule. The Purchasing-Selling Entity initiates a bilateral Interchange between Balancing Authority Areas by submitting a Request for Interchange to the Interchange Coordinator.

Proposed Elimination

Recommend that the functional category of PSE be eliminated as part of the RBR effort. For all Reliability Standards that apply to PSEs, this function should be removed through the Standards Development Process.

Proposed Revised Threshold

N/A- Proposed Function for Elimination

Proposed Critical Sub-function(s)

Dynamic Transfers could be a critical sub-function. However, a survey should be conducted to determine how many entities still use Dynamic Transfers.

Analysis and Support for Proposed Action

There are 447 unique entities registered as a PSE. Five (5) FERC-approved Reliability Standard Requirements currently apply to PSEs. Those standards and requirements are:

- INT-001-3, Requirement R1
- INT-004-2, Requirement R2
- IRO-001-1.1, Requirement R8
- IRO-005-3.1a, Requirement R10
- TOP-005-2a, Requirement R3

With regard to violations, there have only been 40 instances of PSE noncompliance out of 29,545 total instances of noncompliance. The NERC and Regional CMEP efforts have recently begun to utilize more self-certifications (rather than audits) for entities registered only as PSEs, and only one PSE standard is currently listed on Compliance's 2014 Actively Monitored List, IRO-005-3.1a. In addition, only one requirement listed above has a High Violation Risk Factor (VRF), IRO-001-1.1, Requirement R8, which states as follows:

> Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling

> Entities shall comply with Reliability Coordinator directives unless such actions would violate safety, equipment, or regulatory or statutory requirements. Under these circumstances, the Transmission Operator, Balancing Authority, Generator Operator, Transmission Service Provider, Load-Serving Entity, or Purchasing-Selling Entity shall immediately inform the Reliability Coordinator of the inability to perform the directive so that the Reliability Coordinator may implement alternate remedial actions.

IRO-001-1 will eventually be replaced by a new set of IRO standards, together with revised Transmission Operator (TOP) standards.[11] The proposed standard IRO-001-3, which will replace IRO-001-1, has removed applicability for the PSE functions. Further, the Independent Experts Review Panel (IERP) recommended INT-004 standards for potential retirement reasoning that a NAESB guideline exists in the *Electronic Tagging Functional Specification* document.

The remaining standards have a Lower VRF. In reviewing the remaining standards that still apply to PSEs, the Standards Development Process would need to address removing PSEs from individual requirements and must determine if there is a suitable replacement entity or if a business practice/process can be transferred to North American Energy Standards Board (NAESB). Technical analyses in accordance with Section 215 of the FPA will be required to identify any reliability implications so that no reliability gaps are created. As a result, this initial assessment of risk could be revised based on further analysis. An industry survey also will be used to identify issues to be considered as part of the technical analysis.

Finally, Dynamic Transfers may not apply to organized markets. RTO/ISOs usually only dispatch generation in their operational jurisdiction, but this will need to be confirmed as part of the survey to determine if Dynamic Transfers are a critical sub-function. In addition, PSEs do not have the authority to initiate a curtailment on a transaction due to a reliability event, and PSEs do not have the authority to reload transactions or the ability to release a limit.

Interchange Authority / Interchange Coordinator (used interchangeably) (IA)

Current Definition and/or Threshold in Statement of Compliance Registry Criteria

Definition

The responsible entity that authorizes implementation of valid and balanced Interchange Schedules between Balancing Authority Areas, and ensures communication of Interchange information for reliability assessment purposes.

Threshold

N/A

Functional Model Description

The Interchange Coordinator collects approvals or denials for Arranged Interchange from Balancing Authorities and Transmission Service Providers and verifies the validity of the source and sink. The NERC Tag Authority provides this service assigned to the Sink Balancing Authority.

The Interchange Coordinator provides the Balancing Authority with the individual bilateral Arranged Interchange. The Balancing Authority must track the individual Interchange Schedules in case one or more of them are curtailed by the Reliability Coordinator or by the Balancing Authority in those cases where a generator or load is interrupted.

[11] However, both sets of proposed standard were subject to a recent FERC NOPR recommending a remand. A standard development project is ongoing to address the NOPR's proposed remand. FERC did not take issue with the elimination of PSEs in IRO-001-1.

The Balancing Authority then creates a "net" interchange total for use in its energy management system as well as a "net" interchange for each neighboring Balancing Authority. The net Interchange Schedule for each neighboring Balancing Authority is used by the Receiving Balancing Authority for checkout with the neighboring Balancing Authorities.

All bilateral Interchange Transactions that cross a Balancing Authority Area boundary are coordinated through the Interchange Coordinator.

While the approval/denial process may utilize tools (such as computer software and communication protocols), the Model envisages that the Interchange function will be assigned to an actual organization. A Balancing Authority may serve as its own Interchange Coordinator or have this service provided by a separate organization.

Assessing ramping capability and connectivity. The Balancing Authority approves/denies the capability to ramp the Arranged Interchange in or out and notifies the Interchange Coordinator. The connectivity of adjacent Balancing Authorities is also verified by the Balancing Authorities before responding to the Interchange Coordinator.

Ensuring balanced, valid Interchange Transactions. The Interchange Coordinator also ensures that the resulting Confirmed Interchange Transactions is balanced and valid prior to physical delivery. This means:

- The source MW must be equal to the sink MW (plus losses if they are "self-provided"), and
- All reliability entities involved in the Arranged Interchange are currently in the NERC registry.

Only when it receives approvals from the Transmission Service Providers and Balancing Authorities, does the Interchange Coordinator direct the Balancing Authorities to implement the Transaction. If any of these entities — Transmission Service Providers, or Balancing Authorities — does not approve the Arranged Transaction, then the Interchange Coordinator does not authorize the Transaction to become Confirmed Interchange.

Curtailments. The Interchange Coordinator coordinates curtailments of Confirmed Interchange ordered by the Reliability Coordinator by notifying the Balancing Authorities, Transmission Service Providers, and Purchasing-Selling Entities. The Interchange Coordinators also communicates and coordinates the resulting modified Arranged Interchange that result from the curtailments.

Proposed Elimination

The functional category of IA has been identified for potential elimination as part of the RBR effort. The industry must be surveyed to determine if a reliability gap will be created by removing the IA function from the Registry Criteria. Most notably, the industry must answer whether the Balancing Authority (BA) function and applicable requirements are sufficient for ensuring reliability. In eliminating the IA, the BA will not take over all of the IA standards and requirements. The industry must provide whether the existing BA function and existing BA requirements are sufficient for maintaining reliability after the IA has been removed. Industry feedback should provide particular attention to how a BA would balance generation, manage load and schedules, avoid unscheduled transfers, and the ability of the BA to implement congestion management.

Proposed Revised Threshold

N/A

Proposed Critical Sub-function(s)

N/A

Analysis and Support for Proposed Action

There are currently forty-one (41) uniquely registered IAs. Of those forty-one entities, only one (1), Peak Reliability, is not also registered as a BA. Currently, the following families of Reliability Standards apply to IAs:

- CIP
- INT-005-3
- INT-007-1
- INT-008-3
- IRO-010-1a

However, NERC recently submitted a filing that recommended the retirement of INT-005-3, INT-007-1, and INT-008-3.[12] That leaves only one non-CIP requirement that would apply to IAs: IRO-010-1a, Requirement R3. Although the changes have not been adopted, the latest recommendations from the IRO Five-Year Review Team are to remove IAs from the applicability of IRO-010-1a.[13] Although the IERP did not recommend deletion of IRO-010-1a, Requirement R3 due to this being the only data-sharing requirement, the IERP did state this requirement could be consolidated with a TOP requirement.

With regard to violations, IAs have had 598 instances of noncompliance out of 29,545 total instances of noncompliance since 2007. A large majority of those violations were CIP violations.

The IA function itself has evolved greatly since the Registry Criteria was first created. Several aspects of the IA function have become automated over time. Also, because most of the IAs are already registered as BAs, it is recommended that BAs serve as the entity ultimately responsible for the historically-IA functions in the Registry Criteria. This would not entail transferring all of the applicable IA requirements to BAs. Instead, the recommendation is to first survey the industry in order to determine if a reliability gap is created by removing IAs and have the BAs maintain reliability through their on-going operations and requirements.

Distribution Provider (DP)

Current Definition and/or Threshold in Statement of Compliance Registry Criteria

Definition

Provides and operates the "wires" between the transmission system and the end-use customer. For those end-use customers who are served at transmission voltages, the Transmission Owner also serves as the Distribution Provider. Thus, the Distribution Provider is not defined by a specific voltage, but rather as performing the distribution function at any voltage.

Threshold

NERC Rules of Procedure (ROP) Appendix 5B at III.b.1 Distribution Provider system serving >25 MW of peak load that is directly connected to the Bulk Power System.

> *[Exclusion: A Distribution Provider will not be registered based on this criterion if responsibilities for compliance with approved NERC Reliability Standards or associated Requirements including*

[12] *See Petition of the North American Electric Reliability Corporation for Approval of Proposed Reliability Standards for Interchange Scheduling and Coordination,* submitted on February 27, 2014 (available at http://www.nerc.com/FilingsOrders/us/NERC%20Filings%20to%20FERC%20DL/Petition%20for%20Approval%20of%20INT%20Reliability%20Standards_.pdf).

[13] *See http://www.nerc.com/pa/Stand/Project201209IROReview/IRO-010-2_redline_2013Oct01.pdf.*

reporting have been transferred by written agreement to another entity that has registered for the appropriate function for the transferred responsibilities, such as a Load-Serving Entity, Balancing Authority, Transmission Operator, generation and transmission cooperative, or joint action agency as described in Sections 501 and 507 of the NERC Rules of Procedure.]
or;

ROP Appendix 5B at III.b.2 Distribution Provider is the responsible entity that owns, controls, or operates Facilities that are part of any of the following Protection Systems or programs designed, installed, and operated for the protection of the Bulk Power System:

- a required UFLS program.
- a required UVLS program.
- a required Special Protection System [(SPS)].
- a required transmission Protection System [(TPS)].

[Exclusion: A Distribution Provider will not be registered based on these criteria if responsibilities for compliance with approved NERC Reliability Standards or associated Requirements including reporting have been transferred by written agreement to another entity that has registered for the appropriate function for the transferred responsibilities, such as a Load-Serving Entity, Balancing Authority, Transmission Operator, generation and transmission cooperative, or joint action agency as described in Sections 501 and 507 of the NERC Rules of Procedure.]

Functional Model Description
The Distribution Provider provides the physical connection between the end-use customers and the electric system, including customers served at transmission level voltages. The Distribution Provider is not defined by a specific voltage, but rather as performing the Distribution function at any voltage. One Distribution Provider may be directly connected to another Distribution Provider and not directly connected to the Bulk Electric System.

The Distribution Provider maintains “local” safety and reliability. The Distribution Provider provides the switches and reclosers necessary for emergency action. The Distribution Provider may need to demonstrate load-shedding capability to the Balancing Authority and Transmission Operator.

The same organization may serve as the Distribution Provider and Load-Serving Entity, but they may be separate organizations as well. Unlike the Load-Serving Entity, the Distribution Provider has the facilities or assets (“wires”) and does not take title to any energy. However, while these functions are distinct, in many cases an organization, such as a vertically integrated utility, bundles these functions together.

Proposed Elimination
N/A

Proposed Revised Threshold
Recommend that the peak load threshold in Registry Criteria III.b.1 be increased to 75 MW or 100 MW (or other number as determined based on further analysis) and directly connected to the BES.

Replace Registry Criteria III.b.2 with the following two paragraphs. Using the risk-based criteria, which is to be developed, DPs with peak load between 25 MW and the new peak load threshold and directly connected to the BES generally would not be subject to registration even if they participate in a BES protection program (e.g., UFLS, UVLS, SPS or TPS), unless it has been demonstrated that their participation in such a program is necessary for the reliable operation of the BES. To the extent that they are registered, they should be subject only to a sub-list class

of Reliability Standards, including the relevant protection system Reliability Standards, which is to be determined based on further analysis.

Entities with less than 25 MW peak load, or not directly connected to the BES, generally would not be registered, even if they participate in a BES protection program, except in extraordinary circumstances under the risk-based criteria, which is to be developed. To the extent that they are registered, they should be subject only to a sub-list class of Reliability Standards, including the relevant protection system Reliability Standards, which is to be determined based on further analysis.

Proposed Critical Sub-function(s)

DPs with peak load between 25 MW and the new peak load threshold and directly connected to the BES are subject to registration for participation in a BES protection program if it has been demonstrated that their participation in such a program is necessary for the reliable operation of the BES.

Analysis and Support for Proposed Action

Increase DP threshold to a peak load of 75-100 MW and directly connected to the BES

Consistent with a risk-based approach to registration, the general threshold for DP registration should be modified to 75 MW or 100 MW (or other number as determined based on further analysis) and directly connected to the BES. The new threshold should be accompanied by a risk-based process, like the BES Exception Process, that allows Regional Entities to register entities below the threshold on the basis of a demonstration of material impact on the BES, and allows entities above that threshold to seek relief from registration as a DP where the entity demonstrates lack of a material impact on the BES. Replacing the reference in the threshold with BES (rather than BPS) is consistent with FERC's determination in the SLECA case[14] and a risk-based approach because it would take into account the results of the application of the new BES Definition, including its exception process.

Reliability Standards applicable to DPs fall into the following categories: coordination with higher-level entities when adding new facilities; nuclear plant service; compliance with reliability directives issued by higher-level entities; cybersecurity (in limited circumstances); reporting of certain events; operator training (if the DP has field switching personnel identified as performing unique tasks associated with the Transmission Operator's restoration plan that are outside of their normal tasks); and protection systems (addressed in a separate section below).

Except in very unusual cases, imposing all of these requirements on entities with a peak load below 75 MW-100 MW or not directly connected to the BES may not be necessary from a risk-based perspective. According to data assembled by NERC, there were only 0.21 DP violations per registered DP per year in 2007-2014—far less than the rate for other functions, such as TOP and BA. In addition, a preliminary review of Energy Information Administration (EIA) data—which does not present a complete view of Registered Entities—suggests that DPs with peak load under 75 or 100 MW serve a very small proportion of U.S. load, and that including these entities on the NCR may not be needed to accomplish the primary reliability objectives of standards applicable to DPs, particularly when viewed in the context of the purpose of Reliability Standard, which is to avoid BES instability, uncontrolled separation and cascading outages. Further, an initial analysis of applicable Reliability Standards suggests that a risk-based approach to registration generally would not require registration of small (below 75 MW-100 MW peak load) DPs, although further analysis is warranted:

- FAC-002-1 requires DPs "seeking to integrate generation facilities, transmission facilities, and electricity end-user facilities" to coordinate and cooperate on assessments with their TP and PA. DPs are already required by tariff or interconnection agreement to coordinate with the TO/TOP(s) to which they are

[14] *S. La. Elec. Coop. Ass'n*, 144 FERC ¶ 61,050 (2013).

connected before adding another point of interconnection. There may not be a need for a Reliability Standard to ensure that small DPs do not add new facilities without permission. To the extent that any gap in coverage may exist with respect to such small entities, it may not be material.

- It would be unusual for a DP under 100 MW to have Nuclear Plant Interface Requirements (NPIR) responsibilities. To the extent that there are any such DPs, they could be retained on the NCR (for compliance with NUC-001) through the case-by-case material impact process.
- Other DP requirements focus on compliance with reliability directives. In the unlikely event a small (below 75 MW – 100 MW) DP is issued a reliability directive, it would most likely be to shed load. The Open Access Transmission Tariff (OATT) includes provisions for curtailing transmission service for point to point service (§§ 13.6, 14.7) and network service (§ 33). Furthermore, a small DP's failure to follow a reliability directive is unlikely to have a material impact on BES reliability, because the entity is too small to have such an impact. If, however, a particular DP under 100 MW could materially impact BES reliability by failing to comply with a reliability directive, the entity can be registered through the material impact process.
- As for cybersecurity, CIP-002-5 applies to very few DPs with peak load under 100 MW: those with an SPS, Remedial Action Scheme (RAS), or other transmission Protection System (other than UFLS or UVLS) subject to NERC Reliability Standards, and those that own a "Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started." To the extent a particular small DP's compliance with cybersecurity standards is demonstrated to be necessary to prevent a material risk to BES reliability, that DP can be registered on a case-by-case basis through the risk-based criteria.
- DPs are required to have, and follow, an event reporting plan under EOP-004-2; but the events to be reported, for DPs, are only of damage or threats to a Facility (i.e., a BES Element); automatic shedding of at least 100 MW; and the loss of at least 200 MW of firm load. Most if not all small DPs, in their capacity as DPs, do not own Facilities; and by definition, a DP with a peak load under 100 MW will not shed 100 MW or lose 200 MW of firm load. Making EOP-004-2 inapplicable to small DPs would not result in increased risk to BES reliability.
- Operator training is required by EOP-005-2 only where a DP is identified in a TOP's restoration plan, and the DP has field switching personnel identified as performing unique tasks associated with the TOP's restoration plan that are outside of their normal tasks. The subset of DPs that meet those criteria and are under 100 MW is not expected to be large. To the extent the participation of any such DP in the TOP's restoration plan is shown to be material to BES reliability, however, the DP can be registered through the material impact process.

As discussed above, the registration threshold for DPs could be raised from the present 25 MW peak load to 75 MW or 100 MW without a significant impact on risk to BES reliability. While the EIA data suggests that the proportion of load served by DPs with peak loads under 100 MW is *de minimis* on a continent-wide basis, that data may not provide a complete picture. Because tariff and interconnection agreements arise under Section 205 of the FPA, technical analyses in accordance with Section 215 of the FPA will be required to identify any reliability implications so that no reliability gaps are created. As a result, this initial assessment of risk could be revised based on further analysis. An industry survey also will be used to identify issues to be considered as part of the technical analysis.

Restrict DP registration of below-threshold entities based on UFLS/UVLS/SPS/TPS

DPs with peak load between 25 MW and the revised threshold and directly connected to the BES—i.e., entities below the revised threshold who were previously registered based on the minimum 25 MW size—would not be registered based on their participation in a BES protection program, unless there is a demonstrated reliability

need; to the extent that they are registered, they should be subject only to the relevant protection system reliability standards and such other Reliability Standards as determined to be necessary based on further analysis. Rather, consideration of materiality of risk to BES reliability calls for restricting registration of such entities except where demonstrated necessary in light of unusual circumstances, and in such cases limiting the applicable standards.

In unusual situations (i.e., significant portion of load is served by small DPs), the DPs could be registered on a case-by-case basis based on their material impact on reliability, and made subject only to the relevant system protection standards and such other Reliability Standards as determined to be necessary based on further analysis. Where the Planning Coordinator PC or Regional Entity demonstrates that the participation of a particular directly-connected DP between 25 MW and the revised 75MW or 100MW threshold is necessary to protect BES reliability, the DP should be required to comply only with the relevant system protection standards and such other Reliability Standards as determined to be necessary based on further analysis. Removal of small DPs from compliance with other DP requirements would be unlikely to materially increase the risk to BES reliability. Small entities who are no longer subject to DP registration but wish to remain a part of a BES protection program should be permitted to opt in to compliance with such programs and the applicable Reliability Standards, so that small utilities that need to choose which portions of their load to shed can continue to do so.

Technical analyses in accordance with Section 215 of the FPA will be required to identify any reliability implications so that no reliability gaps are created. As a result, this initial assessment of risk could be revised based on further analysis. An industry survey also will be used to identify issues to be considered as part of the technical analysis.

Load-Serving Entity (LSE)

Current Definition and/or Threshold in Statement of Compliance Registry Criteria

Definition

Secures energy and Transmission Service (and related Interconnected Operations Services) to serve the electrical demand and energy requirements of its end-use customers.

Threshold

NERC Rules of Procedure (ROP) Appendix 5B at III.a.1 Load-Serving Entity peak load is > 25 MW and is directly connected to the Bulk Power (>100 kV) System, or;

ROP Appendix 5B at III.a.2 Load-Serving Entity is designated as the responsible entity for Facilities that are part of a required underfrequency load shedding (UFLS) program designed, installed, and operated for the protection of the Bulk Power System, or;

ROP Appendix 5B at III.a.3 Load-Serving Entity is designated as the responsible entity for Facilities that are part of a required undervoltage load shedding (UVLS) program designed, installed, and operated for the protection of the Bulk Power System.

> *[Exclusion: A Load-Serving Entity will not be registered based on these criteria if responsibilities for compliance with approved NERC Reliability Standards or associated Requirements including reporting have been transferred by written agreement to another entity that has registered for the appropriate function for the transferred responsibilities, such as a Load-Serving Entity, Balancing Authority, Transmission Operator, generation and transmission cooperative or joint action agency as described in Sections 501 and 507 of the NERC Rules of Procedure.]*

ROP Appendix 5B at III.a.4 Distribution Providers registered under the criteria in III.b.1 or III.b.2 will be registered as a Load Serving Entity for all load directly connected to their distribution facilities.

> *[Exclusion: A Distribution Provider will not be registered based on this criterion if responsibilities for compliance with approved NERC Reliability Standards or associated Requirements including reporting have been transferred by written agreement to another entity that has registered for the appropriate function for the transferred responsibilities, such as a Load-Serving Entity, Balancing Authority, Transmission Operator, generation and transmission cooperative, or joint action agency as described in Sections 501 and 507 of the NERC Rules of Procedure.]*

Functional Model Description

The Load-Serving Entity arranges for the provision of energy to its end-use customers, but does not provide distribution services (“wires”). The Load-Serving Entity defined in the Model is not to be confused with or equated to the Load-Serving Entity as defined in any tariff or market rule.

Today, organizations serving as Load-Serving Entities may also be Generation Owners and can self-provide, or have contracts with other Generator Owners for capacity and energy to serve the Load-Serving Entity’s customers, or purchase capacity and energy from non-affiliated Generator Owners through a Purchasing-Selling Entity (or Market Operator), or employ a combination of these three options.

The Load-Serving Entity reports its generation (affiliated and non-affiliated) arrangements to serve load to the Balancing Authority, which forwards this information to the Reliability Coordinator, for day-ahead analysis.

The Load-Serving Entity may contract for reliability-related services through the Market Operator (if the Load-Serving Entity is part of a market or pool) or directly from Generator Owners or loads.

The same organization may serve as the Distribution Provider and Load-Serving Entity, but they may be separate organizations as well. Unlike the Distribution Provider, the Load-Serving Entity, does not have Bulk Electric System assets ("wires") but does take title to energy. However, while these functions are distinct, in many cases an organization, such as a vertically integrated utility, bundles these functions together.

The Functional Model assigns to the Load-Serving Entity the identification of loads for curtailment and the development of load profiles and load forecasts. Please see Section II, 114: Roles in Load Curtailment for more detailed information.

The Load-Serving Entity communicates requests for voluntary curtailment to the appropriate end-use customer loads, thereby ensuring that these loads will, in fact, be curtailed.

Proposed Elimination
N/A

Proposed Revised Threshold
Recommend that the peak load threshold in Registry Criteria III.a.1 be increased to 75 MW or 100 MW (or other number as determined based on further analysis) and directly connected to the BES.

Also, revise that section to reflect the following two paragraphs. Using the risk-based criteria, which is to be developed, LSEs with peak load between 25 MW and the new peak load threshold, and directly connected to the BES, generally would not be subject to registration even if they participate a UVLS program, unless it has been demonstrated that their participation in such a program is necessary for the reliable operation of the BES. To the extent that they are registered, they should be subject only to a sub-list class of Reliability Standards, including the relevant protection system Reliability Standards, which is to be determined based on further analysis.

Entities with less than 25 MW peak load, or not directly connected to the BES, generally would not be registered, even if they participate in a BES protection program, unless there is a demonstrated reliability need. To the extent that they are registered, they should be subject only to a sub-list class of Reliability Standards, which is to be determined based on further analysis.

Proposed Critical Sub-function(s)
LSEs with peak load between 25 MW and the new peak load threshold, and directly connected to the BES, generally would not be registered, even if they participate in a UVLS program, except in extraordinary circumstances under the risk-based criteria, which is to be developed. To the extent that they are registered, they should be subject only to a sub-list class of Reliability Standards, including the relevant protection system Reliability Standards, which is to be determined based on further analysis.

Analysis and Support for Proposed Action
Change the LSE registration threshold to LSEs with peak load of at least 75 MW-100 MW and directly connected to the BES
Consistent with a risk-based approach to registration, the threshold for registration should be increased to 75 MW or 100 MW (or other number as determined based on further analysis) and directly connected to the BES. The new threshold would be accompanied by a risk-based process that enables Regional Entities to register entities below the threshold based on a demonstration of material impact on the BES, and allows entities above that threshold to seek relief from registration as an LSE where the entity demonstrates lack of a material impact on

the BES. Replacing the reference in the threshold with BES (rather than BPS or above 100 kV) is consistent with FERC's determination in the SLECA case and a risk-based approach because it would take into account the results of the application of the new BES Definition, including its exception process.

Reliability Standards applicable to LSEs fall into the following categories: coordination with higher-level entities; nuclear plant service; compliance with reliability directives issued by RCs and TOPs; cybersecurity (under currently-effective version 3, but not under version 5); procedures during Energy Emergencies; Requests for Interchange for intra-BA transfers; operate the BES to the most limiting parameter; provide data and information to higher-level entities; appropriately determining Capacity Benefit Margin (CBM) need, where applicable; coordinate operations with host BA and TSP; and UVLS (addressed in Section B below).

Except in very unusual cases, imposing these requirements on entities with peak load below 75 MW or 100 MW or not directly connected to the BES may not be necessary from a risk-based perspective. According to data assembled by NERC, there were only 0.86 LSE violations per registered LSE per year in 2007-2014—far less than the rate for other functions, such as TOP and BA. In addition, a preliminary review of EIA data—which does not present a complete view of Registered Entities—suggests that LSEs with peak load under 75 MW or 100 MW likely serve a very small proportion of U.S. load. Including these entities on the Compliance Registry is not needed to accomplish the primary reliability objectives of standards applicable to LSEs. Specifically:

- LSEs are subject to FAC-002-1, NUC-001-2.1, and Reliability Standards requiring compliance with reliability directives. The analysis of these issues in the discussion of DP registration applies to LSEs as well.
- LSEs are to be removed from CIP requirements under CIP version 5, which suggests that de-registering a subset of LSEs will not pose a risk to BES reliability.
- Energy-deficient LSEs must follow certain procedures under EOP-002-3.1. However, the amount of energy likely to be needed by an energy-deficient LSE whose *peak* load is under 100 MW is unlikely to pose a reliability risk; moreover, such an LSE could voluntarily follow the EOP-002-3.1 R1-R8 procedures to remedy its deficiency. If those procedures were inadequate and firm load needed to be shed to protect reliability, and the unregistered LSE refused to do so, its transmission provider would have the authority and obligation to do so under the OATT and NAESB Wholesale Electric Quadrant Standard WEQ-008, Transmission Loading Relief (TLR) – Eastern Interconnection.
- INT-011-1 (which is pending before FERC) requires that *"Each Load-Serving Entity that uses Point to Point Transmission Service for intra-Balancing Authority Area transfers shall submit a Request for Interchange unless the information about intra-Balancing Authority transfers is included in congestion management procedure(s) via an alternate method."* The purpose of the standard is "[t]o ensure that transfers within a Balancing Authority Area using Point to Point Transmission Service are communicated and accounted for in congestion management procedures." Intra-BA transfers by LSEs with peak load between 25 and 100 MW are subject to tariff, operating agreement, and interconnection agreement requirements and, in any case, are unlikely to be a significant contributor to congestion.
- LSEs, among other entities, are required to operate the BES to the most limiting parameter. LSEs, as such, do not operate the BES, IRO-005-3.1a should not be applicable to LSEs. Making the requirement inapplicable to LSEs with peak load under 100 MW does not pose a material risk to BES reliability.
- Providing data for modeling and planning purposes is the concern often identified with respect to raising the registration threshold for LSEs. Based on the EIA data available, however, it appears that the aggregate load of LSEs under 75 MW or 100 MW is likely within the margin of error in their regions, provides little technical significance to the models, and is accordingly not needed. In the event that data from such entities is needed to avoid an undue risk to BES reliability in a particular region, however, the necessary LSEs can be registered on a case-by-case basis through the material impact process.

- In regions that use CBM, a registered LSE determining the need for transmission capacity to be set aside as CBM must use one of several studies or other methods of determining needed CBM. The TP must then establish a CBM value to use in its Available Transfer Capability (ATC) calculations that reflects consideration of the LSE's study. Subjecting small LSEs to compliance with the CBM-related reliability standard may not be needed to prevent material impact on the BES. Either small LSEs seeking a CBM set-aside will perform the required studies, or their TP will not set aside any CBM for them.
- Finally, TOP-002-2.1b requires that, to the extent permitted by confidentiality agreements, LSEs coordinate their current-day, next-day, and seasonal operations with their BAs and TSPs—i.e., that they provide load forecasts. To a significant degree, such coordination is achieved through tariff provisions or through an LSE's power supplier. To the extent not covered, such coordination by LSEs under 100 MW is unlikely to be material to BES reliability.

As shown above, the registration threshold for LSEs could be raised from the present 25 MW peak load to 75 MW or 100 MW without a significant impact on risk to BES reliability. While the EIA data suggests that the proportion of load served by LSEs with peak loads under 100 MW is *de minimis* on a continent-wide basis, that data may not provide a complete picture. As noted above, because tariff and interconnection agreements arise under Section 205 of the FPA, technical analyses in accordance with Section 215 of the FPA will be required to identify any reliability implications so that no reliability gaps are created. As a result, this initial assessment of risk could be revised based on further analysis. An industry survey also will be used to identify issues to be considered as part of the technical analysis.

Restrict LSE registration of below-threshold entities based on UFLS/UVLS

LSEs with peak load between 25 MW and the revised threshold and directly connected to the BES generally would not be registered, even if they participate in a UVLS program, unless there is a demonstrated reliability need. To the extent that they are registered, they should be subject only to the relevant protection system reliability standard or such other Reliability Standards as determined necessary based on further analysis. No entity should be registered as an LSE based on its participation in a UFLS program, because UFLS standards no longer apply to LSEs. Rather, consideration of materiality of risk to BES reliability calls for restricting registration of such entities except where demonstrated necessary in light of unusual circumstances, and in such cases limit the applicable standards to those directly pertaining to the relevant protection program.

In unusual situations (i.e., significant portion of load is served by small LSEs), the LSEs could be registered on a case-by-case basis based on their material impact on reliability, and made subject only to the UVLS standard or other Reliability Standards based on further analysis. As a general matter, Registered Entities should be encouraged to avoid requiring small LSEs to own or operate UVLS equipment as a mandatory part of the entities' UVLS programs, because direct participation of such entities is not likely to significantly affect the effectiveness of those programs except in unusual circumstances. Where the PC or Regional Entity demonstrates that the participation of a particular directly connected LSE between 25 MW and the revised MW threshold in a UVLS program is necessary to protect BES reliability, the LSE should be required to comply only with the Reliability Standards relevant to the UVLS program or other Reliability Standards based on further analysis. Removal of such small entities (or entities not directly connected with the BES) from compliance with other LSE requirements would be unlikely to materially increase the risk to BES reliability. Small entities should be permitted to opt in to compliance with such programs and the applicable Reliability Standards, so that small utilities that need to choose which portions of their load to shed can continue to do so.

Technical analyses in accordance with Section 215 of the FPA will be required to identify any reliability implications so that no reliability gaps are created. As a result, this initial assessment of risk could be revised based on further analysis. An industry survey also will be used to identify issues to be considered as part of the technical analysis.

Transmission Owner (TO)

Current Definition and/or Threshold in Statement of Compliance Registry Criteria in Statement of Compliance Registry Criteria

Definition
The entity that owns and maintains transmission Facilities.

Threshold
NERC Rules of Procedure (ROP) Appendix 5B at III.d.1 An entity that owns/operates an integrated transmission Element associated with the Bulk Power System 100 kV and above, or lower voltage as defined by the Regional Entity necessary to provide for the Reliable Operation of the interconnected transmission grid; or

ROP Appendix 5B at III.d.2 An entity that owns/operates a transmission Element below 100 kV associated with a Facility that is included on a critical Facilities list that is defined by the Regional Entity.

> *[Exclusion: A Transmission Owner/Operator will not be registered based on these criteria if responsibilities for compliance with approved NERC Reliability Standards or associated Requirements including reporting have been transferred by written agreement to another entity that has registered for the appropriate function for the transferred responsibilities, such as a Load-Serving Entity, generation and transmission cooperative or joint action agency as described in Sections 501 and 507 of the NERC Rules of Procedure.]*

Functional Model Description
The Transmission Owner owns its transmission facilities and provides for the maintenance of those facilities. It also specifies equipment operating limits, and supplies this information to the Transmission Operator, Reliability Coordinator, and Transmission Planner and Planning Coordinator.

In many cases, the Transmission Owner has contracts or interconnection agreements with generators or other transmission customers that would detail the terms of the interconnection between the owner and customer.

Relationship with the Transmission Operator. The organization serving as Transmission Owner may operate its transmission facilities or arrange for another organization (which may or may not be a Transmission Owner) to operate and/or maintain its transmission facilities.

Proposed Elimination
N/A

Proposed Modification of Registration Criteria
Recommend that section III(d) of the Statement of Compliance Registry Criteria be revised to read:

> *Any owner or operator of one or more Bulk Electric System transmission Elements.*

Proposed Revised Threshold/Classes of Standards Applicability
The detailed registration thresholds located at section III(d) of the Registry Criteria are no longer needed to determine whether the owner or operator of an electric transmission Facility is subject to NERC Reliability Standards. The BES Definition and BES Exception Process set forth in the NERC Rules of Procedure perform the same tests, with greater precision and consistency. However, there is merit to establishing criteria to determine the applicability of Reliability Standards to different classes of TO and TOP entities. The following sub-threshold is proposed for consideration:

An entity that owns/operates only transmission lines operated below 200 kV and/or transformers with low voltage terminals connected at below 200 kV, and whose transmission Facilities do not meet the other criteria in Attachment B to reliability standard PRC-023-2, Relay Loadability.

The intent of establishing criteria to differentiate classes of TO/TOPs is not to remove entities owning and operating BES transmission Facilities from the NCR. Rather, such owners and operators would remain registered and subject to compliance with a subset of TO/TOP standards, but those that do not exceed the threshold set in this process would be subject only to the pre-determined subset of TO/TOP requirements appropriate for entities with limited BES transmission Facilities. The resulting sub-set of applicable TO/TOP standards could be accomplished by a variety of approaches:

Three options are proposed for consideration to implement the revised threshold:

(i) Register the BES Element owner/operator as a DP and where necessary, make corresponding changes to the applicability sections and requirements of Reliability Standards.

(ii) Establish a new Registry function, Local Transmission Owners, with corresponding changes to Reliability Standards.

(iii) Develop and post a standard set of TO and TOP requirements that are determined to be applicable to BES transmission owners that meet the revised Local Transmission Facility threshold described above.

Option (i) is discussed in detail below.

Proposed Critical Sub-function(s)
N/A

Analysis and Support for Proposed Action
Under the revised Statement of Compliance Registry Criteria, an entity is subject to registration as a TO/TOP if it owns/operates "transmission Facilities," i.e., BES Elements used for transmission. Entities will thus be registered only if they own/operate BES transmission Elements, i.e., if their transmission equipment meets the revised BES Definition or has been added through the exceptions process, and has not been *excluded* through the exceptions process.

However, the simple revisions outlined above will not, without more analysis,[15] provide for a rational risk-based registration of BES transmission owners and operators. The current registration criteria for TOs and TOPs assume that all TOs and all TOPs perform similar BES functions and have similar capabilities. For example, a small DP entity that owns a single 115 kV switching station on a BES 115 kV transmission circuit that is part of an integrated transmission network owned and operated by others will normally be registered a TO and TOP, and be responsible for the same requirements as a large vertically integrated utility. A strict reading of the Registry Criteria has led to the result that an entity that owns one 138-kV BES loop being subject to the full set of standard requirements that were written to apply to TOs and TOPs with extensive transmission networks and a wide-area view.

[15] Technical analyses in accordance with Section 215 of the FPA will be required to identify any reliability implications so that no reliability gaps are created. As a result, this initial assessment of risk could be revised based on further analysis. An industry survey also will be used to identify issues to be considered as part of the technical analysis.

The results of these processes result in: (i) time consuming reviews of facts and circumstances required for Registered Entities to attest that specific requirements are not applicable; and/or (ii) unduly burdensome efforts to comply with requirements that are inappropriate to an entity with such limited BES facilities and do not significantly contribute to BES reliability.

Consistent with a risk-based approach to registration, entities that own/operate insignificant BES transmission could be registered as DPs instead of TO/TOPs, and any requirements that must apply to such entities be revised to include such entities in the applicability (hereinafter, "DP/TO registration"). This approach to registration was successful in the GO/TO project, which could be emulated here. As in the GO/TO project, some transmission Facilities that fall below the threshold(s) set for DP registration:

> [a]re more complex and may therefore require individual assessment. The reliability gaps associated with such Facilities should not be addressed simply through application of all standards applicable to Transmission Owners and Transmission Operators, but instead through an assessment of the impact of such a Facility on neighboring transmission Facilities. Such assessment should then be used to determine exactly which Reliability Standards and requirements should apply to that Facility and whether additional entity registration is warranted. This assessment should, at a minimum, be based upon the output of transmission planning and operating studies used by the Reliability Coordinator, Transmission Operator and Transmission Planner in complying with applicable Reliability Standards (specifically, IRO, TOP and TPL).

Order 785 at P 8.

Threshold for DP/TO Registration

The applicability of Requirements R1-R5 of PRC-023-2, which is established by Attachment B to that standard, provides a possible starting point for setting a threshold for DP/TO registration. Based on Attachment B, an entity that owns/operates only transmission lines operated below 200 kV and transformers with low voltage terminals connected at below 200 kV, and whose transmission Facilities do not meet the other criteria in Attachment B, would be registered as a DP. Entities that own other transmission Facilities would be registered as TO/TOP.

Separate consideration should be given to operational responsibility for BES transmission Elements operating at below the threshold.

Standards Applicability

Further analysis is required to determine the TO/TOP standards that should apply to DPs that own/operate only the lower voltage transmission Facilities as defined by PRC-023-2 Attachment B.

Special Considerations for Load-Only Manufacturing Facilities

Because most large manufacturing facilities are served by multiple feeds, this configuration may result in BES classification and therefore a candidate for registration based on the bright-line application of the new BES definition. The following Entity Risk Assessment is proposed to assess whether such a facility poses a material risk to the reliability of the BES. It would normally be applied to candidates for registration as TOs/TOPs because the facility did not qualify for the E1/E3 Exclusions. The key concept underlying the Entity Risk Assessment is that, in the case of these retail loads, BES reliability is assured by the real-time actions of the RC/BA/TOP service providers.

Entity Risk Assessment Applicable to Load-Only Manufacturing Facilities

The following criteria could be applied to load-only manufacturing facilities that become candidates for TO/TOP registration by application of the revised BES Definition, with a rebuttable presumption that the entity should not be so registered if the following criteria are met:

1. No BES behind-the-meter generation at facility.
2. Utility maintains the element (e.g., the interconnecting substation and/or protection equipment under the terms and conditions of the applicable interconnection agreement or tariff).
3. Not an "integrated transmission Element" necessary to provide for the reliable operation of the interconnected transmission grid. Element is embedded in a retail customer facility and serves only a local distribution function.
4. No third-party usage of element under terms and conditions of a FERC-jurisdictional OATT.
5. Wide-area view is not relevant to the facility (e.g., it is a retail load).
6. The following additional factors may be used in support of the above criteria, which include that the organization is not required to participate in SPS (or RAS), UVLS or UFLS programs.

The application of the above criteria would not preclude the ability of the facility's Regional Entity, in consultation with the entity's RC/BA/TOP service providers, to register the facility if the Regional Entity can establish that the facility is material to the reliability of the BES. Such demonstration of materiality shall include a fact-specific analysis reflecting technical judgment.

In the event that such load-only manufacturing facilities are determined to be subject to registration as TO/TOP under this analysis, they could be addressed as a separate subclass such as "Customer Distribution." Review of the TO/TOP Reliability Standards should be undertaken to determine if a sub-list of applicable requirements is appropriate from a risk-based perspective.

Moreover, because tariff and interconnection agreements arise under Section 205 of the FPA, technical analyses in accordance with Section 215 of the FPA will be required to identify any reliability implications so that no reliability gaps are created. The technical analysis should take into the need for coordinating high voltage protection schemes and recognizing dependency by BAs and RPs on reserves, resource adequacy and ancillary services, which are important fundamental aspects needed to support reliability.

As a result, this initial assessment of risk could be revised based on further analysis. An industry survey also will be used to identify issues to be considered as part of the technical analysis.

Transmission Operator (TOP)

Current Definition and/or Threshold in Statement of Compliance Registry Criteria in Statement of Compliance Registry Criteria

Definition

The entity responsible for the reliability of its local transmission system and operates or directs the operations of the transmission Facilities.

Threshold

NERC Rules of Procedure (ROP) Appendix 5B at III.d.1 An entity that owns/operates an integrated transmission Element associated with the Bulk Power System 100 kV and above, or lower voltage as defined by the Regional Entity necessary to provide for the Reliable Operation of the interconnected transmission grid; or

ROP Appendix 5B at III.d.2 An entity that owns/operates a transmission Element below 100 kV associated with a Facility that is included on a critical Facilities list that is defined by the Regional Entity.

> *[Exclusion: A Transmission Owner/Operator will not be registered based on these criteria if responsibilities for compliance with approved NERC Reliability Standards or associated Requirements including reporting have been transferred by written agreement to another entity that has registered for the appropriate function for the transferred responsibilities, such as a Load-Serving Entity, generation and transmission cooperative or joint action agency as described in Sections 501 and 507 of the NERC Rules of Procedure.]*

Functional Model Description

The Transmission Operator operates or directs the operation of transmission facilities, and maintains local-area reliability, that is, the reliability of the system and area for which the Transmission Operator has responsibility. The Transmission Operator achieves this by operating the transmission system within its purview in a manner that maintains proper voltage profiles and System Operating Limits, and honors transmission equipment limits established by the Transmission Owner. The Transmission Operator is under the Reliability Coordinator's direction respecting wide-area reliability considerations, that is, considerations beyond those of the system and area for which the Transmission Operator has responsibility and that include the systems and areas of neighboring Reliability Coordinators. The Transmission Operator, in coordination with the Reliability Coordinator, can take action, such as implementing voltage reductions, to help mitigate an Energy Emergency, and can take action in system restoration.

Note that the Model does not attempt to define what is and is not a transmission facility, versus a generating facility. As discussed in Section II-13, this is assumed to be defined elsewhere by NERC or by governmental authorities.

Maintenance. The Transmission Owner provides the overall maintenance plans and requirements for its equipment, specifying, for example, maintenance periods for its transformers, breakers, and the like. The Transmission Owner then develops or arranges for the development of the detailed maintenance schedules (dates and times) based on the Transmission Owner's maintenance plans and requirements, and provides those schedules to the Reliability Coordinator and others as needed.

The organization serving as Transmission Operator may also physically provide or arrange for transmission maintenance, but it does this under the direction of the Transmission Owner, which is ultimately responsible for maintaining its owned transmission facilities.

Bundled with the Reliability Coordinator or Transmission Owner. A single organization may be the functional entity for multiple Functions. In such a case, the functional entities are said to be "rolled up" or "bundled" into a single organization. An organization may be a Transmission Operator without being a Reliability Coordinator or Transmission Owner. However, in many cases the Transmission Operator is bundled with one of these functional entities.

Bundled with Reliability Coordinator. For example, consider a regional transmission organization (RTO) with several members. The RTO registers with NERC as a Reliability Coordinator and Transmission Operator and is NERC-certified for both. The RTO then delegates/assigns some of the Transmission Operator Tasks to its members.

Bundled with the Transmission Owner. In other situations, the RTO registers with NERC as the Reliability Coordinator, and its members register as Transmission Owners and Transmission Operators. In this case, the Model views the RTO as responsible for complying with Reliability Standards associated with the Reliability Coordinator and would be NERC-certified as such. The RTO members would be responsible for complying with all Reliability Standards associated with the Transmission Operator, and would be NERC-certified as such.

Proposed Elimination
N/A

Proposed Revised Threshold
Yes, see the discussion of registration thresholds, standards applicability and implementation options under Transmission Owner.

Generator Owner (GO)

Current Definition and/or Threshold in Statement of Compliance Registry Criteria in Statement of Compliance Registry Criteria

Definition
Entity that owns and maintains generating units.

Threshold
NERC Rules of Procedure (ROP) Appendix 5B at III.c.1 Individual generating unit > 20 MVA (gross nameplate rating) and is directly connected to the Bulk Power System, or;

ROP Appendix 5B at III.c.2 Generating plant/facility > 75 MVA (gross aggregate nameplate rating) or when the entity has responsibility for any facility consisting of one or more units that are connected to the Bulk Power System at a common bus with total generation above 75 MVA gross nameplate rating, or;

ROP Appendix 5B at III.c.3 Any generator, regardless of size, that is a Blackstart Resource material to and designated as part of a Transmission Operator entity's restoration plan, or;

ROP Appendix 5B at III.c.4 Any generator, regardless of size, that is material to the reliability of the Bulk Power System.

> *[Exclusions: A Generator Owner/Operator will not be registered based on these criteria if responsibilities for compliance with approved NERC Reliability Standards or associated Requirements including reporting have been transferred by written agreement to another entity that has registered for the appropriate function for the transferred responsibilities, such as a Load-Serving Entity, generation and transmission cooperative or joint action agency as described in Sections 501 and 507 of the NERC Rules of Procedure.*
>
> *As a general matter, a customer-owned or operated generator/generation that serves all or part of retail load with electric energy on the customer's side of the retail meter may be excluded as a candidate for Registration based on these criteria if (i) the net capacity provided to the Bulk Power System does not exceed the criteria above or the Regional Entity otherwise determines the generator is not material to the Bulk Power System and (ii) standby, back-up and maintenance power services are provided to the generator or to the retail load pursuant to a binding obligation with another Generator Owner/Operator or under terms approved by the local regulatory authority or the Federal Energy Regulatory Commission, as applicable.]*

Functional Model Description
The Generator Owner owns its generation facilities and provides for the maintenance of those facilities. It also provides verified equipment operating limits and supplies this information to the Generator Operator, Reliability Coordinator, Transmission Planner and Planning Coordinator. In many cases, the Generator Owner has contracts or interconnection agreements with Transmission Owners or Distribution Providers that detail the terms of the interconnection between these parties.

Relationship with the Generator Operator. The organization serving as Generator Owner may operate generation facilities, or arrange for another organization to do so. In addition, the organization serving as Generator Owner may perform maintenance and facility verification, or may arrange with another organization to do so.

Proposed Elimination
N/A

Proposed Modification of Registration Criteria
Recommend section III(c) of the Statement of Compliance Registry Criteria be revised to read:

> *Any owner or operator of one or more Bulk Electric System generating resources*.

Proposed Revised Threshold/Classes of Standards Applicability
The proposal is to establish a small GO/GOP MVA threshold for owners and operators of less than 75 MVA of BES generating units and plants (or other amount agreed upon after further technical analysis), including dispersed power generating resources.

The applicability of MOD-026-1, which is established by the Facilities Applicability section of that standard, could, in conjunction with the risk-based "Verification Conditions" set out in Attachment A to that standard, provide a possible starting point for setting qualification criteria for Small GO/GOP registration. These could include capacity and connection thresholds, as in the Applicability section, as well as consideration of reactive power control, capacity factor, and other appropriate factors, as in Attachment A.

The intent of establishing a small GO/GOP threshold is not to remove any BES generator owners and operators from the registry. Rather, all BES generator owners and operators that meet the BES Definition, as well as the Registry Criteria capacity thresholds (individual units >20 MVA, plant >75 MVA), would remain registered and subject to compliance with applicable GO/GOP standards. For entities that do not exceed the small GO/GOP threshold set in the RBR process, they would be subject only to a defined subset of GO/GOP requirements (discussed below), which is to be determined after further analysis.

The following criteria could be applied to behind-the-meter generation where discretionary sales to the BES may exceed the "net" 75 MVA threshold applicable to behind-the-meter generation under Exclusion E2. These criteria are contingent on the development of a higher risk-based threshold "[X] MVA" as determined through further study:

1. Sales in excess of 75 MVA are energy only but not to exceed [X] MVA.
2. Capacity sales in excess of 75 MVA as requested and directed by the BA, TOP or RC, but not to exceed [X] MVA.
3. Additional factors in support of the above criteria, include that the entity is not a registered TO or TOP (or not otherwise a TO/TOP by virtue of generator tie lines) and does not otherwise affect SOLs or Interconnection Reliability Operating Limits (IROLs).

Proposed Critical Sub-function(s)
The working assumption is that all BES generating resource owners and operators with more than 75 MVA (or other threshold as determined through further study) are providing material amounts of capacity and energy to the BES and that misoperation of such BES resources could have an adverse reliability impact, and should accordingly remain subject to the full set of applicable reliability standards. Owners and operators of Blackstart Resources would also remain subject to full compliance responsibilities.

Analysis and Support for Proposed Action
When the revised BES Definition becomes effective, the Registry Criteria could be simplified to refer to an entity that owns/operates "BES generating units." Entities will thus be registered only if they own/operate BES

generation, i.e., if their generation meets the revised BES Definition or has been added through the exceptions process, and has not been *excluded* through the exceptions process.
The current registration criteria for GOs and GOPs, however, do not distinguish between the owners and operators of a 2,000 MW baseload plant and a 30 MW peaking unit that is primarily used to serve local load centers when market prices are high. Consistent with a risk-based approach to registration, entities that own/operate only insignificant BES generation should be subject only to a subset of GO/GOP standards required to ensure that the interconnection and operation of these resources do not cause or contribute to an adverse reliability impact during normal operations or when contingencies occur on the BES. As the drafting team determined in the MOD-026 Project, it is possible to draw technically sound distinctions among applicable units for modeling and other purposes. The purpose of drawing such distinctions is to lessen undue regulatory burdens on the owners and operators of limited amounts of generating capacity, and better target use of NERC resources on reducing risks to reliable interconnected operations.

As in the GO/TO project, it may be the case that some generators that fall below the threshold(s) set for Small GO/GOP registration are more complex and may therefore require individual assessment.

> The reliability gaps associated with such Facilities should not be addressed simply through application of all standards applicable to [Generator] Owners and [Generator] Operators, but instead through an assessment of the impact of such a Facility on [BES reliability]. Such assessment should then be used to determine exactly which Reliability Standards and requirements should apply to that Facility and whether additional entity registration is warranted. This assessment should, at a minimum, be based upon the output of transmission planning and operating studies used by the Reliability Coordinator, Transmission Operator and Transmission Planner in complying with applicable Reliability Standards (specifically, IRO, TOP and TPL).

Order 785 P 8.

Allowing energy-only sales in excess of 75 MVA would encourage entities with discretionary sales not to withhold power sales to the BES in order to stay below the threshold and avoid registration. Such sales would contribute to market liquidity and could be valuable in emergency situations. The variance would be capped at [X] MVA. Similarly, withholding capacity during high-load or emergency situations (to avoid registration) may have a higher reliability risk profile than exceeding the threshold on a limited basis. Any sales of capacity (such as ancillary services) that exceed the threshold by a behind-the-meter generator at the request of the BA, TOP, or RC should not be grounds for registration. The variance would be capped at [X] MVA.

Standards Applicability
The core standard requirements that need to apply across the board to small GO/GOP generators include those focused on protection systems (PRC) and modeling (MOD). Further analysis is required with respect to other Reliability Standards that should remain applicable, including, but not limited to, EOP-004-2, FAC-008-3, IRO-010, and TOP-006-2.

The task force could identify a common set of Reliability Standards that need to be applied to BES resources owned and operated by small GO/GOPs. This task force could also assess the merits of alternative approaches to targeting registration, standards applicability, and compliance monitoring and enforcement to entity risk. Technical analyses in accordance with Section 215 of the FPA will be required to identify any reliability implications so that no reliability gaps are created. As a result, this initial assessment of risk could be revised based on further analysis. An industry survey also will be used to identify issues to be considered as part of the technical analysis.

The resulting analysis can then be used as the basis for establishing a small GO/GOP registration category and making appropriate revisions to Reliability Standard applicability.

Generator Operator (GOP)

Current Definition and/or Threshold in Statement of Compliance Registry Criteria

Definition

The entity that operates generating unit(s) and performs the functions of supplying energy and Interconnected Operations Services.

Threshold

NERC Rules of Procedure (ROP) Appendix 5B at III.c.1 Individual generating unit > 20 MVA (gross nameplate rating) and is directly connected to the Bulk Power System, or;

ROP Appendix 5B at III.c.2 Generating plant/facility > 75 MVA (gross aggregate nameplate rating) or when the entity has responsibility for any facility consisting of one or more units that are connected to the Bulk Power System at a common bus with total generation above 75 MVA gross nameplate rating, or;

ROP Appendix 5B at III.c.3 Any generator, regardless of size, that is a Blackstart Resource material to and designated as part of a Transmission Operator entity's restoration plan, or;

ROP Appendix 5B at III.c.4 Any generator, regardless of size, that is material to the reliability of the Bulk Power System.

> *[Exclusions: A Generator Owner/Operator will not be registered based on these criteria if responsibilities for compliance with approved NERC Reliability Standards or associated Requirements including reporting have been transferred by written agreement to another entity that has registered for the appropriate function for the transferred responsibilities, such as a Load-Serving Entity, generation and transmission cooperative or joint action agency as described in Sections 501 and 507 of the NERC Rules of Procedure.*
>
> *As a general matter, a customer-owned or operated generator/generation that serves all or part of retail load with electric energy on the customer's side of the retail meter may be excluded as a candidate for Registration based on these criteria if (i) the net capacity provided to the Bulk Power System does not exceed the criteria above or the Regional Entity otherwise determines the generator is not material to the Bulk Power System and (ii) standby, back-up and maintenance power services are provided to the generator or to the retail load pursuant to a binding obligation with another Generator Owner/Operator or under terms approved by the local regulatory authority or the Federal Energy Regulatory Commission, as applicable.]*

Functional Model Description

The Generator Owner may operate its generating facilities or designate a separate organization to perform the Generator Operation Function. The Generator Operator operates, or directs the operation of generation facilities. The Generator Operator supports the needs of the Bulk Electric System up to the limits of the generating facilities in its purview. Ultimately, the Generator Operator's role is to meet generation schedules, manage fuel supplies, and provide frequency support and reactive resources without jeopardizing equipment.

Relationship with the Generator Owner. The organization that serves as Generator Operator may also be the owner of the generation facilities it operates; or it may be a separate organization designated by the Generator Owner to operate the facilities. The Generator Operator receives maintenance and performance verification schedules from the Generator Owner, and develops operating and unit commitment plans based on these schedules.

Relationship with the Transmission Operator. The Generator Operator provides reliability related services through arrangements or by direction from the Transmission Operator for support of the Bulk Electric System. The Generator Operator provides maintenance schedules, generator status, and AVR status to the Transmission Operator. The Generator Operator receives notification of transmission system problems affecting its generator from the Transmission Operator or Reliability Coordinator.

Relationship with the Balancing Authority. The Generator Operator provides unit commitment schedules, generator status, and operating and availability status of generating units to the Balancing Authority.

Relationship with the Reliability Coordinator. The Generator Operator provides annual maintenance plans, and operational data to the Reliability Coordinator. The Generator Operator takes actions based on directives from the Reliability Coordinator for the needs of the Bulk Electric System.

Relationship with Purchasing-Selling-Entity. The Generator Operator receives notice of Arranged Interchange approved by the Purchasing-Selling-Entity.

Proposed Elimination
N/A

Proposed Revised Threshold
Yes, as outlined in the analysis and discussion of Generator Owner. A common technical analysis is required of standards applicable to both functions. An initial review indicates a proportionally *smaller* number of Generator Operator-related requirements would likely be determined to be applicable to small GO/GOP entities than would be the case for Generator Owner-related requirements.

For example, proposed COM-002-2a would require all Small Generator Operators to "have communications (voice and data links) with appropriate Reliability Coordinators, Balancing Authorities, and Transmission Operators [that are] . . . staffed and available for addressing a real-time emergency condition." COM-002-3 would require small GOPs to train staff and be prepared to document the use of three-part communications in communications that are unlikely to take place. Regional Entities would similarly be responsible for ensuring compliance with these requirements.

Appendix B – Current State of Registration Program

NERC's Role

NERC plays several key roles in entity registration. NERC has authority to identify candidates for registration. In addition, NERC reviews registration recommendations and changes to the NCR from Regional Entities. NERC also oversees implementation of the Registration program at the Regional Entities. Finally, NERC is responsible for registering entities, and establishing and maintaining the NCR of the BPS users, owners and operators subject to its Reliability Standards.[16]

Throughout implementation of the Registration program, NERC has provided formal and informal guidance to Regional Entities and industry regarding Registration requirements, roles and responsibilities. This guidance generally has been in response to issues that have arisen in execution of the Registration program, primarily through registration appeals as well as entity sales, mergers, and acquisitions of assets. However, NERC has not defined certain terms used in the Registry Criteria[17] or mandated a set of specific criteria that could result in the addition or removal of an entity from the NCR. NERC also has not prescribed the use of a single web-based portal or common registration form.

In addition, NERC has worked closely with Regional Entity Registration activities and reviewed Registration activities and processes over time, and has recently revised internal oversight processes. As part of this initiative, NERC is reviewing best practices and procedures at the Regional Entities to incorporate them into the proposed design. This white paper identifies a summary of those practices and procedures, as well as possible improvements, such as a common registration form.

Regional Entity's Role

As called for in the NERC Rules of Procedure and its appendices, the Regional Entities identify candidates for registration. In addition, Regional Entities review and evaluate registration requests and changes making recommendations to NERC when a request or change may affect the NCR.

The staffs of the Regional Entities actively participate in NERC-led committees, task forces, and working groups, which facilitate the exchange of information between NERC and the Regional Entities. In addition, the Regional Entities are active participants in the ERO Compliance and Enforcement Management Group (ECEMG) and the Registration and Certification Functional Group (RCFG), both of which are under the oversight of the ERO Executive Management Group, comprised of the chief executive officers of NERC and the eight Regional Entities.

As part of this initiative, the ECEMG was asked to provide a review of the Regional Entity registration practices. A summary of the observations is below:

1. The majority of the Regional Entities use the Registry Criteria to determine materiality. If the entity meets the Registry Criteria, it will be registered and considered material. Some Regional Entities invoke the footnote in Registry Criteria that allows registration of an entity if it is material to the reliability of the BPS, even if it does not meet Registry Criteria.
2. Most Regional Entities have developed internal procedures to implement registration, based on the Registry Criteria. However, some Regional Entities use the Registration Criteria to determine registration candidates and then apply a material or risk "assessment."

[16] *See* http://www.nerc.com/pa/comp/Pages/Registration-and-Certification.aspx.

3. There is no consistency among Regional Entities in defining "materiality." A major objective should be to develop a consistent approach, for use by all Regional Entities, to determine an entity's material impact on BPS reliability.

Functional Model

Users, owners and operators of the BPS are registered by the function they perform, based upon the Functional Model. An entity is registered by function to comply with specific Reliability Standards, because the "Applicability" section of each Reliability Standard is based on the functional approach. However, there are some exceptions (e.g., based on facility characteristics such as radial lines 200 kV and above as called for in FAC-003). Unless an entity is registered for the function to which a Reliability Standard requirement is applicable, it is not responsible for compliance with that requirement.

Fifteen function types are included in the Registry Criteria. These include Balancing Authorities (BAs), DPs, Generator Owners (GOs), Generator Operators (GOPs), Interchange Authorities (IAs), LSEs, Planning Authorities (PAs)/Planning Coordinators (PCs), Purchasing-Selling Entities (PSEs), Reliability Coordinators (RCs), Transmission Planners (TPs), Transmission Owners (TOs), Transmission Operators (TOPs), Resource Planners (RPs), Reserve Sharing Groups (RSGs) and Transmission Service Provider (TSPs). User roles, include but are not limited to, DPs, LSEs, IAs and PSEs. Once registered for a function, entities are generally subject to the full set of Reliability Standards applicable to that function.

Thresholds

NERC's Registration program uses threshold criteria to determine if an entity meets a functional category and qualifies for registration. A user, owner or operator of the BES is considered a user, owner and operator of the BPS. Currently, an entity that meets the threshold criteria is deemed to have a material impact on the reliability of the BPS and thus may be registered, unless a Regional Entity determines otherwise. The NERC Rules of Procedure, and specifically the Registry Criteria in Appendix 5B,[18] provide the flexibility needed to register the appropriate organizations and subject them to applicable Reliability Standard requirements. The Registry Criteria provides for registration of an entity based on a material impact assessment even if it does not satisfy the threshold criteria, and for declining to register an entity that satisfies the threshold criteria based on a determination of lack of material impact. Notwithstanding this flexibility, implementation of the Registration program generally has led to a one-size-fits-all approach for identification of candidates for registration and related Reliability Standard applicability.[19] Inconsistencies in application also appear because terms are not be consistently defined or evaluated in the same way across the Regional Entities.

[18] *See* Registry Criteria at p. 11, "Notes to the above Criteria," Item number 1.

[19] For example, an entity that owns only a single BES 115 kV line or substation cannot specify realistic voltage schedules for generators in accordance with VAR-001 R4 when it is between two neighbors with disparate voltage schedules on their systems; the voltage schedule will be driven by larger neighboring system(s) with a wide-area view and responsibility for BES operations, not the small entity operating limited transmission facilities. Another example is that a small TOP without a wide-area view should not be setting System Operating Limits.

Reliability Standard Applicability

Once registered for a function, an entity is subject to the full set of Reliability Standards applicable to that function. There are a few exceptions, such as a technical or physical limitation (e.g., the entity does not have the asset subject to the Reliability Standard requirement such as SPS, Blackstart units, etc., or has an approved Technical Feasibility Exception, etc.).

However, this approach may result in implementation of the Registration program in a manner that does not take the size and scope of entities, and their role in BES reliability, into account in determinations as to registration and Reliability Standard applicability.

In Order No. 693,[20] and as part of its approval of the revised BES Definition,[21] FERC has encouraged Registered Entities to work with NERC and Regional Entities to determine if a sub-list of Reliability Standard requirements should be applicable to its respective registration. In some limited situations, NERC and the Regional Entities have tailored Reliability Standard requirement applicability for certain functional categories, such that the entity is not automatically subjected to the full scope of standard requirements otherwise applicable to a particular function.[22] This experience has shown that appropriately scoped registration better serves reliability, as it allows entities to increase their focus on their specific reliability and operational obligations, as appropriate to the reliability risk they impose. In addition, NERC's GO/TO project, which led to Order No. 785, "Generator Requirements at the Transmission Interface," demonstrated that this approach can be effective in addressing a class of Registered Entities, as well as on an individual basis.

Registration Types

Once the functional type is identified, there are four categories of entity registration:

1. First, in an Individual Registration scenario, an entity is registered on the NCR for one or more specific functions, and that individual entity accepts full compliance responsibility and accountability regarding Reliability Standard requirements associated with those specific functions.
2. Second, in a Joint Registration Organization (JRO) scenario, an entity registers on behalf of one or more of its members or related entities for one or more functions for which its members or related entities would otherwise be required to register, in accordance with Section 507 of the NERC Rules of Procedure. In this case, the registered entity accepts full compliance responsibility and accountability regarding Reliability Standards associated with those functions.
3. Third, Section 508 of the NERC Rules of Procedure allows two or more entities to register using a Coordinated Functional Registration (CFR). In this case, both entities are registered for one or more applicable function(s) and each is assigned respective responsibility for Reliability Standard requirements applicable to those functions. In a CFR, each registered entity accepts full compliance responsibility and accountability regarding Reliability Standards associated with those functions as listed in the CFR.
4. Finally, entities may be registered as a "concurrent registration" or "co-registration." A concurrent registration may be used when two entities meet the requirements for registration individually and may have an existing arrangement, agreement or contract that assigns responsibility for taking certain reliability actions, but the entities have not entered into a JRO or CFR. In this circumstance, NERC has the ability to register both entities for the same function, and may enforce noncompliance by either or both entities for failure to take the required reliability actions.

---

[20] *Mandatory Reliability Standards for the Bulk-Power System*, Order No. 693, FERC Stats. & Regs. ¶ 31,242, *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

[21] Order Approving Revised Definition, 146 FERC ¶ 61,199 (2014).

[22] *See, e.g., Cedar Creek Wind Energy, LLC*, 139 FERC ¶ 61,214 (2012).

The functional registration of an entity does not preclude it from delegating activities and tasks related to compliance to third parties. In such cases, only the entity that appears on the NCR are held accountable for compliance with applicable Reliability Standards.

Multi-Regional Registered Entity (MRRE)

MRRE is not a formal registration process. NERC and the Regional Entities are separately addressing compliance monitoring and enforcement activities for entities registered in more than one Regional Entity footprint. In some enforcement situations, the Regional Entities have worked together to identify a lead region, such that one of the respective Regional Entities has led enforcement efforts for a given MRRE.

Appendix C – BES Definition

"Bulk Electric System" or "BES" means unless modified by the lists shown below, all Transmission Elements operated at 100 kV or higher and Real Power and Reactive Power resources connected at 100 kV or higher. This does not include facilities used in the local distribution of electric energy.

Inclusions:

- ***I1*** *- Transformers with the primary terminal and at least one secondary terminal operated at 100 kV or higher unless excluded by application of Exclusion E1 or E3.*
- ***I2*** *- Generating resource(s) including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above with:*
  - *a) Gross individual nameplate rating greater than 20 MVA. Or,*
  - *b) Gross plant/facility aggregate nameplate rating greater than 75 MVA.*
- ***I3*** *- Blackstart Resources identified in the Transmission Operator's restoration plan.*
- ***I4*** *- Dispersed power producing resources that aggregate to a total capacity greater than 75 MVA (gross nameplate rating), and that are connected through a system designed primarily for delivering such capacity to a common point of connection at a voltage of 100 kV or above. Thus, the facilities designated as BES are:*
  - *a) The individual resources, and*
  - *b) The system designed primarily for delivering capacity from the point where those resources aggregate to greater than 75 MVA to a common point of connection at a voltage of 100 kV or above.*
- ***I5*** *- Static or dynamic devices (excluding generators) dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in Inclusion I1 unless excluded by application of Exclusion E4.*

Exclusions:

- ***E1*** *- Radial systems: A group of contiguous transmission Elements that emanates from a single point of connection of 100 kV or higher and:*
  - a) *Only serves Load. Or,*
  - b) *Only includes generation resources, not identified in Inclusion I2, I3, or I4, with an aggregate capacity less than or equal to 75 MVA (gross nameplate rating). Or,*
  - c) *Where the radial system serves Load and includes generation resources, not identified in Inclusions I2, I3 or I4, with an aggregate capacity of non-retail generation less than or equal to 75 MVA (gross nameplate rating).*

  Note 1 – A normally open switching device between radial systems, as depicted on prints or one-line diagrams for example, does not affect this exclusion.

  Note 2 – The presence of a contiguous loop, operated at a voltage level of 50 kV or less, between configurations being considered as radial systems, does not affect this exclusion.
- ***E2*** *- A generating unit or multiple generating units on the customer's side of the retail meter that serve all or part of the retail Load with electric energy if: (i) the net capacity provided to the BES does not exceed 75 MVA, and (ii) standby, back-up, and maintenance power services are provided to the generating unit*

or multiple generating units or to the retail Load by a Balancing Authority, or provided pursuant to a binding obligation with a Generator Owner or Generator Operator, or under terms approved by the applicable regulatory authority.

- ***E3*** *- Local networks (LN): A group of contiguous transmission Elements operated at less than 300 kV that distribute power to Load rather than transfer bulk power across the interconnected system. LN's emanate from multiple points of connection at 100 kV or higher to improve the level of service to retail customers and not to accommodate bulk power transfer across the interconnected system. The LN is characterized by all of the following:*

  a) *Limits on connected generation: The LN and its underlying Elements do not include generation resources identified in Inclusions I2, I3, or I4 and do not have an aggregate capacity of non-retail generation greater than 75 MVA (gross nameplate rating);*

  b) *Real Power flows only into the LN and the LN does not transfer energy originating outside the LN for delivery through the LN; and*

  c) *Not part of a Flowgate or transfer path: The LN does not contain any part of a permanent Flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection, or a comparable monitored Facility in the ERCOT or Quebec Interconnections, and is not a monitored Facility included in an Interconnection Reliability Operating Limit (IROL).*

- ***E4*** *- Reactive Power devices installed for the sole benefit of a retail customer(s).*

  Note - Elements may be included or excluded on a case-by-case basis through the Rules of Procedure exception process.

Agenda Item 6
MRC Meeting
May 6, 2014

Additional Policy Discussion from Board Committee Meetings

Action

Discussion of specific items presented at the Board Committee meetings. Staff presentations made at the Board Committee meetings will not be duplicated at the MRC meeting.

Status

On May 6, 2014, the MRC can expect to continue its increased participation and dialogue during the Board committee meetings in Philadelphia. The MRC will have additional time for policy discussion, as part of its own agenda, to respond to the information that is presented during the committee meetings.

The May 6, 2014 Board committee agendas and associated background materials will be posted on the following webpages:

Finance and Audit Committee Meeting Agenda (agenda to be posted approximately one week prior to the meeting)

Compliance Committee Meeting Agenda

Standards Oversight and Technology Committee Meeting Agenda

Agenda Item 7
MRC Meeting
May 6, 2014

NERC 2015 Business Plan and Budget

Action
Review and Discussion

Background
On May 16, 2014, a consolidated posting of the first drafts of the 2015 NERC and Regional Entity business plans and budgets will be available for a 45-day comment period. On April 22, 2014, in advance of the May 16, 2014 formal posting of the first drafts and prior to the May 6, 2014 MRC meeting, NERC management will be providing the trade associations, the MRC business plan and budget input group and interested stakeholders an update on the development of NERC's business plan and budget, Regional Entity coordination, key priorities and initiatives, as well as preliminary budget estimates. NERC management will also be meeting on April 23, 2014 in closed session with the NERC Finance and Audit Committee to discuss personnel, contract and other matters affecting NERC's 2015 business plan and budget. Management will then present a preliminary overview of the key elements of NERC's draft 2015 business plan and budget at the May 6, 2014 MRC meeting, taking into consideration any input received during the April 22nd and April 23rd meetings. Given the timing of these April meetings, management's presentation for the May 6, 2014 MRC meeting is not anticipated to be available more than a few days in advance of the May 6th MRC meeting. However, the presentation is expected to draw largely upon the information presented at the April 22nd trades meeting which is anticipated to be posted on NERC's website on the 2015 business plan and budget page on or about April 22, 2014.

Following the formal posting of the NERC, Regional Entity and consolidated ERO Enterprise business plans and budgets on May 16, 2014, two open Finance and Audit Committee conference calls are planned for May 21st and July 17th. These conference calls will provide additional opportunities for stakeholder input in the development of the NERC and Regional Entity 2015 business plans and budgets. Stakeholders will also have an opportunity to comment on NERC's final 2015 business plan and budget, which will be posted in mid-July. Each of the Regional Entities also has a process to obtain direct stakeholder input on their business plans and budgets and stakeholders are encouraged to participate in those forums. A complete copy of the 2015 NERC and Regional Entity business plan and budget schedule may be found on NERC's website.

In addition to the 2015 business plan and budget, NERC management will provide a brief update on the approved 2014 performance metrics, and discuss the plan for developing the 2015 performance metrics. The 2014 performance metrics are included with agenda item 12 in the May 7, 2014 Board of Trustees (Board) agenda package that will be posted on the Board agenda webpage.

Agenda Item 8
MRC Meeting
May 6, 2014

2014 Long-Term Reliability Assessment: Development Plan and MRC Input

Action
Information

Status Update
As part of the annual Long-Term Reliability Assessment (LTRA), NERC staff along with regional and industry input, identifies and analyzes the impact of key issues and trends that may affect reliability in the future, such as market practices, industry developments, potential technical challenges, technology implications, and regulatory or legislative policy changes.

The data and information collected for the development of the LTRA reference case incorporates known policies and regulations expected to impact industry throughout the ten-year timeframe, assuming a variety of factors such as economic growth, weather patterns, and system equipment behavior. Over this ten year period (and beyond), a variety of technical challenges to bulk system reliability—largely as a result of emerging regulatory and legislative mandates promoting changes in North America's resource mix—must be well understood and fully evaluated.

Among the variety of potential impacts, NERC must evaluate which long-term issues take priority and have the greatest risk to the reliability of the Bulk Power System. While the LTRA reference case with electric supply and demand projections offer a valuable perspective on the future state of reliability, additional information and guidance from NERC's Operating, Planning, and Member Representatives Committees will enhance the report by offering a more complete explanation of ongoing industry uncertainties and risks – particularly those that may not be captured in the reference case.

The Planning Committee has identified the following high-priority issues impacting long-term planning and operating reliability (in no particular order):

- Resource adequacy concerns in MISO and TRE-ERCOT
- Continued integration of variable generation
- Fossil-fired retirements and coordination of outages for environmental control retrofits
- Increased dependence on natural gas for electric power
- Increased use of demand-side management
- Nuclear generation retirements and/or long-term outages

NERC also continues to monitor other areas of potential concern. While the challenges noted below are considered low-to-medium priority to Bulk Power System reliability than the high-priority issues listed above, NERC will continue to monitor and determine whether these aspects require further evaluation.

- Workforce aging and skills development

- Load forecasting uncertainty
- Smart Grid deployment
- Change in system behavior and composition of system load
- Transmission siting, permitting, and Right-of-Way issues
- Aging infrastructure
- Region/Interconnection-wide modeling and validation
- Operational risks associated with interaction of Special Protection Systems/Remedial Action Schemes
- Global supply chains and fuel reliability
- Coordinated cyber and physical attacks on electricity infrastructure

NERC is seeking guidance from the MRC through a survey mechanism. MRC responses will be used as front-end input for the *2014 Long-Term Reliability Assessment* and also aid the strategic prioritization conducted by the Reliability Issues Steering Committee (RISC). The survey will begin on **May 1, 2014** and continue through **May 30, 2014**.

The survey will focus on the key risk areas noted above, with opportunity to provide open-ended input and long-term reliability policy guidance. The evaluation of these inputs and insights at the early stage of development of the *2014 Long-Term Reliability Assessment* are intended to expand the perspectives of those aspects that could impact the long term Bulk Power System. The proposed schedule for Member Representatives Committee (MRC), Operating Committee (OC), and Planning Committee (PC) input in the development of the report are provided below:

Date	Milestone/Deliverable
Thursday, May 1	Survey Opens for PC, OC, and MRC
Friday, May 30	Survey Closes
Monday, September 8	LTRA sent to PC, OC, and MRC for Review
Tuesday-Wednesday, September 16-17	LTRA Highlights Presented to PC
Thursday, September 25	PC Vote for Report Approval
October TBD	Board of Trustees Approval

In developing comments for the survey, MRC members should also consider the *2013 Long-Term Reliability Assessment*, including the key findings, report structure, and messaging: http://www.nerc.com/pa/RAPA/ra/Reliability%20Assessments%20DL/2013_LTRA_FINAL.pdf

Essential Reliability Services Whitepaper

Action
Information

Status Update

Essential Reliability Services Task Force
The Planning Committee (PC) and the Operating Committee (OC) have formed a task force as a follow-on action to the recommendations from the *2013 Long-Term Reliability Assessment* as well as the results of the California ISO Joint Report last fall. The task force will focus on expanding NERC's methodology for reliability assessment. The approach is expected to include the development of metrics for further evaluation in future long-term reliability assessments and supplement the existing resource adequacy measures. The task force has also developed a technical reference document on essential reliability services (the ERS Whitepaper), which include frequency response, inertia, voltage stability, ramping capability, and other operational requirements needed to ensure Bulk Power System (BPS) reliability.

The PC/OC approved task force scope and roster are included as attachments. The scope and deliverables provide a framework for activities and results anticipated to emerge during the balance of 2014 and into 2015.

Essential Reliability Services Whitepaper
In forming the task force, NERC staff endeavored to develop a foundational whitepaper that could also serve as a technical reference for regulators and policy makers. Informing, educating, and building awareness on the reliability ramifications of the changing resource mix is a prominent NERC reliability function, and is particularly important to provide a foundation for emerging reliability issues.

The objectives of the ERS Whitepaper are listed as follows:

- Identify and define a standardized set of ERS in functional, technology-neutral, performance based terms that can be used to meet the operational needs of the North American BPS.
- Describe why each ERS is important for BPS reliability.
- Describe how each ERS is being stressed given the changes in the overall resource mix.
- Describe how each ERS fits into the overall needs of the BPS in relation to existing services in place as well as the respective inter-relationships.

The whitepaper will be posted on the NERC website on April 23, 2014.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Attachment 1

Essential Reliability Services Task Force (ERSTF) Scope

Background

Essential Reliability Services (ERS) are the elemental 'reliability building blocks' from resources (generation and demand) necessary to maintain Bulk Power System (BPS) reliability. ERS are operational attributes from conventional generation, such as providing reactive power to maintain system voltages and physical inertia to maintain system frequency, necessary to reliably operate the BPS. In contrast, retirement of conventional generation in near future across many areas in North America, coupled with increasing variable generation installation can adversely impact the availability of ERS unless due considerations are given in planning and operations.

There are many factors that contribute to the need for reassessing reliability services. To include a few; variable renewable generation such as distributed, and utility scale solar, and wind generation, retirement of conventional power plants with substantial inertial response capability, increase use of demand response to address load relief, and the change in the operational landscape with integration of renewables and new technology that is used in conjunction with them, like energy storage. The proposed levels of commitment to renewable variable generation is one component of an ongoing shift in resource mix. It is imperative that power system planners and operators understand the potential and cumulative reliability impacts associated with large scale integration of variable generation, an overall capacity reduction in larger base-load generation, increased participation from demand resources and distributed generation, and a more evident increase in reliance on natural gas-fired generation.

As larger amounts of variable generation are added to the system, they have strong potential to displace the traditional large, rotating machines and the operating characteristics those machines and the ancillary benefits to system reliability that these units provided. Variable generation, in particular, has different operating characteristics and responds differently to changes in frequency and voltage on the system. Beyond capacity and energy characteristics, essential reliability services (ERS), such as inertia, frequency response, and voltage control, must be maintained across a given system to ensure reliable operation. These along with other characteristics or functions make up a suite of Essential Reliability Services or ERS.

To meet the needs of the future Bulk Power System, maintaining sufficient ERS will include a mix of market approaches, technology enhancements, and reliability rules or other regulatory rule changes. While the solution sets will likely be different in various regions, it may be necessary for regulators to make appropriate adjustments to market rules and reliability standards that will ensure reliable operation of the BPS.

Purpose

The ERSTF has a multi-faceted purpose that includes developing a technical foundation of ERS; educating and informing industry, regulators, and the public about ERS; developing an approach for tracking and trending ERS; formulating recommendations to ensure the complete suite of ERS are provided and available; and providing guidance necessary for operating a reliable grid. More specifically, the ERSTF will reconcile a collection of analytical approaches for understanding potential reliability impacts as a result of increasing variable resources and how those impacts can affect system configuration, composition, operation and the need for increased ERS. The ERSTF will include membership from existing technical subcommittees and working groups to strengthen the task force platform, and thus producing results which will maintain, enhance, and sustain reliable operation of BPS.

Activities

1. Develop a technical reference document (primer) on ERS. The primer can be used as a reference manual for regulators and policy makers to inform, educate, and build awareness on the reliability ramifications of the elements essential for the reliability of the BPS.
2. Develop an approach and framework for the long-term assessment of essential reliability services to supplement existing resource adequacy assessments. The approach should include a series of metrics that can be continually measured for further evaluation.
    a. Assess impacts on ERS due to increase in variable generation along with retirements of base generation. Articulate how each region is impacted by this scenario.
3. Develop specific recommendations for practices and proposed requirements, including potential reliability standards, that cover the transmission and generation planning, operations planning, and real-time operating procedures.
4. Compose a technically sound guidance document incorporating ERS in operations and operational planning. With retirement of base load generation plants, integration of variable resources and increased use of demand response for load relief; the operational landscape has changed and is projected to continue for near future. Operations personnel will face different methods and modes of operations; for e.g. with increased transmission line construction to accommodate renewable resources, increased number of reactive support devices are installed on the system to compensate for variability of renewables and voltage support. This philosophy and implementation is different from traditional operations with base load generators providing majority of voltage and reactive support.

Based on the work plan generated in this first phase of activity, the OC and PC will determine follow-on activities to support technical committee recommendations, implementation of enhanced reliability assessment approaches, and/or technical guidance to standard drafting teams.

Membership

NERC requests industry's subject experts to continue their efforts and add additional members as needed, with final selection agreed to by the officers of the Planning Committee and Operating Committee. Members must be willing to commit their time to participate in the task force discussions and contribute to writing the final report.

The task force is comprised of the following:

- Co-chaired (OC/PC)
- One representative from each Region
- At least one representatives from the NERC Planning Committee
- At least one representatives from the NERC Operating Committee
- One member-at-large representing Canada
- Additional members can be added:
  - At the request of the Planning and/or Operating Committee sector representatives, or
  - As needed by the NERC coordinator
- One member of the Reliability Assessment Subcommittee (or designated liaison)
- One member of the System Analysis and Modeling Subcommittee (or designated liaison)
- One member of the Resources Subcommittee (or designated liaison)
- One member of the Frequency Working Group (or designated liaison)
- NERC staff coordinator(s)
- Governmental members include, but not limited to:
  - Federal Energy Regulatory Commission
  - United States Department of Energy
  - National Energy Board, Canada

Participation of additional industry subject matter experts may be requested to support task force activities.

The task force co-chairs will be appointed by the chairs of the NERC Planning Committee and Operating Committee. Representation on this task force follows established Planning Committee and Operating Committee guidelines for participation.

Members are appointed by their Region or electric industry sector for two-year terms, without limit to the number of terms. Any Region or electric industry sector may name an alternate representative(s) who may attend task force meetings.

Order of Business

In general, the desired, normal tone of the task force business is to strive for constructive technically sound solutions which also achieve consensus. On the relatively few occasions where that desired outcome cannot be achieved, the task force will defer to a determination by the Planning and Operating Committees to settle the issue. If any strong minority opinions develop, those opinions may be documented as desired by the minority and forwarded to the PC and OC Chair for future meeting consideration.

Reporting

The task force is responsible to the Planning and Operating Committees for the completion of work associated with the scope items outlined above. Final work products of the task force will be approved as necessary by the Planning and Operating Committees and, if necessary, by the NERC Board of Trustees. The task force chairs will periodically apprise the Planning Committee, Operating Committee, and Board of Trustees, as required, on the task force's status, activities, assignments, and recommendations.

Meetings

Weekly to biweekly conference calls can be expected. Additionally, two to three open in-person meetings per year may be needed.

Approved by the NERC Planning Committee: March 5 , 2014

Five-Year Performance Assessment Update

Action
Information

Background
Pursuant to Federal Energy Regulatory Commission (FERC) regulations, the North American Electric Reliability Corporation (NERC), as the certified electric reliability organization (ERO), is required to submit to FERC, three years after certification and every five years thereafter, a self-assessment of its performance as the ERO and an assessment of the performance of the Regional Entities as parties to delegation agreements with NERC.

Pursuant to the order on the three-year assessment, NERC is required to prepare "a separate section assessing each Regional Entity's satisfaction of statutory and regulatory criteria, and a more detailed discussion of stakeholder comments regarding each Regional Entity" in order to "aid the Commission in making a determination on whether each of the Regional Entities is performing properly under its delegated authority."[1]

The first five-year self-assessment will be filed with FERC on July 21, 2014.

Summary
On March 3, 2014, NERC posted a draft of the five-year performance assessment which consisted of the following: (i) the Statement of Activities and Accomplishments, (ii) a discussion of how NERC meets the ERO certification criteria, (iii) a joint assessment prepared by the Regional Entities assessing their performance over the past five years, (iv) an overview of the comments received in response to the October 2013 survey, and (v) a table showing the status of areas of improvement identified in the order on the three-year performance assessment. NERC received seven sets of comments in response to this posting. These comments will be addressed alongside the October 2013 survey comments in the Statement of Activities.

NERC is currently preparing assessments of the Regional Entities' performance of their delegated functions. NERC expects to post a revised draft of the entire five-year performance, including its assessment of the Regional Entities in June 2014.

NERC is on track to file the five-year performance assessment on or before July 21, 2014. A revised timeline is included below:

[1] *Order on the Electric Reliability Organization's Three-Year Performance Assessment*, 132 FERC ¶ 61,217 at P 36 (2010).

May 6, 2014	Discuss timeline for completing five-year performance assessment at MRC meeting
June 2014	Post second draft of five-year performance assessment, including NERC's assessment of Regional Entity performance Deadline for Regional Entity boards to review or approve, as applicable, joint Regional Entity self-assessment
Early July 2014 July 21, 2014	Review and finalize complete performance assessment File complete performance assessment at FERC File information copies with Canadian jurisdictions

Agenda Item 11
MRC Meeting
May 6, 2014

Update on Regulatory Matters
(As of April 7, 2014)

Action
Information

Regulatory Matters in Canada

1. The second agreement among the North American Electric Reliability Corporation (NERC), the Régie de l'Energie Québec (Régie), and the Northeast Power Coordinating Council (NPCC) regarding implementation of mandatory Reliability Standards in Québec is being developed for consideration by the Québec provincial government. On October 30, 2012, the Régie issued a decision adopting 35 Reliability Standards for Québec. On March 20, 2014, the Régie issued another decision in the same proceeding adopting an additional 7 Reliability Standards for Québec, which brings the total number of adopted standards in Québec to 42. It is expected that the Régie will issue a decision concerning additional Reliability Standards within the same proceeding. Hydro-Québec TransÉnergie, the Québec Reliability Coordinator, has initiated a consultation process on 18 NERC Reliability Standards that will be filed with the Régie once its decision on the pending standards is issued. This filing is expected before the end of 2014. The review of the Sanction Guide proposed by Hydro-Québec TransÉnergie and the determination of Reliability Standards enforcement dates remain pending.
2. The Province of Manitoba (Manitoba) enacted the following in order to establish a new statutory framework for compliance with Reliability Standards in Manitoba: (i) amendments to The Manitoba Hydro Act; (ii) amendments to The Public Utilities Board Act; and (iii) a Reliability Standards Regulation. The Reliability Standards Regulation adopts, by way of a schedule, the NERC / Midwest Reliability Organization (MRO) Reliability Standards applicable to Manitoba registered entities and outlines the Compliance Monitoring and Enforcement Process (CMEP) in Manitoba. In 2013, the Manitoba completed consultations regarding amendment of the Reliability Standards Regulation to adopt new standards developed or revised by NERC since April 1, 2012 and to revise the CMEP to allow a fast-track method of enforcement for minor violations, including the "Find, Fix and Track Process." These CMEP amendments are effective March 25, 2014, and the new standards are effective March 31, 2014.
3. British Columbia has vested the British Columbia Utilities Commission (BCUC) with authority to levy monetary penalties for violations. The BCUC has established an inquiry to consider processes for assessing severity and risk for violations and a possible exception process to the British Columbia Rules of Procedure that govern its Mandatory Reliability Standards regime (this relates primarily to the Bulk Electric System definition and remains pending). On December 12, 2013, the BCUC issued order R-41-13 in response to Mandatory Reliability Standards Assessment Report No. 6 and Addendum,

adopting nine revised NERC Reliability Standards, two errata to the Addendum, and five new or revised defined terms in the NERC *Glossary of Terms*.

4. NERC has filed petitions of several Reliability Standards in Alberta, British Columbia, Manitoba, National Energy Board (NEB), Nova Scotia, Ontario, Québec, New Brunswick, and Saskatchewan.
5. New Brunswick's legislation that amends how Reliability Standards are approved, monitored, and enforced received Royal Assent in New Brunswick and was proclaimed on October 2013. The Act led to the amalgamation of the New Brunswick System Operator (NBSO) with the NB Power Group of Companies. The system operation functions performed by the NBSO are now performed within a vertically integrated NB Power. NBSO's role in the adoption, monitoring, and enforcement of North American reliability standards has been transferred to the New Brunswick Energy and Utilities Board (NBEUB). On December 23, 2013, NBEUB issued version 00 of its Reliability Standards, Compliance and Enforcement Program 2014 Annual Implementation Plan. In accordance with the new legislative requirements, NB Power is required to make an application to the NBEUB within 60 days of FERC's approval of NERC Reliability Standards. Since October 2013, NB Power has filed several applications with the NBEUB for approval of NERC Reliability Standards.
6. The NEB issued an order on December 6, 2012 imposing mandatory Reliability Standards on international power lines (IPL) under the NEB's jurisdiction. The NEB is developing an approach on Administrative Monetary Penalties that might be applicable, as appropriate for violation of Reliability Standards.
7. On February 28, 2014, NERC filed its Fourth Quarter 2013 application for approval of Reliability Standards in Nova Scotia. The Third Quarter 2013 application for approval of five Reliability Standards and updated NERC *Glossary of Terms* in Nova Scotia was approved by the Nova Scotia Utility and Review Board on January 8, 2014.
8. Effective January 1, 2014, the Alberta Electric System Operator (AESO) assumed all responsibilities related to the functions of a Reliability Coordinator. Alberta Reliability Standards related to a Reliability Coordinator will be adopted and this work is underway. The AESO remains an active member and supporter of the WECC and looks forward to a strong working relationship with the adjacent Reliability Coordinators, Peak Reliability and SaskPower. On March 25, 2014, the AESO posted an updated Alberta Reliability Standards Project Plan that tracks the adoption of Alberta Reliability Standards. In particular, NERC Reliability Standards CIP-002 through CIP-011 have been reviewed and are targeted for filing with the Alberta Utilities Commission in June 2014, with a forecasted effective date of the Third Quarter 2016.

FERC Orders Issued Since the Last Update

Please find the FERC orders at the following website:
http://www.nerc.com/FilingsOrders/us/Pages/2014fercordersrules.aspx

NERC Filings Since the Last Update

Please find the NERC filings to FERC at the following website:
http://www.nerc.com/FilingsOrders/us/Pages/nercfilings2014.aspx

Canadian Filings and Orders

Please find the NERC filings to Canadian applicable governmental authorities at the following website:
http://www.nerc.com/FilingsOrders/ca/Pages/default.aspx

Anticipated NERC Filings

1. May 15, 2014 – NERC must submit a compliance filing modifying Violation Risk Factors and Violation Severity Levels in response to FERC's November 22, 2013 order approving Version 5 Critical Infrastructure Protection Reliability Standards. *Docket No. RM13-5-000*
2. May 15, 2014 – Within forty-five days of the end of each quarter, beginning with the quarter ending March 31, 2013, NERC will file with the Commission the unaudited report of the NERC budget-to-actual spending variances during the preceding quarter. This report will include information regarding sources and uses of operating and working capital reserves and will match or exceed the level of detail of the quarterly budget-to-actual variance report of NERC expenditures attached to the agenda of NERC Board of Trustees Finance and Audit Committee's October 2012 meeting. *Docket No. FA11-21-000*
3. May 30, 2014 – NERC must submit a quarterly nuclear data filing in response to Paragraph 629 of Order No. 693. *Docket No. RM06-16-000*
4. May 30, 2014 – NERC must submit a quarterly filing in Nova Scotia of FERC approved Reliability Standards.
5. May 30, 2014 – NERC must submit the true-up filing report of comparisons of actual to budgeted costs for the year 2013 for NERC and the Regional Entities.
6. June 5, 2014 – NERC must submit for approval one or more Reliability Standards that will require certain registered entities to take steps or demonstrate that they have taken steps to address physical security risks and vulnerabilities related to the reliable operation of the Bulk-Power System (CIP-014 Physical Security Measures). *Docket No. RD14-6-000*
7. June 20, 2014 – NERC must submit an annual compliance filing on implementation of the Find, Fix, Track and Report program. *Docket No. RC11-6-004*
8. July 1, 2014 – NERC must submit a quarterly status report informational filing in response to FERC's January 14, 2014 order related to the motion to defer action on revisions to the Transmission Operations (TOP) and Interconnection Reliability Operations and Coordination (IRO) Reliability Standards. *Docket Nos. RM13-12-000, RM13-14-000, and RM13-15-000*

9. July 21, 2014 – NERC must submit the Five-Year ERO Performance Assessment Report in accordance with the requirements of the Commission's regulations at 18 C.F.R. §39.3(c).

Risk-Based Registration Initiative

Mark Lauby, Senior Vice President and Chief Reliability Officer

Member Representatives Committee Meeting

May 6, 2014

RELIABILITY | ACCOUNTABILITY

Current Registration Challenges

- Some functions may have minimal impact on reliability
- Must follow all Reliability Standard requirements according to function, regardless of reliability impacts
- Conservative criteria and thresholds used to register entities
- Flexibility to use entity risk, but limited application to date

Risk-Based Registration (RBR) Vision

- Manage risk, ensuring right entities doing the right thing
- Differentiate entities exhibiting different levels of risk
  - Clear thresholds
  - Registration based on thresholds
  - Focused Reliability Standard requirements
- Align with:
  - Bulk Electric System (BES) definition
  - Reliability Assurance Initiative (RAI)
  - Reliability Standard reform
  - Third party audit findings
- Systematic, repeatable and comprehensive process

Tailor Requirements Based on Risk

- Alignment with risk-based concepts and themes
  - RAI
  - BES implementation
  - Reliability Standard applicability efforts
- Centralize review process for risk determinations
  - Establish clear criteria and thresholds
  - Consistent ERO-wide risk-based methods to assess entity's impact

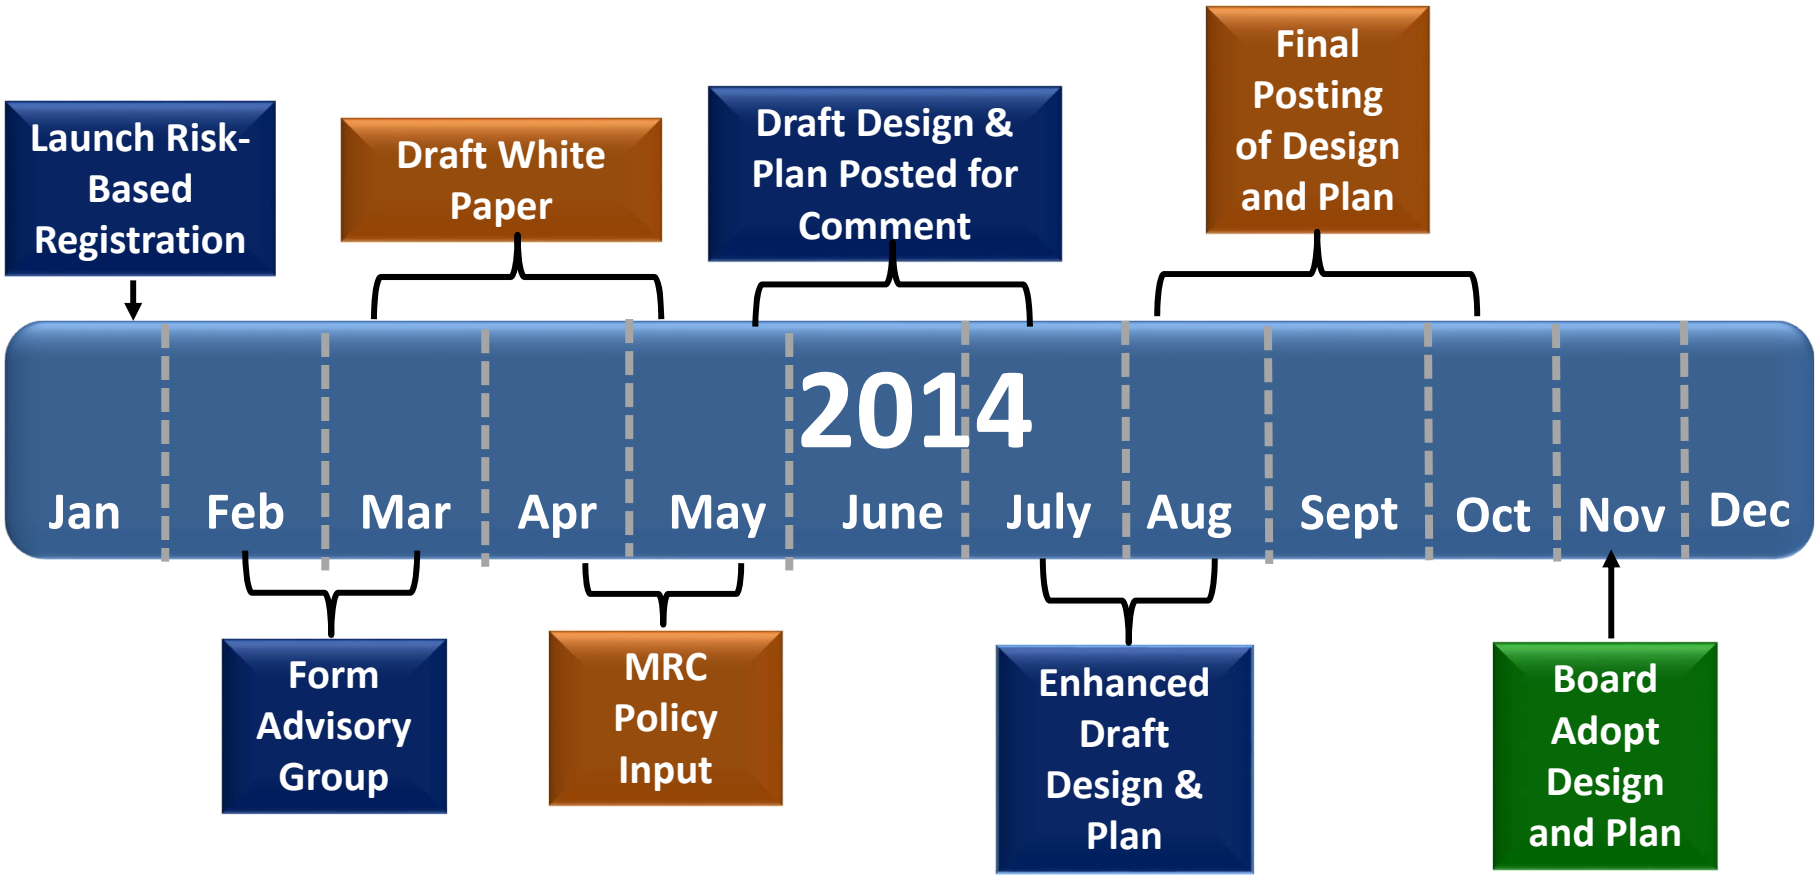
Advisory Group Activities

- Met twice to discuss scope and review draft white paper
- Not all functions require changes to thresholds
- Identified need:
  - Review function and linkage to reliability
  - Process and criteria to identify when entity should be registered
- Formed three *ad hoc* groups for threshold determination
  - Distribution Providers (DPs)/Load-Serving Entities (LSEs)
  - Transmission Owners (TOs)/ Transmission Operators (TOPs)
  - Generator Owners (GOs)/Generator Operators (GOPs)
- Formed one group to assess elimination of Purchasing-Selling Entities (PSE) and Interchange Authorities (IA)
- Draft white paper issued as part of MRC Policy Input Letter

Draft White Paper: Recommendations

- Clarification of terms and improved procedures
- New BES definition as model and anchor for RBR
- Entity risk assessment in a common registration form
- Eliminate functional registrations if not material (PSE & IA)
- Threshold synchronization with the new BES definition
- Standard requirement applicability (DP/LSE, GO/GOP & TO/TOP)
- Status quo for other functional registration categories

RBR Initiative 2014 Timeline



NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Potential Alternative Funding Mechanism to Support Expanded Cyber Security Information Sharing and Capabilities

Gerry Cauley, NERC President and CEO
Members Representative Committee Meeting
May 6, 2014

RELIABILITY | ACCOUNTABILITY

ES-ISAC Organizational Update

- Board adopted policy regarding separation of compliance and enforcement activities
- Recent organizational changes
  - ES-ISAC reports directly to President and CEO
  - CIP auditors transferred to compliance operations
- Moving forward with internal code of conduct further restricting information sharing
- 2015 budget consideration of potential physical separation of ES-ISAC operations within NERC's DC office

CRISP Project Summary – Policy Input Background

- Significant industry interest in project
- Contract/procurement complexity and challenges
- NERC participation tied to minimum level of industry support and resolution of funding and procurement details
- Potential funding from reserves ($200k-$300k) for basic NERC participation
- Policy Input – should NERC consider separate funding directly from CRISP participants to support additional NERC value added analytical services
- Preliminary estimated cost of additional services: $600k-$850k
  - Third party service to store CRISP data
  - Software and hardware to support analyst
  - Additional personnel costs
- Total potential funding $800k-$1.15M

NERC 2015 Business Plan and Budget – Draft #1 Overview

Michael Walker, Senior Vice President and Chief Financial and Administrative Officer

Member Representatives Committee Meeting

May 6, 2014

RELIABILITY | ACCOUNTABILITY

Agenda

- **Major Initiatives**
  - Strategic Planning
  - Registration
  - Standards
  - Compliance and Enforcement
  - Reliability Assessments
  - Situation Awareness/Events Analysis
  - Security/ES-ISAC
  - Training
  - Enterprise IT Applications
  - Corporate Services
- **Financial Projections**
- **2015 BP&B schedule**

Strategic Planning Initiatives

- Updated ERO Enterprise Strategic Plan for 2014-2017
  - Improved focus
  - Five goals
  - Metrics- May Board meeting
  - Drives NERC and Regional Entity resource planning and allocation
- 2014 corporate business plan and budget process improvements
  - Improved schedule
  - Coordination with Regional Entities
  - Reliability Issues Steering Committee (RISC) input
- Stakeholder input tracking posted on NERC website; rolling updates

Risk-Based Registration Initiatives

- Deploying sustainable registration program based on reliability risks
- Identifying a properly scoped set of standard requirements, including incorporating BES definition
- Identifying and implementing supporting business processes and systems
- Aligning changes to the registration criteria with other NERC activities

Reliability Standards Initiatives

- Supporting reliability risk management initiatives and process improvements
- Addressing FERC directives
- Continuing to transform standards to steady state
- Improving quality and content of standards
- Facilitating a smooth transition of new standards (e.g. CIP v5 and Physical Security)
- Continuing support of risk-based registration and the development of concurrent RSAWs

Compliance and Enforcement Initiatives

- Implementing consistent RAI techniques and principles
- Facilitating CIP v5 transition
- Auditor training
- Transitioning to single approach compliance monitoring and audit planning
- Identifying and implementing processing efficiencies
- Providing internal controls models
- Initiating compliance phase-in learning for new standards
- Consolidating common set of RSAWs, or successors, for all standards
- Reducing prior caseload

Reliability Assessment and Performance Analysis Initiatives

- Issuing reliability assessments, performance analyses reports
  - 10-year Long-Term Reliability Assessment
  - Two seasonal assessments: Summer and Winter
  - Special Assessment – e.g.: Essential Reliability Services, GMD, TBD
  - Annual State of Reliability Report
- Managing risk registry and prioritization process
  - Risk control strategies
  - Identify and track reliability risk indicators
  - Benchmark and measure reliability performance
- Supporting standards development and response to FERC directives
- Continuing development of reliability database capabilities

Situation Awareness/Events Analysis Initiatives

- Ensuring ERO is aware of BPS events and information is shared
- Collaborating with Forums on joint reliability initiatives and projects
- Keeping industry informed of emerging risks
- Tracking industry responses and providing timely updates
- Facilitating broader analysis of root and contributing causes and related training for industry
- Providing information and analysis to support risk-based methodologies and assessments

Critical Infrastructure Protection Initiatives

- Conducting security incident analyses and identifying lessons learned and security metrics
- Conducting GridSecCon and GridEx, focusing on physical and cyber security
- Coordinating with government agencies on policy issues
- Supporting CIP standards development and implementation
- Working through Critical Infrastructure Protection Committee (CIPC) to address emerging risk issues.

ES-ISAC Initiatives

- Organizational and procedures enhancements providing further separation from compliance operations
- Option of securing additional space in DC office to facilitate further physical separation and security
- Gathering, analyzing and providing secure information regarding cyber threats and vulnerabilities to industry
- Updating portal capabilities and providing self-service access to users for security awareness services

ES-ISAC-CRISP Project

- Industry interest in program but significant procurement and contract issues remain to be resolved-not clear whether project will move forward
- NERC participation at any level will be tied to minimum level of industry support and resolution of funding and procurement details
- Potential funding from reserves ($200-$300k) to fund basic NERC participation as user
- Considering requesting separate funding directly from CRISP participants to support additional NERC value added analytical services
- Preliminary CFM/CRISP resource estimate $600k-$850k
  - Third party service to store CRISP data
  - Software and hardware to support analyst
  - PNNL subscription services
  - 2 additional analyst (FTEs)

Training Initiatives

- Industry training
  - Standards, compliance, root cause analysis, etc.
- ERO Enterprise staff training
  - Regional entity compliance auditors, enforcement, etc.
- System Operator training
  - Initial certification
  - Continuing education
- Internal training
  - NERC employees - policies, information management, handling of confidential information, security, auditor training, etc.

Enterprise Applications

- Applications that support NERC and Regional Entity operations
- Financial update reviewed during FAC meeting
- Additional discussion at SOTC meeting
- Regrouping with Regions on overall strategy and approach
- Increasing focus
  - Controlling pace and costs
  - Improving vendor procurement and contracting
  - Strengthening development oversight and resources

Corporate Services

- Continuing to strengthen internal controls
- Increasing accounting and IT bench strength
- Continuing to evaluate and where practical implement NERC/Regional entity efficiencies
- NERC employee initiatives
  - Building core values into performance management system
  - Training
  - Climate surveys
  - Mentoring
  - Succession planning

NERC Projections

- Less than 1% operating expense increase
- Less than 2 % total increase in operating and capital expenses (net of depreciation)
- 5.7% less than 2015 forecast in 2014 business plan and budget
- Assessment projections under development

NERC Projections (Con't)

- Personnel Costs and Assumptions
  - No net increase in budgeted FTEs over 2014
  - 6% FTE adjustment (attrition, hiring delays)-based on 3 year average
  - 2.5 % average salary increase pool (slightly below 3% market reference)
  - Incentive compensation budgeted at 18.4% of total base salary expense-represents 3 year average
  - Medical and dental benefit plan cost increase based on market data

NERC Projections (Con't)

- 3% reduction in contractor and consulting expense
- Do not include incremental cost for ES-ISAC CRISP participation
  - $200-$300k participant level cost estimate-would increase operating expenses by approximately 0.5%
  - Potential initial funding from reserves
- Do not include cost of potential physical separation of ES-ISAC operations in NERC's DC office
  - $300k per year estimate- would increase operating expenses approximately 0.5%

NERC Projections (Con't)

- Contractor and Consulting Expenses

Consultants & Contracts	2014 BUDGET	2015 BUDGET	INC (DEC) OVER 2014
Total Reliability Standards	-	-	-
			-

Assessments

- Projections under development
- Posted on May 16th
- Multiple factors considered
  - NERC and Regional Entity budgets and funding requirements
  - Year end working capital and operating reserve projections
  - Loss $1.2M offset applied to reduce NERC assessments in 2014
  - NERC capital financing plan
  - Penalty offsets
  - Presence or absence of excess reserve offsets at Regions
  - Need to consider reserve requirements over planning period

Remaining Schedule

- May 16 - post NERC, Regional Entity BP&Bs and Consolidated Budget and Assessment Projection-45 day comment period
- May 20 - FERC budget staff briefing
- May 21 - FAC Webinar to review 1st drafts
- July 9 - closed FAC call/meeting to review proposed final budget and assessments
- July 15 - post and distribute final NERC and Regional Entity BP&Bs and assessments to FAC
- July 17 - FAC conference call/webinar for management review of final NERC and Regional Entity BP&Bs

Remaining Schedule (Con't)

- August 13 – FAC meeting to recommend approval of final NERC, Regional Entity BP&Bs and assessments
- August 14 – Board of Trustees meeting to approve final NERC BP&B, Regional Entity BP&Bs and assessments
- August 23 – Submit NERC and Regional Entity BP&Bs and assessments to FERC for approval, with subsequent filings with Canadian authorities

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

2014 Long-Term Reliability Assessment: Development Plan

John Moura, Director of Reliability Assessment

Member Representatives Committee Meeting

May 6, 2014

RELIABILITY | ACCOUNTABILITY

Proposed Key Issues for 2014 Long-Term Reliability Assessment

- Accommodating system needs and adapting to change
- Continued integration of variable generation
- Generation retirements and coordination of outages
- Increased dependence on natural gas
- Increased use of demand-side management
- Nuclear generation retirements and/or long-term outages

Seeking MRC Guidance

- Short survey now open
- Opportunity for open-ended input and policy guidance
- Responses will strengthen front-end input
- Support will aid the strategic prioritization by RISC
- Focus on six key risk areas
- Open format to identify other long-term risks

Survey and Report Schedule

Date	Milestone/Deliverable
Thursday, May 1	Survey opens for PC, OC, and MRC
Friday, May 30	Survey closes
Monday, June 2	LTRA development and analysis begins
Monday, September 8	LTRA sent to PC, OC, and MRC for review
Tuesday-Wednesday, September 16-17	LTRA highlights presented to PC
October TBD	Board approval and report published

Essential Reliability Services Whitepaper

John Moura, Director of Reliability Assessment

Member Representatives Committee Meeting

May 6, 2014

RELIABILITY | ACCOUNTABILITY

Recommendation from 2013 LTRA

Develop primer on essential reliability services (ERS):

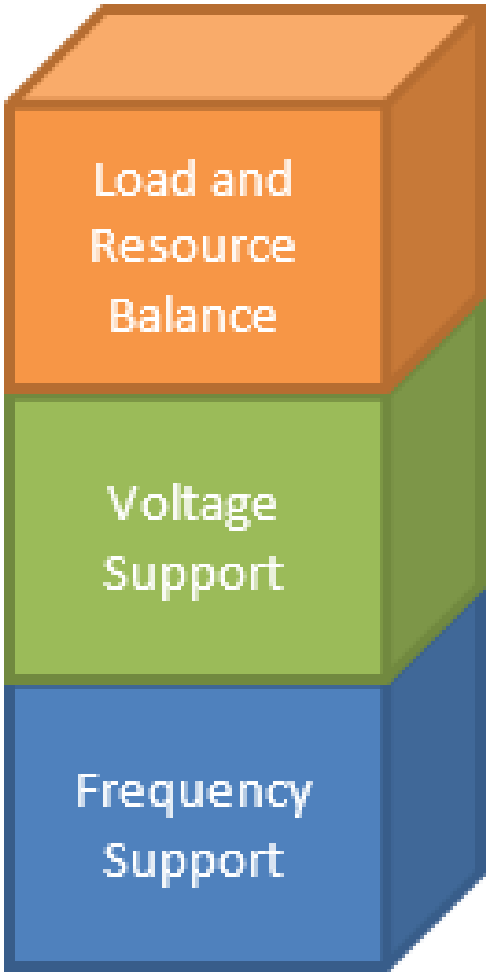
- Develop a reference document on ERS
- Operational requirements needed to ensure bulk power system (BPS) reliability

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Objectives

- Identify a standardized set of ERS
  - Simple tutorial
  - Functional, technology neutral, and performance-based
- Describe the importance for BPS reliability
  - How does the resource mix change affect ERS?
  - What happens when you don't have ERS?
- **Target Audience:** regulators, policy makers, and industry leadership

ERS Fundamentals



- "Building blocks" of physical capabilities
- Accentuated by resource changes
- Some partly covered through ancillary services
- Accommodate local/regional needs

Six Essential Reliability Services

- Operating Reserve
- Frequency Response
- Ramping Capability
- Active Power Control
- Reactive Power and Voltage Control
- Disturbance Ride-Through Tolerance

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Next Steps

- Whitepaper provides a foundation for the task force
- Task force will develop an analytical assessment framework
  - How is the analysis performed for each ERS?
  - What data is needed?
  - What parameters gauge acceptable levels of ERS?
  - How do the parameters relate to the overall resource mix?
- Framework expected in Q4 2014
- Final assessment completed in 2015

Five-Year ERO Performance Assessment

Willie L. Phillips, Assistant General Counsel

Member Representatives Committee Meeting

May 6, 2014

RELIABILITY | ACCOUNTABILITY

Initial Draft Posting

- Posted on March 3, 2014
- NERC received **seven** sets of comments

Comment Highlights

- **Enforcement**
  - Imposing penalties for administrative violations
  - Impact of the find, fix, and track (FFT) process
- **Compliance**
  - Measuring success of “risk-based” approach to compliance
  - Assess impact of Reliability Assurance Initiative (RAI)

Next Steps

- Update NERC Statement of Activities and Accomplishments
- Individual Regional Entity assessments of enforcement and compliance
- NERC's response to industry comments on initial posting

Timeline

- **May 4:** Preview Regional Entity assessments with ERO Boards
- **End of May:** Finalize Regional Entity assessments
- **June:** Post revised draft of five-year assessment
- **July 21:** File five-year assessment with FERC

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and subgroups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost information and participants' expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.
- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

- Any other matters that do not clearly fall within these guidelines should be reviewed with NERC's General Counsel before being discussed.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and subgroups) may have a negative impact on particular entities and thus in that sense adversely impact competition. Decisions and actions by NERC (including its committees and subgroups) should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation, Bylaws, and Rules of Procedure are followed in conducting NERC business.

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or subgroup, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on electricity markets, and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.

Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and employment matters; and procedural matters such as planning and scheduling meetings.

Phoenix, AZ 85044

Call to Order and Chair's Remarks

Chair Frederick W. Gorbet called to order the duly noticed open meeting of the Board of Trustees ("Board") of the North American Electric Reliability Corporation ("NERC") on February 6, 2014, at 8:30 a.m. Mountain, and a quorum was declared present. The agenda is attached as **Exhibit A**.

Present at the meeting were:

Board Members:
Frederick W. Gorbet, Chair
Paul F. Barber
Janice B. Case
Gerald W. Cauley, President and Chief Executive Officer
Robert G. Clarke
David Goulding
Douglas Jaeger
Kenneth G. Peterson
Bruce A. Scherr
Jan Schori
Roy Thilly

NERC Management
Charles A. Berardesco, Senior Vice President, General Counsel, and Corporate Secretary
Matthew Blizard, Director of Critical Infrastructure Protection
Thomas Burgess, Vice President and Director of Reliability Assessment and Performance Analysis
Mark G. Lauby, Vice President and Director of Standards
Michael Moon, Senior Director of Reliability Risk Management
Mark Rossi, Senior Vice President and Chief Operating Officer
Janet Sena, Senior Vice President and Director of Policy and External Affairs
Earl Shockley, Senior Director of Compliance Operations
Brady Walker, Associate Counsel
Michael Walker, Senior Vice President, Chief Financial and Administrative Officer, and Corporate Treasurer

A listing of industry attendees is attached as **Exhibit B.**

Mr. Gorbet acknowledged and welcomed Mr. Ken Quesnelle, Chair of the Canadian Association of Members of Public Utility Tribunals, and Mr. Richard M. Rosenblum, President and CEO of the Hawaiian Electric Company ("HECO").

NERC Antitrust Compliance Guidelines

Mr. Berardesco directed the participants' attention to the NERC Antitrust Compliance Guidelines included in the agenda, and offered to answer any additional questions the participants had at any time regarding antitrust compliance or other matters.

Executive Session

Mr. Gorbet reported that before the open meeting, as is its custom, the Board met in closed session with NERC management, and subsequently in executive session without NERC management, to review NERC management activities.

Consent Agenda

Upon motion duly made and seconded, the Board approved the consent agenda as follows:

Minutes

The draft minutes for the November 7, 2013 Board meeting, and for the November 21, 2013 and December 20, 2013 Board conference calls, were approved in the form as presented to the Board at the meeting.

Committee Charter Amendments

Standards Committee Charter Amendments

RESOLVED, that the Board hereby approves the amended Standards Committee Charter, substantially in the form presented to the Board at this meeting, to replace the SC Charter approved by the Board on February 7, 2013.

Committee Membership Appointments

Critical Infrastructure Protection Committee

RESOLVED, that the Board hereby approves the election of the following individuals to the Executive Committee of the Critical Infrastructure Protection Committee, each for a term of two years, effective January 1, 2014:

- David Grubbs of the City of Garland
- Marc A. Child of Great River Energy
- Ross Johnson of Capital Power

Compliance and Certification Committee

RESOLVED, that the Board hereby appoints to the Compliance and Certification Committee Silvia Parada-Mitchell, NextEra Energy, for a term of three years.

Welcoming Remarks of Chair Gorbet

Mr. Gorbet welcomed and introduced Mr. Quesnelle and Mr. Rosenblum.

Remarks by Ken Quesnelle

Mr. Quesnelle commented on the significance of the distinctions between the regulatory frameworks of the United States and the Canadian Provinces. He emphasized that a close relationship between NERC and Canadian regulators is essential to building a clear, mutual understanding of the mandates governing each party, and in managing the "seams" issues that often arise.

Mr. Quesnelle referenced a discussion from the previous day regarding "right-sizing" regulation, and identified this as a key factor in creating value for both the industry and for the public at large. He gave several specific examples of the application of this principle, including (i) the adaptation of ancillary services to the introduction of variable generation resources, and (ii) NERC's registration methodology.

Remarks by Richard Rosenblum

Mr. Cauley gave a brief introduction in which he explained why Mr. Rosenblum's attendance at the meeting was particularly important. Specifically, he referenced the joint NERC-California ISO report that had been finalized in November of 2013, and identified some of the operational challenges that penetration of variable generation resources to levels of 20 to 30% of demand can create. Mr. Cauley described these challenges as non-traditional, in the sense that they are not capacity-related and include issues like responsive reserves, load following, frequency response, and voltage control. He described how these factors had historically been taken for granted by system operators because they were inherent in the nature of the North American generation fleet.

Mr. Cauley referenced an increasing push in many jurisdictions toward the greater incorporation of variable generation resources, and identified highlighting these non-traditional challenges for policy makers as a key role for NERC in the coming year. To this end, he noted that he had instructed NERC management to (i) produce a report by early spring presenting these issues in a way that is understandable to policy makers, and (ii) conduct a special assessment that examines regions where the 20 to 30% penetration of variable generation resources is becoming an operational reality. Mr. Cauley emphasized that NERC would highlight these challenges for policy makers while remaining neutral regarding the appropriateness or inappropriateness of any particular generation policy. He identified Hawaii as a region at the forefront of dealing with these issues, and stated that Mr. Rosenblum's willingness to discuss his experience as president and CEO of HECO was therefore particularly important to better understanding these challenges.

Mr. Rosenblum identified some of the technical challenges that HECO has experienced from a reliability perspective as a result of the large-scale integration of variable generation resources. He described these challenges in the context of Hawaii's uniqueness, namely (i) its high cost of generation, (ii) its complete isolation from other interconnected transmission systems, and (iii) the high cost and relative scarcity of available land for constructing new generation facilities. Mr. Rosenblum noted that approximately 10% of HECO customers are currently utilizing rooftop photovoltaic systems, and predicted that this number would increase in the coming years. He noted that he was not taking a position on any particular policy that encourages or discourages the deployment of these resources.

Chairman's Report on Closed Strategic Planning Session

Mr. Gorbet reported that the Board met in a duly noticed closed session in January to discuss a variety of topics, and noted that the Board did not take any action at this meeting. Among the topics discussed were (i) the Three-Year ERO Strategic Plan, (ii) corporate metrics, (iii) preparation of the business plan and budget, and (iv) the relationship between NERC and the Regional Entities.

President's Report

Mr. Cauley noted some of the major achievements of NERC in the past year, and described how these achievements helped to clarify the future goals of the ERO enterprise. Among these achievements, he identified:

1) The significant improvement in the development of Reliability Standards, including (i) the definition of Bulk-Electric System ("BES"), (ii) Geomagnetic Disturbance ("GMD"), and (iii) Critical Infrastructure Protection Version 5 Reliability Standards;
2) The success of NERC's Find, Fix and Track initiative;
3) The progress in the initial development of the Reliability Assurance Initiative ("RAI");
4) Increased communication, engagement, and collaboration with U.S. and Canadian regulatory authorities; and
5) The steps NERC has taken to improve reliability, including (i) vegetation management, (ii) the three-year program on right-of-way maintenance, and (iii) the 345kV circuit breaker alert.

Lastly, Mr. Cauley described the ongoing work between NERC and Regional Entity management, and cited the development of a "Roles and Responsibilities" operations whitepaper that establishes a vision for the ERO in terms of integration and the resolution of internal seams issues. He noted that the whitepaper identified eleven action items, and that he had preliminarily reviewed it with the Board. Mr. Cauley stated that NERC's intention was to review the whitepaper again with the Board and with the Regional Entity Board chairs and vice chairs in May. He further stated that NERC planned to report back to the Member Representatives Committee ("MRC") and to the Board in the coming 12 to 24 months regarding the progress made on integrating ERO infrastructure, policies and practices. Mr. Cauley anticipated that the whitepaper would be made public once he received concurrence from the Regional Entity CEOs.

Election and Appointment of Officers

Upon motion duly made and seconded, the Board appointed the following officers for 2014:

- Frederick W. Gorbet, Chair
- Paul F. Barber, Vice Chair
- Gerald W. Cauley, President and Chief Executive Officer

Upon recommendation of the President, and upon motion duly made and seconded, the Board appointed the following individuals as officers of the corporation:

- Mark Rossi, Senior Vice President and Chief Operating Officer
- Charles A. Berardesco, Senior Vice President, General Counsel, and Corporate Secretary
- Janet Sena, Senior Vice President
- Michael Walker, Senior Vice President, Chief Financial and Administrative Officer, and Corporate Treasurer
- Thomas Bugress, Vice President
- Mark G. Lauby, Vice President

Board of Trustees' Self-Assessment Review

Mr. Gorbet provided an overview of the Board of Trustees' Self-Assessment results and the Member Representatives Committee Board Effectiveness Survey results. Mr. Gorbet stated the Board takes seriously comments on its performance and indicated the Trustees will work with the MRC to address areas identified for improvement.

Three-Year ERO Strategic Plan

Mr. Cauley noted feedback on the Three-Year ERO Strategic Plan that had been received the previous day at the meetings of the Corporate Governance and Human Resources Committee ("CGHRC") and the MRC. In particular, he identified these comments as relating to (i) replacing the term Bulk-Power System "BPS" with the term "BES," and (ii) augmenting the objective regarding the development of a new framework for registration and deregistration of entities. Mr. Cauley recommended that the Board approve the Three-Year ERO Strategic Plan with these two changes, and permit the Plan to become a driving document in the coming months while NERC and the Regional Entities develop their business plans and budgets. He stated that all of the comments received would be compiled into a matrix that indicated how they were addressed. Mr. Cauley also noted that the Three-Year ERO Strategic Plan is reexamined by the Board every year, creating additional opportunities for comments to be incorporated. Lastly, he noted that the metrics associated with the Three-Year ERO Strategic Plan had been separated out, and that an updated version of these metrics would be presented to the CGHRC in March. Upon motion duly made by Mr. Gorbet and seconded by Ms. Schori, the Board approved the Three-Year ERO Strategic Plan, subject to the two changes discussed above and without the associated metrics, as follows:

> RESOLVED, that the Board hereby approves the Three-Year ERO Strategic Plan, substantially in the form presented to the Board at this meeting.

Standards

Mr. Lauby provided an overview of the Reliability Standards program and presented the following items for Board action. After discussion, and upon motions duly made and seconded, the Board approved the following resolutions:

Coordinate Interchange Standards – INT-004-3, INT-006-4, INT-009-2, INT-010-2, INT-011-1

RESOLVED, that the Board hereby adopts, subject to ballot body approval of the definitions for "Request for Interchange" and "Arranged Interchange," the following proposed Coordinate Interchange Reliability Standards, as presented to the Board at this meeting:

- INT-004-3—Dynamic Transfers;
- INT-006-4—Evaluation of Interchange Transactions;
- INT-009-2—Implementation of Interchange;
- INT-010-2—Interchange Initiation and Modification for Reliability;
- INT-011-1—Intra-Balancing Authority Transaction Identification.

FURTHER RESOLVED, that the Board hereby approves the associated implementation plan, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the revised and new NERC Glossary definitions, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the Violation Risk Factors and Violation Severity Levels for the proposed Reliability Standards, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the Reliability Standards proposed for retirement, as presented to the Board at this meeting.

FURTHER RESOLVED, that NERC management is hereby authorized to make the appropriate filings with ERO governmental authorities.

Operations Personnel Training—PER-005-2

RESOLVED, that the Board hereby adopts proposed Reliability Standard PER-005-2, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the associated implementation plan, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the new NERC Glossary definitions, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the Violation Risk Factors and Violation Severity Levels for the proposed Reliability Standard, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the Reliability Standard proposed for retirement, as presented to the Board at this meeting.

FURTHER RESOLVED, that NERC management is hereby authorized to make the appropriate filings with ERO governmental authorities.

Available Transmission System Capability—MOD-001-2 (MOD A)

RESOLVED, that the Board hereby adopts proposed Reliability Standard MOD-001-2, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the associated implementation plan, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the Violation Risk Factors and Violation Severity Levels for the proposed Reliability Standard, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the Reliability Standards proposed for retirement, as presented to the Board at this meeting.

FURTHER RESOLVED, that NERC management is hereby authorized to make the appropriate filings with ERO governmental authorities.

Modeling Data—MOD-032-1, MOD-033-1 (MOD B)

RESOLVED, that the Board hereby adopts the following proposed Modeling Data Reliability Standards, as presented to the Board at this meeting:

- MOD-032-1—Data for Power System Modeling and Analysis;
- MOD-033-1—Steady-State and Dynamic System Model Validation.

FURTHER RESOLVED, that the Board hereby approves the associated implementation plan, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the Violation Risk Factors and Violation Severity Levels for the proposed Reliability Standards, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the Reliability Standards proposed for retirement, as presented to the Board at this meeting.

FURTHER RESOLVED, that NERC management is hereby authorized to make the appropriate filings with ERO governmental authorities.

Voltage and Reactive Control—VAR-001-4

RESOLVED, that the Board hereby adopts proposed Reliability Standard VAR-001-4, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the associated implementation plan, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the Violation Risk Factors and Violation Severity Levels for the proposed Reliability Standard, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the Reliability Standard proposed for retirement, as presented to the Board at this meeting.

FURTHER RESOLVED, that NERC management is hereby authorized to make the appropriate filings with ERO governmental authorities.

Operating Personnel Communications Protocols—COM-002-4

Mr. Gorbet noted a productive discussion the previous day in both the Standards Oversight and Technology Committee ("SOTC") and the MRC. Mr. Gorbet stated that the Board is prepared to leave the decision regarding the appropriate next steps for COM-002-4 to the Standard Drafting Team. Mr. Gorbet expressed his hope that the Standard Drafting Team will be expeditious in whatever course it decides to take.

Reliability Standards Reaffirmed by Periodic Review

RESOLVED, that the Board hereby adopts the Reliability Standards reaffirmed by the Periodic Review, as presented to the Board at this meeting.

FURTHER RESOLVED, that NERC management is hereby authorized to make the appropriate filings with ERO governmental authorities.

Unit Auxiliary Transformer – Response to the Board

Mr. Lauby stated that during the discussion and approval of the Reliability Standard relating to generator relay loadability at its August 2013 meeting, the Board asked the Standard Drafting Team to further examine a minority issue. This minority issue related to unit auxiliary transformers, and the relays connected to those transformers.

Mr. Lauby reported that the Standard Drafting Team had studied this issue in detail and concluded that no reliability gaps resulted from the exclusion of low voltage unit auxiliary transformer relays. Mr. Lauby stated that NERC staff would continue to monitor the issue going forward.

WECC Interpretation of TOP-007-WECC-1

RESOLVED, that the Board hereby adopts the proposed Interpretation of Requirement R1 of Reliability Standard TOP-007-WECC-1, as presented to the Board at this meeting.

FURTHER RESOLVED, that NERC management is hereby authorized to make the appropriate filings with ERO governmental authorities.

GridEx II

Mr. Blizard updated the Board on the results of GridEx II.

Status Report on 345kV Breaker Alert

Mr. Thomas J. Galloway, CEO of the North American Transmission Forum, and Mr. Moon updated the Board on the progress made in addressing the issues associated with the 345kV circuit breaker alert.

Reliability Assessment Priorities and Process Update

Mr. Burgess provided a brief overview to the Board of Reliability Assurance and Performance Analysis processes and major strategic priorities.

Canadian Affairs

Mr. James Burpee, President and CEO of the Canadian Electricity Association, presented an update on current Canadian reliability-related initiatives.

Standing Committee Reports

Representatives of the Standing Committees provided reports to the Board highlighting items from their written reports as contained within the agenda package.

Operating Committee

Mr. James D. Castle, chair, highlighted some of the Operating Committee's ("OC's") activities since the last Board meeting. He noted and thanked Ms. Case for her attendance at previous OC meetings, and also thanked Mr. Cauley for sharing his thoughts on improving BES reliability as the industry supply-side landscape has continued to evolve.

Planning Committee

Mr. Benjamin Crisp, chair, identified some of the Planning Committee's ("PC's") key initiatives in 2014. Among these, he described the seasonal and annual reliability assessment studies, the formation of the Essential Reliability Services Task Force, and the ongoing efforts of the PC to support the Reliability Issues Steering Committee ("RISC"). Mr. Crisp also reported that since the last Board meeting, the PC has completed an in-depth review of its strategy document, and identified several areas for improvement.

Critical Infrastructure Protection Committee
Mr. Charles F. Abell, chair, briefly summarized some of the accomplishments of the Critical Infrastructure Protection Committee ("CIPC") in 2013. These included reports on security clearance and information sharing, updating the physical security response guidelines, supplying expertise to GridEx II, and the feedback provided to NERC staff by the Compliance and Enforcement Working Group. Mr. Abell also discussed some of the priorities of the CIPC going forward.

Member Representatives Committee
Mr. John A. Anderson, vice chair, thanked Mr. Gorbet and the Board for the continued use of the MRC's policy input, and summarized several issues that had been discussed at the MRC meeting the previous day.

Personnel Certification Governance Committee
Mr. Brett Hallborg, chair, was not in attendance. Mr. Gorbet referred the meeting participants to the written report of the Personnel Certification and Governance Committee, located in the agenda package.

Standards Committee
Mr. Brian Murphy, chair, expressed his gratitude for the good working relationship between the Standards Committee ("SC") and the Board, NERC staff, industry, and the staff of the Federal Energy Regulatory Commission. He also identified coordination between RISC and the SC as a critical effort, and stated that he was looking forward to working with Robert Schaffeld.

Reliability Issues Steering Committee
Mr. Robert A. Schaffeld, chair, thanked Mr. Murphy and Mr. Rossi for the progress they have made in improving processes across the ERO. He identified some of the key focus areas of RISC in the coming year, with a particular emphasis on unified prioritization at the ERO level, and described how these focus areas will be implemented.

Compliance and Certification Committee
Mr. Terry Bilke, chair, reported on several items that were not listed in the Board package. First, he noted that the annual plan was not being presented at the current Board meeting, but would instead be presented at the next Board meeting and include several additions. Second, Mr. Bilke stated that the Compliance and Certification Committee ("CCC") provided a summary of achievements and issues that still need to be addressed to the Board of Trustees Compliance Committee ("BOTCC"). He reiterated that the CCC stands ready to assist NERC in any activities in the coming year.

Electricity Sub-Sector Coordination Council
Mr. Cauley, executive committee member, reported on the progress of the restructured Electricity Sub-Sector Coordination Council ("ESCC"), and some of its key focus areas. He reported that many industry CEOs regularly attend the meetings, and that Thomas A. Fanning, Chairman and CEO of Southern Company, is now chair of the ESCC.

Forum and Group Reports

North American Energy Standards Board
Mr. Michael Desselle, chair, updated the Board on three matters: (i) beginning the process of coordinating timelines and filings necessary to adopt the recently approved MOD (A) Reliability Standards as the business practices of the North American Energy Standards Board to prevent gaps in coverage; (ii) the development of a Parallel Flow Visualization Project to support the NERC Reliability Standards, and associated coordination with the Interchange Distribution Calculator Association; and (iii) the progress of the transition regarding the NERC Transmission System Information Network Registry tool.

Regional Entity Management Group
Ms. Stacey Dochoda, chair, summarized some of the key focus areas of the Regional Entity Management Group for 2014. These include: (i) improving operations; (ii) increasing board level interactions among Regional Entities; (iii) delivering on RAI; (iv) assessing opportunities for joint employee development; and (v) preparing for review of the Regional Delegation Agreements and completing the five-year assessment.

North American Transmission Forum
Mr. Galloway, president and CEO, summarized some of the key collaborative efforts between NERC and the North American Transmission Forum ("NATF"), including protection system misoperations and the 345kV breaker issue. He also described some of the collaborative efforts with the Electric Power Research Institute and the Institute of Nuclear Power Operation, including (i) a GMD workshop in February, (ii) human and equipment performance improvement, and (iii) improvements to offsite power reliability at nuclear power plants. Mr. Galloway also described some of NATF's security initiatives, and the ongoing effort to incorporate lessons learned from the recent cold snap.

North American Generator Forum
Mr. Allen D. Schriver, chair, stated that in addition to the NAGF's written report, the Forum wanted to thank Mr. Moon and Mr. Galloway for providing many opportunities to collaborate with both NERC and the NATF.

Board Committee Reports

Corporate Governance and Human Resources Committee
Ms. Schori, chair, summarized the open meeting of the CGHRC that was held the previous day, including the following four specific action items: (i) recommendation of approval for the new Enterprise-wide Risk Committee; (ii) recommendation of approval for the Board committee assignments for 2014; (iii) recommendation of approval for the NERC Governance Guidelines; and (iv) recommendation of approval for an 8% contribution to the employee savings and investment plan for 2013. Upon motion duly made and seconded, the Board approved the following resolutions:

RESOLVED, that the Board, upon recommendation of the Corporate Governance and Human Resources Committee, hereby approves the proposed Mandate of the Enterprise-wide Risk Committee, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board, upon recommendation of the Corporate Governance and Human Resources Committee, hereby approves the 2014 Board Committee Assignments, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board, upon recommendation of the Corporate Governance and Human Resources Committee, hereby approves the NERC Governance Guidelines, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board, upon recommendation of the Corporate Governance and Human Resources Committee, hereby approves a contribution into NERC's Savings and Investment Plan for the year ended December 31, 2013 for the account of each eligible employee participant in the Plan equal to 8% of such employee participant's 2013 base salary, as presented to the Board at this meeting.

Board of Trustees Compliance Committee

Mr. Scherr reported that the BOTCC met in executive session on February 4, 2014, and in subsequent open session on February 5, 2014. He reported on some of the issues covered during those meetings, including (i) accomplishments and milestones moving forward for RAI, (ii) enforcement activities associated with RAI, and (iii) highlights of efficiency gains of the ERO in 2013 associated with the processing of noncompliance.

Finance and Audit Committee

Mr. Thilly, chair, reported that on January 30, 2014, the Finance and Audit Committee met and reviewed the Fourth Quarter Unaudited Statements of Activities of NERC and the Regions, and provided input on the proposed process improvements for the 2015 business plan and budgets. Mr. Thilly thanked Mr. Walker, his staff, and the Regional Entities, for their work on improving the process. Upon motion duly made and seconded, the Board approved the following resolution:

RESOLVED, that the Board, upon recommendation of the Finance and Audit Committee, hereby accepts the NERC Fourth Quarter 2013 Unaudited Statement of Activities, as presented to the Board at this meeting.

Standards Oversight and Technology Committee

Mr. Gorbet introduced Mr. Barber, who gave the report of the SOTC on behalf of Mr. Peterson. Mr. Barber reported that the SOTC had examined the committee self-assessment and discussed ways to improve IT oversight. He stated that the SOTC acknowledged policy input from the SC regarding the Strategic Plan and referenced the process that will be used to reconcile differences. Mr. Barber also stated that the members of the SOTC were pleased with the work performed by the SC regarding COM-002-4. He commended the work done thus far on process reforms and Reliability Standard Audit

Worksheets ("RSAWs"), and expressed his hope that improvements in the RSAW process will help to reduce the fear of compliance risk.

Closing Remarks of Chair Gorbet

Mr. Gorbet expressed his appreciation on behalf of the Board to all of those individuals who had made the Board meeting successful. He noted that Mr. Cauley's President's Report referenced how far the ERO enterprise has come in its development and maturity, and stated that while challenges remain, he remains very confident that they will be met.

Adjournment

There being no further business, and upon motion duly made and seconded, the meeting was adjourned at 11:59 p.m. Mountain.

Submitted by,

Charles A. Berardesco
Corporate Secretary

Agenda Item 2.a
Board of Trustees Meeting
May 7, 2014

Compliance and Certification Committee Membership

Action

Approve the Compliance and Certification Committee (CCC) Membership as proposed.

Background

The CCC is recommending that the Board of Trustees: 1) appoint one new CCC representative; 2) reappoint two current CCC representatives; and 3) appoint the CCC chair and vice chair, as follows:

New Member Appointments:

- Mr. Rick Terrill of Luminant Mining.
- Ms. Caroline Dupuis of Hydro-Québec TransÉnergie.

Member Reappointments:

- Mr. William Temple of Northeast Utilities.
- Ms. Jennifer Flandermeyer of Kansas City Power & Light.

Officer Appointments:

- Ms. Patti Metro as the CCC chair for the period of July 1, 2014 – Jun 30, 2016.
- Ms. Jennifer Flandermeyer as the CCC vice chair for the period of July 1, 2014 – Jun 30, 2016.

Agenda Item 2.b
Board of Trustees Meeting
May 7, 2014

Compliance and Certification Committee

Action

The Compliance and Certification Committee (CCC) requests that the Board of Trustees (Board) approve the formation of the Compliance Processes and Procedures Subcommittee (CPPS) and the retirement of the CCC's Standards Interface Subcommittee (SIS) and Procedures Subcommittee (PROCS).

Background

As the ERO has evolved, some of the tasks performed by two of the CCC's subcommittees are either no longer performed or only performed infrequently. In order to streamline support obligations and better align the CCC with NERC's strategic direction, the CCC has approved the scope of a new subcommittee called the CPPS (attached). The subcommittee's scope retains the relevant items from the CCC's SIS and PROCS, and positions the subcommittee to support NERC's compliance monitoring and enforcement improvements.

The CCC requests the Board approve the formation of the CPPS and the retirement of the SIS and PROCS.

Preface

NERC Compliance and Certification Committee		CCCXX-00X
Title: XXX		
Version: x.0	**Revision Date: MM/DD/201X**	**Effective Date: MM/DD/201X**

Summary

The North American Electric Reliability Corporation (NERC) is a not-for-profit international regulatory authority whose mission is to ensure the reliability of the Bulk Power System (BPS) in North America. NERC develops and enforces Reliability Standards; annually assesses seasonal and long-term reliability; monitors the BPS through system awareness; and educates, trains, and certifies industry personnel. NERC's area of responsibility spans the continental United States, Canada, and the northern portion of Baja California, Mexico. NERC is the electric reliability organization (ERO) for North America, subject to oversight by the Federal Energy Regulatory Commission (FERC) and governmental authorities in Canada. NERC's jurisdiction includes users, owners, and operators of the BPS, which serves more than 334 million people.

The Compliance and Certification Committee (CCC) is a NERC board-appointed stakeholder committee serving and reporting directly to the NERC Board of Trustees (Board) and is responsible for engaging with, supporting, and advising the NERC Board and NERC regarding all facets of the NERC Compliance Monitoring and Enforcement Program (CMEP), Organization Registration Program (Registration program), and Organization Certification Program (Certification program). The CCC is responsible for establishing and implementing a program as specified in Section 405 of the NERC Rules of Procedure (ROP) to monitor NERC's adherence to ROP for Compliance Enforcement, including but not limited to the uniform Compliance Monitoring and Enforcement Program (Appendix 4C) and the Sanction Guidelines (Appendix 4B).

Revision History

Date	Version Number	Comments
March 12, 2014	1.0	Approved by the Compliance and Certification Committee in order to consolidate PROCS and SIS.
Month DD, YYYY	1.0	Approved by the Board of Trustees

Section 1. Mission

The NERC Compliance and Certification Committee (CCC) is a NERC Board-appointed stakeholder committee serving and reporting directly to the NERC Board. Operation and governance of the CCC is as articulated in the CCC Charter.

The **Compliance Processes and Procedures Subcommittee (CPPS)** is formed by the CCC to assist the committee in fulfilling its mission and functions[1] in a thorough and efficient manner. Further details of what the subcommittee will undertake, on behalf, and under the supervision, of the CCC are provided in Section 2.

[1] See Sections 1 and 2 of the CCC Charter, respectively.

Section 2. Compliance Processes and Procedures Subcommittee Tasks and Functions

To fulfill its mission, the CCC has established the **CPPS** to perform the following tasks on behalf, and under the supervision, of the CCC:

i. Perform document review to promote consistency between multiple documents (procedures, policies, standards, rules, orders, etc.) that comprise the overall NERC Compliance Monitoring and Enforcement Program (CMEP) and to assure documents are clear, unambiguous, consistent and complementary, to advise the CCC of any such situations, and propose changes that it believes will clarify such situations. Activities may include, but are not limited to:

   a. Reviews of changes to the Rules of Procedure related to the Compliance program, Registration program, and Certification program.

   b. Proposals to change the ROP related to the Compliance program, Registration program, and Certification program.

ii. Support the development and implementation of enhancements to the CMEP (including efforts as set forth in the CCC Work Plan) and provide this information to the CCC, applicable CCC subcommittees, and NERC.

iii. Develop and maintain CCC operational procedures with respect to the CCC responsibilities under the CCC Charter, as specified in Attachment A.

iv. Advise and prepare recommendations to the CCC to address any standards related issues relevant to and within the scope of the NERC Compliance and Certification Committee (e.g. request from the Standards Committee, Standard Drafting Team, CCC, NERC Compliance Staff, etc.).

v. Act as liaison of the CCC to the NERC Standards Committee.

vi. Implement CCC oversight, facilitate, participate as needed, in the development of the compliance administration elements (CAEs), including RSAWs, for new Reliability Standards under development or for revisions to existing Reliability Standards.

vii. Prepare and maintain guidance and other related documents and materials for the benefit of Standards Drafting Teams regarding the development of CAEs.

The subcommittee will work within its assigned scope and be accountable for the responsibilities assigned to it by the CCC.

Section 3. Membership

3.1. Goals

The membership of this subcommittee will be established to address the need for expertise and balance of interests to carry out the subcommittee's assigned Tasks and Functions as in Section 2.

3.2. General

General membership requirements for members of a sub-group of the CCC are as articulated in Section 7 of the CCC Charter. Additional membership requirements for this committee are as defined within this scope document.

3.3. Subgroup Membership and Representation

As outlined in the CCC Charter, each member of this subcommittee, and its officers, will be appointed by the chair of the CCC.

3.4. Membership Not Restricted to CCC Members

Members of this subcommittee are not required to be members of the CCC, but must be eligible to be members of the committee.

3.5. Resignations

a. By the Member

In the event a member can no longer serve on the subcommittee, that member will submit a written resignation to the subcommittee chair or the CCC secretary.

b. Requested by the Chair

The chair may request any subcommittee member who ceases to participate in the subcommittee, as indicated by not attending or sending a proxy for two consecutive meetings, to submit a resignation or to request continuation of membership with an explanation of extenuating circumstances. If a written response is not received within 30 days of the chair's request, the lack of response will be considered a resignation.

c. Referral to the CCC Chair

The subcommittee chair will refer the vacancy resulting from a resignation to the chair of the CCC who may recommend a replacement pursuant to the CCC Charter.

d. By the Board

CCC Committee members and, by extension, members of CCC subcommittees serve at the pleasure of the NERC Board which may request resignation, remove or replace a member as it deems appropriate.

3.6. Proxies

A substitute representative, or proxy, may attend on behalf of a member during all or a portion of a subcommittee meeting, provided the absent member notifies the subcommittee chair, vice chair, or CCC secretary of the proxy.

a. Notification

Such notification will be in writing (electronic medium is acceptable). The proxy representatives and their affiliation will be named in the correspondence.

b. May Not Serve as a Proxy for Another Member

A voting member of a subcommittee may not serve as a proxy for another voting member on the same subcommittee (i.e. a member may not cast more than his or her own vote).

3.7. Exclusions

Exclusions shall be as articulated in Section 3 of the CCC Charter.

3.8. Changes in Member Affiliation

A subcommittee member whose affiliation has changed may remain a member of the subcommittee by remaining subject to membership requirements and by notifying the chair of the CCC and the subcommittee chair of the change and receiving the approval of the chair of the CCC to remain on the subcommittee.

3.9. Acknowledgement of a Membership Conflict

No subcommittee member may have a conflict of interest that would impair his or her ability to fulfill obligations under this scope document. Any subcommittee member who knows of any form of membership conflict, such as working for an entity affiliated with that of another subcommittee member, will notify the subcommittee chair and the chair of the CCC within ten business days of obtaining that knowledge.

Section 4. Meetings

In the absence of specific provisions in this document or the CCC Charter, all subcommittee meetings will follow Robert's Rules of Order, Newly Revised.

Actions requiring a vote by the members of the subcommittee will be approved upon receipt of the affirmative vote of the majority of the voting members of the subcommittee present and voting, in person or by proxy at any meeting at which five (5) or more members are present.

4.1. Antitrust Guidelines

All persons attending or otherwise participating in a NERC committee or subgroup meeting will act in accordance with NERC's Antitrust Compliance Guidelines at all times during the meeting.

4.2. Open Meetings

NERC committee meetings will be open to the public, except as noted below under Confidential Sessions.

4.3. Confidential Sessions

With approval of the NERC Director of Compliance Operations, a meeting or portion of a meeting of the sub-committee may have attendance limited based on confidentiality of the information to be disclosed at the meeting. Such limitations should be applied sparingly and on a non-discriminatory basis as needed to protect information that is sensitive information or confidential information to one or more parties. Confidential information will only be disclosed as provided by Section 1500 of the NERC Rules of Procedure. Confidentiality agreements may also be applied, as necessary, to protect sensitive information or confidential information.

4.4. Types of Meetings

Meetings may be conducted in person, by conference call, or other means. The procedures contained in this scope document will apply to all meetings regardless of how they are conducted.

4.5. Majority and Minority Views

All members of the subcommittee will be afforded the opportunity to provide alternative views on an issue. The results of the subcommittee actions, including recorded minutes, will reflect the majority as well as any minority views of the subcommittee members. The chair will communicate both the majority and any minority views in presenting results to the CCC.

4.6. Actions without a Meeting

Actions without a meeting are permitted in accordance with the provisions of the CCC Charter.

4.7 Quorum

A quorum for conducting business is 50 percent of the members listed on the current subcommittee roster. If a quorum is not present, then the subcommittee may not take any actions requiring a vote of the subcommittee. However, the chair may, with the consent of the members present, allow discussion of agenda items.

Section 5. Officers and Staff

5.1. General

a. Number of Positions
The subcommittee will have two officers and a secretary.

b. Officers
The subcommittee officers will be one chair and one vice chair.

c. Secretary
The NERC staff coordinator will serve as the subcommittee's secretary.

d. Officers May Vote
The subcommittee chair and vice chair are voting members of the subcommittee.

e. Officers are Named by the CCC Chair for a Two-year Term
Officers may be reappointed for a second two-year term.

5.2. Chair
The chair will direct and provide general supervision of subcommittee activities, including:

i. Coordinate the schedule of all subcommittee meetings.

ii. Develop subcommittee agendas and rule on any deviation, addition, or deletion from a published agenda.

iii. Preside at, and manage, subcommittee meetings including the nature and length of discussion, recognition of speakers and proxies, motions, and voting.

iv. Will act as the spokesperson for the subcommittee to the CCC.

The subcommittee chair will serve as a member of the Executive of the CCC as described in the CCC Charter. The subcommittee chair must be a member of the CCC.

5.3. Vice Chair
The vice chair will assume the responsibilities of the chair under the following conditions:

i. At the discretion of the chair (for brief periods of time);

ii. When the chair is absent or temporarily unable to perform the chair's duties; or

iii. When the chair is permanently unavailable or unable to perform the chair's duties. In the case of a permanent change, the vice chair will continue to serve until a new chair is appointed by the chair of the CCC.

The vice chair is unable to assume the responsibilities of the chair on the CCC Executive unless the vice chair is also a member of the CCC.

5.4. Staff Coordinator
A member of the NERC staff will be selected by NERC's Director of Compliance Operations to serve as the staff coordinator and secretary of the subcommittee. The staff coordinator is not a subcommittee member and does not have a vote. Under the direction of the subcommittee officers, the chair of the CCC and applicable NERC Bylaws, guidelines and Rules of Procedure, the staff coordinator will:

i. Manage the day-to-day operation and business of the subcommittee.

ii. Prepare and distribute the notices of the subcommittee meetings, prepare the meeting agenda, and prepare and distribute minutes of the subcommittee meetings.

iii. Act as the subcommittee's parliamentarian.

6. Subordinate Groups

6.1. Committee Organization Hierarchy

As allowed in the NERC Bylaws the CCC organizational structure supports a superior-subordinate hierarchy that is ordered as follows:

- Committee
- Subcommittee
- Working Group
- Task Force

6.2. Establishing Subgroups

The CCC has established this subcommittee and is responsible for it to the NERC Board. This subcommittee may establish subordinate groups as discussed in the CCC Charter.

Appendix A – CCCPP Responsibilities

It is envisioned that the other CCC Subcommittees will be primarily responsible for maintaining the CCCPPs that they administer, and CPPS is available as support.[2]

CCCPP	Responsible Subcommittee
• CCC Monitoring Program — CCCPP–001 | Monitoring Program for NERC's Adherence to NERC's Rules of Procedure for Compliance Enforcement	**EROMS**
• CCC Monitoring Program — CCCPP–002–1 | Compliance Monitoring Program for Reliability Standards Applicable to NERC	**EROMS**
• CCC Monitoring Program — CCCPP–003–1 | Monitoring Program for NERC's Reliability Standards Development Procedure	**EROMS**
• CCC Monitoring Program — CCCPP–004–1 | NERC Compliance and Certification Committee Hearing Procedures	**CPPS**

Agenda Item 2.c
Board of Trustees Meeting
May 7, 2014

Critical Infrastructure Protection Committee Membership

Action

The Board of Trustees is asked to approve the following subject matter expert to serve on the CIPC Executive Committee.

- Operations Security: Mr. David Revill, Georgia Transmission

Agenda Item 2.d
Board of Trustees Meeting
May 7, 2014

Personnel Certification Governance Committee Membership

Action

The Board of Trustees is asked to appoint one new member to the Personnel Certification Governance Committee.

- Michael Hoke, Senior Lead Trainer, PJM Interconnection

Demand and Energy Data — MOD-031-1

Action

Adopt the following standards documents and direct staff to file with applicable regulatory authorities:

- **Reliability Standard – MOD-031-1 Demand and Energy Data**

  [MOD-031-1-clean]

- **Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) for MOD-031-1**

  [VRFs and VSLs]

- **Implementation Plan for MOD-031-1 Demand and Energy Data**

  [Implementation Plan]

  - This standard shall become effective the first day of the first calendar quarter that is twelve months after the date that this standard is approved by applicable regulatory authorities or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve months after the date the standard is adopted by the NERC Board of Trustees (Board) or as otherwise provided for in that jurisdiction.

- **Definitions**
  The MOD C Standard Drafting Team (SDT) proposes the following new definition and one revised definition (Demand-Side Management):

  - **Total Internal Demand:** The Demand of a metered system which includes, the Firm Demand, plus any controllable and dispatchable DSM Load and the Load due to the energy losses incurred within the boundary of the metered system.
  - **Demand-Side Management (DSM):** All activities or programs undertaken by any applicable entity to achieve a reduction in Demand.

- **Retirements**
  Retire the following standards midnight of the day immediately prior to the effective date of MOD-031-1:

  - MOD-016-1.1 – Documentation of Data Reporting Requirements for Actual and Forecast Demands, Net Energy for Load, Controllable Demand-Side Management
  - MOD-017-0.1 – Aggregated Actual and Forecast Demands and Net Energy for Load
  - MOD-018-0 – Treatment of Nonmember Demand Data and How Uncertainties are Addressed in the Forecasts of Demand and Net Energy for Load

- MOD-019-0.1 – Reporting of Interruptible Demands and Direct Control Load Management
- MOD-021-1 – Documentation of the Accounting Methodology for the Effects of Demand-Side Management in Demand and Energy Forecasts

The existing definition for Demand-Side Management should be retired midnight of the day immediately prior to the effective date of MOD-031-1.

Background

A fundamental test for determining the reliability of the Bulk Power System is an assessment of whether there is an adequate amount of resources available to serve peak Demand while also maintaining a sufficient margin to address operating events. The purpose of this reliability standard is to provide authority for applicable entities to collect Demand, energy and related data to support reliability studies and assessments. The reliability standard enumerates the responsibilities and obligations of requestors and respondents of the data. The proposed reliability standard consolidates MOD-016 through MOD-019 and MOD-021 into a single standard that comprehensively address Demand and energy data collection requirements.

The SDT considered the Paragraph 81 criteria when it evaluated the draft standard. The SDT concluded that since this data supports reliability, it did not qualify for retirement under the Paragraph 81 criteria. The collection of Demand projections requires coordination and collaboration between Planning Authorities/Planning Coordinators (PCs), Transmission and Resource Planners (TPs and RPs), and Load-Serving Entities (LSEs). Ensuring that planners and operators have access to complete and accurate load forecasts—as well as the supporting methods and assumptions used to develop these forecasts—will ultimately enhance the reliability of the Bulk Electric System. Consistent documenting and information-sharing activities will also improve the efficiency of planning practices and support the identification of needed system reinforcements. Furthermore, collection of actual Demand and Demand-Side Management performance data during the prior year enables comparison to prior forecasts and further contributes to enhanced accuracy of load forecasting practices. Finally, the data to be collected under the standard is necessary for the ERO to conduct its reliability assessments, such as the Long Term Reliability Assessment.

The SDT concluded that a standard was necessary to meet thse reliability needs and help ensure that data will be collected and shared among the necessary parties (LSEs, PCs, TPs, RPs, Balancing Authorities (BAs), Distribution Providers (DPs), Transmission Service Providers (TSPs), etc.) in the United States and Canada to support reliability assessments.

Pertinent FERC Order No. 693 directives

Project 2010-04, MOD C, addressed 14 FERC directives from FERC Order No. 693 Mandatory Reliability Standards for the Bulk Power System. These FERC directives are in paragraphs 1232, 1249, 1250, 1251, 1252, 1255, 1256, 1265, 1276, 1277, 1287, and 1298.

Standard Development Process

Three drafts of MOD-031-1 were posted for industry comment during the development period. Draft 3 of the standard was posted for an additional comment period from February 25 through April 10, 2014, with a ballot that was conducted from April 1 through April 10, 2014. The results of the additional ballot and subsequent final ballot were not available when these materials were prepared and will be reported during the May 7, 2014 Board meeting.

Unresolved Minority Issues

There were three minority issues raised by industry stakeholders, as identified below. These issues were resolved by the majority of stakeholders.

Issue: Several stakeholders stated that the existing MOD C standards (MOD-016-1.1, MOD-017-0.1, MOD-018-0, MOD-019-0.1 and MOD-021-1) should be retired. These stakeholders argued that the data could be collected by NERC and the Regional Entities through data requests issued pursuant to Section 800 or Section 1600 of NERC's Rules of Procedure.

Response: The SDT concluded that a standard was necessary for two reasons:

- First, the standard provides a mechanism for (1) PCs and BAs to obtain Demand and energy data from data owners for their own reliability purposes that is not necessarily connected to the ERO's reliability assessments; and (2) the sharing of Demand and energy data between neighboring LSEs, DPs, PCs, BAs, RPs and TPs to provide additional clarity in their system analysis. Replacing standard MOD-016 through MOD-019 and MOD-021 with a data request geared to provision of data to NERC would not provide a mechanism for this data sharing or enable PCs and BAs to obtain Demand and energy data from data owners for their own reliability purposes. The SDT concluded that because there is a reliability need for PCs and BAs to obtain demand data for their own reliability purposes and for data sharing between Registered Entities, a standard was necessary.
- Second, the standard provides an efficient and enforceable mechanism for NERC and the Regional Entities to obtain Demand and energy data from all applicable registered entities across the entire continent. Because certain Canadian provinces have adopted only select portions of the NERC Rules of Procedure, a standard is necessary to ensure that the authority to collect the necessary data from all applicable Registered Entities is in place. The data to be collected under the standard is necessary for the ERO to conduct its reliability assessments, such as the Long Term Reliability Assessment.

Issue: A few stakeholders stated that they were unsure of the value of collecting weather normalized data.

Response: The SDT is responding to a FERC directive to collect weather nomlaized data. However, the SDT modified the requirement to identify only those entities whose Demand varies due to weather-related conditions would need to provide this data.

Issue: Some stakeholders disagreed with allowing an entity, other than the PC or BA, to have the opportunity to request data from its neighbors.

Response: The SDT disagrees with the stakeholders as there are instances when a neighboring entity has a reliability related need for the data. Additionally, this opportunity exists in the present FERC approved standards.

[**Project 2010-04 Demand Data (MOD C)**]

Voltage and Reactive Control – VAR-002-3

Action

Adopt the following standard documents and authorize staff to file with applicable regulatory authorities:

- **Reliability Standard – VAR-002-3— Generator Operation for Maintaining Voltage Schedules**

  [VAR-002-3- Clean] [VAR-002-3 - Redline to last approved]

- **Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) for VAR-002-3— Voltage and Reactive Control**

  [VRFs and VSLs]

- **Implementation Plan for – VAR-002-3 — Generator Operation for Maintaining Voltage Schedules**

  [VAR-002-3 Implementation Plan]

  - The standard shall become effective on the first day of the first calendar quarter after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, VAR-002-3 shall become effective on the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees (Board) or as otherwise provided for in that jurisdiction.

- **Retirements**

  Retire the following standard midnight of the day immediately prior to the effective date of VAR-002-3:

  - VAR-002-2b, Voltage and Reactive Control

Background

VAR-002-3 is a companion standard to VAR-001-4, which was adopted by the Board at its February 2014 meeting. VAR-002-3 addresses requirements for Generator Owners and Generator Operators (GOPs), and VAR-001-4 addresses requirements for Transmission Operators (TOPs).

VAR-002-3 help ensure that generators provide reactive support and voltage control, within generating Facility capabilities, in order to protect equipment and maintain reliable operation of the Interconnection. The new standard eliminated unnecessary notifications found in VAR-002-2b that may hinder reliability, and the standard requires GOPs to communicate according to the protocols established by TOPs.

Pertinent FERC Order No. 693 and 724 directives

The FERC directives pertaining to the VAR standards were addressed in the VAR-001 standard.

Standard Development Process

This standard development project began as an informal development project in February 2013. The informal development transitioned to formal development in July 2013 with the posting of the Standards Authorization Request, along with a draft of the proposed VAR standards for comment and ballot, and the formation of a Standard Drafting Team. Drafts of the standard were posted for three comment and ballot periods, ending in August 2013, November 2013, and April 2014. The results of the last additional ballot and subsequent final ballot were not available when these materials were prepared and will be reported during the May 7, 2014 Board meeting.

Unresolved Minority Issues

There are no unresolved minority issues.

Additional Information

A link to the project history and files is included here for reference:

[**Project 2013-04 Voltage & Reactive Control**]

Operating Personnel Communication Protocols—COM-002-4

Actions

1. Adopt the following standard documents and authorize staff to file with applicable regulatory authorities:

   - **Reliability Standard – COM-002-4—Operating Personnel Communication Protocols**

     [COM-002-4 - Clean] [COM-002-3 - Board adopted]

   - **Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) for COM-002-4—Operating Personnel Communication Protocols**

     [VRFs and VSLs]

   - **Implementation Plan for COM-002-4—Operating Personnel Communication Protocols**

     [Implementation Plan]

   - **Definitions**
     Operating Instruction — A command by operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. (A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction.).

   - **Retirements**
     COM-001-1.1 Requirement R4, COM-002-2, and COM-002-3, as applicable, shall be retired at midnight of the day immediately prior to the effective date of COM-002-4 in the particular jurisdiction in which the new standard is becoming effective.

   - **Reliability Standard Audit Worksheet**

     [RSAW]

2. Rescind the Board of Trustees' (Board's) February 9, 2012 approval, available here, of the Interpretation of COM-002-2, effective (i) for U.S. registered entities upon implementation of COM-002-4 in substantially the form approved by the Board and (ii) for Canadian entities, effective upon implementation of COM-002-4 in substantially the form approved by the Board, as such implementation is approved by the applicable governmental authority for each such entity, it being the intent of the Board that an entity's compliance with existing COM-002-2 continue to reflect the Board's Interpretation of COM-002-2 until such time as COM-002-4 is implemented by each applicable governmental authority.

Background – Action 1

The proposed standard is designed to ensure that reliability-related information is conveyed effectively, accurately, consistently, and in a timely manner towards mutual understanding by all key parties when issuing or receiving Emergency and non-Emergency Operating Instructions.

On November 7, 2013, the Board approved a resolution on Operating Personnel Communications Protocols (OPCP), which is available here. In response to this resolution, the standard drafting team (SDT) developed a new draft of COM-002-4. The COM-002-4 standard

combines COM-002-3 and the draft COM-003-1 standard into a single standard regarding communication protocols. COM-002-4 requires entities to develop specific documented communication protocols for the issuance and receipt of Operating Instructions by operating personnel during Emergency, alert, and non-Emergency situations. Among these protocols are: (1) use of the English language (unless an alternate language is agreed to otherwise); (2) protocols for three-part communications; and (3) protocols for single-party to multiple-party burst Operating Instructions. COM-002-4 also requires entities to conduct initial training for operating personnel on the communications protocols and to provide feedback to those operating personnel on adherence to the communications protocols. Entities are further required to periodically evaluate their set of communications protocols for effectiveness and add protocols, as necessary. Finally, entities are required to always use three-part communication when issuing and receiving oral Operating Instructions during Emergencies.

Background – Action 2

On October 1, 2009, a clarification was requested by the ISO-RTO Council of Requirement R2 of COM-002-2, specifically asking whether "directives" are limited to actions requested during actual and anticipated emergency operating conditions, or whether routine operating instructions are also considered "directives." The interpretation of Reliability Standard COM-002-2 was adopted by the Board on February 9, 2012. Because COM-002-4 no longer uses the undefined term "directive," the ambiguity in COM-002-2 that resulted in the interpretation request has been resolved by the revisions in COM-002-4.

Pertinent FERC Order No. 693 directives

Paragraph 512

> *The Commission finds that, during both normal and emergency operations, it is essential that the transmission operator, balancing authority and reliability coordinator have communications with distribution providers…we adopt our proposal to require the ERO to modify COM-002-2 to apply to distribution providers through its Reliability Standards development process.*

Paragraph 531

> *We adopt our proposal to require the ERO to establish tightened communication protocols, especially for communications during alerts and emergencies, either as part of COM-002-2 or as a new Reliability Standard. We note that the ERO's response to the Staff Preliminary Assessment supports the need to develop additional Reliability Standards addressing consistent communications protocols among personnel responsible for the reliability of the Bulk-Power System.*

Paragraph 532

While we agree with EEI that EOP-001-0, Requirement R4.1 requires communications protocols to be used during emergencies, we believe, and the ERO agrees, that the communications protocols need to be tightened to ensure Reliable Operation of the Bulk-Power System. We also believe an integral component in tightening the protocols is to establish communication uniformity as much as practical on a continent-wide basis. This will eliminate possible ambiguities in communications during normal, alert and emergency conditions. This is important because the Bulk-Power System is so tightly interconnected that system impacts often cross several operating entities' areas.

Paragraph 535

Accordingly, we direct the ERO to either modify COM-002-2 or develop a new Reliability Standard that requires tightened communications protocols, especially for communications during alerts and emergencies.

Paragraph 540

While the Commission identified concerns regarding COM-002-2, the proposed reliability standard serves an important purpose by requiring users, owners and operators to implement the necessary communications and coordination among entities. Accordingly, the Commission approves Reliability Standard COM-002-2 as mandatory and enforceable. In addition, pursuant to section 215(d)(5) of the FPA and § 39.5(f) of our regulations, the Commission directs the ERO to develop a modification to COM-002-2 through the Reliability Standards development process that: (1) expands the applicability to include distribution providers as applicable entities; (2) includes a new Requirement for the reliability coordinator to assess and approve actions that have impacts beyond the area view of a transmission operator or balancing authority and (3) requires tightened communications protocols, especially for communications during alerts and emergencies. Alternatively, with respect to this final issue, the ERO may develop a new Reliability Standard that responds to Blackout Report Recommendation No. 26 in the manner described above. Finally, we direct the ERO to include APPA's suggestions to complete the Measures and Levels of Non-Compliance in its modification of COM-002-2 through the Reliability Standards development process.

Standard Development Process

The second draft of COM-002-4 (eighth draft overall) was posted on December 30, 2013, for a 30-day comment period and concurrent 10 day ballot period ending January 29, 2014. The standard achieved a quorum and received sufficient affirmative votes for approval. The standard was subsequently posted for a final ballot. The final ballot was conducted from March 28 through April 7, 2014, during which the proposed standard received a final approval of 77.62 percent.

Minority Issues

Issue: Several commenters indicated that Distribution Providers (DPs) should not be included as an applicable entity to COM-002-4 or that, if included, the applicability be limited to DPs who "shed 300 MW or more of load in a single manually initiated

operation or have switching obligations related to Any Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource…."

Response: The OPCP SDT chose to include DPs in the Applicability section because they can be and are on the receiving end of some Operating Instructions. The SDT could not determine a technical basis to support a threshold to exclude certain DPs. The addition of DPs is also responsive to the FERC directive.

Issue: Other commenters noted that the requirements do not differentiate clearly between the actions operators must take during non-Emergency and Emergency situations.

Response: In COM-002-4, the same protocols are to be used for Operating Instructions in all operating conditions, i.e., non-emergency, alert, and Emergency communications. The OPCP SDT believes that one set of communication protocols should be used at all times by operators in order to improve consistency and minimize confusion. The standard uses the phrase "Operating Instruction during an Emergency" in certain Requirements (R5, R6, R7) to provide a demarcation for what is subject to a zero-tolerance compliance approach.

Issue: It was suggested by several individuals and entities that the inclusion of a training requirement was not necessary and or would be better suited for inclusion in PER-005.

Response: The OPCP SDT consulted with the SDT responsible for the development of PER-005 on this concern. The OPCP SDT was advised that while training on communications protocols would fall into an entity's systematic approach to training, the requirements in PER-005 do not mandate training on communications protocols. The OPCP SDT asserts it is essential for all operators to have a common level of understanding and be trained in three-part communication. Therefore, inclusion of a requirement in COM-002-4 to conduct initial training is appropriate.

Issue: Some commenters noted that they felt the "assess adherence and assess effectiveness" contained within Requirement R4, the associated Measure, and VRFs/VSLs was similar to the "identify assess and correct" (IAC) language contained in certain CIP Version 5 requirements, which FERC directed NERC to remove or clarify.

Response: In Order No. 791 approving the CIP Version 5 Reliability Standards, FERC expressed concerns with ambiguities around the meaning of the "identify, assess, and correct" language in certain Requirements. For example, FERC questioned what a reasonable timeframe would be for identifying and correcting a deficiency, whether the language could be used to avoid audit risk, and how the implementation and performance of the language can be expected to be consistent across responsible entities and regions. The obligations required by COM-002-4 do not have the same issues inherent in the "identify, assess, and correct" language. The obligations in

COM-002-4 are clearly defined in the language of Requirement R4 and Measure M4: at least every twelve (12) months, entities must evaluate and document performance of operating personnel based on its documented communications protocols, take corrective action to the assessment as necessary, and periodically assess and document the effectiveness of the documented communications protocols. With respect to implementation of COM-002-4, the standard explicitly creates a system of periodic, backward-looking reviews of systems based on predefined standards that are to be reviewed for efficacy on a regular basis. The program anticipated by Requirement R4 is substantially similar to assessments required in other Reliability Standards (e.g., FAC-003, PRC-005, PRC-006, and PRC-004, and the language of the Requirement and accompanying Measure provide adequate detail regarding the obligations of the entity in performing the assessment.

Additional Information

Violation Severity Levels and Violation Risk Factors for Various Standards

Action

Adopt modified Violation Severity Levels (VSLs) and Violation Risk Factors (VRFs) for the following standards, and authorize staff to file with applicable regulatory authorities:

- **TPL-001-4** [redline showing revised VRF for Requirement R1]
- **CIP-003-5** [redline showing revised VSLs for Requirements R1 and R2]
- **CIP-004-5.1** [redline showing revised VRF and VSLs for Requirement R4]
- **CIP-006-5** [redline showing revised VRF for Requirement R3]
- **CIP-008-5** [redline showing revised VSL for Requirement R2]
- **CIP-009-5** [redline showing revised VSLs for Requirement R3]
- **MOD-026-1** [redline showing revised VSLs for Requirement R6]
- **MOD-027-1** [redline showing revised VSLs for Requirement R5]
- **PRC-005-2** [redline showing revised VSL for Requirement R1]
- **PRC-005-3** [redline showing revised VSL for Requirement R1]
- **BAL-003-1** [redline showing revised VRF and VSLs for Requirement R1]

Background

In several recent orders approving Reliability Standards, the Federal Energy Regulatory Commission (FERC) directed changes to Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs). The NERC Rules of Procedure Section 320 requires the NERC Board of Trustees' (Board's) approval for modifications to VRFs and VSLs resulting from a directive by an applicable regulatory authority. As described below, NERC has prepared the directed revisions in consultation with the relevant drafting teams and is hereby requesting the Board's approval of those revisions.

I. **TPL-001-4, Requirement R1 VRF**. On October 17, 2013, FERC issued Order No. 786 approving TPL-001-4 and directing NERC to modify the VRF for Requirement R1 from Medium to High. Requirement R1 requires Transmission Planners (TPs) and Planning Coordinators to maintain system models within their respective areas for the purpose of conducting studies needed to perform Planning Assessments. The drafting team reviewed the directive and agreed to the change. No other changes have been made to the standard.

II. **Multiple VRFs and VSLs for Version 5 CIP Standards**. On November 22, 2013, FERC issued Order No. 791, *Version 5 Critical Infrastructure Protection Reliability Standards*. In this order, FERC approved the CIP Version 5 standards and directed NERC to modify certain of those standards. In addition, FERC directed NERC to modify certain VRFs and

VSLs for particular CIP Version 5 standards. The directives pertaining to VRFs and VSLs are included in Paragraphs 176, 181-184, 192-195, and 205-210 of FERC Order No. 791.

FERC directed NERC to submit revisions to the VRFs by May 5, 2014, which is 90 days after the February 3, 2014 effective date of the order. March 18, 2014, NERC staff filed a request for an extension of the VRFs' filing deadline in order to afford time for the Board to adopt the revisions at its May 7, 2014 meeting. FERC granted NERC's requested extension and directed NERC to file the revisions by May 15, 2014. FERC did not direct a deadline for filing the revised VSLs.

NERC conferred with the standard drafting team (SDT) for Project 2014-02 CIP Version 5 Revisions because the Project 2008-06 Cyber Security Order 706 Version 5 CIP Standards SDT is no longer convened, and proposes the following revisions to VRFs and VSLs for the Version 5 CIP standards in response to FERC's Order No. 791 directives:

1. **VSLs for CIP-003-5, Requirements R1 and R2**. This standard addresses security management controls for cyber security. Requirement R1 governs management approval of policies on topics addressed in other CIP standards for medium and high impact BES Cyber Systems. Requirement R2 governs policies for low impact BES Cyber Systems. NERC staff, in consultation with the SDT for Project 2014-02 CIP Version 5 Revisions, revised the VSLs in CIP-003-5, Requirements R1 and R2 to eliminate redundant language to meet the FERC directive in P 206 of Order No. 791.
2. **VRF and VSLs for CIP-004-5.1, Requirement R4**. This standard includes requirements for personnel and training related to cyber security. Requirement R4 governs implementation of access management programs. In response to the FERC directive in P 192 of Order No. 791, NERC staff revised the VRF from Lower to Medium. Further, NERC staff, in consultation with the SDT for Project 2014-02 CIP Version 5 Revisions, revised the VSLs to a percentage-based gradation to meet the FERC directive in P 208 of Order No. 791.
3. **VRF for CIP-006-5, Requirement R3**. This standard addresses physical security of BES Cyber Systems. Requirement R3 governs implementation of Physical Access Control System maintenance and testing programs. In response to the FERC directive in P 184 of Order No. 791, NERC staff revised the VRF from Lower to Medium.
4. **Severe VSL for CIP-008-5, Requirement R2**. This standard addresses incident reporting and response planning for cyber security. Requirement R2 governs implementation of documented Cyber Security Incident response plans. In response to the FERC directive in P 209 of Order No. 791, NERC staff revised the Severe VSL to reduce a gap in months between the High VSL and Severe VSL.
5. **VSLs for CIP-009-5, Requirement R3**. This standard addresses recovery plans for BES Cyber Systems. Requirement R3 governs maintenance of the recovery plans. In response to the FERC directive in P 210 of Order No. 791, NERC staff revised the timeframe contained in the VSLs from 90-210 days to 90-120 days.

To respond to the directive in P 205 of Order No. 79, NERC will request Board approval of revisions to the VSLs associated with the requirements that include the "identify, assess, and correct" language when those requirements are modified consistent with FERC's directive to remove or modify that language. The SDT for Project 2014-02 CIP Version 5 Revisions is currently addressing the "identify, assess, and correct" language in the requirements of the CIP standards and will revise the VSLs accordingly.

III. **VSLs for MOD-026-1, Requirement R6 and MOD-027-1, Requirement R5**. On March 20, 2014, FERC issued Order No. 796, *Generator Verification Reliability Standards*. In this order, FERC approved five generator verification standards and directed NERC to make modifications to VSLs for two requirements, each of which require the TP to provide a written response to the Generator Owner that it has received certain model information, and, if the model is unusable, to provide a technical explanation as to why the model is unusable. The modified VSLs address a violation where the model is unusable but the TP fails to provide a technical explanation as to why the model is unusable. The Project 2007-09 Generator Verification drafting team was consulted in developing these revisions.

IV. **VSLs for PRC-005-2 and PRC-005-3, Requirement R1.** On December 19, 2013, FERC issued Order No. 793, approving Reliability Standard PRC-005-2 – Protection System Maintenance, stating that the "Reliability Standard contains overall improvements over the four existing Reliability Standards." However, FERC directed one change to the VSL assignment in Requirement R1 regarding the failure to include station batteries in a time-based maintenance program, noting that "the level of risk associated with the failure to test a given battery is not an appropriate consideration in the context of assigning violation severity levels, but rather, should be considered when assigning a violation risk factor." FERC therefore directed NERC to submit a compliance filing changing the VSL for the failure to include station batteries in a time-based maintenance program to "severe."

    In consultation with the relevant SDTs, NERC has made the change to the VSL in Reliability Standard PRC-005-2 and also made the change in Reliability Standard PRC-005-3, which has been adopted by the Board and since filed for regulatory approval.

V. **VRF and VSLs for BAL-003-1, Requirement R1.** The Board adopted Reliability Standard BAL-003-1 – Frequency Response and Frequency Bias Setting, on February 7, 2013. FERC issued Order No. 794 approving BAL-003-1 on January 16, 2014. This order directed the ERO to: 1) modify the Requirement R1 Violation Risk Factor to a "high" level, and 2) modify the Violation Severity Level for Requirement R1 to remove references to performance by other entities. NERC staff made the modifications to the VRF and VSL in Requirement R1 as directed.

Board of Trustees Meeting
May 7, 2014

Physical Security Standard Project

Action
Information

Background
On March 7, 2014, the Federal Energy Regulatory Commission (FERC) issued an order directing NERC to submit for approval, within 90 days of the order, one or more Reliability Standards to address physical security risks and vulnerabilities of critical facilities on the Bulk Power System (BPS).[1]

Summary
The order focuses on critical facilities, directing steps to evaluate physical security threats and implement security plans that continues NERC's ongoing physical security efforts. In the order, FERC stated that the proposed standard(s) should require entities to take a least the following three steps:

- Perform a risk assessment to identify facilities that, if rendered inoperable or damaged, could result in instability, uncontrolled separation, or cascading failures on the BPS.
- Evaluate the potential threats and vulnerabilities to those identified facilities.
- Develop and implement a security plan designed to protect against physical attacks to those identified facilities based on the assessment of the potential threats and vulnerabilities to their physical security.

Additionally, FERC directed that the proposed Standard(s) should also: (1) include a procedure that will ensure confidential treatment of sensitive or confidential information; (2) include a procedure for a third party to verify the list of identified facilities and allow the verifying entity, as well as FERC, to add or remove facilities from the list of critical facilities; (3) include a procedure for a third party to review the evaluation of threats and vulnerabilities and the security plan; and (4) require that the identification of the facilities, the assessment of the potential risks and vulnerabilities, and the security plans be periodically reevaluated and revised to ensure their continued effectiveness. FERC directed that the proposed Physical Security Reliability Standard(s) be filed by June 5, 2014.

In response to the order, NERC staff and the Standards Committee (SC) worked together in order to develop an action plan for meeting the June 5, 2014 filing deadline. The SC approved several waivers to facilitate meeting the required timelines and seated the Standard Drafting Team (SDT) on March 21, 2014. Further details are provided below under the "Standards Development Process Update" section.

[1] *Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (2014).

Pertinent directives from the FERC Order, *Reliability Standards for Physical Security Measures* 146 FERC ¶ 61,166 (2014):

Paragraph 5

Therefore, to carry out section 215 of the FPA and to provide for the reliable operation of the Bulk-Power System, the Commission directs the ERO to develop and file for approval proposed Reliability Standards that address threats and vulnerabilities to the physical security of critical facilities on the Bulk-Power System.

Paragraph 6

The Reliability Standards should require owners or operators of the Bulk-Power System to take at least three steps to address the risks that physical security attacks pose to the reliable operation of the Bulk-Power System. First, the Reliability Standards should require owners or operators of the Bulk-Power System to perform a risk assessment of their systems to identify their "critical facilities." A critical facility is one that, if rendered inoperable or damaged, could have a critical impact on the operation of the interconnection through instability, uncontrolled separation or cascading failures on the Bulk-Power System.

Paragraph 8

In the second step, the Reliability Standards should require owners or operators of the identified critical facilities to evaluate the potential threats and vulnerabilities to those identified facilities. The threats and vulnerabilities may vary from facility to facility based on factors such as the facility's location, size, function, existing protections and attractiveness as a target. Thus, the Reliability Standards should require the owners or operators to tailor their evaluation to the unique characteristics of the identified critical facilities and the type of attacks that can be realistically contemplated.

Paragraph 9

Third and finally, the Reliability Standards should require those owners or operators of critical facilities to develop and implement a security plan designed to protect against attacks to those identified critical facilities based on the assessment of the potential threats and vulnerabilities to their physical security.

Paragraph 10

NERC should include in the Reliability Standards a procedure that will ensure confidential treatment of sensitive or confidential information but still allow for the Commission, NERC and the Regional Entities to review and inspect any information that is needed to ensure compliance with the Reliability Standards.

Paragraph 11

In addition, the risk assessment used by an owner or operator to identify critical facilities should be verified by an entity other than the owner or operator. Such verification could be performed by NERC, the relevant Regional Entity, a Reliability Coordinator, or another entity. The Reliability Standards should include a procedure for the verifying entity, as well as the

Commission, to add or remove facilities from an owner's or operator's list of critical facilities. Similarly, the determination of threats and vulnerabilities and the security plan should also be reviewed by NERC, the relevant Regional Entity, the Reliability Coordinator, or another entity with appropriate expertise. Finally, the Reliability Standards should require that the identification of the critical facilities, the assessment of the potential risks and vulnerabilities, and the security plans be periodically reevaluated and revised to ensure their continued effectiveness. NERC should establish a timeline for when such reevaluations should occur.

Standards Development Process Update

Section 16 of the Standards Processes Manual (SPM) allows SPM Provisions to be waived by the SC to meet a regulatory deadline. On March 21, 2014, the SC approved waivers to support drafting activities to meet the FERC-imposed regulatory deadline of June 5, 2014. The SC approved the following waivers of provisions from the SPM for the Physical Security Reliability Standards Project:

1. Standard Authorization Request (SAR) to be posted for a seven-calendar day informal comment period. (Sections 4.1-4.2)
2. Initial formal comment and ballot period reduced from 45 days to 15 calendar days, with a ballot conducted during the last 5 days of the comment period. Form ballot pool in first 10 days. (Sections 4.7-4.9)
3. Additional formal comment and ballot period(s) reduced from 45 days to 10 calendar days, with ballot conducted during the last five days of the comment period. (Sections 4.9 and 4.12)
4. Final ballot from 10 days to five calendar days. (Section 4.9)

On, March 21, 2014, the SC also accepted the Project 2014-04 Standard Authorization Request (SAR) for a seven-calendar day informal comment period posting, pursuant to the SC-approved waiver, and seated the SDT with 11 members. NERC staff posted the SAR from Friday, March 21, 2014, through Friday, March 28, 2014.

On April 1, 2014, NERC staff convened a technical conference in Atlanta, GA, to focus stakeholder discussion on developing a draft of a Physical Security Reliability Standard, with the intent of assisting the SDT to quickly develop and post a Reliability Standard for comment and ballot. The conference provided a forum for industry input on the concepts in the draft standard, to include criteria for determining applicable entities, identification of critical facilities, evaluation of potential threats and vulnerabilities, development and implementation of physical security plans, and the proposed standard's implementation plan. NERC compliance staff also provided an overview of the Reliability Standard Audit Worksheet (RSAW) approach. There were approximately 150 in-person attendees and 550 attendees registered to participate via audio and web presentation.

Given the SC waiver, the SDT developed the draft CIP-014-1 standard and posted it for a 15-calendar day initial formal comment and concurrent 10-day ballot period. NERC compliance

staff, with SDT and Regional Entity input, prepared and posted a draft RSAW concurrent with the posting of the draft standard. At the time of preparing these materials, the dates and results from the ballot were not available. NERC management will provide an update on the ballot results to the Standards Oversight and Technology Committee at the May 6, 2014 meeting and to the NERC Board of Trustees (Board) at the May 7, 2014 meeting.

In addition to completion of the initial formal comment and ballot period, NERC anticipates the SDT will meet the following timeline to complete the project through the standard drafting process:

1. **Early-May:** Additional posting (if needed) of draft CIP-014-1 for 10-day comment and concurrent five-day ballot period, pursuant to the SC-approved waiver.
2. **Mid to late May:** Five-day final ballot, pursuant to the SC-approved waiver.
3. **End of May to Early June (not later than June 5, 2014):** Board adoption; NERC staff file standard with applicable regulatory authorities.

Agenda Item 9
Board of Trustees Meeting
May 7, 2014

Proposed Amendments to the Delegation Agreement with SERC Reliability Corporation – Amended Exhibit B – the SERC Bylaws

Action

Approve proposed amendments to NERC's Delegation Agreement with SERC Reliability Corporation (SERC), consisting of amendments to Exhibit B – the SERC Bylaws, and file with applicable regulatory authorities for approval. The amendments to the SERC Bylaws do not affect SERC's qualifications to serve as a Regional Entity with delegated authority from NERC and do not adversely impact the ability of SERC to function as a Regional Entity under the Delegation Agreement.

Background

SERC is in the process of transitioning from an Alabama non-profit corporation to a North Carolina non-profit corporation, in consideration of its current base of operations and lack of substantial nexus to the state of Alabama. As part of this transition, SERC has formed a North Carolina non-profit corporation. In October 2012, the SERC Board approved the Articles of Incorporation and initial Bylaws for the North Carolina non-profit corporation. These Bylaws mirrored the pre-existing SERC Bylaws, save for a few amendments.

At the time these initial Bylaws were approved, the SERC Board also directed staff to consider whether it would be appropriate to seek tax-exempt status under Section 501(c)(3) of the Internal Revenue Code, rather than under Section 501(c)(6), the status of the Alabama corporation. The initially-approved Bylaws of the North Carolina corporation contained language necessary to support the 501(c)(3) application.

After consideration, it was decided that it would be preferable to maintain the same tax status for the North Carolina corporation, rather than to seek tax-exempt status under Section 501(c)(3), and in October 2013, the SERC Board unanimously approved amendments to the SERC Bylaws to codify this decision.

The following summarizes the amendments made to the SERC Bylaws. Items #2, 3, 5, 6, and 7 were approved by the SERC Board in October 2012. Items #1 and 4 were approved by the SERC Board in October 2013.

1. In Section 11.2, the "Distribution of Assets" provision was amended to remove language necessary for 501(c)(3) status. Section 501(c)(6) of the Internal Revenue Code requires different language in the Bylaws than is required under Section 501(c)(3). The changes

necessary to support this recommendation are needed prior to filing an application for tax-exempt status in North Carolina.

2. The Table of Contents was updated to reflect changes in pagination caused by the amendments to the Bylaws.

3. In Section 2.2, language was added to state that the terms "Bulk Power System," "Reliability Standards," and "Regional Entity" shall be as defined in 16 U.S.C. § 824o.

4. Section 2.6 was added to clarify that Member Companies shall be non-voting members and shall have no power or authority or right to vote with respect to the actions of the Corporation.

5. Section 4.2 was amended to require corporate affiliates to consolidate and coordinate their representation on the Board and any Board-level committees.

6. In Section 13.1, the terms "Alternate Director" and "Customer Advisor" were added to reflect that this Section applies to these representatives.

7. Article XIV was expanded to apply to the Articles of Incorporation.

The amendments to the SERC Bylaws do not affect SERC's qualifications to serve as a Regional Entity with delegated authority from NERC and do not adversely impact the ability of SERC to function as a Regional Entity under the Delegation Agreement. Accordingly, SERC requests that the Board approve the amended Bylaws and forward to FERC for approval and adoption as a replacement for Exhibit B to the SERC Delegation Agreement.

AMENDED AND RESTATED

BYLAWS

OF

SERC RELIABILITY CORPORATION
[Hereinafter referred to as the "Corporation"]

A North Carolina Nonprofit Corporation

ARTICLE I - OFFICES

1.1 **Principal Office**. The principal office of the Corporation shall be located in the City of Charlotte, Mecklenburg County, North Carolina. The Board of Directors may by resolution change the location of this office from time to time.

1.2 **Other Offices**. The Corporation may have other offices at such place or places as the Board of Directors may from time to time appoint or the business of the Corporation may require.

ARTICLE II - MEMBERSHIP

2.1 **General**. The Corporation shall be a membership corporation. Entities that meet the eligibility requirements and apply for membership in the Corporation shall hereinafter be referred to individually as a "Member Company" and collectively as "Member Companies".

2.2 **Eligibility**. Membership in the Corporation is open to any entity in the SERC Region (defined in Section 3.2 below) that is a user, owner or operator of the Bulk Power System and is subject to the jurisdiction of the Federal Energy Regulatory Commission for the purpose of complying with Reliability Standards established under Section 215 of the Federal Power Act and all amendments thereto. Membership in the Corporation is voluntary; however, membership is predicated on mandatory acceptance of the responsibility to promote, support, and comply with Reliability Standards of the Corporation and the North American Electric Reliability Corporation ("NERC"), and to assist the Corporation in its compliance with the terms and provisions of a Delegation Agreement (a "Delegation Agreement") with NERC, by which NERC delegates authority to propose and enforce Reliability Standards, pursuant to 16 U.S.C. § 824o or the corresponding provisions of any subsequent U.S. Code revisions. For purposes of

these Bylaws, the terms “Bulk Power System”, “Reliability Standards” and “Regional Entity” shall be as defined in 16 U.S.C. § 824o or the corresponding provisions of any subsequent U.S. Code revisions.

2.3 **Termination**. A Member Company may terminate its membership in the Corporation by giving the Board of Directors at least thirty (30) days written notice of its intent to terminate such membership (such Member Companies shall hereinafter be referred to as "Terminated Member Companies"). Terminated Member Companies shall nevertheless continue to be liable for any and all obligations incurred prior to the end of the calendar year in which such notice is given, including, but not limited to, the obligation to pay a pro rata share of any Corporation expense. In addition to termination of membership by the Member Company, the Board of Directors, following notice to the Member Company, may terminate the membership of a Member Company if in the judgment of the Board of Directors that Member Company has violated its obligations and responsibilities to the Corporation. The termination of the membership of a Member Company by the Board of Directors shall require a Supermajority vote, as defined in these Bylaws.

2.4 **Sectors.** Each Member Company shall be classified by the Executive Committee in one of the following seven (7) Sectors (each a “Sector”, and collectively, the “Sectors”):

(a) Investor-Owned Utility Sector – This Sector includes any investor-owned entity with substantial business interest in ownership and/or operation in any of the asset categories of generation, transmission or distribution.

(b) Federal/State Sector – This Sector includes any U.S. federal entity that owns and/or operates electric facilities and/or provides balancing authority services, in any of the asset categories of generation, transmission, or distribution; or any entity that is owned by or subject to the governmental authority of a state and that is engaged in the generation, delivery, and/or sale of electric power to end-use customers primarily within the political boundaries of the state.

(c) Cooperative Sector – This Sector includes any non-governmental entity that is incorporated under the laws of the state in which it operates, is owned by and provides electric service to end-use customers at cost, and is governed by a board of directors that is elected by the membership of the entity; and any non-governmental entity owned by and which provides generation and/or transmission service to such entities.

(d) Municipal Sector – This Sector includes any entity owned by or subject to the governmental authority of a municipality, that is

engaged in the generation, delivery, and/or sale of electric power to end-use customers primarily within the political boundaries of the municipality; and any entity, whose members are municipalities, formed under state law for the purpose of generating or purchasing electricity for sale at wholesale to their members.

(e) Marketer Sector– This Sector includes any entity that is engaged in the activity of buying and selling of wholesale electric power in the SERC Region on a physical or financial basis.

(f) Merchant Electricity Generator Sector – This Sector includes any entity that owns or operates an electricity generating facility or provides balancing authority services for such entities. This includes, but is not limited to, small power producers and all other non-utility producers such as exempt wholesale generators who sell electricity at wholesale.

(g) ISO-RTO Sector – This Sector includes any entity that operates a FERC approved ISO or RTO.

The Executive Committee's classification of a Member Company in a particular Sector may only be changed by the Executive Committee.

2.5 **Transfer of Membership.** A Member Company may not give or otherwise transfer its membership, except to a successor that becomes a Member Company in accordance with the terms and conditions of these Bylaws, and provided that the successor continues to meet its predecessor's obligations.

2.6 **Powers.** Notwithstanding any other provisions of these Bylaws, except for the appointment of Directors as provided in Section 4.2 below, Member Companies shall be non-voting members and shall have no power or authority or right to vote with respect to the actions of the Corporation, specifically including, but not limited to, the dissolution or merger of the Corporation.

ARTICLE III - PURPOSES

3.1 **General Purposes.** The purpose of the Corporation is to promote effective and efficient administration of Bulk Power System reliability in the SERC Region, as defined in Section 3.2. In pursuit of this goal, the Corporation shall:

(a) enter into a Delegation Agreement to serve as a Regional Entity pursuant to 16 U.S.C. § 824o or the corresponding provisions of any subsequent U.S. Code revisions;

(b) promote the development of reliability and adequacy arrangements among the systems in the SERC Region;

(c) participate in the establishment of Reliability Standards;

(d) participate in the measurement of performance relative to these Reliability Standards;

(e) promote conformance to and compliance with these Reliability Standards;

(f) develop and exchange information with respect to planning and operating matters relating to the reliability and adequacy of the Bulk Power System;

(g) review as necessary activities in the SERC Region on reliability and adequacy in order to meet Reliability Standards;

(h) provide a mechanism to resolve disputes on reliability issues in a manner that meets the needs of the parties and the SERC Region; and

(i) provide information with respect to matters considered by the Corporation, where appropriate, to the Federal Energy Regulatory Commission ("FERC") and to other federal and state agencies concerned with reliability and adequacy.

3.2 **Geographic Area.** The Corporation accomplishes its purposes in a geographic area (the "SERC Region") that is defined in Exhibit A of the Amended and Restated Delegation Agreement Between North American Electric Reliability Corporation and SERC Reliability Corporation.

3.3 **Other Statutory Functions.** The Corporation may also perform statutory functions outside of the SERC Region, on behalf of NERC or other Regional Entities. The Corporation may undertake such activities pursuant to a contract that is approved by the Executive Committee.

ARTICLE IV - BOARD OF DIRECTORS

4.1 **General Powers**. The affairs of the Corporation shall be managed by its Board of Directors except as otherwise provided in these Bylaws.

4.2 **Composition and Eligibility**. The Board of Directors shall be comprised of no fewer than three (3) Directors and no more than two (2) Customer Advisors.

Each Director shall be the principal officer or other authorized employee from a Member Company or a company that controls, is controlled by, or is under common control with such Member Company (an "affiliated entity"). Each Member Company, together with any affiliated entities, may appoint one (1) Director to the Board of Directors. For clarification purposes only, each Member Company and all of such Member Company's affiliated entities (including any affiliated entities which may be a separate Member Company) shall have the right to appoint only one (1) Director to serve on behalf of such Member Company and all of such Member Company's affiliated entities. Each Director shall serve until otherwise replaced by the applicable Member Company, together with any affiliated entities. Each Member Company, together with any affiliated entities, may designate one (1) alternate Director, who shall be a principal officer or other authorized employee from the Director's Member Company or an affiliated entity, to serve in the place of the Member Company's Director at any meeting of the Board of Directors (an "Alternate Director"). Directors may not otherwise use proxy votes. Any vacancy occurring among the Directors or Alternate Directors shall be filled by the applicable Member Company, together with any affiliated entities.

Each Customer Advisor shall be a person who is (i) employed by an entity that receives service at retail and does not otherwise sell, purchase, or transmit power over the Bulk Power System or own, operate or maintain, control or operate facilities or systems that are part of the Bulk Power System; (ii) a state public utility commission representative; or (iii) any other customer advocate. Should the Board of Directors not include two (2) Customer Advisors, the Board of Directors may elect additional Customer Advisors to fill such vacancies. The term of these Customer Advisors shall be for a two (2) year period.

The Chair of FERC and the chair or president of any State Utility Commission in a state in which electric service is provided by a Member Company of the Corporation shall be invited to designate an observer to attend meetings of the Board.

4.3 **Regular Meetings of the Board**. Unless otherwise determined by the Chair, a regular meeting of the Board of Directors shall be held without other notice than these Bylaws on the fourth Wednesday in the months of April and October in each year. Notwithstanding the foregoing, the Chair may elect to hold a regular semi-annual meeting of the Board of Directors on another date provided that the Board receives at least ten (10) days advance notice. If the day fixed for the meeting shall be a legal holiday in the State of North Carolina, the meeting shall be held on the next succeeding business day. The Board of Directors may designate any place as the place of meeting for any meeting. The Board of Directors may provide by resolution the time and place for the holding of additional regular meetings of the Board without other notice than the resolution. Directors or any committee designated by the Board of Directors may participate in such Board or committee meetings by means of a telephone conference, webcast or any other communication by means of which all persons participating in the

meeting can hear each other at the same time, and participation by such means shall constitute presence in person at such meeting.

4.4 **Special Meetings of the Board**. Special meetings of the Board of Directors may be called at the request of the Chair, or by Directors holding twenty percent (20%) or more of the Individual Votes. The Chair may fix any place as the place for holding any special meeting of the Board.

4.5 **Notice of Special Meetings**. Notice of any special meeting of the Board of Directors shall be given at least two (2) days prior to the special meeting by written notice delivered personally, or sent by mail or electronic mail to each Director at the address as shown by the records of the Corporation. If mailed, such notice shall be deemed to be delivered when deposited in the United States mail in a sealed envelope so addressed, with postage prepaid. If sent by electronic mail, such notice shall be deemed to be delivered when sent via electronic mail. Any Director may waive notice of any meeting. The attendance of a Director at any meeting shall constitute a waiver of notice of such meeting, except where a Director attends a meeting for the express purpose of objecting to the transaction of any business because the meeting is not lawfully called or convened. Neither the business to be transacted at, nor the purpose of, any special meeting of the Board need be specified in the notice or waiver of notice of such meeting, unless specifically required by law or by these Bylaws.

4.6 **Election of Board Officers and Executive Committee**. Biennially, at the April meeting, the Board of Directors shall elect Board Officers from among the Directors for the positions of Chair, Vice Chair, and Secretary-Treasurer, each for a term of two (2) years beginning on July 1st after the election. No Director may serve in more than one (1) Board Officer position at the same time. The Chair shall conduct all meetings and shall be responsible for the preparation of the agenda. In the Chair's absence, the Vice Chair shall serve as acting Chair. In the event that a Board Officer cannot complete his or her term, the Board of Directors may hold a special election to elect a replacement Board Officer for the remainder of the unexpired term.

At the same time, the Board shall also approve representatives to the Executive Committee nominated by the Sectors to serve for a period of two (2) years. Each Sector may also elect alternates to the Executive Committee, and, if a Sector has more than one (1) representative on the Executive Committee, such Sector shall designate the priority of succession by such alternates.

4.7 **Agenda**. As far in advance of each regular and special meeting as practical, an agenda shall be distributed to each Director and Customer Advisor.

4.8 **Voting Definitions**.

(a) "Adjusted Weighted Vote" shall mean the number of votes of each Director determined in the manner set forth in Section 4.9 hereof.

(b) "Simple Majority" shall require the presence of a quorum and the (i) concurrence of Directors whose combined Individual Votes are greater than fifty percent (50%) of the total Individual Votes of all Directors present at the meeting and entitled to vote on the issue (the "Individual Vote Test"), (ii) concurrence of Directors whose combined Adjusted Weighted Votes are greater than fifty percent (50%) of the total Adjusted Weighted Vote of all Directors at the meeting and entitled to vote on the issue (the "Adjusted Weighted Vote Test"), and (iii) for at least one of the Individual Vote Test or the Adjusted Weighted Vote Test, on an individual Sector basis, the positive vote shall outweigh the negative vote for at least three Sectors.

(c) "Supermajority" shall require the presence of a quorum and the concurrence of (i) Directors whose combined Individual Votes equal or exceed two-thirds (2/3) of the total Individual Votes of all Directors present at the meeting and entitled to vote on the issue, provided that a quorum is present, and (ii) Directors whose combined Adjusted Weighted Votes are greater than two-thirds (2/3) of the total Adjusted Weighted Vote of all Directors present at the meeting and entitled to vote on the issue.

(d) "Individual Vote" shall mean a single vote accorded to each Director.

(e) "Given Year" shall mean the applicable fiscal year for which the Adjusted Weighted Votes are calculated.

(f) "Reporting Year" shall mean the fiscal year immediately preceding the Given Year.

(g) "Previous Year" shall mean the fiscal year immediately preceding the Reporting Year.

4.9 **Determination of Adjusted Weighted Vote**. The Directors' Adjusted Weighted Votes for a Given Year shall be determined by the following formula:

V = 10(1/N) + 30(B/C) + 30(D/E) + 30(F/G)

V = % of Adjusted Weighted Vote

N = total number of Member Companies

B = Member Company's Previous Year internal peak demand

C = total of factor B for all Member Companies

D = Member Company's owned generating capacity as of January 1 of the Reporting Year

E = total of factor D for all Member Companies

F = Member Company's sum of circuit miles of transmission times the respective operating voltage for facilities of 69 kV and above as of December 31 of the Previous Year

G = total of factor F for all Member Companies

4.10 **Voting; Manner of Acting; Voting Rights; Quorum; Proxies**.

(a) Except as otherwise provided in these Bylaws, all actions by the Board of Directors require approval by a Simple Majority vote.

(b) A motion shall be deemed to have passed if it passes either:

(i) the Individual Vote Test; or
(ii) the Adjusted Weighted Vote Test;

and, for purposes of the failed test (any test that is not satisfied), on an individual Sector basis, the positive votes outweigh the negative votes in every Sector but one.

(c) Directors holding two-thirds (2/3) of the Individual Votes shall constitute a quorum for action by the Board. If Directors holding less than two-thirds (2/3) of the Individual Votes are present at the meeting, a majority of the Directors present may adjourn the meeting from time to time without further notice.

(d) The intent of Section 4.8(b)(iii) and Section 4.10(b) is to ensure that no two Sectors should be able to control any decision and that a single Sector should not be able to veto any matter, respectively (other than amendments to these Bylaws). In the event that either of the foregoing shall nevertheless occur, the Member Companies shall promptly revise the provisions of these Bylaws so that no two Sectors shall be able to control any decision and no single Sector shall be able to veto any matter.

4.11 **Compensation**. Directors shall not receive any compensation from the Corporation for their services to the Corporation.

4.12 **Informal Action by Directors**. Any action required by law to be taken at a meeting of Directors, or any action which may be taken at a meeting of Directors, may

be taken without a meeting if all of the Directors consent in writing to the action so taken.

4.13 **Duties**. The Board of Directors shall have the exclusive responsibility to:

(a) Authorize distributions;

(b) Recommend to members or approve dissolution, merger or the sale, pledge or transfer of substantially all of the ~~c~~Corporation's assets;

(c) Fill vacancies on any of the Board's committees;

(d) Adopt, amend, or repeal the Articles of Incorporation or Bylaws;

(e) Form or dissolve committees of the Board as it deems necessary to carry out the business of the Corporation; and

(f) Resolve any disputes regarding the Member Companies and the Corporation, if those issues cannot be resolved by the standing committees or subcommittees of the Corporation and are not otherwise subject to NERC's dispute provisions for non-compliance with Reliability Standards.

ARTICLE V - CORPORATE OFFICERS

5.1 **Corporate Officers**. The Board of Directors shall appoint a President & Chief Executive Officer, Vice President, Secretary, and Treasurer of the Corporation. Two (2) or more of such offices may be held by the same person, except for the offices of President & Chief Executive Officer and Secretary. The Board of Directors may appoint such other officers and assistant officers as it deems necessary.

5.2 **President & Chief Executive Officer**. The President shall be the Chief Executive Officer of the Corporation and shall manage the operations of the Corporation to the end that its purposes shall be accomplished. The Board Officers shall determine the compensation and benefits for the President & Chief Executive Officer (President). The President shall:

(a) Attend all Board of Directors meetings of the Corporation and NERC Stakeholder and Board of Trustees, meetings, as appropriate;

(b) Assist and coordinate the preparation of testimony and reports;

(c) Coordinate subregional activities and interregional affairs, to include data collection;

(d) Install and maintain an adequate system of accounts and records;

(e) Arrange for meetings as directed;

(f) Assist the Corporation Committee Chairs as appropriate;

(g) Manage the business affairs of the Corporation, including the Corporation staff;

(h) Maintain minutes of all the Corporation-related meetings; and

(i) Provide other assistance to the Corporation and NERC, as appropriate.

5.3 **Vice President.** The Vice President shall perform such duties and exercise such powers as may be assigned to him or her from time to time by the Board of Directors, the Executive Committee, or the President. In the absence of the President, or in the case of the President's inability to act, the Vice President shall perform the duties and exercise the powers of the President, but subject to the control of the Board of Directors and the Executive Committee. The Board Officers shall determine the compensation and benefits of the Vice President.

5.4 **Secretary.** The Secretary shall be custodian of the records and of the seal of the Corporation and in general shall perform all duties incident to the office of Secretary and such other duties as may, from time to time, be assigned to him or her by the Board of Directors, the Executive Committee, or the President.

5.5 **Treasurer.** The Treasurer shall have charge and custody of, and be responsible for, all funds and securities of the Corporation and deposit all such funds in the name of the Corporation in such banks, trust companies, or other depositaries as shall be selected in accordance with the provisions of these Bylaws; and in general, perform all of the duties incident to the office of Treasurer and such other duties as from time to time may be assigned to him or her by the Board of Directors, the Executive Committee, or the President.

ARTICLE VI - EXECUTIVE COMMITTEE

6.1 **Executive Committee Representatives**. The Executive Committee shall be comprised of twelve (12) Sector representatives from the Board of Directors, consisting of:

(a) The Investor-Owned Utility Sector shall have three (3) representatives;

(b) The Federal/State Sector shall have two (2) representatives;

(c) The Cooperative Sector shall have two (2) representatives;

(d) The Municipal Sector shall have two (2) representatives;

(e) The Marketer Sector shall have one (1) representative;

(f) The Merchant Electricity Generator Sector shall have one (1) representative; and

(g) The ISO-RTO Sector shall have one (1) representative.

It is the desire of the Board of Directors that the Cooperative and Municipal sectors have representation from both transmission dependent and transmission owning Members. Each Sector shall be responsible for nominating their representative(s) and alternates from among the Directors. The Chair of the Board shall serve as Chair of the Executive Committee and shall conduct all meetings and shall be responsible for the preparation of the agenda. In the event that a representative on the Executive Committee is unable to complete a term, the Sector's alternate shall replace such representative.

6.2 **Ex Officio Representatives**. The Chair, Vice Chair, and Secretary-Treasurer of the Board of Directors shall also be ex officio representatives on the Executive Committee, but shall not have voting rights unless such Board Officer is also elected by a Sector to the Executive Committee pursuant to Section 6.1 above.

6.3 **Authority of Executive Committee**. Except as limited by Section 55A-8-25 of the North Carolina Nonprofit Corporation Act and Section 4.13 of these Bylaws, the Executive Committee is empowered to make all such decisions and take such actions as are deemed to be necessary for the operation of the Corporation.

6.4 **Action.** Each voting representative on the Executive Committee shall have one vote. The presence of three-quarters (3/4) of the voting representatives on the Executive Committee shall constitute a quorum. The positive vote of two-thirds

(2/3) of Executive Committee voting representatives present and voting is necessary to pass a particular action.

ARTICLE VII - OTHER COMMITTEES

7.1 **Designation by Board**. The Board of Directors, by resolution adopted by a Simple Majority vote, may designate Board committees and standing committees, as shall be necessary to address the purposes of the Corporation. Each Board committee shall have at least two Directors among its members.

7.2 **Rules for Governance**. Each committee shall adopt rules for its own governance that are not inconsistent with these Bylaws, rules adopted by the Board of Directors, applicable NERC or FERC rules or regulations, or applicable state or federal laws. Each committee shall maintain its rules for governance in a written scope document that is approved by the Board of Directors.

7.3 **Ad-Hoc Support Committees**. The Board or its committees may, from time to time, appoint ad-hoc committees to research and/or advise it on compliance or technical issues or matters, among other things. Such ad-hoc committees may be formed on an as-needed basis and may vary in makeup depending on the needs of the Board or its committees.

ARTICLE VIII - MISCELLANEOUS

8.1 **Conflicts of Interest.** All Directors, Alternate Directors, Customer Advisors, and Board committee representatives shall comply with the Corporation's Standards of Conduct policy that prohibits conflicts of interest, as such conflicts could cast doubt on the ability of such persons to act with total objectivity with regard to the overall interests of the Corporation.

8.2 **Contracts**. The Board of Directors may authorize any officer or agent of the Corporation, in addition to the officers so authorized by these Bylaws, to enter into any contract or execute and deliver any instrument in the name of and on behalf of the Corporation, and such authority may be general or confined to specific instances.

8.3 **Checks, Drafts, etc**. All checks, drafts, or orders for the payment of money, notes or other evidences of indebtedness issued in the name of the Corporation, shall be signed by an authorized officer or agent of the Corporation and in such manner as shall from time to time be determined by resolution of the Executive Committee. In the absence of such determination by the Executive Committee, such

instruments shall be signed by the Board's Secretary-Treasurer, the Corporation's President, or the Corporation's Finance Director, as stipulated by the Executive Committee. The Corporation's Finance Director may arrange audits of financial records, sign appropriate documents, and perform such duties normally performed by the Board's Secretary-Treasurer, except duties assigned to the Corporation's President.

8.4 **Deposits**. All funds of the Corporation shall be deposited from time to time to the credit of the Corporation in such banks, trust companies, or other depositories as the Corporation's President may select.

8.5 **Books and Records**. The Corporation shall keep correct and complete books and records of account and shall also keep minutes of the proceedings of the Board of Directors and committees having any of the authority of the Board of Directors, and shall keep at its registered or principal office a record giving the names and addresses of the Directors. All books and records of the Corporation may be inspected by any Director, or agent or attorney representing any Director, for any proper purpose at any reasonable time.

8.6 **Seal**. The corporate seal shall be in circular form and shall have inscribed thereon the name of the Corporation, the words "Corporate Seal", and such other word or words, if any, as may be determined by the Board of Directors to be inscribed thereon.

8.7 **Fiscal Year.** The fiscal year of the Corporation shall begin on the first day of January and end on the last day of December in each year.

ARTICLE IX - EXPENSES

9.1 **Allocation of Specific Expenses.** The expenses of Directors and Board Officers shall be borne by that person's regular employer.

9.2 **Statutory Functions.** The Corporation anticipates that as a general rule all of its expenses shall be incurred in the furtherance of statutory activities pursuant to Section 215 of the Federal Power Act, and that all such expenses shall be funded by NERC, subject to FERC approval.

9.3 **Non-Statutory Functions.** Notwithstanding Section 9.2, the Board of Directors may from time to time authorize the Corporation to participate in non-statutory activities (i.e., activities not described in Section 215 of the Federal Power Act). In the event that the Corporation proposes to engage in non-statutory activities, such activities shall be identified in the Corporation's annual business plan that is submitted to NERC and, if approved by NERC, shall be submitted to FERC for approval in advance of engaging in such non-statutory activities. The expenses incurred by the Corporation for

any such approved non-statutory activities shall be allocated by the Board of Directors to the beneficiaries of such activities on a basis proposed in the business plan submitted for NERC and FERC approval.

ARTICLE X - DISPUTE RESOLUTION PROCESS

10.1 **Dispute Resolution.** All disputes regarding non-compliance with Reliability Standards shall be handled in accordance with the NERC Rules of Procedure. The organizational units of the Corporation shall deal with all other disputes within the framework of their respective organizations. For such other disputes, Member Companies of the Corporation are encouraged to utilize the appropriate Dispute Resolution Process within the Corporation prior to seeking resolution at NERC, FERC, or with legal counsel.

ARTICLE XI - DISSOLUTION

11.1 **Dissolution**. The Corporation may be voluntarily dissolved upon unanimous consent of its Member Companies, and in accordance with Section 55A-14-02 of the North Carolina Nonprofit Corporation Act, as amended from time to time.

11.2 **Distribution of Assets**. Upon dissolution of the Corporation as provided in Section 11.1, the residual assets, after payment of all just obligations, shall be distributed exclusively to organizations which are exempt from federal income tax under ~~Section 501(c)(3)~~Section 501(c)(6) of the Internal Revenue Code of 1986, or corresponding provisions of any subsequent federal tax laws, as the Board of Directors shall determine, ~~or to federal, state, or local governments to be used exclusively for public purposes.~~

ARTICLE XII - WAIVER OF NOTICE

12.1 **Waiver.** Whenever any notice is required to be given under the provisions of the North Carolina Nonprofit Corporation Act or under the provisions of the articles of incorporation or the Bylaws of the Corporation, a waiver thereof in writing signed by the person or persons entitled to such notice, whether before or after the time stated therein, shall be deemed equivalent to the giving of such notice.

ARTICLE XIII - INDEMNIFICATION

13.1 **Indemnification of Directors, Alternate Directors, Customer Advisors, Committee Members, Officers, Employees and Agents**. Every person who is, or has served as, a Director, Alternate Director, Customer Advisor, committee member, Officer, ~~Director by virtue of serving as an Alternate Director,~~ employee, or agent of the Corporation shall be indemnified by the Corporation in the manner and to the extent authorized by the North Carolina Nonprofit Corporation Act. The foregoing rights of indemnification shall be without prejudice to any other rights to which any such Director, Alternate Director, Customer Advisor, committee member, Officer, ~~Alternate Director,~~ employee, or agent may be entitled as a matter of law.

ARTICLE XIV - AMENDMENT OF THE BYLAWS AND ARTICLES OF INCORPORATION

14.1 **Amendment of the Bylaws and Articles of Incorporation**. After a request by twenty percent (20%) of the Board of Directors or an affirmative vote of the Executive Committee, a proposal to amend the Bylaws or the Articles of Incorporation shall be put before the Board of Directors at any regular or special meeting for a vote. Copies of the proposed amendments shall be distributed to the Board of Directors at least thirty (30) days before the meeting at which they are to be considered. An amendment to the Bylaws or the Articles of Incorporation shall be adopted after being approved by a Supermajority vote of the Board of Directors, provided that a quorum is present.

2014 State of Reliability Report

Action
Information

Background
The NERC *2014 State of Reliability Report* continues to build upon the analysis and findings presented in the *2013 State of Reliability Report*[1]. This report focuses on analyses of specific aspects of the performance of the bulk power system reliability, based on the integration of a wide variety of information and data sources.

The State of Reliability Report is prepared annually at the request of the Operating Committee and Planning Committee. The primary leads for report development were NERC's Performance Analysis Subcommittee (PAS) and NERC staff in collaboration with many technical support groups, each focused on evaluating specific aspects of reliability, including the Resources Subcommittee (RS), Frequency Working Group (FWG), Operating Reliability Subcommittee (ORS), Event Analysis Subcommittee (EAS), Reliability Assessment Subcommittee (RAS), Protection System and Control Subcommittee (SPCS), Protection System Misoperations Task Force (PSMTF), Transmission Availability Data System Working Group (TADSWG), Generating Availability Data System Working Group (GADSWG), Demand Response Availability Data System Working Group (DADSWG), Spare Equipment Database Working Group (SEDWG), and Compliance and Certification Committee (CCC).

The report objectively reviews and assesses the state of reliability based on the analysis of data and metric trends. The report also provides an integrated view of reliability performance, and identifies potential reliability issues. The key findings and recommendations of the report serve as the technical foundation for NERC's range of risk-informed efforts addressing reliability performance, and serve as key inputs to the annual *RISC Report* and report on *Top Priority Reliability Risks*. The metrics measured in the report address the characteristics of an adequate level of reliability (ALR) and trends indicate the bulk power system has been performing consistently well. There are no significant upward or downward trends from 2009 to 2013.

An overview of the report and key findings will be presented herein with consideration of the final report expected to occur at a future Board meeting.

2014 Summer Reliability Assessment Status Update

Action Required
None

Background
The objectives for NERC's Summer Reliability Assessment are to identify, assess, and report areas of concern regarding the reliability of the North American bulk power system and to make recommendations if actions are needed. The assessment identifies potential summer resource deficiencies and operating reliability concerns, determines peak electricity demand and supply changes, and highlights unique regional challenges. The assessment represents the results of working with the Reliability Assessment Subcommittee (RAS), the Regions, and NERC staff to develop sound technical basis for understanding these challenges. The report is intended to enable entities to better anticipate and respond in ways that ensure bulk power system reliability.

NERC will issue its *2014 Summer Reliability Assessment* on May 15, 2014. The following preliminary findings have been presented to the RAS as potential issues for the upcoming summer:

- **NERC Assessment Areas to Meet the Summer Reference Margin Levels**
  - TRE-ERCOT: adequate margins depend on pending capacity expected in August
  - MISO: unit retirements, derates, and mothballs contribute to reduced margins
  - NPCC-New England: reduced reserve margins due to recent unplanned outages
- **Summer Gas-Electric Transportation Considerations**
  - Meeting summer peaks with increasing dependence on gas-fired
  - Summer pipeline maintenance can create constraints that impact supply
  - Localized deliverability impacts in the Southeast caused by hurricanes
- **Continued Impacts of Baseload Retirements**
  - Contribute to reduced reserve margins in some areas.
  - Ontario retired last coal plant in April; Anticipated Margin is 10 percent lower compared to last summer.
  - Planners and operators continue to address localized reliability issues through transmission enhancements and replacement capacity.
- **Other highlights include (still under evaluation)**:
  - **MISO-South Integration -** North-south transmission constraints
  - **California Drought Impacts -** Conditions have improved substantially since March; issues could arise as drought is expected to continue

- **Rail Shipments of Coal in the Midwest -** Capacity shortfalls will not be an issue this summer; NERC will provide an update and address more thoroughly in the 2014 Long Term Reliability Assessment.

RAS set the draft schedule below for the *2014 Summer Reliability Assessment*:

Dates	Description
Tuesday, April 29	Final draft sent to PC/OC/MRC
Monday, May 5	PC webinar review and approval
Tuesday, May 6	Final draft sent to NERC Board of Trustees
Tuesday, May 13	NERC Board of Trustees webinar review and approval
Wednesday, May 15	Target release

Agenda Item 12
Board of Trustees Meeting
May 7, 2014

ERO Enterprise and Corporate Performance Metrics

Action

Approve the 2014 performance metrics, as an enclosure to the February 6, 2014 ERO Enterprise Strategic Plan.

Background

On February 6, 2014 the NERC Board of Trustees approved the ERO Enterprise Strategic Plan for the 2014-2017 planning period and deferred approval of the proposed performance metrics until its May 7th meeting. On March 20th, the Corporate Governance and Human Resources Committee approved the revised 2014 Performance Metrics for NERC staff compensation purposes and recommended Board approval of the revised metrics for use in the ERO Strategic Plan. These performance metrics will be used to assess the overall effectiveness of the enterprise in addressing risk to the bulk electric system (BES), achieving reliability results, assuring standards and compliance effectiveness and improving risk mitigation and program execution.

Revisions to the metrics include:

- Metric 1: revised to consider a composite of category 1-3 events through more accurate measurement of frequency and impact to determine the influence of NERC on improving reliability. The Daily event Severity Risk Impact data and a statistical evaluation to minimize randomness will be used to create a consistent measurable value for measurement of performance.
- Metric 3: the measure has been revised to include a listing of specific actual and potential risks identified for mitigation.
- Sub-Metric A: the Standards Committee and NERC Staff will work together to develop a periodic review process for steady state Reliability Standards. The process will include a quality and content review and the use or adaptation of the 2013 Independent Expert Review Team's quality and content scoring system will be considered during development. The review will be conducted by a cross-functional task force that will consist of Committee chairs, NERC management, NERC and stakeholder subject matter experts, and other parties as deemed necessary and appropriate. This review may also be incorporated into the current Standards Processes Manual periodic review process to avoid duplication of effort. So that the task force will be able to identify Reliability Standards for inclusion in the 2016-2018 Reliability Standards Development Plan, the task force will be operational no later than mid-2015 to allow ample time for the development of the annual task force review timeline.

Enclosed Attachment

1. ERO Enterprise Strategic Plan, 2014-2017 with enclosed 2014 Performance Metrics

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Electric Reliability Organization (ERO) Enterprise Strategic Plan 2014-2017

A multi-year strategic plan for the Electric Reliability Organization (ERO) Enterprise was originally developed in 2012. The plan was significantly expanded in early 2013 to include additional details on deliverables. The updated draft plan below is intended for use by NERC and Regional Entities in developing 2015 business plans. New this year, is the addition of ERO Enterprise performance metrics that will be initially used in 2014.

The ERO Enterprise is a collaborative, international network comprised of the North American Electric Reliability Corporation (NERC) and the eight Regional Entities that brings together collective leadership, experience, judgment, skills, and technologies for ensuring the reliability of the North American bulk power system. This plan summarizes the ERO Enterprise's mission, vision, values and goals; and provides strategic direction and priorities for 2014 and beyond.

Mission

To ensure the reliability of the North American bulk power system.

Vision

To be the trusted leadership that ensures the reliability of the North American bulk power system by implementing relevant standards; promoting effective collaboration, cooperation, and communication around important risks to reliability; and utilizing expertise from the industry to produce outcomes that effectively manage risks to reliability, in a cost effective manner.

Core Values and Guiding Principles

The following core values and guiding principles serve as guidelines for the conduct and behavior of all involved in the ERO Enterprise.

Accountability and Independence — The ERO Enterprise will:

- Be accountable for the public responsibilities delegated to it (a public trust obligation).
- Be impartial, independent of special interests, and impervious to improper influence.
- Balance its own independent regulatory judgment with the need to involve those with expert knowledge and experience in bulk power system reliability matters.

Responsiveness — The ERO Enterprise will act in a timely manner on the basis of unfolding events, emerging reliability risks, and the needs of industry and other stakeholders.

Fairness and Inclusiveness — The ERO Enterprise will:

- Be open and transparent.
- Provide access for clear communication with stakeholders.
- Ensure the legitimate interests of all parties, including costs imposed on registered entities, are duly considered and balanced in the development of policies and reliability standards, and in its programs and operations.
- Conduct compliance and enforcement actions judiciously and in proportion to risk, paying regard to both potential and actual (realized) risks.

Adaption and Innovation — The ERO Enterprise will:

- Continuously assess and prioritize its goals.
- Embrace change and encourage new ideas that contribute to effective action.
- Recognize the complex relationships and potential tensions between reliability objectives and business imperatives (including cost control).
- Be nimble and artful in development of tools and dissemination of lessons learned and other information to respond to novel, unfamiliar, and emerging challenges.

Excellence —The ERO Enterprise will:

- Promote and rely upon the active participation of the best technical leaders from industry.
- Strive for excellence and efficiency in all aspects of Enterprise activities.

Efficiency —The ERO Enterprise will make informed decisions regarding efficient use of its resources and resources shared by industry, with due consideration of the cost to industry.

Integrity — The ERO Enterprise will:

- Maintain the highest levels of professional and ethical conduct.
- Be independent, impartial, fair, intellectually honest, truthful, and candid.
- Be rigorous and thorough in all it does, doing the right things the right way.
- Earn trust by treating every person with fairness and respect.
- Work to meet or exceed expectations of stakeholders.

Four Pillars for Success

In order to succeed, the ERO Enterprise will emphasize:

- ***Reliability*** – to address events and identifiable risks, thereby ensuring the reliability of the bulk power system through proper mitigation and remediation.
- ***Assurance*** – to provide assurance to the public, industry, and government for the reliable performance of the bulk power system.
- ***Learning*** – to promote learning and continuous improvement of operations and adapt to lessons learned for bulk power system reliability.
- ***Risk-based Approach*** – to focus attention, resources and actions on issues most important to bulk power system reliability.

Strategic Goals 2014 – 2017

The ERO Enterprise has identified five goals in the strategic areas of standards; compliance, registration and certification; risks to reliability; and coordination and collaboration.

Standards

Goal 1. **Develop clear, reasonable and technically sound mandatory reliability standards in a timely and efficient manner.** These standards establish threshold requirements for ensuring the bulk power system is planned, operated, and maintained in a manner that minimizes risks of cascading failures, avoids damage to major equipment, or limits interruptions of bulk power supply.

Objectives and valued outcomes include:

a. Standards are clear, responsive to reliability and security risks, practical to implement and cost effective.

Key deliverables include:

- Ensure all new standards meet quality and results-based criteria[1] by 2017 with subsequent review every five years thereafter, including addressing quality and content issues identified in the 2013 Independent Expert Review Team Report and the work of the standing committees and the Reliability Issues Steering Committee (RISC) and others
- Evaluate significant bulk power system events (Category 3 and above) to identify any gaps in standards and address any such gaps.

[1] Quality criteria are the attributes of excellent reliability standards as stated in Section 300 of NERC's Rules of Procedure. Results based criteria mean each requirement defines a performance outcome, risk mitigation, or essential competency necessary for a reliable bulk power system.

- Develop a bulk power system risk profile and assess standards compared to the profile, address the most important unmitigated risks including applicable high impact low frequency risks.
- Address all high priority risks designated for control by a standard within one year or two years if technical study is required.
- Address all new FERC directives within one year or two years if technical study is required; close all pre-2013 directives by 2015 (by filing or negotiated resolution).
- Facilitate smooth transition of new standards (e.g., CIP Version 5).
- Consolidate to a common set of RSAWs, or successors, for all standards.
- Identify and file requirements to be retired (e.g., Paragraph 81 Phase 2), including addressing recommendations from the Independent Expert Review Team, the standing committees, the Reliability Issues Steering Committee (RISC) and others.
- Develop and implement procedures for assessing the cost effectiveness of reliability standards, as needed.

Compliance, Registration and Certification

Goal 2. **Be a strong enforcement authority that is independent, without conflict of interest, objective and fair and promote a culture of reliability excellence through risk-informed compliance monitoring and enforcement.** The ERO retains and refines its ability to use standards enforcement when warranted and imposes penalties and sanctions commensurate with risk.

Objectives and valued outcomes include:

a. The ERO registers entities commensurate with risk to the bulk power system and ensures all key reliability entities are certified to have essential capabilities.

Key deliverables include:

- Implement the BES exception process.
- Evaluate the certification program for sufficiency and effectiveness, modify as needed.
- Develop a framework and implement criteria for registration based on risk to the bulk power system.
- Develop common and consistent registration processes, information systems and methods among regions.

b. The ERO holds industry accountable for violations that create serious risk to the bulk power system; resulting actions are timely and transparent to industry.

Key deliverables include:

- Develop and implement the Reliability Assurance Initiative (enforcement reform) which includes the objective of improving the efficiency and effectiveness of NERC and Regional Entity operations by focusing on serious risk violations, reducing unnecessary costs of compliance on registered entities while, in each case, ensuring reliability objectives are achieved.
- Develop and implement new caseload and mitigation aging curves and monitor caseload and mitigation performance.
- Develop and implement enforcement strategies based on the Reliability Assurance Initiative, including enhancements to Find, Fix, and Track (FFT).
- Continue to expand use of enforcement discretion.

Goal 3. Promote a culture of compliance that supports reliability excellence within industry. The ERO works with industry to identify standards, procedures, practices and controls to address reliability risks.

Objectives and valued outcomes include:

a. Industry has effective procedures and programs to monitor, detect, correct, report, and prevent compliance, reliability, and security issues.

Key deliverables include:

- Develop and implement Reliability Assurance Initiative (compliance reform) and all Regions implement RAI techniques and principles consistently.
- Make effective internal controls models and information available to industry.
- Initiate compliance phase-in learning periods for new standards.

b. All ERO compliance activities are risk informed, efficient and effective.

Key deliverables include:

- Develop and implement Reliability Assurance Initiative (compliance reform).

- Monitor registered entities and standards requirements commensurate with the risk to reliability and role of each type of registered entity.

Risks to Reliability

Goal 4. Identify the most significant risks to reliability, be accountable for mitigating reliability risks and promote a culture of reliability excellence. The ERO identifies and prioritizes reliability risks, facilitates effective solutions and interventions, and monitors results. The ERO works with industry stakeholders and experts to ensure the mitigation of known risks to reliability and facilitates a learning environment through event causal analysis, communication of lessons learned, tracking of recommendations, and implementation of best practices.

Objectives and valued outcomes include:

a. Risks are identified and prioritized based on reliability impacts, cost/practicality of assessments, projected resources, and emerging issues.

Key deliverables include:

- Continue RISC's work to develop risk profiles and to include HILF issues.
- Prepare an annual state of reliability report and associated reliability metrics.
- Develop the BPS risk profile to prioritize and rank reliability risks
- Develop project plans and business case assessments for high priority risks; implement or facilitate initiatives to address high priority risks.

b. Events and system performance are consistently analyzed for sequence, cause, and remediation to identify reliability risks and trends, and lessons learned.

Key deliverables include:

- Analyze significant events to identify gaps in standards, compliance effectiveness, registration, and risk controls effectiveness.
- Make all bulk power system event reports available on a timely basis to industry through a secure portal.
- Provide lessons learned and recommendations from events and identified risks.
- Merge event driven databases and cause codes into one (e.g., event analysis, TADS, GADS, relay mis-operations).

c. **ERO supports industry situational awareness, cyber security preparedness and provides independent reliability information to policy makers.**

Key deliverables include:

- Expand security maturity model assessments to be widely accessible across industry.
- Issue and track physical security and cybersecurity recommendations to protect the bulk power system.
- Expand the use and value of physical security and cybersecurity threat and vulnerability information sharing, analytics, and analysis.
- Implement periodic wide area security exercises (e.g., GridEx).
- Increase security clearances available to industry and facilitate access to secured briefings through local fusion centers.

d. **Reliability models and data accurately represent system behavior and are shared among reliability entities.**

Key deliverables include:

- Assess data and modeling needs and develop recommendations to ensure quality planning and operating data/models are available to registered entities across each interconnection.
- Evaluate event disturbances using phasor measurements and other methods to assess sufficiency of data and models.

Coordination and Collaboration

Goal 5. **Improve transparency, consistency, quality and timeliness of results; operate as a collaborative enterprise; and improve efficiencies and cost effectiveness.** The ERO accomplishes this through working with the Regional Entities and registered entities to ensure effective coordination, collaboration and process improvements. The ERO, is an efficient steward of resources, and leverages information systems to create efficiencies and process controls.

Objectives and valued outcomes include:

a. **The ERO acts in a coordinated and collaborative manner with stakeholders.**

Key deliverables include:

- Maintain a list of suggestions and recommendations made by stakeholders (e.g. through policy input) and ERO responses to each.
- Engage the support and expertise of stakeholders in prioritizes and resourcing reliability initiatives.
- Communicate expectations clearly and fosters collaboration to deliver important results in advancing system reliability.
- Develop and implement ERO-wide consensus IT solutions for common touch points with Registered Entities.
- Implement collaborative governance by which ERO and Regions are bound by consensus decisions.
- Clearly delineate ERO and Regional Roles and Responsibilities.

b. The ERO acquires, engages, and retains highly qualified talent suited to the mission.

Key deliverables include:

- Implement employee climate surveys and succession planning and promote favorable hiring and retention of ERO staffs.
- Develop ERO qualifications requirements for auditors and other key positions across the ERO and implement training as needed.

c. The ERO internal risks are understood and managed; ERO processes are effective, efficient, and continuously improved.

Key deliverables include:

- Develop, test and deploy ERO enterprise-wide applications, platform and database.
- Implement an ERO-wide internal risk management program.

ERO Enterprise Performance Metrics

New in 2014, NERC and the Regional Entities are introducing a common set of ERO Enterprise performance metrics. These metrics are intended as indicators of the overall effectiveness of the ERO Enterprise in achieving its mission and the goals and objectives outlined in the ERO Enterprise Strategic Plan, 2014-2017. There are four overarching metrics focused on overall effectiveness in addressing bulk power system risks and improving reliability. There are a number of supporting measures that assess the effectiveness of the key operational elements of the ERO Enterprise.

The intent is to report the results of these metrics on an ERO Enterprise-wide basis, and also as applicable distinguish results for NERC and individual regions. NERC and the Regional Entities are encouraged to further use relevant portions of these measures in their internal corporate performance management programs.

Metric 1: Reliability Results

Measure – Determine the frequency of BPS events, excluding weather[2], flood, or earthquake. The target is fewer, less severe events during 2014-2017; no Category 4 and 5 events and Category 3 events are trending down.

Metric 2: Assurance Effectiveness

Measure – Assess all Category 3 and above events. The target is to reach zero gaps in Reliability Standards and compliance monitoring by 2017.

Metric 3: Risk Mitigation Effectiveness

Measure – Review the BES risk profile each year to determine actual and potential risks. The target is to identify, select and mitigate the high priority risks (and issue specific metrics for each established project).

1. **Changing Resource Mix** - As the generation and load on the power system changes, new vulnerabilities may be exposed that the system was not previously designed to address or respond to. Fundamental operating characteristics and behaviors are no longer a certainty and focused action is needed to address this risk.

[2] Terrestrial weather excluded from metric, however space weather (GMD) is included in metric.

2. **Extreme Physical Events** – Risk mitigation efforts (reducing the potential consequence) are underway, but additional focus is needed to address and minimize both the magnitude and duration of the consequences of an extreme physical event.
3. **Protection System Misoperations** – NERC's 2012 and 2013 State of Reliability Reports identified protection system misoperations as a significant threat to BPS reliability. Additional activities are needed to ensure this risk is managed adequately.
4. **Cold Weather Preparedness** - Lack of generator preparedness for cold weather extremes may result in forced outages, de-ratings, and failures to start. Insufficient availability of intra-regional generation and limits on import transfer capability may result in insufficient generation to serve forecasted load, resulting in load shedding.
5. **Right of Way Clearances** - Transmission Owners and applicable Generation Owners may have established incorrect ratings based on design documents, rather than on the actual facilities built. Managing to stay within SOL and IROL limits that are based on incorrect ratings may be inadequate to prevent equipment damage and/or cascading, instability, or separation.
6. **345kV Breaker Failures** - NERC has identified a potential trend of 345 kV SF6 puffer type breakers failing. Circuit breaker failures, in conjunction with another fault, may lead to more BES Facilities removed from service than required to clear the original fault. This poses a risk to the reliability of the BES.

Metric 4: Program Execution Effectiveness

Measure – Sum of the weighted sub-metrics.

Sub metric A *(Primary NERC)* - Percent of all board-approved standards[3] meet quality criteria and results-based construct[4].

The Standards Committee and NERC Staff will work together to develop a periodic review process for steady state Reliability Standards. The process will include a quality and content review and the use or adaptation of the 2013 Independent Expert Review Team's quality and content scoring system will be considered during development. The review will be conducted by a cross-functional task force that will consist of Committee chairs, NERC management, NERC and stakeholder subject matter experts, and other parties as deemed necessary and appropriate. This review may also be incorporated into the current Standards Processes Manual periodic review process to avoid duplication of effort. So that the task force will be able to identify Reliability Standards for inclusion in the 2016-2018 Reliability Standards Development Plan, the task force will be operational no later than mid-2015 to allow ample time for the development of the annual task force review timeline.

[3] Regional standards are not included, this applies to NERC only.
[4] Based on Independent Expert Review Team scoring method 3 out of 3 on content and at least 10 out of 12 on quality.

Sub metric B *(Primary NERC)* - Quality, up-to-date Reliability Standard Audit Worksheets, or any successor guidance, developed for board-approved Reliability Standards.

2014 = Every standard that goes to ballot will have a posted RSAW alongside. Every standard that is reviewed as part of the 5 year review cycle will have a current up-to-date RSAW or successor.

2015 = All RSAWs are converted to the new format and are available to industry.

2016 – 2017 = Violations for new standards do not occur at rates higher than the average rate for standards (or for which they replace) and repeat violations for standards is trending down.

Sub metric C *(Joint ERO Enterprise)* – Implementation of risk-based registration criteria to achieve efficient and effective allocation of compliance obligations. Registration is commensurate with risk and RAI and in light of new BES definition implementation.

2014 = Assessment complete with recommended framework and registration criteria. Implementation plan following assessment, criteria and framework completed.

2015 = Business processes / tools

2016 = Implementation launch

2017 = Stable state

Sub metric D *(Joint ERO Enterprise)* – Timeliness and transparency of compliance results: 12 month rolling average of the ERO Enterprise caseload index trending favorably.[5] Maximum age of unclosed cases is less than 24 months and improving.

2014 = ERO Enterprise caseload index less than or equal to 7 months, with all Regional Entities above average trending downward. ERO Enterprise average violation aging less than or equal to 13.5 months.

2015 = ERO Enterprise caseload index of 8 months, with all Regional Entities above average trending downward. ERO Enterprise average violation aging less than or equal to 13 months.

2016 = ERO Enterprise caseload index of 8 months, with all Regional Entities above average trending downward. ERO Enterprise average violation aging less than or equal to 12.5 months.

[5] ERO Enterprise Caseload Index is defined as Violations in ERO Inventory (defined as Active violations that have not been filed with FERC) divided by the total number of violations filed with FERC over previous 12-months (NOPs, SNOPs, FFTs and Dismissals) multiplied by 12.

2017 = ERO Enterprise caseload index of 8 months. ERO Enterprise average violation aging less than or equal to 12 months.

Sub metric E *(Joint ERO Enterprise)* - Percent of self-identified non-compliances (includes self-reports and self-certifications).

2014 = 70%

2015 = 74%

2016 = 78%

2017 = 80%

Sub metric F *(Joint ERO Enterprise)* - Mitigation aging curve improving[6].

2014 = Percentage of the noncompliance items discovered in that year that are mitigated as of December 31, 2014)

- 2013: 80%
- 2012: 95%
- 2011: 98%
- 2010 (and older): 100%

2015 - 2017 = Mitigation aging curve trending favorably.

Sub metric G *(Joint ERO Enterprise)* - RAI reforms and percent of total findings (excluding dismissals) not going to enforcement or filed with FFT or spreadsheet.

2014 =

- ERO auditor handbook deployment;
- RAI compliance reform design complete and reflected in the CMEP implementation plan for 2015;
- Enforcement pilots completed and FERC filings made, if required;
- Train at least two partnering entities to complete maturity model assessments and complete either directly or through trained partners 20 maturity model assessments;
- At least 75% of noncompliance posing a minimal or moderate risk to the BPS is processed through discretion (i.e.: does not trigger an enforcement action), FFT or SNOP;
- Average time from discovery to posting FFT is 6 months;

[6] Final metrics to be discussed and approved at the February 2014 BOTCC meeting.

- Average time from discovery to decision to enforce or not (i.e.: the triage process) is 60 days.

2015 = Higher percentage of lower and moderate risk violations staying in compliance through exercise of discretion to initiate an enforcement action; audit scope based on common ERO methodology.

2016 = Compliance and enforcement end state designs implemented; continued increase in lower and moderate risk violations staying in compliance through exercise of discretion to initiate an enforcement action.

2017 = Achieve fewer, less severe violations. Positive trend in number of matters dispensed outside of enforcement.

Sub metric H *(Primary NERC)* - Participation in ES-ISAC increased (2013 statistics used as baseline)

2014 =

- 90% of all RCs and TO/TOPs;
- 10% increase in enrollment of all other registered entities;
- 20% increase in information share activity on portal (baseline 2013 uploads figures).
- Develop an ES-ISAC mission performance program, including Key Performance Indicators (KPIs) and benchmarks, by end of Q3.

2015 - 2017 = KPIs trending favorably.

Sub metric I *(Joint ERO Enterprise)* – Assessment of quality and availability of planning and engineering models and data.

2014 = Methodology to validate models developed and endorsed by appropriate technical committees.

2015 = Acquire data and capability for set up / start up.

2016 = Assessment of state and quality of modeling. Establish plan to implement assessment recommendations.

2017 = Implement plan.

Sub metric J *(Joint ERO Enterprise)* – Achieving transition laid out in oversight model regarding ERO Enterprise personnel and ERO Enterprise (NERC and Regional Entity) infrastructure and applications qualifications.

2014= Report quarterly progress and achieve 25% completion of action items.

2015= Report quarterly progress and achieve 50% completion of action items.

2016= Report quarterly progress and achieve 75% completion of action items.

2017= Report quarterly progress and achieve 100% completion of action items.

Sub metric K *(Joint ERO Enterprise)* –Stakeholder annual satisfaction/perception survey of the ERO's effectiveness to manage risk, budget and stewardship.

2014 = Develop questionnaire with stakeholder input and vetting. Survey complete and benchmarks established.

2015 – 2017 = Performance trending favorably.

ERO Enterprise Strategic Plan, 2014-2017

Goal 5: Improve transparency, consistency, quality, and timeliness of results; operate as a collaborative enterprise; and improve efficiencies and cost-effectiveness.

5a - The ERO acts in a coordinated and collaborative manner with stakeholders.

- Maintain a list of suggestions and recommendations made by stakeholders (e.g., through policy input) and ERO responses to each.

Strategic and Business Planning Input

Entity / Stakeholder (Date)	Stakeholder Comment (Abridged version)	Action/Response and Notes
CEA (Jan 2014)	Goal 4: Determine if there can be a deliverable to identify and develop a suite of tools to address reliability issues (as alternatives to standards).	Under consideration by NERC management and referred to RISC and standing committees for input.
	Goal 5: Recognize the obligations to all applicable governmental authorities and modify to indicate "all applicable authorities".	Agreed. Processes are in place to coordinate with both US and Canadian government authorities.
EEI (Jan 2014)	Include a strategic internal management goal with clear accountability of goals and objectives, deliverables and meaningful metrics.	Already in place with integration of NERC metrics to NERC performance management system.
	Map existing program area plans and processes to strategic plan. Specifically, how NERC's plan complements or conflicts with the standards development work plan or the RISC's proposal to address reliability issues.	NERC's priorities for the standards review process are addressed on an ongoing basis and reflected in the Reliability Standards Development Plan developed in collaboration with the Standards Committee. RISC coordination is ongoing in 2014 and will be reflected in plans for 2015.
	Align various metrics with goals and deliverables. • Set clear and measurable metrics for regulatory outreach and advocacy.	Regulatory outreach and advocacy are embedded in our normal work processes and aligned with key initiatives. Consideration to specific metrics for this area will be given for future years.
SM-TDUs (Jan 2014)	Define measures by which the Regional Entities and NERC will evaluate entity risk (as part of RAI).	Will be addressed in the ongoing implementation and development of RAI.
NRECA (Jan 2014)	Recommend replacing BPS with BES throughout the plan	Adopted. NERC updated the Board approved (Feb 6) Strategic Plan replacing BPS throughout.
	Goal 1: Include the SC role and focus on retiring standards and requirements that are not needed to support BES reliability.	The Standards Committee's role in the standards review process will be addressed as part of developing the long term quality review process.
	Goal 2: Include deliverable to add a deregistration process for currently registered entities that have a change. Also add a deliverable that requires development of a single document/resource that describes RAI.	Adopted. NERC updated the Board approved (Feb 6) Strategic Plan adding deregistration.
	Goal 4: Add SC responsibilities.	Standards Committee's responsibilities in the standards development process will be addressed on an ongoing basis.
EPSA (Jan 2014)	Combine metric 1 and 2. These metrics seem interrelated as to not represent two different metrics to score and evaluate.	Not adopted. Metric 1 measures the effectiveness of the ERO Enterprise to influence reliability overall as measured by the frequency and severity of events. Metric 2 focuses on conducting analysis of severe events to assess

		whether there are gaps in reliability standards as currently in force or compliance monitoring on the part on the ERO. Both metrics are focused on accountability of the ERO Enterprise to influence reliability and reduce the occurrence of severe events.
ELCON (Jan 2014)	Encourage specific metrics to allow the measurement of: • Maintain a list of suggestions made by stakeholders and ERO responses • Engage expertise of stakeholders in reliability initiatives • Implement collaborative governance (ERO and Regions) bound by consensus	• This list addresses first bullet. • Not appropriate for a "metric", but we agree conceptually. • Not appropriate for a "metric", but that governance exists in the form of the ERO EMG, which is comprised of the CEOs of all nine entities.
Standards Committee, Brian Murphy (Jan 2014)	Goal 1: Revise to align with the RSDP and SC's work plan (refer to policy input attachment)	Adopted.
NPCC (Jan 2014)	Recommends the implementation of the registration framework and criteria be advanced to 2015 to better align with the implementation of the BES definition.	To be considered during the registration initiative project and will be reflected in the development of the 2015 BP&B if time permits.
SERC (Jan 2014)	Encourages ERO Enterprise to conduct a clean slate review of the strategic plan's content with a particular focus beyond the current 3 year horizon.	To be discussed with ERO EMG.
MRC BP&B Input Group (Jan 2014)	Add important MRC meeting and conference call dates to BP&B schedule.	NERC staff updated BP&B schedule prior to the Jan 30 Finance and Audit Committee meeting to reflect this input.
EEI (Jan 2014)	Describe/ address budget and cost management, coordination among the core operational areas and duplicative activities among the Regions. • Consider cost-benefit analysis, similar to Standards, to help inform decision-making and determine priorities for limited resources.	To be considered by NERC management in the development of the 2015 BP&B.
Sector 4 (Jan 2014)	Consider cost impacts to industry. There are mounting pressures to manage costs and minimize rate impacts to customers. NERC must ensure resources are spent appropriately.	To be considered by NERC management in the development of the 2015 BP&B.
ELCON (Jan 2014)	Specific "IT solution" benefits to Registered Entities should be quantified through cost savings in dollars. Strongly encourages restraint in the amount that will be proposed and recommends keeping the amount level if not reduced.	To be considered by NERC management in the development of the 2015 BP&B.
NPCC (Jan 2014)	Identify "benefits" associated with standards to provide more information surrounding standards' costs vs. benefits.	Efforts are underway to consider cost benefit in the standards development process.

Texas RE (Jan 2014)	Requests there be additional clarity and transparency regarding amounts that the Regional Entities will be expected to expend to support specific enterprise efforts. • If particular ERO-level projects are required the amounts should be identified and incorporated into the Regional Entities' budgets.	Addressed through the coordination and development of the NERC and Regional Entities BP&Bs.
SERC (Jan 2014)	Resource needs and budgets should reflect the stable nature of the enterprise. Effectiveness parameters, including cost, should be established for ERO activities.	Addressed through the coordination and development of the NERC and Regional Entities BP&Bs.
RISC (Jan 2014)	Encourages the inclusion of more explicit focus on reliability risk management and RISC's priority recommendations in the BP&B.	RISC intends to produce its next recommendations in February 2015 for the 2016 BP&B.

Other Input - Related to ERO Enterprise Activities and Priorities

Entity / Stakeholder (Date)	Stakeholder Comment (Abridged version)	Action/Response and Notes
CEA (Jan 2014)	Requests that NERC present # of new or modified standards to NERC BOT for approval.	Addressed in the standards development plan.
	Examine where efficiencies can be gained and where resources can be better focused on core reliability priorities. • Focus on registration criteria for PSEs.	The registration initiative will address criteria for entities such as PSEs. Efficiency opportunities will be addressed through the coordination and development of the NERC and Regional Entities BP&Bs.
EEI (Jan 2014)	Fully implement the RAI before the implementation date of CIP v5, ensure the completion of regional pilots by mid-2014, and address compliance process issues and expectations for entities operating in multiple regions.	RAI compliance pilots are complete and the enforcement pilots will be complete in April. RAI final compliance design will be complete in Q3 2014. Integration with CIP v5 implementation is being planned.
SM-TDUs (Jan 2014)	Afford RAI as the highest priority since it is relied upon in standards development.	RAI is one of the highest priorities this year.
NRECA (Jan 2014)	Consider the challenges of too many initiatives in play at any one time and focus on doing less, better.	Agree conceptually and will continue to work with stakeholders to pace initiatives.
	Develop a revised Statement Compliance Registry Criteria (SCRC) and other needed ROP modifications for BOT approval at its November 2014 meeting. • Develop a project plan with timelines and milestones.	Will be taken under consideration as part of the registration initiative this year.
IRC ISO/RTO (Jan 2014)	Consider developing a structured approach and metrics for exploring and applying alternative approaches to standards • Work with the RISC on an approach that expands on the suite of tools.	Under consideration by NERC management and referred to RISC and standing committees for input.
ELCON (Jan 2014)	Risk-based approach is not fully defined yet and needs to be encoded in priorities such as enforcement principles related to CIP v5 requirements.	RAI implementation will take into consideration, including the CIP v5 implementation.
NPCC (Jan 2014)	Recommends prioritization be given to the development of a secure portal to enable confidential sharing of post-event report.	The portal is in place as is the process for vetting and gaining permission from entities.

	Limit any risk project related to resource adequacy assessments of the reliability impacts of planned resource capacity and projected reserve margins.	That is the intent of that RISC identified project. Resource adequacy was not selected as a major 2014 risk project for the ERO Enterprise. Will be considered in future updates to the risk projects.
MRO (Jan 2014)	Continue risk-based work in the RAI and incorporate risk based concepts across all programs. The work being done in the RAI and through the implementation of the BES definition addresses how risk is to be considered in scoping the ERO's work.	Agreed.
SERC (Jan 2014)	Encourages further coordination of processes and timelines for "feeder" activities which are significant inputs into the business planning processes (RISC, LTRA, etc.).	Will be addressed in ongoing improvement to BP&B process between NERC and the Regional Entities.

Agenda Item 14.a
Board of Trustees Meeting
May 7, 2014

Operating Committee
Board of Trustees Report

Action
Information

Background

I. Operating Committee's (OC) Major Accomplishments for 2014 (Year-to-date)

1. Reliability Guidelines – The OC is currently addressing two reliability guidelines.
   a. In March 2013, the OC approved the *Reliability Guideline: Generating Unit Winter Weather Readiness – Current Industry Practices*. This guideline provides a general framework for developing an effective winter weather readiness program for generating units throughout North America. The focus is on maintaining individual unit reliability and preventing future cold weather related events. At its March 2014 meeting the OC reviewed the impacts to the BES of the Polar Vortex weather phenomenon. As a result of this review, the OC tasked its Event Analysis Subcommittee with conducting a review of the Generating Unit Winter Weather Readiness reliability guideline.
   b. In December 2013, the OC approved the posting for a 45-day comment period the draft *Reliability Guideline: Generating Unit Operations During Complete Loss of Communications*. Comments were due by February 28, 2014 and are currently being reviewed by the Resources Subcommittee. The proposed guideline provides a strategy for power plant operations in the case of complete loss of communications (both data and voice) between the on-site generating unit(s) operator and the System Operator for the Balancing Area, Transmission Operator (TOP) and Reliability Coordinator (RC).
2. MISO Reliability Plan – During the OC's June 20, 2013 meeting, it was reported that an Operations Reliability Coordination Agreement (ORCA) had been reached with Associated Electric Cooperative, Louisville Gas and Electric, Kentucky Utilities, PowerSouth Energy Cooperative, Southern Companies, Southwest Power Pool and Tennessee Valley Authority. Given this agreement, the parties recommended that the OC approve the revised MISO reliability plan. The ORCA provides a long term road map for coordination and study between the parties to ensure reliability in the consolidated MISO Balancing Authority Area that stretches from the gulf coast through the middle of the United States to the U.S. - Canadian border. The OC continues to receive status reports from MISO as the provisions in the ORCA are addressed in accordance with its approval of the reliability plan.

3. NERCnet (ISN) – NERC is in the process of transitioning NERCnet to the Eastern Interconnection Data Sharing Network, Inc. (EIDSN). The EIDSN is a consortium of reliability coordinators in the Eastern Interconnection that has been formed to manage the current NERCnet. In addition, the EIDSN intends to issue a Request for Proposals for a replacement network in the third quarter of 2014.

4. Independent Experts Review of the Reliability Standards – The OC engaged in a discussion of the reliability gaps (outage coordination, generator frequency response, and EMS real time contingency analysis models) identified by the in the independent experts in their report. The OC is developing a response for submittal to the Standards Committee and the Reliability Issues Steering Committee.

5. Essential Reliability Services Task Force (ERSTF) – The OC approved the scoping document for the ERSTF. The scoping document provides that essential reliability services (ERS), in addition to capacity and energy characteristics, must be maintained across a given system to ensure reliable operation. Inertia, frequency response, and voltage control are key ERS. Analysis may determine that other characteristics or functions could be included within the suite of ERS.

II. OC's Major Initiatives for 2014

1. OC Realignment of Activities and Organization – Following the approval of the OC's strategic plan, the committee will, throughout 2014, focus on the realignment and reprioritization of the work of its subgroups. In collaboration with its subcommittees and working groups, the OC will identify and implement opportunities for increased efficiency and use of stakeholder's resources.

2. Event Analysis Subcommittee (EAS) – Following an excellent start-up in 2012, the OC and the EAS continue to work jointly with the NERC Events Analysis (EA) program to further enhance the EA process and to enhance the identification and publication of lessons learned and event reports. In addition, the NERC EA program is beginning to develop and analyze event related metrics to identify trends, reliability gaps, and opportunities for industry improvement.

3. Annual State of Reliability Report – The OC's Event Analysis Subcommittee will partner with the Planning Committee's Performance Analysis Subcommittee to review and develop the 2014 State of Reliability report.

III. March 2014 Meeting Summary:

The following is a summary of the OC's March 2014 meeting, which highlights the latest activities of the OC and its associated subcommittees in support of the NERC or OC mission and corporate goals. The March 2014 OC Meeting Minutes are posted on the NERC website.

1. Reliability Issues Steering Committee (RISC) – On behalf of the RISC, Andy Rodriquez of NERC briefed the OC on the development of the Reliability Risk Management Process and the ERO Top Priority Reliability Risks 2014 – 2017, which identify what the RISC perceives as the most significant reliability concerns for the period 2014-2017.

2. Eastern Interconnection Frequency Initiative – The Resources Subcommittee briefed the OC on an Eastern Interconnection initiative to improve the Eastern Interconnection frequency response. The current initiative focuses on the existing generator fleet with respect to the completeness and accuracy of the data provided in the 2010 NERC generator survey and improving their frequency response capabilities. Following a brief discussion, the OC approved a motion to support the Resources Subcommittee's Eastern Interconnection Frequency Initiative and to encourage participation by Eastern Interconnection balancing authorities and generator operators and owners.

3. Planning Committee's Performance Analysis Subcommittee – Melinda Montgomery, chair of the Performance Analysis Subcommittee (PAS), reviewed proposed revisions to the ALR1-4 (BPS Transmission Related Events Resulting in Loss of Load) metric. The OC endorsed the proposed revision to ALR1-4 and a proposed revision to the Severity Risk Index whitepaper.

4. Polar Vortex Weather Phenomenon – Representatives from ERCOT, FirstEnergy, MISO, South Carolina Electric and Gas, and TVA briefed the OC on the impacts of the polar vortex weather phenomenon on the Bulk Electric System within their respective service areas. A particular concern of the industry was fuel availability during cold weather extremes, particularly the availability of natural gas when competing usage for heating diminishes its supply for generation. The OC will further investigate the current status and future plans for the gas-electric coordination initiatives at its June meeting. The OC tasked its EAS to consolidate all of the lessons learned associated with cold weather operations and distribute them to the OC for review. In addition, the OC charged the EAS to benchmark the OC's Generating Unit Winter Weather Readiness reliability guideline using the 2013/2014 cold weather phenomenon and recommend any improvements at the June 2014 OC meeting. This will in turn enhance the Fall 2014 cold weather preparedness webinar.

5. Eastern Interconnection Data Sharing Network (R. Mandes) – Mr. Mandes discussed the transition of the ISN (formerly NERCnet) to the industry in a secure manner to ensure the continued reliability and redundancy of the tool. The new network is expected to be in service during the first quarter of 2015.

6. Independent Experts Report – The Standards Committee asked the OC to review the Outage Coordination, Generator Governor Frequency Response and RTCA Models (Situational Awareness) gaps outlined in the Independent Experts report and associated draft Authority Standard. During the discussion it became clear that the Independent Experts needed to be involved in the discussion to answer questions and provide their perspective. The OC authorized its Executive Committee (EC) to meet with the Independent Experts and develop a response for use by the Standards Committee and RISC. Following the OCEC-Independent Experts webinar, the OC developed an opinion for each of the three gaps, as requested, and reviewed and provided an opinion for each requirement in the draft Authority Standard.

7. Essential Reliability Services Task Force – Mr. Moura summarized the scope of the Essential Reliability Services Task Force (ERSTF) as a joint OC and Planning Committee

effort to identify critical system reliability products such as inertia, frequency response and voltage control which must be maintained to continue reliable BPS operation as the resource mix changes. He estimated that the effort would require approximately 18 months to fulfill its mission. To provide effective operational input and avoid replication of efforts by the Operating and Planning Committees, the OC appointed a small core of operational representatives with an operational chair who will also serve as the Co-Chair of the Task Force. The OC approved the scope and structure of the ERSTF as presented.

Agenda Item 14.b
Board of Trustees
May 7, 2014

Planning Committee Status Update

Action
None

Status Update
In support of the NERC Planning Committee's (PC) long-term vision, significant tasks have been undertaken in 2013 to support the electric reliability organization's (ERO's) overall reliability mission. These tasks have laid the foundation for the projects being conducted in 2014. Along with the committee's development of a strategic plan and its annually produced reliability assessments, the NERC PC is actively engaged in a number of areas which are important to maintain the reliability of the Bulk-Power system (BPS) of North America.

First Quarter Status Report
The PC has observed significant improvements in the quality of material being submitted to the committee. The following items have been incorporated into the PC's regular course of business and tactical objectives:

- The PC executive team formed a reliability risk team to manage Reliability Issues Steering Committee (RISC) deliverables.
- Regional status reports are now requested at each meeting to get regional perspectives on emerging issues and progress on regional initiatives

Planning Committee's Major Initiatives for 2014

- **2014 Reliability Assessment Reports** – The PC expects to submit three annual assessment reports to the NERC Board of Trustees for their consideration: (1) the *2014 Long-Term Reliability Assessment*, (2) the *2014 Summer Reliability Assessment*, and (3) the *2014/2015 Winter Reliability Assessment*.
- ***2014 State of Reliability Report*** – The *State of Reliability Report* provides NERC's independent view of ongoing BPS trends to objectively analyze the state of reliability based on metric information and provide an integrated view of reliability performance. The report will provide an industry reference for historical BPS reliability as well as analytical insights toward industry action and will enable the discovery and prioritization of specific risk control steps.
- **Geomagnetic Disturbance Task Force (GMDTF)** – The GMDTF is primarily focused on the development of the Phase I and II Reliability Standards and providing technical guidance to the standards drafting team. The GMDTF is also developing a pilot assessment to better understand the planning approaches that will be used in Phase II of the GMD Reliability Standards.

- **Support of Standards Development** – The PC continues to support the NERC Standards Development process. In particular, subcommittees of the PC conduct essential technical research into current and proposed areas of reliability issues to either highlight on-going issues or improve the industry's body of knowledge relating to system planning and reliable operation of the bulk power system. This research is used to inform standards development.

  The PC is also engaged with the Standards Committee (SC) on technical discussions regarding the BPS reliability impacts of the demand response and distributed resources—highlighted as emerging long-term reliability challenges in numerous NERC assessments.

- **Completion of the Integration of Variable Generation Task Force (IVGTF) Work Plan** – In response to the NERC *2009 Summary Report on Accommodating High-Levels of Variable Generation*, the IVGTF is working to address the recommendations through a series of 12 efforts on specific issues such as wind forecasting, distributed variable resources, and capacity contributions of variable generation. A final report is expected in mid-2014 and will be the culmination of this task force's work to address the reliability challenges of integrating large amounts of variable generation.

- **"Essential Reliability Services" Task Force** – The PC (and Operating Committee) has formed a task force as a follow-on action to the recommendations from the *2013 Long-Term Reliability Assessment*. The task force will focus on expanding NERC's methodology for reliability assessment. The new approach may include the development of metrics for further evaluation in future long-term reliability assessments and supplement the existing resource adequacy measures. The task force will also develop a technical reference document on essential reliability services, which include frequency response, inertia, voltage stability, ramping capability, and other operational requirements needed to ensure BPS reliability. A technical reference for regulators and policy makers is needed to inform, educate, and build awareness on the reliability ramifications of a changing resource mix.

- **Coordination with the Reliability Issues Steering Committee (RISC)** – The PC continues to support RISC efforts and provide technical guidance for risk identification, develop gap analyses, and prioritize focus areas. The PC will specifically provide guidance on modeling and data concerns that should be considered as "high-risk" gaps as well as other risk areas detailed in the *State of Reliability Report* and *Long-Term Reliability Assessment*. The PC has focused its efforts on two key risk areas (titles of risk areas may be adjusted):

  - Adaptation and Planning for Change
  - Operational Modeling and Model Inputs

Future Meetings

The PC future meetings are scheduled as follows:

- June 10-11, 2014 – Orlando, FL
- September 16-17, 2014 – Vancouver, BC
- December 9-10, 2014 – Atlanta, GA

Agenda Item 14.c
Board of Trustees Meeting
May 7, 2014

Critical Infrastructure Protection Committee (CIPC) Report

Action
Information

Summary
GridEx II Distributed Play Report
The CIPC Executive Committee (EC) reviewed the recommendations from the GridEx II Distributed Play Report and issued assignments to the following CIPC working groups and task forces:

- Control System Security Working Group (CSSWG)
- Electricity Sub-sector Information Sharing Task Force (ESISTF)
- Security Training Working Group (STWG)
- Business Continuity Guideline Task Force (BCGTF)

March CIPC Meeting Highlights
CIPC Technical Workshop – In conjunction with the March CIPC meeting, a workshop was held in which NERC staff presented an overview of the technical differences between the currently enforceable Critical Infrastructure Protection (CIP) Version 3 NERC Reliability Standards and the recently approved CIP Version 5.

Elections – Mr. David Revill was elected to serve on the CIPC EC, filling the position recently vacated by Mr. Carl Eng.

Physical Security Workshop
At the June CIPC meeting, a Physical Security Workshop will offer a featuring state-of-the-art physical security technology that is currently being used by BC Hydro at its substations.

- Advanced Laser Detection System for substation protection. There will be a demonstration of how BC Hydro views the use of this technology, and Mr. Arik Garber, Senior Security Advisor at BC Hydro, will answer questions.

Future Meetings
The future meetings of the CIPC are scheduled as follows:

- June 10-11, 2014 – Orlando, FL
- September 16-17, 2014 – Vancouver, BC
- September 17-18, 2014 – Vancouver, BC – CIPC EC Planning Meeting

Personnel Certification Governance Committee
Board of Trustees Update Report

Action
Information

Background
This report highlights the key activities of the Personnel Certification Governance Committee (PCGC) during the first quarter 2014. The PCGC meets four times per year. Task force meetings are held as needed. The first quarter 2014 meeting minutes are under review and pending approval. Draft minutes were posted to the NERC website during first quarter in 2014.

Policy Oversight
The System Operator Certification (SOC) Program Manual was updated to reflect the new test center vendor, as well as the vendor's scheduling and cancellation policy. No additional changes were made to the SOC Program Manual. The revised program manual will be posted during second quarter of 2014. No changes were made to any other program document.

Quarterly Metrics
There are several metrics tracked by the NERC Personnel Certification group that are used to evaluate the efficacy of the SOC program. Following is an overview of key metrics for the first quarter 2014.

SOC Exam Development
The SOC Exam Development Metric (Figure 1) is used to track the development of SOC exams during the 36 month development cycle. During each development cycle, the Exam Development and Delivery TaskForce works with the Exam Working Group (EWG) and the Psychometric Consulting and Test Delivery vendor to ensure the exams are timely developed and delivered. As the metric below demonstrates, the PCGC is currently on track to deliver the next set of SOC exams by January 1, 2015.

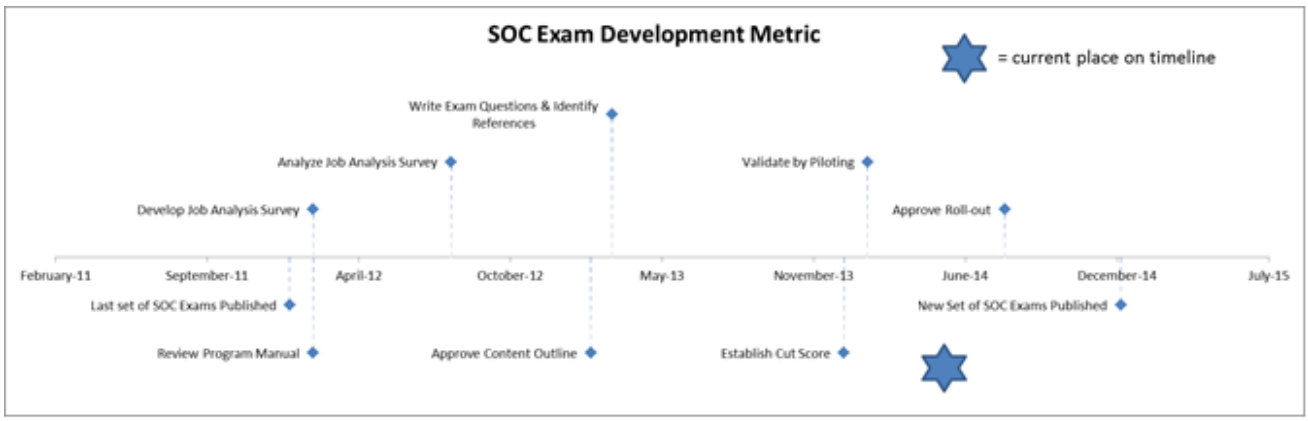

Figure 1: SOC Exam Development Timeline

System Operator Certification and Continuing Education Database (SOCCED) Availability Metric

The SOCCED Availability Metric is used to track the availability of the SOCCED Database. The metric reports the percentage of time both the website and SQL server, used to support the database, are available. As the metric below demonstrates, both the website and SQL server were available 100% during the first quarter of 2014.

Objective	Goal	Actual	Timeframe
Website Availability	99%	100%	1st Quarter 2014
SQL Server Availability	99%	100%	1st Quarter 2014

SOC Examination Pass Rate

The SOC Exam Pass Rate Metric is used to track the pass rate of the SOC exam for the period 2010-2014. Figure 2 compares the number of exams taken to the number of exams passed and Figure 3 compares the current year-to-date breakdown of exams based on the type of System Operator credential.

There are four Certified System Operator exams:

- RC: Reliability Coordinator
- BT: Balancing, Interchange, and Transmission
- BI: Balancing and Interchange
- TO: Transmission Operator

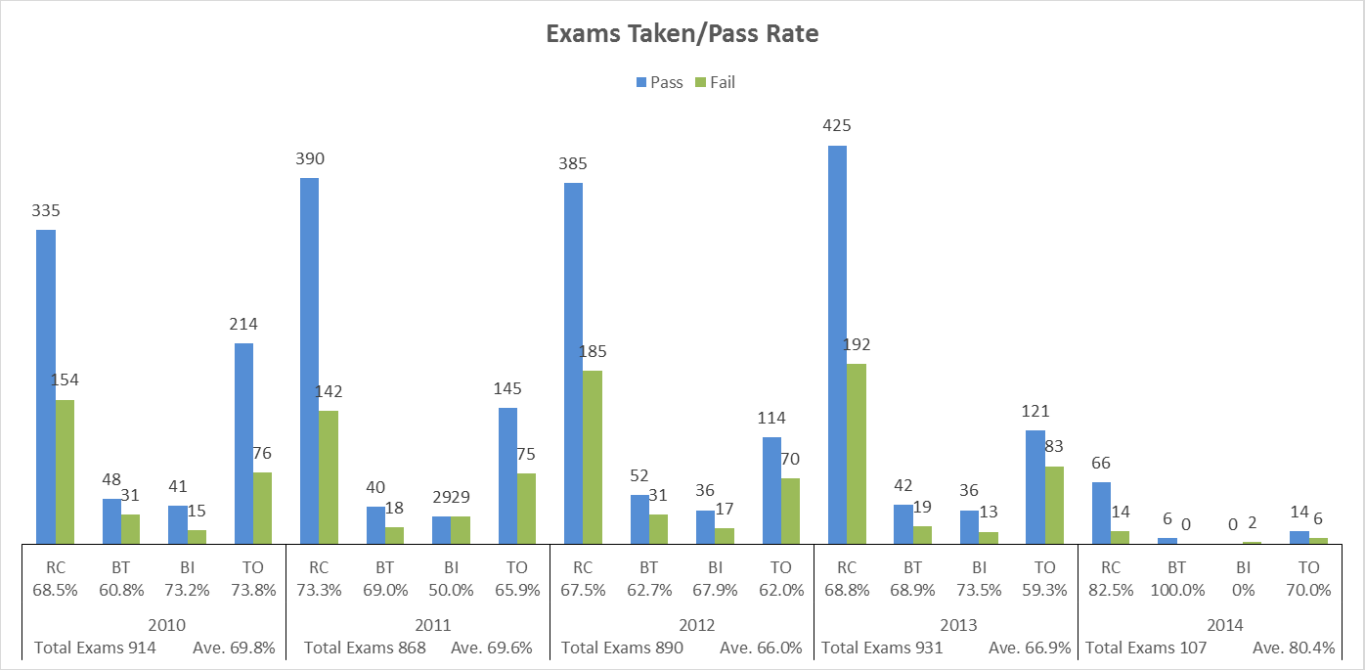

Figure 2: SOC Exam Pass Rate by Exam 2010-2014

The average overall pass rate for all exams for 2010 – 2013 is 68%. In January 2014, the exams were transitioned to a new vendor and no exams were given during the transition period. Due to the lag in exams because of the transition period, the data set for first quarter 2014 does not reflect the historical overall pass rate. As more data points are captured in 2014 and a pass rate is identified, the pass rate is expected to be average and remain in the mid to high 60th percentile. Although first quarter numbers are lower than expected, the projection for new exams taken in 2014 is 900 (Figure 6).

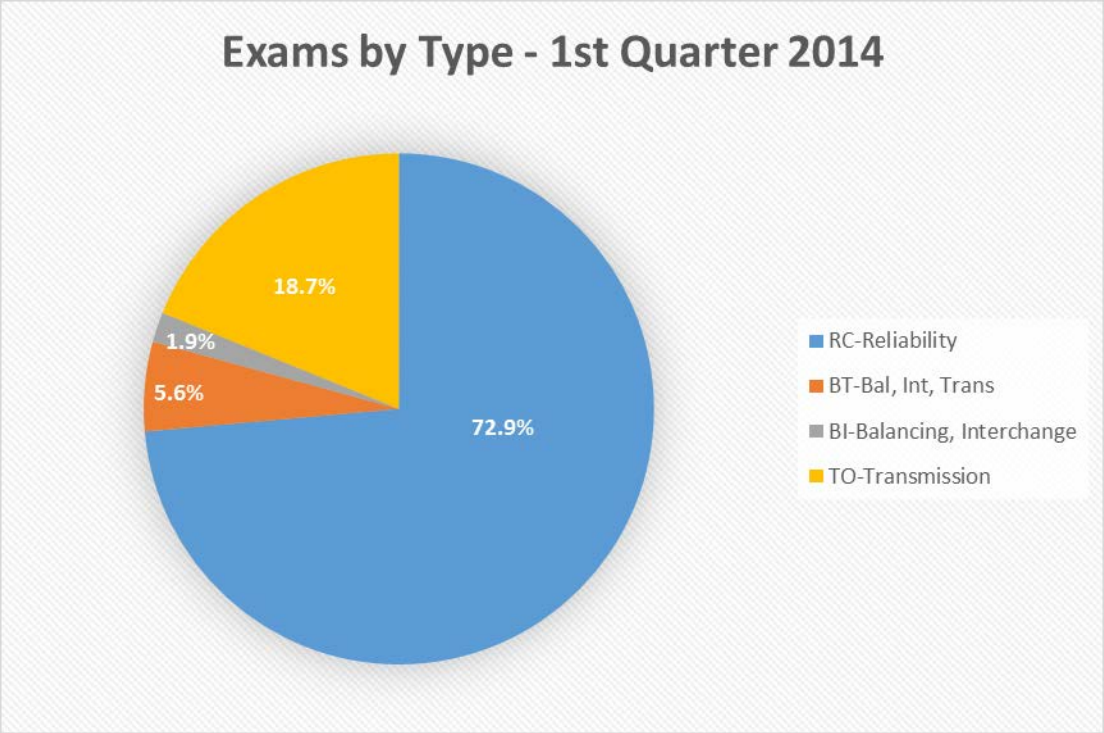

Figure 3: Exams Taken by Type – 1st Quarter 2014

Traditionally, the RC exam is taken more than the other System Operator exams because the RC credential gives the system operator more flexibility in potential jobs. Also, the RC credential is attractive to support functions within the utility industry such Planners and EMS Engineers.

Active Credentials

The Active Credentials Metric details the number of active certificates per credential from 2011 through current YTD (over a four year rolling average). Some operators hold multiple credentials.

Count of Certificate Status Credential Name	2011	2012	2013	2014	Total	Rolling Four Year Avg
Balancing and Interchange	124	100	133	18	**375**	**94**
Balancing, Interchange and Transmission	252	217	267	54	**790**	**197**
Transmission	352	310	445	68	**1175**	**294**
Reliability	1573	1285	1762	270	**4890**	**1223**
Total	**2301**	**1912**	**2607**	**410**	**7230**	

SOC Program Budget

Under Section 602.4.10 of the NERC Rules of Procedure, the PCGC shall have control over the matters related to the Personnel Certification and re-Certification Programs, without being

subject to approval by any other body. Section 602.4.10 further states that financial matters related to the operation of the program shall be segregated from other NERC activities.

The Program Budget Metric tracks the SOC Program budget. While the financials for the SOC Program were not available in time for publication of this report, the YTD-2013 Funding – Actual vs. Budget (Figure 4) details the revenue received from SOC Exams taken and SOC Certifications renewed as compared to the budget allocated for these items. Both, the number of exams taken and the number of credential renewals were higher than projected for 2013; therefore, the Actual funding is greater than the Budgeted funding.

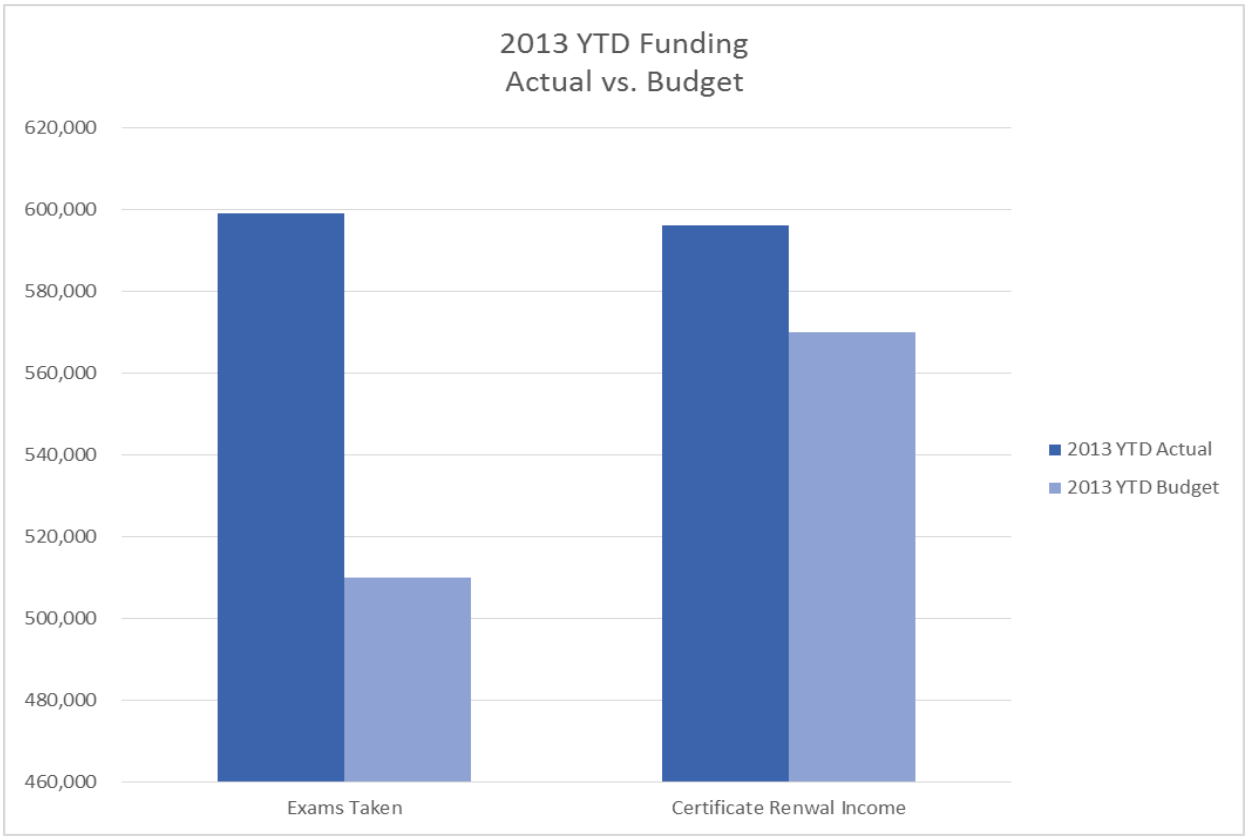

Figure 4: PCGC 2013 YTD Funding

The YTD-2013 Expenses – Actual vs. Budget depicted in Figure 5 details the expenses of operating the program in comparison to the budget from the service providers used to administer the program.

In the AMP column which depicts the Actual vs. Budget expenses (Figure 5) for the vendor AMP, the difference between the actual versus budgeted expenses is the result of a cancelled Item Writing Workshop which was budgeted in 2013 but never occurred.

In the Prometric column which depicts the Actual vs. Budget expenses (Figure 5) for the vendor Prometric, the difference is due to the decrease in exam fees. The number of exams taken was higher than projected for 2013.
In the MCG column which depicts the Actual vs. Budget expenses (Figure 5) for the vendor MCG, the difference includes costs for the SOCCED Upgrade Plan. The Upgrade costs are not directly reflected in the PCGC "fixed costs" budget, rather they are covered under the PCGC Capital Fund.

In the PSI column which depicts the Actual vs. Budget expenses (Figure 5) for the vendor PSI, the difference is the result of preliminary work for the transition to the new test center vendor in 2013.

In the Meeting + Office Costs column which depicts the Actual vs. Budget expenses (Figure 5), the difference includes PayPal fees which increase due to the exams taken and renewals processed in 2013.

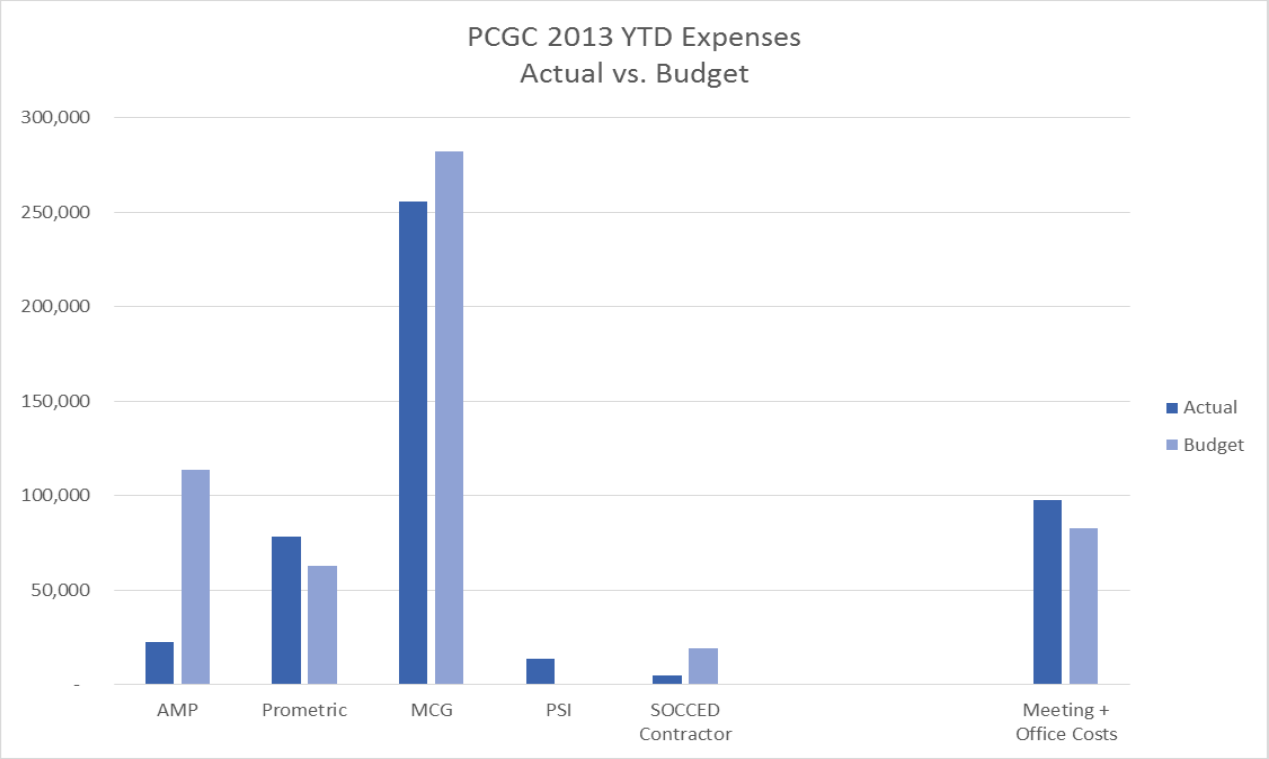

Figure 5: PCGC 2013 YTD Expenses

Figure 6 and Figure 7 detail the Exams Taken and Renewals (2012-YTD2014) which can affect the Actual vs. Budget for revenue.

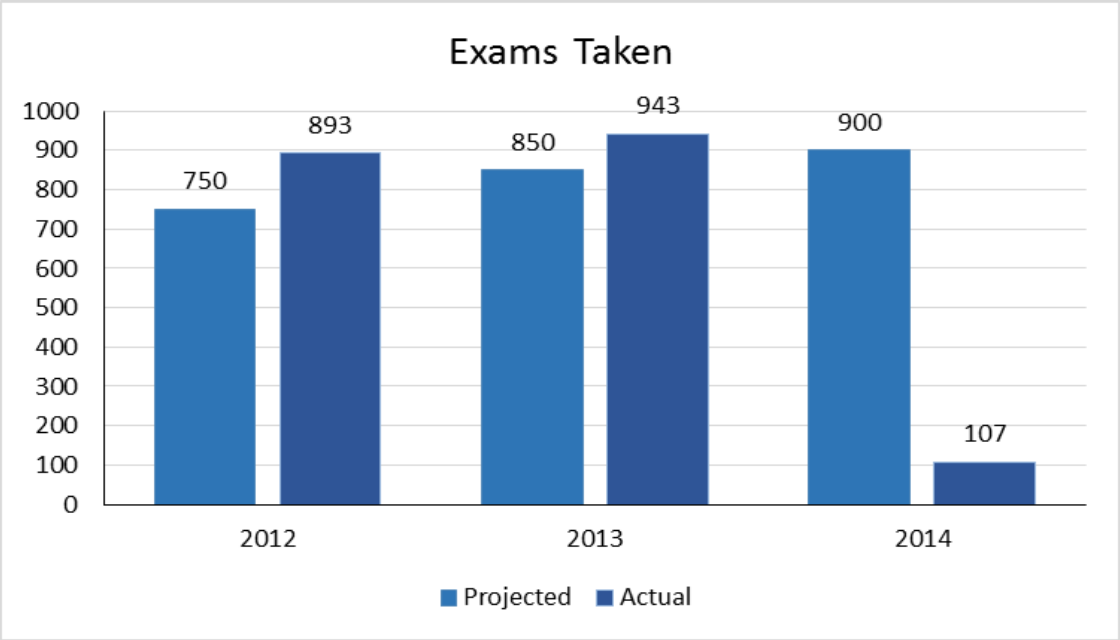

Figure 6: Exams Taken Projected vs. Actual

A reduction in exam fees resulted in a significant increase in exams taken in 2013. In October 2013, a new vendor was selected for the test centers. The exams were transitioned to the new vendor during the month of January. No exams were given during the transition period resulting in the low number for first quarter of 2014.

System operators may renew their credentials as much as six months in advance. The fee for credential renewal was reduced in 2013. System operators who were able to delay their credential renewal waited for the fee reduction date of January 1, 2013.

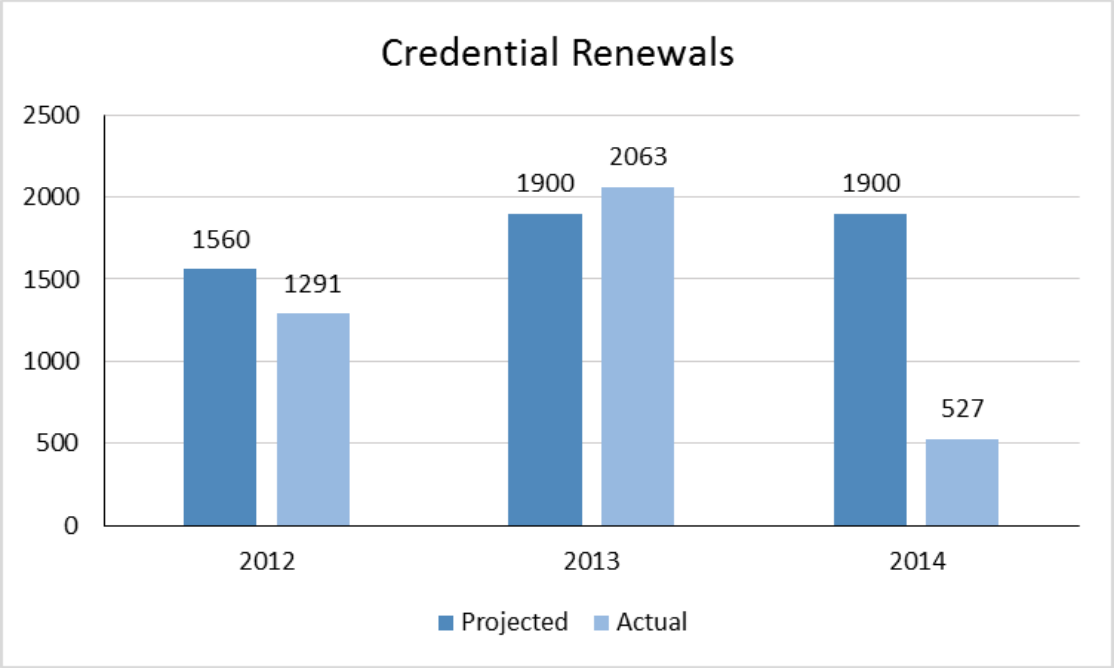

Figure 7: Credential Renewals Projected vs. Actual

Accomplishments

Successfully transitioned from two vendors into one vendor for test centers and exam development services which allow faster testing of sample questions and reduce the exam development cycle.

Future Tasks

- An Item Writing Workshop will be held May 8-9, 2014 in St. Louis, MO.
- Members of the PCGC, Personnel Subcommittee, EWG and industry experts have been invited to participate in creating items for the upcoming 2015 exams. Items are analyzed and evaluated by the psychometric vendor before they are transitioned into exam questions.
- Standing task forces have been created to deliver on each of the metrics included in this report. Each task force meets, outside of the quarterly meetings, as needed to address issues within their scope.

Standards Committee Report

Action
Information

Project 2014-04 Physical Security Waivers
The Standards Committee (SC) approved the waiver of several Standards Process Manual (SPM) provisions on a March 21, 2014 committee call. The waivers were necessary due to a recent Federal Energy Regulatory Commission (FERC) order that provided 90 days to complete the project on developing Physical Security standard(s). The motion on the waivers, as approved by the SC, is as follows:

> Approve the following waiver of provisions of the SPM for the Physical Security Reliability Standard(s) Project:
>
> 1. Standard Authorization Request to be posted for a seven-calendar day informal comment period. (Sections 4.1-4.2)
> 2. Initial formal comment and ballot period reduced from 45 days to 15 calendar days, with a ballot conducted during the last five days of the comment period. Form ballot pool beginning immediately upon approval of this waiver with closure of the ballot pool 10 days after the initial formal comment and ballot period begins. (Sections 4.7-4.9)
> 3. Additional formal comment and ballot period(s) reduced from 45 days to 10 calendar days, with ballot conducted during the last five days of the comment period. (Sections 4.9 and 4.12)
> 4. Final ballot reduced from 10 days to five calendar days. (Section 4.9)

A signed letter, from the SC Chair, Brian Murphy, was sent via e-mail on March 31, 2014, to Ken Peterson, chair of the Standards Oversight and Technology Committee (SOTC), notifying the SOTC of the waivers.

Goals and Metrics SC Endorsement
At a March 12-13, 2014 meeting, the SC endorsed a Standards Metric to be included in the proposed Electric Reliability Organization Enterprise Strategic Plan (ERO SP). The SC also endorsed the implementation of the 2016 and 2017 metric and the effort to develop a periodic review approach for 2016 and beyond. The team conducting the periodic review development has committed to present to the SC, by the end of the second quarter of 2014, the draft approaches to be presented for industry comment. The final periodic review approach is expected to be presented to the NERC Board of Trustees by the end of the first quarter in 2015.

Project Tracking Spreadsheet

The **project tracking spreadsheet** for standards has been enhanced to include prioritization in the 2014-2016 RSDP. It was also updated to depict whether the project is directionally consistent with Independent Expert Review Panel findings.

SC agendas and meeting minutes are posted at: [**Standards Committee**]

Agenda Item 14.g
Board of Trustees Meeting
May 7, 2014

Reliability Issues Steering Committee (RISC) Report

Action

Information, Approve

Background

The Reliability Issues Steering Committee (RISC) is an advisory committee that reports directly to the NERC Board of Trustees (the Board), and assists the Board, NERC standing committees, NERC staff, regulators, Regional Entities, and industry stakeholders in establishing a common understanding of the scope, priority, and goals for the development of solutions to address risks to the Bulk Electric System (BES). To carry out its responsibility to provide a framework for steering, developing, formalizing and organizing recommendations to help NERC and the industry effectively focus resources on addressing critical issues to improve the reliability of the bulk power system, the RISC presented an initial report to the Board in February 2013. The report provided a prioritization of reliability risk areas, categorizing each area as High, Medium, or Low priority. Specific analytical steps were recommended for assessing each risk area, and thoughts regarding the allocation of resources were offered. An update to the report was presented to the Board in August 2013. The RISC has also been working closely with NERC staff to develop an ERO business planning process that incorporates the work products of the RISC into a broad, risk-informed strategy for maintaining reliability around which staff and committees can align their work efforts.

Bob Schaffeld, chair of the RISC, will provide an update on the status of the group. Additionally, the Board is being asked to take the following actions:

1. Approve an amended Charter for the RISC, and
2. Approve term extensions for four members of the RISC, and
3. Approve a slate of new members to the RISC.

Charter Revisions

The MRC conducted a review of the RISC Charter in 2013, and offered no changes or adjustments at its August 14 meeting in Montreal. At the time, it was determined that there were no pressing issues needing resolution that had to be addressed immediately. However, members of the RISC have identified a number of opportunities for improvement within the Charter. Similarly, NERC's legal department has suggested that conforming the RISC charter to the general style and content of the charters of NERC' other committees is advisable. Accordingly, the members of the RISC have, working with NERC's legal department, developed a revised charter that is intended to ensure consistency with the original Standards Process Input Group (SPIG) recommendations, transfer the charter into the common NERC template, and streamline the charter to improve efficiency. This streamlining includes:

- Moving a number of "process/how" elements out of the charter for inclusion in a "Member Handbook," currently in development. The charter has been refocused to emphasize the "scope/what" of the RISC, leaving the details of implementation out of the charter to allow more flexibility in the RISC undertaking its work.
- Clarifying the process for the recommendation and appointment of committee-based, MRC and At-Large members to the RISC.
- Removing the MRC obligation to review the charter every three years. To the extent such review is needed (by the MRC or any other group), that review should be undertaken as needed, rather than on a periodic schedule.

Term Extensions

As documented in the RISC charter, terms of the MRC and At-Large members are to be staggered to ensure continuity (*i.e.*, roughly half the terms should end in odd years, while the other half should end in even years). In addition to the Standing Committee members, the RISC was initially comprised of four MRC members and five At-Large members. All began serving their terms at the same time, and all terms are coming to a close. Several members (Sylvain Clermont, Peter Flynn, Chris Schwab, Brian Silverstein, and Mike Smith) have left the RISC through retirement, career change, or resignation. A recommendation for new members to replace these members follows; however, the terms of the remaining four members of the RISC are still scheduled to expire. Rather than establish the RISC with a complete slate of all new MRC and At-Large members, it is requested that the Board extend the remaining member's terms to ensure continuity as was envisioned by the original staggering requirement. Further, it is recommended that continuity in leadership be effected through the additional extension of the RISC chair's term. Proposed extensions to achieve this are requested as follows:

- MRC representative Scott Helyer, through May 2015
- MRC representative Jason Marshall, through May 2015
- At-Large member and RISC chair Bob Schaffeld, through May 2016
- MRC representative John Twitty, through May 2015

New Members

As described above, a number of RISC members have left through retirement, career change, or resignation. Pursuant to the RISC charter, a RISC nominating committee was formed comprised of Sylvain Clermont, vice-chair of the MRC; Ken Peterson, chair of the Standards Oversight and Technology Committee (SOTC); Bob Schaffeld, chair of the RISC; and Gerry Cauley, president and CEO of NERC. Chaired by Mr. Clermont, this committee reviewed a number of candidates and evaluated them based on general experience and qualifications, as well as diversity within the context of the entire membership of the RISC. Six of the following candidates were selected, and, pending endorsement by the MRC at its May 6, 2014 meeting, the Board is being requested to approve their appointment to the RISC for terms of two years, ending in May 2016. A seventh candidate, Terry Bilke, was separately advanced by the Compliance and Certification Committee (CCC) to replace the current CCC representative, Clay Smith, whose participation on the CCC is

coming to a close. The Board is also being requested to approve Mr. Bilke's appointment. A complete list of candidates recommended for membership on the RISC is as follows:

Name	Title and Company
Daniel Froetscher, At-Large Member	Senior Vice President, Transmission, Distribution, and Customers, Arizona Public Service Company
Ray Gorman, At-Large Member	Chairman, New Brunswick Energy and Utilities Board
Scot Hathaway, At-Large Member	Vice President – Transmission, Dominion Virginia Power
Duane Highley, At-Large Member	President and CEO, Arkansas Electric Cooperative
Nabil Hitti, MRC Member	Vice President, Transmission Network Operations, National Grid
Steve Whitley, At-Large Member	President and CEO, New York ISO
Terry Bilke, CCC Representative	Consulting Advisor, Compliance Services, Midcontinent ISO

Section 2. Reporting 3

Section 3. Overview and Functions 3

Section 4. Membership 3

Section 5. Officers 4

Section 6. Meetings 4

RISC Charter

Section 1. Purpose

The Reliability Issues Steering Committee (RISC or Committee) is an advisory committee that triages and provides front-end, high-level leadership for issues of strategic importance to bulk power system (BPS) reliability and offers high-level stakeholder leadership engagement and input on issues that impact bulk-power system reliability. The RISC advises the North American Electric Reliability Corporation (NERC) Board of Trustees (Board), NERC standing committees, NERC staff, regulators, Regional Entities, and industry stakeholders to establish a common understanding of the scope, priority, and goals for the development of solutions to address these issues, including the use of solutions other than the development of new or revised reliability standards. In doing so, the RISC provides a framework for steering, developing, formalizing, and organizing recommendations to help NERC and the industry effectively focus their resources on the critical issues needed to best improve the reliability of the BPS.

Section 2. Reporting

The RISC reports directly to the Board. The Board shall approve this Charter and any amendments to this Charter pursuant to Section 1300 of the NERC Rules of Procedure.

Section 3. Overview and Functions

The RISC performs two primary functions for the Board.

The first function of the RISC is evaluating bulk power system reliability issues and risks. The RISC provides strategic leadership and advice to the NERC Board of Trustees and others to triage key reliability risks and propose solutions to manage those risks.

Second, the RISC provides an annual analysis of risks to the bulk power system, and produces a relative prioritization of the risks. The prioritization is designed to advise:

- annual ERO action planning, resource allocation, budgeting and strategic planning processes; and
- standing committee planning, including the development of the Reliability Standards Development Plan.

In addition, the RISC performs such other functions that may, from time to time, be delegated or assigned by the Board.

Section 4. Membership

The RISC shall be comprised of the following allocation of members:

a. **At least six (6)** stakeholder-based— four (4) from the MRC and at least two (2) At-Large members (not members of the MRC);

b. **Five (5)** committee-based—one (1) from each of the standing committees: Standards (SC), Operating (OC), Planning (PC), Critical Infrastructure Protection (CIPC), and Compliance and Certification (CCC). The Board will be responsible for appointing the committee-based members to the RISC. These members will be the chair or vice chair unless otherwise recommended by the standing committee and be subject to NERC Board approval.

In advance of the annual May Board meeting, a RISC Nominating Committee (RISCNC) chaired by the MRC vice-chair will be formed to solicit a pool of candidates, with the goal of meeting the following general criteria:

a. Geographic and International diversity, including international, such that Eastern, Western, and Texas Interconnections, along with Canada are represented on the RISC;

b. Sector, size, and asset (transmission, distribution, load, generation, etc.) diversity;

c. High-level understanding and perspective on reliability risks;

d. Experience in a leadership role or background in an executive-level position is strongly preferred; and

e. Balanced consideration of these criteria, across the entire membership of the RISC.

The Board is responsible for appointing the committee-based, MRC and At Large members to the RISC. At the May Board meeting each year (or as needed), the RISCNC shall present to the Board a recommended slate of all RISC member candidates as appropriate for consideration and approval. All MRC and At-Large members will be appointed by the Board to serve for two-year terms. Membership terms will be staggered to ensure continuity.

Section 5. Officers

1. **Selection of the Chair.** The Board shall appoint a chair of the RISC to serve a two-year term and direct the activities of the RISC, and work toward reaching consensus on all recommendations and actions.

2. **Selection and Duties of the Secretary.** NERC will appoint one senior staff person to serve as a secretary with the responsibility to:

    a. Prepare, distribute and post notices of Committee meetings, record meeting proceedings, and prepare, distribute and post meeting minutes.

    b. Maintain a record of all Committee proceedings, including responses, and correspondence.

    c. Maintain Committee membership records.

Section 6. Meetings

1. **Open Meetings.** Meetings shall occur at least once every quarter and can be in person or by conference call as determined by the chair. All meetings of the RISC will be open to all interested parties (except as noted in the paragraph below for confidential sessions). Only members may act on items before the Committee. Meeting notices shall be publicly posted on the NERC website on the same day they are distributed to Committee members. Final minutes of Committee meetings shall be publicly posted on the NERC website. Notices shall describe the purpose of meetings and shall identify a readily available source for further information about the meeting.

2. **General Requirements.** The Committee shall hold meetings as needed and may use conference calls or email to conduct its business.

3. **Notice.** The RISC secretary shall announce its regularly scheduled meetings with a written notice (letter or e-mail) to all Committee members not less than ten and no more than sixty calendar days prior to the date of the meeting.

4. **Agenda.** The RISC secretary shall provide an agenda with a written notice (letter, facsimile, or e-mail) for Committee meetings no less than five business days before a proposed meeting.

    a. The agenda shall include, as necessary, background material for agenda items requiring a decision. The agenda shall be posted on the NERC website the same day it is distributed to Committee members.

    b. Items not in the agenda that require a decision cannot be added at a meeting without the consensus of the members present. If such a matter comes up, it may also be deferred to the next meeting so that Committee members have time to consult with others.

5. **Quorum.** The quorum necessary for the transaction of business (*i.e.*, formal actions) at meetings of the committee is a majority of the members currently on the committee roster (*i.e.,* not including vacancies). The committee may engage in discussions without a quorum present.
6. **Proxies.** Proxies are not permitted.
7. **Observers.** Non-members may observe RISC meetings, either in person or via conference call.
8. **Confidential Sessions.** The chair of the RISC may limit attendance at a meeting or portion of a meeting, based on confidentiality of the information to be disclosed at the meeting. Such limitations will be applied sparingly and on a nondiscriminatory basis as needed to protect critical energy infrastructure information and other information that is sensitive to one or more parties.

Agenda Item 14.h
Board of Trustees Meeting
May 7, 2014

Compliance and Certification Committee

Action

Approve the Compliance and Certification Committee (CCC) 2014 Annual Work Plan.

Accept the 2013 Stakeholder Perception Survey results and report recommendations, and the CCC recommendation to extend the period between surveys to 18 months.

Background

The CCC is providing its Annual Work Plan for 2014 for approval, as well as the final report from the 2013 Stakeholder Perception Survey to the Board of Trustees (Board).

Annual Work Plan

The CCC approved its 2014 Annual Work Plan in December. Subsequently, NERC staff requested changes to the plan. The primary change is the addition of an executive summary as well as a listing of the major project areas, activities, and deliverables on which the CCC will focus. The attached work plan reflects input and comments from NERC senior management.

2013 Stakeholder Perception Survey

In the third quarter of 2013, consistent with its 2013 Annual Plan, the NERC CCC conducted its fifth annual survey measuring stakeholder perceptions on the policies, practices and effectiveness of NERC and Regional Entities with respect to the Compliance program, Registration program, and Certification program.[1] This survey is an essential element of the CCC's responsibilities under its Board-approved Charter.

The survey was sent to 1,201 individuals on the NERC Primary Compliance Contact roster. The survey received responses from 352 individuals, a response rate of 29.3 percent. As compared with 2012, there was a nearly 3 percent increase in the response rating. 5 of the 6 survey areas showed improvement over 2012.

See attachment for the full "ERO Effectiveness and Stakeholder Perceptions Survey Report," dated April 2013.

---

[1] The recommendations made in the report are tied to the following themes: (i) Return on Investment (ROI) of the compliance program, (ii) inconsistencies within and across Regions, and (iii) transparency of the enforcement and penalty processes. With regard to the subject of ROI, NERC staff continues to believe that "ROI" is not an appropriate focus or framework in the context of compliance programs. Work to streamline compliance monitoring and enforcement, and to reduce unnecessary compliance burdens is on-going. NERC is committed to continuing these efforts.

The CCC is also recommending extending the period between surveys to 18 months.

Other Highlights

- Held CCC meeting at NERC's Atlanta offices on March 11-12, 2014. The focus of the meeting was on Reliability Assurance Initiative-related topics.
- Subject to Board approval, the CCC will have new leadership in July 2014.
- The CCC is working with Mechelle Ferguson Thomas, NERC's Director of Internal Audit and Corporate Risk Management, on plans for an independent audit of NERC, scheduled in July of 2014. The CCC is assisting with the development of audit criteria, which will cover the handling of the Standards Process and standards applicable to NERC.
- The CCC's Organization Registration and Certification Subcommittee (ORCS) is actively supporting NERC's Risk-Based Registration initiative.

Upcoming Items

- Work with NERC staff on revisions to CCC procedures to reflect the CCC's involvement with the Board's Enterprise-wide Risk Management Committee.
- The next CCC meeting will be June 4-5, at FPL offices in Juno Beach, FL.

Summary

The North American Electric Reliability Corporation (NERC) Compliance and Certification Committee (CCC) is a NERC Board of Trustees (Board)-appointed stakeholder committee serving and reporting directly to the Board. The CCC is responsible for engaging with, supporting, and advising the Board and NERC regarding all facets of the NERC Compliance Monitoring and Enforcement Program (CMEP), Organization Registration Program (Registration program), and Organization Certification Program (Certification program). The CCC is also responsible for monitoring NERC's adherence to the Reliability Standards development process and those standards applicable to NERC. In order to support this endeavor, the CCC has developed this annual work plan to identify the activities that the CCC intends to perform in 2014 to fulfill the responsibilities the Board has established for the CCC.

Revision History:

Date	Version Number	Comments
09/25/2013	1.0	Initial Draft
10/25/2013	1.1	CCC Balloted Version
11/08/2013	1.1	Approved by CCC
02/21/2014	1.2	Revised to include NERC Staff input and additional CCC Ballot
02/27/2014	1.2	Approved by CCC

Executive Summary

The purpose of this work plan is to identify the anticipated activities and deliverables of the CCC for the year 2014 and beyond. The plan is based on the responsibilities assigned to the CCC by the Board through programs and tasks identified by the CCC that are required to fulfill these responsibilities. Additionally, the CCC identified projects and deliverables that will further support the goals of the ERO Strategic Plan 2014-2017.

There are four main project areas CCC activities will center on:

1. **Core Function of CCC Oversight of ERO**: As a committee providing support and advice, but otherwise independent of the execution of NERC CMEP, Registration program, and Certification program , and consistent with prior Federal Energy Regulatory Commission (FERC) Orders, the CCC will monitor NERC's compliance with the Rules of Procedure (ROP) for these programs on an ongoing basis. In a similar manner, as a committee independent of the NERC Reliability Standards development process, the CCC will monitor NERC's compliance with the ROP regarding the NERC Reliability Standards development process.
2. **NERC's Risk-based Registration project**: Provide input and support into the design of NERC's risk-based registration development. The CCC will assist in identifying modifications to the Statement of Compliance Registry Criteria and associated changes to the NERC ROP.
3. **ERO's Reliability Assurance Initiative (RAI):** Participate and support RAI activities. The CCC will assist in the transition of compliance monitoring and enforcement processes that are risk-informed, efficient and effective.
4. **Multi-region registered entity process:** Perform outreach and support activities for ongoing NERC multi-region registered entity processes and enhancements.

The CCC has subcommittees performing certain assigned tasks on behalf of and under the supervision of the CCC. The CCC will use these subcommittees, along with NERC and Regional Entity staff, as the primary resource for project and activities. The subcommittees include:

- Organization Registration and Certification Subcommittee (ORCS)
- Standards Interface Subcommittee (SIS) and Procedures Subcommittee (PROCS), pending consolidation to form Compliance Processes and Procedures Subcommittee (CPPS)
- ERO Monitoring Subcommittee (EROMS)
- CCC Nominating Subcommittee

Oversight and Deliverables

Project Area: Core Function of CCC Oversight of ERO-Monitoring Plan			
As a committee providing support and advice, but otherwise independent of the execution of NERC CMEP, Registration program, and Certification program , and consistent with prior FERC Orders, the CCC will monitor NERC's compliance with the ROP for these programs on an ongoing basis. In a similar manner, as a committee independent of the NERC Reliability Standards development process, the CCC will monitor NERC's compliance with the ROP regarding the NERC Reliability Standards development process.			
Project Name	**Activities**	**Schedule**	**Resource(s)**
1. Stakeholder Perceptions Survey	• Conduct and prepare a summary report for the Board • Include lessons learned from the 2013 survey • Continue to refine the question and survey instrument	1st and 2nd Quarters 2014	EROMS, TalentQuest, and Jerry Hedrick (NERC)
2. Independent Audit of Standards Applicable to NERC and the Standards Process Manual	• Develop criteria for audit • Provide subject matter experts to act as observers for audit • Review and accept audit report • Monitor mitigation of any non-conformance audit findings	2nd and 3rd Quarters 2014	EROMS, CCC, Mechelle Thomas (NERC), and independent audit firm
3. NERC Self-Certifications	• Develop self-certification forms and request NERC to self-certify adherence with the ROP for the Compliance Monitoring and Enforcement Program (CMEP) and Organization Registration and Certification Programs (ORCP) • Prepare a summary report of the results of the submitted NERC Self-Certifications for the Board	3rd and 4th Quarters 2014	EROMS, CMMS, and Mechelle Thomas
4. Enterprise-wide Risk Committee (EWRC) 2015 Work-Plan	• Provide input as requested by the EWRC	As requested	CCC Chair and Vice Chair, Mechelle Thomas (NERC), and EWRC

Project Area: Risk-based registration research and project support			
Applicable ERO 2014-2017 Strategic Goal No. 2a: Compliance, Registration and Certification-The ERO registers entities commensurate with risk to the bulk power system and ensures all key reliability entities are certified to have essential capabilities. Coordination and Collaboration (Goal No. 5) – Improve transparency, consistency, quality, and timeliness of results; operate as a collaborative enterprise; and improve efficiencies and cost-effectiveness.			
Project Name	**Activities**	**Schedule**	**Resource(s)**
5. Registration Steering Group	• Participation and support	Ongoing	CCC/ORCS representative
6. Risk-Based Registration Survey	• Develop questions • Analysis of responses	1st and 2nd Quarters 2014	ORCS, CCC, Mark Lauby (NERC), Rebecca Michael (NERC), and Earl Shockley (NERC)
7. Risk-Based Registration White-Paper	• Support and input on whitepaper outline • Support and input on final whitepaper product	2nd and 3rd Quarters 2014	ORCS, CCC, Mark Lauby (NERC), Rebecca Michael (NERC), and Earl Shockley (NERC)
8. Risk-Based Registration Design and Implementation	• Participation and support • Participate in roll-out as requested	4th Quarter 2014	ORCS, CCC, Mark Lauby (NERC), Rebecca Michael (NERC), and Earl Shockley (NERC)

Project Area: Reliability Assurance Initiative			
Applicable ERO 2014-2017 Strategic Goal No. 3a and 3b: Compliance, Registration and Certification- Industry has effective procedures and programs to monitor, detect, correct, report, and prevent compliance, reliability, and security issues. All ERO compliance activities are risk informed, efficient and effective.			
9. Internal Controls-Question and Answer Document	• Update the QA document upon completion of pilots and in response to stakeholder requests	Ongoing and 3rd and 4th Quarters 2014	CCC, CPPS, and Jim Armstrong (NERC)
10. Internal Controls Guide	• Update the document upon completion of pilots • Continue collecting examples of Internal Controls for inclusion in guide	Ongoing and 3rd and 4th Quarters 2014	CCC, CPPS, Tobias Whitney (NERC)
11. RAI Data Retention and Sampling	• Support team responsible for developing the whitepaper based on survey results ▪ Share with NERC RAI leadership (May 2014) ▪ Post paper for public comment (June 2014) ▪ Make changes based on comments (June 2014)	1st – 4th Quarters 2014	CCC, CPPS, and Ed Kichline (NERC)

	• Support communications of potential ROP changes resulting from team results Draft supporting documents (e.g. process bulletin, audit handbook supplement)		
12. Communication Tools Redesign (RSAWs)	• Update previously provided recommendations upon review and input from NERC and Standards Committee. Four initial areas of suggested improvement: ▪ RSAW Structure ▪ RSAW Use ▪ RSAW Development ▪ Internal Controls application • Support communications on RSAW processes and content development ▪ Provide technical reviews where needed	Ongoing	CCC, CPPS, and Matthew Gibbons (NERC)
13. Update criteria for assessing effectiveness of Regional Entity CMEP programs	• After consultation with NERC, update CCCPP-010 to incorporate criteria that appropriately reflects expected program improvements resulting from RAI	4th Quarter (based on input from relevant NERC personnel on progress of RAI projects, either complete initial updating or begin updating)	CPPS, CCC and Jerry Hedrick (NERC)
14. Aggregation of Minimal Issues Pilot Program	• CPPS to provide advisory input to NERC on conclusions drawn from pilot, as pilot will lead to program redesign and possible ROP changes	TBD-NERC	CPPS and Sonia Mendonca

Project Area: Multi-region registered entity process			
Applicable ERO 2014-2017 Strategic Goal No. 2a: Compliance, Registration and Certification - The ERO registers entities commensurate with risk to the bulk power system and ensures all key reliability entities are certified to have essential capabilities. Coordination and Collaboration (Goal 5) – Improve transparency, consistency, quality, and timeliness of results; operate as a collaborative enterprise; and improve efficiencies and cost-effectiveness.			
Project Name	**Activities**	**Schedule**	**Resource(s)**
15. Multi-Region Registered Entity Process	• Perform outreach efforts with stakeholders to determine continued need for this process or to assist with isolation of issues requiring resolution • Determine if guidance documents require adjustment for the current processes or identified areas requiring resolution	2nd - 4th Quarters 2014	ORCS, Mark Lauby and Earl Shockley (NERC)

Introduction

In the capacity of a NERC Board-appointed stakeholder committee serving and reporting directly to the NERC Board under a NERC Board-approved charter,[1] and as approved by FERC[2] and as set forth in NERC's ROP, the CCC will engage with, support, and advise the NERC Board and NERC Board of Trustees Compliance Committee (BOTCC) regarding all facets of the NERC CMEP, Registration program, and Certification program. As a committee providing support and advice, but otherwise independent of the execution of these programs, and consistent with prior FERC Orders, the CCC will monitor NERC's compliance with the ROP for these programs on an ongoing basis. In a similar manner, as a committee independent of the NERC Reliability Standards development process, the CCC will monitor NERC's compliance with the ROP regarding the NERC Reliability Standards development process.

The CCC provides for balanced discussion, commentary, and recommendations on compliance issues by bringing together a wide diversity of opinions and perspectives from NERC member sectors. Members are appointed to the CCC by the NERC Board and serve on the committee at the pleasure of the Board.

Individuals deemed qualified to serve on the committee will generally include senior level industry experts who have particular familiarity, knowledge, and experience in the areas of compliance, compliance enforcement, compliance administration and management, organization responsibilities and registration, organization certification, and NERC and Regional standards.

These individuals are normally involved with internal compliance programs within their respective organizations. Committee members are expected to represent the interests of the sector they represent, to the best of their ability and judgment.

CCC Organization

In addition to certain core responsibilities, the CCC has established subcommittees and a working group to perform certain tasks on behalf of and under the supervision of the CCC. Key responsibilities of these subcommittees are outlined below.

Organization Registration and Certification Subcommittee (ORCS)

To fulfill its mission, the CCC has established the Organization Registration and Certification Subcommittee to perform the following tasks on behalf of and under the supervision of the CCC:

1. Advise and provide support to NERC and the Regional Entities with development and implementation of organization registration and certification processes (i.e., ROP 500 & Appendix 5);
2. Advise and provide ongoing support to NERC and the Regional Entities relating to approved organization registration and certification processes;
3. Evaluate the success and effectiveness of NERC and the Regional Entities' administration of the organization registration and certification processes; and
4. Establish programs to monitor NERC and the Regional Entities' implementation of the organization registration and certification processes.

Standards Interface Subcommittee (SIS) and Procedures Subcommittee (PROCS) Consolidation to Form Compliance Processes and Procedures Subcommittee (CPPS)

To fulfill its mission, the CCC has elected to consolidate the SIS and PROCS. The CCC envisions that this consolidation will: (a) address the increased volume of work associated with RAI, thereby facilitating NERC and CCC communications on key characteristics and activities associated with RAI during its development and once adopted into CMEP, and address NERC Management's invitation to the CCC that it support NERC in the development and implementation of RAI; (b) lessen ERO and ERO Stakeholder administrative burdens by reducing the number of CCC Subcommittees; and (c) reflect a decreased volume of work associated with traditional PROCS and SIS activities. The key objectives of the CPPS are:

1. Perform document review to promote consistency between multiple documents (procedures, policies, standards, rules, orders, etc.) that comprise the overall NERC CMEP and to assure documents are clear, unambiguous, consistent and complementary, to advise the CCC of any deficiencies, and propose changes that it believes will clarify such situations. Activities may include, but are not limited to:
    a. Reviews of changes to the Rules of Procedure related to the Compliance Program, Registration program, and Certification Program.
    b. Proposals to change the Rules of Procedure related to the Compliance program, Registration program, and Certification Program.
2. Support the development and implementation of enhancements to the CMEP (including efforts as set forth in the CCC Work Plan) and provide this information to the CCC, applicable CCC subcommittees, and NERC.
3. Develop and maintain CCC operational procedures with respect to the CCC responsibilities under the CCC Charter;
4. Advise and prepare recommendations to the CCC to address any standards-related issues relevant to and within the scope of the NERC CCC (e.g. request from the Standards Committee, Standard Drafting Team, CCC, NERC Compliance Staff, stakeholders, etc.);
5. Act as liaison of the CCC to the NERC Standards Committee;

6. Implement CCC oversight (facilitating and participating as needed), in the development of the compliance administration elements (CAEs), including Reliability Standards Audit Worksheets (RSAWs), for new Reliability Standards under development or for revisions to existing Reliability Standards; and
7. Prepare and maintain guidance and other related documents and materials for the benefit of Standards Drafting Teams regarding the development of CAEs.

ERO Monitoring Subcommittee (EROMS)

To fulfill its mission, the CCC has established the EROMS to perform the following tasks on behalf of and under the supervision of the CCC:

1. Establish and implement programs to monitor NERC's compliance with the Reliability Standards that apply to NERC;
2. Establish and implement programs to monitor NERC's adherence to the ROP regarding the CMEP as specified in Section 405 of NERC's ROP;
3. Establish and implement programs to monitor NERC's adherence to the ROP regarding the Reliability Standards development process with the exception of appeals of substantive or procedural action or inaction associated with a Reliability Standard or the standards process as defined in the appeals section of the NERC Standards Processes Manual as specified in Section 405 of NERC's ROP;
4. Develop criteria for use by NERC for the annual evaluation of the goals, tools, and procedures of each Regional Entity compliance enforcement program in the determination of the effectiveness of each Regional Entity program as specified in Section 402.1.2 of NERC's ROP;
5. Develop and implement methods to actively solicit information with respect to stakeholder perception of the procedures, policies, standards, rules, orders, etc., and the effectiveness of the NERC CMEP and Standards development activities, and provide this information to the CCC and applicable CCC subcommittees. An annual report on stakeholder perception is provided to the NERC Board; and
6. EROMS, in 2014, will continue working closely with the Enterprise-wide Risk Committee (EWRC) and NERC staff to implement these programs.

CCC Nominating Subcommittee

The CCC annually appoints a Nominating Subcommittee. The subcommittee consists of five members nominated by the committee chair and approved by the committee. The chair of the subcommittee will be selected by the CCC chair from among the five subcommittee members. Members of the Nominating Subcommittee prepare a slate of committee officer candidates for submission to the NERC Board for approval, and prepare a slate of recommended individuals to fill designated committee vacancies as required.

For the year 2014, the Nominating Subcommittee will continue to identify qualified candidates to submit to the NERC Board for approval for those industry sectors that require representation.

Key Responsibilities Not Assigned to Subcommittees

In addition to tasks assigned to subcommittees, the CCC, in general caucus, will continue to address certain key responsibilities. These responsibilities include, but are not limited to:

1. Provide comments to NERC with respect to stakeholders' perception of the policies, practices, consistency, and effectiveness of the compliance, registration, and certification programs;
2. Recommend revisions to sections 400 and 500 (and their appendices) of the NERC ROP to the NERC Board, and provide comments to the NERC Board regarding the same when revisions are proposed by the Industry or NERC personnel;

3. Establish hearing bodies, as directed by the NERC Board, for any contest regarding findings of, or penalties or sanctions for, violation(s) of Reliability Standard(s) where NERC is directly monitoring the entity for compliance with those standards as described in the NERC ROP Section 409 (Registered entity by agreement with a Regional Entity or absent a delegation agreement; the Region itself where approved standards are applicable to the Region);
4. Establish hearing bodies with respect to registered entities Certification Appeals;
5. Serve as a mediator, as directed by the NERC Board, for any disagreements between NERC and the Regional Entities concerning NERC performance audits of Regional Entities' compliance programs;
6. Observe Regional Entity compliance program audits that are conducted at least once every five years for each Regional Entity; and
7. The CCC will provide a representative to participate on the NERC Reliability Issues Steering Committee (RISC) with the CCC providing expertise and input as requested by said member.

Hearing / Mediation Responsibilities

The CCC will conduct hearings as necessary to fulfill its function of serving as the hearing body for any contest between NERC and a Regional Reliability Organization (RRO) or Regional Entity (RE) regarding NERC findings of penalties or sanctions for violation(s) of Reliability Standard(s) by the RRO or RE as described in the NERC ROP Section 409. Note: The CCC's hearing procedures follow the hearing procedures mandated and approved by jurisdictional authorities for use by NERC and the REs in the compliance program.

The CCC will conduct hearings as necessary to fulfill its function of serving as a hearing body for any registered entity appeal regarding the determination that a registered entity is not qualified to be certified to perform the functional activities that require certification by NERC. Note: The Certification Appeal Hearing will be conducted on an expedited basis.

The CCC will conduct mediation activities when requested by the Board.

The CCC hearing and mediation procedures are described in the documents identified below and have been approved by FERC:

- CCCPP-004: CCC Hearing Procedures
- CCCPP-005: CCC Hearing Procedures for Use in Appeals of Certification Matters
- CCCPP-006: CCC Mediation Procedures

Meetings (2014)

CCC quarterly meetings (dates and locations tentative)

- March 11-12: Atlanta, GA (NERC Office)
- June 4-5: Juno Beach, FL (FPL host location)
- September 17-18: Vancouver, BC (Joint Standing Committees location)
- December 3-4: Phoenix, AZ (APS host location)

CCC subcommittees meet as needed. At a minimum, subcommittees meet the morning of the first day of CCC meetings.

NERC Board of Trustee Assignments

The CCC undertakes assignments from the NERC Board or the Board's Committees related to compliance, organization registration, and organization certification.

The primary Board assignments for 2014 are:

- With the ERO undertaking an initiative to transform compliance monitoring and enforcement to processes that are more focused on the adequacy of internal reliability risk controls, the CCC can assist in this effort by gathering examples of internal and reliability risk controls from registered entities, documenting examples of quality programs and providing an update to the BOTCC as well as the NERC Board on the state and progress of the industry in this area. CCC support in encouraging the industry to participate in these efforts also would be very helpful.
- The CCC could continue to support the quality review process in standards development and input to RSAW development during standards development. The CCC could provide additional assistance by supporting voluntary compliance trials after the NERC Board has approved a standard and prior to the mandatory and effective date for such standard. This will provide an opportunity for industry to understand compliance obligations prior to the standard becoming enforceable.
- The CCC will provide support to NERC staff on the Risk Based Registration Initiative to identify modifications to the Statement of Compliance Registry Criteria and associated changes to the NERC Rules of Procedure.

APPENDIX A - CCC Projects/Subcommittee Activities

Global CCC Projects/Activities

- CCC and subcommittee member Audit Training.
- CCC Member Hearing Training.
- Perform a Self-Assessment of the CCC and its subcommittees by July 2014.
- Develop a 2015 Annual Work Plan by November 2014.
- Review and act (if appropriate) upon reports and recommendations provided by NERC and its other Standing Committees.
- Review and comment on FERC and NERC requests for information and comments.

ORCS Activities

- Provide industry perspective and actively participate in the creation of the Risk Based Registration Framework and associated criteria consistent with the developed RAI principles.
    - This will include identification or consideration of the following:
        - Removal of redundancies
        - Ensure adequate or completeness of coverage
        - Removal of complexity
        - Consistency in application
        - Revisions to guidance documents
- Multi-Region Registered Entity Process – Perform outreach efforts with stakeholders to determine continued need for this process or to assist with isolation of issues requiring resolution. Determine if guidance documents require adjustment for the current processes or identified areas requiring resolution.
- Provide assistance with Organization Registration and Certification activities related to NERC initiatives. Monitor initiatives for impacts to guidance documents (Rules of Procedure, Compliance Registry Criteria, etc.) to assure necessary modifications are identified and addressed as needed in a timely manner, i.e. the Bulk Electric System Definition project.

EROMS Activities (See Appendix B for Monitoring Plan)

- Develop reports for the CCC.
- Implement surveys, webinars, and conduct workshops as appropriate.
- Review the criteria for annual Regional Entity Evaluations and CMEP compliance audits in 2014. Suggest modifications to this program and criteria as appropriate.
- Complete and publish the 2013 Stakeholders Perceptions Survey Report, and prepare to conduct the next survey in early 2015.
- Provide input for the EWRC 2015 Work Plan.
- Work with NERC staff to review and revise CCC procedures related to EROMS assignments.

CPPS (SIS/PROCS) Activities

- Coordinate Reliability Standards Quality Reviews on behalf of the CCC.
- Review criteria for audit/review of NERC adherence to Standards Processes Manual.
- Coordinate activities to review and provide input to NERC on compliance administration resources developed by NERC.
- Continue to review and recommend comments for CCC on proposed changes to the ROP.
- Review and format new CCC Programs as needed and as resources allow pending future changes to ROP.
- Review existing CCC Procedures to support 2014 NERC Internal Audits and CCC oversight (i.e., CCCPP-005, CCCPP-006, CCCPP-008, CCCPP-009 and CCCPP-010), and identify any necessary work for 2014 to carry out these CCC Procedures.
- Review relationship between NERC's RAI and ROP.
- Revise CCC Procedures to conform to the new monitoring model that includes NERC internal auditor and EWRC involvement. Receive reports from NERC on status and execution of RAI and to NERC from ad hoc Working Groups.
- Provide input on development of work plan related to RAI elements not part of Calendar Year 2013 RAI work effort.
- Assess how CMEP practices change after RAI is adopted in regards to: (a) monitoring practices (as embodied in CCCPP-010 and also including assisting EROMS in the annual Regional Entity Audit Criteria work); (b) enforcement; and (c) Standards development.

Reliability Assurance Initiative (RAI) Support Teams

- RAI Benefits:
  - Work with staff to provide recommendations and test approaches to take advantage of "low-hanging fruit" identified by stakeholders and NERC. Examples include:
    - Risk-focused monitoring and auditing
    - Expedited disposition approach for minor infractions
- RAI Internal Controls:
  - Work with NERC to evaluate pilots to implement a consistent approach to RAI in all Regions
  - Assist NERC in the implementation of the RAI by completing projects as requested by NERC
  - Review and revise the RAI Question & Answer Document as needed based on current RAI implementation status
  - Review and revise the RAI Internal Controls Guide as needed based on current RAI implementation status
  - Work with staff on a repository to deploy example controls for these high impact requirements
  - Work with staff to develop an information sharing site for application guidance and controls for other requirements
- RAI Data Retention and Sampling

- Draft data retention guidance and sampling documents based on responses to the team's survey
- If not completed in 2013, draft and post conforming changes to the ROP

- RAI RSAW
  - Work to provide input on the content of the current RSAWs and how the RSAWs are used
  - Focus on primary areas of concern, scope, and consistency
  - Four initial areas of suggested improvement:
    - RSAW Structure
    - RSAW Use
    - RSAW Development
    - Internal Controls application

APPENDIX B - 2014 CCC Monitoring Plan

Stakeholder Perceptions Survey

- EROMS will conduct and prepare a summary report for the Board.
  - Include lessons learned from the 2013 survey
  - Continue to refine the question and survey instrument

NERC Self-Certifications

- EROMS will request NERC to self-certify adherence with the ROP for the following areas:
  - Compliance Monitoring and Enforcement Program (CMEP)
  - Organization Registration and Certification Programs (ORCP)
- EROMS will prepare a summary report of the results of the submitted NERC Self-Certifications for the Board.

Enterprise-wide Risk Committee (EWRC)

- The CCC Executive Team will coordinate with the EWRC to determine the use of Spot-Checks of NERC processes in 2014 for those areas for which the CCC is responsible for monitoring in coordination with the EWRC.
- The CCC Executive Team will coordinate with the EWRC to determine the use of a third party to conduct audits of the standards applicable to NERC and the Standard Process Manuel in 2014.

Detailed Overview of Monitoring Activities

In pursuit of its responsibilities, the CCC will mirror the monitoring approaches used by the ERO. To the extent NERC self-reports issues and develops sound internal controls, the approaches to monitoring outlined below will be adjusted.

Self-Certifications

In accordance with CCCPP-001, the EROMS will review and modify (if necessary) the subset of performance items related to the ROP for the CMEP. The CCC will then request that NERC self-certify adherence to ROP for the CMEP, with respect to the subset of performance items, by providing the CCC with a report at its regularly scheduled September 2014 meeting.

In accordance with CCCPP-007, the ORCS will review and modify (if necessary) a subset of performance items related to the ROP for Organization and Registration. The CCC will then request that NERC self-certify adherence to the ROP for Organization Registration and Certification, with respect to the subset of performance items, by providing the CCC with a report at its regularly scheduled September 2014 meeting.

The two reports described above will be in the form of a presentation provided by a NERC officer or equivalent responsible for ensuring adherence to the above identified four elements of the ROP. The presentation will identify adherence to the rules as well as any areas of non-adherence. The CCC will include the results of the self-certifications in these four areas in a report to the Board.

Audits/Reviews

In accordance with CCCPP-001, the CCC will perform an audit/review of NERC's adherence with the ROP for Compliance Monitoring and Enforcement every three years. Additionally, an unscheduled audit/review may be initiated by the CCC if deemed necessary to determine NERC's adherence with the ROP for compliance enforcement or to review deficiencies from previous audits.

In accordance with CCCPP-003, the CCC will perform an audit/review of NERC's adherence with the NERC Standards Processes Manual every three years. Additionally, an unscheduled audit/review may be initiated by the CCC, if deemed necessary, to determine NERC's adherence with the NERC Standards Processes Manual. The audit/review team will develop a draft review report, review it with NERC, make any necessary changes, and then prepare a final report to be submitted to the CCC. The CCC will review/assess the report and provide NERC a final copy. The CCC will advise the NERC Board of any Preliminary Adverse Findings and include the results of the audit/review in the report to the Board. Based on the experience of the 2012 audits, the CCC Executive Team will coordinate with the NERC Board EWRC to determine the use of a third party audit of Reliability Standards development in 2014.

In accordance with CCCPP-007, the CCC will perform an audit/review of NERC's adherence with ROP for Organization Registration and Certification every three years. Additionally, an unscheduled audit/review may be initiated by the CCC, if deemed necessary, to determine NERC's adherence with the ROP for Organization Registration and Certification. The audit/review team will develop a draft review report, review it with NERC, make any necessary changes, and prepare a final report to be submitted to the CCC. In accordance with CCCPP-001, the CCC may initiate an Adverse Finding Investigation, at any time, as directed by the Board or based on an event, complaint, or other possible Adverse Finding identified by any other means. Adverse Finding Investigations will follow the processes outlined in a Compliance Program Audit.

In accordance with CCCPP-003, the CCC may initiate a Standards Development Process Review Investigation, at any time, as directed by the Board or in response to a complaint or evidence that NERC has not adhered to the

Standards Development Process Procedures. Standards Development Process Review Investigations will follow the processes outlined for a Standards Development Process Review.

In accordance with CCCPP-007, the CCC may initiate an Organization Registration and Certification Investigation as directed by the Board, or at any time in response to a complaint or evidence that NERC has not adhered to the ROP for Organization Registration and Certification. Adverse Finding Investigations will follow the processes outlined for a Registration and Certification Program Audit.

Spot-Checks

In accordance with CCCPP-001, the CCC may from time-to-time perform spot-checks to determine whether NERC is adhering and/or has adhered to the ROP for Compliance Enforcement. Spot-checking may also be initiated in response to a directive from the Board or to events or a complaint. Results of spot-checks will be provided to NERC and will be reported to the NERC Board.

In accordance with CCCPP-003, the CCC may from time to time perform spot-checks to determine whether NERC is adhering and/or has adhered to the Reliability Standards development process. Spot-checking may also be initiated in response to a directive from the Board or to events or a complaint. Results of spot-checks will be provided to NERC and will be reported to the NERC Board.

In accordance with CCCPP-007, the CCC may from time to time perform spot-checks to determine whether NERC is adhering and/or has adhered to the ROP for Organization Registration and Certification. Spot-checking may also be initiated in response to a directive from the Board or to events or a complaint. Results of spot-checks will be provided to NERC and will be reported to the NERC Board.

The CCC Executive Team will coordinate with the NERC Board EWRC to determine the use of spot-checks of NERC processes in 2014.

NERC Evaluation of Regional CMEP Implementation

The CCC developed the CCCPP-010 – Criteria for Annual Regional Entity Program Evaluation that, per Rule of Procedure 402.1.2, establishes criteria for NERC to use in order to "annually evaluate the goals, tools, and procedures of each Regional Entity Compliance Monitoring and Enforcement Program to determine the effectiveness of each Regional Entity Compliance Monitoring and Enforcement Program." In 2014, the CPPS is expected to update CCCPP-010, and, as was the case in the original development of CCCPP-010, intends to collaborate with NERC Compliance Operations on developing the Criteria.

Monitoring Stakeholder Perceptions

As stated in the CCC Charter in Section 3, Committee members are expected to represent the interests of the sector they represent, to the best of their ability and judgment. Members are expected to solicit comments and opinions from constituents and groups of constituents, or trade organizations represented by the member and convey them to the CCC. During 2014, committee members will participate in documenting comments to the CCC, with respect to stakeholders' perception of the policies, practices and effectiveness of the CMEP, Registration Program, and Certification Program. The EROMS will lead, direct, and initiate these reviews and surveys of CCC members and provide recommendations for consideration to NERC.

The CCC has developed the Program for Monitoring Stakeholders' Perceptions of NERC CMEP, Registration Program, and Certification Program. An element of this program expected to be carried out in 2014, in addition to obtaining direct feedback from committee members, will include conducting surveys of stakeholders in the second half of the year. Depending upon the level and nature of the feedback gathered, additional elements of

the program may include seeking stakeholder feedback in a CCC-sponsored segment contemporaneous with Regional Entity Compliance Workshops or in conjunction with existing stakeholder compliance working groups. Part of the communication provided in advance would include the explanation of the roles/functions of the CCC, the survey elements being considered, and the manner for providing a feedback report to the Board and the stakeholders. Additional methods of communicating with stakeholders may include providing information regarding the survey in NERC News and direct e-mails to stakeholders.

An important element of the program will be an annual report, presented to the CCC for approval to forward to NERC, the Board, and the stakeholders, as well as quarterly stakeholder perceptions reports to the CCC. Specifically, the NERC BOTCC has asked that the CCC take the lead on analysis of the perception survey responses, refining issue identification, developing possible action plans with industry input, facilitating development of alternatives, and making recommendations to the NERC staff or Board.

In addition to the annual perception survey, the CCC will hold a member roundtable at each CCC meeting. During the roundtable, the members are expected to raise issues, observations and concerns of their stakeholders. The CCC will capture issues raised and work with staff to resolve them as they arise.

Longer term activities, beyond 2014, may include mechanisms for the CCC to directly receive feedback from stakeholders following audits and any of the other effectiveness monitoring inputs or evaluations surrounding the effectiveness metrics endorsed in CCCPP-008.

Appendix C - CCC Programs

The CCC has established several programs to fulfill its obligations. Many of these will be coordinated with the NERC Director of Internal Audit. These programs include specific monitoring activities such as periodic on-site audits/reviews, NERC Self-Certifications, CCC Spot-Checks, CCC Adverse Finding Investigations, NERC Self-Reporting, Periodic Data Submittals, and CCC Review of Stakeholder Complaints. As resources allow, audits and spot-checks may be conducted by independent contractors. The programs are described below.

CCCPP-001: Monitoring Program for NERC's Adherence to NERC's ROP

This program has been established so that the CCC can monitor NERC's adherence to its ROP for Compliance Enforcement. The NERC CCC EROMS will coordinate this effort.

CCCPP-002: Compliance Monitoring Program for Reliability Standards Applicable to NERC

This program has been established so that the CCC can monitor NERC's adherence to NERC Reliability Standards applicable to NERC. The CCC will use a variety of activities to perform the monitoring. The NERC CCC EROMS will coordinate this effort.

CCCPP-003: Monitoring Program for NERC's Standards Processes Manual

This program has been established so that the CCC can monitor NERC's adherence to its ROP concerning Reliability Standards development. The NERC CCC EROMS will coordinate this effort.

CCCPP-007: Monitoring Program for NERC's Adherence to NERC's ROP for Organization Registration and Certification

This program has been established so that the CCC can monitor NERC's adherence to its ROP for Organization Registration and Certification. The NERC CCC ORCS will coordinate this effort.

CCCPP-008: Program for Monitoring Stakeholders' Perceptions of NERC Compliance Program, Registration Program, and Certification Program

This program has been established so that the CCC can gather and report to the Board, stakeholder perceptions with respect to NERC's CMEP, Organization Registration Program and Certification Program and the way the programs are administered. The NERC CCC EROMS will coordinate this effort.

CCCPP-010: Criteria for Annual Regional Entity Program Evaluation

This program has been established to identify the criteria by which these audits are conducted, provide a guidance letter to NERC regarding these criteria, and document the process for the CCC to annually review and affirm these for use. The NERC CCC EROMS will coordinate this effort.

Appendix D - Logistics and Budget Requirements for CCC Activities

Listed below are items identified by the CCC that NERC should take into account with respect to costs NERC will incur concerning CCC activities for 2014-2016.

CCC Quarterly Meetings (Cost to be determined by NERC)

Assumptions: Four CCC meetings per year

- NERC staff attendance
- NERC travel expenses
- Hotel (Conference Rooms and Food)

Hearings and Appeals (Cost to be determined by NERC)

Assumptions: One hearing or appeal in 2014

- Administrative Law Judge's fee
- Hearing refresher training
- Transcription costs
- Travel expenses

Notes:
The CCC conducted hearing training in 2012. It is recommended that training be conducted in 2014 for those CCC members that have not received training or for those that request refresher training.

CCC will notify NERC and the Board if additional hearings are expected.

Mediation (Cost to be determined by NERC)

Assumptions: No mediations expected, but noted here as a placeholder

- Mediator fee and travel expenses

CCC Program Audits/Review

Assumptions: Audit/Review Independent Contractor $125,000 annually

- Audit periodicity will increase as NERC internalizes monitoring capability, based upon recommendations of independent reviewer.

WebEx/Conference Calls (Cost to be determined by NERC)

Assumptions: Three CCC/Subcommittees NERC Web-Ex or conference calls quarterly

Stakeholder Perception Survey (Cost to be determined by NERC)

Assumptions: At the request of the NERC Board, the CCC engaged a professional survey firm to conduct stakeholder perception surveys.

Training (Cost to be determined by NERC)

Assumptions: Half day of hearing training appended to regular CCC meeting every even year.

- Five to ten CCC members will attend NERC auditor training annually.

Executive Summary

In the third quarter of 2013, consistent with its 2013 Annual Plan, the NERC Compliance and Certification Committee (CCC) conducted its fifth annual survey measuring stakeholder perceptions on the policies, practices and effectiveness of NERC and Regional Entities with respect to the Compliance program, Registration program, and Certification program. This periodic review is an essential element of the Board of Trustees (Board) and Federal Energy Regulatory Commission (FERC)-endorsed CCC Charter.

http://www.nerc.com/docs/compliance/ccc/CCC_Charter-Feb_2010.pdf)

The CCC survey is intended to be a source of industry feedback to the NERC Board on NERC's and the Regions' effectiveness and performance. To execute this year's survey, the CCC partnered with third-party provider TalentQuest, a talent management software and human capital management consulting firm, to drive survey enhancements. The CCC also reformulated survey content to create a more discerning, rigorous and valid evaluation, captured demographic data (3-year vs. 6-year audit cycle and registered function), examined responses across Regions, employed favorability analyses to interpret response polarity, conducted a year-to-year comparison of perception to identify trends, and incorporated thematic analysis of written responses. The NERC Board is encouraged to provide feedback and insight to the CCC that would be helpful for future enhancements to this survey.

The 2013 survey employed both a qualitative and quantitative approach to measure perceptions of industry stakeholders. Perceptions were measured across 6 Topic Areas including: Compliance Monitoring, Enforcement Actions, Organization Registration, Organization Certification, Compliance and Reliability Impact, and Other **(Appendix A)**. With the objective of more robust analysis and greater interpretability, a CCC project committee identified, developed and validated a set of 26 items that measured the constructs of the 6 Topic Areas. The CCC also updated the five rating scale descriptors, transitioning to an agreement-driven scale of "Strongly Disagree" to "Strongly Agree." This rating scale captured the degree to which respondents perceived NERC and the Region performance against the referenced program aspect.

Survey participants included all individuals listed on the NERC Primary Compliance Contact (PCC) Roster. For those respondents representing entities in multiple Regions, the 2013 survey form contained a section on each Region represented. NERC and the Regions were evaluated separately in all Topic Areas except Compliance and Reliability Impact and Other where perceptions were measured in the aggregate.

The results provide a range of views from all sectors represented on the CCC and all registered entity functions. The overall responses and comments were insightful in delineating stakeholders' relative perceptions of program strengths and opportunity areas.

Industry feedback of strengths included:

- Compliance Monitoring components involving audit teams, audit processes, and self-certification.
- Positive progress by NERC and the Regions across all Topic Areas between 2012 and 2013 is reflected by increases in perceptions ranging from .05 to .29.

Industry feedback for improvement included the themes:

- Increased consistency and standardization (in processes across Regions, in penalty application and the settlement process, and in communications from NERC and Regional Entities).
- Communication of clearer, more applicable definitions (in the recertification processes, in Joint Registration Organization (JRO) and Coordinated Functional Registration (CFR) processes, in the BES, and in valid reliability measure).

- Greater efficiencies (via increased process timeliness and feedback, increased return on investment of compliance program, continued streamlining of standards, and increased transparency).

In addition, following the preliminary presentation of survey results, including the thematic analysis of all comments, NERC leadership requested additional analysis to uncover more specificity and clarification around any comments that may suggest inappropriate or unprofessional conduct.

2013 Recommendations

Through analysis and interpretation of the 2013 Stakeholder Perception Survey, the CCC has decided to recommend that NERC continue to move forward with the 2012 recommendations which are tied to the three themes that have prevailed over the past three years the survey has been conducted:

1. Return on Investment (ROI) of compliance program;
2. inconsistencies within and across Regions; and
3. transparency of the enforcement and penalty processes

In this context, ROI means reliability benefits versus resources expended on compliance. In addition to the recommendations below, NERC should address the specific conduct concerns that were presented in some of the comments.

These concerns have been presented to NERC under separate cover:

1. The CCC should continue to work with NERC staff to communicate the survey results in a productive way to NERC and the Regions to facilitate performance improvement and positively impact stakeholder perceptions.
2. The recommendations provided in the 2011 Stakeholder Perceptions Survey specifically included items to address ROI (recommendation number one) and transparency (recommendation number four). NERC should compile a new list of action items based on this 2012 survey and those provided in the 2011 survey. The CCC should have a standing item on its agenda for the next year to review NERC's progress on its action plan, offer assistance where requested, and work with NERC to communicate its successes to improve the results of future surveys.
3. NERC should review key/identified post-audit processes (audit reports, mitigation plans and settlements) with the objective of standardizing the process across Regions, streamlining components, and reducing the total process time.
4. NERC staff should review the free form written responses to the survey to identify the predominant consistency issues and develop an action plan to address them. NERC should implement a Multi-Region Registered Entity (MRRE) process by the end of 2014 (this was also addressed in the 2011 survey recommendations).

The CCC thanks the industry for their participation and the feedback provided in the survey. The CCC also wants to recognize NERC's support in facilitation of the CCC Stakeholder Survey, and its provision of an outside consultant to drive survey enhancement. The CCC requests that the Board consider releasing a public version of the report.

Introduction

The CCC Electric Reliability Organization Monitoring Subcommittee (EROMS) conducted a survey of stakeholder perceptions in accordance with the NERC CCC Charter.[1] Primary Compliance Contacts in the NERC database (1201 PCCs) were polled to measure stakeholder perceptions of NERC and Regional Entity effectiveness in implementing and executing components of the continent-wide Compliance, Registration, and Certification programs since June 18, 2007.

The 26 item survey measuring the constructs of the 6 Topic Areas was transmitted to the NERC PCC Roster in order to solicit response from the broad stakeholder spectrum within registered entities. The CCC received a 29.3 percent response rate to the 2013 survey, a 3 percent increase compared to 2012.

The Topic Areas evaluated in the 2013 survey included the following:

- Compliance Monitoring
- Enforcement Actions
- Organization Registration
- Organization Certification
- Compliance and Reliability Impact
- Other

To facilitate greater interpretability and more robust analysis, a CCC project committee identified, developed and validated the set of 26 items measuring the constructs of the 6 Topic Areas **(Appendix A)**. These items were evaluated via a five-point, agreement-based rating scale ("Strongly Disagree" to "Strongly Agree"). Stakeholders were asked to evaluate NERC and the Regions separately on the first four Topic Areas (Compliance Monitoring, Enforcement Actions, Organization Registration, and Organization Certification), and for a combined NERC/Region evaluation in the Compliance and Reliability Impact and Other Topic Areas. Qualitative data was gathered at the Topic Areas and through three open-ended questions. The qualitative data was interpreted through a thematic analysis to quantify open-ended perceptions. Demographics gathered included Region, Registered Function, and Audit Cycle. In addition to Regional topic and item analyses, the survey reported item favorability (item response distribution), and year-over-year trend analyses.

[1] Section 2.2.a: "Provides comments to NERC with respect to stakeholder's perception of the policies, practices and effectiveness of the Compliance program, Registration program, and Certification program."

Survey Composition and Response Rates / Demographics

Rating Scale

1 – Strongly Disagree

2 – Disagree

3 – Neither Disagree nor Agree

4 – Agree

5 – Strongly Agree

Survey Items

Compliance Monitoring [NERC, Regions evaluated separately]

1. Our most recent audit process (including pre- and post- audit activities) was conducted in a timely manner.
2. The audit team conducts themselves in a professional and credible manner.
3. The audit team is prepared and organized to conduct the audit process.
4. The audit team adheres to established rules and processes.
5. The spot check process is well-defined, organized and timely.
6. The self-reporting process is well-defined, organized and timely.
7. The self-certification process is well-defined, organized and timely.

Please provide any recommendations regarding Compliance Monitoring: _____

Enforcement Actions [NERC, Regions evaluated separately]

8. The audit report identifies clear, definitive, and actionable items to address.
9. All communication of violations clearly and specifically describe the manner in which a requirement was violated.
10. All communication of violations clearly and specifically describe the risk of the PV both actual and potential.
11. The mitigation plan submission and approval process is efficient and effective.
12. The settlement process is transparent, consistently applied, and clearly communicated.
13. The penalty process and penalties are transparent, consistently applied, and clearly communicated.

Please provide any recommendations regarding Enforcement Actions: _____

Organization Registration [NERC, Regions evaluated separately]

14. The functional model is clear and minimizes overlaps and gaps.
15. The Organization Registration process minimizes overlaps and gaps.
16. The Organization Registration process is well-defined and efficient.
17. The rules for assigning registered functions to entities are clear and accurately applied.
18. The Joint Registration Organization (JRO) and Coordinated Functional Registration (CFR) processes are clear and consistently implemented.

19. Inquiries about the registration process are responded to in a timely and effective manner.
20. There is a timely and effective response during the Registry Appeals Process.

Please provide any recommendations regarding Organization Registration: _____

Organization Certification [NERC, Regions evaluated separately]

21. Organization Certification rules and procedures are clear and consistent

Please provide any recommendations regarding Organization Certification: _____

Compliance and Reliability Impact

22. NERC Compliance programs and corresponding industry efforts have enhanced reliability of the bulk power system.
23. Regional Entity Compliance programs and corresponding industry efforts have enhanced reliability of the bulk power system.
24. The Standards Driven Index (SDI) which includes the Compliance Index (CI) coupled with the Adequate Level of Reliability (ALR) demonstrates enhanced reliability for the industry.
25. The reliability benefits experienced are worth the degree of compliance effort (time and resources) our entity has expended.

Please provide any recommendations regarding Compliance and Reliability Impact: _____

Other

26. The Compliance Monitoring and Enforcement processes are applied consistently across NERC and the Regions.
    - *If applicable, please provide specific examples of inconsistencies across Regions and/or NERC*
    - *Please provide any recommendations regarding the ERO CMEP: _____*

Please provide any recommendations regarding the Regional Entities: _____

Response Rate and Demographics

There were 1201 PCCs invited to respond to the 2013 survey. There were 352 individual survey respondents (29.3 percent response rate). PCCs representing entities in multiple Regions completed the survey for each applicable Region resulting in more Regional data points than individual respondents. The response rating increased from 26.4 percent to 29.3 percent over 2012 despite a 78 decrease in number of respondents.

Regional Responses (frequencies) by Registered Function

While the Registered Function demographic was not utilized in response analysis, the data more fully describes the respondent sample.

	BA	DP	GO	GOP	IA	LSE	PA	PSE	RC	RP	RSG	TO	TOP	TP	TSP

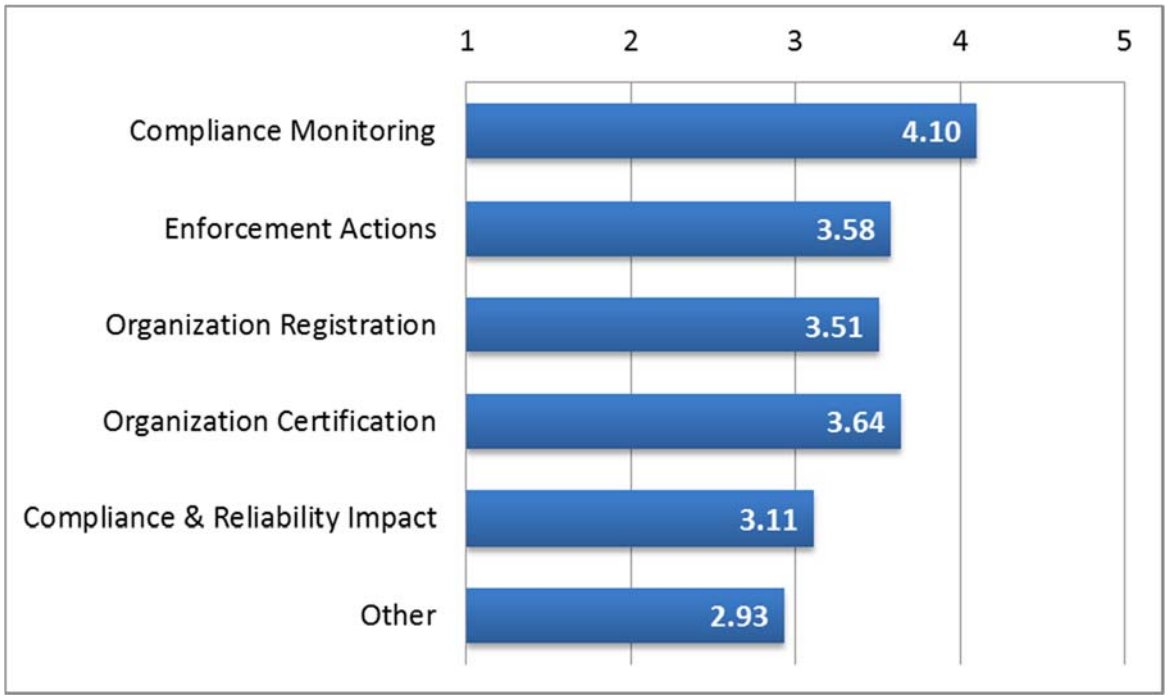
TOTAL	169	391

Summary of Survey Responses

Topic Area Analyses

The first level of analysis was conducted at the Topic Area level and considered all survey responses in aggregate (NERC and Regions combined). Compliance Monitoring was the highest-rating Topic Area (mean = 4.10), with all five of the survey's highest-rated items emerging from Compliance Monitoring. The lowest rated Topic Area, "Other" (mean 2.93) was comprised of a single item, "The Compliance Monitoring and Enforcement processes are applied consistently across NERC and the Regions." The four remaining lowest-rated items were distributed across the Topic Areas of Compliance and Reliability Impact, Organization Registration, and Enforcement Actions.

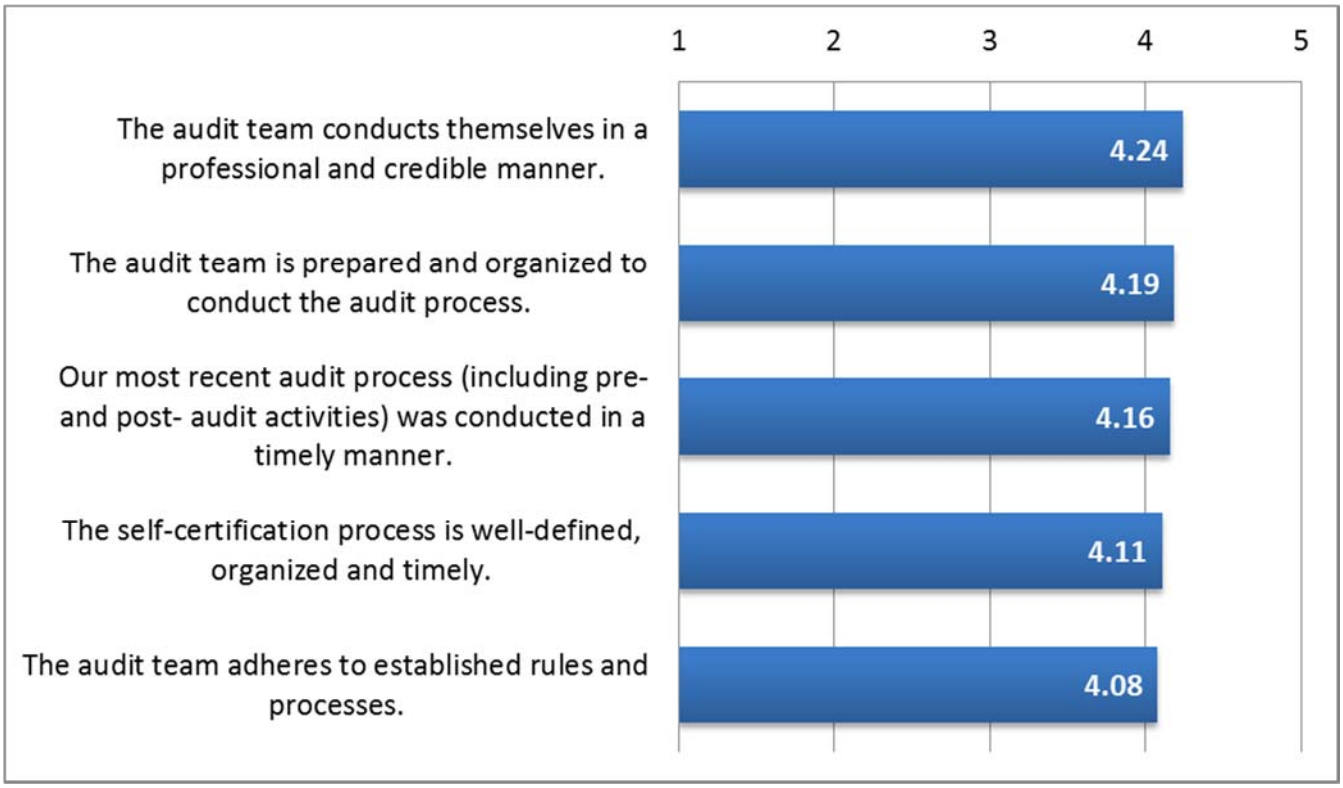
Topic Area Means



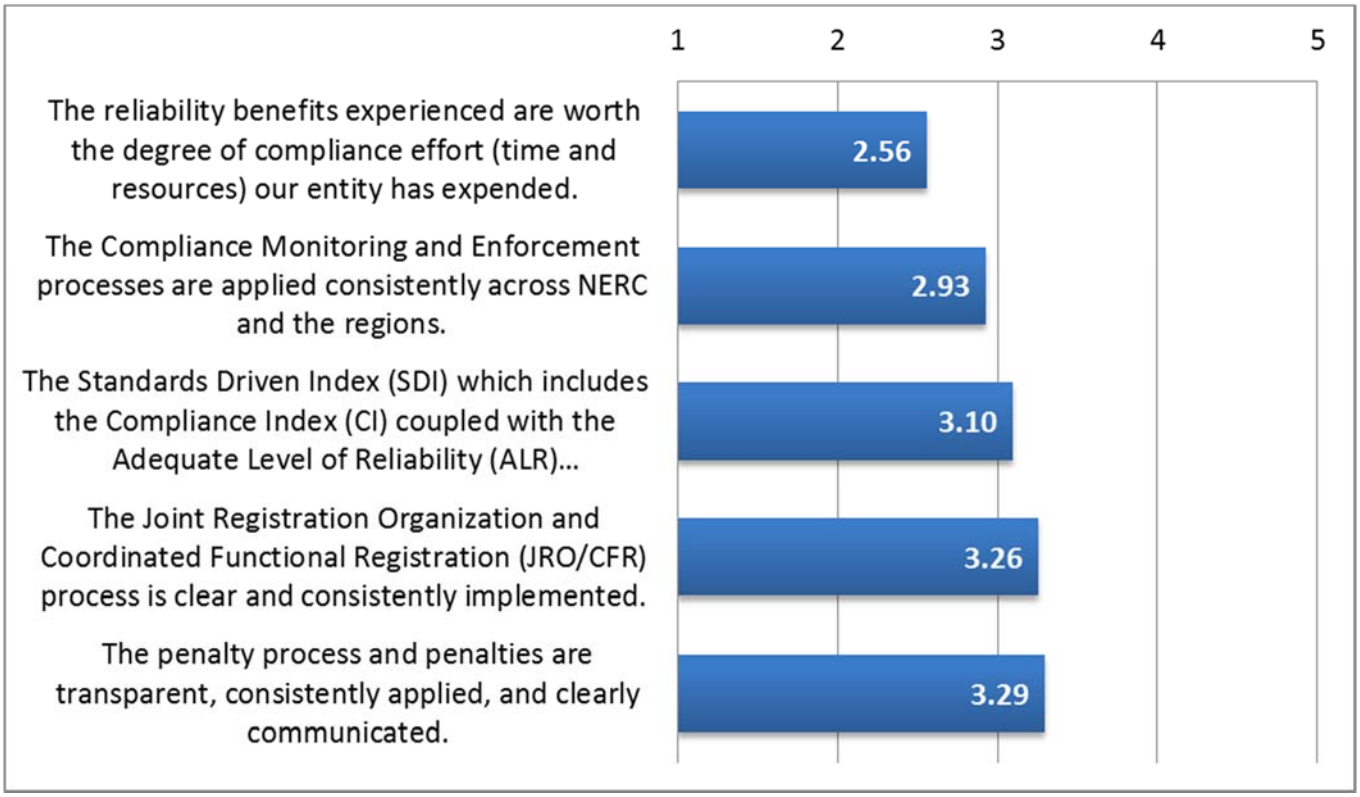
Highest and Lowest-rated Items

All five of the survey's highest-rated items were in the Compliance Monitoring Topic Area with means of 4.08 and above. The lowest-rated item means ranged from 2.56 to 3.29 and were distributed across Topic Areas of Other, Compliance and Reliability Impact, Organization Registration, and Enforcement Actions. All item means can be found in **Appendix A**.

Highest-Rated Items



Lowest-Rated Items



Topic Analyses by Region

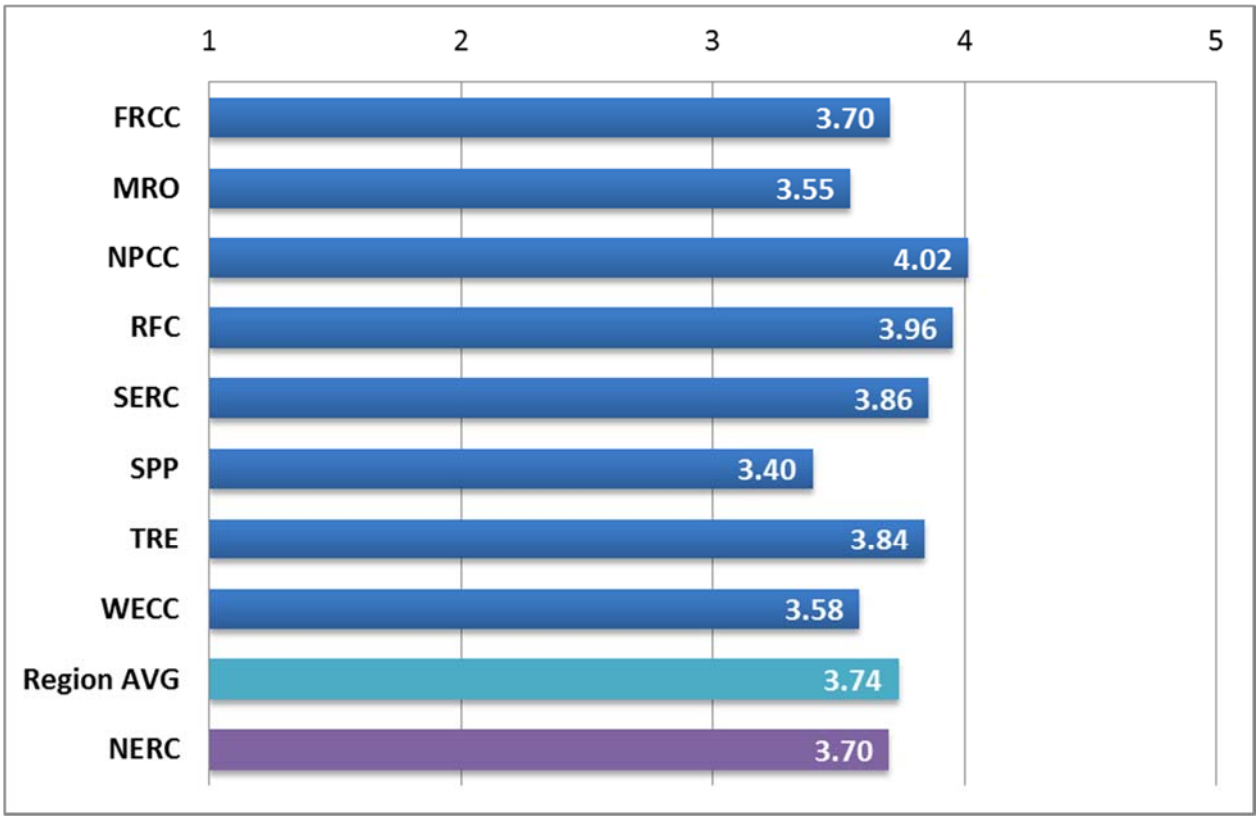
For the 4 Topic Areas where ratings were gathered for NERC and the Regions, analysis was conducted for both the Regions and NERC. Those Topic Areas were: Compliance Monitoring, Enforcement Actions, Organization Registration and Organization Certification. The following analyses depict differences across the individual Regions, the combined Regions, and NERC. T-tests and ANOVA were used to identify statistically significant differences.

In this analysis, the calculated, "Overall Average" of all items (the 21 items contained in these Topic Areas), identified a slight difference between NERC (3.70) and the Regions (3.74). Individual Region Overall means ranged from 3.40 to 4.02.

The 4 Topic Area analyses reflected little variation between the Regions (combined) and NERC, with differences ranging only from .01 to .16. Conversely, means between Regions varied both in the ranking order of Regions across Topic Areas, and in within-Topic differences (ranging up to .79).

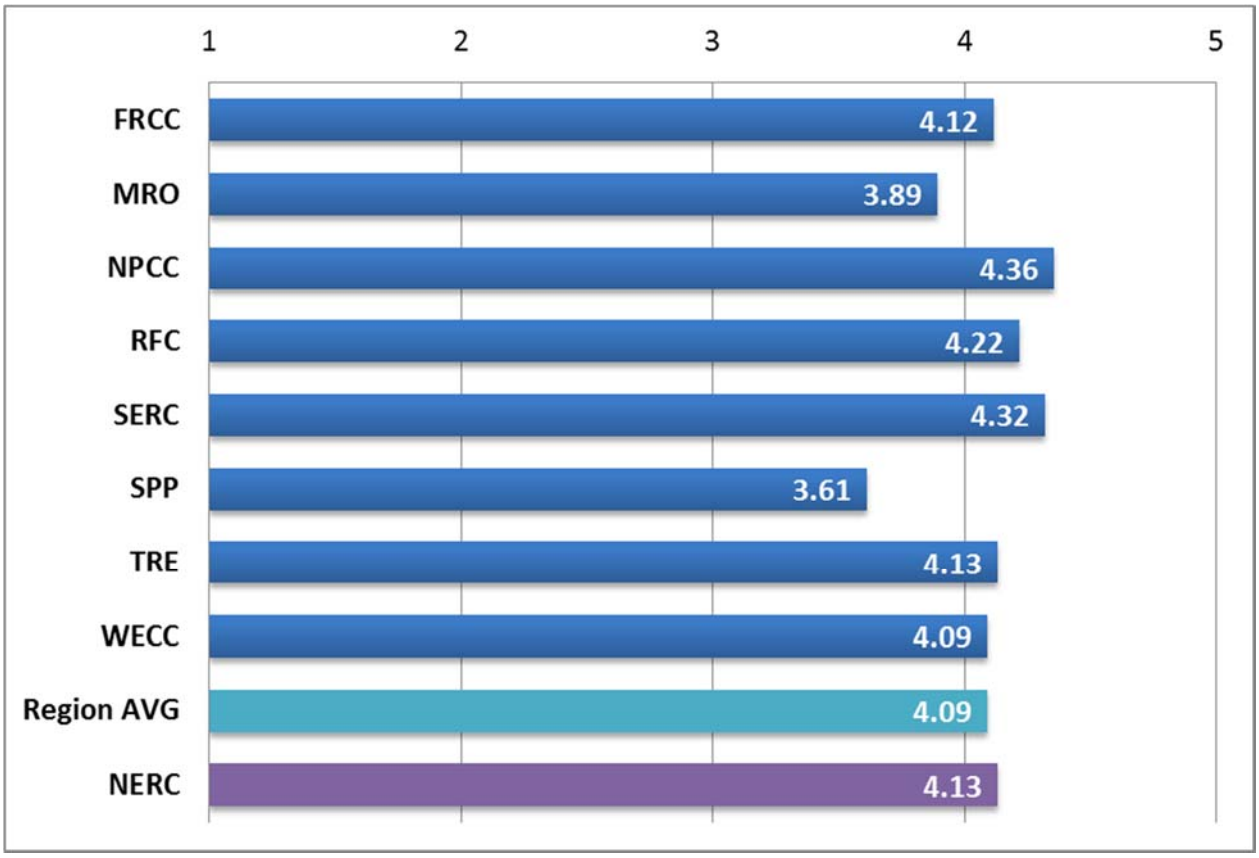
Overall Averages

Between the Regions, a .62 difference exists between the highest mean (4.02, NPCC) and the lowest mean (3.40, SPP), with statistically significant differences found between SPP and NPCC ($p < .05$).



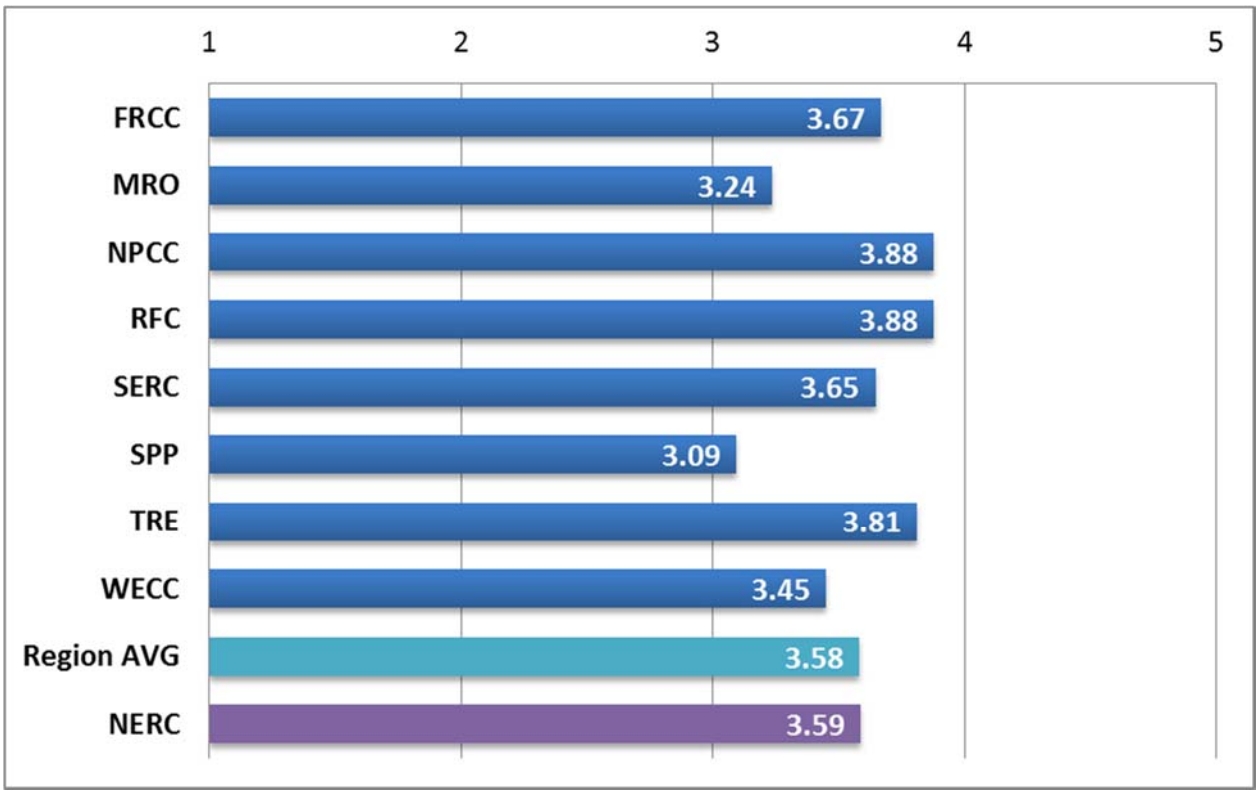
Compliance Monitoring

Individual Region averages ranged from 3.61 (SPP) to 4.36 (NPCC) within Compliance Monitoring, and significant differences were found between SPP and NPCC, MRO and NPCC, and FRCC and NPCC (all at p <.05).



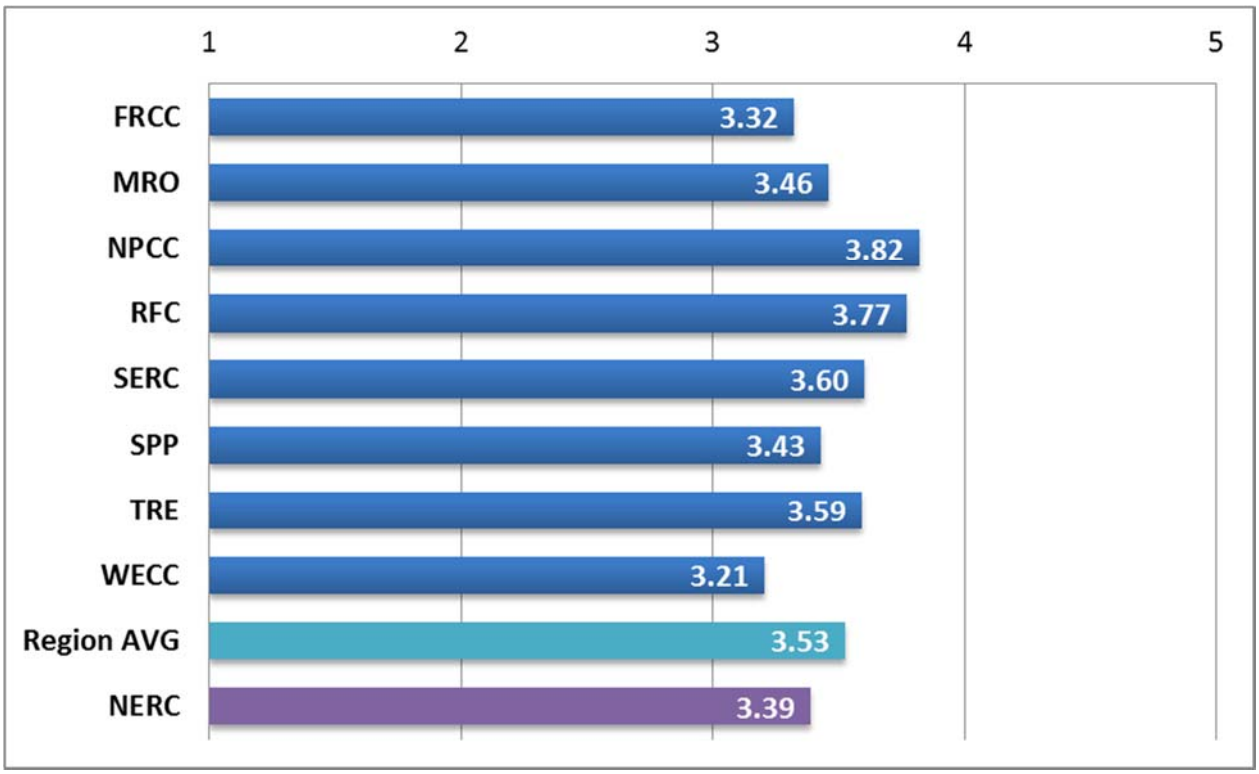
Enforcement Actions

Individual Region averages ranged from 3.09 (SPP) to 3.88 (NPCC and RFC) with significant differences found in SPP and NPCC, and SPP and RFC (p<.05).



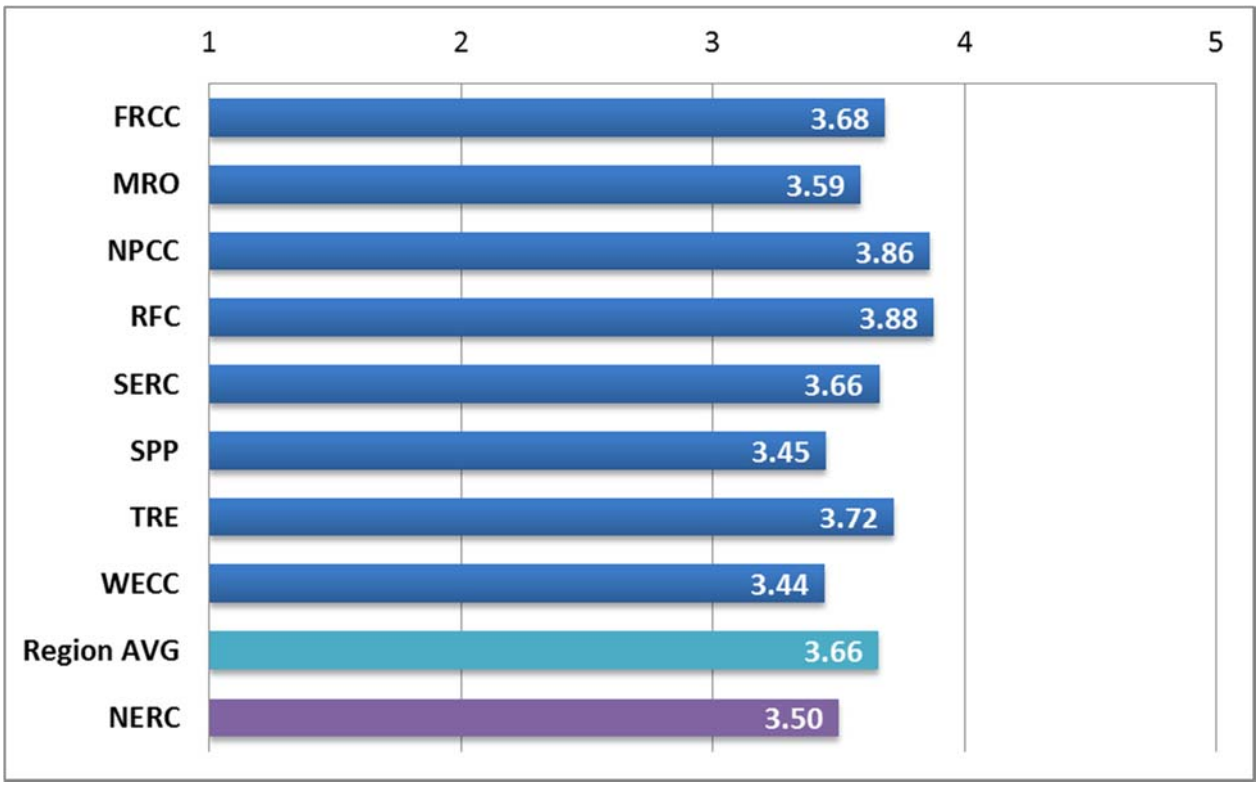
Organization Registration

Individual Region averages ranged from 3.21 (WECC) to 3.82 (NPCC) with a significant difference present between WECC and NPCC ($p < .05$).



Organization Certification

Individual Region averages ranged from 3.44 (WECC) to 3.88 (RFC) with a significant difference present between WECC and RFC ($p < .05$).

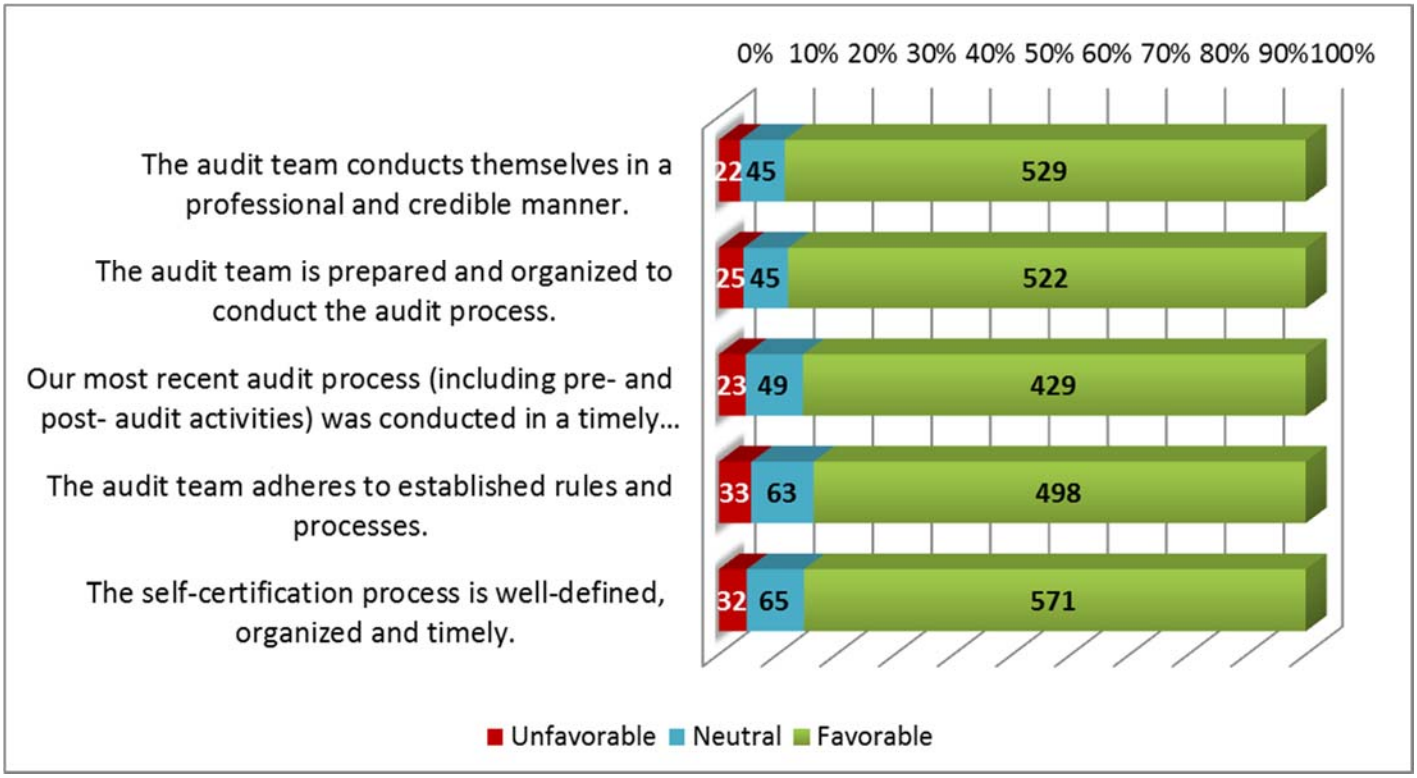


Favorability Analyses

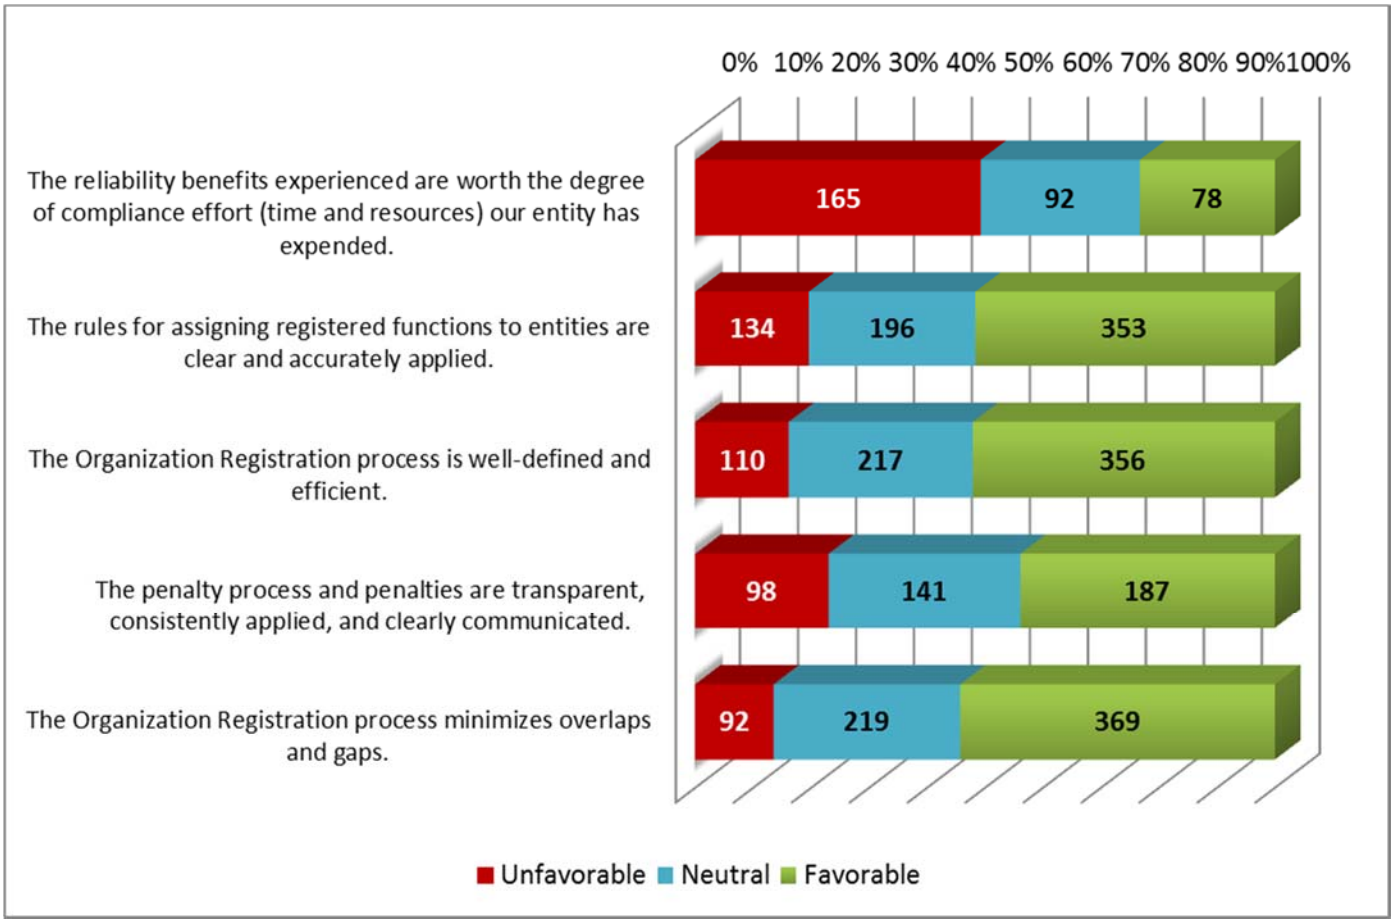
Favorability analysis allowed for additional insight into the strength of stakeholder perception through examination of the rating distribution. Responses across all Regions and NERC were re-coded as "Unfavorable" (rating of 1 – Strongly Disagree or 2 – Disagree), "Neutral" (rating of 3 – Neither Disagree Nor Agree), and "Favorable" (rating of 4 – Agree or 5 – Strongly Agree). Rank ordering of all items by those "Most Favorable," and by those "Least Favorable," highlighted items for further interpretation.

Across all Regions, the five items with the greatest number of favorable ratings (ranging from 84-89 percent) were in the Compliance Monitoring Topic Area. Conversely, the 5 items with the greatest number of unfavorable ratings (ranging from 14-49 percent) were in the Topic Areas of Compliance and Reliability Impact, Other, Enforcement Actions, and Organization Registration.

Most Favorable



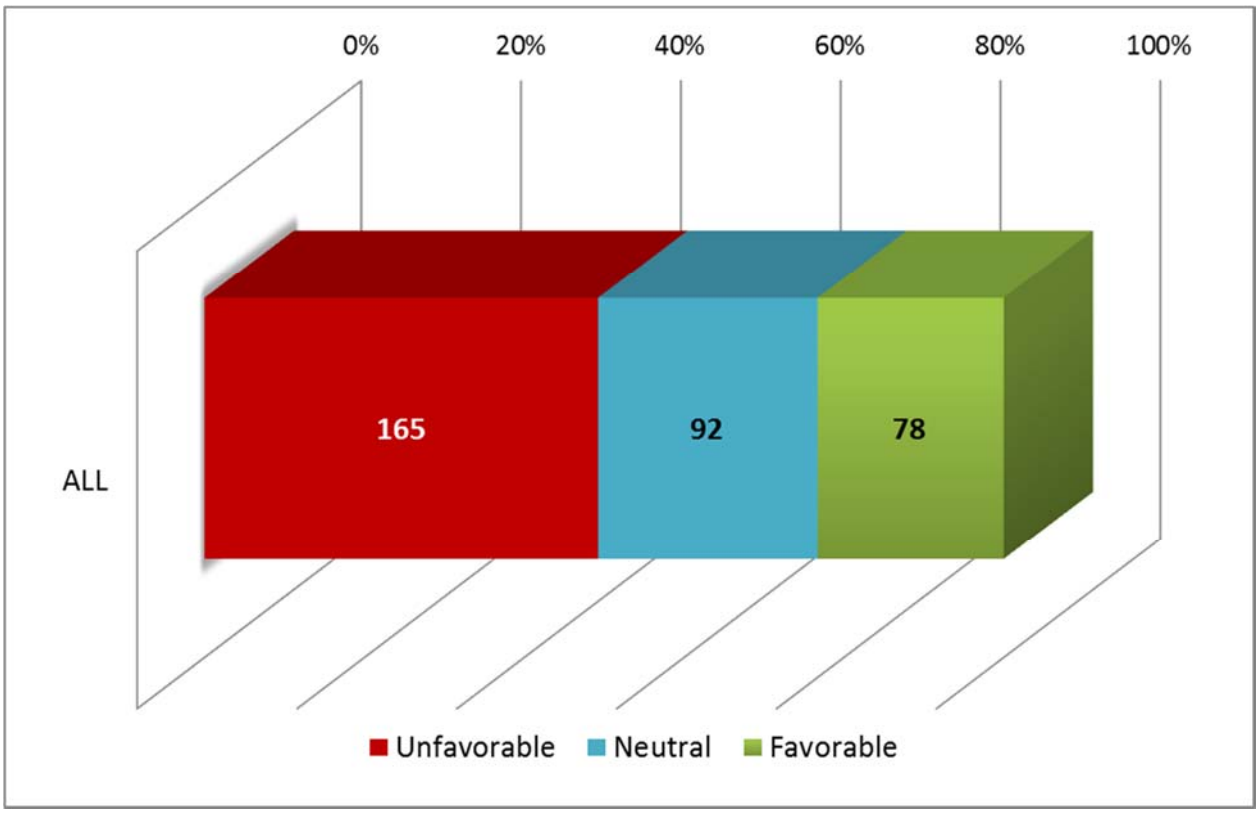
Least Favorable



Regional Favorability Analysis

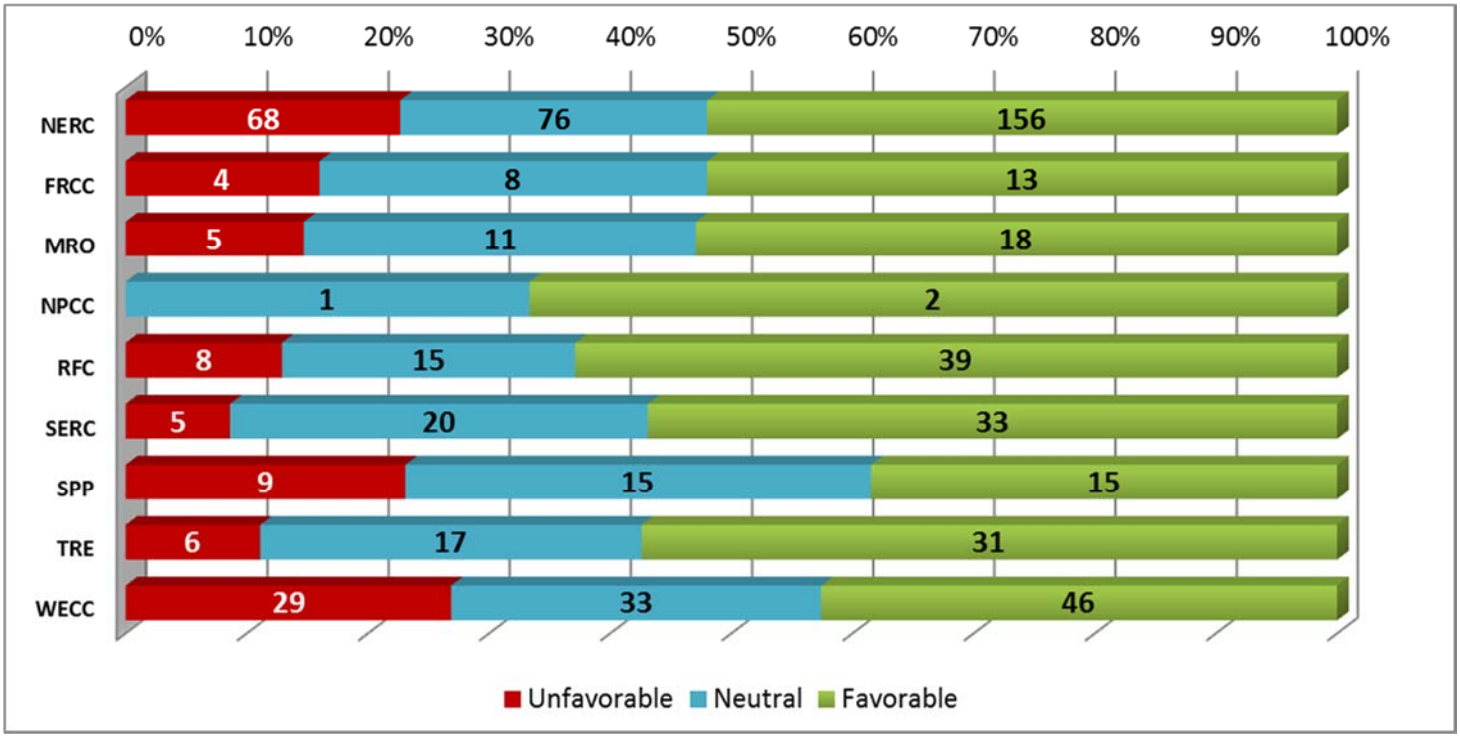
For the 5 least favorable items, a Region breakdown (where applicable) identified further variation.

"The reliability benefits experienced are worth the degree of compliance effort (time and resources) our entity has expended:"



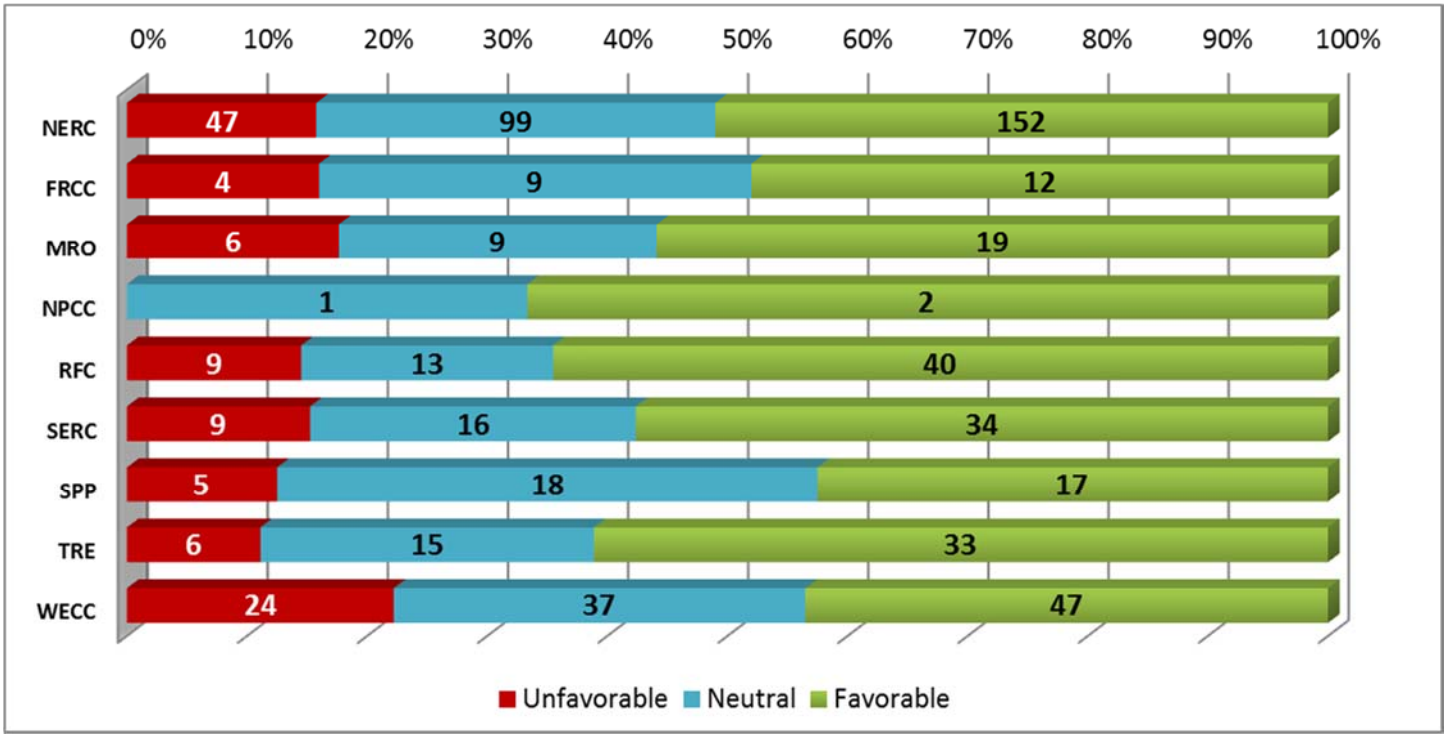
For this item, the average overall unfavorability is 49 percent.

"The rules for assigning registered functions to entities are clear and accurately applied:"



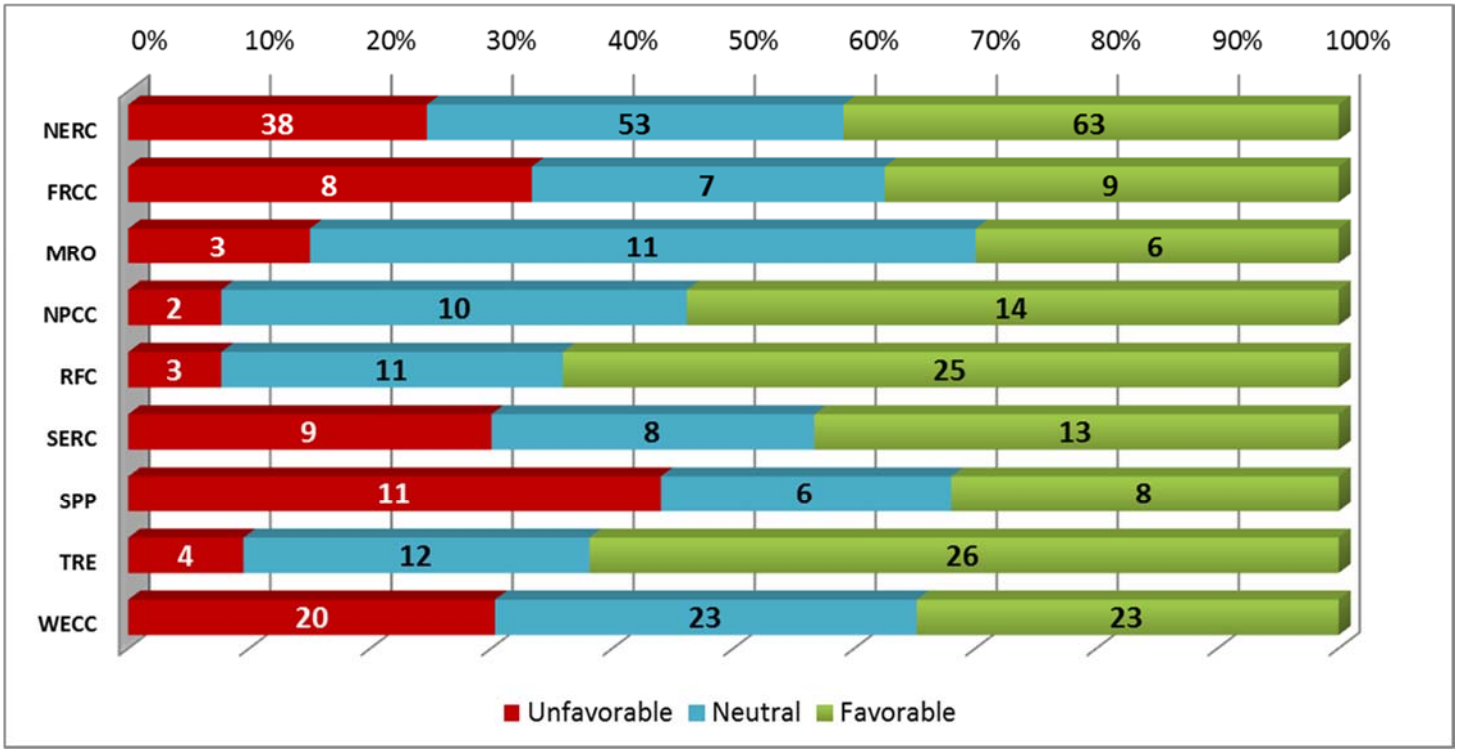
For this item, Regional comparisons identify WECC's 27 percent unfavorability the highest and NPCC's 0 percent unfavorability the lowest. Average overall unfavorability is 15.10 percent.

"The Organization Registration process is well-defined and efficient:"



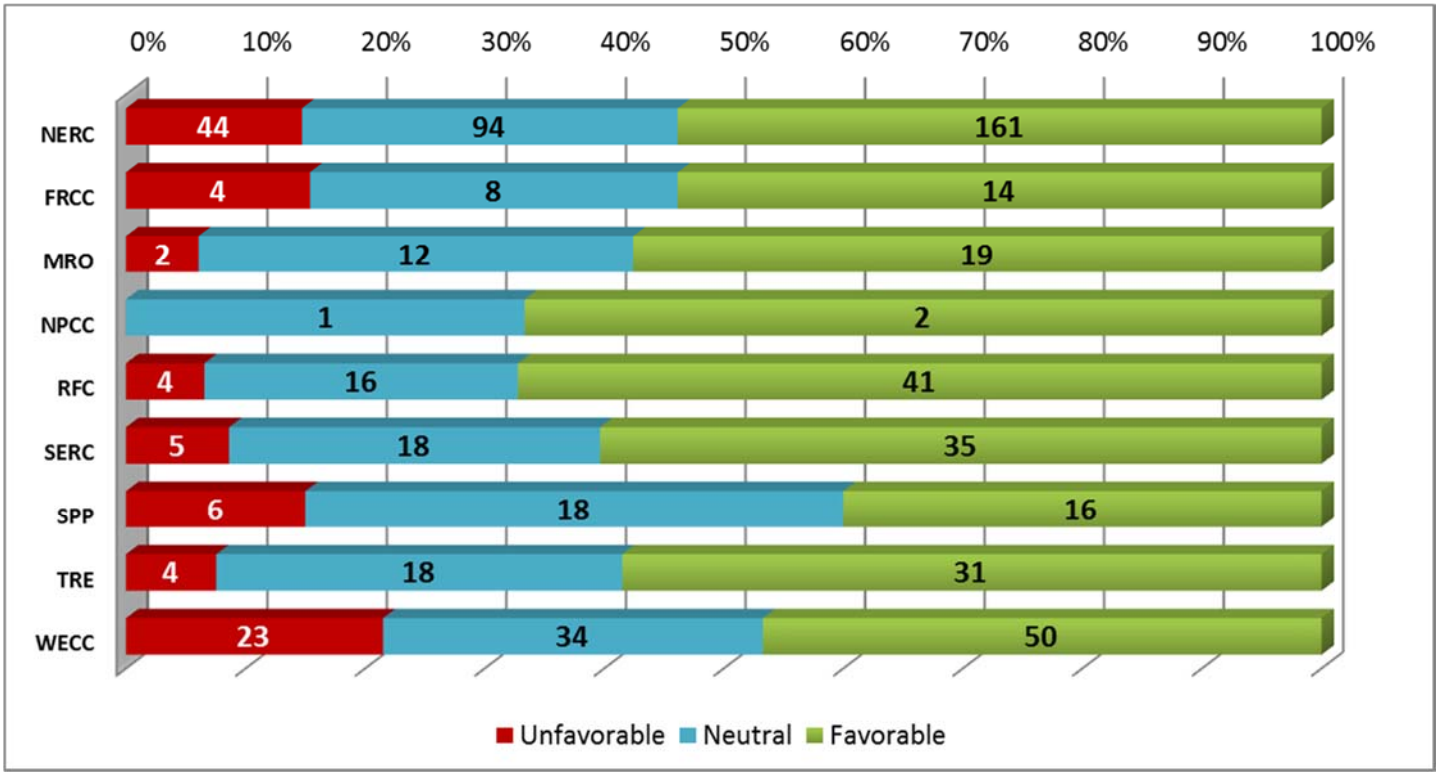
For this item, Regional comparisons identify WECC's 22 percent unfavorability the highest and NPCC's 0 percent unfavorability the lowest. Average overall unfavorability is 14 percent.

"The penalty process and penalties are transparent, consistently applied, and clearly communicated:"



For this item, Regional comparisons identify SPP's 44 percent unfavorability the highest and NPCC's and RFC's 8 percent unfavorability the lowest. Average overall unfavorability is 22 percent.

"The Organization Registration process minimizes overlaps and gaps:"

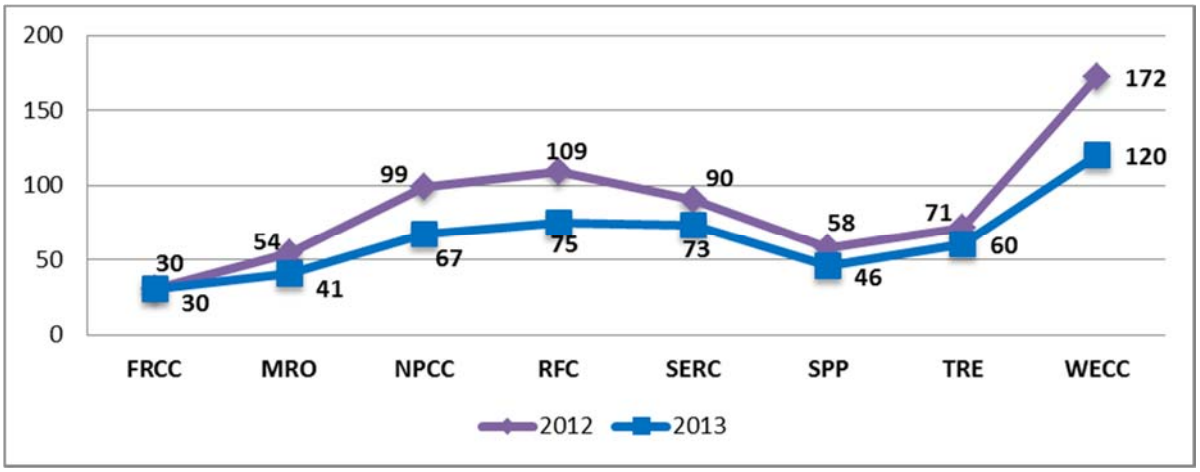


For this item, Regional comparisons identify WECC's 22 percent unfavorability the highest and NPCC's 0 percent unfavorability the lowest. Average overall unfavorability is 11 percent.

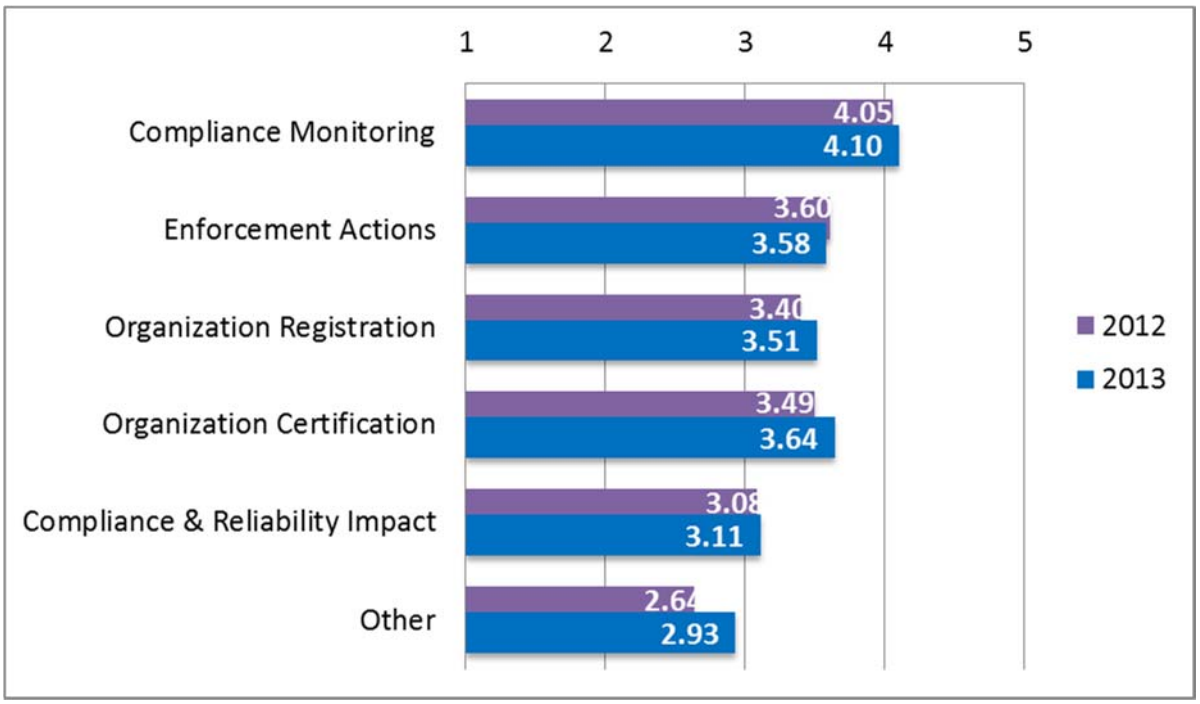
Year-over-year Analyses

New rating scale descriptors and extensive survey item updates in 2012 have previously constrained year-over-year analyses. However, 2013 survey items are an exact match from 2012 survey items, allowing a comparative year-over-year exploration of stakeholder perception.

Response Demographics: Region



Overall Averages by Topic Area

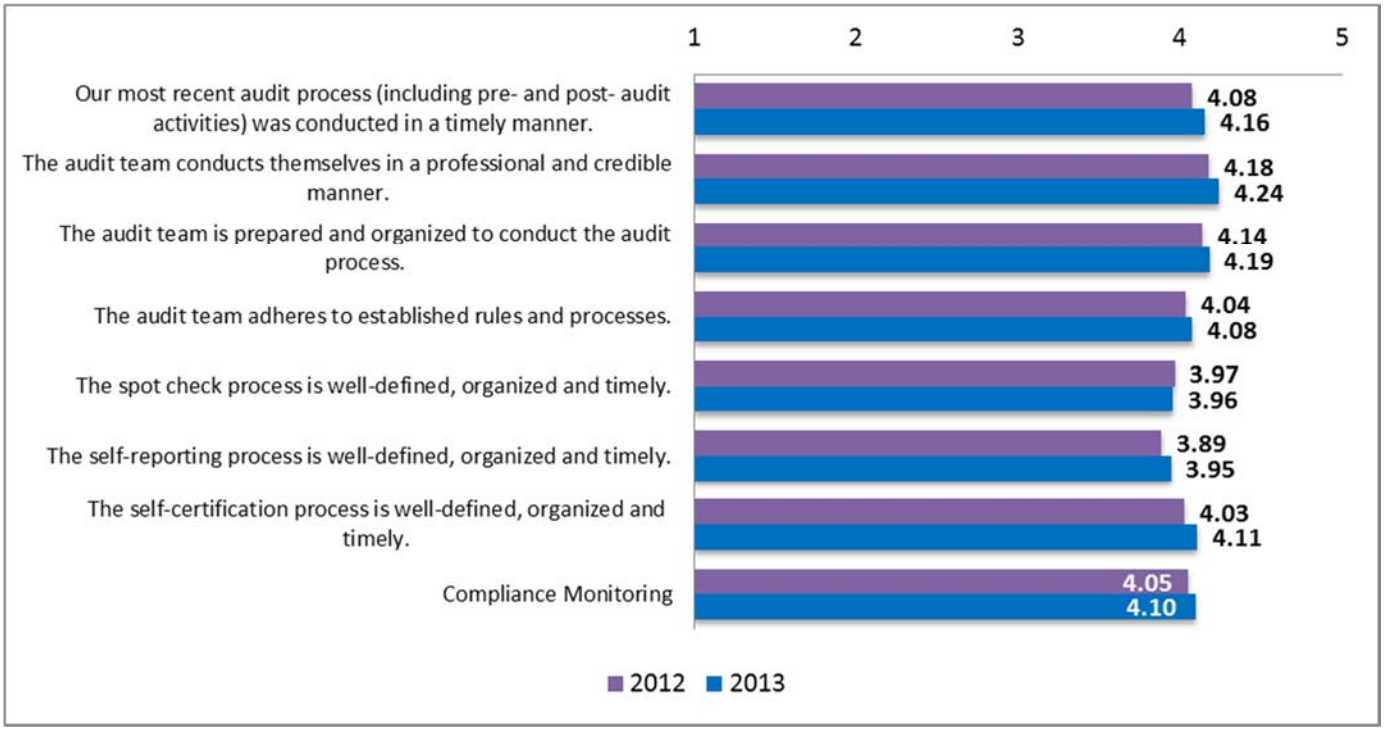


Consistent with 2012, Compliance Monitoring remains the highest rated Topic Area (4.10), increasing by .05. "Other" remains the lowest rated Topic Area (2.93), increasing by .29 as compared to 2012.

Year-Over-Year analysis did not yield any statistically significant differences between topic areas (p>.05).

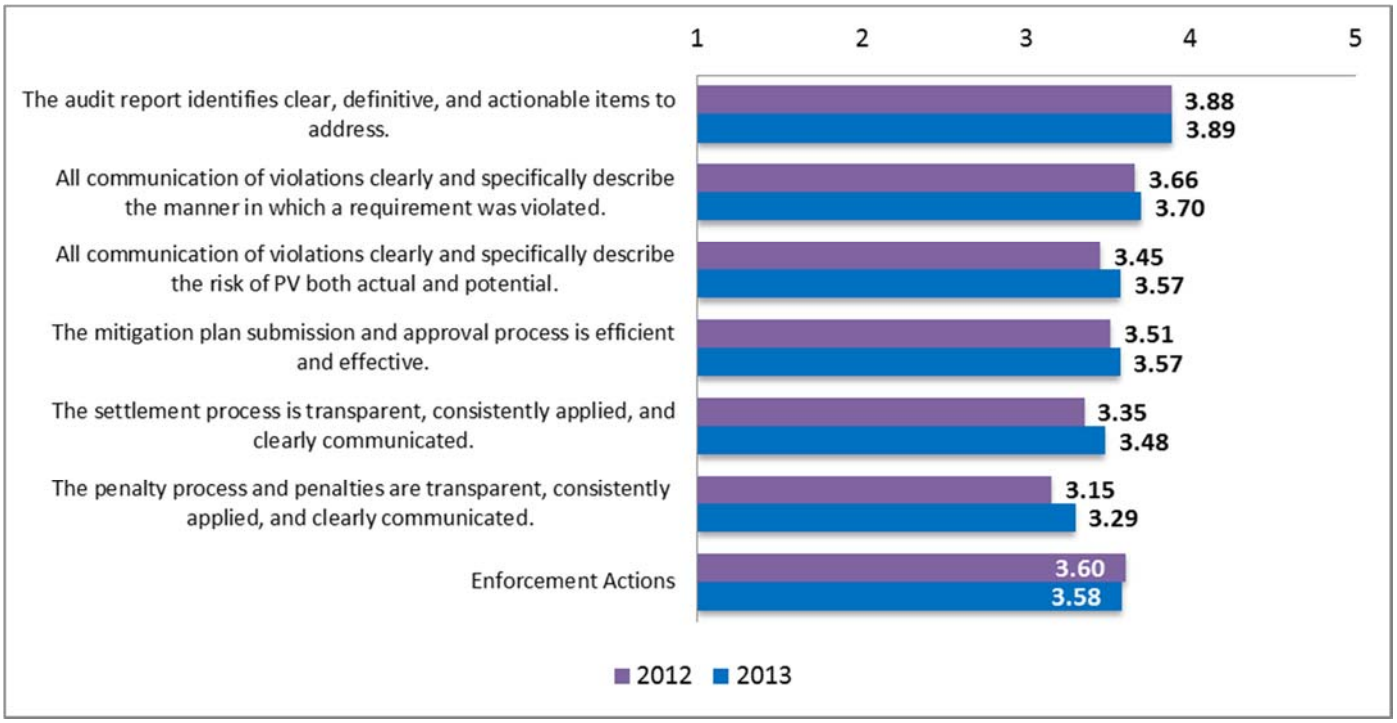
Compliance Monitoring

**Differences are not statistically significant (p>.05)*



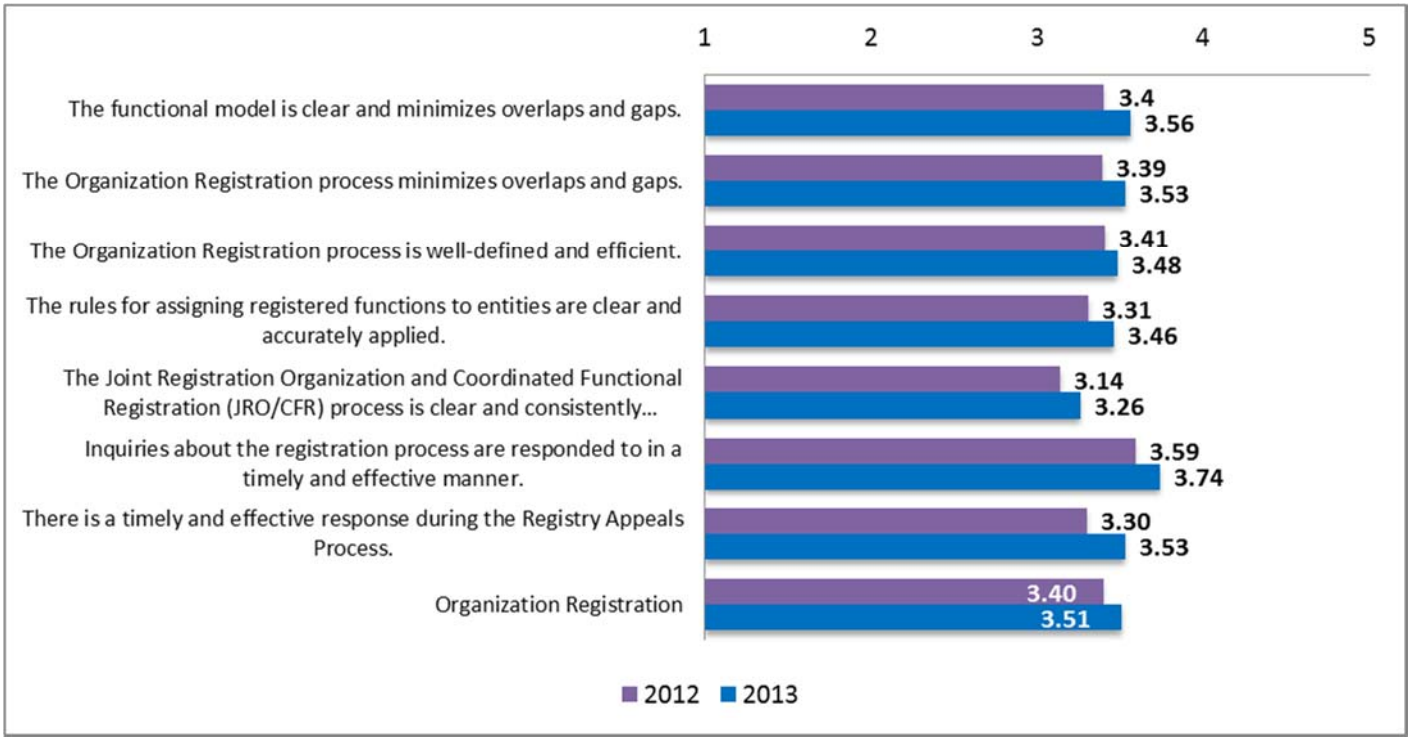
Enforcement Actions

**Differences are not statistically significant (p>.05)*



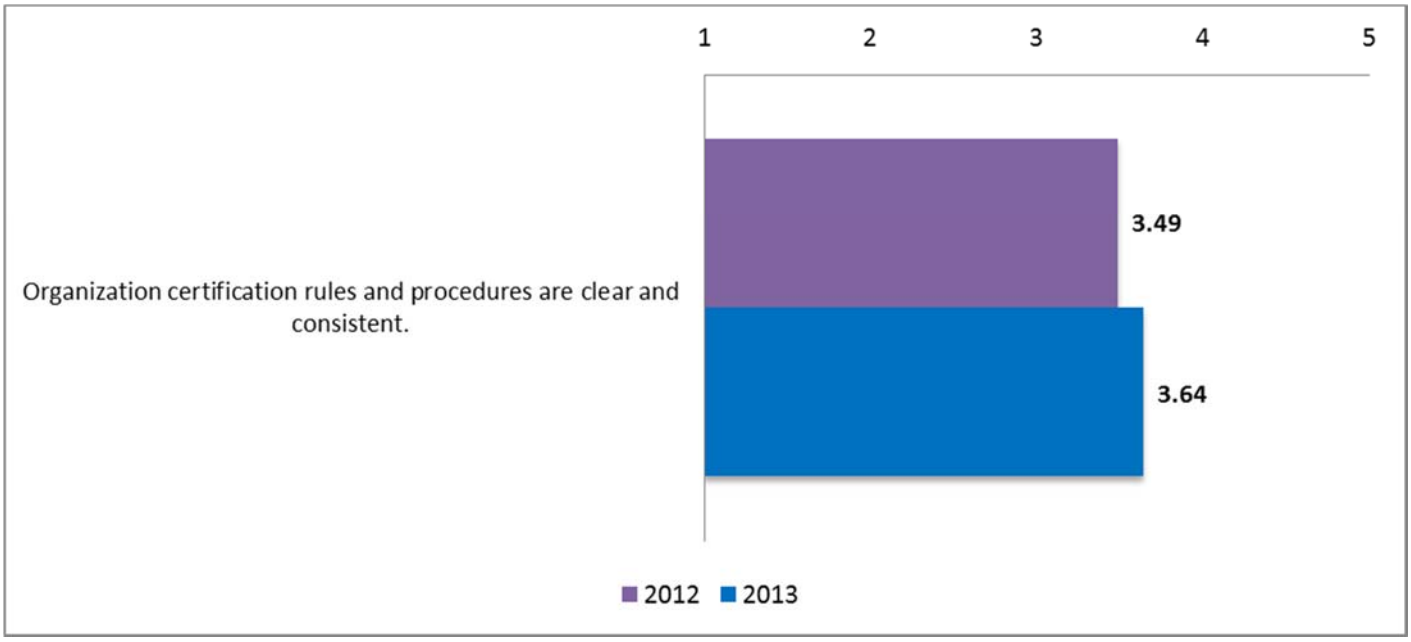
Organization Registration

**Differences are not statistically significant (p>.05)*



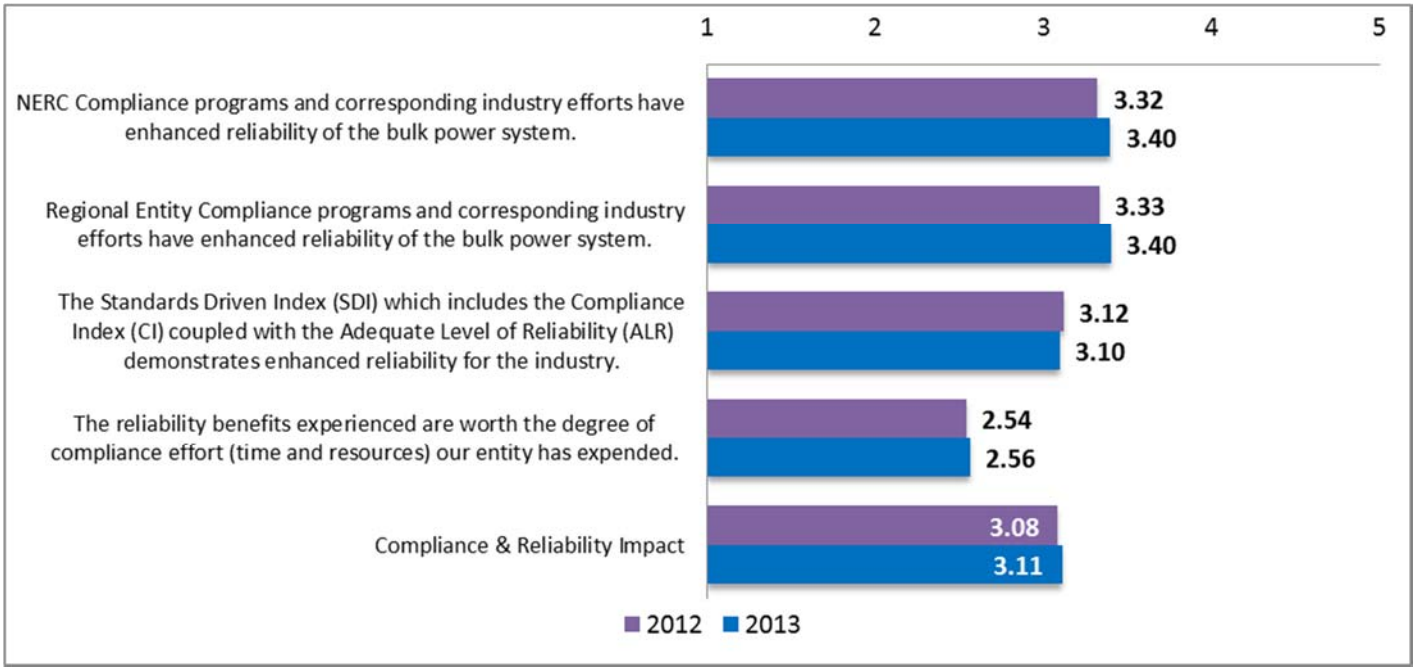
Organization Certification

**Differences are not statistically significant (p>.05)*



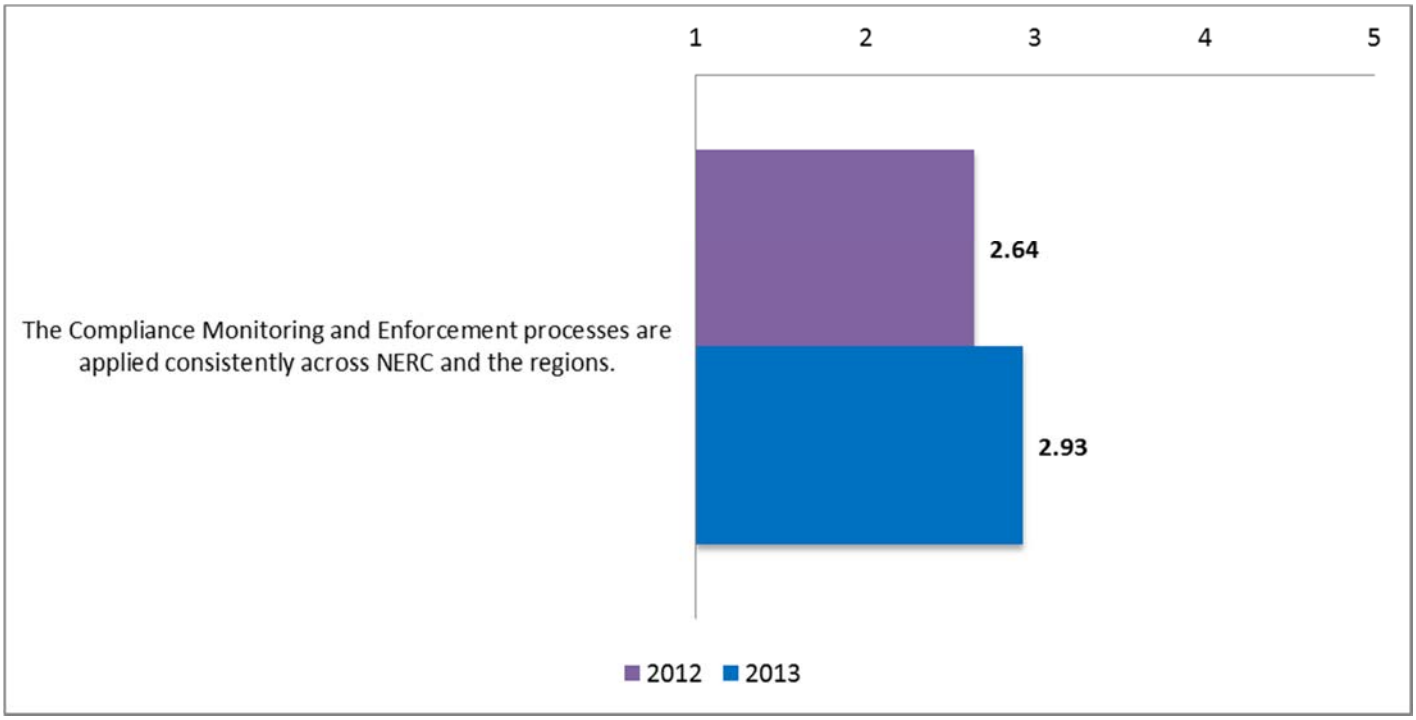
Compliance and Reliability Impact

**Differences are not statistically significant (p>.05)*



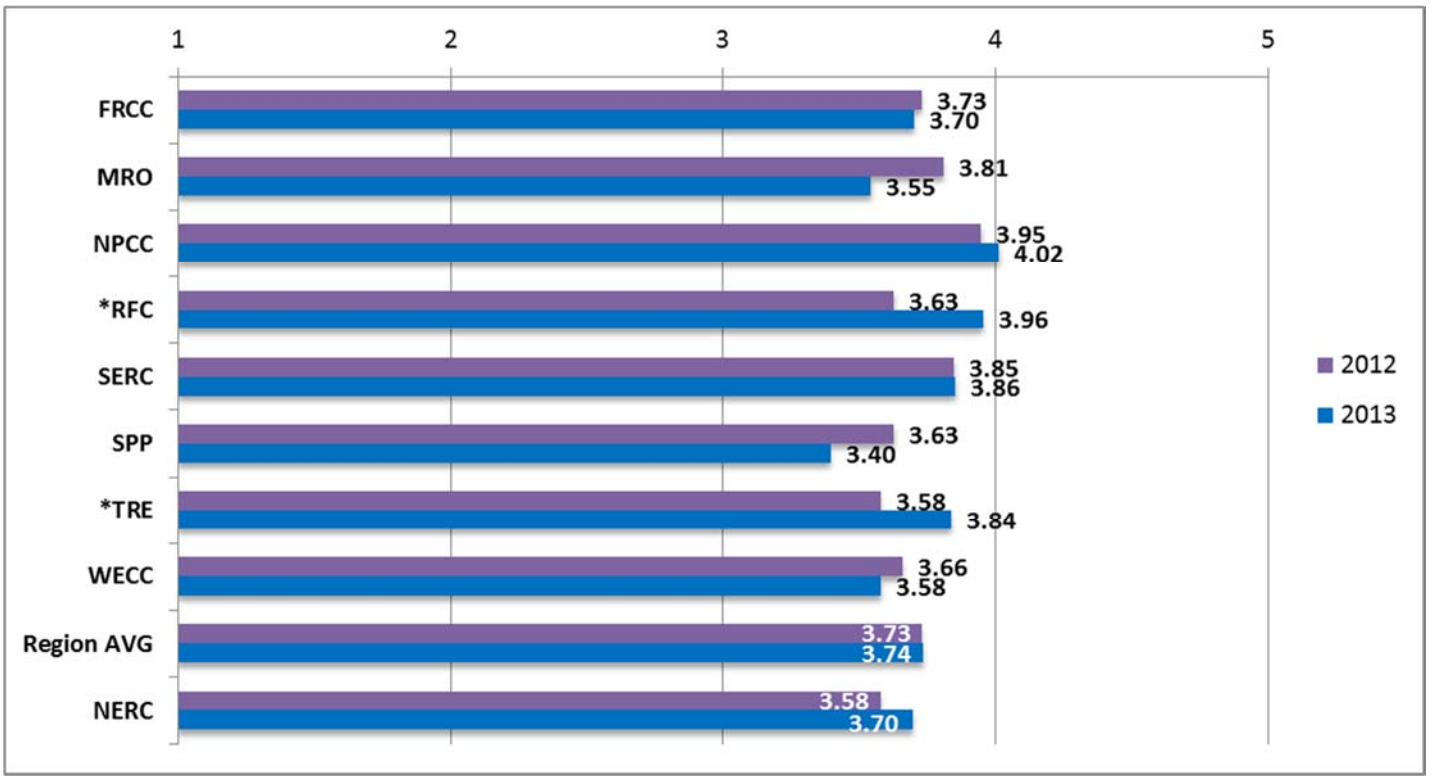
Other

**Difference in means are not statistically significant (p>.05)*



Overall Averages by Region

**Statistically significant difference (p<.05)*

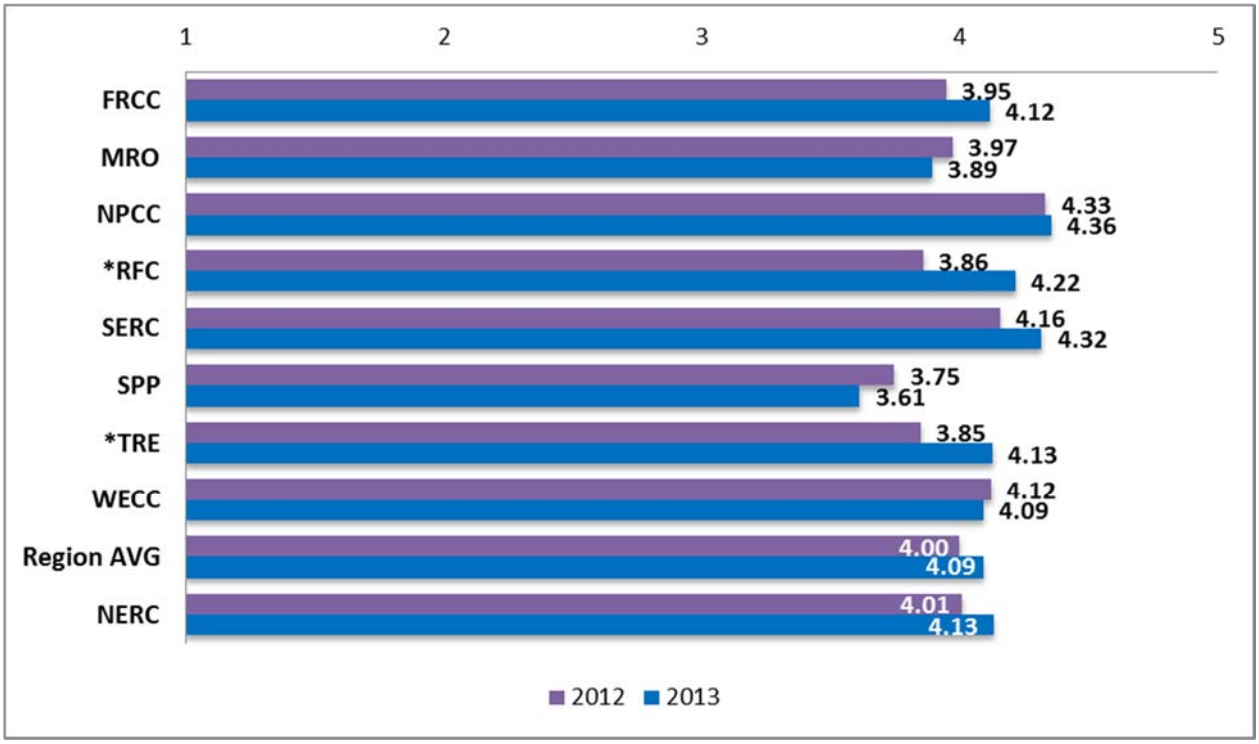


At the Regional level, 4 of the 8 Regions (NPCC, RFC, SERC, and TRE) averaged higher ratings overall as compared to 2012 with differences ranging from .01 to .33. Similarly, NERC as compared to the Regions, received .08 higher ratings than reflected in 2012. However, the overall Regional average remains consistent, reflecting only a slight increase of .01 when compared to 2012 ratings.

The RFC and TRE Regions both show statistically significant differences in their year-over-year overall response averages (p<.05).

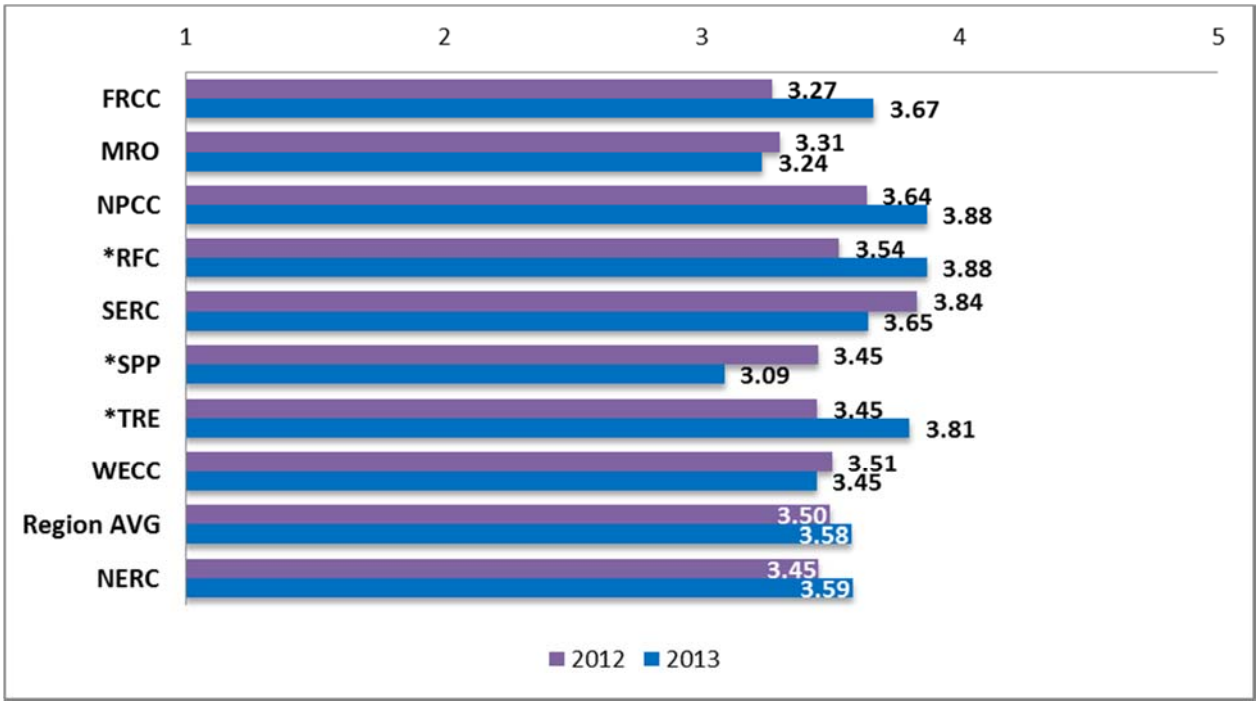
Compliance Monitoring

**Statistically significant difference (p<.05)*



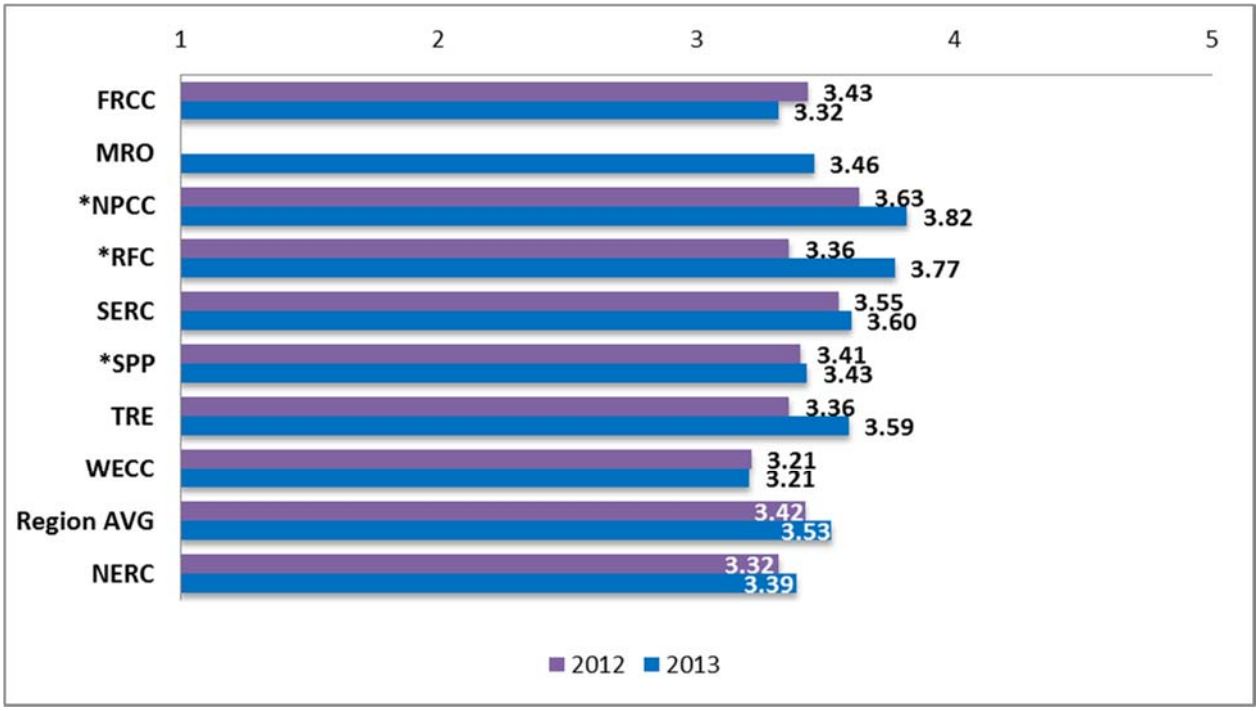
Enforcement Actions

**Statistically significant difference (p<.05)*



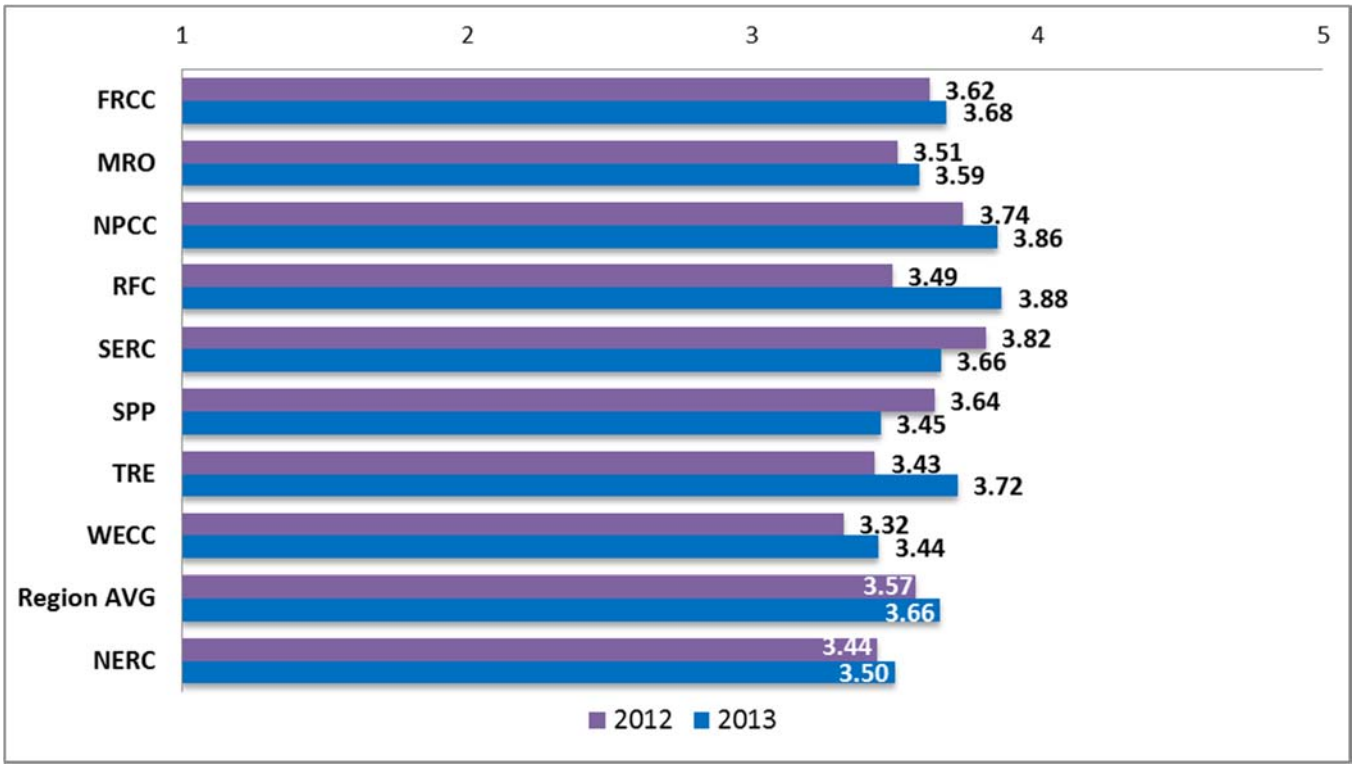
Organization Registration

**Statistically significant difference (p<.05)*



Organization Certification

**Statistically significant difference (p<.05)*



Comment Analysis

In the 2013 survey, open-ended responses underwent thematic qualitative analysis, creating objective output for interpretation. For each Topic Area and for the directed open-ended questions, all comments were coded thematically.

Stakeholder feedback focused on the following themes:

- Increased Consistency and Standardization:
  - In processes across Regions (Audit, Self-Reporting and Certification, Mitigation, the Functional Model, etc.)
  - In penalty application and the settlement process
  - In communications from NERC and RE's (portals, web links, etc.)
- Communication of Clearer, More Applicable Definitions:
  - In recertification processes
  - In JRO and CFR processes
  - In the BES
  - In valid reliability measure
- Greater Efficiencies via:
  - Increased process timeliness and feedback
  - Increased return on investment of compliance program
  - Continued streamlining of standards
  - Increased transparency

Compliance Monitoring

In both NERC and the Regions, leading themes in Compliance Monitoring referenced Auditor Inconsistencies and Self-Reporting/Certification.

THEME	NERC	RE
*Audit Inconsistencies	10	36
*Self-Reporting/Certification	15	23
Positive and Professional	2	11
Untimely Audits	2	9
Audit Feedback	2	4
Inappropriate and Unprofessional	1	3
Petty Fines	2	3
Standard Inconsistencies	2	3
Compliance Monitoring		2
Portal Consistency	2	2

THEME	NERC	RE
Process Inefficacies		2
Accountability		1
Limited to Regional Entity	1	1
Standards Development Process	1	1
Unjustified Costs	1	1
Contribution Clarity -WECC		1
Evidence Statements	1	
Increased Transparency and Consistency	2	
NERC Audit Guidance	1	

Auditor Inconsistencies – Sample Comments:

- "Overall our audit experiences have been favorable; however, in the past we have found inconsistencies, even within the same Region from auditor to auditor. We are in hopes that this will be eliminated by the auditor handbook."
- "This question will vary, depending on audit type. The 693 audits are well organized, well planned, and well executed. The CIP audits are not well organized, seemed to lack sufficient planning, and resulted in a somewhat chaotic environment. Also, the ever-changing CIP interpretations made compliance challenging."

Self-Reporting/Certification – Sample Comments:

- "The self-reporting process should be organized as a learning process for others instead of a punitive process."
- "The self-certification process has improved slightly, but needs to focus more on the BES that has a valid potential risk."
- "Recommend consideration of less frequent Self-Certifications and Data Submittals for smaller entities."

Enforcement Actions

In both NERC and the Regions, leading themes in Enforcement Actions referenced Settlement and Penalty Process and Consistency/Standardization.

THEME	NERC	RE
*Settlement and Penalty Process	17	37
*Consistency/Standardization	12	22
Mitigation	8	17
Transparency	5	16
Communications	4	11
FFT/FFR Implementation	3	1
Untimely Approval	1	7
Feedback		5
Positive and Professional		2
Accountability		1
Audit Report		1
Compliance		1

Settlement and Penalty Process – Sample Comments:

- "The settlement and penalty processes are not transparent. When more than one requirement is included in the settlement agreement, the penalty assessment is not defined and the calculation is not clear."
- "The audit report is overloaded with legal boilerplate, which may obscure improvement opportunities. Rules of Procedure are clear on mitigations, but mitigation of the immediate problem vs the underlying causes is variable. Settlements on the surface are transparent and end up being well documented, but never sure how they are going to turn out. Penalties seem to drift between the NERC VSL/VRF Penalty Table, and the FERC Sanction Guidelines; never sure which way an issue is going to lean, but prefer the structured approach of the FERC guidelines."

Consistency/Standardization – Sample Comments:

- "Audit team findings are not necessarily identical to Enforcement team findings."
- "Enforcement varies from Region to Region. WECC has applied more penalties and stiffer fines than the other Regions."
- "The audit process should be an open book test. It should have clear expectations of compliance. If I don't have clear expectations of compliance, how can the enforcement process be fair and impartial? If I don't understand what I've violated, I can't fix it or prevent reoccurrence."

Organization Registration

In both NERC and the Regions, leading themes in Organization Registration referenced Definitions/Clarity, Functional Model and Consistency/Standardization.

THEME	NERC	RE
*Definitions/Clarity	16	10
*Functional Model	9	9
*Consistency/Standardization	10	5
Feedback	3	4
Deregistration	4	4
Clear and Efficient	1	3
Overlaps/Gaps	5	3
Burdensome	5	2
Communications	2	2
GO/GOP/TO/TOP	3	2
Accountability	1	1
Process Improvement	1	1
Applicability	2	
BES	2	

Definitions/Clarity – Sample Comments:

- "The Planning Authority, Planning Coordinator function is not well-defined. There are gaps in registration and smaller entities are registered but should not be as they should be included in a larger Planning Coordinator Area."
- "The rules for assigning registered functions are not clear with information sprinkled in various documents. It is difficult to discern what is needed. The only saving grace is that inquiries on the process are quickly responded to. Discussion with the Regional Entities is necessary to understand the rules."

Functional Model – Sample Comments:

- "We believe the functional model is clear; however, it can create some confusion when you begin to apply it to certain standards, particularly the earlier versions of the Standards."
- "The function model was created back in early 2000s. Needs revamping. The original effort was to develop functions that an entity could perform. However the standards cross so many of these functions, confusion occurs within a utility of which function is connected to which requirement."

Consistency/Standardization- Sample Comments:

- "Registration criteria is not consistently applied in comparing other Regions. Request for transfer of registration function from one entity to another has not been addressed after multiple contacts."
- "Inconsistencies by RE personnel in different Regions. Complicated processes make registered entities look for ways not to use ROP options for ORC."

Organization Certification

In both NERC and the Regions, the leading theme in Organization Registration referenced Definitions/Clarity.

THEME	NERC	RE
*Definitions/Clarity	6	7
Re-Certification	2	3
Feedback		2
Deregistration	1	1
Efficient	1	1
BES		1
Consistency/Standardization	1	
Functionality	2	
Process Improvements	1	

Definitions/Clarity- Sample Comments:

- "The re-certification efforts need to be defined. E.g., what is the criteria that NERC uses to conduct a re-certification of an RC, TOP, BA."
- "At a RRO meeting, the Organization Reorganization function gave global examples of when to notify the Organization Reorganization Department of changes applied by the entity. The examples were too broad, not clear and not concise. The group should provide a procedure/program defining for the entity when the Organization Registration Department should be contacted for changes in the entity's function."
- "The Certification process is seemingly unknown even to the Regional Entity. Re-certification triggered by the NERC Rules of Procedure has apparently been in place for years, so it is unclear why the Regional Entity has no more understanding of what is entailed than the registered entity seeking re-certification. Perhaps some more detailed guidance from NERC would be beneficial."

Compliance and Reliability Impact

Comments regarding Compliance and Reliability Impact were gathered at the aggregate level and leading themes included Return on Investment and Reliability Standards.

THEME	#
Return on Investment	38
Reliability Standards	18
Administrative Issues	8
Compliance and Enforcement	7
Small Entities	6
Reliability Assurance Initiative	5
Risk Based vs. Zero Tolerance	3
Reliability Improvements	3
CIP Standards/Auditing	3

THEME	#
Consistency Complications	2
Reliability Metrics	1
Quantitative Results	1
Penalties	1
Independent Reliability Monitor	1
Deregulation	1
Cultural Alignment	1
BPS Reliability	1
BES Reliability Metrics	1

Return on Investment- Sample Comments:

- "While we agree that reliability of the bulk electric system has been enhanced to some degree, the enormous effort and associated costs that have been expended on things with no incremental benefit to the BES has drained resources from areas that are resource poor to begin with."
- "Agencies are spending much more time on Compliance Documentation and it is taking time from operators actually performing reliable operations of the Bulk Electric System."
- "The effort to ensure adequate documentation is excessive for our entity. The reliability effort is the same but documenting such is a burden."

Reliability Standards – Sample Comments:

- "The main focus of most conversations around the Reliability Standards now are what are the compliance implications and how will compliance be measured and not what will the reliability benefit be from a particular standard."
- "Our entity has been pushed to some "best practices" that were not previously done, but the overall impact on reliability is negligible at best."
- "While there have been improvements with regard to the reliability benefits experienced overall, there is still much work to be done to ensure that the Standards in effect truly do (or may) have a material impact to the operations of the BES. Those Standards that do not have a material impact to the reliability of the BES should be eliminated."

Recommendations: ERO-CMEP

Recommendations regarding the ERO-CMEP were gathered at the aggregate level and leading themes included Reliability Assurance Initiative and Focus on Reliability/Security.

THEME	#
Reliability Assurance Initiative	9
Focus on Reliability/Security	5
Audit Efficiency	4
Consistency	4
Risk Based vs. Zero Tolerance	4
Compliance Monitoring/Transparency	3
Target Due-Date Consistency	2
FFT Processing	1
Focus on Compliance and Enforcement	1
Process Improvement	1
Reliability Standards Program	1
Reporting Efficiency	1
Identify, Assess, Correct	1
Training	1

Reliability Assurance Initiative- Sample Comments:

- "Recommend diligent completion of development and implementation of the Reliability Assurance Initiative (RAI), particularly with regard to the impact on smaller entities, since the RAI appears to be headed in the right direction."
- "The RAI should try to maintain the focus on managing/mitigating reliability risk, providing consistency across the N.A. footprint and distinguishing between the reliability standards that maximize reliability assurance from those that are not as critical to that assurance."
- "The concern is with the level of effort around implementation of the RAI, specifically the Internal Controls. The White Paper guidance and the Internal Controls Working Guide appear inconsistent with statements by NERC that the RAI process would be less onerous. A more clear direction needs to be provided."

Focus on Reliability/Security- Sample Comments:

- "We need to facilitate a culture of reliability/security excellence. Where we all work together to keep this machine and all its parts rolling."
- "The process is too punitive and not necessarily geared toward improving reliability. We can't openly share potential reliability gaps for fear of retribution."
- "Provide better information about cyber security violations in the form of lessons learned around specific compliance issues that will enhance reliability."

Recommendations: Regional Entities

Recommendations regarding the Regional Entities were gathered at the aggregate level and leading themes included Collaboration/Consistency and Audit Standardization.

THEME	#
Collaboration/Consistency	17
Audit Standardization	4
Transparency	1
SPP RE Trustee Effectiveness	1
Reporting Improvements	1
Region Principles	1
RE Understanding	1
RE Praise	1
Focus on Reliability/Security	1
FFT Improvements	1
CDAA Improvements	1
Board Expansion	1
Audit Training	1

Collaboration/Consistency – Sample Comments:

- "There should be more collaboration and consistency between the Regions."
- "The Regions need to be consistent regarding JRO's, audit practices, and compliance requirements relative to documentation required, method of submittal, etc. It would be helpful if the Regions settled on one portal."
- "Recommend continued emphasis on achieving uniformity across Regions under the direction of NERC."

Audit Standardization – Sample Comments:

- "More standardization in the 'audit approach' would be very welcome."
- "Regional entities should work to standardize expectations, timelines, and interpretations of standards. This will minimize the efforts for entities to 'prove compliance' verses focusing on what will make the system more reliable and safe for all customers of the bulk electric power system."
- "We would like to have a single audit where SERC is the lead to cover us for audits in RFC. Our last audit for RFC consisted of a single requirement that really didn't apply to us. Seemed extremely unnecessary."

Inconsistencies across Regions

Comments regarding inconsistencies across Regions were gathered at the aggregate level and leading themes included Regional Inconsistencies and Audit Inconsistencies.

THEME	#
Regional Inconsistencies	23
Audit Inconsistencies	15
Standards	4
Compliance Monitoring	3
Portal Inconsistencies	3
Self-Certification	3
CMEP Schedules	1
Interpretation Clarity	1
CIP	1
Department Inconsistencies	1
Settlement Process	1

Regional Inconsistencies – Sample Comments:

- "Hearing from other entities that operate in other Regions or multiple Regions, they indicate there is a definite inconsistency within the Regions regarding application of NERC Reliability Standards."
- "There continue to be inconsistencies across the Regions regarding the enforcement process."
- "Just look at PRC-005 and VAR-002 violations across the Regions. You will see varying amounts of penalties going back to 2007. In defense of the Regions, it is difficult to be consistent with some many variable to consider. Some degree on inconsistency is to be expected, but the gap is too wide today."

Audit Inconsistencies – Sample Comments:

- "There are significant differences in the way CIP audits are being conducted in the SPP Region versus other Regions. The SPP CIP audits are going above and beyond the purview of the Standards. The SPP CIP auditors are auditing to best practices and not auditing to the letter of the Standards."
- "We have been told during workshops and audits that different auditors may reach different conclusions. That is an admission of inconsistency."
- "While there are many areas of consistencies across the Regions, each audit takes on its own persona based on the makeup of the team and especially if there are NERC and FERC observers."

Conclusion and Recommendations

Conclusion

The 2013 Stakeholder Perception Survey illustrated positive trends in all year-over-year evaluations, indicating industry's view of continued enhancements to ERO Effectiveness. Industry's relative perceptions of program strengths and opportunity areas were delineated through quantitative and qualitative analysis.
Industry feedback of strengths included:

- Compliance Monitoring components involving audit teams, audit processes, and self-certification.
- Positive progress by NERC and the Regions between 2011 and 2012 across all program areas, with a 38 percent increase in perceptions of NERC around Compliance Monitoring and Enforcement Actions.

Industry feedback for improvement included the themes:

- Increased consistency and standardization (in processes across Regions, in penalty application and the settlement process, and in communications from NERC and REs).
- Communication of clearer, more applicable definitions (in the recertification processes, in JRO and CFR processes, in the BES, and in valid reliability measure).
- Greater efficiencies (via increased process timeliness and feedback, increased return on investment of compliance program, continued streamlining of standards, and increased transparency).

2013 Recommendations

Through analysis and interpretation of the 2013 Stakeholder Perception Survey, the CCC has decided to recommend that NERC continue to move forward with the 2012 recommendations which are tied to the three themes that have prevailed over the past three years the survey has been conducted.

1. ROI of compliance program;
2. Inconsistencies within and across Regions; and
3. Transparency of the enforcement and penalty processes. In addition to recommendations below, NERC should address the specific conduct concerns that were presented in some of the comments.

These concerns have been presented to NERC under separate cover.

1. The CCC should continue to work with NERC staff to communicate the survey results in a productive way to NERC and the Regions to facilitate performance improvement and positively impact stakeholder perceptions.
2. The recommendations provided in the 2011 Stakeholder Perceptions Survey specifically included items to address ROI (recommendation number one) and transparency (recommendation number four). NERC should compile a new list of action items based on this 2012 survey and those provided in the 2011 survey. The CCC should have a standing item on its agenda for the next year to review NERC's progress on its action plan, offer assistance where requested, and work with NERC to communicate its successes to improve the results of future surveys.
3. NERC should review key/identified post-audit processes (audit reports, mitigation plans and settlements) with the objective of standardizing the process across Regions, streamlining components, and reducing the total process time.
4. NERC staff should review the free form written responses to the survey to identify the predominant consistency issues and develop an action plan to address.
5. NERC should implement a Multi-Region Registered Entity (MRRE) process by the end of 2013 (this was also addressed in the 2011 survey recommendations).

The CCC thanks the industry for their participation and the feedback provided in the survey. The CCC also wants to recognize NERC's support in facilitation of the CCC Stakeholder Survey, and its provision of an outside consultant to drive survey enhancement. The CCC requests that the NERC Board consider releasing a public version of the report.

REMG
REGIONAL ENTITY MANAGEMENT GROUP

STACY DOCHODA – FRCC | ED SCHWERDT – NPCC | SCOTT HENRY – SERC | LANE LANFORD – TRE
DAN SKAAR – MRO | TIM GALLAGHER – RFC | RON CIESIEL – SPP | CONSTANCE WHITE – WECC

Date: April 7, 2014

To: NERC Board of Trustees

From: Carter B. Edge, Director of REMG Coordinated Activities

Cc: Regional Executives

Subj: Regional Entity Management Group (REMG) report for the May NERC Board Meeting

Dear Trustees:

The Regional Entities continue to believe that our individual success should be measured by our collective success. To that end, leading up to the 2014 ERO Enterprise Metrics, we have been collaborating together and with NERC staff to complete work necessary to:

- File the 5-year ERO assessment
- Implement reforms under the Reliability Assurance Initiative (RAI) in a coordinated and consistent manner
- Conduct ERO-wide staff training on the Compliance Auditor Manual

Some efforts and accomplishments in these areas include:

- Development of a joint regional self-assessment as Attachment 2 to the *Five-Year Electric Reliability Organization Performance Assessment Report*. This assessment, with appendixes describing the Regional Entities' responses to specific concerns raised in the Commission's September 16, 2010 order on the Three-Year ERO Performance Assessment, as well as, how each region satisfies the applicable statutory and regulatory criteria for continued certification as part of the ERO, shows how NERC and the Regional Entities have coordinated over the period into an ERO Enterprise. Efforts, going forward, to improve enterprise operations with NERC will be around (1) clarifying and refining roles and responsibilities; (2) coordinating strategic planning and operational decision-making; (3) continuing to improve consistency; (4) sharing tools and infrastructure for delegated functions; and (5) coordinating communications.
- Preparation for execution of reforms under RAI began last year with the development of the 2014 ERO Compliance Monitoring and Enforcement Program required under the NERC Rules of Procedure. The 2014 ERO CMEP Implementation Plan is now a single, consolidated plan that aligns with the RAI and supports efforts toward a risk-based approach to compliance monitoring. It is important to note that 2014 is a transition year and that modifications to CMEP processes will occur across the ERO Enterprise to capture ongoing RAI efforts and project results that affect CMEP activities during the implementation year in a coordinated and consistent manner. The convergence of RAI pilot activity is an example. Specific guidance on CMEP activities will be provided throughout the 2014 implementation year and it is anticipated that more consistent, standardized processes will be implemented during the 2015 cycle.

- An ERO audit checklist and associated auditor handbook as a basis for enhancing Regional Entity audit practices, audit consistency, and auditor skills was developed late last year. A training program around these tools has started for ERO audit staff with specific auditor capabilities and competencies supporting the sustainment of ERO staff skills on a going forward basis.

BES Implementation

With the Commission approval of a revised Bulk Electric System definition, reliability will be improved by focusing activities on core facilities that are necessary for operating the interconnected transmission network. The definition provides clarity (when applied consistently) to those who are responsible for performance under the Reliability Standards around what is considered Bulk Electric System.

While the majority of the industry's effort should be focused on applying the revised definition to their asset inventory, the Regional Entities and NERC have developed corresponding enterprise-wide practices and an online application called the BES Notifications and Exceptions tool (BESnet) to support requests for exceptions to the definition. The BESnet provides a consistent way for entities to make notifications of changes to Bulk Electric System assets that affect their responsibilities for compliance with the Reliability Standards and to submit requests for a case-by-case determination of exception. The BESnet allows the ERO Enterprise to manage this workflow in an efficient and effective manner. Regional Entity staff will be the initial reviewers of notifications and exception requests and all eight regions have been actively engaged in developing consistent practices for these reviews.

Reference documents and training will continue to be developed and delivered leading up to the July 1, 2014 effective date to assist industry with the transition and ERO staff in consistently applying the definition and processes across the regions. These materials and schedules for training and outreach activities can be found on the NERC website.

OPEN DISTRIBUTION

April 7, 2014

NATF Report for NERC Board of Trustees (BOT) – May 2014

- NATF / NERC Coordination Progress:
  - 345 kV Breaker Performance (see attached)
  - Protection System Mis-operation
  - Sharing of NATF Modeling Documents
  - EMS (Situational Awareness) Performance
  - FAC Rating Alert – Best Practices for ongoing ROW Maintenance
  - Security / Physical and CIP V5 Practices

- Systematic Interaction with Members / ERO on Reliability Assurance Initiative (RAI)
  - Sharing of Key Principles and Lessons Learned
  - Risk / Controls focus in Peer Reviews
  - Preparing Members for Risk-focused Audits
  - Interacting with ERO Staff (workshops, etc.)

- EPRI Collaborations
  - Resiliency:
    - Physical Security
    - GMD Workshop(s)
    - EMP Workshop
    - Severe Weather
  - Equipment Performance and Maintenance Issues
  - Strategy Sessions Regarding Grid Operations and Planning Synergies

- INPO Collaborations - Operating Experience / LOOP Reductions (IER 13-53) / Blackstart

- NATF 2014 Peer Review Program Fully Integrates:
  - Risk Assessment and Internal Controls
  - Human Performance Error Reduction
  - Operating Experience Exchange
  - Physical Security

- Other Recently Completed / Near Term Activities
  - Compliance Practices Workshop (focus on Risk / Controls)
  - Human Performance Symposium
  - System Operations – EMS focus

TO: NERC Board of Trustees
Gerry Cauley, NERC President and CEO

FROM: Allen D. Schriver
Chair, North American Generator Forum (NAGF)

DATE: April 7, 2014

SUBJECT: NAGF 2014 Spring Report

---

1. The NAGF Standards Review Team collaborated with the VAR-002 Standards Drafting Team to first review generator comments from the last posting and then to develop and propose compromise language to the SDT, most of which was incorporated into the Standard. The NAGF strongly encouraged its members to review and evaluate the proposed Standard from the perspective that the new iteration was an improvement, was a compromise with TO/TOP's and was produced through what the NAGF leadership believes will be the first of many collaborative projects.

2. The NAGF Standards Review Team at the request of Mr. James Castle, NYISO and Chairman of the Operating Committee reviewed and submitted comments on the **Reliability Guideline: Generating Unit Operations During Complete Loss of Communications.**

3. On Wednesday April 2, 2014, the NAGF Security Practices Group held an NAGF conference call to update the membership on the status of **Project 2014-02 CIP Version 5 Revisions**. The call covered discussions on the overall plan, the changes to be worked on, the subgroup breakout and expected direction, the proposed schedule and the possibility for the NAGF to collaborate on the development of RSAW's.

4. Friday April 25, 2014, the NAGF is sponsoring a **BES Definition Workshop** to be held at the NextEra Energy Inc. Office in Juno Beach Florida. Mr. Thomas Burgess, NERC Vice President and Director, Reliability Assessment and Performance Analysis and Mr. Peter Heidrich, FRCC Manager of Reliability Standards have been kind enough to volunteer to lead the Workshop. The goal of the Workshop is to exchange information on the revised definition and to discuss impacts to GO/GOP's due to the change.

5. The NAGF continues to work on collaborative efforts as follows:
    A. With Mr. Troy Blalock, SCE&G, on the Eastern Interconnection Frequency Response Initiative. The NAGF is working to develop tuning guidelines for older GE mechanical governors.
    B. With Mr. Scott Barfield-McGinnis, NERC on opportunities to update and engage the NAGF on two specific NERC projects that affect generation entities. The projects are 2010-05.1 – Protection Systems: Misoperations (PRC-004-3) and 2010-13.3 – Relay Loadability: Stable Power Swings (PRC-026-1, new).
    C. With Mr. Mark Lauby, NERC as a member of the Reliability Based Registration Advisory Group (RBRAG)

Standards

Mark Lauby, Senior Vice President and Chief Reliability Officer
Board of Trustees Meeting
May 7, 2014

RELIABILITY | ACCOUNTABILITY

Demand Data (MOD C) – MOD-031-1

- Reliability benefits
  - Establishes consistency in data requirements and reporting procedures
  - Provides the authority to collect data necessary for reliability
  - Identifies responsible entities
- Action
  - Adopt MOD-031-1 Demand and Energy Data and associated documents

Voltage and Reactive Control – VAR-002-3

- Reliability benefits
  - Ensures Generator Operators (GOPs) provide reactive and voltage support
  - Enable GOPs to operate in controlling voltage or other mode as instructed by the Transmission Operator (TOP)
  - Requires GOPs to follow notification requirements established by the TOPs

- Action
  - Adopt VAR-002-3-Generator Operation for Maintaining Network Voltage Schedules and associated documents

Communication Protocols COM-002-4

- Reliability Benefits
  - Reliability-related information for Emergency and non-Emergency Operating Instructions is conveyed effectively, accurately, and consistently, in a timely manner towards mutual understanding by all key parties
- Action
  - Adopt COM-002-4—Operating Personnel Communication Protocols and associated documents
  - Rescind approval of Interpretation of COM-002-2, effective upon implementation of COM-002-4 in substantially the form adopted by the Board

Modify VRFs and VSLs as directed by FERC

- Background
  - FERC directed modification of Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) in 11 Reliability Standards
- Action
  - Adopt Violation Risk Factor/Violation Severity Level Revisions:
    - TPL-001-4
    - CIP Version 5 (CIP-003-5, CIP-004-5.1, CIP-006-5, CIP-008-5, CIP-009-5)
    - MOD-026-1 and MOD-027-1
    - PRC-005-2 and PRC-005-3
    - BAL-003-1

Physical Security Standard

- Background
  - FERC order issued on March 7, 2014, directed NERC to submit Reliability Standard(s) that require steps to address physical security risks and vulnerabilities within 90 days
- Final ballot update

State of Reliability Report

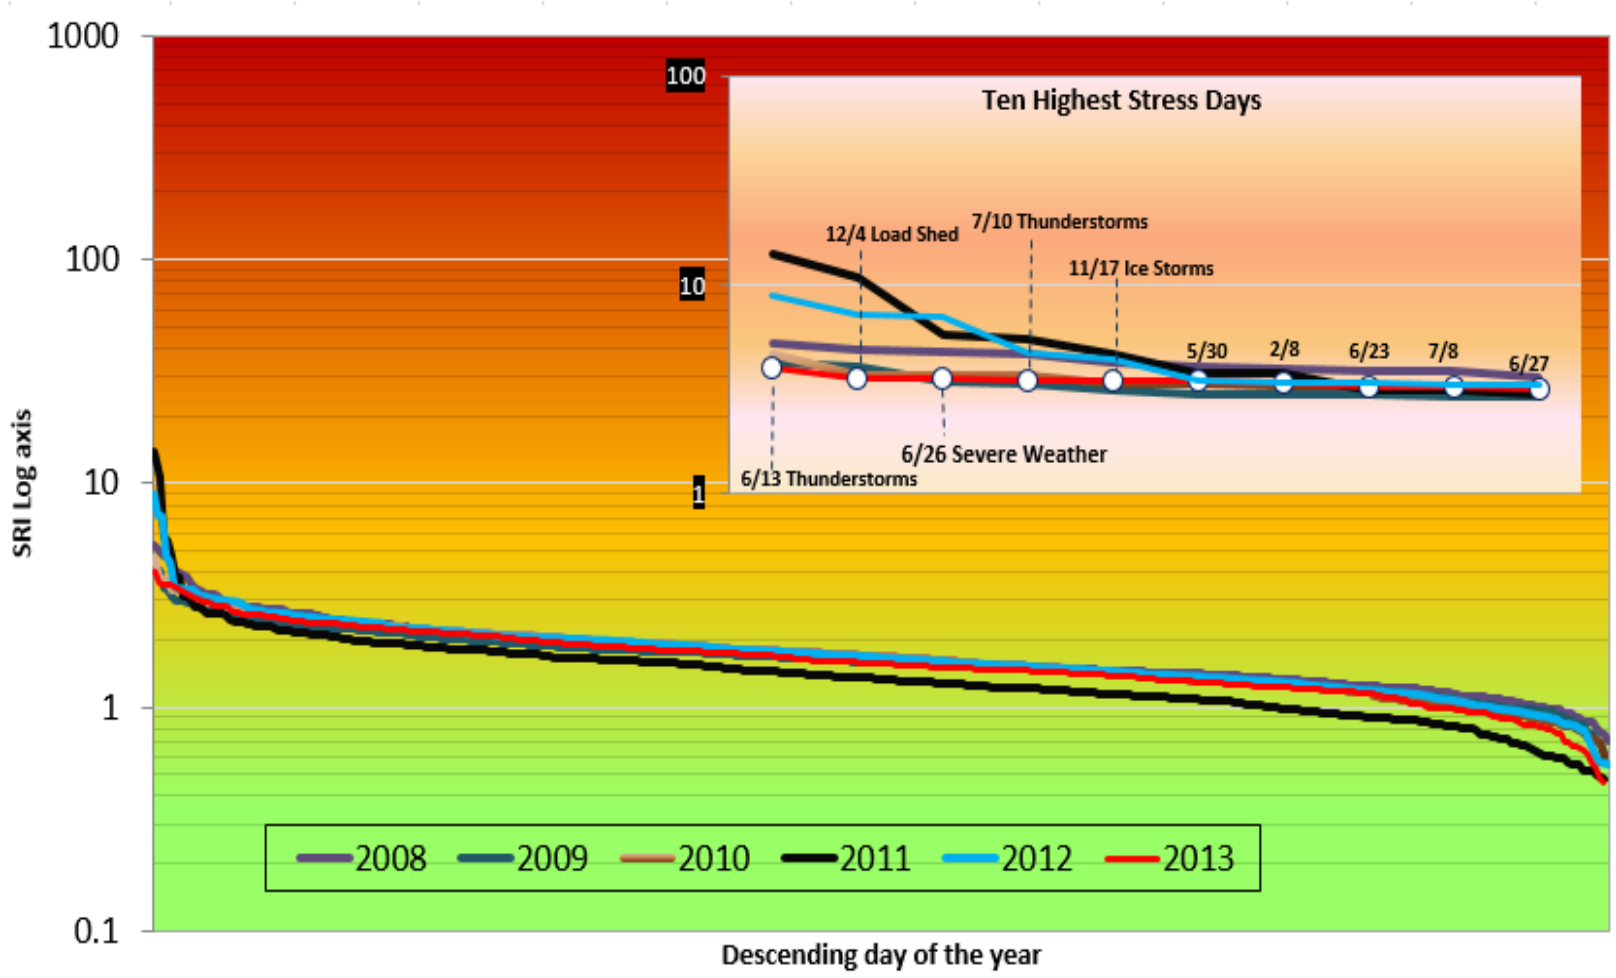
Howard Gugel, Director, Performance Analysis
Board of Trustees
May 7, 2014

RELIABILITY | ACCOUNTABILITY

State of Reliability

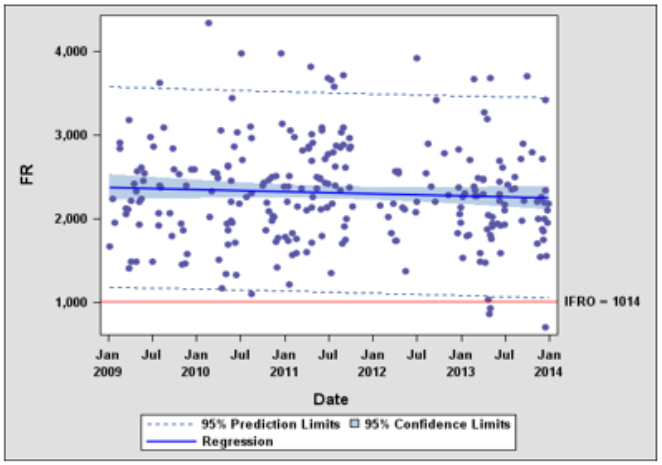
- Purpose – independent view of performance
- Identify trends and risks to reliability
- Provide recommendations
- Serve as risk-informed input to:
  - Reliability Issues Steering Committee (RISC) project prioritization
  - Standards projects
  - Reliability assurance initiatives
  - Event analysis reliability assessment, and critical infrastructure protection

Sustained High BPS Performance

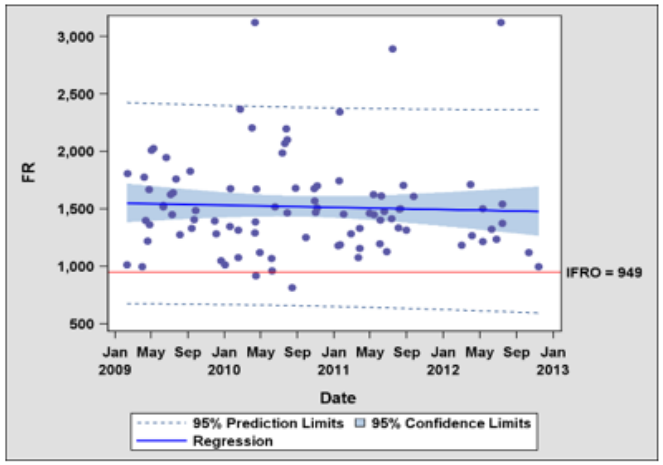


Frequency Response Remains Stable

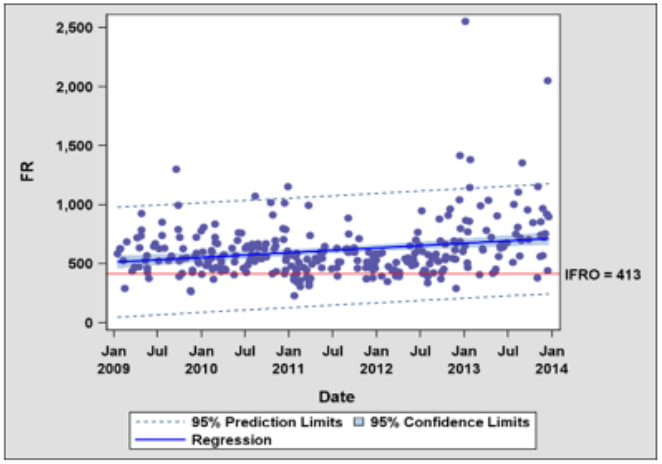
Eastern Interconnection



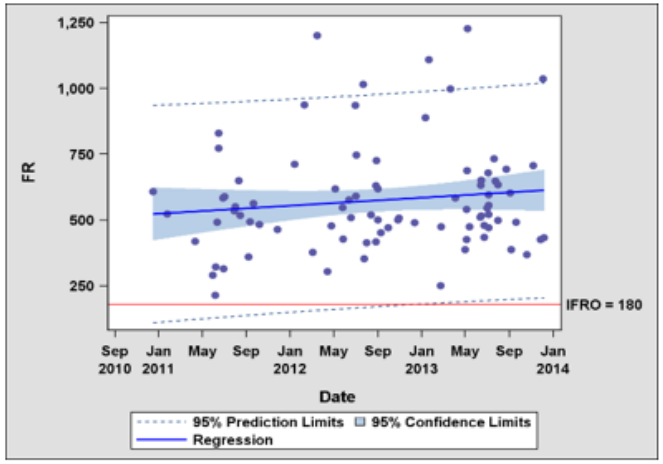
Western Interconnection



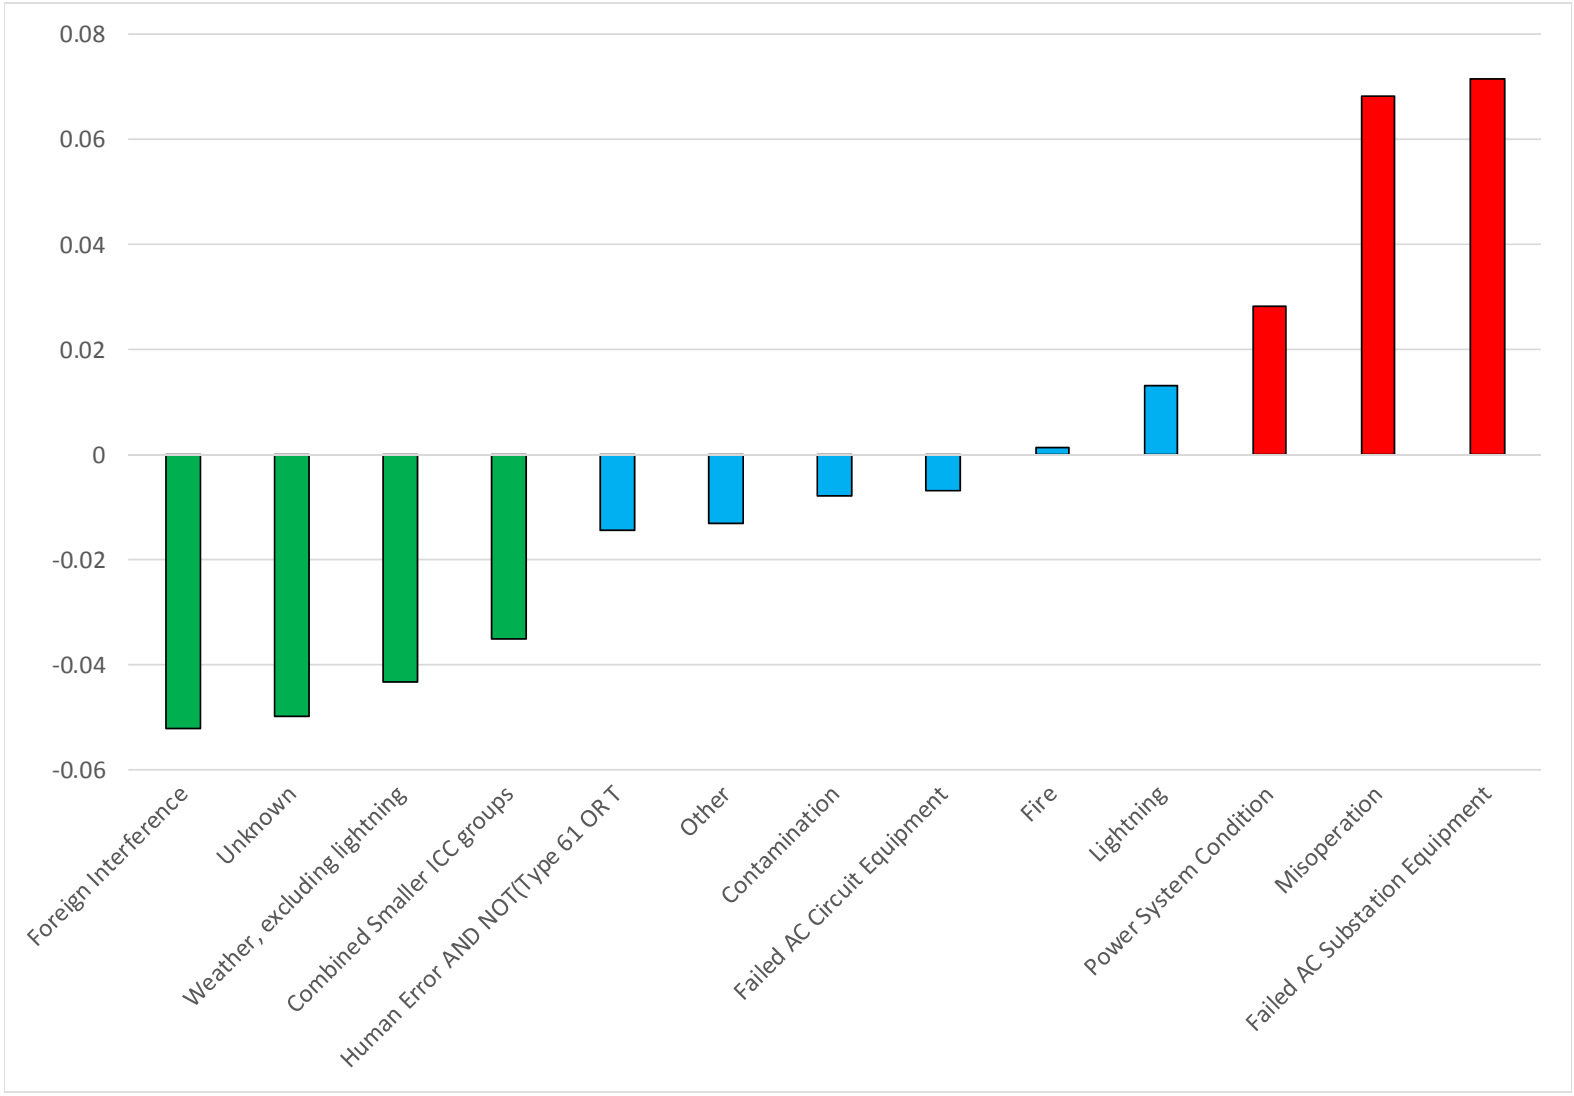
ERCOT Interconnection



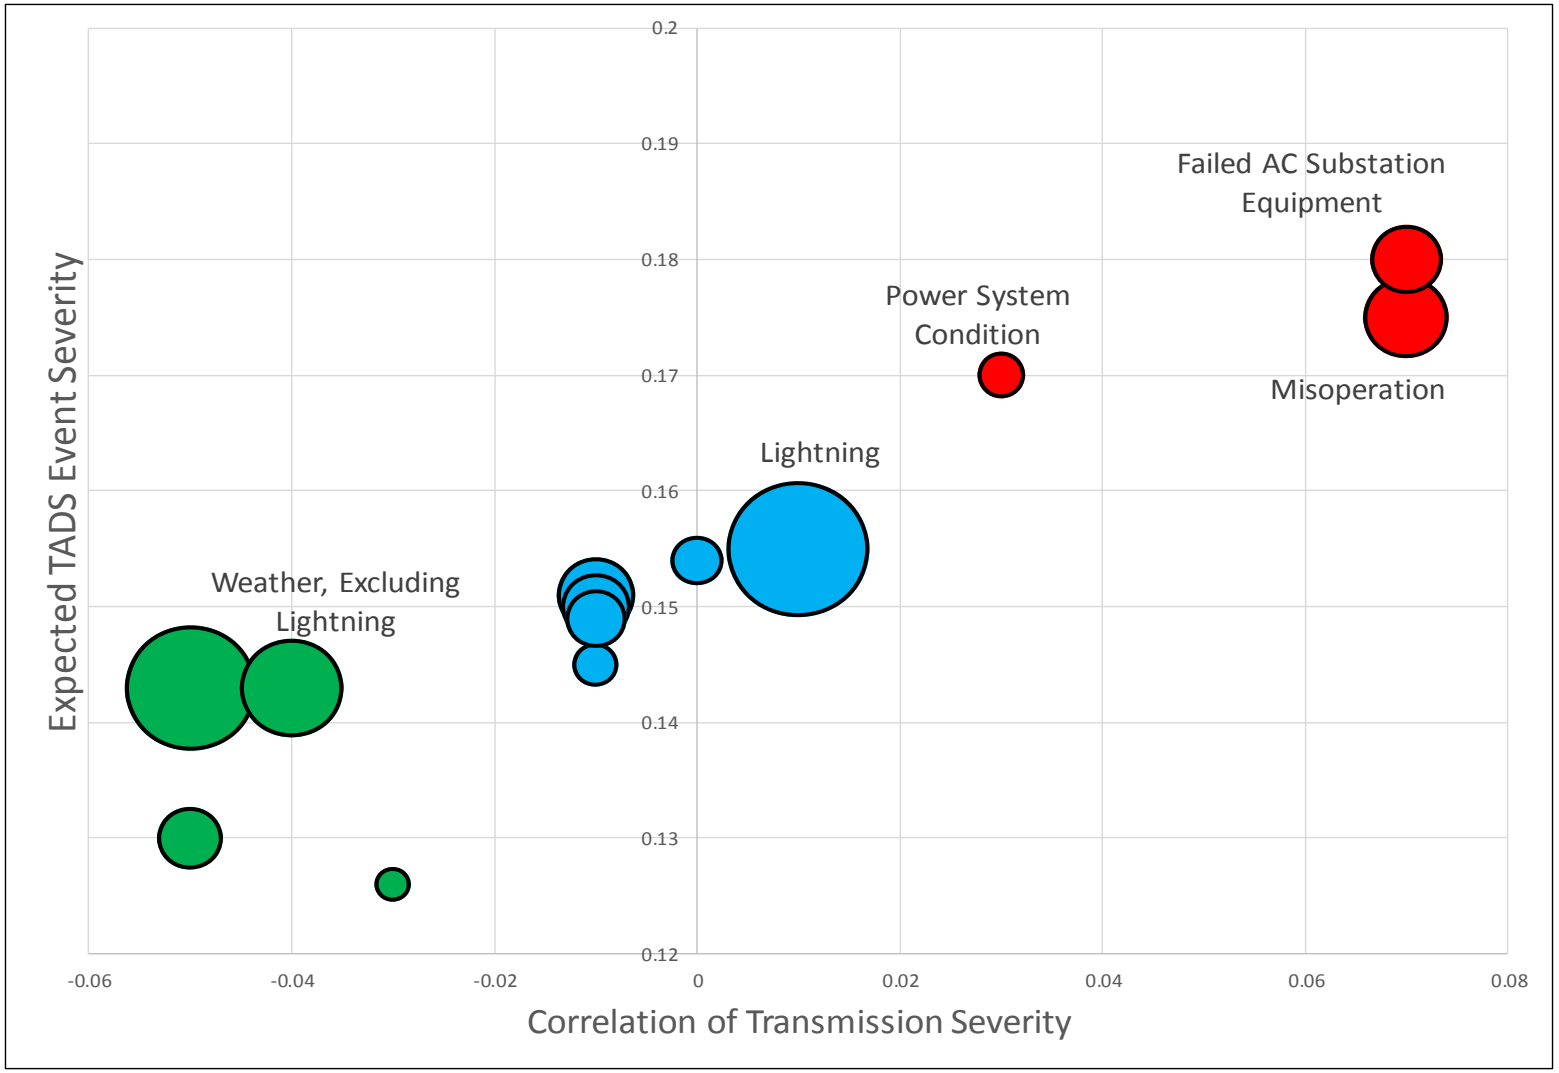
Québec Interconnection



Protection System Misoperations and Failed AC Substation Equipment



Transmission Outage Severity Correlation



Use of EEA Level 3 Declines

Number of Events	Year							
	2006	2007	2008	2009	2010	2011	2012	2013

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

2014 Summer Reliability Assessment

John Moura, Director of Reliability Assessments
Board of Trustees
May 7, 2014

RELIABILITY | ACCOUNTABILITY

Key Findings - Summary

1. All Regions Meet Summer Reference Margin

- **ERCOT**: sufficient margins dependent on in-service dates of new generation
- **MISO**: retirements, derates, mothballing

2. Gas-Electric Interdependencies – Considerations for Summer

- Year-on-year increasing dependence on gas-fired generation
- Pipeline maintenance
- Natural gas storage

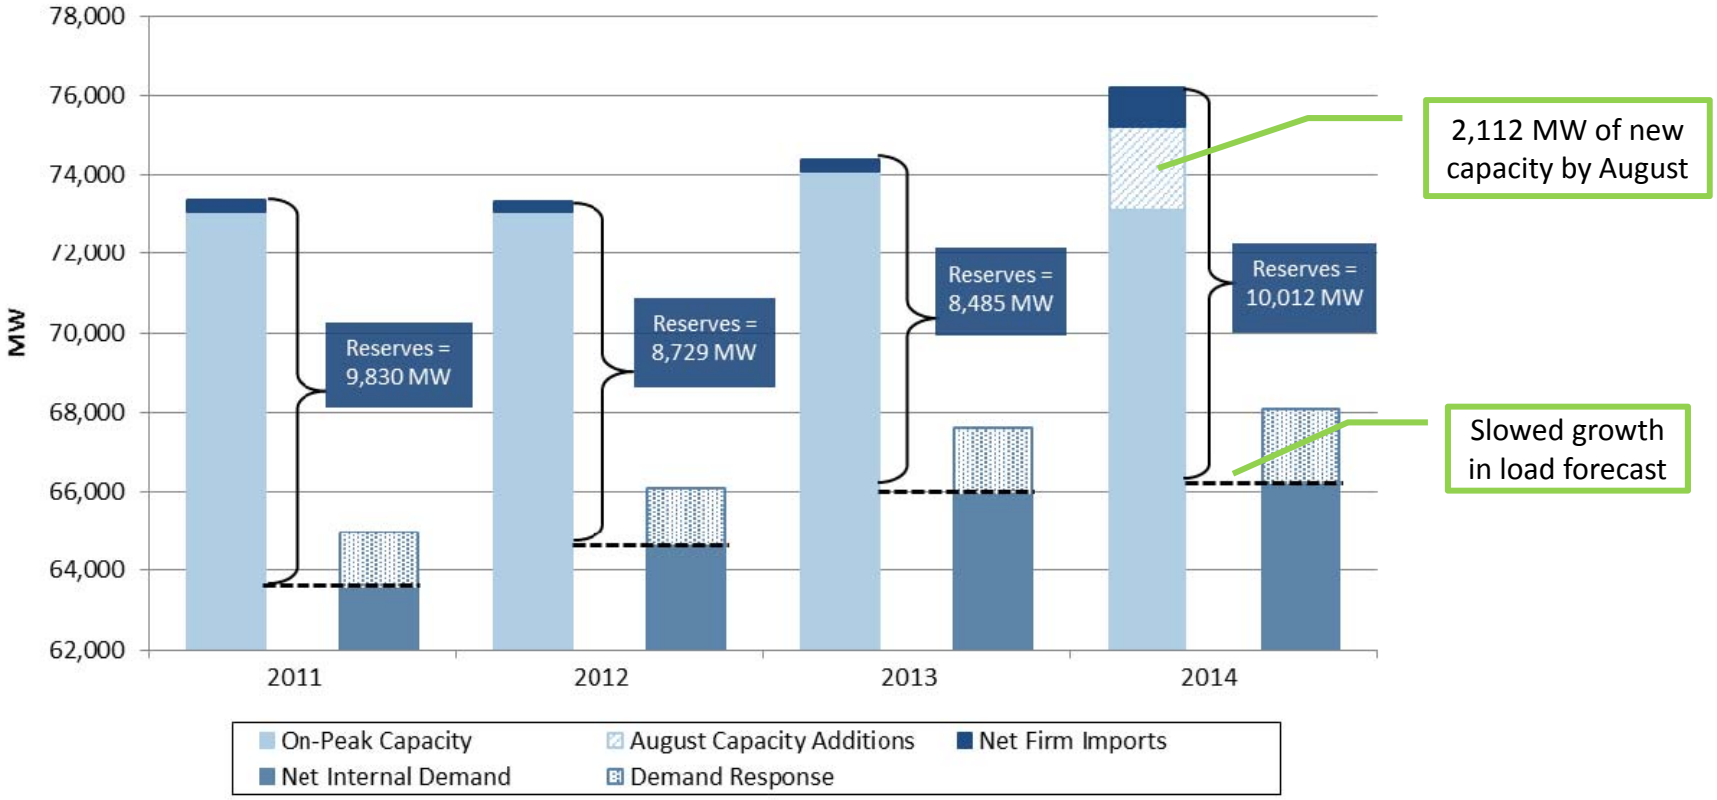
3. Continued Impacts of Baseload Retirements

- Contribute to tighter reserve margins
- Ontario retired last coal plant in April
- Localized reliability issues identified in operational planning

Other Summer Season Highlights

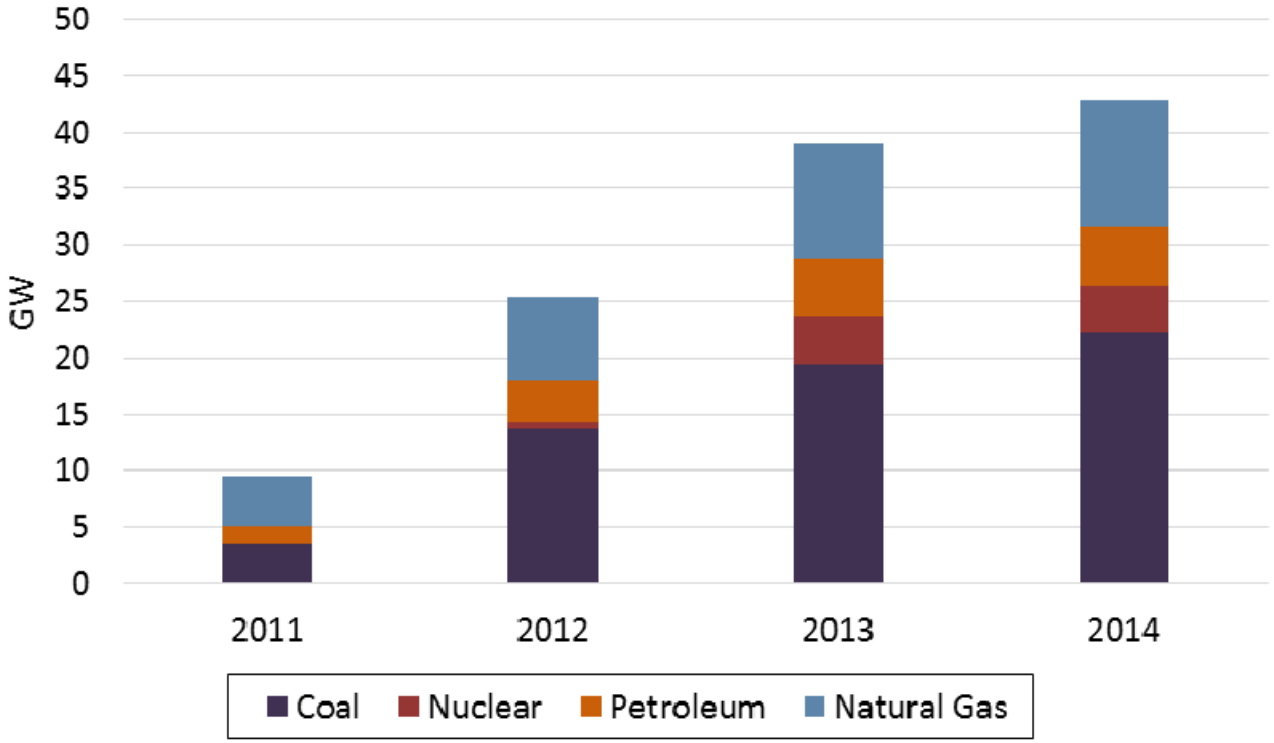
- **MISO-South integration**
  - North-south transmission constraints
- **California drought impacts**
  - Conditions have improved since March
  - “Extreme Drought” for most of California; some parts “Exceptional"
- **Rail shipments of coal in the Midwest**
  - Generation impacts unlikely for summer peak
  - Further evaluations warranted for longer-term challenge

New Capacity in ERCOT Strengthening Reserve Margins



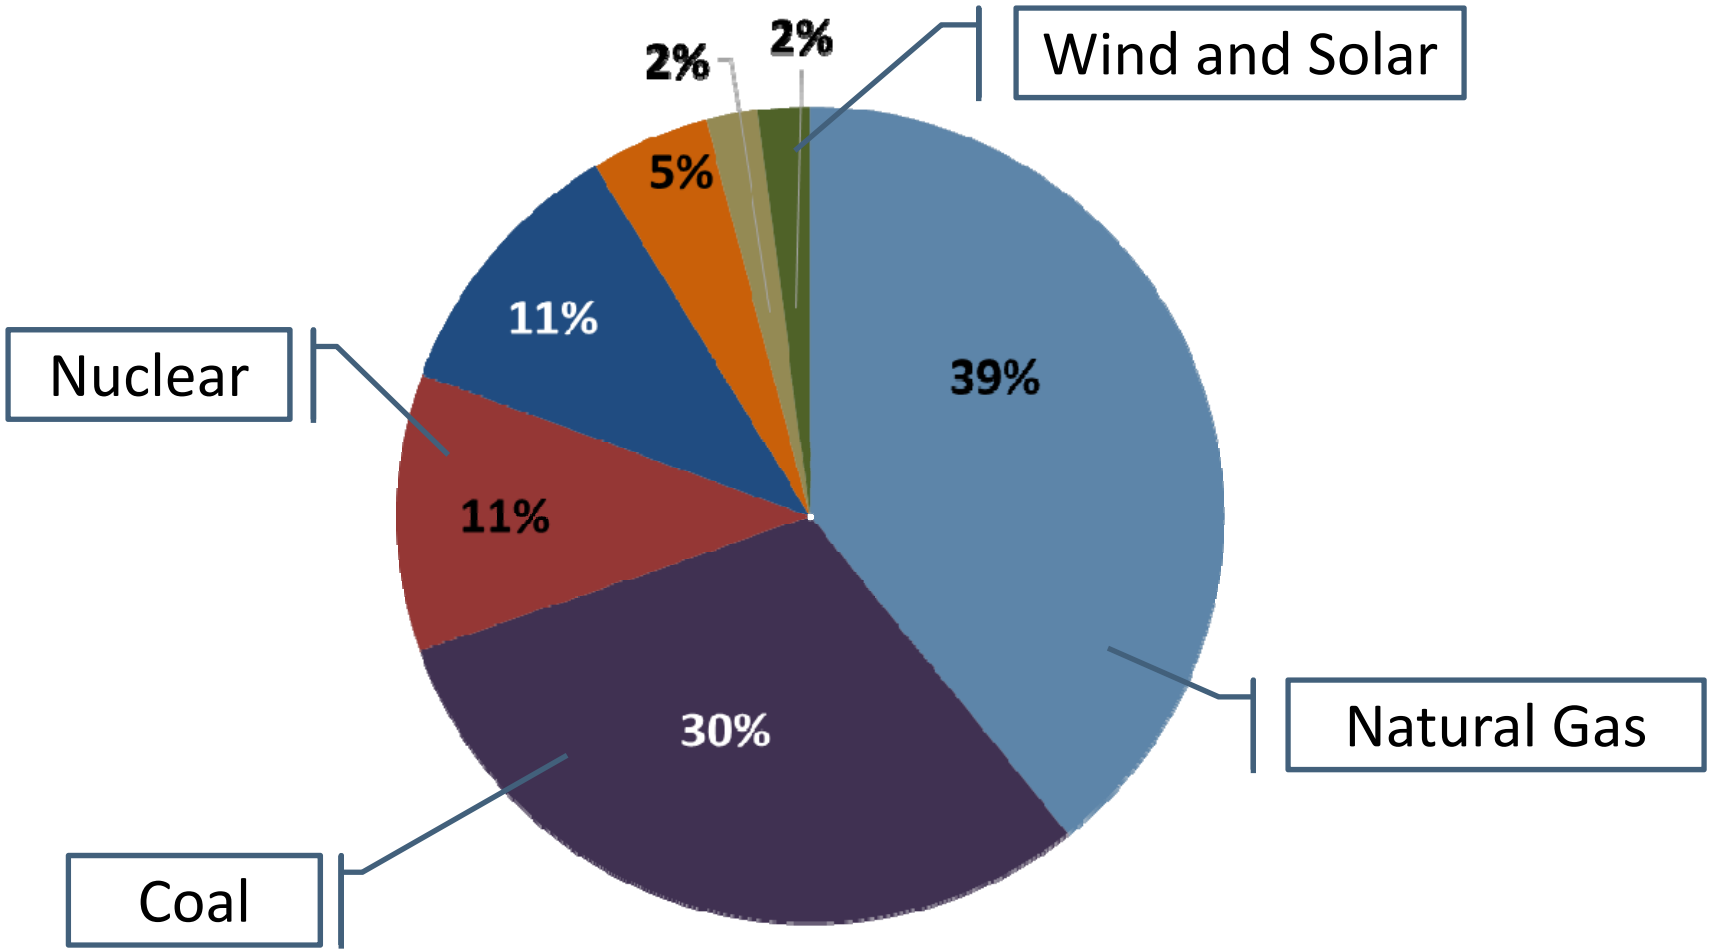
- August in-service date for needed capacity
- Growth in Demand Response programs
- Slower load growth projected, based on modified forecasting methodology

Generator Retirements On-Pace with NERC Projections



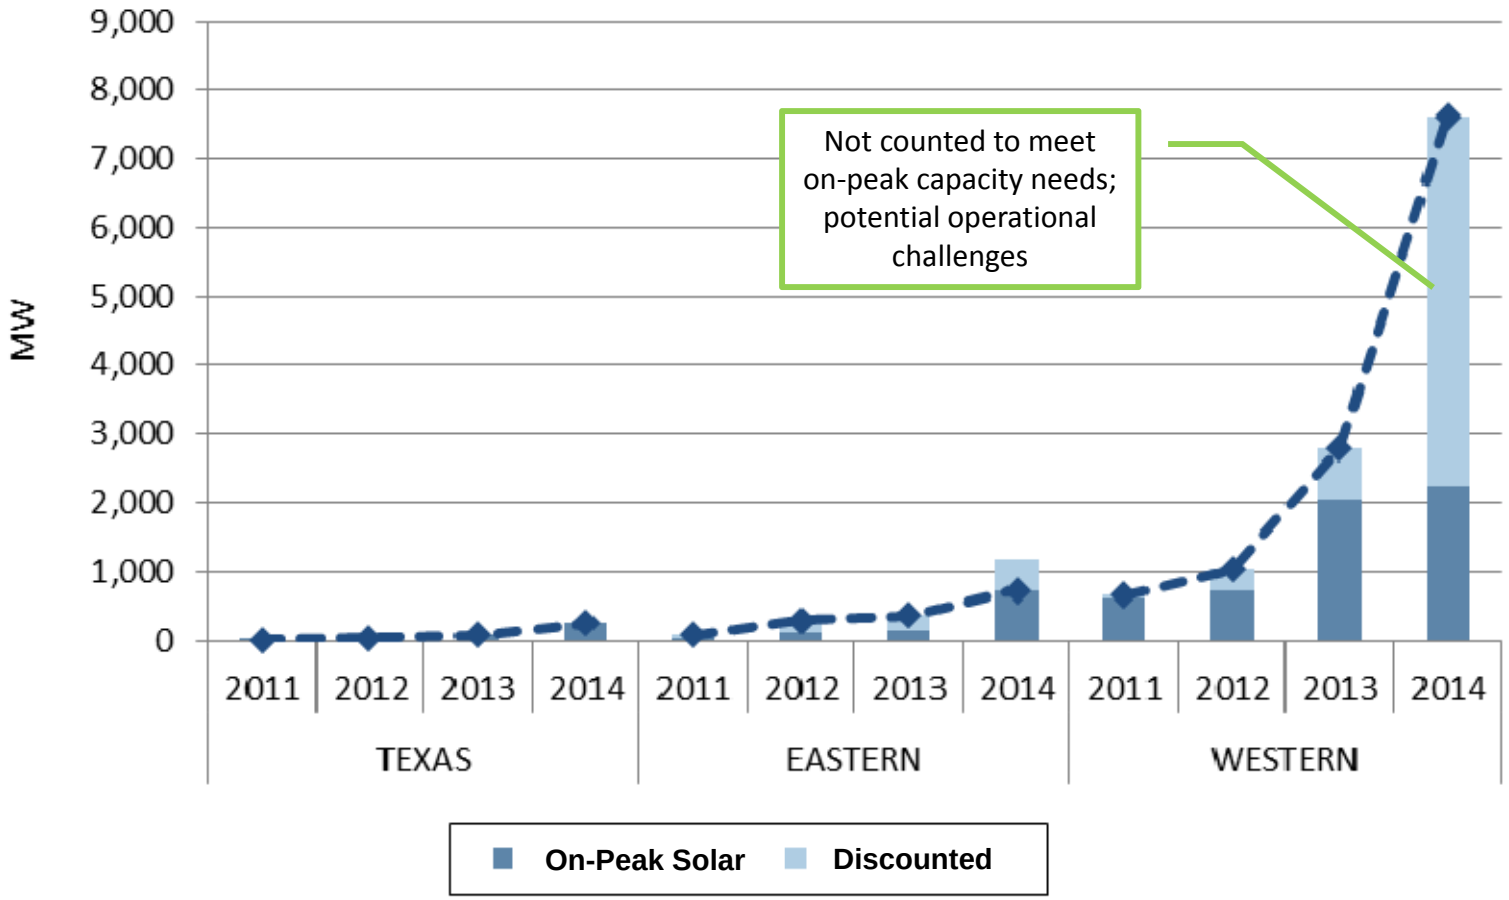
- **Retirements:** 43 GW of capacity since 2011
- Significant capacity reductions in Ontario and MISO
- Continue to track long-term impacts in the *Long-Term Reliability Assessment*

An Evolving Resource Mix



Substantial Growth in Solar Resources

Solar Energy in WECC (primarily California)



Approval and Publishing Schedule

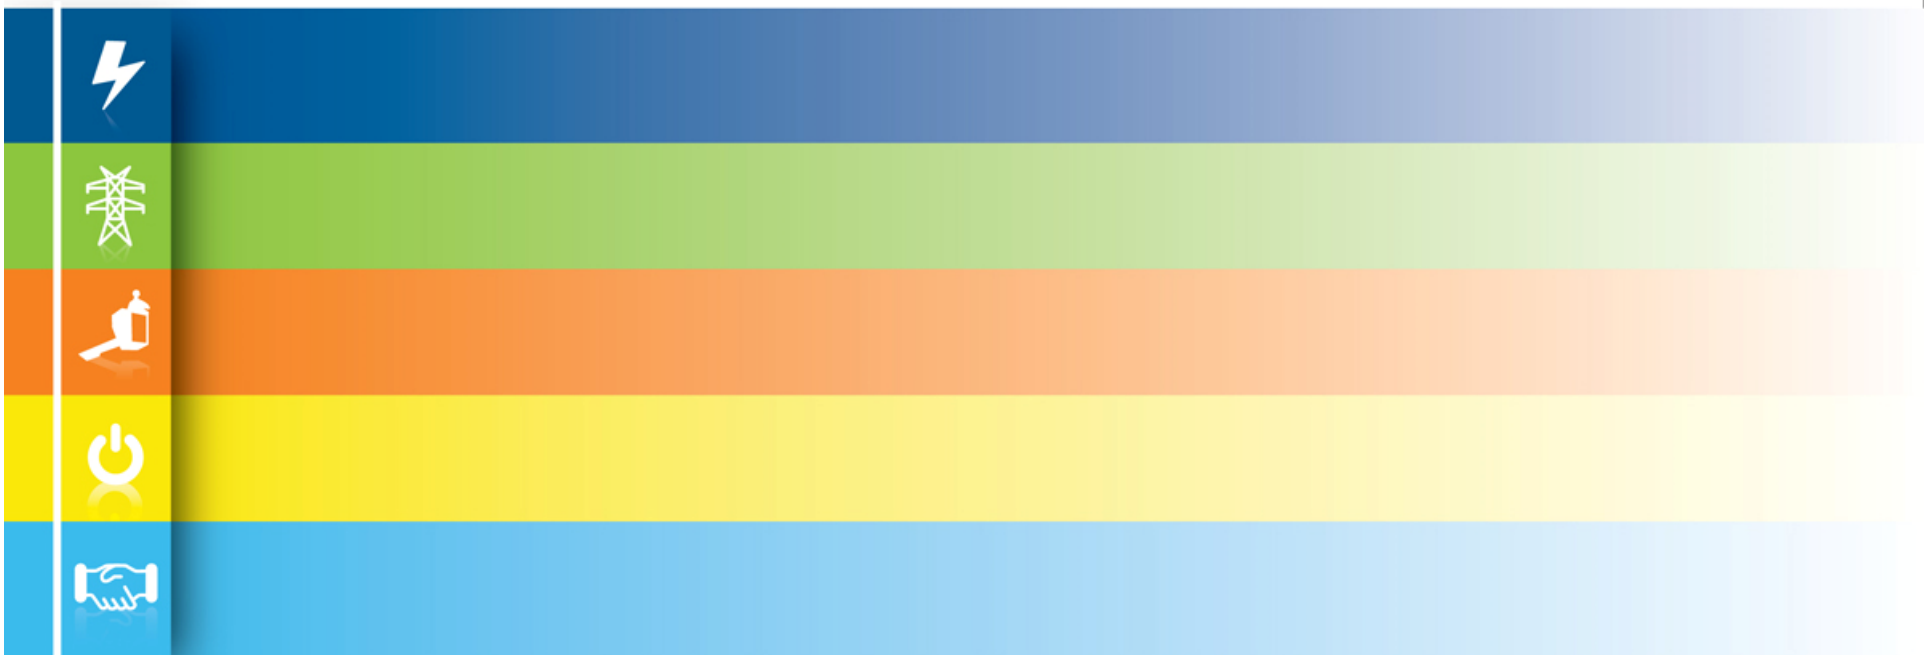
Canadian Affairs Update

Jim Burpee
President & CEO, Canadian Electricity Association
NERC Board Meeting – Philadelphia, Pennsylvania
May 7, 2014



Overview

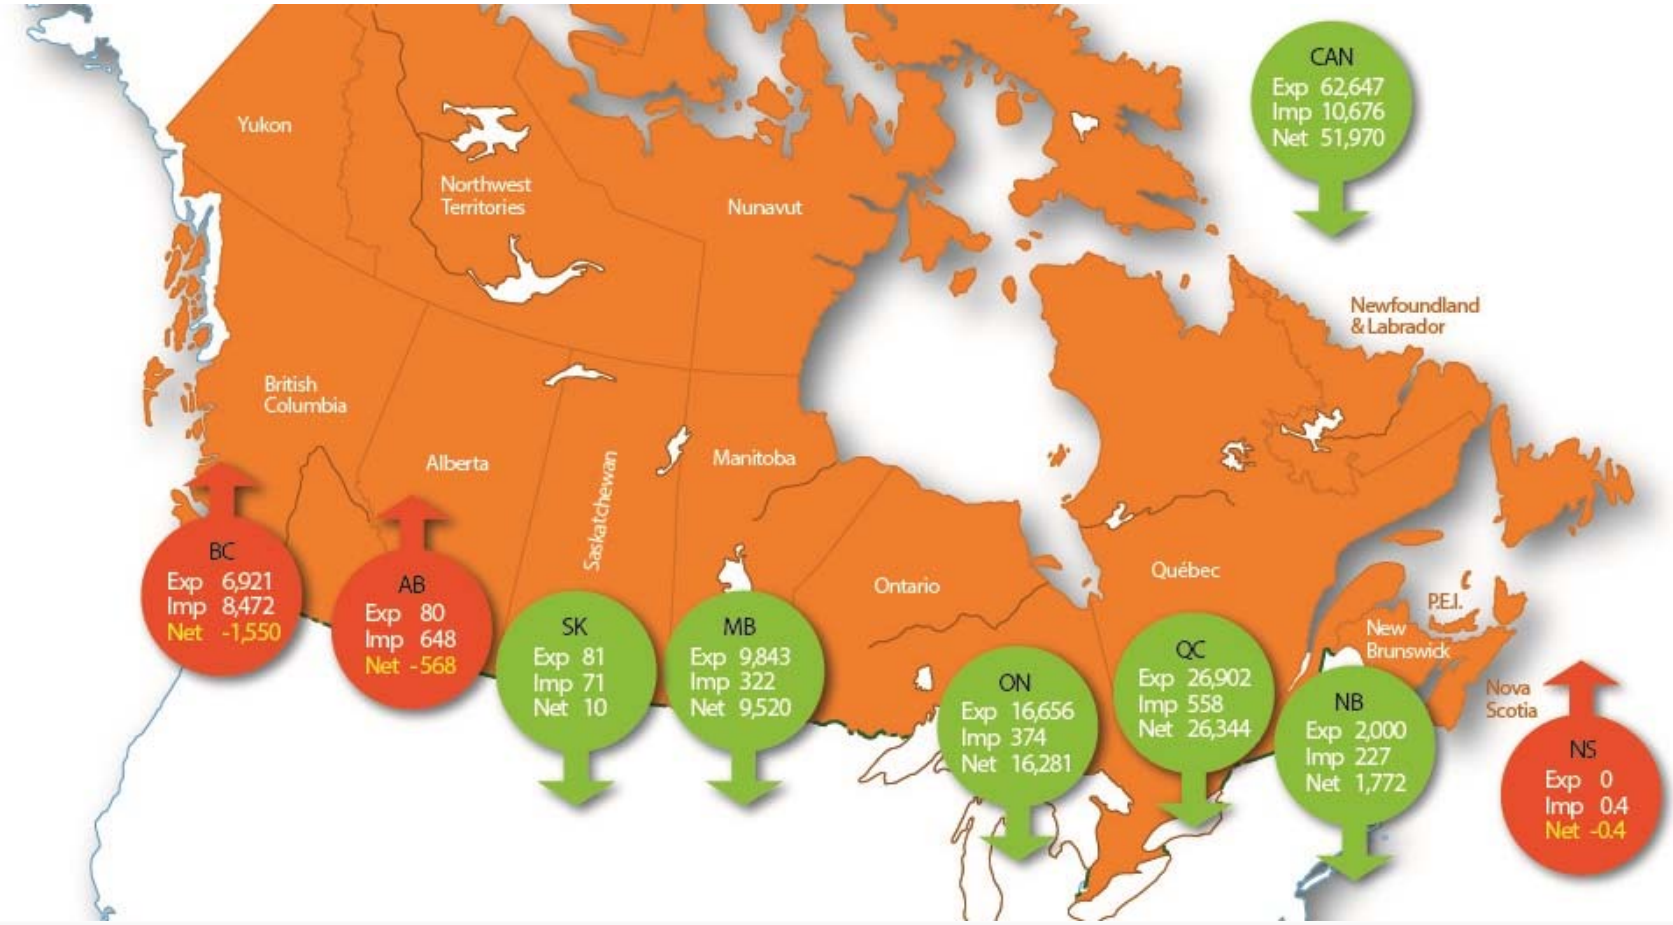
1. The Evolving Bilateral Electricity Relationship – Recent Events
   - 2013 data on Canada-U.S. electricity trade
   - New Minnesota-Manitoba transmission interconnection

2. CEA Policy Initiatives & Engagements – Recent Highlights
   - *Vision 2050: The Future of Canada's Electricity System*
   - EPA GHG Guidelines, Quadrennial Energy Review
   - Bipartisan Policy Center Electric Grid Cybersecurity Initiative

3. Comments on Major NERC Projects & Initiatives
   - Physical security standard
   - Risk-based registration

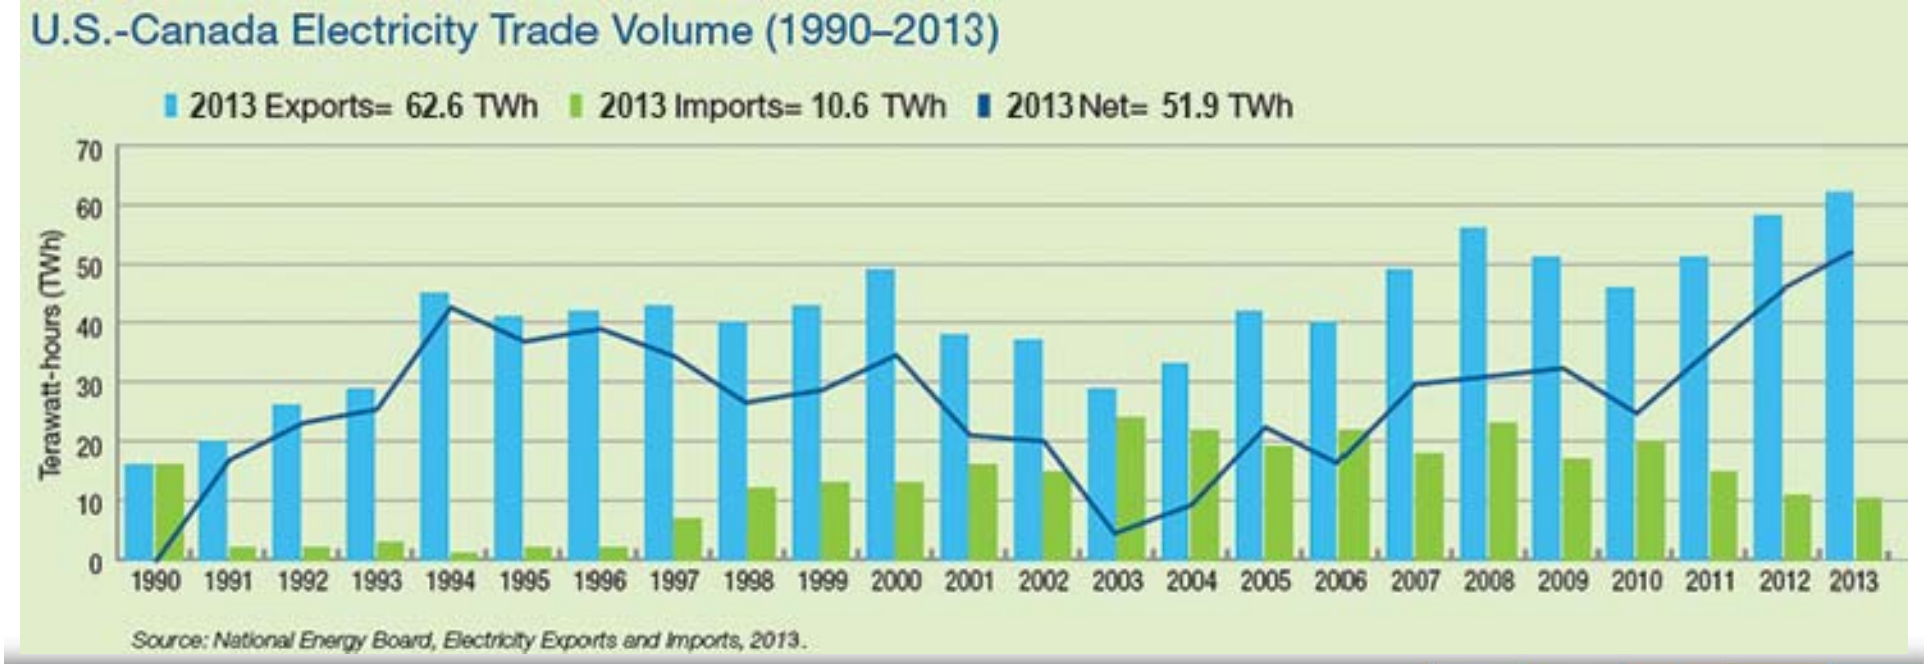
1. Evolving Bilateral Electricity Relationship – Recent Events

- Feb. 2014 – publication of 2013 NEB data on cross-border trade.



Data displayed are in gigawatt-hours. Source: National Energy Board, Electricity Exports and Imports, 2013.

- Key take-aways:
  - Exports from Canada rose 8% over 2012. U.S. exports remained even.
  - 2013 continued the recent trend of increased exports from Canada.
  - Most trading is transacted through the spot market (in 2013, 75%+). Long-term contracts represent <25% (and continue to decline).
  - Historically, Canada has been a net exporter (exports = 5-10% of generation).



Great Northern Transmission Line

- Apr. 16, 2014 – Minnesota Power applies for state and federal permits for U.S. segment of new interconnection with Manitoba.
- Project being developed in partnership with Manitoba Hydro.
- 500 kV line from border to Iron Range; 750 MW transfer capacity.
- “Hydro by wire” from Manitoba enables “wind by wire” from North Dakota.
- Further diversifies Minnesota Power’s energy mix.
- Hydropower’s “load-following” capability and the unique “wind storage” provision add value to both wind and water assets.
- Overall project (energy + transmission line) enhances regional reliability and provides energy market benefits.
- Public engagement is ongoing for Manitoba’s segment of the line.

Hydropower + Windpower: A Perfect Marriage

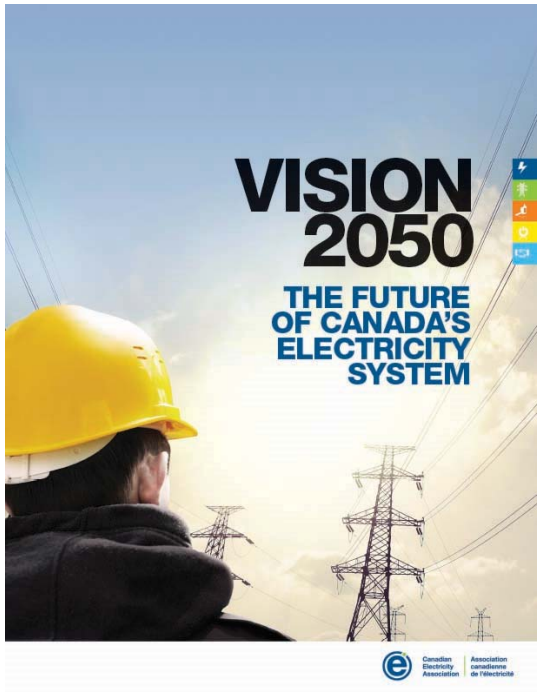
2. CEA Policy Initiatives & Engagements – Recent Highlights

Vision 2050: The Future of Canada's Electricity System

- Sheds light on the urgent need for informed decision-making – in policy development and infrastructure investment – if Canada is to maintain a reliable, sustainable and affordable system.
- Frames context for decisions about electricity, including drivers of change, in next 5-10 years.
- Offers recommendations in areas most likely to produce the greatest transformations:
  - Accelerating innovation and customer management.
  - Implementing financial instruments for CO_2 reduction.
  - Enabling electric vehicles.
  - Expanding collaboration across borders.
- Serves as basis for all CEA work going forward.



EPA GHG Guidelines, Quadrennial Energy Review

- CEA is engaging in both initiatives. Similar key messages:
  - Both should recognize & seek to expand benefits of U.S.-Canada integration:
    - Enhanced reliability and affordability; and
    - Reduced emissions (thru access to & support for low-carbon resources).
  - More integration will help maximize North America's clean energy potential.
- CEA appreciates the N. American scope to NERC's QER comments.

Bipartisan Policy Center Cyber Security Report

- Offers recommendations in four areas:
  - Standards and best practices; info sharing; responding to a cyber attack; and paying for cybersecurity.
- CEA participated in advisory board.
- Report's ideas are thoughtful; a few, contentious.

3. Comments on Major NERC Projects & Initiatives

Physical Security Standard

- CEA was concerned about language in FERC Order signaling an active role for regulatory authorities wrt to critical facilities lists.
- Draft standard has addressed this well and alleviated concerns.
- However, challenges look set to arise with 3rd-party verification:
  - What exactly does “verification” mean? How will verification be audited?
  - How can or should compliance be linked to activities or recommendations of a 3rd-party, which falls outside of NERC and governmental oversight?

Risk-based Registration

- Registration varies across Canada. Approaches build upon/are modelled upon NERC’s program. (*See CEA policy input).*
- Different approaches; same goals, focus (w/positive outcomes).

Reliability Issues Steering Committee Update

Bob Schaffeld, Chair, NERC Reliability Issues Steering Committee

NERC Board of Trustees Meeting

May 7, 2014

RELIABILITY | ACCOUNTABILITY

RISC Update

- Process-oriented Activities Completed
  - Charter Changes and Triage Process
  - Committee Interactions and ERO Planning Process Integration
- Membership Adjustments
  - RISC Nominating Committee Process
  - Extensions to Support Staggering and Continuity
  - New Members
- Risk Management Activities Underway
  - Execution in 2014
  - Business Planning and Budgeting for 2015
  - Analysis and Planning for the Future

Charter Changes

- Consistency
  - Reviewed Standards Process Input Group (SPIG) recommendations and ensured alignment with original intent of committee creation
- Formatting
  - Transfers charter to common NERC template
- Streamlining
  - Moves “how” elements to member handbook, keeps “what” elements in charter
  - Clarifies how members are appointed to the RISC
  - Removes MRC obligation to review charter every three years

Reliability Risk Management Process Status

- Execution in 2014
  - Triage and other process clarifications underway
  - Reliability Leadership Summit scheduled
  - Risk and action prioritization on schedule
- 2015 Business Plan and Budget Preparation
  - BP&B in development, with discussion of activities linked to Reliability Risk Management
  - **Goal**: Ensure 2015 activities are aligned with Reliability Risk priorities
- Longer-Term
  - Detailed Risk Analyses and Strategic Planning underway
  - **Goal:** Sustainable process, provides strategy and BP&B influence

Requested Actions

- Approve new Charter
- Approve membership adjustments

Draft Minutes
Board of Trustees

May 7, 2014 | 8:30 a.m.-12:00 p.m. Eastern

Hyatt Regency Philadelphia at Penn's Landing
201 S. Columbus Blvd.
Philadelphia, PA 19106

Call to Order and Chair's Remarks

Mr. Frederick W. Gorbet, chair, called to order the duly noticed open meeting of the Board of Trustees ("Board") of the North American Electric Reliability Corporation ("NERC") on May 7, 2014, at 8:30 a.m. Eastern, and a quorum was declared present. The agenda is attached as **Exhibit A**.

Present at the meeting were:

Board Members:
Frederick W. Gorbet, Chair
Paul F. Barber
Janice B. Case
Gerald W. Cauley, President and Chief Executive Officer
Robert G. Clarke
David Goulding
Douglas Jaeger
Kenneth G. Peterson
Bruce A. Scherr
Jan Schori
Roy Thilly

NERC Staff
Charles A. Berardesco, Senior Vice President, General Counsel, and Corporate Secretary
Thomas Burgess, Vice President and Director of Reliability Assessment and Performance Analysis
Howard Gugel, Director of Performance Analysis
Mark G. Lauby, Senior Vice President and Chief Reliability Officer
John Moura, Director of Reliability Assessment
Steven Noess, Associate Director of Standards Development
Janet Sena, Senior Vice President and Director of Policy and External Affairs
Brady Walker, Associate Counsel
Michael Walker, Senior Vice President, Chief Financial and Administrative Officer, and Corporate Treasurer

A listing of industry attendees is attached as **Exhibit B.**

Mr. Gorbet acknowledged and welcomed Mr. John R. Norris, Commissioner, Federal Energy Regulatory Commission ("FERC"), and Mr. Denis O'Brien, Chief Executive Officer of Exelon Utilities. He expressed regrets on behalf of Mr. Ken Quesnelle, Chair of the Canadian Association of Members of Public Utility Tribunals, who was not able to attend the meeting.

NERC Antitrust Compliance Guidelines

Mr. Berardesco directed the participants' attention to the NERC Antitrust Compliance Guidelines included in the agenda, and offered to answer any additional questions the participants had at any time regarding antitrust compliance or other matters.

Consent Agenda

Upon motion duly made and seconded, the Board approved the consent agenda as follows:

Minutes

The draft minutes for the February 6, 2014 Board meeting were approved in the form as presented to the Board at the meeting.

Compliance Processes and Procedures Subcommittee Formation

RESOLVED, that the Board hereby approves the elimination of the Compliance and Certification Committee's Standards Interface Subcommittee and Procedures Subcommittee.

FURTHER RESOLVED, that the Board hereby approves the formation of the Compliance Processes and Procedures Subcommittee.

Committee Membership Appointments

Critical Infrastructure Protection Committee

RESOLVED, that the Board hereby approves the appointment of the following individuals to the Critical Infrastructure Protection Committee ("CIPC") for a term of at least two years:

- Gary Mayfield of the Western Area Power Administration
- Ed Goff of Duke Energy

RESOLVED, that the Board hereby approves the election of the following individual to the Executive Committee of the CIPC for a term commencing May 7, 2014 and concluding December 31, 2015:

- David Revill of Georgia Transmission

Compliance and Certification Committee

RESOLVED, that the Board hereby appoints the following individuals to the Compliance and Certification Committee, each for a term of three years, effective May 7, 2014:

- Rick Terrill of Luminant Mining
- Caroline Dupuis of Hydro-Québec TransÉnergie
- William Temple of Northeast Utilities
- Jennifer Flandermeyer of Kansas City Power & Light

FURTHER RESOLVED, that the Board hereby appoints the following individuals as officers, each for a term of two years, effective July 1, 2014.

- Patti Metro of the National Rural Electric Cooperative Association, chair
- Jennifer Flandermeyer of Kansas City Power & Light, vice chair

Personnel Certification Governance Committee

RESOLVED, that the Board hereby appoints the following individual to the Personnel Certification Governance Committee for a term beginning May 7, 2014 and concluding December 31, 2015:

- Michael Hoke of PJM Interconnection

Executive Session

Mr. Gorbet reported that before the open meeting, as is its custom, the Board met in closed session with NERC management, and subsequently in executive session without NERC management, to review NERC management activities.

Mr. Gorbet also reported that on Monday, May 5, 2014, the Board met with the leadership of the Boards of the Regional Entities with Regional Entity chief executive officers present, and then without the CEOs in a subsequent executive session. Mr. Gorbet summarized the discussion and reported that these meetings have helped to improve communication at the governance level within the ERO Enterprise.

Welcoming Remarks

Mr. Gorbet welcomed and introduced Mr. Norris and Mr. O'Brien.

Remarks by John R. Norris

Mr. Norris remarked on the evolution of the relationship between FERC and NERC and stated he believed interactions between the two organizations had improved significantly. He praised the quality of NERC's work and commented on the overall positive direction of the organization. Mr. Norris thanked NERC leadership and staff for their response to and work on the Physical Security Order and the related proposed Reliability Standard. He noted that caution should be exercised when responding to political pressures to act, both now and in the future, and encouraged NERC to continue to take

action in the interest of reliability. Mr. Norris stated he was looking forward to continuing a productive working relationship with NERC.

Remarks by Denis O'Brien

Mr. Cauley provided a brief introduction of Mr. O'Brien.

Mr. O'Brien provided the Board with an overview of Exelon's investments in infrastructure and commitment to reliability. He highlighted the positive effects of NERC's outreach to and collaboration with the electric industry.

President's Report

Mr. Cauley provided comments on the evolution of the standards development process. He stated that the process has matured over the years and has benefitted from the high quality of FERC orders that allow industry to work collaboratively to arrive at the best and most efficient solutions for reliability. Mr. Cauley highlighted the flexibility and adaptability of the standards development process and cited the development of the proposed Physical Security Reliability Standard as an example of NERC's and industry's ability to respond to urgent issues. He praised the hard work of the standard drafting team members.

Mr. Cauley stated that the standards development process is working as it was envisioned with broad oversight from FERC, leadership from NERC's Board, and the effective application of technical expertise that leads to improved reliability, avoids undue compliance burdens, and serves the public interest.

Standards

Mr. Lauby provided an overview of the Reliability Standards program and presented the following items for Board action. After discussion, and upon motions duly made and seconded, the Board approved the following resolutions:

Demand Data (MOD C)—MOD-031-1

RESOLVED, that the Board hereby adopts proposed Reliability Standard MOD-031-1, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the associated implementation plan, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the revised and new NERC Glossary definitions, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the Violation Risk Factors and Violation Severity Levels for the proposed Reliability Standard, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the Reliability Standards proposed for retirement, as presented to the Board at this meeting.

FURTHER RESOLVED, that NERC management is hereby authorized to make the appropriate filings with ERO governmental authorities and take such further actions and make such further filings as are necessary and appropriate to effectuate the intent of the foregoing resolutions.

Voltage and Reactive Control—VAR-002-3

RESOLVED, that the Board hereby adopts proposed Reliability Standard VAR-002-3, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the associated implementation plan, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the Violation Risk Factors and Violation Severity Levels for the proposed Reliability Standard, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the Reliability Standard proposed for retirement, as presented to the Board at this meeting.

FURTHER RESOLVED, that NERC management is hereby authorized to make the appropriate filings with ERO governmental authorities and take such further actions and make such further filings as are necessary and appropriate to effectuate the intent of the foregoing resolutions.

Operating Personnel Communications Protocols—COM-002-4

RESOLVED, that the Board hereby adopts proposed Reliability Standard COM-002-4, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the associated implementation plan, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the new NERC Glossary definition, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the Violation Risk Factors and Violation Severity Levels for the proposed Reliability Standard, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the Requirement and Reliability Standards proposed for retirement, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby rescinds its February 9, 2012 approval of the Interpretation of COM-002-2, effective (i) for U.S. registered entities upon implementation of COM-002-4 in substantially the form approved by the Board and (ii) for Canadian entities, effective upon implementation of COM-002-4 in substantially the form approved by the Board.

FURTHER RESOLVED, that NERC management is hereby authorized to make the appropriate filings with ERO governmental authorities and take such further actions and make such further filings as are necessary and appropriate to effectuate the intent of the foregoing resolutions.

Violation Risk Factor/Violation Severity Level Revisions

RESOLVED, that the Board hereby adopts proposed Violation Risk Factor and Violation Severity Level Modifications for the following Reliability Standards, as presented to the Board at this meeting:

- TPL-001-4—Transmission System Planning Performance Requirements
- CIP-003-5—Cyber Security—System Management Controls
- CIP-004-5.1—Cyber Security—Personnel and Training
- CIP-006-5—Cyber Security—Physical Security of BES Cyber Systems
- CIP-008-5—Cyber Security—Incident Reporting and Response Planning
- CIP-009-5—Cyber Security—Recovery Plans for BES Cyber Systems
- MOD-026-1—Verification of Models and Data for Generator Excitation Control System or Plant Volt/Var Control Functions
- MOD-027-1—Verification of Models and Data for Turbine/Governor and Load Control or Active Power/Frequency Control Functions
- PRC-005-2—Protection System Maintenance
- PRC-005-3—Protection System and Automatic Reclosing Maintenance
- BAL-003-1—Frequency Response and Frequency Bias Setting

FURTHER RESOLVED, that NERC management is hereby authorized to make the appropriate filings with ERO governmental authorities and take such further actions and make such further filings as are necessary and appropriate to effectuate the intent of the foregoing resolutions.

Physical Security Reliability Standard Development

Mr. Lauby introduced Mr. Noess who announced that the proposed Physical Security Reliability Standard had received final industry approval. He thanked the standard drafting team, the Standards Committee, and industry stakeholders for their collaborative efforts on this project. Mr. Noess indicated that NERC staff would begin to prepare the proposed Reliability Standard for approval by the NERC Board at a future meeting.

Mr. Brian Murphy, chair of the Standards Committee ("SC"), praised the collaborative nature of the development process and stated that the approach to development on this project could benefit all future standards development projects.

Amendments to SERC Bylaws

Mr. Berardesco presented a set of proposed amendments to the SERC Reliability Corporation Bylaws. He stated that the amendments reflect a decision made by SERC regarding its tax status and that these changes do not impact SERC's ability to operate as a Regional Entity. Mr. Berardesco indicated Board approval was required because the Bylaws are an exhibit to the delegation agreement and noted that FERC will also need to approve the amendments.

Upon motion duly made and seconded, the Board approved the following resolution:

WHEREAS, the SERC Board of Directors has proposed amendments to the Delegation Agreement between NERC and SERC ("Delegation Agreement") by amending Exhibit B – the SERC Bylaws.

WHEREAS, the proposed amendments do not affect SERC's Regional Entity functions.

WHEREAS, the proposed amendments continue to satisfy the governance criteria specified in the Delegation Agreement.

RESOLVED, that the Board hereby approves the proposed amendments to NERC's Delegation Agreement with SERC, consisting of amendments to Exhibit B – the SERC Bylaws, in the form as presented to the Board at this meeting.

FURTHER RESOLVED, that NERC management is hereby authorized to make the appropriate filings with ERO governmental authorities.

State of Reliability Report

Mr. Burgess provided an introduction to the State of Reliability Report ("SORR"). He explained that the SORR is developed by NERC's Reliability Assessment and Performance Analysis group, stakeholders, and regional assessment groups. Mr. Burgess stated the SORR utilizes a variety of data, event analyses, and historical performance information to identify trends and indicators related to Bulk-Power System performance and reliability. With that information, NERC and stakeholders are able to take proactive steps to focus on key areas of reliability performance.

Mr. Gugel provided an overview of the 2014 SORR. He stated the SORR represents NERC's independent view of ongoing Bulk-Power System trends through an objective analysis of the state of reliability. The SORR's key findings serve as guide to risk assessment, reliability standards development project prioritization, compliance and enforcement process improvement, event analysis, and critical infrastructure protection. Mr. Gugel presented a summary of the keys findings and recommendations, a copy of which was included with the advance meeting materials.

Summer Reliability Assessment

Mr. Burgess provided an overview of the Summer Reliability Assessment. He indicated that NERC provides seasonal assessments that describe anticipated conditions and key areas for focus and

attention during upcoming summer seasonal conditions. Mr. Moura presented a summary of the key findings and recommendations, a copy of which was included with the advance meeting materials.

ERO Strategic Plan Metrics

Mr. Cauley provided an overview of the Three-Year ERO Strategic Plan approval process. He noted that the Board approved the Strategic Plan without the plan metrics at its February 2014 meeting, so as to allow management to refine a few of the metrics to reflect industry comments. Mr. Cauley presented a summary of the revisions and indicated that the metrics are intended to provide guidance for achieving the goals outlined in the Strategic Plan. He stated that both the Strategic Plan and metrics will be updated as necessary.

Upon motion duly made and seconded, the Board approved the following resolution:

RESOLVED, that the Board hereby approves the metrics for use with the ERO Strategic Plan, as presented to the Board at this meeting.

Canadian Affairs

Mr. James Burpee, President and CEO of the Canadian Electricity Association, presented an update on current Canadian reliability-related initiatives.

Standing Committee Reports

Representatives of the Standing Committees provided reports to the Board highlighting items from their written reports as contained within the agenda package.

Operating Committee

Mr. James D. Castle, chair, highlighted some of the Operating Committee's ("OC") activities since the last Board meeting. He thanked Trustees Jaeger and Barber for their attendance at the OC's March meeting and stated the OC is looking forward to welcoming Ms. Case and Mr. Gorbet at future meetings. Mr. Castle praised the Board for their commitment to engaging with the OC. He also provided updates on the OC's work on (i) the Essential Reliability Services Taskforce, (ii) the cold weather preparedness reliability guideline, (iii) the independent experts' report, and (iv) improvements to the organization and structure of the OC.

Planning Committee

Mr. Benjamin Crisp, chair, reviewed progress on some of the Planning Committee's ("PC") key initiatives. He outlined the PC's work in helping to develop the Summer Reliability Assessment and State of Reliability Report. Mr. Crisp also summarized the PC's work with the GMD taskforce and efforts to provide technical basis and justification to that project's standard drafting team. He provided an overview of the PC's process changes which are intended to allow for more feedback from the regions and an increased ability to reprioritize projects within the PC as necessary. Mr. Crisp thanked the Trustees for their active participation with the PC.

Critical Infrastructure Protection Committee

Mr. Charles F. Abell, chair, briefly summarized the ongoing work of the CIPC. He highlighted the issuance of two reports related to NERC's GridEx II, one for the distributed play exercise and one for the executive table top exercise. Mr. Abell stated that the CIPC was actively engaged in implementing the recommendations and addressing the concerns identified in the reports. He also highlighted the strong attendance at and feedback from the CIPC technical workshops and stated that planning was underway for another workshop in June focusing on physical security issues.

Member Representatives Committee

Mr. John A. Anderson, chair, thanked Mr. Gorbet and the Board for the continued use of the Member Representatives Committee's ("MRC") policy input, and summarized the issues that had been discussed at the MRC meeting the previous day. He stated he was appreciative of new meeting structure and recognized MRC members for attending Board Committee meetings.

Personnel Certification Governance Committee

Mr. Brett Hallborg, chair, was not in attendance. Mr. Gorbet referred the meeting participants to the written report of the Personnel Certification and Governance Committee, located in the agenda package.

Standards Committee

Mr. Murphy expressed his gratitude for the good working relationship between the SC and the Board, NERC staff, industry, and the staff of FERC. He outlined work that was ongoing on a number of projects and initiatives including (i) coordination between the SC and the Reliability Issues Steering Committee ("RISC"), (ii) the Reliability Standards Development Plan and its relation to the newly approved ERO Strategic Plan metrics, and (iii) the development of an evaluation framework to be used in conjunction with the metrics.

Reliability Issues Steering Committee

Mr. Robert A. Schaffeld, chair, outlined some of the recent activities of the Reliability Issues Steering Committee ("RISC") including (i) several process improvements intended to assist with the delivery of clear recommendations to Board, (ii) revisions to the RISC charter that are intended to provide clarity on the role of the RISC, and (iii) the completion of an effort to extend and expand committee membership. Mr. Schaffeld also made mention of the RISC's upcoming Reliability Leadership Summit, scheduled to take place in September 2014. He thanked the Board for their continued involvement with RISC activities.

Upon motions duly made and seconded, the Board approved the following resolutions:

RISC Charter Amendments

RESOLVED, that the Board hereby approves the amended Reliability Issues Steering Committee (RISC) Charter, substantially in the form presented to the Board at this meeting, to replace the RISC Charter approved by the Board on August 16, 2012.

RISC Committee Membership Appointments

RESOLVED, that the Board hereby approves extensions to the current Reliability Issues Steering Committee (RISC) members' terms, as follows:

- MRC representative Scott Helyer, through May 2015
- MRC representative Jason Marshall, through May 2015
- At-large member and RISC chair Bob Schaffeld, through May 2016
- MRC representative John Twitty, through May 2015

FURTHER RESOLVED, that the Board hereby approves the following new members to the RISC:

Name	Title	Type of Membership	Term
Daniel Froetscher	Senior Vice President, Transmission, Distribution, and Customers, Arizona Public Service Company	At-Large Member	Two-year term ending May 2016
Ray Gorman	Chairman, New Brunswick Energy and Utilities Board	At-Large Member	Two-year term ending May 2016
Scot Hathaway	Vice President – Transmission, Dominion Virginia Power	At-Large Member	Two-year term ending May 2016
Duane Highley	President and CEO, Arkansas Electric Cooperative	At-Large Member	Two-year term ending May 2016
Nabil Hitti	Vice President, Transmission Network Operations, National Grid	Member Representatives Committee member to the RISC	Two-year term ending May 2016
Steve Whitley	President and CEO, New York ISO	At-Large Member	Two-year term ending May 2016
Terry Bilke	Consulting Advisor, Compliance Services, Midcontinent ISO	Compliance and Certification Committee member to the RISC	Two-year term ending May 2016

Compliance and Certification Committee

Mr. Terry Bilke, chair, reported on the activities of the three Compliance and Certification Committee ("CCC") subcommittees which included (i) involvement in the upcoming independent audit process, (ii) participation in the development of the Reliability Assurance Initiative ("RAI"), and (iii) monitoring of the ongoing risk-based registration project. He also thanked FERC staff for their involvement with the enforcement report. Mr. Bilke presented the 2014-2016 CCC Work Plan for Board approval, as well as the 2013 Stakeholder Perception Survey Report for Board acceptance.

Mr. Gorbet recognized that this is Mr. Bilke's last report to the Board as chair of the CCC and thanked him for his work. Mr. Gorbet welcomed the incoming CCC chair, Ms. Patti Metro.

Upon motions duly made and seconded, the Board approved the following resolutions:

CCC 2014-2016 Work Plan

RESOLVED, that the Board hereby approves the 2014-2016 Compliance and Certification Committee Work Plan, substantially in the form as presented to the Board at this meeting.

CCC 2013 Stakeholder Perception Survey Results and Report Recommendations

RESOLVED, that the Board hereby accepts the 2013 ERO Effectiveness and Stakeholder Perceptions Survey report, substantially in the form as presented to the Board at this meeting.

Electricity Sub-Sector Coordination Council

Mr. Cauley, executive committee member, reported on the recent activities of the Electricity Sub-Sector Coordination Council ("ESCC"), and some of its key focus areas. He described the committee's membership and structure, and stated that the committee is functioning as envisioned. Mr. Cauley also noted the involvement of Mr. Barber with the ESCC.

Forum and Group Reports

North American Energy Standards Board
Mr. Michael Desselle, chair, updated the Board on three matters: (i) the progress of the coordinated effort to retire Reliability Standards that contain commercial aspects, (ii) the development of the Parallel Flow Visualization Project, and (iii) the collaborative effort of North American Energy Standards Board ("NAESB") and NERC staff to support the implementation of the NAESB Electric Industry Registry.

Regional Entity Management Group
Mr. Scott Henry, chair, summarized the current key focus areas for the Regional Entity Management Group: (i) the Five-Year ERO assessment, (ii) the implementation of reforms to RAI and the associated training, (iii) work to fully implement the compliance auditor manual, and (iv) implementation of the new Bulk Electric System ("BES") definition and BES exception processes. Mr. Henry also stated that he appreciates the collaborative process that resulted in the successful development of common metrics but that more work must be done to track and trend their effectiveness. He noted that the joint meeting of the leadership of the regional Boards, the regional CEOs, and the NERC trustees was a success, and thanked Mr. Gorbet for hosting the joint meeting.

North American Transmission Forum
Mr. Galloway, president and CEO, summarized key collaborative efforts between NERC and the North American Transmission Forum, including an update on the 345kV breaker inspection, maintenance, and tracking process and preliminary work on the development of best practices regarding protection system misoperations. He also noted progress on ongoing work with the Electric Power Research

Institute on resiliency and with an effort to promote improved reliability of off-site power sources for nuclear power plants.

North American Generator Forum
Mr. Allen D. Schriver, chair, stated that in addition to the North American Generator Forum's ("NAGF") written report, the increased interactions between NAGF, NERC Staff, and the regions had led to the strengthening of processes and an increase in the quality of feedback received.

Board Committee Reports

Corporate Governance and Human Resources Committee
Ms. Schori, chair, summarized the recent meetings of the Corporate Governance and Human Resources Committee ("CGHRC"). She stated that the CGHRC met in closed session on April 23, 2014 to review management compensation and benefits, and to consider a deferred compensation plan for certain executives and other key employees. Ms. Schori noted that no action had been taken at the meeting and that the committee would continue to consider such a plan.

She reported also that the CGHRC met in open session on May 1, 2014. At that meeting, the committee reviewed a draft of the IRS Form 990, and received updates on both the 2014 corporate goals and NERC staffing. In addition, the committee recommended Board approval of proposed revisions to the Board of Trustees Compliance Committee mandate.

Upon motion duly made and seconded, the Board approved the following resolution:

Compliance Committee Mandate Amendments

RESOLVED, that the Board, upon recommendation of the Corporate Governance and Human Resources Committee, hereby approves the Compliance Committee Mandate, as presented to the Board at this meeting, to replace the Compliance Committee Mandate approved by the Board on May 9, 2012.

Board of Trustees Compliance Committee
Mr. Scherr reported that the Compliance Committee met in executive session on May 5, 2014, and in subsequent open session on May 6, 2014. He reported on some of the issues covered during those meetings, including (i) progress on RAI, (ii) the new processes for revising existing Reliability Standard Audit Worksheets ("RSAW") and management's work to finalize the document, and (iii) consideration of Compliance caseload statistics.

Finance and Audit Committee
Mr. Thilly, chair, reported that on May 6, 2014, the Finance and Audit Committee met in closed and open sessions. He reported that the committee reviewed and recommended Board acceptance of both the 2013 Audit Financial Statements and the First Quarter 2014 Unaudited Statement of Activities for NERC and the Regions. Mr. Thilly also provided an update on the development of the 2015

Business Plans and Budgets for NERC and the Regions and stated that the process has been refined to allow more time for stakeholder review and comment.

Upon motions duly made and seconded, the Board approved the following resolutions:

2013 Audit Financial Statements

RESOLVED, that the Board, upon recommendation of the Finance and Audit Committee, hereby accepts the 2013 Audit Financial Statements, as presented to the Board at this meeting.

First Quarter Unaudited Statement of Activities

RESOLVED, that the Board, upon recommendation of the Finance and Audit Committee, hereby accepts the NERC First Quarter 2014 Unaudited Statement of Activities, as presented to the Board at this meeting.

Enterprise-wide Risk Committee
Mr. Goulding, chair, reported that the first meeting of the Enterprise-wide Risk Committee took place in closed session on May 5, 2014. He indicated that the committee reviewed the 2014 Audit Plan, received an update on risk management activities, and reviewed the CCC's 2014-2016 Work Plan.

Standards Oversight and Technology Committee
Mr. Peterson, chair, stated that the Standards Oversight and Technology Committee met in open session on May 6, 2014. He reported that the committee received an update on the CIP Version 5 transition and that committee members engaged in an active discussion of issues and concerns raised with regard to ERO Enterprise IT Applications. Mr. Peterson indicated that committee members had taken a more active oversight role on those projects. He noted also that he believes there has been a significant improvement in the quality of NERC's work with regard to standards development over the last several years.

Closing Remarks of Chair Gorbet

Mr. Gorbet expressed his appreciation on behalf of the Board to all of those individuals who had made the Board meeting successful. He again thanked Commissioner Norris for attending and offering supportive and encouraging comments. Mr. Gorbet stated that NERC has grappled with many difficult issues at once, has been able to come to a successful resolution to many, and is well positioned for success when confronted with the challenges that are ahead. He commended the work of the NERC standing committees and expressed his satisfaction that Board members have and are continuing to become more involved with the work of the standing committees. Mr. Gorbet reiterated the importance of the MRC policy input process and indicated that the process would continue to be used and refined.

Adjournment

There being no further business, and upon motion duly made and seconded, the meeting was adjourned at 11:42 a.m. Eastern.

Submitted by,

Charles A. Berardesco
Corporate Secretary

Draft Minutes
Board of Trustees

May 7, 2014 | 8:30 a.m.-12:00 p.m. Eastern

Hyatt Regency Philadelphia at Penn's Landing
201 S. Columbus Blvd.
Philadelphia, PA 19106

Call to Order and Chair's Remarks

Mr. Frederick W. Gorbet, chair, called to order the duly noticed open meeting of the Board of Trustees ("Board") of the North American Electric Reliability Corporation ("NERC") on May 7, 2014, at 8:30 a.m. Eastern, and a quorum was declared present. The agenda is attached as **Exhibit A**.

Present at the meeting were:

Board Members:
Frederick W. Gorbet, Chair
Paul F. Barber
Janice B. Case
Gerald W. Cauley, President and Chief Executive Officer
Robert G. Clarke
David Goulding
Douglas Jaeger
Kenneth G. Peterson
Bruce A. Scherr
Jan Schori
Roy Thilly

NERC Staff
Charles A. Berardesco, Senior Vice President, General Counsel, and Corporate Secretary
Thomas Burgess, Vice President and Director of Reliability Assessment and Performance Analysis
Howard Gugel, Director of Performance Analysis
Mark G. Lauby, Senior Vice President and Chief Reliability Officer
John Moura, Director of Reliability Assessment
Steven Noess, Associate Director of Standards Development
Janet Sena, Senior Vice President and Director of Policy and External Affairs
Brady Walker, Associate Counsel
Michael Walker, Senior Vice President, Chief Financial and Administrative Officer, and Corporate Treasurer

A listing of industry attendees is attached as **Exhibit B.**

Mr. Gorbet acknowledged and welcomed Mr. John R. Norris, Commissioner, Federal Energy Regulatory Commission ("FERC"), and Mr. Denis O'Brien, Chief Executive Officer of Exelon Utilities. He expressed regrets on behalf of Mr. Ken Quesnelle, Chair of the Canadian Association of Members of Public Utility Tribunals, who was not able to attend the meeting.

NERC Antitrust Compliance Guidelines

Mr. Berardesco directed the participants' attention to the NERC Antitrust Compliance Guidelines included in the agenda, and offered to answer any additional questions the participants had at any time regarding antitrust compliance or other matters.

Consent Agenda

Upon motion duly made and seconded, the Board approved the consent agenda as follows:

Minutes

The draft minutes for the February 6, 2014 Board meeting were approved in the form as presented to the Board at the meeting.

Compliance Processes and Procedures Subcommittee Formation

RESOLVED, that the Board hereby approves the elimination of the Compliance and Certification Committee's Standards Interface Subcommittee and Procedures Subcommittee.

FURTHER RESOLVED, that the Board hereby approves the formation of the Compliance Processes and Procedures Subcommittee.

Committee Membership Appointments

Critical Infrastructure Protection Committee

RESOLVED, that the Board hereby approves the appointment of the following individuals to the Critical Infrastructure Protection Committee ("CIPC") for a term of at least two years:

- Gary Mayfield of the Western Area Power Administration
- Ed Goff of Duke Energy

RESOLVED, that the Board hereby approves the election of the following individual to the Executive Committee of the CIPC for a term commencing May 7, 2014 and concluding December 31, 2015:

- David Revill of Georgia Transmission

Compliance and Certification Committee

RESOLVED, that the Board hereby appoints the following individuals to the Compliance and Certification Committee, each for a term of three years, effective May 7, 2014:

- Rick Terrill of Luminant Mining
- Caroline Dupuis of Hydro-Québec TransÉnergie
- William Temple of Northeast Utilities
- Jennifer Flandermeyer of Kansas City Power & Light

FURTHER RESOLVED, that the Board hereby appoints the following individuals as officers, each for a term of two years, effective July 1, 2014.

- Patti Metro of the National Rural Electric Cooperative Association, chair
- Jennifer Flandermeyer of Kansas City Power & Light, vice chair

Personnel Certification Governance Committee

RESOLVED, that the Board hereby appoints the following individual to the Personnel Certification Governance Committee for a term beginning May 7, 2014 and concluding December 31, 2015:

- Michael Hoke of PJM Interconnection

Executive Session

Mr. Gorbet reported that before the open meeting, as is its custom, the Board met in closed session with NERC management, and subsequently in executive session without NERC management, to review NERC management activities.

Mr. Gorbet also reported that on Monday, May 5, 2014, the Board met with the leadership of the Boards of the Regional Entities with Regional Entity chief executive officers present, and then without the CEOs in a subsequent executive session. Mr. Gorbet summarized the discussion and reported that these meetings have helped to improve communication at the governance level within the ERO Enterprise.

Welcoming Remarks

Mr. Gorbet welcomed and introduced Mr. Norris and Mr. O'Brien.

Remarks by John R. Norris

Mr. Norris remarked on the evolution of the relationship between FERC and NERC and stated he believed interactions between the two organizations had improved significantly. He praised the quality of NERC's work and commented on the overall positive direction of the organization. Mr. Norris thanked NERC leadership and staff for their response to and work on the Physical Security Order and the related proposed Reliability Standard. He noted that caution should be exercised when responding to political pressures to act, both now and in the future, and encouraged NERC to continue to take

action in the interest of reliability. Mr. Norris stated he was looking forward to continuing a productive working relationship with NERC.

Remarks by Denis O'Brien

Mr. Cauley provided a brief introduction of Mr. O'Brien.

Mr. O'Brien provided the Board with an overview of Exelon's investments in infrastructure and commitment to reliability. He highlighted the positive effects of NERC's outreach to and collaboration with the electric industry.

President's Report

Mr. Cauley provided comments on the evolution of the standards development process. He stated that the process has matured over the years and has benefitted from the high quality of FERC orders that allow industry to work collaboratively to arrive at the best and most efficient solutions for reliability. Mr. Cauley highlighted the flexibility and adaptability of the standards development process and cited the development of the proposed Physical Security Reliability Standard as an example of NERC's and industry's ability to respond to urgent issues. He praised the hard work of the standard drafting team members.

Mr. Cauley stated that the standards development process is working as it was envisioned with broad oversight from FERC, leadership from NERC's Board, and the effective application of technical expertise that leads to improved reliability, avoids undue compliance burdens, and serves the public interest.

Standards

Mr. Lauby provided an overview of the Reliability Standards program and presented the following items for Board action. After discussion, and upon motions duly made and seconded, the Board approved the following resolutions:

Demand Data (MOD C)—MOD-031-1

RESOLVED, that the Board hereby adopts proposed Reliability Standard MOD-031-1, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the associated implementation plan, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the revised and new NERC Glossary definitions, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the Violation Risk Factors and Violation Severity Levels for the proposed Reliability Standard, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the Reliability Standards proposed for retirement, as presented to the Board at this meeting.

FURTHER RESOLVED, that NERC management is hereby authorized to make the appropriate filings with ERO governmental authorities and take such further actions and make such further filings as are necessary and appropriate to effectuate the intent of the foregoing resolutions.

Voltage and Reactive Control—VAR-002-3

RESOLVED, that the Board hereby adopts proposed Reliability Standard VAR-002-3, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the associated implementation plan, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the Violation Risk Factors and Violation Severity Levels for the proposed Reliability Standard, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the Reliability Standard proposed for retirement, as presented to the Board at this meeting.

FURTHER RESOLVED, that NERC management is hereby authorized to make the appropriate filings with ERO governmental authorities and take such further actions and make such further filings as are necessary and appropriate to effectuate the intent of the foregoing resolutions.

Operating Personnel Communications Protocols—COM-002-4

RESOLVED, that the Board hereby adopts proposed Reliability Standard COM-002-4, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the associated implementation plan, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the new NERC Glossary definition, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the Violation Risk Factors and Violation Severity Levels for the proposed Reliability Standard, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby approves the Requirement and Reliability Standards proposed for retirement, as presented to the Board at this meeting.

FURTHER RESOLVED, that the Board hereby rescinds its February 9, 2012 approval of the Interpretation of COM-002-2, effective (i) for U.S. registered entities upon implementation of COM-002-4 in substantially the form approved by the Board and (ii) for Canadian entities, effective upon implementation of COM-002-4 in substantially the form approved by the Board.

FURTHER RESOLVED, that NERC management is hereby authorized to make the appropriate filings with ERO governmental authorities and take such further actions and make such further filings as are necessary and appropriate to effectuate the intent of the foregoing resolutions.

Violation Risk Factor/Violation Severity Level Revisions

RESOLVED, that the Board hereby adopts proposed Violation Risk Factor and Violation Severity Level Modifications for the following Reliability Standards, as presented to the Board at this meeting:

- TPL-001-4—Transmission System Planning Performance Requirements
- CIP-003-5—Cyber Security—System Management Controls
- CIP-004-5.1—Cyber Security—Personnel and Training
- CIP-006-5—Cyber Security—Physical Security of BES Cyber Systems
- CIP-008-5—Cyber Security—Incident Reporting and Response Planning
- CIP-009-5—Cyber Security—Recovery Plans for BES Cyber Systems
- MOD-026-1—Verification of Models and Data for Generator Excitation Control System or Plant Volt/Var Control Functions
- MOD-027-1—Verification of Models and Data for Turbine/Governor and Load Control or Active Power/Frequency Control Functions
- PRC-005-2—Protection System Maintenance
- PRC-005-3—Protection System and Automatic Reclosing Maintenance
- BAL-003-1—Frequency Response and Frequency Bias Setting

FURTHER RESOLVED, that NERC management is hereby authorized to make the appropriate filings with ERO governmental authorities and take such further actions and make such further filings as are necessary and appropriate to effectuate the intent of the foregoing resolutions.

Physical Security Reliability Standard Development

Mr. Lauby introduced Mr. Noess who announced that the proposed Physical Security Reliability Standard had received final industry approval. He thanked the standard drafting team, the Standards Committee, and industry stakeholders for their collaborative efforts on this project. Mr. Noess indicated that NERC staff would begin to prepare the proposed Reliability Standard for approval by the NERC Board at a future meeting.

Mr. Brian Murphy, chair of the Standards Committee ("SC"), praised the collaborative nature of the development process and stated that the approach to development on this project could benefit all future standards development projects.

Amendments to SERC Bylaws

Mr. Berardesco presented a set of proposed amendments to the SERC Reliability Corporation Bylaws. He stated that the amendments reflect a decision made by SERC regarding its tax status and that these changes do not impact SERC's ability to operate as a Regional Entity. Mr. Berardesco indicated Board approval was required because the Bylaws are an exhibit to the delegation agreement and noted that FERC will also need to approve the amendments.

Upon motion duly made and seconded, the Board approved the following resolution:

WHEREAS, the SERC Board of Directors has proposed amendments to the Delegation Agreement between NERC and SERC ("Delegation Agreement") by amending Exhibit B – the SERC Bylaws.

WHEREAS, the proposed amendments do not affect SERC's Regional Entity functions.

WHEREAS, the proposed amendments continue to satisfy the governance criteria specified in the Delegation Agreement.

RESOLVED, that the Board hereby approves the proposed amendments to NERC's Delegation Agreement with SERC, consisting of amendments to Exhibit B – the SERC Bylaws, in the form as presented to the Board at this meeting.

FURTHER RESOLVED, that NERC management is hereby authorized to make the appropriate filings with ERO governmental authorities.

State of Reliability Report

Mr. Burgess provided an introduction to the State of Reliability Report ("SORR"). He explained that the SORR is developed by NERC's Reliability Assessment and Performance Analysis group, stakeholders, and regional assessment groups. Mr. Burgess stated the SORR utilizes a variety of data, event analyses, and historical performance information to identify trends and indicators related to Bulk-Power System performance and reliability. With that information, NERC and stakeholders are able to take proactive steps to focus on key areas of reliability performance.

Mr. Gugel provided an overview of the 2014 SORR. He stated the SORR represents NERC's independent view of ongoing Bulk-Power System trends through an objective analysis of the state of reliability. The SORR's key findings serve as guide to risk assessment, reliability standards development project prioritization, compliance and enforcement process improvement, event analysis, and critical infrastructure protection. Mr. Gugel presented a summary of the keys findings and recommendations, a copy of which was included with the advance meeting materials.

Summer Reliability Assessment

Mr. Burgess provided an overview of the Summer Reliability Assessment. He indicated that NERC provides seasonal assessments that describe anticipated conditions and key areas for focus and

attention during upcoming summer seasonal conditions. Mr. Moura presented a summary of the key findings and recommendations, a copy of which was included with the advance meeting materials.

ERO Strategic Plan Metrics

Mr. Cauley provided an overview of the Three-Year ERO Strategic Plan approval process. He noted that the Board approved the Strategic Plan without the plan metrics at its February 2014 meeting, so as to allow management to refine a few of the metrics to reflect industry comments. Mr. Cauley presented a summary of the revisions and indicated that the metrics are intended to provide guidance for achieving the goals outlined in the Strategic Plan. He stated that both the Strategic Plan and metrics will be updated as necessary.

Upon motion duly made and seconded, the Board approved the following resolution:

RESOLVED, that the Board hereby approves the metrics for use with the ERO Strategic Plan, as presented to the Board at this meeting.

Canadian Affairs

Mr. James Burpee, President and CEO of the Canadian Electricity Association, presented an update on current Canadian reliability-related initiatives.

Standing Committee Reports

Representatives of the Standing Committees provided reports to the Board highlighting items from their written reports as contained within the agenda package.

Operating Committee

Mr. James D. Castle, chair, highlighted some of the Operating Committee's ("OC") activities since the last Board meeting. He thanked Trustees Jaeger and Barber for their attendance at the OC's March meeting and stated the OC is looking forward to welcoming Ms. Case and Mr. Gorbet at future meetings. Mr. Castle praised the Board for their commitment to engaging with the OC. He also provided updates on the OC's work on (i) the Essential Reliability Services Taskforce, (ii) the cold weather preparedness reliability guideline, (iii) the independent experts' report, and (iv) improvements to the organization and structure of the OC.

Planning Committee

Mr. Benjamin Crisp, chair, reviewed progress on some of the Planning Committee's ("PC") key initiatives. He outlined the PC's work in helping to develop the Summer Reliability Assessment and State of Reliability Report. Mr. Crisp also summarized the PC's work with the GMD taskforce and efforts to provide technical basis and justification to that project's standard drafting team. He provided an overview of the PC's process changes which are intended to allow for more feedback from the regions and an increased ability to reprioritize projects within the PC as necessary. Mr. Crisp thanked the Trustees for their active participation with the PC.

Critical Infrastructure Protection Committee

Mr. Charles F. Abell, chair, briefly summarized the ongoing work of the CIPC. He highlighted the issuance of two reports related to NERC's GridEx II, one for the distributed play exercise and one for the executive table top exercise. Mr. Abell stated that the CIPC was actively engaged in implementing the recommendations and addressing the concerns identified in the reports. He also highlighted the strong attendance at and feedback from the CIPC technical workshops and stated that planning was underway for another workshop in June focusing on physical security issues.

Member Representatives Committee

Mr. John A. Anderson, chair, thanked Mr. Gorbet and the Board for the continued use of the Member Representatives Committee's ("MRC") policy input, and summarized the issues that had been discussed at the MRC meeting the previous day. He stated he was appreciative of new meeting structure and recognized MRC members for attending Board Committee meetings.

Personnel Certification Governance Committee

Mr. Brett Hallborg, chair, was not in attendance. Mr. Gorbet referred the meeting participants to the written report of the Personnel Certification and Governance Committee, located in the agenda package.

Standards Committee

Mr. Murphy expressed his gratitude for the good working relationship between the SC and the Board, NERC staff, industry, and the staff of FERC. He outlined work that was ongoing on a number of projects and initiatives including (i) coordination between the SC and the Reliability Issues Steering Committee ("RISC"), (ii) the Reliability Standards Development Plan and its relation to the newly approved ERO Strategic Plan metrics, and (iii) the development of an evaluation framework to be used in conjunction with the metrics.

Reliability Issues Steering Committee

Mr. Robert A. Schaffeld, chair, outlined some of the recent activities of the Reliability Issues Steering Committee ("RISC") including (i) several process improvements intended to assist with the delivery of clear recommendations to Board, (ii) revisions to the RISC charter that are intended to provide clarity on the role of the RISC, and (iii) the completion of an effort to extend and expand committee membership. Mr. Schaffeld also made mention of the RISC's upcoming Reliability Leadership Summit, scheduled to take place in September 2014. He thanked the Board for their continued involvement with RISC activities.

Upon motions duly made and seconded, the Board approved the following resolutions:

RISC Charter Amendments

RESOLVED, that the Board hereby approves the amended Reliability Issues Steering Committee (RISC) Charter, substantially in the form presented to the Board at this meeting, to replace the RISC Charter approved by the Board on August 16, 2012.

RISC Committee Membership Appointments

RESOLVED, that the Board hereby approves extensions to the current Reliability Issues Steering Committee (RISC) members' terms, as follows:

- MRC representative Scott Helyer, through May 2015
- MRC representative Jason Marshall, through May 2015
- At-large member and RISC chair Bob Schaffeld, through May 2016
- MRC representative John Twitty, through May 2015

FURTHER RESOLVED, that the Board hereby approves the following new members to the RISC:

Name	Title	Type of Membership	Term
Daniel Froetscher	Senior Vice President, Transmission, Distribution, and Customers, Arizona Public Service Company	At-Large Member	Two-year term ending May 2016
Ray Gorman	Chairman, New Brunswick Energy and Utilities Board	At-Large Member	Two-year term ending May 2016
Scot Hathaway	Vice President – Transmission, Dominion Virginia Power	At-Large Member	Two-year term ending May 2016
Duane Highley	President and CEO, Arkansas Electric Cooperative	At-Large Member	Two-year term ending May 2016
Nabil Hitti	Vice President, Transmission Network Operations, National Grid	Member Representatives Committee member to the RISC	Two-year term ending May 2016
Steve Whitley	President and CEO, New York ISO	At-Large Member	Two-year term ending May 2016
Terry Bilke	Consulting Advisor, Compliance Services, Midcontinent ISO	Compliance and Certification Committee member to the RISC	Two-year term ending May 2016

Compliance and Certification Committee

Mr. Terry Bilke, chair, reported on the activities of the three Compliance and Certification Committee ("CCC") subcommittees which included (i) involvement in the upcoming independent audit process, (ii) participation in the development of the Reliability Assurance Initiative ("RAI"), and (iii) monitoring of the ongoing risk-based registration project. He also thanked FERC staff for their involvement with the enforcement report. Mr. Bilke presented the 2014-2016 CCC Work Plan for Board approval, as well as the 2013 Stakeholder Perception Survey Report for Board acceptance.

Mr. Gorbet recognized that this is Mr. Bilke's last report to the Board as chair of the CCC and thanked him for his work. Mr. Gorbet welcomed the incoming CCC chair, Ms. Patti Metro.

Upon motions duly made and seconded, the Board approved the following resolutions:

CCC 2014-2016 Work Plan

RESOLVED, that the Board hereby approves the 2014-2016 Compliance and Certification Committee Work Plan, substantially in the form as presented to the Board at this meeting.

CCC 2013 Stakeholder Perception Survey Results and Report Recommendations

RESOLVED, that the Board hereby accepts the 2013 ERO Effectiveness and Stakeholder Perceptions Survey report, substantially in the form as presented to the Board at this meeting.

Electricity Sub-Sector Coordination Council

Mr. Cauley, executive committee member, reported on the recent activities of the Electricity Sub-Sector Coordination Council ("ESCC"), and some of its key focus areas. He described the committee's membership and structure, and stated that the committee is functioning as envisioned. Mr. Cauley also noted the involvement of Mr. Barber with the ESCC.

Forum and Group Reports

North American Energy Standards Board
Mr. Michael Desselle, chair, updated the Board on three matters: (i) the progress of the coordinated effort to retire Reliability Standards that contain commercial aspects, (ii) the development of the Parallel Flow Visualization Project, and (iii) the collaborative effort of North American Energy Standards Board ("NAESB") and NERC staff to support the implementation of the NAESB Electric Industry Registry.

Regional Entity Management Group
Mr. Scott Henry, chair, summarized the current key focus areas for the Regional Entity Management Group: (i) the Five-Year ERO assessment, (ii) the implementation of reforms to RAI and the associated training, (iii) work to fully implement the compliance auditor manual, and (iv) implementation of the new Bulk Electric System ("BES") definition and BES exception processes. Mr. Henry also stated that he appreciates the collaborative process that resulted in the successful development of common metrics but that more work must be done to track and trend their effectiveness. He noted that the joint meeting of the leadership of the regional Boards, the regional CEOs, and the NERC trustees was a success, and thanked Mr. Gorbet for hosting the joint meeting.

North American Transmission Forum
Mr. Galloway, president and CEO, summarized key collaborative efforts between NERC and the North American Transmission Forum, including an update on the 345kV breaker inspection, maintenance, and tracking process and preliminary work on the development of best practices regarding protection system misoperations. He also noted progress on ongoing work with the Electric Power Research

Institute on resiliency and with an effort to promote improved reliability of off-site power sources for nuclear power plants.

North American Generator Forum
Mr. Allen D. Schriver, chair, stated that in addition to the North American Generator Forum's ("NAGF") written report, the increased interactions between NAGF, NERC Staff, and the regions had led to the strengthening of processes and an increase in the quality of feedback received.

Board Committee Reports

Corporate Governance and Human Resources Committee
Ms. Schori, chair, summarized the recent meetings of the Corporate Governance and Human Resources Committee ("CGHRC"). She stated that the CGHRC met in closed session on April 23, 2014 to review management compensation and benefits, and to consider a deferred compensation plan for certain executives and other key employees. Ms. Schori noted that no action had been taken at the meeting and that the committee would continue to consider such a plan.

She reported also that the CGHRC met in open session on May 1, 2014. At that meeting, the committee reviewed a draft of the IRS Form 990, and received updates on both the 2014 corporate goals and NERC staffing. In addition, the committee recommended Board approval of proposed revisions to the Board of Trustees Compliance Committee mandate.

Upon motion duly made and seconded, the Board approved the following resolution:

Compliance Committee Mandate Amendments

RESOLVED, that the Board, upon recommendation of the Corporate Governance and Human Resources Committee, hereby approves the Compliance Committee Mandate, as presented to the Board at this meeting, to replace the Compliance Committee Mandate approved by the Board on May 9, 2012.

Board of Trustees Compliance Committee
Mr. Scherr reported that the Compliance Committee met in executive session on May 5, 2014, and in subsequent open session on May 6, 2014. He reported on some of the issues covered during those meetings, including (i) progress on RAI, (ii) the new processes for revising existing Reliability Standard Audit Worksheets ("RSAW") and management's work to finalize the document, and (iii) consideration of Compliance caseload statistics.

Finance and Audit Committee
Mr. Thilly, chair, reported that on May 6, 2014, the Finance and Audit Committee met in closed and open sessions. He reported that the committee reviewed and recommended Board acceptance of both the 2013 Audit Financial Statements and the First Quarter 2014 Unaudited Statement of Activities for NERC and the Regions. Mr. Thilly also provided an update on the development of the 2015

Business Plans and Budgets for NERC and the Regions and stated that the process has been refined to allow more time for stakeholder review and comment.

Upon motions duly made and seconded, the Board approved the following resolutions:

2013 Audit Financial Statements

RESOLVED, that the Board, upon recommendation of the Finance and Audit Committee, hereby accepts the 2013 Audit Financial Statements, as presented to the Board at this meeting.

First Quarter Unaudited Statement of Activities

RESOLVED, that the Board, upon recommendation of the Finance and Audit Committee, hereby accepts the NERC First Quarter 2014 Unaudited Statement of Activities, as presented to the Board at this meeting.

Enterprise-wide Risk Committee
Mr. Goulding, chair, reported that the first meeting of the Enterprise-wide Risk Committee took place in closed session on May 5, 2014. He indicated that the committee reviewed the 2014 Audit Plan, received an update on risk management activities, and reviewed the CCC's 2014-2016 Work Plan.

Standards Oversight and Technology Committee
Mr. Peterson, chair, stated that the Standards Oversight and Technology Committee met in open session on May 6, 2014. He reported that the committee received an update on the CIP Version 5 transition and that committee members engaged in an active discussion of issues and concerns raised with regard to ERO Enterprise IT Applications. Mr. Peterson indicated that committee members had taken a more active oversight role on those projects. He noted also that he believes there has been a significant improvement in the quality of NERC's work with regard to standards development over the last several years.

Closing Remarks of Chair Gorbet

Mr. Gorbet expressed his appreciation on behalf of the Board to all of those individuals who had made the Board meeting successful. He again thanked Commissioner Norris for attending and offering supportive and encouraging comments. Mr. Gorbet stated that NERC has grappled with many difficult issues at once, has been able to come to a successful resolution to many, and is well positioned for success when confronted with the challenges that are ahead. He commended the work of the NERC standing committees and expressed his satisfaction that Board members have and are continuing to become more involved with the work of the standing committees. Mr. Gorbet reiterated the importance of the MRC policy input process and indicated that the process would continue to be used and refined.

Adjournment

There being no further business, and upon motion duly made and seconded, the meeting was adjourned at 11:42 a.m. Eastern.

1. **Minutes***
   a. February 6, 2014 Meeting
2. **Committee Membership and Charter Changes***
   a. Compliance and Certification Committee Membership
   b. Compliance Processes and Procedures Subcommittee Formation
   c. Critical Infrastructure Protection Committee Membership
   d. Personnel Certification Governance Committee Membership

Regular Agenda

3. **Opening Remarks by Board Chair**
4. **Remarks by FERC Commissioner Cheryl LaFleur**
5. **Remarks by FERC Commissioner Tony Clark**
6. **Remarks by Mr. Denis O'Brien, CEO, Exelon Utilities**
7. **President's Report**

8. **Standards***
    a. Demand Data (MOD C) – MOD 031-1 — **Adopt**
    b. Voltage and Reactive Control – VAR-002-3 – **Adopt**
    c. Operating Personnel Communictions Protocols – COM-002-4 – **Adopt**
    d. Violation Risk Factor/Violation Severity Level Revisions – **Adopt**
        - TPL-001-4
        - CIP Version 5 (CIP-003-5, CIP-004-5.1, CIP-006-5, CIP-008-5, CIP-009-5)
        - MOD-026-1 and MOD-027-1
        - PRC-005-2 and PRC-005-3
        - BAL-003-1
    e. Physical Security Standard — **Information**
9. **Amendments to SERC Bylaws* – Approve**
10. **State of Reliability Report*— Information**
11. **Summer Assessment*— Information**
12. **ERO Strategic Plan Metrics – Approve**
13. **Canadian Affairs – Jim Burpee — Information**
14. **Committee Reports***
    a. Operating Committee
    b. Planning Committee
    c. Critical Infrastructure Protection Committee
    d. Member Representatives Committee
    e. Personnel Certification Governance Committee
    f. Standards Committee
    g. Reliability Issues Steering Committee
        i. Charter Amendments – **Approve**
        ii. Committee Membership Appointments – **Approve**
    h. Compliance and Certification Committee
        i. 2014-2016 Work Plan – **Approve**
        ii. 2013 Stakeholder Perception Survey Results and Report Recommendations – **Accept**
    i. Electricity Sub-Sector Coordinating Council

15. **Forum and Group Reports***
    a. North American Energy Standards Board
    b. Regional Entity Management Group
    c. North American Transmission Forum
    d. North American Generator Forum
16. **Board Committee Reports**
    a. Corporate Governance and Human Resources
        i. Compliance Committee Mandate Amendments – **Approve**
    b. Compliance
    c. Finance and Audit
        i. 2013 Audit Financial Statements – **Accept**
        ii. First Quarter Statement of Activities – **Accept**
    d. Enterprise-wide Risk
    e. Standards Oversight and Technology

***Background materials included.**

Agenda
Reliability Issues Steering Committee

May 7, 2014 | 12:30 p.m. – 2:30 p.m. EDT

ReadyTalk Conference
Audio Dial In: 866-740-1260 | Access Code 9473885 | Security Code 5741587
On the web at www.readytalk.com

Introductions and Chair's Remarks

NERC Antitrust Compliance Guidelines and Public Announcement

Agenda Items

1. **Board Meeting Update — (Discussion)**
2. **Reliability Leadership Summit — (Review, Discussion)**
3. **2015-2017 RSDP, Reliability Standards Development Plan — (Review, Discussion)**
4. **Risk Management Projects *— (Review, Discussion)**
5. **Committee Reports— (Discussion)**

   Status on matters as it pertains to the RISC

   a. Operating Committee
   b. Planning Committee
   c. Critical Infrastructure Committee
   d. Compliance and Certification Committee
   e. Standards Committee
6. **Review Future Meetings**
   a. June 17, 2014 8:00-5:00 CDT - In-Person Meeting Chicago, IL
   b. July 10, 2014 9:00-12:00 EDT - Conference Call
   c. August 14, 2014 12:30-2:30 PDT - Post-BOT Meeting, Vancouver, BC
   d. September 11, 2014 9:30-4:30 EDT - Reliability Leadership Summit, Washington, DC
   e. September 12, 2014 8:00-2:30 EDT - In-Person Meeting, Washington, DC
   f. October 07, 2014 9:00-12:00 EDT - Conference Call
   g. November 13, 2014 12:30-2:30 EST - Post-BOT Meeting, Atlanta, GA
   h. December 02, 2014 8:00-5:00 MST - In-Person Meeting, Phoenix, AZ
7. **Adjourn**

Meeting Notes
Reliability Issues Steering Committee

May 7, 2014 | 12:30 p.m. – 2:30 p.m. EDT

Hyatt Regency Philadelphia at Penn's Landing
201 South Columbus Blvd
Philadelphia, PA and ReadyTalk Conference Call

Introductions and Chair's Remarks

Chair Schaffeld and Secretary Burgess welcomed the new members and thanked the outgoing members for their contributions.

RISC Member Attendance:

Bob Schaffeld – Present
Jim Brenton – Present
Jim Case – Not Present
Sylvain Clermont – Present, outgoing member
Ben Crisp – Present
Daniel Froetscher – Not present, newly elected
Ray Gorman – Present
Scot Hathaway – Not Present, newly elected
Scott Helyer – Not Present
Duane Highley – Not Present, newly elected
Nabil Hitti – Present, newly elected
Jason Marshall – Present
Brian Murphy –Present
Clay Smith – Not present, outgoing member
John Twitty – Present
Andy Rodriquez – Present, outgoing member
Steve Whitley – Present, new member
Thomas Burgess – Present, new member

A number of observers attended the meeting including NERC Board of Trustees Chair, Fred Gorbet.

NERC Antitrust Compliance Guidelines and Public Announcement

Gugel reviewed the anti-trust guidance and the public meeting notification.

Agenda Items Were Reordered in the Meeting:

Item 1 - Board Meeting Update

A roundtable was conducted on Board meeting highlights.

Item 2 - Reliability Leadership Summit

- The FERC technical conference will be held in July. This conference compliments the Reliability Leadership Summit.
- For the Summit, the refined agenda was discussed and a number of recommendations were provided.

Actions:

- *Schaffeld and Burgess plan to invite the no-brainer panelists by the June RISC meeting.*
- *RISC members should provide contact information for panelists as well as the rationale for their selection to Schaffeld and Burgess.*

Item 3 - Review Future Meetings

- June 17, 2014 8:00-5:00 CDT - In-Person Meeting Atlanta, GA
    - This meeting was originally scheduled to be in Chicago, IL.
- July 10, 2014 9:00-12:00 EDT - Conference Call
- August 14, 2014 12:30-2:30 PDT - Post- Board of Trustees Meeting, Vancouver, BC
- September 11, 2014 9:30-4:30 EDT - Reliability Leadership Summit, Washington, DC
- September 12, 2014 8:00-2:30 EDT - In-Person Meeting, Washington, DC
- October 07, 2014 9:00-12:00 EDT - Conference Call
- November 13, 2014 12:30-2:30 EST - Post- Board of Trustees Meeting, Atlanta, GA
- December 02, 2014 8:00-5:00 MST - In-Person Meeting, Phoenix, AZ

Item 4 - 2015:2017 RSDP, Reliability Standards Development Plan

Murphy will provide an overview of this plan at the RISC meeting in June.

Actions:

- *Overview to include:*
    - *Any plans for outreach to the technical committees or other entities*
    - *Information on how the RISC should move forward on integrating triaged reliability assessments into the plan*

Item 5 - Risk Management Projects

A dialogue on how best to represent a "dashboard" of risk projects was facilitated by Burgess and Gugel.

Actions:

- *Dialogue to continue at the RISC meeting in June.*
- *ERO Top Priority Reliability Risks 2014-2017 to be part of the new member orientation in June.*

Item 6 - Committee Reports

a. Operating Committee– no update (member not present)

b. Planning Committee – Conducting scenario analysis for Adaptation and Planning for Change

c. Critical Infrastructure Protection Committee – Continuing with on-going activity

d. Compliance and Certification Committee – Focus is on risk based registration

e. Standards Committee – Refer to RSDP update.

Item 7 - Adjourn

There being no additional business to conduct, the meeting was adjourned.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Summary Agenda
2014 Reliability Leadership Summit

September 11, 2014 9:30a.m. – 4:30p.m.

Washington Marriott at Metro Center
775 12th St NW, Washington, DC

In Person Only

Welcome Remarks 9:30am – 9:45am

Bob Schaffeld, Vice President, Transmission, Southern Company; Chair of the RISC
Gerry Cauley, President and CEO, NERC

Morning Keynote Speaker 9:45am – 10:15am

Cheryl LaFleur?

Panel 1 – Changing Resource Mix, New Technologies, and the Impacts on Operations
10:15am – 11:15am

Our industry is undergoing fundamental change. Fuel prices, environmental regulations, and legislative support for renewable energy initiatives change not only how the bulk power system is planned, but how equipment and resources are being operated, controlled, and dispatched. New technologies (wind, solar, microgrids, plug-in hybrids, storage, PMUs, etc.) are also having an impact.

The convergence of large quantities of variable generation resources, the increase in gas-fired generation, and the retirement of conventional coal and nuclear generation resources, requires a complete rethinking on the way the industry assesses resource adequacy and essential reliability services. A change in resources means a change in operating characteristics. Newer generation technologies behave inherently different than traditional means of producing electricity.

How are these changes or the pace of change impacting our ability to plan for reliability? What new technologies present the most challenges for the industry to overcome? Are different approaches to operations or planning needed to address the changes facing us? What are the main policy drivers that should be considered so there is no impact to reliability?

Panelists:
General Panel Structure: 5 panelists, 5 minute opening remarks, 30 minutes of Q&A

Who are the panelists?

- RTOs?
- ERCOT
- CAISO
- MISO
- NE (gas dependency?)
- RCs?

Morning Break 11:15am – 11:30am

Panel 2 – Resource Adequacy and Complex Interdependencies 11:30am - 12:30pm

Ensuring North America has enough resources to meet changing demand is a critical component to reliability. The bulk power system was designed to use a portfolio of large-scale, synchronous generators to produce electricity and supply it to consumers through an interconnected high-voltage transmission backbone and a medium- and low-voltage distribution system. In North America, the power system is anchored by over a million megawatts of central station generation.

However, as the composition of the resource portfolio changes, complex risks to the industry are being identified. For example, the effect of increased reliance on natural gas for electric power and resource adequacy, the role of natural gas and electric storage, and the continued growth of demand and distributed resources are all vital components for ensuring future electric reliability.

Addressing these interdependent risks requires innovative problem solving. Industry leaders and policy-makers need to address these challenges and give them due consideration to ensure future BPS reliability is maintained.

How should the characteristics of essential reliability services be addressed given that the industry is a crossroads? Does the industry need to consider other metrics for assessing resource adequacy, beyond reserve margins? How should interdependences on gas and coal fuel resources be addressed? Wind and other variable resources? Given extreme conditions that plague many areas, such as hurricanes and drought, how should these considerations impact resource adequacy targets? Are requirements necessary?

Panelists:
General Panel Structure: 5 panelists, 5 minute opening remarks, 30 minutes of Q&A

Who are the panelists? Tom Burgess/John Moura (LTRA tie-in)? Others?

- MISO #2
- NPCC
- ERCOT – Ken McIntyre
- California
- PJM for changing reserve margins

Lunch 12:30pm – 1:30pm

Afternoon Keynote Speaker 1:30pm – 2:00pm

Focus on 9/11 or other major event. Black swan. Response, resiliency, recovery. Who should this be?

Panel 3 – Preparing for the Worst: Resiliency and Recovery 2:00pm – 3:00pm

Risks managers understand that beyond efforts to prevent a risk from manifesting, there are other ways to manage risk. Mitigation is taking appropriate action to reduce the impact of a risk when it does manifest. Because the bulk-power system has been designed to be reliable, incremental changes to reduce the likelihood of an event become cost prohibitive fairly quickly. However, focused efforts to reduce the size or duration of any event also serve to manage reliability risk.

What is resiliency? Are we doing all we can to ensure it? How best can the industry work together to support resiliency and recovery? What should the industry do to be prepared and ready for extreme weather events?

Panelists:

TBD; General Panel Structure: 5 panelists, 5 minute opening remarks, 30 minutes of Q&A

Who are the panelists?

- PGE
- Dominion
- DOE?
- FERC?
- Others?

Afternoon Break 3:00pm – 3:15pm

Panel 4– Leadership Round Table: Next Steps for Reliability 3:15pm – 4:15pm

Based on insights and themes presented, as well as others, this open-format discussion is intended to encourage leaders from industry to share thoughts and ideas relative to priority and significance of these reliability risks and relative priority steps to address.

Panelists:
Moderator – Bob Schaffeld
TBD; Round Table Structure: 10 panelists, 3 minute opening remarks, 25 minutes of discussion
Who are the panelists?

- Steve Whitely and/or Duane Highley?
- Billy Ball, Southern CTO?
- PA Consulting's "Reliability One" award winner(s)? PSEG, CONED, WE Energies, KCPL, or SDGE?
- Mike Bardee?
- Terry Boston?
- Jim Jura
- Caren Anders
- Others?

Closing Remarks 4:15pm – 4:30pm
Gerry Cauley, President and CEO of NERC

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Reliability Standard Audit Worksheet[1]

FAC-003-3 – Transmission Vegetation Management

This section must be completed by the Compliance Enforcement Authority.

Compliance Enforcement Authority:	
Registered Entity Name:	
NCR Number:	
Applicable Function(s): Applicable only for TO and GO	
Compliance Assessment Date:	
Compliance Monitoring Method:	
RSAW Version:	RSAW_FAC-003-3_2014_v2
Revision Date:	April 23, 2014
Names of Auditors:	

[1] NERC developed this Reliability Standard Audit Worksheet (RSAW) language in order to facilitate NERC's and the Regional Entities' assessment of a registered entity's compliance with this Reliability Standard. The NERC RSAW language is written to specific versions of each NERC Reliability Standard. Entities using this RSAW should choose the version of the RSAW applicable to the Reliability Standard being assessed. While the information included in this RSAW provides some of the methodology that NERC has elected to use to assess compliance with the requirements of the Reliability Standard, this document should not be treated as a substitute for the Reliability Standard or viewed as additional Reliability Standard requirements. In all cases, the Regional Entity should rely on the language contained in the Reliability Standard itself, and not on the language contained in this RSAW, to determine compliance with the Reliability Standard. NERC's Reliability Standards can be found on NERC's website. Additionally, NERC Reliability Standards are updated frequently, and this RSAW may not necessarily be updated with the same frequency. Therefore, it is imperative that entities treat this RSAW as a reference document only, and not as a substitute or replacement for the Reliability Standard. It is the responsibility of the registered entity to verify its compliance with the latest approved version of the Reliability Standards, by the applicable governmental authority, relevant to its registration status.

The NERC RSAW language contained within this document provides a non-exclusive list, for informational purposes only, of examples of the types of evidence a registered entity may produce or may be asked to produce to demonstrate compliance with the Reliability Standard. A registered entity's adherence to the examples contained within this RSAW does not necessarily constitute compliance with the applicable Reliability Standard, and NERC and the Regional Entity using this RSAW reserves the right to request additional evidence from the registered entity that is not included in this RSAW. Additionally, this RSAW includes excerpts from FERC Orders and other regulatory references. The FERC Order cites are provided for ease of reference only, and this document does not necessarily include all applicable Order provisions. In the event of a discrepancy between FERC Orders, and the language included in this document, FERC Orders shall prevail.

Subject Matter Experts

Identify Subject Matter Expert(s) responsible for this Reliability Standard. (Insert additional rows if necessary)

Registered Entity Response (Required):

SME Name	Title	Organization	Requirement(s)

R1 Supporting Evidence and Documentation

Requirement

R1. Each applicable Transmission Owner and applicable Generator Owner shall manage vegetation to prevent encroachments into the Minimum Vegetation Clearance Distance (MVCD) of its applicable line(s) which are either an element of an IROL, or an element of a Major WECC Transfer Path; operating within their Rating and all Rated Electrical Operating Conditions of the types shown below[2]:

1. An encroachment into the MVCD as shown in FAC-003-Table 2, observed in Real-time, absent a Sustained Outage,[3]
2. An encroachment due to a fall-in from inside the ROW that caused a vegetation-related Sustained Outage,[4]
3. An encroachment due to the blowing together of applicable lines and vegetation located inside the ROW that caused a vegetation-related Sustained Outage,[4]
4. An encroachment due to vegetation growth into the MVCD that caused a vegetation-related Sustained Outage.[4]

Measure

M1. Each applicable Transmission Owner and applicable Generator Owner has evidence that it managed vegetation to prevent encroachment into the MVCD as described in R1. Examples of acceptable forms of evidence may include dated attestations, dated reports containing no Sustained Outages associated with encroachment types 2 through 4 above, or records confirming no Real-time observations of any MVCD encroachments.

Questions for Registered Entity

Question: Does the applicable Generator Owner own overhead transmission lines that (1) extend greater than one mile or 1.609 kilometers beyond the fenced area of the generating station switchyard to the point of interconnection with a Transmission Owner's Facility or (2) do not have a clear line of sight4 from the generating station switchyard fence to the point of interconnection with a Transmission Owner's Facility? ☐ Yes ☐ No

If Yes, provide a list of the applicable transmission lines and respond to the following Questions.

Registered Entity Response to Question **(Required)**:

[2] This requirement does not apply to circumstances that are beyond the control of a applicable Transmission Owner or applicable Generator Owner subject to this reliability standard, including natural disasters such as earthquakes, fires, tornados, hurricanes, landslides, wind shear, fresh gale, major storms as defined either by the applicable Transmission Owner or applicable Generator Owner or an applicable regulatory body, ice storms, and floods; human or animal activity such as logging, animal severing tree, vehicle contact with tree, or installation, removal, or digging of vegetation. Nothing in this footnote should be construed to limit the Transmission Owner's or applicable Generator Owner's right to exercise its full legal rights on the ROW.

[3] If a later confirmation of a Fault by the applicable Transmission Owner or applicable Generator Owner shows that a vegetation encroachment within the MVCD has occurred from vegetation within the ROW, this shall be considered the equivalent of a Real-time observation.

[4] Multiple Sustained Outages on an individual line, if caused by the same vegetation, will be reported as one outage regardless of the actual number of outages within a 24-hour period.

Question: Does the applicable Transmission Owner or Generator Owner own overhead transmission lines that are either an element of an IROL or an element of a Major WECC Transfer Path? ☐ Yes ☐ No

If Yes, provide a list of the applicable transmission lines and respond to the next Question.

Registered Entity Response to Question **(Required)**:

Question: Did the applicable Transmission Owner or Generator Owner have any encroachment (Types 1-4) into the MVCD of its applicable line(s) in the audit period? ☐ Yes ☐ No

If Yes, describe the encroachment(s).

Registered Entity Response to Question **(Required)**:

Registered Entity Response (Required):

Describe, in narrative form, how you meet compliance with this Requirement.

Registered Entity Evidence Listing (Required):

Provide the following for all evidence submitted (Insert additional rows if necessary):
File Name, File Extension, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description

1.
2.
3.

Audit Team Evidence Reviewed

This section must be completed by the Compliance Enforcement Authority

1.
2.
3.

Compliance Assessment Approach Specific to FAC-003-3, R1

This section must be completed by the Compliance Enforcement Authority

Review the evidence to verify the Registered Entity has performed the following:

	Responded to the Questions and provided evidence of compliance if it owns applicable line(s).
	Managed vegetation to prevent encroachments into the Minimum Vegetation Clearance Distance (MVCD) as follows:
	• No Real-time observations of any MVCD encroachments absent a Sustained Outage (type 1) or;
	• No Sustained Outages associated with encroachment types 2 through 4 or;
	If applicable, provided documentation of circumstances resulting in an encroachment that are beyond the control of an applicable Transmission Owner or applicable Generator Owner subject to compliance with this reliability standard including natural disasters, or human or animal activity, as detailed in footnote 5.
Note to Auditor: Information on the purpose, applicability, and effective dates of this standard is included in the Additional Information section of this RSAW. Auditor should consider verifying the entity's list of overhead lines that were identified as an element of an IROL or an element of a Major WECC Transfer Path are the same as the applicable Planning Coordinator's list. Review the guidance provided in footnotes 2-4 as well as example evidence in the requirement measure**.** Auditor should review the Quarterly Vegetation-Related Transmission Outage Reports to verify entity response for the applicable audit period. Consider Requirement 1 on page 18 of the Guidelines and Technical Basis in the attached FAC-003-3 Standard for more information.	

Auditor Notes:

R2 Supporting Evidence and Documentation

Requirement

R2. Each applicable Transmission Owner and applicable Generator Owner shall manage vegetation to prevent encroachments into the MVCD of its applicable line(s) which are not either an element of an IROL, or an element of a Major WECC Transfer Path; operating within its Rating and all Rated Electrical Operating Conditions of the types shown below[5]:

1. An encroachment into the MVCD, observed in Real-time, absent a Sustained Outage,6
2. An encroachment due to a fall-in from inside the ROW that caused a vegetation-related Sustained Outage,7
3. An encroachment due to blowing together of applicable lines and vegetation located inside the ROW that caused a vegetation-related Sustained Outage,7
4. An encroachment due to vegetation growth into the line MVCD that caused a vegetation-related Sustained Outage7

Measure

M2. Each applicable Transmission Owner and applicable Generator Owner has evidence that it managed vegetation to prevent encroachment into the MVCD as described in R2. Examples of acceptable forms of evidence may include dated attestations, dated reports containing no Sustained Outages associated with encroachment types 2 through 4 above, or records confirming no Real-time observations of any MVCD encroachments.

Questions for Registered Entity

Question: Does the applicable Generator Owner own overhead transmission lines that (1) extend greater than one mile or 1.609 kilometers beyond the fenced area of the generating station switchyard to the point of interconnection with a Transmission Owner's Facility or (2) do not have a clear line of sight4 from the generating station switchyard fence to the point of interconnection with a Transmission Owner's Facility? ☐ Yes ☐ No

If Yes, provide a list of the applicable transmission lines and respond to the following Questions.

Registered Entity Response to Question **(Required)**:

Question: Does the applicable Transmission Owner or Generator Owner own overhead transmission lines operated at 200kV or above that are not either an element of an IROL or an element of a Major WECC Transfer Path that are operating within its Rating? ☐ Yes ☐ No

If Yes, provide a list of the applicable transmission lines.

Registered Entity Response to Question **(Required)**:

Question: Did the applicable Transmission Owner or Generator Owner have any encroachment (Types 1-4) into the MVCD of its applicable line(s) in the audit period? ☐ Yes ☐ No. **If Yes,** describe the encroachment(s). **Registered Entity Response** to Question **(Required)**:

Registered Entity Response (Required):

Describe, in narrative form, how you meet compliance with this Requirement.

Registered Entity Evidence Listing (Required):

Provide the following for all evidence submitted (Insert additional rows if necessary): File Name, File Extension, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description

1.
2.
3.

Audit Team Evidence Reviewed

This section must be completed by the Compliance Enforcement Authority

1.
2.
3.

Compliance Assessment Approach Specific to FAC-003-3, R2

This section must be completed by the Compliance Enforcement Authority

Review the evidence to verify the Registered Entity has performed the following:

	Responded to the Questions and provided evidence of compliance if it owns applicable line(s).
	Managed vegetation to prevent encroachments into the Minimum Vegetation Clearance Distance (MVCD) as follows:
	• No Real-time observations of any MVCD encroachments absent a Sustained Outage (type 1) or;
	• No Sustained Outages associated with encroachment types 2 through 4 or;
	If applicable, provided documentation of circumstances resulting in an encroachment that are beyond the control of an applicable Transmission Owner or applicable Generator Owner subject to compliance with this reliability standard including natural disasters, or human or animal activity, as detailed in footnote 5.

Note to Auditor: Auditor should consider verifying the entity's list of overhead lines that were not identified as an element of an IROL or an element of a Major WECC Transfer Path are the same as the applicable Planning Coordinator's list. Review the guidance provided in footnotes 2-4 as well as example evidence in the requirement measure. Auditor should review the Quarterly Vegetation-Related Transmission Outage Reports to verify entity response for the applicable audit period.

Consider Requirement 2 on page 18 of the Guidelines and Technical Basis in the attached FAC-003-3 Standard for more information.

Auditor Notes:

R3 Supporting Evidence and Documentation

Requirement

R3. Each applicable Transmission Owner and applicable Generator Owner shall have documented maintenance strategies or procedures or processes or specifications it uses to prevent the encroachment of vegetation into the MVCD of its applicable lines that accounts for the following:
3.1 Movement of applicable line conductors under their Rating and all Rated Electrical Operating Conditions;
3.2 Inter-relationships between vegetation growth rates, vegetation control methods, and inspection frequency.

Measure

M3. The maintenance strategies or procedures or processes or specifications provided demonstrate that the applicable Transmission Owner and applicable Generator Owner can prevent encroachment into the MVCD considering the factors identified in the requirement.

Registered Entity Response (Required):

Describe, in narrative form, how you meet compliance with this Requirement.

Registered Entity Evidence Listing (Required):

Provide the following for all evidence submitted (Insert additional rows if necessary):
File Name, File Extension, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description

1.
2.
3.

Audit Team Evidence Reviewed

This section must be completed by the Compliance Enforcement Authority

1.
2.
3.

Compliance Assessment Approach Specific to FAC-003-3, R3

This section must be completed by the Compliance Enforcement Authority

Review the evidence to verify the Registered Entity has provided the following:

	Documented maintenance strategies or procedures or processes or specifications it uses to prevent the encroachment of vegetation into the MVCD of its applicable lines that accounts for the following:
	• Consideration of movement of applicable line conductors under their Rating and all Rated

	Electrical Operating Conditions;
	• Consideration of Inter-relationships between the following:
	○ Vegetation growth rates
	○ Vegetation control methods
	○ Inspection frequency
Note to Auditor: Consider Requirement 3 on pages 19-20 of the Guidelines and Technical Basis in the attached FAC-003-3 Standard for more information.	

Auditor Notes:

R4 Supporting Evidence and Documentation

Requirement

R4. Each applicable Transmission Owner and applicable Generator Owner, without any intentional time delay, shall notify the control center holding switching authority for the associated applicable line when the applicable Transmission Owner and applicable Generator Owner has confirmed the existence of a vegetation condition that is likely to cause a Fault at any moment.

Measure

M4. Each applicable Transmission Owner and applicable Generator Owner that has a confirmed vegetation condition likely to cause a Fault at any moment will have evidence that it notified the control center holding switching authority for the associated transmission line without any intentional time delay. Examples of evidence may include control center logs, voice recordings, switching orders, clearance orders and subsequent work orders.

Questions for Registered Entity

Question: Did the applicable Transmission Owner or applicable Generator Owner have confirmed existence of any vegetation conditions likely to cause a Fault at any moment in the audit period? ☐ Yes ☐ No

If Yes, explain the event and provide evidence of notification of the control center without any intentional time delay.

Registered Entity Response to Question **(Required)**:

Registered Entity Response (Required):

Describe, in narrative form, how you meet compliance with this Requirement.

Registered Entity Evidence Listing (Required):

Provide the following for all evidence submitted (Insert additional rows if necessary):
File Name, File Extension, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description

1.
2.
3.

Audit Team Evidence Reviewed

This section must be completed by the Compliance Enforcement Authority

1.
2.
3.

Compliance Assessment Approach Specific to FAC-003-3, R4

This section must be completed by the Compliance Enforcement Authority

Review the evidence to verify the Registered Entity has performed the following:

	Responded to the Question and provided evidence of compliance.
	Notified the control center holding switching authority for the associated transmission line without any intentional time delay when:
	• The applicable Transmission Owner or applicable Generator Owner has confirmed the existence of a vegetation condition that is likely to cause a Fault at any moment and;
	• That this notification was made without any intentional time delay
Note to Auditor: Consider Requirement 4 on pages 20-21 of the Guidelines and Technical Basis in the attached FAC-003-3 Standard for more information.	

Auditor Notes:

R5 Supporting Evidence and Documentation

Requirement

R5. When an applicable Transmission Owner and applicable Generator Owner is constrained from performing vegetation work on an applicable line operating within its Rating and all Rated Electrical Operating Conditions, and the constraint may lead to a vegetation encroachment into the MVCD prior to the implementation of the next annual work plan, then the applicable Transmission Owner or applicable Generator Owner shall take corrective action to ensure continued vegetation management to prevent encroachments.

Measure

M5. Each applicable Transmission Owner and applicable Generator Owner has evidence of the corrective action taken for each constraint where an applicable transmission line was put at potential risk. Examples of acceptable forms of evidence may include initially-planned work orders, documentation of constraints from landowners, court orders, inspection records of increased monitoring, documentation of the de-rating of lines, revised work orders, invoices, or evidence that the line was de-energized.

Questions for Registered Entity

Question: Was the applicable Transmission Owner or applicable Generator Owner constrained during the audit period from performing vegetation work on applicable line(s) operating within its Rating and all Rated Electrical Operating Conditions? ☐ Yes ☐ No

If Yes, could the constraint have led to a vegetation encroachment into the MVCD prior to the implementation of the next annual work plan? ☐ Yes ☐ No

If Yes, did the applicable Transmission Owner or applicable Generator Owner take corrective action to ensure continued vegetation management to prevent encroachments? ☐ Yes ☐ No

If Yes, to any of the questions, provide a description of the constraint(s) and the corrective action taken to prevent encroachments.

Registered Entity Response to Question **(Required)**:

Registered Entity Response (Required):

Describe, in narrative form, how you meet compliance with this Requirement.

Registered Entity Evidence Listing (Required):

Provide the following for all evidence submitted (Insert additional rows if necessary):
File Name, File Extension, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description

1.
2.
3.

Audit Team Evidence Reviewed

This section must be completed by the Compliance Enforcement Authority

1.
2.
3.

Compliance Assessment Approach Specific to FAC-003-3, R5

This section must be completed by the Compliance Enforcement Authority

Review the evidence to verify the Registered Entity has performed the following:

	Responded to the Question and provided evidence of compliance.
	Provided evidence of being constrained from performing vegetation work on applicable line(s) operating within its Rating and all Rated Electrical Operating Conditions, and;
	• The constraint may lead to a vegetation encroachment into the MVCD prior to the implementation of the next annual work plan and;
	• The applicable Transmission Owner or applicable Generator Owner took corrective action to ensure continued vegetation management to prevent encroachments
Note to Auditor: In situations where transmission line reliability is potentially at risk due to a constraint, the applicable Transmission Owner is required to take an interim corrective action to mitigate the potential risk to the transmission line. Consider Requirement 5 on pages 21-22 of the Guidelines and Technical Basis in the attached FAC-003-3 Standard for more information.	

Auditor Notes:

R6 Supporting Evidence and Documentation

Requirement

R6. Each applicable Transmission Owner and applicable Generator Owner shall perform a Vegetation Inspection of 100% of its applicable transmission lines (measured in units of choice - circuit, pole line, line miles or kilometers, etc.) at least once per calendar year and with no more than 18 calendar months between inspections on the same ROW[5]

Measure

M6. Each applicable Transmission Owner and applicable Generator Owner has evidence that it conducted Vegetation Inspections of the transmission line ROW for all applicable lines at least once per calendar year but with no more than 18 calendar months between inspections on the same ROW. Examples of acceptable forms of evidence may include completed and dated work orders, dated invoices, or dated inspection records.

Registered Entity Response (Required):

Describe, in narrative form, how you meet compliance with this Requirement.

Registered Entity Evidence Listing (Required):

Provide the following for all evidence submitted (Insert additional rows if necessary):
File Name, File Extension, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description

2.
3.

Compliance Assessment Approach Specific to FAC-003-3, R6

This section must be completed by the Compliance Enforcement Authority

Review the evidence to verify the Registered Entity has performed the following:

	A Vegetation Inspection of 100% of its applicable transmission lines at least once per calendar year and

[5] When the applicable Transmission Owner or applicable Generator Owner is prevented from performing a Vegetation Inspection within the timeframe in R6 due to a natural disaster, the TO or GO is granted a time extension that is equivalent to the duration of the time the TO or GO was prevented from performing the Vegetation Inspection.

	with no more than 18 calendar months between inspections on the same ROW or;
	Provided evidence of any necessary Vegetation Inspection timeframe extensions due to a natural disaster per footnote 8.

Note to Auditor: Verify that 100% of the applicable transmission lines were inspected within the intervals established in the applicable entity's "documented maintenance strategies" established in Requirement 3. Initially, entities are required to inspect 100% of their applicable transmission lines in the calendar year 2014, regardless of their previous inspection cycle. An entity performing inspections between 1/1/14 and 6/30/14 would satisfy this requirement. For calendar year 2015, such an entity would be required to perform subsequent inspections within 18 months of the prior inspection date. For entities performing their calendar year 2014 inspections after 7/1/14, they would have until 12/31/15 to perform the calendar year 2015 inspections. Consider Requirement 6 page 22 of the Guidelines and Technical Basis in the attached FAC-003-3 Standard for more information.

Auditor Notes:

R7 Supporting Evidence and Documentation

Requirement

R7. Each applicable Transmission Owner or applicable Generator Owner shall complete 100% of its annual vegetation work plan of applicable lines to ensure no vegetation encroachments occur within the MVCD. Modifications to the work plan in response to changing conditions or to findings from vegetation inspections may be made (provided they do not allow encroachment of vegetation into the MVCD) and must be documented. The percent completed calculation is based on the number of units actually completed divided by the number of units in the final amended plan (measured in units of choice - circuit, pole line, line miles or kilometers, etc.) Examples of reasons for modification to annual plan may include:

- Change in expected growth rate/ environmental factors
- Circumstances that are beyond the control of a applicable Transmission Owner or applicable Generator Owner[6]
- Rescheduling work between growing seasons
- Crew or contractor availability/ Mutual assistance agreements
- Identified unanticipated high priority work
- Weather conditions/Accessibility
- Permitting delays
- Land ownership changes/Change in land use by the landowner
- Emerging technologies

Measure

M7. Each applicable Transmission Owner or applicable Generator Owner has evidence that it completed its annual vegetation work plan for its applicable lines. Examples of acceptable forms of evidence may include a copy of the completed annual work plan (as finally modified), dated work orders, dated invoices, or dated inspection records.

Registered Entity Response (Required):

Describe, in narrative form, how you meet compliance with this Requirement.

Registered Entity Evidence Listing (Required):

Provide the following for all evidence submitted (Insert additional rows if necessary):
File Name, File Extension, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description

[6] Circumstances that are beyond the control of an applicable Transmission Owner or applicable Generator Owner include but are not limited to natural disasters such as earthquakes, fires, tornados, hurricanes, landslides, ice storms, floods, or major storms as defined either by the TO or GO or an applicable regulatory body.

1.
2.
3.

Compliance Assessment Approach Specific to FAC-003-3, R7

This section must be completed by the Compliance Enforcement Authority

Review the evidence to verify the Registered Entity has performed the following:

	Completed 100% of its annual vegetation work plan of applicable lines or;
	Provided documentation of reasons for modification of its annual plan
	Provided documentation that the percent completed calculation is based on the number of units actually completed divided by the number of units in the final amended plan
Note to Auditor: This requirement sets the expectation that the work identified in the annual work plan will be completed as planned. Deferrals or relevant changes to the annual plan shall be documented. Auditor should rely on professional judgment to accurately identify and select a sample of transmission lines ROWs that traverse the major biomes within the applicable entities footprint. Auditors should consider biome conditions such as climate, geography, elevation, botany, population density, and land uses when selecting the sample transmission lines for R7. Consider Requirement 7 on pages 23-24 of the Guidelines and Technical Basis in the attached FAC-003-3 Standard for more information

Additional Information

The following information comes directly from the standard FAC-003-03

1. **Title:** Transmission Vegetation Management

2. **Number:** FAC-003-3

3. **Purpose:** To maintain a reliable electric transmission system by using a defense-in-depth strategy to manage vegetation located on transmission rights of way (ROW) and minimize encroachments from vegetation located adjacent to the ROW, thus preventing the risk of those vegetation-related outages that could lead to Cascading.
4. **Applicability**

4.1. Functional Entities:

4.1.1. Applicable Transmission Owners

4.1.1.1 Transmission Owners that own Transmission Facilities defined in 4.2.

4.1.2 Applicable Generator Owners

4.1.2.1 Generator Owners that own generation Facilities defined in 4.3

4.2. Transmission Facilities: Defined below (referred to as "applicable lines"), including but not limited to those that cross lands owned by federal[7], state, provincial, public, private, or tribal entities:

4.2. 1 Each overhead transmission line operated at 200kV or higher.

4.2.2 Each overhead transmission line operated below 200kV identified as an element of an IROL under NERC Standard FAC-014 by the Planning Coordinator.

4.2.3 Each overhead transmission line operated below 200 kV identified as an element of a Major WECC Transfer Path in the Bulk Electric System by WECC.

4.2.4 Each overhead transmission line identified above (4.2.1 through 4.2.3) located outside the fenced area of the switchyard, station or substation and any portion of the span of the transmission line that is crossing the substation fence.

4.3. Generation Facilities: Defined below (referred to as "applicable lines"), including but not limited to those that cross lands owned by federal[8], state, provincial, public, private, or tribal entities:

4.3.1 Overhead transmission lines that (1) extend greater than one mile or 1.609 kilometers beyond the fenced area of the generating station switchyard to the point of interconnection with a

[7] EPAct 2005 section 1211c: "Access approvals by Federal agencies."
[8] Id.

Transmission Owner's Facility or (2) do not have a clear line of sight[9] from the generating station switchyard fence to the point of interconnection with a Transmission Owner's Facility and are:

4.3.1.1 Operated at 200kV or higher; or

4.3.1.2 Operated below 200kV identified as an element of an IROL under NERC Standard FAC-014 by the Planning Coordinator; or

4.3.1.3 Operated below 200 kV identified as an element of a Major WECC Transfer Path in the Bulk Electric System by WECC.

Effective Dates

There are two effective dates associated with this standard.

The first effective date allows Generator Owners time to develop documented maintenance strategies or procedures or processes or specifications as outlined in Requirement R3.

In those jurisdictions where regulatory approval is required, Requirement R3 applied to the Generator Owner becomes effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirement R3 becomes effective on the first day of the first calendar quarter one year following Board of Trustees' adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

The second effective date allows entities time to comply with Requirements R1, R2, R4, R5, R6, and R7.

In those jurisdictions where regulatory approval is required, Requirements R1, R2, R4, R5, R6, and R7 applied to the Generator Owner become effective on the first calendar day of the first calendar quarter two years after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirements R1, R2, R4, R5, R6, and R7 become effective on the first day of the first calendar quarter two years following Board of Trustees' adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

Effective dates for individual lines when they undergo specific transition cases:

1. A line operated below 200kV, designated by the Planning Coordinator as an element of an Interconnection Reliability Operating Limit (IROL) or designated by the Western Electricity Coordinating Council (WECC) as an element of a Major WECC Transfer Path, becomes subject to this standard the latter of: 1) 12 months after the date the Planning Coordinator or WECC initially designates the line as being an element of an IROL or an element of a Major WECC Transfer Path, or 2) January 1 of the

[9] "Clear line of sight" means the distance that can be seen by the average person without special instrumentation (e.g., binoculars, telescope, spyglasses, etc.) on a clear day.

planning year when the line is forecast to become an element of an IROL or an element of a Major WECC Transfer Path.

2. A line operated below 200 kV currently subject to this standard as a designated element of an IROL or a Major WECC Transfer Path which has a specified date for the removal of such designation will no longer be subject to this standard effective on that specified date.

3. A line operated at 200 kV or above, currently subject to this standard which is a designated element of an IROL or a Major WECC Transfer Path and which has a specified date for the removal of such designation will be subject to Requirement R2 and no longer be subject to Requirement R1 effective on that specified date.

4. An existing transmission line operated at 200kV or higher which is newly acquired by an asset owner and which was not previously subject to this standard becomes subject to this standard 12 months after the acquisition date.

5. An existing transmission line operated below 200kV which is newly acquired by an asset owner and which was not previously subject to this standard becomes subject to this standard 12 months after the acquisition date of the line if at the time of acquisition the line is designated by the Planning Coordinator as an element of an IROL or by WECC as an element of a Major WECC Transfer Path.

.

FAC-003-3.pdf

Sampling Methodology

Sampling is essential for auditing compliance with NERC Reliability Standards since it is not always possible or practical to test 100% of either the equipment, documentation, or both, associated with the full suite of enforceable standards. The Sampling Methodology Guidelines and Criteria, or sample guidelines, provided by the Electric Reliability Organization help to establish a minimum sample set for monitoring and enforcement uses in audits of NERC Reliability Standards.

There are two approaches to sampling: statistical and non-statistical, and choosing which to use depends on the objectives for sampling. (When the population sample to be reviewed is documentation, a statistical approach using RAT-STATS is expected.) Both are represented in the sample guideline in line with standard practices for their use. The Audit Team Lead may determine if the scope of the audit samples should be reduced to levels below those established in the sample guideline. In doing so, the audit team will document the rationale for reducing the scope of the of sample population in the RSAW or audit report.

Additionally, separate from the audit, the registered entity may use this methodology to determine the sample population to test in order to provide themselves reasonable assurance that management's expectations are being met by the organization.

Auditor should rely on professional judgment to accurately identify and select a sample of transmission lines ROWs that traverse the major biomes within the applicable entities footprint. Auditors should consider biome conditions such as climate, geography, elevation, botany, population density and land uses when selecting the sample transmission lines for R7.

Regulatory Language

Order No. 785 (September 19, 2013)

P1. Pursuant to section 215 of the Federal Power Act, the Federal Energy Regulatory Commission (Commission) approves modifications to four existing Reliability Standards submitted by the North American Electric Reliability Corporation (NERC), the Commission certified Electric Reliability Organization. Specifically, the Commission approves Reliability Standards FAC-001-1 (Facility Connection Requirements), FAC-003-3 (Transmission Vegetation Management), PRC-004-2.1a (Analysis and Mitigation of Transmission and Generation Protection System Misoperations), and PRC-005-1.1b (Transmission and Generation Protection System Maintenance and Testing). The modifications improve reliability either by extending applicability of the Reliability Standard to certain generator interconnection facilities, or by clarifying that the existing Reliability Standard is and remains applicable to generator interconnection facilities. The Commission also approves the related Violation Risk Factors and Violation Severity Levels, as well as the implementation plan and effective dates proposed by NERC.

P 9. With respect to implementation, NERC requested an effective date [for Generator Owners] of one year following the first quarter after regulatory approvals for FAC-001-1, and for FAC-003-3 Requirement R3. For the remaining requirements of FAC-003-3, NERC requested an effective date of two years following the first calendar quarter after regulatory approvals…. [NERC's July 30, 2012 petition states: If FAC-003-2 is filed with applicable regulatory authorities and approved before FAC-003-3 is filed with applicable regulatory authorities, then when and if FAC-003-3 is approved by applicable regulatory authorities, the implementation plan and effective dates for Transmission Owners in FAC-003-2 will be transferred into this implementation plan."]

P 26. We approve Reliability Standard FAC-003-3. Consistent with the NOPR, we find that the modifications to FAC-003 address a potential reliability gap in the current set of Reliability Standards, since they do not include a requirement for generator owners to perform vegetation management on their tie-lines or to maintain minimum levels of clearance between vegetation and significant overhead generator interconnection facilities. Further, we conclude that the proposed limits on applicability reflected in FAC-003-3 are reasonable, as it is common for generator interconnection facilities of relatively short span (i.e., less than one mile) to cross only areas with limited or no vegetation.

P 27. Further, we adopt our proposed guidance that the exemption for overhead lines with a clear line of sight from the generator to the point of interconnection should be "interpreted narrowly," meaning there should be "no obstructions . . . that prevent personnel from identifying potential reliability hazards over the full length of the line." Footnote: *See* NOPR, 143 FERC ¶ 61,049 at P 20.

P 60. This Final Rule approves Reliability Standards FAC-001-1, FAC-003-3, PRC-004-2.1a, and PRC-005-1.1b, which would replace currently effective Reliability Standards FAC-001-0, FAC-003-1, PRC-004-2a, and PRC-005-1b…. Footnote: As of the date of issuance of this Final Rule, the currently effective standard is FAC-003-1. While a revised version of that standard, FAC-003-2, was approved in Docket No. RM12-4-000, it has yet to go into effect. The information collection requirements of Reliability Standard FAC-003-2 were approved by the OMB on May 29, 2013, under FERC-725A (OMB Control No. 1902-0244).

P 62. The modifications reflected in FAC-003-3 extend NERC's vegetation management requirements to certain generator interconnection facilities, including requirements to create and maintain records related to the generator owner's vegetation management work plan and performance of inspections. Generator owners typically already maintain the vegetation surrounding the right-of-way for the generator interconnection facility that connects the generating station switchyard to the point of interconnection with a transmission owner's facility. However, the proposed requirements outlined in FAC-003-3 may exceed a generator owner's current vegetation management program, particularly with respect to recordkeeping and reporting.

Order No. 777 (March 21, 2013)

P 27. We adopt our NOPR proposal and approve Reliability Standard FAC-003-2, including the associated definitions and implementation plan, as just, reasonable, not unduly discriminatory or preferential, and in the public interest. We find that FAC-003-2 is an improvement over the currently-effective Version 1 standard, will support vegetation management practices that can effectively protect against vegetation-related transmission outages, and satisfies a number of the outstanding directives from Order No. 693…. Footnote: Likewise, we approve as requested by NERC, the retirement of FAC-003-1 and the current definitions of "right-of-way" and "vegetation inspection" effective "midnight immediately prior to the first day of the first calendar quarter that is a year following the effective date" of the final rule. NERC December 21, 2011 Petition at 2.

Auditors:

Disclaimer

NERC developed this Reliability Standard Audit Worksheet (RSAW) language in order to facilitate NERC's and the Regional Entities' assessment of a registered entity's compliance with this Reliability Standard. The NERC RSAW language is written to specific versions of each NERC Reliability Standard. Entities using this RSAW should choose the version of the RSAW applicable to the Reliability Standard being assessed. While the information included in this RSAW provides some of the methodology that NERC has elected to use to assess compliance with the requirements of the Reliability Standard, this document should not be treated as a substitute for the Reliability Standard or viewed as additional Reliability Standard requirements. In all cases, the Regional Entity should rely on the language contained in the Reliability Standard itself, and not on the language contained in this RSAW, to determine compliance with the Reliability Standard. NERC's Reliability Standards can be found on NERC's website. Additionally, NERC Reliability Standards are updated frequently, and this RSAW may not necessarily be updated with the same frequency. Therefore, it is imperative that entities treat this RSAW as a reference document only, and not as a substitute or replacement for the Reliability Standard. It is the responsibility of the registered entity to verify its compliance with the latest approved version of the Reliability Standards, by the applicable governmental authority, relevant to its registration status.

The NERC RSAW language contained within this document provides a non-exclusive list, for informational purposes only, of examples of the types of evidence a registered entity may produce or may be asked to produce to demonstrate compliance with the Reliability Standard. A registered entity's adherence to the examples contained within this RSAW does not necessarily constitute compliance with the applicable Reliability Standard, and NERC and the Regional Entity using this RSAW reserves the right to request additional evidence from the registered entity that is not included in this RSAW. Additionally, this RSAW includes excerpts from FERC Orders and other regulatory references. The FERC Order cites are provided for ease of reference only, and this document does not necessarily include all applicable Order provisions. In the event of a discrepancy between FERC Orders, and the language included in this document, FERC Orders shall prevail.

NUC-001-2.1 — Nuclear Plant Interface Coordination

Purpose:
This standard requires coordination between Nuclear Plant Generator Operators and Transmission Entities for the purpose of ensuring nuclear plant safe operation and shutdown.

Applicability:
NPGO, TOP, TO, TP, TSP, BA, RC, PA, DP, LSE, GO, GOP

NERC BOT Approval Date: 5/1/2007

FERC Approval Date: 10/16/2008

Reliability Standard Enforcement Date in the United States: 4/1/2013

Requirements:

R1. The Nuclear Plant Generator Operator shall provide the proposed NPIRs in writing to the applicable Transmission Entities and shall verify receipt [*Risk Factor: Lower*]

Describe, in narrative form, how you meet compliance with this requirement: *(Registered Entity Response Required)*

R1 Supporting Evidence and Documentation

Response: *(Registered Entity Response Required)*

Provide the following:
Document Title and/or File Name, Page & Section, Date & Version

Title	Date	Version

Audit Team: Additional Evidence Reviewed:

This section must be completed by the Compliance Enforcement Authority.

Compliance Assessment Approach Specific to NUC-001-2.1 R1.

___ Review evidence the Nuclear Plant Generator operator provided the proposed Nuclear Plant Interface Requirements in writing to the applicable Transmission Entities.

___ Review the Nuclear Plant Generator Operator received confirmation of the delivery of the NPIR.

Detailed notes:

R2. The Nuclear Plant Generator Operator and the applicable Transmission Entities shall have in effect one or more Agreements[1] that include mutually agreed to NPIRs and document how the Nuclear Plant Generator Operator and the applicable Transmission Entities shall address and implement these NPIRs. [Risk Factor: Medium]

1. Agreements may include mutually agreed upon procedures or protocols in effect between entities or between departments of a vertically integrated system.

Describe, in narrative form, how you meet compliance with this requirement: *(Registered Entity Response Required)*

R2 Supporting Evidence and Documentation

Response: *(Registered Entity Response Required)*

Provide the following:

___ Review evidence applicable Transmission Entities informed the Nuclear Plant Generator Operator of actual or proposed changes to nuclear plant design, configuration, operations, limits, protection systems, or capabilities that may impact the ability of the electric system to meet the NPIRs.

Detailed notes:

R9. The Nuclear Plant Generator Operator and the applicable Transmission Entities shall include, as a minimum, the following elements within the agreement(s) identified in R2: [*Risk Factor: Medium*]

R9.1. Administrative elements:

R9.1.1. Definitions of key terms used in the agreement. (Retirement of R9.1.1 approved by FERC effective January 21, 2014.)

R9.1.2. Names of the responsible entities, organizational relationships, and responsibilities related to the NPIRs. (Retirement of R9.1.2 approved by FERC effective January 21, 2014.)

R9.1.3. A requirement to review the agreement(s) at least every three years. (Retirement of R9.1.3 approved by FERC effective January 21, 2014.)

R9.1.4. A dispute resolution mechanism. (Retirement of R9.1.4 approved by FERC effective January 21, 2014.)

R9.2. Technical requirements and analysis:

R9.2.1. Identification of parameters, limits, configurations, and operating scenarios included in the NPIRs and, as applicable, procedures for providing any specific data not provided within the agreement.

R9.2.2. Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs.

R9.2.3. Types of planning and operational analyses performed specifically to support the NPIRs, including the frequency of studies and types of Contingencies and scenarios required.

Describe, in narrative form, how you meet compliance with this requirement: ***(Registered Entity Response Required)***

R9.3. Operations and maintenance coordination:

R9.3.1. Designation of ownership of electrical facilities at the interface between the electric system and the nuclear plant and responsibilities for operational control coordination and maintenance of these facilities.

R9.3.2. Identification of any maintenance requirements for equipment not owned or controlled by the Nuclear Plant Generator Operator that are necessary to meet the NPIRs.

R9.3.3. Coordination of testing, calibration and maintenance of on-site and off-site power supply systems and related components.

R9.3.4. Provisions to address mitigating actions needed to avoid violating NPIRs and to address periods when responsible Transmission Entity loses the ability to assess the capability of the electric system to meet the NPIRs. These provisions shall include responsibility to notify the Nuclear Plant Generator Operator within a specified time frame.

R9.3.5. Provision for considering, within the restoration process, the requirements and urgency of a nuclear plant that has lost all off-site and on-site AC power.

R9.3.6. Coordination of physical and cyber security protection of the Bulk Electric System at the nuclear plant interface to ensure each asset is covered under at least one entity's plan.

R9.3.7. Coordination of the NPIRs with transmission system Special Protection Systems and underfrequency and undervoltage load shedding programs.

Describe, in narrative form, how you meet compliance with this requirement: ***(Registered Entity Response Required)***

R9.4. Communications and training:

R9.4.1. Provisions for communications between the Nuclear Plant Generator Operator and Transmission Entities, including communications protocols, notification time requirements, and definitions of terms.

R9.4.2. Provisions for coordination during an off-normal or emergency event affecting the NPIRs, including the need to provide timely information explaining the event, an estimate of when the system will be returned to a normal state, and the actual time the system is returned to normal.

R9.4.3. Provisions for coordinating investigations of causes of unplanned events affecting the NPIRs and developing solutions to minimize future risk of such events.

R9.4.4. Provisions for supplying information necessary to report to government agencies, as related to NPIRs.

R9.4.5. Provisions for personnel training, as related to NPIRs.

Describe, in narrative form, how you meet compliance with this requirement: ***(Registered Entity Response Required)***

R9 Supporting Evidence and Documentation

Response: ***(Registered Entity Response Required)***

Provide the following:
Document Title and/or File Name, Page & Section, Date & Version

Title	Date	Version
Audit Team: Additional Evidence Reviewed:		

This section must be completed by the Compliance Enforcement Authority.

Compliance Assessment Approach Specific to NUC-001-2.1 R9.

___ Verify the Nuclear Plant Generator Operator and the applicable Transmission Entities shall include, as a minimum, the following elements within the agreement(s) identified in R2:

Technical requirements and analysis:

___ (R9.2.1) Identification of parameters, limits, configurations, and operating scenarios included in the NPIRs and, as applicable, procedures for providing any specific data not provided within the agreement.

___ (R9.2.2) Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs.

___ (R9.2.3) Types of planning and operational analyses performed specifically to support the NPIRs, including the frequency of studies and types of Contingencies and scenarios required.

Operations and maintenance coordination:

___ (R9.3.1) Designation of ownership of electrical facilities at the interface between the electric system and the nuclear plant and responsibilities for operational control coordination and maintenance of these facilities.

___ (R9.3.2) Identification of any maintenance requirements for equipment not owned or controlled by the Nuclear Plant Generator Operator that are necessary to meet the NPIRs.

___ (R9.3.3) Coordination of testing, calibration and maintenance of on-site and off-site power supply systems and related components.

___ (R9.3.4) Provisions to address mitigating actions needed to avoid violating NPIRs and to address periods when responsible Transmission Entity loses the ability to assess the capability of the electric system to meet the NPIRs. These provisions shall include responsibility to notify the Nuclear Plant Generator Operator within a specified time frame.

___ (R9.3.5) Provision for considering, within the restoration process, the requirements and urgency of a nuclear plant that has lost all off-site and on-site AC power.

___ (R9.3.6) Coordination of physical and cyber security protection of the Bulk Electric System at the nuclear plant interface to ensure each asset is covered under at least one entity's plan.

___ (R9.3.7) Coordination of the NPIRs with transmission system Special Protection Systems and underfrequency and undervoltage load shedding programs.

Communications and training:

___ (R9.4.1) Provisions for communications between the Nuclear Plant Generator Operator and Transmission Entities, including communications protocols, notification time requirements, and definitions of terms.

___ (R9.4.2) Provisions for coordination during an off-normal or emergency event affecting the NPIRs, including the need to provide timely information explaining the event, an estimate of when the system will be returned to a normal state, and the actual time the system is returned to normal.

___ (R9.4.3) Provisions for coordinating investigations of causes of unplanned events affecting the NPIRs and developing solutions to minimize future risk of such events.

___ (R9.4.4) Provisions for supplying information necessary to report to government agencies, as related to NPIRs.

___ (R9.4.5) Provisions for personnel training, as related to NPIRs.

Detailed notes:

Supplemental Information

Other - The list of questions above is not all inclusive of evidence required to show compliance with the Reliability Standard. Provide additional information here, **as necessary** that demonstrates compliance with this Reliability Standard.

Excerpts From FERC Orders -- For Reference Purposes Only
Updated Through ----------
NUC-001-1

Order 716

http://www.nerc.com/files/Order_716-NUC_Standard.pdf

P1 "Pursuant to section 215 of the Federal Power Act (FPA), the Commission approves the Nuclear Plant Interface Coordination Reliability Standard (NUC-001-1) developed by the North American Electric Reliability Corporation (NERC), the Commission-certified Electric Reliability Organization (ERO)...."

P2 "On November 19, 2007, NERC filed its petition for Commission approval of the Nuclear Plant Interface Coordination Reliability Standard, designated NUC-001-1 (November 19, 2007 Petition). NERC supplemented the filing on December 11, 2007 (December 11, 2007 Supplement) to propose four related NERC Glossary terms: "Nuclear Plant Generator Operator," "Nuclear Plant Off-site Power Supply (Off-site Power)," "Nuclear Plant Licensing Requirements (NPLRs)," and "Nuclear Plant Interface Requirements (NPIRs)." In the November 19, 2007 Petition, NERC stated that the proposed Reliability Standard addresses the coordination of interface requirements for two domains: (i) Bulk-Power System planning and operations and (ii) nuclear power plant licensing requirements for off-site power necessary to enable safe nuclear plant operation and shutdown."

P4 "...The Reliability Standard requires nuclear plant generator operators and transmission entities to develop expectations and procedures for coordinating operations to meet the nuclear plant licensing requirements, as well as SOLs and IROLs, and to develop agreements or arrangements, which may include mutually agreed upon procedures or protocols, reflecting those expectations and procedures. These agreements or arrangements are known as interface agreements. The resulting operations and planning requirements developed in the agreements to address the nuclear plant licensing requirements, SOLs and IROLs are called nuclear plant interface requirements or NPIRs.10 NERC stated that Requirements R3 through R8, which state that the interface agreement parties will address the NPIRs in planning, operations, and facility upgrade and outage coordination, provide additional specificity on these expectations."

P17 "...The Commission finds that coordination of nuclear licensing requirements and grid operating limits through auditable interface agreements will ensure that an important resource is operated safely and reliably, while minimizing grid disturbances from separation of nuclear power plants from the grid, due to the loss or degradation of auxiliary power supply. Further, the Commission disagrees with CenterPoint Energy that the Reliability Standard is flawed and unnecessary. Nuclear power plants represent an important power resource and provide reliability support throughout the Bulk-Power System. Unlike other large units, nuclear power plants are subject to separate regulatory oversight that mandates stringent operating and auxiliary power requirements, which, if not met, require the plant to separate from the grid. We find that NUC-001-1 is an appropriate means to ensure that the particular requirements faced by nuclear power plants are met, maximizing the reliability support to be provided while minimizing the potential for grid disruption caused by separation."

P18 "...NUC-001-1 supplements NRC oversight of nuclear plant facilities by providing oversight of the transmission entities that operate facilities on the Bulk-Power System providing off-site power supply and delivery service to meet nuclear plant licensing requirements."

P21 "The Commission approves the applicability provisions of NUC-001-1 as appropriately identifying the applicable entities, while providing the flexibility to accommodate differing design criteria, grid configurations and services procured by the various nuclear power plants addressed. The Commission finds appropriate the ERO's use of the term transmission entities in NUC-001-1 to refer to the subset of registered entities that provide services to nuclear plant generator operators. Similarly, the term nuclear plant generator operators refers to the subset of generator owners and generator operators that are NRC licensees. While the Commission prefers that Reliability Standards apply to all entities within a functional category defined in the Registry Criteria, it has approved appropriate limitations incorporated into an applicability provision. We address the specific questions raised by the Commission in the NOPR, as well as responses and comments, on an issue-by-issue basis below."

P28 "The Commission accepts NERC's proposal to require nuclear plant generator operators to identify entities that provide services related to off-site power supply or delivery. With NERC's and other industry representatives' assurances, the Commission is satisfied that the appropriate transmission entities can be identified based on the nuclear plant generator operators' historical compliance with NRC licensing requirements to obtain off-site power and develop solutions with grid operators to avoid service interruptions from foreseeable grid disturbances."

P29 "...A nuclear plant generator operator may be found in noncompliance for failing to provide notice to an entity responsible for providing services relating to its off-site power-related licensing requirements."

P34 "In the NOPR, the Commission proposed to accept the identification and registration process described by NERC in the November 19, 2007 Petition with the understanding that NERC will use its authority under the compliance registry process to register all users, owners, and operators of the Bulk-Power System that provide transmission or generating services relating to off-site power supply or delivery. Further, the Commission requested clarification from the ERO, as well as public comment, on three issues: (i) how NERC's plan to identify transmission entities on a "plant-by-plant basis" in the compliance registration process relates to the definition of bulk electric system; (ii) whether NUC-001-1 is enforceable against a transmission entity upon execution of an interface agreement or some earlier time; and (iii) how the Reliability Standard will be implemented for an entity that both operates a nuclear power plant and is responsible to provide services related to NPIRs."

P42 "The Commission accepts NERC's approach to determining applicable entities. The Commission agrees with the ERO that the identification of transmission entities, which may fit any one of 11 functional categories described in the NERC Functional Model, provides the ERO with needed breadth and flexibility in identifying and registering all users, owners and operators of the Bulk-Power System that provide services related to NPIRs."

P46 "...We also reject the concerns raised by Wisconsin Electric and TVA that the terms transmission entity and nuclear plant generator operator do not appear in the NERC Functional Model. While the NERC Functional Model is a useful guidance document, "the Applicability section of a particular Reliability Standard should be the ultimate determinant of applicability of each Reliability Standard." Moreover, the ERO's definition of transmission entity is linked to the functional categories set forth in the NERC Functional Model.27 Likewise, the nuclear plant generator operator can simply be viewed as a sub-category of the generator operator function."

P51 "The Commission accepts NERC's clarification that registration of lower voltage facilities and the applicability of NUC-001-1 will be limited to those facilities identified by the nuclear plant generator operator in its NPIRs. (Footnote 30: This approach for lower voltage facilities is consistent with our determination in prior proceedings that the ERO may register an entity that falls below the minimum registry criteria on a facility-by-facility basis. See Order No. 693-A at P 38.) We would expect that any NPIRs agreed to between a nuclear plant generator operator and transmission entity would include all facilities needed to transmit offsite power and auxiliary power to the nuclear facility. The Commission remains sensitive to the need for NERC to register operators of lower-voltage facilities used to deliver off-site power. The NOPR stated the Commission's understanding that NERC would register entities operating facilities not currently identified in the Regional Entities' definition of bulk electric system that are needed for Bulk-Power System reliability, through NERC's authority to register an owner or operator of an otherwise exempt facility that is needed for Bulk-Power System reliability, on a facility-by-facility basis. We note that it is in the best interest of the nuclear plant generator operator to have any such facility identified in the NPIRs."

P68 "...NERC and others have made clear that NUC-001-1 was intended to apply to transmission entities following receipt of notification from the nuclear plant generator operator, rather than after execution of the interface agreement. The applicability of NUC-001-1 is determined by the function performed by the entity—that is, an entity that provides services relating to a nuclear plant generator operator's nuclear plant licensing requirements is subject to NUC-001-1 on the latter of the effective date of the Reliability Standard or when a proposed NPIR is provided by the nuclear plant generator operator. This is consistent with other Reliability Standards where an entity is subject to a Reliability Standard based on the factual determination of whether it operates certain facilities or provides a certain service, not based on the consent of the entity."

P69 "We believe that this interpretation resolves the concerns of commenters who predict that entities supplying services to enable nuclear plant generator operators to meet nuclear plant licensing requirements would balk at executing an interface agreement if they become subject to NUC-001-1. This should not occur since transmission entities will be identified as providing services relating to NPIRs by a nuclear plant generator operator and will become subject to NUC-001-1 when they receive notice, not when they finalize an agreement."

P73 "The Commission accepts NERC's clarification that NUC-001-1 applies to nuclear plant generator operators and transmission entities where both parties are in a single integrated system. NERC clarified that a formal agreement is not necessary to have an agreement, procedures, or protocols in place that will comply with Requirement R2. Based on this clarification and industry comments, we accept NERC's conclusion that the Requirements of NUC-001-1 can be met by a single entity that is both the nuclear plant generator operator and the transmission entity. The Commission directs the ERO, in enforcing NUC-001-1, to require that an integrated entity provides documentation of its arrangements, including appropriate procedures and protocols, ensuring that its business units perform the functions under NUC-001-1 that would otherwise be met by separate entities. This will ensure that an integrated entity's compliance with NUC-001-1 is auditable in a manner comparable to other entities that are subject to the Reliability Standard."

P80 "The Commission accepts the ERO's explanation of its registration and compliance options when parties fail to come to an agreement. Should parties fail to come to an agreement and thus find themselves in violation of the requirement that they have such an agreement in place, NERC states that it may require mediation or arbitration as a remedial action. We agree that ordering such dispute resolution processes may be an appropriate response in some instances in which there is no immediate risk to grid reliability and support NERC requiring the use of arbitration or mediation on a voluntary basis where appropriate." (Footnote 43: Where there is an immediate reliability risk, we direct the ERO to take appropriate action to address the risk.)

P87 "Based on NERC's statement that parties may rely on less formal procedures and protocols, the Commission finds that NUC-001-1 does not dictate any particular format for the interface agreement. Nuclear plant generator operators and transmission entities may rely on pre-existing arrangements so long as the parties can document the fact that they have agreed that the pre-existing arrangements address all of the NPIRs, cover all required facilities and otherwise fulfill the requirements of NUC-001-1. (Footnote 47: Nuclear plant generator operators and transmission entities that choose to rely on generally-applicable tariffs should make provision to ensure that the tariff terms and conditions continue to meet the parties' needs should the tariff or nuclear licensing requirements change, and document such an arrangement.) This includes multi-party agreements."

P100 "...While not all system changes can be anticipated, the Commission expects that significant changes to the parties' operating relationship would be formalized and documented in an auditable format as interim changes in an addendum or revisions to the agreement, as appropriate."

P109 "The Commission clarifies that employees of nuclear plant generator operators and transmission entities should receive the training necessary to execute the terms of the interface agreement, and such training should be specified in the interface agreement between the parties. In addition, employees operating facilities used to provide services to meet NPIRs should be properly trained to Reliability Standard training requirements that apply to those facilities or the function served by the employees."

P124 "The Commission confirms its understanding that coordination under the Reliability Standard includes coordination among transmission entities. No party objected to the Commission's interpretation that the coordination required under Requirement R9.3.1 includes designating an entity to coordinate among various transmission entities providing unbundled services, and that such a role had been previously filled by former control area operators. Therefore, we adopt that proposal."

February 3, 2012 Order Approving Revised Definition of Protection System, Docket No. RD11-13-000
http://www.nerc.com/FilingsOrders/us/FERCOrdersRules/Order_approving_modif_Definition_2.3.2012.pdf

P5. The current definition of Protection System includes protective relays, associated communication systems, voltage and current sensing devices, station batteries and DC control circuitry. The revised definition with the proposed modification states:

"Protection System –

- Protective relays which respond to electrical quantities,
- Communications systems necessary for correct operation of protective functions,
- Voltage and current sensing devices providing inputs to protective relays,
- Station dc supply associated with protective functions (including station batteries, battery chargers, and non-battery-based dc supply), and
- Control circuitry associated with protective functions through the trip coil(s) of the circuit breaker or other interrupting devices."

P9. The Commission finds that the ERO's modification to the definition of Protection System is just, reasonable, not unduly discriminatory or preferential, and in the public interest. As explained by NERC, battery chargers are essential to assure that batteries used to operate protection systems are in a continuous state of readiness. Therefore, it is appropriate that battery chargers be included in the definition of Protection System. The modified definition removes any uncertainty as to whether battery chargers should be included in a responsible entity's maintenance and testing program and, therefore, closes a reliability gap identified by NERC.

Order No. 788
http://www.nerc.com/FilingsOrders/us/Pages/2013fercordersrules.aspx

FERC issued a final rule approving NERC's proposed retirement of 34 requirements within 19 Reliability Standards in response to the Commission's proposal in paragraph 81 of the March 15, 2012 order in Docket No. RC11-6-000. The final rule approved the retirement of the 34 requirements that either provided little protection for Bulk-Power System reliability or were redundant with other aspects of the Reliability Standards, including NUC-001-2, Requirements R9.1, R9.1.1, R9.1.2, R9.1.3, and R1.9.4.

Revision History

Version	Date	Reviewers	Revision Description
1	May 2010	RSAW Working Group	New Document.
1	December 2010	QRSAW WG	Revised Findings Table, modified Supporting Evidence tables, and added Revision History.
1	January 2011	Craig Struck	Reviewed for format consistency and content.
1.1	September 2011	Craig Struck	Format changes for 2012.
2.2	April 2014	RSAWTF	Revised to reflect removal of R9.1 and subrequirements per Paragraph 81 project and Implementation Plan for revised term for "Protection System" per Project 2007-17.

Compliance Questionnaire and
Reliability Standard Audit Worksheet

PRC-001-1.1 — System Protection Coordination

Registered Entity: *(Must be completed by the Compliance Enforcement Authority)*

NCR Number: *(Must be completed by the Compliance Enforcement Authority)*

Applicable Function(s): **BA, TOP, GOP**

Auditors:

Disclaimer

NERC developed this Reliability Standard Audit Worksheet (RSAW) language in order to facilitate NERC's and the Regional Entities' assessment of a registered entity's compliance with this Reliability Standard. The NERC RSAW language is written to specific versions of each NERC Reliability Standard. Entities using this RSAW should choose the version of the RSAW applicable to the Reliability Standard being assessed. While the information included in this RSAW provides some of the methodology that NERC has elected to use to assess compliance with the requirements of the Reliability Standard, this document should not be treated as a substitute for the Reliability Standard or viewed as additional Reliability Standard requirements. In all cases, the Regional Entity should rely on the language contained in the Reliability Standard itself, and not on the language contained in this RSAW, to determine compliance with the Reliability Standard. NERC's Reliability Standards can be found on NERC's website. Additionally, NERC Reliability Standards are updated frequently, and this RSAW may not necessarily be updated with the same frequency. Therefore, it is imperative that entities treat this RSAW as a reference document only, and not as a substitute or replacement for the Reliability Standard. It is the responsibility of the registered entity to verify its compliance with the latest approved version of the Reliability Standards, by the applicable governmental authority, relevant to its registration status.

The NERC RSAW language contained within this document provides a non-exclusive list, for informational purposes only, of examples of the types of evidence a registered entity may produce or may be asked to produce to demonstrate compliance with the Reliability Standard. A registered entity's adherence to the examples contained within this RSAW does not necessarily constitute compliance with the applicable Reliability Standard, and NERC and the Regional Entity using this RSAW reserves the right to request additional evidence from the registered entity that is not included in this RSAW. Additionally, this RSAW includes excerpts from FERC Orders and other regulatory references. The FERC Order cites are provided for ease of reference only, and this document does not necessarily include all applicable Order provisions. In the event of a discrepancy between FERC Orders, and the language included in this document, FERC Orders shall prevail.

Subject Matter Experts

Identify your company's subject matter expert(s) responsible for this Reliability Standard. Include the person's title, organization and the requirement(s) for which they are responsible. Insert additional lines if necessary.

Response: ***(Registered Entity Response Required)***

SME Name	Title	Organization	Requirement

Reliability Standard Language

PRC-001-1.1 — System Protection Coordination

Purpose:

To ensure system protection is coordinated among operating entities.

Applicability:

Balancing Authorities
Transmission Operators
Generator Operators

NERC BOT Approval Date: 11/1/2006

FERC Approval Date: 3/16/2007

Reliability Standard Enforcement Date in the United States: 4/1/2013

Requirements:

R1. Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of Protection System schemes applied in its area.

Describe, in narrative form, how you meet compliance with this requirement: *(Registered Entity Response Required)*

Question:

Who are the Transmission Operator, Generator Operator, and Balancing Authority personnel identified as being familiar with the purpose and limitations of Protection System schemes applied in their area? Please provide the job titles of identified personnel.

Registered Entity Response (Required):

R1 Supporting Evidence and Documentation

Response: ***(Registered Entity Response Required)***

Provide the following: Document Title and/or File Name, Page & Section, Date & Version

Title	Date	Version
Audit Team: Additional Evidence Reviewed:		

This section must be completed by the Compliance Enforcement Authority.

Compliance Assessment Approach Specific to PRC-001-1.1 R1.

___ Verify the identified personnel are familiar with:
___ The purpose of relay protection schemes applied in its area.
___ The limitations of relay protection schemes applied in its area.

(Protection System schemes shall include, but are not limited to, Special Protection Systems within its area.)

Note to auditor: Auditors shall use their professional judgment to determine whether identified personnel are familiar with the purpose and limitations of Protection System schemes applied in its area. Identified Generator Operator personnel should be familiar with the purpose and limitations of its generator protection system and any associated generator interconnection Facilities. In general, the purpose of relay protection schemes relates to what type of fault the protection system will detect (ground fault, phase to phase fault, failure to clear fault, backup etc.) and how the detection is accomplished (measure impedance of fault, differential measurement, etc.). Examples of limitations could include, but are not limited to, a Zone 1 relay typically being set to detect faults up to about 80% of a line, or a transformer differential relay only detecting a fault between two current transformers on each side of the transformer bank. Evidence may include, but is not limited to, training records and personnel interviews, training

with an overview of the different types of protection used on the system for generators, transmission line(s), and transformers on the entity's system. Also, an overview of the zones of protection, fault locations and which relay would operate based on the location is desirable. If the entity has Special Protection Systems (SPSs), any training could include an overview of the SPS's operation, arming and disarming of the SPS and how to verify which mode is in service. Documentation of any training provided should be specific training on the purpose of protection systems and limitations associated with the entity's system. Auditors need reasonable assurance that the required familiarity exists at the functional level (TOP, BA, GOP) of the entity. An interview of all identified personnel, or a statistical sample thereof, may be performed, but is not required.

Auditor's Detailed Notes:

R2. Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows:

R2.1. If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible.

R2.2. If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.

Describe, in narrative form, how you meet compliance with this requirement: ***(Registered Entity Response Required)***

Question – Did you have an equipment or relay failure during the audit period which reduced system reliability? If yes, provide evidence you notified the proper entities.

Entity Response: ***(Registered Entity Response Required)***

R2 Supporting Evidence and Documentation

Response: ***(Registered Entity Response Required)***

Provide the following:
Document Title and/or File Name, Page & Section, Date & Version

Title	Date	Version
Audit Team: Additional Evidence Reviewed:		

This section must be completed by the Compliance Enforcement Authority.

Compliance Assessment Approach Specific to PRC-001-1.1 R2.

___ Verify the entity took the following actions related to a relay or equipment failure that reduced system reliability:

- ___ (R2.1) Generator Operator notified its Transmission Operator and Host Balancing Authority and
- ___ Generator Operator took corrective action as soon as possible.
- ___
- ___ (R2.2) Transmission Operator notified its Reliability Coordinator and affected Transmission Operators and Balancing Authorities and
- ___ Transmission Operator took corrective action as soon as possible.

Auditor's Detailed notes:

R3. A Generator Operator or Transmission Operator shall coordinate new Protective Systems and changes as follows.

R3.1. Each Generator Operator shall coordinate all new Protective Systems and all Protective System changes with its Transmission Operator and Host Balancing Authority.

R3.2. Each Transmission Operator shall coordinate all new Protective Systems and all Protective System changes with neighboring Transmission Operators and Balancing Authorities.

Describe, in narrative form, how you meet compliance with this requirement: ***(Registered Entity Response Required)***

Question: Have you made changes to new or added new Protective Systems during the audit period? If yes, provide evidence you coordinated with the appropriate entities.

Entity Response: ***(Registered Entity Response Required)***

R3 Supporting Evidence and Documentation

Response: ***(Registered Entity Response Required)***

Provide the following:
Document Title and/or File Name, Page & Section, Date & Version

Title	Date	Version
Audit Team: Additional Evidence Reviewed:		

This section must be completed by the Compliance Enforcement Authority.

Compliance Assessment Approach Specific to PRC-001-1.1 R3.

___ Verify the entity coordinated new Protective Systems and changes as follows:
- ___ Each Generator Operator coordinated with its Transmission Operator and Host Balancing Authority.
- ___ Each Transmission Operator coordinated with neighboring Transmission Operators and Balancing Authorities.

Auditor's Detailed notes:

R4. Each Transmission Operator shall coordinate Protection Systems on major transmission lines and interconnections with neighboring Generator Operators, Transmission Operators, and Balancing Authorities.

Describe, in narrative form, how you meet compliance with this requirement: ***(Registered Entity Response Required)***

R4 Supporting Evidence and Documentation

Response: ***(Registered Entity Response Required)***

Provide the following:
Document Title and/or File Name, Page & Section, Date & Version

Title	Date	Version
Audit Team: Additional Evidence Reviewed:		

This section must be completed by the Compliance Enforcement Authority.

Compliance Assessment Approach Specific to PRC-001-1.1 R4.

___ Verify each Transmission Operator coordinated Protection Systems on major transmission lines and interconnections with neighboring Generator Operators, Transmission Operators, and Balancing Authorities.

Auditor's Detailed notes:

R5. A Generator Operator or Transmission Operator shall coordinate changes in generation, transmission, load or operating conditions that could require changes in the Protection Systems of others:

R5.1. Each Generator Operator shall notify its Transmission Operator in advance of changes in generation or operating conditions that could require changes in the Transmission Operator's Protection Systems.

R5.2. Each Transmission Operator shall notify neighboring Transmission Operators in advance of changes in generation, transmission, load, or operating conditions that could require changes in the other Transmission Operators' Protection Systems.

Describe, in narrative form, how you meet compliance with this requirement: ***(Registered Entity Response Required)***

Question: Did you experience changes in operating conditions that could require changes of Protection Systems of other entities? If yes, provide evidence of coordination.

Entity Response: ***(Registered Entity Response Required)***

R5 Supporting Evidence and Documentation

Response: ***(Registered Entity Response Required)***

Provide the following:

Excerpts from FERC Orders -- For Reference Purposes Only
Updated Through March 31, 2009
PRC-001-1

Order 693

P 1418. Protection and Control systems (PRC) on Bulk-Power System elements are an integral part of reliable grid operation. Protection systems are designed to detect and isolate faulty elements on a system, thereby limiting the severity and spread of system disturbances, and preventing possible damage to protected elements. The function, settings and limitations of a protection system are critical in establishing SOLs and IROLs. The PRC Reliability Standards apply to transmission operators, transmission owners, generator operators, generator owners, distribution providers and regional reliability organizations and cover a wide range of topics related to the protection and control of power systems.

P 1419. PRC-001-1 ensures that protection systems are coordinated among operating entities by requiring transmission and generator operators to notify appropriate entities of relay or equipment failures that could affect system reliability. In addition, transmission and generator operators must coordinate with appropriate entities when new protection systems are installed, or when existing protection systems are modified.

P 1433. The Commission approves PRC-001-1 as mandatory and enforceable….

P 1435. Protection systems on Bulk-Power System elements are an integral part of reliable operations. They are designed to detect and isolate faulty elements on a power system, thereby limiting the severity and spread of disturbances and preventing possible damage to protected elements. If a protection system can no longer perform as designed because of a failure of its relays, system reliability is reduced or threatened. In deriving SOLs and IROLs, moreover, the functions, settings, and limitations of protection systems are recognized and integrated. Systems are only reliable when protection systems perform as designed. This is what PRC-001-1 means in linking a reduction in system reliability with a protection relay failure or other equipment failure.

P 1436. … we note that while the PRC Reliability Standards do not specifically require protection systems consisting of redundant and independent protection groups for each critical element in the Bulk-Power System, such requirements are included as one potential solution in the TPL Reliability Standards.

P 1438. In the case, … of a system element protected by a single protection System with a failed relay that threatens system reliability, that scenario would require the use of appropriate operating solutions including removing a system element from service. Another possible solution is to operate a system at a lower SOL or IROL that recognizes the degraded protection performance.

P 1439. Corrective actions taken by transmission operators to return a system to a secure operating state when a protective relay or equipment failure reduces system reliability normally refer to “operator control actions”, consisting of operator actions such as removing the facility without protection from service, generation redispatch, transmission re-configuration, etc. Corrective action must be completed as soon as possible, but no longer than 30 minutes after a notice of protection system failure. Failure to complete corrective action within

30 minutes will be considered a violation of the relevant IROL or TOP Reliability Standards. In contrast, troubleshooting or replacing failed relays or equipment are performed by field maintenance personnel and normally take hours or even days to complete. These actions are not normally considered corrective actions in the context of real-time operation of the Bulk-Power System.

P 1440. We believe that "[t]he transmission operator shall take corrective action as soon as possible" refers to transmission operators taking operator control actions. It does not refer to troubleshooting, repairing or replacing failed relays or equipment, etc., since these time-consuming corrective actions would prolong the risk of cascading failures to the Bulk-Power System.

P 1442. We agree … that generator operators do not have the same ability as transmission operators to take corrective control actions on the Bulk-Power System…

P 1443. As explained above, the requirement for system operators to take corrective control action when protective relay or equipment failure reduces system reliability should be treated the same as the requirement for returning a system to a secure and reliable state after an IROL violation, i.e., as soon as possible, but no longer than 30 minutes after a violation. A longer time limit would place an entity in violation of relevant IROL or TOP Reliability Standards.

P 1448. … The time allowed for mitigating actual IROL violations is very clear: as soon as possible and within 30 minutes. We clarify that our concern is not about "field protection and control personnel not being alerted about failure of relays and protection systems on critical elements." Our focus, rather, is that upon detection of failure of relays and protection systems on critical elements, field personnel must report the failures promptly to the transmission operators so that corrective operator control actions can be taken as soon as possible and within 30 minutes… with respect to …[concerns] that our proposed directives would result in local-level personnel undermining or not following the instructions of reliability coordinator personnel at a time when the system is unstable, we do not understand how local level personnel, who have no operating control of a transmission operator's system or a reliability coordinator's system could do so.

P 1449. The Commission approves Reliability Standard PRC-001-1 as mandatory and enforceable. …

June 8, 2007 Order Approving Regional Reliability Standards for the Western Interconnection and Directing Modifications, Docket No. RR07-11-000

P 87. We note that upon failure of protective relays, NERC Reliability Standard PRC-001-1 requires transmission operators and generator operators to take corrective actions as soon as possible (within thirty minutes as directed by Order No. 693). Order No. 693 clarifies that "corrective actions" do not refer to the repair of protective relays, but instead to actions that ensure the reliability of the system, such as lowering IROLs and SOLs. The proposed regional Reliability Standard does not relieve compliance with this requirement but, rather, adds more stringency by defining a maximum timeframe for removal and repair of protective equipment.

February 3, 2012 Order Approving Revised Definition of Protection System, Docket No. RD11-13-000

P 5. The current definition of Protection System includes protective relays, associated communication systems, voltage and current sensing devices, station batteries and DC control circuitry. The revised definition with the proposed modification states:

"Protection System –

- Protective relays which respond to electrical quantities,
- Communications systems necessary for correct operation of protective functions,
- Voltage and current sensing devices providing inputs to protective relays,
- Station dc supply associated with protective functions (including station batteries, battery chargers, and non-battery-based dc supply), and
- Control circuitry associated with protective functions through the trip coil(s) of the circuit breaker or other interrupting devices."

P 9. The Commission finds that the ERO's modification to the definition of Protection System is just, reasonable, not unduly discriminatory or preferential, and in the public interest. As explained by NERC, battery chargers are essential to assure that batteries used to operate protection systems are in a continuous state of readiness. Therefore, it is appropriate that battery chargers be included in the definition of Protection System. The modified definition removes any uncertainty as to whether battery chargers should be included in a responsible entity's maintenance and testing program and, therefore, closes a reliability gap identified by NERC.

Revision History

Version	Date	Reviewers	Revision Description
1	October 2009	RSAW Working Group	New Document.
1	December 2010	QRSAW WG	Revised Findings Table, modified Supporting Evidence tables, and added Revision History.
1	January 2011	Craig Struck	Reviewed for format consistency and content.
1.1	September 2011	Craig Struck	Format changes for 2012.
1.2	October 2013	ECEMG	Clarified auditor guidance for R1 and R3. Other minor changes to format and wording.
1.3	February 2014	ECEMG	Clarified auditor guidance for R1.
1.4	April 2014	RSAWTF	Errata associated with Project 2007-17 regarding revised definition of "Protection System."

Reliability Standard Audit Worksheet[1]

PRC-005-1.1b — Transmission and Generation Protection System Maintenance and Testing

This section must be completed by the Compliance Enforcement Authority.

Registered Entity:
NCR Number:
Compliance Assessment Date:
Compliance Monitoring Method:
Applicable Function(s): DP, GO, TO
Names of Auditors:

[1] NERC developed this Reliability Standard Audit Worksheet (RSAW) language in order to facilitate NERC's and the Regional Entities' assessment of a registered entity's compliance with this Reliability Standard. The NERC RSAW language is written to specific versions of each NERC Reliability Standard. Entities using this RSAW should choose the version of the RSAW applicable to the Reliability Standard being assessed. While the information included in this RSAW provides some of the methodology that NERC has elected to use to assess compliance with the requirements of the Reliability Standard, this document should not be treated as a substitute for the Reliability Standard or viewed as additional Reliability Standard requirements. In all cases, the Regional Entity should rely on the language contained in the Reliability Standard itself, and not on the language contained in this RSAW, to determine compliance with the Reliability Standard. NERC's Reliability Standards can be found on NERC's website. Additionally, NERC Reliability Standards are updated frequently, and this RSAW may not necessarily be updated with the same frequency. Therefore, it is imperative that entities treat this RSAW as a reference document only, and not as a substitute or replacement for the Reliability Standard. It is the responsibility of the registered entity to verify its compliance with the latest approved version of the Reliability Standards, by the applicable governmental authority, relevant to its registration status.

The NERC RSAW language contained within this document provides a non-exclusive list, for informational purposes only, of examples of the types of evidence a registered entity may produce or may be asked to produce to demonstrate compliance with the Reliability Standard. A registered entity's adherence to the examples contained within this RSAW does not necessarily constitute compliance with the applicable Reliability Standard, and NERC and the Regional Entity using this RSAW reserves the right to request additional evidence from the registered entity that is not included in this RSAW. Additionally, this RSAW includes excerpts from FERC Orders and other regulatory references. The FERC Order cites are provided for ease of reference only, and this document does not necessarily include all applicable Order provisions. In the event of a discrepancy between FERC Orders, and the language included in this document, FERC Orders shall prevail.

Subject Matter Experts

Identify Subject Matter Expert(s) responsible for this Reliability Standard. (Insert additional rows if necessary)

Registered Entity Response (Required):

SME Name	Title	Organization	Requirement(s)

R1 Supporting Evidence and Documentation

R1. Each Transmission Owner and any Distribution Provider that owns a transmission Protection System and each Generator Owner that owns a generation or generation interconnection Facility Protection System shall have a Protection System maintenance and testing program for Protection Systems that affect the reliability of the BES. The program shall include:

R1.1. Maintenance and testing intervals and their basis.

R1.2. Summary of maintenance and testing procedures.

Registered Entity Response (Required):

Describe, in narrative form, how you meet compliance with this requirement.

Registered Entity Evidence (Required):

Provide the following for all evidence submitted (Insert additional rows if necessary): File Name, File Extension, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description

Compliance Assessment Approach Specific to PRC-005-1.1b R1

This section must be completed by the Compliance Enforcement Authority

Review the evidence to verify the Registered Entity has:

(R1) Review the evidence provided by the entity to determine if the entity has a transmission Protection System and/or a generation or generator interconnection Facility Protection System (*see* Requirement 2). If yes:	
	Review the evidence provided by the entity to verify the entity has a maintenance and testing program for the Protection System. The maintenance and testing program should include:

	Protective relays which respond to electrical quantities
	Communication systems necessary for correct operation of protective functions
	Voltage and current sensing devices providing inputs to protective relays
	Station DC supply associated with protective functions (including Station batteries, battery chargers, and non battery based DC supply)
	DC control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.
Review the program and determine if it has the following for each protective system device:	
	(R1.1) Maintenance and testing intervals
	(R1.1) Basis for those intervals
	(R1.2) Summary of Maintenance and Testing procedures

Note to Auditor:

All equipment specified by the new definition that was not covered by the old definition must be included in the maintenance and testing program (i.e., a periodicity, basis, and testing/maintenance procedure) by April 1, 2013. The actual test should be completed by the end of the first specified testing cycle. (For example, if quarterly and annual battery charger tests are added, all quarterly battery charger tests should be complete by July 1, 2013 and annual tests by April 1, 2014.) For more information, review Technical Justification Resource Document for Project 2010-07 Generator Requirements at the Transmission Interface.

Auditor Notes:

R2 Supporting Evidence and Documentation

R2. Each Transmission Owner and any Distribution Provider that owns a transmission Protection System and each Generator Owner that owns a generation or generator interconnection Facility Protection System shall provide documentation of its Protection System maintenance and testing program and the implementation of that program to its Regional Entity on request (within 30 calendar days). The documentation of the program implementation shall include:

R2.1. Evidence Protection System devices were maintained and tested within the defined intervals.

R2.2. Date each Protection System device was last tested/maintained.

Registered Entity Response (Required):

Describe, in narrative form, how you meet compliance with this requirement.

Data Request: Provide a list of all substations 100kV and above, generating stations and generator interconnection Facilities connected to the BES for use in NERC Sampling Methodology.

TEST RECORDS NOTE: If test records are provided as evidence of compliance with R2 please provide an annotated sample test record for each type of test record provided. The sample test record(s) should include descriptive annotations for each relevant section, heading, cell, etc. The annotations should include an explanation of what each relevant section/heading/cell is and what the test results are indicating. The annotations should be written from the perspective that the person reviewing the test record is unfamiliar with your test record format. Examples of annotations could include cell comments in MS Excel spreadsheets, review comments in MS Word documents, and Sticky Note comments in PDF formatted documents, to name a few.

Registered Entity Evidence (Required):

Provide the following for all evidence submitted (Insert additional rows if necessary): File Name, File Extension, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), Description

Compliance Assessment Approach Specific to PRC-005-1.1b R2

This section must be completed by the Compliance Enforcement Authority

Review the evidence to verify the Registered Entity has:

(R2) Review the evidence provided by the entity to determine if the entity is required to have a Protection System maintenance and testing program. If yes:	
Review the evidence provided by the entity to determine if the entity provided the above information to its Regional Entity within 30 calendar days of the request (Prior to compliance assessment, determine if a 30 day data request was made (the audit notice constitutes a 30 day request)) and that the documentation included:	
	(R2.1) Evidence Protection System devices were maintained and tested within the defined intervals.
	(R2.2) Date when each Protection System device was last tested/maintained.
Note to Auditor: CEAs are to obtain the last date a registered entity tested and maintained its Protection System devices in order to verify compliance with PRC-005-1 R2 starting from June 18, 2007. The last maintenance or test date is necessary for a CEA to determine whether a registered entity is conducting maintenance and testing	

within the intervals defined by its own Protection System maintenance and testing program, including circumstances when the interval began prior to June 18, 2007, the mandatory and enforceable date of the standard.
However, CEAs are not to require registered entities to produce records of testing and maintenance activities conducted prior to June 18, 2007, because keeping such records was not mandatory at that time. Therefore, CEAs are only to require production of actual maintenance and testing records from June 18, 2007 forward.
When obtaining the last date of maintenance and testing activity prior to June 18, 2007, CEAs are to allow several options of evidence, including: (1) the registered entity's actual maintenance and testing records, if available, (2) a simple representation by the registered entity regarding the last known maintenance and testing date, or (3) the registered entity's good faith approximation of the previous maintenance and testing date, based on best available information.

If an entity elects to provide a CEA with the evidence listed in points (2) or (3) above, the CEA is to obtain the entity's description of the basis for its representation of an actual or estimated date. The basis can refer to the registered entity's actual knowledge, approximate periodicity of established maintenance and testing practices, timing of commissioning of equipment, or any other reasonable basis.

Focus on Current Intervals
A CEA is to enforce PRC-005-1 R2 only with consideration of interval dates beginning June 18, 2007 or later if the entity can demonstrate it has conducted the required maintenance and testing at least once since June 18, 2007, unless there is additional cause that warrants requesting additional evidence.

For example, if a registered entity completed its required maintenance and testing activities in November 2007 and provided appropriate maintenance and testing records, the CEA is to accept that evidence and is not to request the registered entity's prior maintenance and testing date if it occurred before June 18, 2007. However, a CEA is to request evidence of the registered entity's last maintenance and testing date if it occurred after June 18, 2007.

A CEA is to obtain one or more of the following as evidence of the last date of maintenance and testing activity that occurred prior to June 18, 2007 (if such evidence is necessary as discussed above):

1. Actual maintenance and testing records, if available;
2. A simple representation by the registered entity regarding the last known maintenance and testing date and the registered entity's description of the basis for its representation of an actual or estimated date. The basis can refer to the registered entity's actual knowledge, approximate periodicity of established maintenance and testing practices, timing of commissioning of equipment, or any other reasonable basis; or

3. The registered entity's good faith approximation of the previous maintenance and testing date based on best available information and the registered entity's description of the basis for its representation of an actual or estimated date. The basis can refer to the registered entity's actual knowledge, approximate periodicity of established maintenance and testing practices, timing of commissioning of equipment, or any other reasonable basis.

Auditor Notes:

Supplemental Information

Question: How does your company document and confirm that program implementation is on schedule? Include a discussion of defined maintenance and testing intervals, and your process for tracking the dates each protective device was last tested/maintained.

Question: Describe your maintenance program to periodically test protection systems in order to ensure proper performance. Include in your description how your company's program identifies the equipment specified in the NERC Glossary definition of Protection Systems (e.g. Protective relays, associated communication systems, voltage and current sensing devices, station batteries/chargers and DC control circuitry).

Other : The list of questions above is not all inclusive of evidence required to show compliance with the Reliability Standard. Provide additional information here, **as necessary** that demonstrates compliance with this Reliability Standard.

Compliance Finding Summary [Author to update table based on number of Requirements in the standard]

This section must be completed by the Compliance Enforcement Authority

Req.	NF	PV	OEA	NA	Statement

Additional Information:

Reliability Standard

A. Introduction

1. **Title:** **Transmission and Generation Protection System Maintenance and Testing**
2. **Number:** PRC-005-1.1b
3. **Purpose:** To ensure all transmission and generation Protection Systems affecting the reliability of the Bulk Electric System (BES) are maintained and tested.
4. **Applicability**
   - **4.1.** Transmission Owner.
   - **4.2.** Generator Owner.
   - **4.3.** Distribution Provider that owns a transmission Protection System.
5. **Effective Date:** In those jurisdictions where regulatory approval is required, all requirements become effective upon approval. In those jurisdictions where no regulatory approval is required, all requirements become effective upon Board of Trustee's adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

B. Requirements

R1. Each Transmission Owner and any Distribution Provider that owns a transmission Protection System and each Generator Owner that owns a generation or generator interconnection Facility Protection System shall have a Protection System maintenance and testing program for Protection Systems that affect the reliability of the BES. The program shall include:

R1.1. Maintenance and testing intervals and their basis.

R1.2. Summary of maintenance and testing procedures.

R2. Each Transmission Owner and any Distribution Provider that owns a transmission Protection System and each Generator Owner that owns a generation or generator interconnection Facility Protection System shall provide documentation of its Protection System maintenance and testing program and the implementation of that program to its Regional Entity on request (within 30 calendar days). The documentation of the program implementation shall include:

R2.1. Evidence Protection System devices were maintained and tested within the defined intervals.

R2.2. Date each Protection System device was last tested/maintained.

C. Measures

M1. Each Transmission Owner and any Distribution Provider that owns a transmission Protection System and each Generator Owner that owns a generation or generator interconnection Facility Protection System that affects the reliability of the BES, shall have an associated Protection System maintenance and testing program as defined in Requirement 1.

M2. Each Transmission Owner and any Distribution Provider that owns a transmission Protection System and each Generator Owner that owns a generation or generator interconnection Facility Protection System that affects the reliability of the BES, shall have evidence it provided documentation of its associated Protection System maintenance and testing program and the implementation of its program as defined in Requirement 2.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Entity.

1.2. Compliance Monitoring Period and Reset Time Frame

One calendar year.

1.3. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner and any Distribution Provider that owns a transmission Protection System and each Generator Owner that owns a generation or generator interconnection Facility Protection System, shall retain evidence of the implementation of its Protection System maintenance and testing program for three years.

The Compliance Monitor shall retain any audit data for three years.

1.4. Additional Compliance Information

The Transmission Owner and any Distribution Provider that owns a transmission Protection System and the Generator Owner that owns a generation or generator interconnection Facility Protection System, shall each demonstrate compliance through self-certification or audit (periodic, as part of targeted monitoring or initiated by complaint or event), as determined by the Compliance Monitor.

2. Violation Severity Levels (no changes)

E. Regional Differences

None identified.

Appendix 1 of PRC-005-1.1b

Requirement Number and Text of Requirement
R1. Each Transmission Owner and any Distribution Provider that owns a transmission Protection System and each Generator Owner that owns a generation Protection System shall have a Protection System maintenance and testing program for Protection Systems that affect the reliability of the BES. The program shall include: **R1.1.** Maintenance and testing intervals and their basis. **R1.2.** Summary of maintenance and testing procedures. **R2.** Each Transmission Owner and any Distribution Provider that owns a transmission Protection System and each Generator Owner that owns a generation Protection System shall provide documentation of its Protection System maintenance and testing program and the implementation of that program to its Regional Reliability Organization on request (within 30 calendar days). The documentation of the program implementation shall include: **R2.1** Evidence Protection System devices were maintained and tested within the defined intervals. **R2.2** Date each Protection System device was last tested/maintained.
Question:
Is protection for a radially-connected transformer protection system energized from the BES considered a transmission Protection System subject to this standard?
Response:
The request for interpretation of PRC-005-1 Requirements R1 and R2 focuses on the applicability of the term "transmission Protection System." The NERC Glossary of Terms Used in Reliability Standards contains a definition of "Protection System" but does not contain a definition of transmission Protection System. In these two standards, use of the phrase transmission Protection System indicates that the requirements using this phrase are applicable to any Protection System that is installed for the purpose of detecting faults on transmission elements (lines, buses, transformers, etc.) identified as being included in the Bulk Electric System (BES) and trips an interrupting device that interrupts current supplied directly from the BES. A Protection System for a radially connected transformer energized from the BES would be considered a transmission Protection System and subject to these standards only if the protection trips an interrupting device that interrupts current supplied directly from the BES and the transformer is a BES element.

Appendix 2 of PRC-005-1.1b

Requirement Number and Text of Requirement
R1. Each Transmission Owner and any Distribution Provider that owns a transmission Protection System and each Generator Owner that owns a generation Protection System shall have a Protection System maintenance and testing program for Protection Systems that affect the reliability of the BES. The program shall include: **R1.1.** Maintenance and testing intervals and their basis. **R1.2.** Summary of maintenance and testing procedures.
Question:
1. Does R1 require a maintenance and testing program for the battery chargers for the "station batteries" that are considered part of the Protection System? 2. Does R1 require a maintenance and testing program for auxiliary relays and sensing devices? If so, what types of auxiliary relays and sensing devices? (i.e transformer sudden pressure relays) 3. Does R1 require maintenance and testing of transmission line re-closing relays? 4. Does R1 require a maintenance and testing program for the DC circuitry that is just the circuitry with relays and devices that control actions on breakers, etc., or does R1 require a program for the entire circuit from the battery charger to the relays to circuit breakers and all associated wiring? 5. For R1, what are examples of "associated communications systems" that are part of "Protection Systems" that require a maintenance and testing program?
Response:
~~1. While battery chargers are vital for ensuring "station batteries" are available to support Protection System functions, they are not identified within the definition of "Protection Systems." Therefore, PRC-005-1 does not require maintenance and testing of battery chargers.~~ The currently-effective definition of Protection System, includes battery chargers as an element of the definition. As a result of this inclusion, battery chargers must be maintained and tested. Thus, the modified definition of Protection System supersedes Response #1 in Appendix 2 related to battery 2. The existing definition of "Protection System" does not include auxiliary relays; therefore, maintenance and testing of such devices is not explicitly required. Maintenance and testing of such devices is addressed to the degree that an entity's maintenance and testing program for 3 DC control circuits involves maintenance and testing of imbedded auxiliary relays. Maintenance and testing of devices that respond to quantities other than electrical quantities (for example, sudden pressure relays) are not included within Requirement R1.

3. No. "Protective Relays" refer to devices that detect and take action for abnormal conditions. Automatic restoration of transmission lines is not a "protective" function.
4. PRC-005-1 requires that entities 1) address DC control circuitry within their program, 2) have a basis for the way they address this item, and 3) execute the program. PRC-005-1 does not establish specific additional requirements relative to the scope and/or methods included within the program.
5. "Associated communication systems" refer to communication systems used to convey essential Protection System tripping logic, sometimes referred to as pilot relaying or teleprotection. Examples include the following:
   - communications equipment involved in power-line-carrier relaying
   - communications equipment involved in various types of permissive protection system applications
   - direct transfer-trip systems
   - digital communication systems (which would include the protection system communications functions of standard IEC 618501 as well as various proprietary systems)

Sampling Methodology

Sampling is essential for auditing compliance with NERC Reliability Standards since it is not always possible or practical to test 100% of either the equipment, documentation, or both, associated with the full suite of enforceable standards. The Sampling Methodology Guidelines and Criteria, or sample guidelines, provided by the Electric Reliability Organization help to establish a minimum sample set for monitoring and enforcement uses in audits of NERC Reliability Standards.

There are two approaches to sampling: statistical and non-statistical, and choosing which to use depends on the objectives for sampling. (When the population sample to be reviewed is documentation, a statistical approach using RAT-STATS is expected.) Both are represented in the sample guideline in line with standard practices for their use. The Audit Team Lead may determine if the scope of the audit samples should be reduced to levels below those established in the sample guideline. In doing so, the audit team will document the rationale for reducing the scope of the of sample population in the RSAW or audit report.

Additionally, separate from the audit, the registered entity may use this methodology to determine the sample population to test in order to provide themselves reasonable assurance that management's expectations are being met by the organization.

Regulatory Language for Reference Purposes Only (through March 28, 2014)

Order No. 693 [cite]
http://www.nerc.com/files/order_693.pdf

P 1418. Protection and Control systems (PRC) on Bulk-Power System elements are an integral part of reliable grid operation. Protection systems are designed to detect and isolate faulty elements on a system, thereby limiting the severity and spread of system disturbances, and preventing possible damage to protected elements. The function, settings and limitations of a protection system are critical in establishing SOLs and IROLs. The PRC Reliability Standards apply to transmission operators, transmission owners, generator operators, generator owners, distribution providers and regional reliability organizations and cover a wide range of topics related to the protection and control of power systems.

P 1470. PRC-005-1 ensures that all transmission and generation protection systems affecting the reliability of the Bulk-Power System are maintained and tested by requiring the transmission owners, distribution providers, and generator owners to develop, document, and implement a protection system maintenance program that may be reviewed by the regional reliability organization.

P 1474. For the reasons stated in the NOPR, the Commission approves Reliability Standard PRC-005-1 as mandatory and enforceable.

Order Approving Interpretation (September 26, 2011)
http://www.nerc.com/FilingsOrders/us/FERCOrdersRules/Order_approving_PRC-004-1_interp_2011.9.26.pdf

P 7. NERC interprets "transmission Protection System," as it appears in Requirements R1 and R3 of PRC-004-1 and Requirements R1 and R2 of PRC-005-1, to mean "any Protection System that is installed for the purpose of detecting faults on transmission elements (lines, buses, transformers, etc.) identified as being included in the Bulk Electric System (BES) and trips an interrupting device that interrupts current supplied directly from the BES."[Footnote omitted.] In addition, NERC's proposed interpretation states that "[a] Protection System for a radially connected transformer energized from the BES would be considered a transmission Protection System and subject to these standards only if the protection trips an interrupting device that interrupts current supplied directly from the BES and the transformer is a BES element."[Footnote omitted.]

P 11. The Commission approves NERC's interpretation as it is consistent with the intent of Requirements R1 and R3 of PRC-004-1 and Requirements R1 and R2 of PRC-005-1. The interpretation clarifies that the Requirements are "applicable to any Protection System that is installed for the purpose of detecting faults on transmission elements (lines, buses, transformers, etc.) identified as being included in the [BES] and trips an interrupting device that interrupts current supplied directly from the BES."[Footnote omitted.] This

interpretation is consistent with the Commission's understanding that a "transmission Protection System" is installed for the purpose of detecting and isolating faults affecting the reliability of the bulk electric system through the use of current interrupting devices. The Commission further understands that the "interrupting device" referred to in the interpretation is a device that has the performance capability to interrupt full fault current associated with the protected bulk electric system facilities.

Order Approving Modification of Definition for Protection System (February 3, 2012)

P5. The current definition of Protection System includes protective relays, associated communication systems, voltage and current sensing devices, station batteries and DC control circuitry. The revised definition with the proposed modification states:

> **"**The modified definition approved herein shall supersede the interpretation of Requirement R1 of Reliability Standard PRC-005-1 approved concurrently with this order in Docket No. RM10-5-000 on the effective date of the modified definition (the first day of the first calendar quarter twelve months from approval, i.e., April 1, 2013).
>
> "Protection System –
> - Protective relays which respond to electrical quantities,
> - Communications systems necessary for correct operation of protective functions,
> - Voltage and current sensing devices providing inputs to protective relays,
> - Station dc supply associated with protective functions (including station batteries, battery chargers, and non-battery-based dc supply), and
> - Control circuitry associated with protective functions through the trip coil(s) of the circuit breaker or other interrupting devices."

P6. In the Petition, NERC explains that the modification will improve the definition by clearly identifying the essential elements that constitute a Protection System. NERC states that battery chargers are an essential piece of the bulk power system that should be included in the definition since battery chargers function to assure that batteries associated with protection systems are in a continuous state of readiness.

Order Approving Generator Requirements at the Transmission Interface, Order No. 785, 144 FERC ¶ 61,221 (2013) http://www.nerc.com/FilingsOrders/us/FERCOrdersRules/Final%20Rule%20RM12-16-000.pdf

P7. "NERC asserted that the proposed modifications in Reliability Standards PRC-004-2.1a and PRC-005-1.1b are designed merely to clarify that their requirements extend not only to protection systems associated with the generating facility or station itself, but also to any protection systems associated with the generator interconnection facilities."

P10. In the NOPR, "the Commission found that the clarifications proposed in PRC-004-2.1a and PRC-005-1.1b would mitigate the possibility that the standards' requirements could be interpreted to exclude the generator interconnection facilities."

P 30. "We agree with NERC that the changes mitigate the possibility that entities could interpret the standards to exclude generator interconnection facilities."

Revision History

Version	Date	Reviewers	Revision Description
1	December 2009	RSAW Working Group	New Document
1	December 2010	QRSAW WG	Revised Findings Table, modified Supporting Evidence tables, and added Revision History
1	January 2011	Craig Struck	Reviewed for format consistency and content. Added test record annotation remarks for R2 evidence.
1.1	September 2011	Craig Struck	Format update for 2012.
1.1	October 2011	NERC Legal	Updated Excerpts from FERC Orders from March 31, 2009 through and including October 19, 2011.
2	March 2013	RSAW WG	Updated template, added interpretation, revised for new definition of protection system, and updated title.
2.1	March 2014	RSAW Task Force	Added auditor guidance from CAN-0008, CAN-0009, and CAN-0043.
2.2	March 2014	RSAW Task Force	Revised to reflect .1 errata changes. Legal updated Regulatory Language section.
2.3	May 2014	NERC Compliance	Update appendix 2 of standard to delete question excluding battery charges.

Lesson Learned

High AC Voltage Can Lead to Remote Terminal Unit (RTU) Failures

Primary Interest Groups
Generator Owners (GOs)
Generator Operators (GOPs)
Transmission Owners (TOs)
Transmission Operators (TOPs)

Problem Statement
High ac voltage delivered to remote terminal unit (RTU) control cards can cause RTU failures. The RTU failure mode caused by this high, applied ac voltage can cause random trips and closure of circuit breakers connected to the RTU, which could lead to large outages on the bulk power system. Three instances of this type of failure have been reported through the NERC Event Analysis process.

Details
If ac voltage is being switched by an RTU control output card, moderately high ac voltage for a prolonged period or very high ac voltage for a short duration can cause the metal oxide varistors (MOVs) on the control card to break down. This varistor breakdown can lead to the equivalent of a control output contacts being shorted. This shorting of output contacts can lead to random operation of devices that are connected to these RTU control outputs. In addition, the breakdown of the varistors can lead to excessive heating, which can melt ribbon cables, leading to random trips and closure of circuit breakers connected to the RTU. This failure mode is not exclusive to one RTU vendor, and the reports submitted identifying this failure mechanism have not been exclusive to one vendor.

Research indicated that most RTUs are susceptible to this type of failure due to high voltage applied to the control board. The cause of the high ac voltage can be varied. For example, a CCVT delivered high voltage for approximately three minutes before failing catastrophically. In another instance, an EHV transmission line conductor fell across a lower-voltage transmission line, causing momentary high voltage from the potential transformer at the lower-voltage substation. Yet, in another case, a programmable logic controller delivered high ac voltage to an RTU, which caused the random trips.

Corrective Actions
The corrective actions implemented by the affected entities are dependent upon the specific situations each event presented. One solution is to apply high voltage protection (i.e., MOVs) on the ac circuits connected to the control boards, external to the RTU. Another solution is to use an external interpose relay for all ac control switching to eliminate any ac on the RTU control output board.

In most instances, RTUs are limited to a certain number of control points per output card. One solution was to try to isolate the ac voltage inputs from the dc control voltages—commonly used for breaker controls—by not having dc and ac signals on the same control output card. In this solution, if high ac voltage were to

cause a breakdown of the MOVs, the shorted MOVs would not be shorting out contacts that had dc (breaker control) on them. In effect, isolating the high ac voltage from dc control voltages would alleviate erroneous breaker trips and closures.

Lessons Learned

If an entity employs a station RTU to switch ac voltages via the RTU control functionality, the entity should consider researching the effects that high ac voltage may have on the RTU control. If random trips and closures are a possible effect of high ac voltages, the entity should consider preventive mitigation if the entity's Station also interacts with dc control voltages.

NERC's goal in publishing lessons learned is to provide industry with technical and understandable information that assists them with maintaining the reliability of the bulk power system. NERC requests that you provide input on this lesson learned by taking the short survey provided in the link below.

Circuit Breaker Modification Leads to Inadvertent Trips

Primary Interest Groups
Transmission Owners (TOs)
Transmission Operators (TOPs)
Generation Owners (GOs)
Generation Operators (GOPs)

Problem Statement
Sulfur hexafluoride (SF6) gas circuit breaker controls were field modified to trip on low gas and air pressure. This field modification resulted in the breakers tripping when direct current (DC) power was removed and then re-applied to the SF6 Gas circuit breaker.

Details
This model of SF6 circuit breaker comes prewired from the manufacturer to lock-on-bus (disable tripping) for falling SF6 gas pressure and for falling air pressure. This is necessary to prevent operation of the circuit breaker when there is not enough stored energy (air pressure) for the operating mechanism or if there is not sufficient SF6 pressure in the interrupter chamber to interrupt a fault. The Entity determined that the risk of locking circuit breakers on the bus had a greater impact to the grid than tripping a circuit breaker under these conditions and reconfigured the circuit breaker to trip on falling SF6 gas pressure or falling air pressure. The modification made to this model of circuit breaker involved connecting manufacturer-provided low-pressure auxiliary relay contacts labeled for use in the primary and secondary trip circuits in parallel with the control switch trip contact.

This scheme worked correctly as long as the DC to the trip circuit was not disconnected. However, when the DC was removed, the low-pressure auxiliary relay coils became de-energized, closing the contacts (“b” contacts) connected to the trip circuits. This set up a trip signal to the trip coils which was initiated as soon as the DC source was turned back on because the operating time of the low-pressure auxiliary relay to re-open the tripping contacts is several cycles.

During construction activities, the DC secondary power source (DC #2) to multiple SF6 gas circuit breakers in a station was temporarily removed to facilitate relocation of a DC disconnect box. The DC #2 source fed the low gas and low air pressure trip circuits. When the DC circuits were re-energized, this resulted in multiple SF6 gas circuit breakers opening upon restoration of the DC power. This action open ended multiple transmission lines and resulted in a generation facility being disconnected from the system.

Corrective Actions
The entity reconfigured/redesigned the pressure switch and auxiliary relay circuit. The pressure switch was changed to energize the auxiliary relay on falling/low pressure. Consequently, the tripping of the circuit breaker is accomplished through an auxiliary relay “a” contact. This alleviated a standing trip on the circuit breaker when DC supply power was removed from the gas circuit breaker. (See attached schematic)

Lesson Learned

When making changes to original factory equipment schemes, entities should analyze the scheme change to ensure that the removal/restoration of DC power to the scheme does not cause an undesirable operation.

Improved Contractor Oversight Needed

Primary Interest Groups
Transmission Owners (TOs)
Generation Owners (GOs)
Generation Operators (GOPs)
Distribution Providers (DPs)

Problem Statement
Multiple instances of vendor performed work in stations without a verification method in place for ensuring work quality have caused significant system disturbances.

Details
Following are three examples of events that took place due to the lack of vendor oversight:

1. A generation facility experienced a trip due to an internal fault in a sulfur hexafluoride (SF6) gas breaker. The breaker trip interrupted power to the auxiliary transformer that is the normal feed for a generating plant. The generation facility is equipped with a fast bus transfer scheme that isolates the auxiliary transformer and closes in a startup transformer. Upon closure of the startup transformer a 487/T1 B phase startup transformer differential relay actuated. The 487/T1 relay signal inputs to a 286/T1 lockout relay which when triggered initiates de-energization of the startup transformer, causing it to be isolated.

   Investigation revealed that two splices on the startup transformer's current transformer (CT) were missing insulating sleeves. This created an alternate path for the CT secondary current, which impacted the differential protection scheme operation by causing the 487/T1 to actuate.

   Prior to the event, an inspection of a startup transformer's junction boxes found a leaking substance from the wires within the boxes. A work order was issued to replace the startup transformer's CT penetration blocks. The utility hired a vendor to replace the junction boxes per an aggressive schedule. During this effort, the vendor's scope of work grew to include control cable replacement.

   After the vendor's work was completed, two of the CT penetrations were found to be leaking and the vendor was asked to return in order to replace the leaking CT penetrations. During this replacement two insulating sleeves that are necessary to prevent terminal-to-terminal contact, were inadvertently not installed on the external connections which led to the differential relay action that isolated the start-up transformer.

2. A nuclear generating unit correctly tripped due to the loss of a reactor coolant pump, but then separated from the 230kV switchyard (Loss of Offsite Power, LOOP) due to incorrect logic with the unit's turbine underfrequency protection scheme. The turbine underfrequency protection scheme had been replaced with microprocessor relays, as part of the main generator protective relaying protection upgrade project during the unit's previous refueling outage.

The turbine underfrequency protection scheme protects the turbine. If the grid frequency reaches one of four unacceptable set points, each with a specified time duration, the four 230kV switchyard breakers will open and separate the unit from the grid. The original turbine underfrequency protection scheme had a 'unit offline block' that defeated the scheme if the unit was offline, thus no inadvertent LOOP events had been previously caused by this scheme.

The GO hired a vendor to perform the design, installation, and testing for the turbine underfrequency protection scheme replacement. The 'unit offline block' scheme had been successfully incorporated into three of the four frequency set points. The 'unit offline block' was not incorporated in the settings (logic) of the new microprocessor relays for the instantaneous frequency set point (lowest frequency, no time delay to trip allowed). The GO did not successfully communicate to the vendor the need for the 'unit offline block' to be included with all four frequency set points, although the GO's logic diagrams for the turbine underfrequency protection scheme identified this requirement. The GO had provided the vendor the turbine underfrequency protection scheme design used for a similar scheme replacement from a unit at another plant location. This design had similar logic, but a different voltage restraint set point effectively blocked the turbine underfrequency protection scheme when the unit was offline. Without the 'offline block', a LOOP event could possibly occur anytime the subject unit tripped. Neither the vendor who developed the settings, nor the GO personnel who reviewed and accepted them recognized the settings error.

The GO performed commissioning testing per the scheme's design. The vendor performed Factory Acceptance Testing (FAT testing) prior to shipment of the relaying. The FAT testing validated the panel wiring and relay set points, and also verified proper operation of relays. Since the scheme's design, as defined in the vendor produced calculation, did not address the missing block function, the error was not identified during commissioning.

The primary factors contributing to the LOOP event were the failure to communicate the need for the unit offline block, as identified in the logic diagrams; and, utilizing a design with a similar error.

3. Entity personnel performed a switching operation on Gas Insulated Switchgear (GIS) to remove a capacitor bank and bus section from service for a maintenance activity. This required the operation of the bus section motor operated ground switch for the purpose of safely grounding the capacitor bank. When the section motor operated ground switch was operated, a line-to-ground fault was detected within the GIS bus. The GIS breakers operated properly and successfully cleared the fault.

It was later determined that the GIS manufacturer used incorrect assembly drawings. The manufacturer reversed a bus section disconnect switch and ground switch module. This resulted in two ground switches being installed on one bus section and none on another section. The issue was caused by insufficient handling of a design variation. The position of the affected GIS module was changed by the manufacturer to avoid physical interference with a steel structure. The drawing was modified and the variation order was sent to the switchgear factory, however there were no markings to identify this change. There was no check of the arrangement with the single line diagram (which included the correct configuration) in the process chain that followed. Also, the manufacturer's commissioning engineer did not identify the discrepancy between the physical arrangement of the GIS module and the electrical single line diagram during the final project commissioning performed by the manufacturer.

Lesson Learned

These events highlight the need for vendor oversight policies to include a discussion with the vendor of performance standards, expectations for the work, human error reduction techniques, and verification of completed work. It is common practice in the electric industry for an entity to supplement its workforce with a vendor's specialized skills. As shown by these events the expectations between the entity and vendor with regard to the design, validation of calculations and settings, scheme testing and commissioning must be clear to ensure a successful outcome. Effective oversight of contractor work activities should be in place to help prevent these types of events.

Note: This lesson learned (LL) combines several LLs that have been submitted by different Regions. This subject is also mentioned in LL20140202: A Generating Station Ground Mat Problem Led to the Trip of Two Generating Units (2000 MW), published by NERC on February 25, 2014, and LL20140302: Verification of Alternating Current Quantities during Protection System Commissioning, published by NERC on March 11, 2014.

NERC's goal in publishing lessons learned is to provide industry with technical and understandable information that assists them with maintaining the reliability of the bulk power system. NERC requests that you provide input on this lesson learned by taking the short survey provided in the link below.

Organizational Overview

The Florida Reliability Coordinating Council (FRCC) is a Florida not-for-profit corporation that was formed in 1996 and is one of the eight regions of the North American Electric Reliability Corporation (NERC). The FRCC's mission is to ensure and enhance the reliability and adequacy of the Bulk Electric System (BES) in Florida now and into the future. The FRCC's Web site is www.frcc.com. The FRCC Region is comprised of all of Florida east of the Apalachicola River. Florida's unique geography and its highly integrated transmission system coupled with its single interface boundary to the rest of the Eastern Interconnection required the development of a reliability focus in the FRCC Region. Membership in the FRCC's Regional Entity Division is open to any entity, without cost, that has a material interest in the reliability of the BES in the FRCC Region. Currently there are 69 Registered Entities within the FRCC

Region. The FRCC is governed by a balanced stakeholder Board of Directors, and accomplishes its activities through qualified professional staff and standing committees which also have balanced stakeholder governance.

The FRCC provides the statutory functions and services for the FRCC Region through its Regional Entity Division. Non-statutory services for the FRCC Region are provided through its Member Services Division. This divisional structure is an efficient and effective means of clearly separating statutory and non-statutory activities and related funding for each. The revised FRCC Bylaws, creating this divisional structure, were first approved by the Federal Energy Regulatory Commission ("FERC") on March 21, 2008.

The FRCC Regional Entity Division works to enhance the reliability of the BES in the FRCC Region pursuant to the approved Regional Delegation Agreement with NERC, as the Electric Reliability Organization ("ERO"), under the authority of the FERC. The functions performed by the FRCC Regional Entity Division include regional reliability standards development, compliance monitoring and enforcement of reliability standards, reliability assessment and performance analysis, event analysis and reliability improvement, training and education, situation awareness and infrastructure security. The Regional Entity division of the FRCC has one standing committee, the FRCC Regional Entity Committee and Compliance Forum (RECCF). This committee provides input to the FRCC in support of the delegated activities and functions.

The Member Services division of the FRCC provides, coordinates and administers a variety of services relating to the reliable planning and operation of the BES within the FRCC Region. These services are carried out by the FRCC Planning Committee (PC) and the FRCC Operating Committee (OC) and their various subcommittees, task forces and working groups, as well as FRCC Staff.

The FRCC PC and OC actively participate in the development and approval of their committee's budget. The budgets reflect activities of each committee's responsibilities, such as reliability coordination, resource adequacy, stability studies, transmission studies, operations tools, telecommunication tools and infrastructure.

Each year, the total FRCC budget is presented to the FRCC Board of Directors early in the second quarter for informational purposes prior to final approval in June. This process gives all FRCC members advanced indication of the funding level, both statutory and non-statutory, which will be required for the coming fiscal year (January 1 – December 31). This allows for timely inclusion of each member's funding responsibility in their individual budgeting process. The final budget is presented for approval to the FRCC Board of Directors in June of each year and is then submitted to NERC for approval by the NERC Board of Trustees and then by FERC.

Membership and Governance

The FRCC's members (in both divisions) include investor-owned utilities, cooperative utilities, municipal utilities, power marketers, independent power producers and others. Membership is currently 30 FRCC members in the Regional Entity Division and 23 FRCC members in the Member Services Division including affiliate and adjunct members.

The FRCC has six (6) membership sectors which include the following:

- Non-Investor Owned Utility Wholesale
- Load Serving Entity
- Generating Load Serving Entity
- Investor Owned Utility
- Suppliers
- General

There are currently two (2) members in the General Sector of the Regional Entity Division and no members in the General Sector of the Member Services Division.

The activities of FRCC are governed by its Board of Directors. The Board is comprised of senior level executives from members of FRCC.

As part of its responsibilities, NERC, as the ERO, delegates its authority to Regional Entities to perform certain functions through delegation agreements. On October 21, 2010, FERC approved revised delegation agreements between NERC and the eight (8) Regional Entities that became effective January 1, 2011 and will expire at the end of 2015. These delegation agreements describe the responsibility and authority delegated to the Regional Entities. NERC and the Regional Entities revised the delegation agreements in 2010 to improve the efficiency, transparency, quality and effectiveness of the combined NERC and Regional Entity operations. The funding for Regional Entities is approved separately with each Regional Entity submitting its own business plan and budget for consideration by NERC and FERC.

Statutory Functional Scope

The FRCC carries out its delegated functions as outlined and detailed in Exhibits A, B, C, D and E of the delegation agreement. NERC and the Regional Entities will continue to work under the existing regulatory framework governing the establishment and enforcement of reliability standards for the BPS. The existing delegation agreements expire on January 1, 2016. NERC and the Regional Entities will work collaboratively to identify any necessary revisions to the delegation agreements as renewal efforts begin in 2014 and continue through 2015. The delegated functions as defined by the NERC Rules of Procedures include:

- Reliability Standards Development (“RSD”) - Section 300
- Compliance Monitoring and Enforcement (“CMEP”) - Section 400
- Organization Registration and Certification - Section 500 (This program budget has been combined with the Compliance Monitoring and Enforcement function budget.)
- Reliability Assessment and Performance Analysis (“RA”) - Section 800 (including necessary data gathering activities and Events Analysis)
- Training, Education and Operator Certification (“TE”) - Section 900
- Situation Awareness and Infrastructure Security (“SA”) - Section 1000

2015 Key Assumptions

The NERC and Regional Entity business plans and budgets reflect a set of common assumptions (see Exhibit A of the 2015 NERC Business Plan and Budget) developed jointly by NERC and the Regional Entities as part of the annual business plan and budget process. The significant assumptions underlying FRCC's 2015 business plan include:

- NERC will provide oversight of the Regional Entities performance of their delegated functions to ensure that the delegated responsibilities are adequately performed. The Regional Entities are expected to continue to have the primary responsibility for day-to-day operations and interactions with Registered Entities. NERC and the Regional Entities will also work to refine and revise procedures and processes to eliminate duplication, increase operational efficiencies, to enhance ERO-wide consistency and to achieve measurable reliability outcomes, consistent with their respective roles and responsibilities.
- Cost pressures may affect some stakeholder resources available to participate in NERC and Regional Entity activities. However, the assumption of continued industry participation in support of key program areas such as event analysis, reliability assessments and standards development is included in this business plan and budget. NERC and the Regional Entities will evaluate projected initiatives involving stakeholder participation to determine the availability and adequacy of industry resources to support these undertakings.
- The effective date for compliance with the CIP Version 5 standards will be April 1, 2016 for High and Medium impact assets and April 1, 2017 for Low impact assets. The transition between V3 to V5 will be a mission critical activity in 2015. The Regional Entities must plan to support the ongoing CIP v5 transition plans and should anticipate an expansion in the number of Registered Entities that require guidance during 2015. For most CIP activities, the resource demands are expected to increase throughout the planning period.
- The implementation of a BES exception process will require the allocation of resource requirements from several FRCC departments. Resources are expected to manage the process execution, technical validation of the definition and exception requests, and requests for registration and certification reviews. However, the long-term impact cannot be fully assessed at this time as the resource requirements will be based on the number and complexity of exception and registration requests received.
- NERC will continue to budget and incur costs to operate and maintain the software applications and systems known as Situational Awareness for FERC, NERC, and Regional Entities ("SAFNR"). Additional resource investments may be required to enhance the capabilities of SAFNR throughout the planning period; however, there will be no increased cost to the Regional Entities. NERC will continue to review the appropriateness of continued funding of existing reliability tools, with any proposed changes thereto subject to review and input from the Regional Entities, appropriate NERC Committees and working groups, and other affected parties.
- NERC and the Regional Entities will collaboratively work to build and develop ERO Enterprise applications supporting both NERC and Regional Entity operations that will maximize efficiency of technology hardware, consistency of application, resources and data security. These will be managed by a single Project Management Office (PMO) at

NERC. ERO Enterprise funding for the development and maintenance of Enterprise applications will be subject to the budget and funding limits set forth in the approved Business Plan and Budget. The FRCC will also continue to fund applications and systems to satisfy our regional business needs.

- Improved disaster recovery mechanisms and improved IT security procedures will increase capital and operating costs at the Regional Entities.

2015 Goals and Key Deliverables (Regional Entity Division)

- Support NERC's goals that will continue to improve the quality and content of Reliability Standards, including a cost effectiveness assessment of proposed standards.
- Continue to encourage stakeholder awareness and participation in the NERC standards development process through educational outreach efforts and participation in Standard Drafting Teams, the NERC Standards Committee and related subcommittees. Support NERC's efforts to develop the bulk power system risk profile and assess standards compared to the profile and address the most important risk gaps.
- Work with NERC and the other Regional Entities, to continue refinement, improvement and prioritization of risk based compliance monitoring efforts. Continue support of the Reliability Assurance Initiative, including providing the necessary training for compliance and enforcement staff.
- Work with NERC and the other Regional Entities to register entities commensurate with risk to the Bulk Power System (BPS). Support the implementation of any changes resulting from the registration review that began in 2014.
- Continue the implementation of the BES exception process which began mid-2014.
- Work with NERC and the other Regional Entities to hold the industry accountable for violations that create serious risk to the BPS. Improve consistency, quality, and timeliness of compliance monitoring and enforcement activities while utilizing more enforcement discretion for those violations that have minimal impact to the reliability of the BES.
- Continue to be a strong enforcement authority that is independent, without conflict of interest, objective and fair, using enforcement discretion when warranted and imposing penalties and sanctions that are commensurate with risk.
- Support an ERO culture of reliability excellence. Work with NERC and the other Regional Entities to facilitate a learning environment throughout the industry. Work to improve event causal analysis, communication of lessons learned, tracking of recommendations, and implementation of best practices.
- Continue to improve consistency, quality, timeliness and cost effectiveness of NERC and Regional Entity data collection, analysis systems and capabilities through process improvements and more effective coordination and collaboration.
- Support NERC's efforts to move toward and implement an outcome based approach in Reliability Assessments to achieve measureable improvements in the BES reliability. Risks will be identified and prioritized based on reliability impacts, cost/practicality assessments, projected resources, and emerging issues.

- Work closely with the other Regional Entities and NERC to ensure that the delegated functions are implemented consistently and rationally and to promote the success of the ERO as a collaborative enterprise. Perform delegated functions with independence, without conflict of interest, with objectivity and fairness and with increased transparency.
- Support the ERO in addressing and mitigating reliability risks. Work with NERC and the other Regional Entities and the industry to effectively address security vulnerabilities and threats. During crisis situations, support ERO sharing of information among industry, Regions, and government.

2015 Overview of Cost Impacts

The FRCC's proposed 2015 Regional Entity budgeted expenses and net fixed assets (see page 12) is $7,162,233, which is a $368,944 or 5.4% increase over the 2014 budget. The major drivers of this increase are the net effect of:

- Increased compliance software maintenance and development to reflect current costs from the vendor, implement changes necessary to implement RAI and for needed portal efficiencies and program improvements.
- Increased allocated General and Administrative expense due to implementing succession plans for key functions involving a temporary increase of 1 FTE for training to succeed an anticipated retirement
- Budgeted 3% annual merit increase.
- Reduced Medical Benefits expense based on actual experience.
- Decrease in legal fees due to in house legal support.

Statutory Accounting Methodology

The FRCC, in order to be consistent with all the regions, has modified its accounting reporting as follows:

- ERO assessments needed to fund working capital are reflected in the General and Administrative Program within Administrative Services.
- The majority of the Operating Expenses are accounted for within their related department's budget. If an expense cannot be specifically linked to a department, it is included in the General and Administrative Program, within Administrative Services.
- All expenses for the Administrative Services Programs, referred to as indirect expenses for 2015, are allocated to the delegated program areas by their respective FTEs and are shown on one line of each delegated program area Statement of Activities as "Indirect Expenses".
- Capital expenditures are broken out as fixed assets at the end of each statement of activities rather than being included in their related lines in the operating expenses section.
- Expenses include depreciation, but since funding is not being requested for depreciation expense, it has been deducted from the funding requirement for capital expenditures.

2015 Key Deliverables by Program

In 2015, FRCC will achieve the following key deliverables:

- **Reliability Standards Development** — Continue support of NERC in its efforts to improve the quality and content of Reliability Standards and to support NERC's implementation of a cost effectiveness assessment of proposed standards. Support NERC in its efforts to evaluate significant BPS events (Category 3 and above) to identify gaps in standards and address any gaps identified. Support NERCs plan to develop or modify the Reliability Standard Audit Worksheets (RSAWs) by the time a Reliability Standard is balloted. Develop regional reliability standards as needed to support NERC's prioritized work plan and provide increased coordination of standards development activities.
- **Compliance Monitoring and Enforcement** — Continue to support the development and implementation of the Reliability Assurance Initiative, including implementation of the ERO Auditor Handbook and Manual and implementation of the common methodology to assess risk and determine the scope of monitoring activities. Ensure timely and thorough mitigation of all violations of mandatory reliability standards with the most focus on those violations that create serious risk to the Bulk Electric System. Promote a strong culture of compliance excellence, reliability improvement, and risk-based methods among all registered entities in the FRCC Region.
- **Event Analysis** — Continue to support improved reliability through reporting and categorizing of system events and security incidents. Consistently analyze events and system performance for sequence, cause, and remediation to identify reliability risks and trend, and to inform standards, compliance, and other programs. Work to ensure that the industry is well informed of system events, emerging trends, risk analysis, lessons learned and expected actions. Provide timely written lessons learned and recommendations from events and provide all BPS system event reports to the industry through a secure portal.
- **Critical Infrastructure Protection and Cyber Security** — Facilitate, educate and support Registered Entities in complying with CIP reliability standards and responding to cyber security alerts. Facilitate a proactive action plan by industry that demonstrates effective identification and mitigation of security risks, including safeguarding of assets, developing mitigation alternatives, and preparing and testing recovery plans. Support the transition from CIP V3 to V5 including provision of necessary training to FRCC staff, and providing education and outreach to stakeholders to ensure their understanding of the technical aspects of the requirements.
- **Reliability Assessments** — Provide annual, seasonal, probabilistic, scenario and special reliability assessments of the reliability of the FRCC BES in accordance with definitions and requirements. Work with NERC and the other Regional Entities to develop and demonstrate BES performance metrics for the purpose of analyzing and trending reliability improvements and benefits, as well as risk/severity based methods. Work with NERC and the other Regional Entities to support the exception process for the evaluation of Exception Requests as permitted by the revised definition of the BES and the NERC Rules of Procedure.

- **Situation Awareness** — Continue to support NERC in maintaining and enhancing the current and future situation awareness capabilities that include near real-time information and communications protocols that meet the needs of FERC, NERC, and applicable Registered Entities. Issue and track security recommendation to protect the Bulk Power System. Share information learned in Situation Awareness with the Events Analysis program to develop relevant lessons learned.
- **Effective Financial Controls** — Continue to provide rigorous cost controls and efficient management of resources to remain an efficient provider of ERO delegated functions.

Long Term Business Planning

NERC and the Regional Entities continue to work together to improve the overall ERO business planning and budgeting process, including long-term resource and financial planning. The 2015 Business Plan and Budget process builds upon the improvements made over the past several years including face-to-face meetings, conference calls and exchanges of documentation among senior management and staff of NERC and Regional Entities regarding budget assumptions, resource requirements, and opportunities to improve operational efficiency and effectiveness.

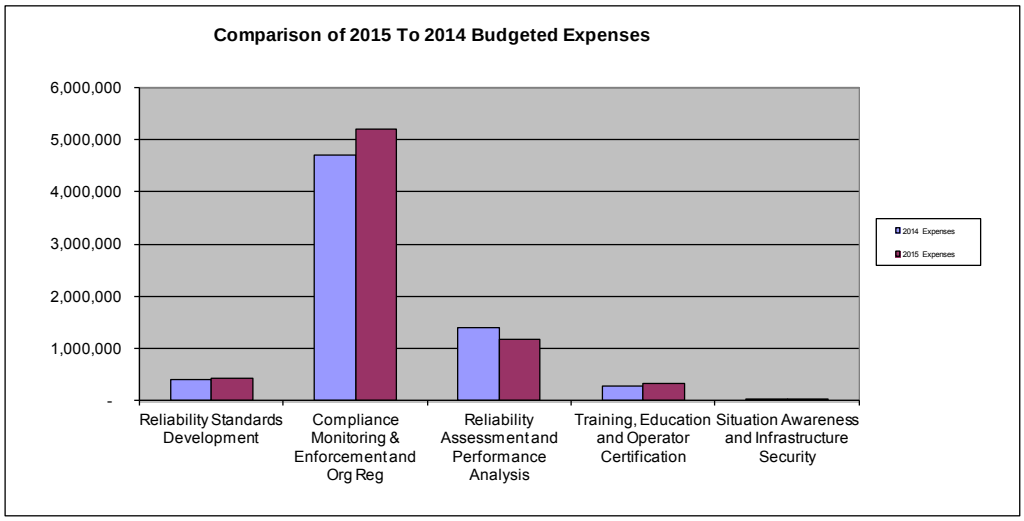
Throughout 2013 and into early 2014, NERC and the Regional Entities worked to develop a common operating model with defined roles and responsibilities that align with business planning goals, objectives, metrics and assumptions for the ERO Enterprise. As part of updating the ERO Strategic Plan, NERC and the Regional Entities consolidated five goals within the existing focus areas of standards; compliance, registration and certification; risks to reliability; and coordination and collaboration. A number of objectives and deliverables expected of the ERO Enterprise were identified. NERC and the Regional Entities added four overarching performance metrics to assess the overall effectiveness of the ERO Enterprise in addressing risk to the Bulk Power System and improving reliability. With the ERO Strategic Plan, the developed performance metrics, and the set of common assumptions, the 2015 Business Plan and Budgets of NERC and the Regional Entities will support and complement each other. The Shared Business Plan and Budget Assumptions (Exhibit A of the 2015 NERC Business Plan and Budget) incorporate assumptions affecting resource demands through the 2017 planning horizon.

NERC and the Regional Entities continue to work together to develop, strengthen and improve an integrated long term ERO business plan and budget that leverages and builds on the combined strengths and resources of NERC and the Regional Entities to improve the overall effectiveness and efficiency of ERO operations and improve the reliability of the BES of North America.

Detailed Business Plans and Budgets by Program

Details of the planning, operation, review, and adjustment for each program area are included in Section A. The corresponding budget details are shown in Section B. Below is an overall summary of the changes by program area.

Funding by Program	Budget 2014	Projection 2014	Budget 2015	Variance 2015 Budget v 2014 Budget	Variance %
Reliability Standards Development	409,591	409,592	423,143	13,552	3.3%
Compliance Monitoring & Enforcement and Org Reg	4,702,351	4,702,351	5,211,874	509,523	10.8%
Reliability Assessment and Performance Analysis	1,391,299	1,391,299	1,182,409	(208,890)	-15.0%
Training, Education and Operator Certification	272,310	297,679	321,525	49,215	18.1%
Situation Awareness and Infrastructure Security	19,380	19,380	23,281	3,901	20.1%
Total Funding All Sources	6,794,932	6,820,302	7,162,233	367,301	5.4%



This graphical representation does not include an allocation of working capital requirements among the Program Areas.

Reliability Standards Development Program

Reliability Standards Development Program (in whole dollars)	2014 Budget	2015 Budget	Increase (Decrease)
Total FTEs	1.74	1.71	(0.03)
Direct Expenses	$ 369,582	$ 370,389	$ 807
Indirect Expenses	$ 40,021	$ 49,808	$ 9,787
Inc(Dec) in Fixed Assets	$ (12)	$ 2,946	$ 2,958
Total Funding Requirement	$ 409,591	$ 423,143	$ 13,552

Program Scope and Functional Description

The FRCC may develop, through the FRCC Regional Reliability Standards Development Process, separate Regional Reliability Standards that are specific to the FRCC Region and go beyond, add detail to, or implement NERC Reliability Standards. FRCC Regional Reliability Standards will not be inconsistent with or less stringent than NERC Reliability Standards.

The FRCC Regional Reliability Standards Development Process is an open, balanced and fair process that ensures all interested and affected parties have an opportunity to participate in the development of FRCC Regional Reliability Standards for the FRCC Region.

While the FRCC may develop separate Regional Reliability Standards, the preference is to support the development of continent wide reliability standards. The FRCC staff follows and participates in NERC's Standards Development Process. This includes FRCC standards staff participation in the NERC Standards Committee, the NERC Standards Committee Process Subcommittee, and NERC standards drafting teams as appropriate. In addition, the FRCC supports and encourages stakeholder awareness and participation in the NERC standards development process through educational outreach efforts at workshops, webinars and committee meetings.

2015 Key Assumptions

The key assumptions included in the Shared Business Plan and Budget Assumptions, Exhibit A, affecting the Reliability Standards Program include:

1. NERC will continue to focus on reaching a steady state, and improving quality and content of Reliability Standards. This will require the allocation of resources from NERC and the Regional Entities. The implementation of a cost effectiveness assessment of proposed standards and other reform activities are expected to require additional resources however the impacts are not fully known at this time.

2. The number of projects contained in NERC's Reliability Standards Development Plan is expected to increase over the planning period reflecting the transformation of standards to

a steady-state. However, the scope of these projects is expected to narrow as regulatory obligations in the form of directives and five-year reviews, Paragraph 81, and other recommendations are addressed.

3. The focus on improving the quality and content of standards will likely increase the demand on NERC, the Regional Entities and stakeholders to review and comment on proposed revisions to standards, support regulatory filings and support successful implementation of new standards as they become effective.

4. The number of interpretation and guidance requests is expected to remain low, reflecting the initiative to reach steady state and implementation of the Reliability Assurance Initiative (RAI).

5. NERC and the Regional Entities must provide sufficient resources to develop or modify the RSAWs by the time a Standard is balloted which is required to support the Reliability Standards Development Plan.

6. Activity associated with FRCC Regional Reliability Standards development is expected to remain low. FRCC will continue to keep several regional standards development projects on hold while NERC development, on standards addressing the same reliability issues, proceeds to a conclusion.

7. NERC and the Regional Entities will continue to provide communication and outreach opportunities, project level communications and will continue education and training for new or revised standards.

2015 Goals and Key Deliverables

The Standards Program objectives for 2015 are outlined below:

- Continue to follow and participate in NERC's Standards Development Process. This includes FRCC standards staff participation in the NERC Standards Committee, the NERC Standards Committee Process Subcommittee and on NERC standards drafting teams as appropriate.
- Continue to encourage stakeholder awareness and participation in the NERC standards development process.
- Continue to monitor the need for development of Regional Reliability Standards that are required by NERC Reliability Standards or are needed for reliability within the FRCC region.
- Assist the FRCC members and registered entities in following and understanding NERC standards development activities by increasing education and outreach programs to include:
    - Development and presentation at Standards Workshops, Webinars and committee meetings to address continent-wide and regional reliability issues.
    - Develop and deliver project level communications, education and training for new or revised reliability standards.
    - Review, analyze and identify potential Regional concerns associated with NERC Reliability Standards under development.

- Establish a stronger relationship with the FRCC Regional Entity Committee to fully vet and identify any concerns and assist in articulating the concern to standard drafting teams as appropriate.

Funding Sources and Requirements — Explanation of Increase (Decrease)

- **Personnel Expenses** – The slight decrease in the number of FTEs is due to the expectation of more time being spent in Reliability Assessment program implementing the NERC BES Definition and the BES Definition Exception Process and the expectation of more time being spent in review of Registered Entity registration. The increase in personnel expenses is due to budgeted annual merit increases partially offset by a reduction in Medical Benefit expense.
- **Meeting Expenses** - Less travel is expected in 2015 with the BES Standards Writing Project being complete.
- **Operating Expenses** – The decrease in Operating Expenses is primarily the anticipated decrease in legal fees partially offset by increased contract costs included in Contracts, Consultants and Software for a security improvement initiative.
- **Indirect Expenses -** The increase in Indirect Expense is the result of a succession plan for expected future retirements.
- **Fixed Assets –** The increase in Fixed Assets is due to increased physical and cyber security measures and planned replacement of old computer equipment.

Reliability Standards Development Program

Funding sources and related expenses for the reliability standards section of the 2015 business plan are shown in the table below.

Total Funding Requirement	$ 4,702,351	$ 5,211,874	$ 509,523

Program Scope and Functional Description

Monitoring, evaluating, investigating and enforcing compliance with Reliability Standards by owners, operators and users of the BES, as well as the development and adoption of the reliability standards themselves, are at the core of FRCC's mission. Reliable operation of the BES is in the public interest, because it will benefit all owners, operators and users of the BES, and, ultimately, all users and consumers of electric power in the FRCC Region.

Compliance and Enforcement activities are carried out by the FRCC compliance staff and are independent of all users, owners and operators of the BES. Compliance activities are governed by the delegation agreement between the North American Electric Reliability Corporation (NERC) and the FRCC. Through a risk-based program of monitoring, evaluating, enforcing, and if necessary, the imposition of penalties and sanctions for noncompliance with Reliability Standards, FRCC will strive to increase the level of reliable operation of the BES in the FRCC Region.

The NERC Compliance Monitoring and Enforcement Program (CMEP) is the program used by the FRCC to monitor, assess, and enforce compliance with Reliability Standards within the FRCC Region. The FRCC compliance staff works with the compliance staff of the other Regional Entities and with NERC to achieve as much consistency and transparency as possible in the implementation of the CMEP. The development and implementation of the Reliability Assurance Initiative (RAI) throughout 2014 and into early 2015 provides the foundation and guidance for NERC and the Regional Entities in moving to a risk-based environment aimed at focusing on those risks that are most important to the reliability of the BES.

2015 Highlights Compliance Monitoring and Enforcement Processes

In 2015 the FRCC will monitor, assess and enforce compliance with Reliability Standards using seven (7) monitoring processes (Compliance Audits, Self-Certifications, Spot Checking, Compliance Investigations, Self-Reporting, Periodic Data Submittals, and Complaints) to collect information in order to make assessments of compliance to Reliability Standards. However as risk based monitoring activities increase, strong consideration will be given by NERC and the

Regions to modify the current three (3) and six (6) year audit cycles for registered entities. The rigor, scope, depth and recurrence of audits and spot checks will be assessed by the reliability risk and not a predetermined schedule.

Registration and Certification

The FRCC has registered the organizations responsible for complying with Reliability Standards in accordance with Section 500 of the NERC Rules of Procedure. Currently there are 69 Registered Entities with a total of 244 registered functions. Maintaining a complete and accurate registration database will be an ongoing activity. The FRCC will develop, maintain and provide to NERC accurate information on entity registration within the FRCC Region with updates as changes occur. NERC and the Regional Entities began a review of the organization registration process in 2014 which may result in changes to the registration process that could begin in 2015. While expectations of increased activity are associated with the implementation of the BES Exception Process mid-2014, there is some uncertainty in the amount of activity associated with registration and certification of registered entities. The FRCC may consider the reallocation of existing resources should the need arise for additional support in this area.

Enforcement and Mitigation

Enforcement actions taken by FRCC may include the imposition of remedial action directives, sanctions and penalties which are applied per the NERC Rules of Procedure. Mitigation of violations of the approved Reliability Standards remains central to the FRCC's reliability focus. Registered Entities found in violation of a Reliability Standard will be required to fully mitigate the violation regardless of any enforcement actions taken. The year 2014 continued to bring advances in enforcement discretion of violations with minimal impact to the reliability of the BES. This additional discretion will continue in 2015 through the development and implementation of the NERC Reliability Assurance Initiative allowing for more focus being placed on those violations that pose a more serious risk to the reliability of the BES.

2015 Key Assumptions

- Audits are expected to continue under the current three and six year schedules until NERC and the Regional Entities transition to a more risk-based approach to compliance monitoring as developed in the Reliability Assurance Initiative (RAI).
- Reliability risk profiles for all Registered Entities will be developed and audit scopes will be tailored to the risk profiles which may increase the depth and complexity of some audits and decrease the depth and complexity of others. The consistent approach to audit scope methodology being developed as part of the RAI in 2014 is expected to be used in early 2015.
- Integration of the assessment of Registered Entity internal controls programs as part of the compliance monitoring program will allow NERC and the Regional Entities to further prioritize risk based compliance monitoring activities. Greater emphasis on internal controls provides positive incentives for industry to demonstrate effective management of compliance programs that are focused on reliability, as well as place downward pressure on compliance resource requirements for industry, NERC and the Regional Entities.
- The use of spot checks and self-certifications is expected to increase as risk-based monitoring is implemented, but that should have little effect on FRCC's overall resource requirements. The implementation of the Reliability Assurance Initiative and the

expansion of the Find Fix and Track (FFT) process will require resources to complete the design and to begin implementing RAI for both compliance and enforcement.

- The approval of CIP V5 is anticipated to significantly increase the compliance monitoring activities. The effective date for compliance with the CIP Version 5 standards will be April 1, 2016 for High and Medium impact assets and April 1, 2017 for Low impact assets. The transition between V3 to V5 will be a mission critical activity for the ERO Enterprise in 2015. FRCC plans to support the ongoing CIP v5 transition plans and anticipates an expansion in the number of Registered Entities that require guidance during 2015. Additional training requirements will be necessary to support the transition and will affect the annual training commitments. For most CIP activities, the resource demands are expected to increase throughout the planning period.
- The number of non-CIP violations is expected to decrease as most registered entities have been audited and the standards and RSAWs have matured.
- The Technical Feasibility Exception (TFE) program will continue however the processing per the revised Appendix 4D, of the NERC Rules of Procedure, is expected to drive a less onerous process for TFE reporting and reviewing.
- Applications planned to be centralized, such as a common audit management tool, at NERC to improve consistency and efficiency, will require Regional Entity support and resources for development and implementation. A significant multiyear investment will be required to develop and implement the system which will be funded by NERC.
- NERC and the Regional Entities are expected to utilize consistent audit practices and focus on higher target reliability risks to increase efficiency and mitigate overall compliance costs.
- NERC and the Regional Entities will provide sufficient resources to develop or modify the RSAWs by the time a Standard is balloted which is required to support the Reliability Standards Development Plan.
- NERC and the Regional Entities must plan to support the training requirements necessary to meet the criteria set forth by the ERO Auditor Manual and Handbook and the Compliance Auditor Capabilities and Competency Guide. Regional Entities will be expected to provide training documents and other related compliance guidance to compliance staff, review Auditor job descriptions and properly reflect the guidance provided in the Compliance Auditor Capabilities and Competency Guide, perform a gap analysis to identify both individual training needs and organizational compliance resource needs, provide an assessment process to evaluate audit team competencies and capability needs, and put a training program in place that addresses initial and continuing training for capability and competency development.
- NERC will continue to budget and incur the cost of a unified learning management system (LMS) for the regional audit staff and work with the Regional Entities to consolidate training resources and promote better coordination, planning, delivery and management of training efforts across the ERO.
- Additional resources will be required, and increases to NERC and Regional Entity training budgets are expected to support certain training initiatives of the RAI. Regional Entities are expected to allocate resources to meet the training requirements for the compliance and enforcement staff that are associated with the implementation of the RAI.

- Maintaining budgeted qualified compliance and enforcement staff will continue to be a challenge driven by a limited pool of qualified people and an aging work force. Investments in training less experienced personnel are likely to increase.

2015 Goals and Key Deliverables

The Compliance Monitoring and Enforcement Program objectives for 2015 are outlined below:

- Continue to assess and update entity registration and certification. The FRCC will support the implementation of the changes resulting from the registration review that began in 2014.
- Support the development and implementation of NERC's Reliability Assurance Initiative, including providing the necessary training for compliance and enforcement staff. Enforce compliance with mandatory reliability standards in accordance with the CMEP and ROP while improving consistency, quality, timeliness and utilizing more enforcement discretion for those violations that have minimal impact to the reliability of the BES.
- Develop and maintain reliability risk profiles of all registered entities in the FRCC Region for use in the continued transition to a more risk-based compliance monitoring.
- Implement the ERO Auditor Handbook and Manual and continue to work with NERC Compliance staff and other Regional Entity Compliance staff to modify compliance procedures to increase consistency in the determination of violations and penalties.
- Implement the common methodology developed in 2014 to assess risk and determine scope of monitoring activities. Conduct periodic audits, spot checks, self-certifications, and compliance investigations as required by the NERC Compliance Monitoring and Enforcement Program.
- Continue to promote the self-identification of non-compliance by Registered Entities and utilize increased discretion as appropriate. Ensure timely and thorough mitigation of all violations of mandatory reliability standards.
- Promote a culture of compliance excellence through education, transparency, information sharing and incentives.

Funding Sources and Requirements — Explanation of Increase (Decrease)

- **Personnel Expenses** – The increase in FTEs and personnel expense can be primarily attributed to expected increased effort in the Organization Registration Program and the effect of having an addition to staff budgeted for May of 2014 for a full year in 2015. The increase in personnel expense is also due to a budgeted annual merit increase. These increases are partially offset by reduced expected benefit expenses based from medical expenses being less than anticipated in the 2014 budget.
- **Meeting Expenses** – Increased travel is expected in 2015 to meet expectations of NERC for meetings to ensure consistent implementation of the Reliability Assurance Initiative (RAI), RAI associated updates to the Auditor Handbook, and to support ERO IT development projects.
- **Operating Expenses** – Anticipated increased cost of the Compliance Software to implement RAI and NERC business rules, increased contract costs included in Contracts,

Consultants and Software for a security improvement initiative and the increased depreciation effect of the additions of same in 2014 and 2015 partially offset by an anticipated decrease in legal fees.

- **Indirect Expenses -** The increase in Indirect Expense is the result of a succession plan for expected future retirements.
- **Fixed Assets –** The increase in Fixed Assets is due to increased cost in enhancements of the Compliance Software, increased physical and cyber security measures and planned replacement of old computer equipment.

Compliance Monitoring and Enforcement Program and Organization Registration and Certification Program

Funding sources and related expenses for the compliance enforcement and organization registration and certification section of the 2015 business plan are shown in the table below.

Statement of Activities, Fixed Assets Expenditures and Change in Working Capital 2014 Budget & Projection, and 2015 Budget

Compliance Monitoring & Enforcement and Organization Registration & Certification

Total Funding Requirement	$ 1,391,299	$ 1,182,409	$ (208,890)

Program Scope and Functional Description

The FRCC will assess the reliability of the BES in the FRCC region and will continue to ensure that the planned system is robust, reliable and stable. The FRCC will participate in Event Analysis Teams to analyze any disturbances that may occur within the FRCC region.

The FRCC performs transmission reliability studies in order to provide an assessment to NERC for its periodic NERC Reliability Assessments. These studies evaluate regional and inter-regional facilities. The FRCC prepares a minimum of three reliability assessments each year and a probabilistic assessment every other year in support of NERC Reliability Assessments:

- A 20 year long-term reliability assessment report
- A summer assessment report
- A winter assessment report
- A probabilistic long-term reliability assessment (biennial)

These reports evaluate electricity demand, the adequacy of supply and its deliverability, fuel reliability and the adequacy of the transmission system within the FRCC. The FRCC will prepare special reliability assessment reports as conditions warrant.

The FRCC Reliability Assessment and Performance Analysis Program (RA) will support NERC's efforts to move toward and implement an outcome based approach in Reliability Assessments to achieve measureable improvements in the BES reliability. Risks will be identified and prioritized based on reliability impacts, cost/practicality of assessments, projected resources, and emerging issues. The FRCC will support NERC's efforts for collection and analysis of data, as well as support any of NERC's special reliability assessments and the efforts related to the collection of data via the Generation Availability Data System (GADS), Transmission Availability Data System (TADS) and Demand Response Availability Data System (DADS). In addition, the FRCC will work with NERC to gather data and/or complete

analysis in support of U.S. Federal initiatives, including high impact/low frequency events such as geomagnetic disturbances, system frequency response analysis, climate change and other environmental regulations.

The FRCC will support a new ERO initiative focused on identifying essential reliability services and providing the industry with technical papers and guidelines as appropriate.

The FRCC actively participates in the Eastern Interconnection Reliability Assessment Group (ERAG) which is responsible for the Eastern Interconnection transmission models and inter-regional studies. The FRCC will support NERC's and ERAG's efforts to improve the data quality of the Eastern Interconnection (EI) transmission models and validate the performance of these models compared to system events. The FRCC is an active participant on the NERC Reliability Assessment Subcommittee which is responsible for performing an independent review of reliability assessments.

The FRCC Events Analysis Program will analyze or support the analysis of significant events and system performance that impact the BES within the FRCC Region. The FRCC will facilitate consistent identification of sequence, root cause and remediation to identify reliability risks and trends, and lessons learned. FRCC's analysis will result in the identification of any gaps in standards, compliance effectiveness, registration and risk controls effectiveness. The FRCC will provide lessons learned and recommendations from events and identified risks.

The FRCC will support NERC to improve event causal analysis, communication of lessons learned, tracking of recommendations, and implementation of best practices. The FRCC will support NERC to continue to improve consistency, quality, timeliness and cost effectiveness of NERC and Regional Entity data collection, analysis systems and capabilities through process improvements and more effective coordination and collaboration.

2015 Key Assumptions

- NERC will continue to incrementally improve definitions, refine data reporting requirements for Registered Entities and review adequate level of reliability related metrics used in reliability assessments.
- NERC and Regional Entities will be requested to gather data or perform analysis in support of federal initiatives related to critical infrastructure protection including high impact/low frequency, climate change, environmental regulations, and/or renewable energy initiatives. Generation Availability Data System (GADS), Spare Equipment Database (SED) and Demand Response Data System (DADS) collection will continue to be mandatory in 2015.
- NERC and the Regional Entities are expected to provide independent reviews of assessments to assure a high level of technical rigor.
- Implementation of the BES exception process will require the re-allocation of resources from several NERC and Regional Entity departments. The resources will be expected to manage the process execution, technical validation of the definition and exception requests, self-determined notification submittals and requests for registration and certification review. The resource impacts are not fully known at this time, but are expected to be driven by the number and complexity of exception requests, self-determined notification submittals and registration requests received.

- NERC has established an Essential Reliability Services Task Force that may have an impact on resource requirements in order to support the work of this task force which is expected to have weekly conference calls and two or three in person meetings.
- NERC will sustain a Reliability Assessment and Performance Analysis team with representatives from the Regional Entities to:
    - Develop and implement improved enterprise-based data collection and analysis systems and capabilities
    - Support the integration of RAPA information systems for modeling and data requirements and achieve timelines for delivering high quality reports
    - Develop, verify and validate quality reliability assessment and analyses model and data quality characteristics
    - Address impacts of new technologies, changing resource or demand resource composition, and environmental related regulations or legislation
    - Support the compilation of long-term sustainable Eastern Interconnection models
    - Provide technical resources and expertise to perform analyses as needed for standards development, compliance and enforcement activities
    - Support quality analysis and overall assessment of the geomagnetic disturbance (GMD) vulnerability, planning guides and planning standards.
- The number of "qualified system events" as defined in the NERC Events Analysis Process, is expected to remain steady (approximately 10 per month across North America). Greater collaboration with the region and the registered entity is leading to more detailed analysis and supporting the identification of reliability issues and challenges.

2015 Goals and Key Deliverables

The Reliability Assessment and Performance Analysis Objectives for 2015 are outlined below:

- Perform a reliability assessment of the FRCC Region to determine if the planned resources and proposed transmission expansion plans will meet the needs of the projected demand throughout the planning horizon.
- Support NERC in preparing its reliability assessment reports.
- Support the implementation of the BES exception process. This will include providing a technical review of exception requests that are submitted by the registered entities.
- Support the work of the newly created Essential Reliability Services Task Force by assigning an FRCC Staff person to support this NERC initiative.
- Evaluate, track and assess severity/risk and reliability metrics and risk indices – including providing support to update reliability metrics and risk indices.
- Support data gathering and reporting efforts for the Generating Availability Data System (GADS), the Transmission Availability Data System (TADS), Spare Equipment Database (SED) and Demand Response Availability Data System (DADS).

- Strengthen data collection and validation processes by designing, creating, testing and implementing data checking systems to accommodate the increasing amount of data NERC collects for its long-term, seasonal, operational, scenarios and special reliability assessments along with the databases supporting reliability performance assessments.
- Review and/or analyze significant events that impact the FRCC BES and work with NERC to identify the root causes of events that may be precursors of potentially more serious events.
- Assess past reliability performance for potential lessons learned.
- Maintain relationships with NERC, regulatory and governmental organizations involved with BES reliability (e.g., Florida Public Service Commission (FPSC), Department of Energy (DOE), FERC, Energy Information Administration (EIA), etc.).
- Maintain a databank of power flow, short circuit and dynamic models to use in planning and evaluating future systems and current operating conditions.
- Work with ERAG Multi-Area Modeling Working Group (MMWG) to develop Eastern Interconnection steady-state and dynamics models and develop model validation processes.
- Conduct Loss of Load Probability and the Scenario Analysis studies as needed.

Funding Sources and Requirements — Explanation of Increase (Decrease)

- **Personnel Expenses** – In 2014, the committee structure was streamlined to reduce the amount of time that staff spent preparing for meetings and participating in meetings. Previously, the FRCC conducted business associated with Reliability Assessments in both the Operating Committee and the Planning Committee. This approach resulted in staff members attending multiple meetings each month to cover the same topics. With the revised structure, all Regional Entity activities will be conducted in one forum; the new Regional Entity Committee and Compliance Forum (RECCF). In addition to consolidating the Regional Entity activities under the RECCF, it was also determined that the RECCF will not need to meet monthly, but will meet face-to-face six times in 2015. This new construct will allow FRCC staff to complete the Reliability Assessment deliverables much more efficiently and drives the decrease to FTEs and personnel expenses.
- **Meeting Expenses** – With the formation of the RECCF, there will be fewer meetings required to complete the RA deliverables decreasing Meeting Expenses.
- **Operating Expenses** –The decrease is due to an anticipated decrease in legal fees and a reduction in certain consultant expenses which have been consistently over-budgeted.
- **Indirect Expenses -** The increase in Indirect Expense is the result of a succession plan for expected future retirements.
- **Fixed Assets –** The increase in Fixed Assets is due to increased physical and cyber security measures and planned replacement of old computer equipment.

Reliability Assessment and Performance Analysis Program

Funding sources and related expenses for the reliability assessment and performance analysis section of the 2015 business plan are shown in the table below.

Statement of Activities, Fixed Assets Expenditures and Change in Working Capital 2014 Budget & Projection, and 2015 Budget

Program Scope and Functional Description

The FRCC is a NERC-approved Continuing Education (CE) Provider. The FRCC System Operator Subcommittee (SOS) develops and delivers training in which FRCC grants NERC CE hours to those individuals who successfully complete a course. FRCC will utilize the NERC database to accommodate the recordkeeping requirements for the continuing education program. Maintaining the reliability of the BES requires informed and trained personnel. The FRCC supports training activities through its staff and its System Operator Subcommittee which reports to the FRCC Operating Committee.

The FRCC provides educational workshops and web based seminars to improve Registered Entity understanding of the FRCC CMEP, NERC Standards Development and CIP topics and trends. These outreach efforts are aimed at improving the effectiveness, understanding of and adherence to NERC reliability initiatives. The workshops also improve the working relationships between the FRCC Regional Entity program areas and the Registered Entities within the FRCC region.

System Operator Certification Program

The FRCC SOS identifies and manages annual training activities for the FRCC System Operators and provides information to FRCC members regarding the NERC training standards and any issues they may have related to system operators obtaining/retaining required NERC Certification.

The training and education program activities are carried out by FRCC's professional/technical staff and SOS members possessing the appropriate technical knowledge and competencies. In addition, vendors that specialize in System Operator training are also used. Providing the FRCC training and education programs helps to achieve a high level of knowledge and competence among the operating personnel in the performance of their reliability-related functions.

Compliance Workshops

Compliance workshops will be held in the spring and fall of 2015 consisting of three (3) sessions each. These workshops will be aimed at providing updates to the Registered Entities on

compliance procedures, instructions on changes to FRCC compliance website, lessons learned for previous violations and providing sufficient and appropriate evidence in a compliance audit. The entities will also be apprised of changes in rules and expectations of NERC and FERC with regard to the CMEP. The effect on compliance monitoring as a result of on-going changes in the NERC and Regional Reliability Standards will also be addressed.

In addition, there will be at least one (1) CIP Compliance Workshop that will address technical aspects of the CIP Reliability Standards, including, providing quality evidence, lessons learned and compliance processes specific to the monitoring and enforcement of the CIP standards. In addition, particular focus will be made on the transition from CIP V3 to CIP V5 standards.

In addition to the face to face venues, in 2015 FRCC compliance staff projects holding at least three (3) webinars (two sessions each) that will address specific topics that may be identified by registered entities or by emerging trends within the FRCC.

Standards Workshops

The FRCC Standards Department will be supporting and participating in various FRCC sponsored workshops (e.g., FRCC Compliance Workshops and FRCC SOS seminars) throughout 2015. The Standards Department contribution to the workshops will be designed to promote stakeholder awareness of Reliability Standards activities as well as education and training for new or revised Reliability Standards. In addition, the FRCC Standards Department plans to hold at least four (4) workshops or webinars that will educate stakeholders on the NERC Reliability Standards Development Procedure, and specific changes to existing reliability standards or specifics on new reliability standards. To help encourage stakeholder participation at the continent-wide level, the workshops will provide stakeholders with details of associated NERC Reliability Standards Development Projects, identifying key areas that may be of concern or interest to the stakeholders and identifying areas that are in need of industry support.

2015 Key Assumptions

- The Operating Personnel Certification program is expected to remain at steady state therefore no significant changes are expected in System Operator Certification CEH requirements through 2015.
- The System Operator Certification Program and Continuing Education Program will continue to be self-funded through a fee based structure for the exams and applications for approval of continuing education activities.
- The Regional Entities are expected to help determine training needs and anticipate areas of support for standards, compliance monitoring and enforcement and information technology (IT) for their staffs and stakeholders.

2015 Goals and Key Deliverables

The training, education and operator certification program objectives for 2015 are outlined below:

- Provide assistance to Regional Entity members in any issues they may have related to System Operator Certification.

- Conduct the annual system operator training seminars over a five (5) week period, with two (2) days each for the training. The training seminars involve from two (2) to four (4) FRCC staff members, as well as industry volunteers who participate as presenters. This activity is funded primarily through registration fees.
- Host FRCC Compliance Workshops and Webinars open to all FRCC Members and Registered Entities aimed at providing updates on compliance procedures, instructions on changes to compliance tools, changes associated with the implementation of the RAI and guidance on the providing of appropriate and sufficient evidence in a compliance audit.
- Host Reliability Standards Workshops and Webinars open to all FRCC Members and Registered Entities aimed at providing information concerning reliability standards under development, as well as the identification of technical concerns or issues that may impact the reliability of the FRCC BES.
- Conduct FRCC Reliability Standards Department presentations to support multiple training objectives (i.e., FRCC Compliance Workshops and FRCC SOS Seminars) to promote stakeholder awareness of continent wide and regional standards activities.
- Work with NERC and the other Regional Entities to achieve improvements in the coordination, content and manner of internal and external training programs.

Funding Sources and Requirements — Explanation of Increase (Decrease)

- **Personnel Expenses** – The increase in FTEs and Personnel Expenses is due to more time planned to be spent on training and education of registered entities in elements pertaining to the Reliability Assurance Initiative and in expectation of the transition to CIP Version 5. The increase in personnel expense is also due to a budgeted annual merit increase.
- **Meeting Expenses** – The decrease in Meeting Expenses is due to the anticipation that the cost for the SOS meeting facility will be less than it has been in the past.
- **Operating Expenses** –The increase in Operating Expenses is due to the cost of a security improvement initiative offset by an anticipated decrease in legal fees.
- **Indirect Expenses -** The increase in Indirect Expense is the result of a succession plan for expected future retirements.

Training, Education, and Operator Certification Program

Funding sources and related expenses for the training, education, and operator certification section of the 2015 business plan are shown in the table below.

Total Funding Requirement	$ 19,380	$ 23,281	$ 3,901

Program Scope and Functional Description

The FRCC and the other Regional Entities support the ERO's situational awareness, cyber security preparedness and provide independent reliability information to policy makers and regulators. The Reliability Process for the FRCC Bulk Electric System documents the various reliability roles and functions that are coordinated, monitored and established by FRCC to provide situation awareness of the reliability of the FRCC BES. Two of the primary reliability goals of the FRCC are continuous improvement of the situation awareness of the operators within the FRCC and ensuring that adequate physical, operational and cyber security objectives are in place for the Regions' shared communications networks.

The FRCC supports NERC's situation awareness/event analysis coordination conference calls, the Situation Awareness for FERC, NERC and the Regions (SAFNR) Version 2 project and the FRCC satellite phone for situation awareness.

The NERC Rules of Procedure, Section 1000, requires that NERC monitor present conditions on the BES and provide leadership coordination, technical expertise and assistance to the industry in responding to events as necessary.

The Situation Awareness process will be used to support NERC and FERC's efforts for situation awareness of current system conditions.

2015 Key Assumptions

- NERC's Critical Infrastructure Department will have responsibility for the identification and management of the specialized critical infrastructure protection resources needed to support overall ERO CIP goals and objectives, as well as the specialized CIP resources needs of the other program areas (e.g., Standards, Compliance, Situation Awareness)

- NERC will continue to budget and incur costs to operate and maintain the software applications and systems known as Situational Awareness for NERC, FERC and Regions (SAFNR). NERC will also continue to fund the Grid Security Exercise (GridEx) and the Security Readiness Program to help Registered Entities with CIP compliance and security

awareness. The Regional Entities will be expected to provide subject matter experts for support of these activities.

- NERC will continue to fund, operate and maintain the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), with no increased cost to Regional Entities.

- There will be increased need and demand for CIP-related training and workshops. CIP compliance activities are budgeted within compliance. FRCC will continue to support and facilitate the development of NERC's secure portal for the management of alerts and infrastructure security information.

- There will be continued focus on detecting off-normal events to be analyzed by the responsible entity, FRCC or NERC.

2015 Goals and Key Deliverables

- Ensure that FRCC goals and activities support the mission to provide FERC, NERC and the staffs from the eight Regional Entities a visualization tool that enables the appropriate level of situation awareness for the near real-time conditions on the BES. Continue to work with the FRCC Reliability Coordinator to ensure that SAFNR and appropriate hardware and software resources are allocated. Continue to support future development of the situation awareness project capabilities.
- Issue and track security recommendations to protect the Bulk Power System. Share information learned in Situation Awareness with the Events Analysis program to develop relevant lessons learned.

Funding Sources and Requirements — Explanation of Increase (Decrease)

- **Personnel Expenses** – There is a de minimus (0.01) increase in FTEs. The increase in personnel expense is due to a budgeted annual merit increase.
- **Operating Expenses** –The increase in Operating Expenses is driven by the cost of a security improvement initiative offset by an anticipated decrease in legal fees.
- **Indirect Expenses -** The increase in Indirect Expense is the result of a succession plan for expected future retirements.

Situation Awareness and Infrastructure Security Program

Total Allocation to Statutory Programs	$ 621,940	$ 782,663	$ 160,723
Working Capital Requirement	$ (849,875)	$ (657,395)	$ 192,480

Program Scope and Functional Description Background

Charges included in General and Administrative are general legal expenses, executive time and expenses, human resources, information technology and accounting and finance. Every effort is made to charge items and time directly to activities and to designate as statutory or non-statutory. Undesignated items are shared costs between the Regional Entity Division and the Member Services Division and are allocated based on actual labor hours charged.

Legal and Regulatory Background

The FRCC General Counsel serves as the chief legal advisor to the President and CEO, Board of Directors, staff and stakeholders on all legal and regulatory matters affecting the FRCC. FRCC may use additional specialized legal resources on an as-needed basis, such as for tax matters, employee benefit plan issues and significant policy or FERC matters.

2015 Goals and Key Deliverables

- Assist the FRCC in carrying out its responsibilities as required by the approved delegation agreement between NERC and FRCC.
- Provide general corporate legal advice, legal training and timely, accurate filings to Regulatory authorities.

2015 Assumptions

In the 2015 Budget, as in the 2014 and 2013 budgets, there are no specific funds for hearings under CMEP Rules.

Information Technology Background

The FRCC maintains a number of tools and other support services for the benefit of its members, Registered Entities, Reliability Coordinator agent(s) and other system operators. These services include the FRCC Load and Resource Database (LRDB), the Compliance Tracking System (CTS), Compliance Issues Tracking System (CITS), Models on Demand (MOD), the FRCC corporate website, as well as other systems for collaboration, communication, data gathering and analysis.

Several years ago, NERC and the eight (8) Regional Entities formed an executive management group (known as the ERO EMG) which has, among other things, concentrated on developing enterprise-wide IT applications; with a goal of improving efficiency and consistency across NERC and the Regional Entities. As enterprise-wide projects are identified and prioritized by the ERO EMG, they are managed through a single Project Management Office (PMO) at NERC. The PMO has developed an ERO Enterprise application roadmap that will identify projects that NERC and the Regional Entities have agreed upon that are necessary to support improved efficiency and consistency across the ERO.

The NERC IT budget does not supplant the FRCC's need for IT expenditures for specific regional projects, but to the extent that agreed –upon ERO Enterprise applications provide greater efficiencies, there is no unnecessary, redundant expenditures contained in the FRCC business plan and budget.

2015 Goals and Key Deliverables

- Maintain IT and telecommunications systems and resources for efficient utilization of FRCC personnel.
- Improve the physical security of the FRCC office with additional access control and logging.
- Implement updated communications tools and technologies.
- Develop and enhance tools to automate and improve FRCC data collection and analysis processes.
- Expand IT support of the FRCC CMEP and provide additional metrics to improve accuracy and tracking within the CMEP processes.
- Continue the process of Document Management conversion in the Operating and Planning and Administrative programs.
- Implement needed changes to improve the FRCC corporate security posture as identified in the security assessment performed in 2014; improve overall security in all programs, enhance access controls with improved authentication mechanisms and increase security awareness and training.
- Improve disaster recovery and business continuity capabilities by implementing new geographically diverse data recovery solutions.

Human Resources Background

The FRCC has assembled an exceptional team of highly qualified employees to carry out the activities of the FRCC. The human resources department, in adherence with applicable federal and state laws, develops plans, and implements human resources policies and procedures, including staffing, compensation, benefits, employee relations, and training and development.

2015 Goals and Key Deliverables

- Recruit successful employees
- Improve human resource policies and procedures

- Provide management and training programs
- Ensure competitive employee compensation and benefits

Finance and Accounting Background

The FRCC will submit its annual budget for statutory and non-statutory activities to the FRCC Board of Directors for approval and then file the approved annual budget for statutory and non-statutory activities to NERC. This includes supporting materials such as a complete business plan and organizational chart, and the proposed expenditure of funds collected in sufficient detail to justify the requested funding collection and budget expenditures.

The Finance and Accounting Department will: direct the overall financial plans and accounting practices of the organization; oversee treasury, accounting, budget preparation and reporting, tax, and audit activities; and oversee financial and accounting system controls and standards.

2015 Goals and Key Deliverables

- Prepare the 2016 statutory and non-statutory budgets
- Report budget variances to the FRCC Corporate Compliance Finance and Audit Committee, the FRCC Board and to NERC on a quarterly basis
- Evaluate and advise on the impact of long-range planning
- Continue to provide on-going training to employees to ensure employees charge their time correctly
- Carry out succession planning and training in anticipation of retirement of key personnel

Funding Sources and Requirements — Explanation of Increase (Decrease)

- **Personnel Expenses** – The increase is the result of a succession plan for an anticipated retirement and the training costs associated with that transition. The increase in personnel expense is also due to a budgeted annual merit increase.
- Operating Expenses –The increase in Operating Expenses is driven by the increased contract costs included in Contracts, Consultants and Software for a security improvement initiative.

General and Administrative

Funding sources and related expenses for the general and administrative section of the 2015 business plan are shown in the table below.

Desired Working Capital Reserve, December 31, 2015	[2]	596,853
Less: Projected Working Capital Reserve, December 31, 2014		**(1,254,248)**
Increase(decrease) in assessments to achieve desired Working Capital Reserve		**(657,395)**
2015 Assessment for Expenses and Capital Expenditures		7,162,233
Less: Penalty Sanctions	[1]	**(153,000)**
Less: Other Funding Sources		**(114,000)**
Adjustment to achieve desired Working Capital Reserve		**(657,395)**
2015 Assessment		6,237,838

[1] Represents collections prior to June 30, 2014.

[2] On June 26, 2013, the FRCC Board of Directors set a working capital and operating working capital and operating reserve requirement of one (1) month of the total annual budget. The FRCC has a $1.5 million line of credit.

Breakdown by Statement of Activity Sections

The following detailed schedules are in support of the Table on page 13, of the 2015 FRCC Business Plan and Budget. All significant variances have been disclosed by program area in the preceding pages.

Penalty Sanctions

Penalty monies received prior to June 30, 2014 are to be used to offset assessments in the 2015 Budget, as documented in the NERC Policy – ACCOUNTING, FINANCIAL STATEMENT AND BUDGETARY TREATMENT OF PENALTIES IMPOSED AND RECEIVED FOR VIOLATIONS OF RELIABILITY STANDARD. Penalty monies received from July 1, 2014 through June 30, 2015 will be used to offset assessments in the 2016 Budget.

All penalties received prior to June 30, 2014 are detailed below.

Allocation Method: Penalty sanctions received have been allocated to the following statutory programs to reduce assessments: Reliability Standards; Compliance Monitoring & Enforcement and Organization Registration & Certification; Reliability Assessments and Performance Analysis; Training, Education and Operator Certification; and Situation Awareness and Infrastructure Security. Penalty sanctions are allocated based upon the number of FTEs in the Program divided by the aggregate total FTEs in the Programs receiving the allocation.

Table B-2

Penalty Sanctions Received On or Prior to June 30, 2014	Date Received	Amount Received
Penalty #1	10/25/2013	$ 38,000
Penalty #2	11/26/2013	100,000
Penalty #3	12/27/2013	7,000
Penalty #4	1/22/2014	2,000
Penalty #5	1/22/2014	2,000
Penalty #5	3/25/2014	4,000
Total Penalties Received		$ 153,000

Non-Statutory Functional Scope Background

The Member Services (MS) division of the FRCC provides, coordinates and administers a variety of services relating to the reliable planning and operation of the BES within the FRCC Region. These services are carried out by the FRCC Member Services Planning Committee (PC) and the FRCC Member Services Operating Committee (OC), various subcommittees, task forces and working groups, as well as FRCC Staff.

Member Services Objectives

- Ensure the reliability of the BES in the FRCC region.
- Coordination, planning, operation and maintenance of reliable bulk electricity supply in the FRCC region.

Membership and Governance

The FRCC's Members in the Member Services Division include investor-owned utilities, cooperative utilities, municipal utilities, power marketers and independent power producers. Current membership is 23 FRCC Members in 2014 and is not expected to change in 2015.

The activities of FRCC are directed by its Board of Directors. The Board is comprised of senior level executives from the FRCC membership.

Planning Committee (PC) Functional Scope

The PC promotes the reliability of the BES within the FRCC Region by assessing and encouraging generation and transmission adequacy. The PC assesses generation adequacy by performing a reliability assessment taking into account projected load and resources. The PC, through the FRCC Regional Transmission Planning Process, provides a vehicle for ensuring that transmission planning within the FRCC will provide for the development of a robust transmission network within the FRCC Region. The Regional Transmission Planning Process is a coordinated transmission planning process that evaluates all BES and non-BES transmission facilities. The major goal of this process is to ensure that the planning of transmission facilities

will meet the needs of all market participants in a coordinated, open and transparent transmission planning environment.

The FRCC will continue to develop, on an annual basis, a Regional Transmission Plan following the Regional Transmission Planning Process. The Regional Transmission Planning process will be revised to incorporate the planning principles from FERC Order 1000. The Regional Plan is based on the Ten Year Site Plans that are required to be submitted to the Florida Public Service Commission (FPSC) on April 1st of each year. The FRCC participates in an annual Ten Year Site Plan Workshop held by the FPSC where the results of resource and transmission adequacy assessments are presented.

The FRCC PC relies on the following subordinate groups to achieve its goals: Resource Working Group (RWG), Stability Working Group (SWG), and the Transmission Working Group (TWG).

The PC, supported by FRCC MS staff, has the primary responsibility of the Planning Authority (PA) function including implementation of all applicable PA NERC Reliability Standards.

Resource Working Group
The RWG performs reliability assessments of FRCC resource adequacy for the future 10-year period for peninsular Florida based on individual utility information that was the basis of their respective EIA-411 and Ten Year Site Plan filings with the Florida Public Service Commission. These reliability assessments are based upon the FRCC resource adequacy criteria.

Stability Working Group
The SWG is responsible for assessing the dynamic performance of the FRCC BES under various credible system conditions. In addition, the SWG performs the following assessments and studies: Coordination and performance of Special Protection Systems, the effectiveness of FRCC under-frequency load shedding program and coordination with other protection and control systems, Extreme Event Study and other assessments in support of the FRCC Regional Transmission Planning Process. The SWG annually develops FRCC dynamic models.

Transmission Working Group
The TWG engages in active coordination of transmission planning within the FRCC Region under the direction of the FRCC Planning Committee in support of the FRCC Regional Transmission Planning Process. The TWG annually performs a FRCC Long Range Study, sensitivity studies as directed by the PC, evaluates Transmission Service Requests and evaluates Generator Interconnection Service Requests. In addition, the TWG annually develops a FRCC Transmission Map, FRCC power flow models and FRCC short circuit models.

Operating Committee (OC) Functional Scope

The primary goal of the OC is to promote the reliability of the BES within the FRCC Region. The OC is responsible for the coordination, operations planning, operation and maintenance of the interconnected systems operating in the Region. The OC's primary reliability goals include effective implementation of the Regional Reliability Plan (*Reliability Process for the FRCC Bulk Electric System*), continuous improvement of operator awareness and communications and ensuring that adequate physical, operational and cyber security objectives are in place for the Region's shared communications network. The OC subordinate groups include the Operating

Reliability Subcommittee (ORS), Data Exchange Working Group (DEWG), Fuel Reliability Working Group (FRWG), Operations Planning Working Group (OPWG), Telecommunications Subcommittee (TS), System Protection and Control Subcommittee (SPCS) and the Critical Infrastructure Protection Subcommittee (CIPS). The OC ensures reliable operations are maintained through the implementation and oversight of the FRCC Reliability Coordinator (RC) functions as established in the Regional Reliability Plan.

The FRCC RC responsibilities include the real-time operating function and the next-day operations planning function. The RC tasks are performed by a designated agent of the FRCC with direction and oversight by FRCC committees and support staff. The designated agent performs real-time operations and next-day planning operations. FRCC staff supports Regional reliability by performing the roles of the Operations Planning Coordinator (OPC), and State Capacity Emergency Coordinator (SCEC) as defined in the *Reliability Process for the FRCC Bulk Electric System* document.

The FRCC RC function is accountable to the FRCC OC who has overall responsibility of the administration, development and implementation of operating procedures provided by the ORS for the NERC Operations & Planning (Non-CIP) Standards.

The FRCC continues to improve FRCC PA and RC compliance management programs under the Member Services Division based on the evolving regulatory requirements. The FRCC has improved its oversight of PA and RC functions by creating an independent Member Services Regulatory Department with a dedicated Regulatory Director who reports directly to the FRCC President and CEO and who has direct access to the FRCC Board of Directors. This position is responsible for the implementation, maintenance and oversight of the FRCC Internal Compliance Program (ICP) including all compliance activities for the FRCC registered entity functions and is the primary interface for all regulatory activities associated with the FRCC Member Services committees and is the FRCC liaison between external Compliance Enforcement Authorities.

Operating Reliability Subcommittee (ORS)

The ORS provides overall administration for the development and implementation of operating procedures and other reliability matters including the oversight of the FRCC RC function for Operating and Planning (non-CIP) NERC Standards. The ORS reviews and assesses regional import and export limits, scheduled transmission outages, real-time system reliability, events analysis, information and data exchange and other reliability issues. The ORS provides formal oversight and implementation of the Reliability Process for the FRCC Bulk Electric System which establishes the reliability responsibilities of the various entities within the Region and specifically monitors the agent responsible for performing the RC functions.

Data Exchange Working Group (DEWG)

The DEWG, subordinate to the ORS, supports the real-time data needs of the FRCC Reliability Coordinator and other operating entities. It is also responsible for developing methodologies to facilitate the exchange of real-time, modeling and other operational data to help ensure reliable electric power system operations. Accurate modeling of the FRCC BES is essential to maintaining situation awareness and ensuring reliability. Within the FRCC, operating entities provide system data via the FRCC Reliability Data Link (RDL). The FRCC RDL receives electric system reliability data from the operating entities on a real-time basis and allows the data to be made available.

Fuel Reliability Working Group (FRWG)
The FRWG, also subordinate to the ORS, has been established to deal with matters relating to fuel and impacts to BES reliability. Specifically, the FRWG provides the administrative oversight of a Regional fuel reliability forum that studies the interdependencies of fuel availability and electric reliability and supports coordinated Regional responses to fuel issues and fuel emergencies.

Operations Planning Working Group (OPWG)
The OPWG, as a part of the ORS, has been established to provide oversight, guidelines and procedures to the FRCC Operations Planning Coordinator (OPC) in accordance with the Reliability Process for the FRCC BES document. The OPWG focuses on BES reliability and developing processes and documentation that support regional reliability and adherence to the NERC Reliability Standards as they relate to the OPC function.

FRCC Telecommunications Subcommittee (TS)
The TS provides oversight for the TS budget which is included in the OC budget. The primary purpose of the TS is to ensure that adequate and redundant communications facilities are made available to the operating entities within the FRCC, including the FRCC Reliability Coordinator. The TS administers the FRCC Hotline program, Satellite phone program, and also ensures that reliable and redundant communications are maintained by the Eastern Interconnect Data Sharing Network, Inc. (EIDSN). All TS programs are non-statutory and support the Reliability Coordinator functions; with the exception of the FRCC satellite phone (located at the FRCC office) which is a tool that can be used by the Regional Entity to perform situation awareness and thus is budgeted as statutory.

FRCC System Protection and Control Subcommittee (SPCS)
The FRCC System Protection and Control Subcommittee (SPCS) has primary responsibility for the coordination of protection and control systems within the FRCC region, including regional disturbance monitoring equipment, review of protective mis-operations, protection related disturbance analysis and implementation of specific regional programs and procedures including the assessments of the FRCC Under-Frequency Load Shedding Program. The SPCS also reviews and coordinates system protection and control equipment installations, settings, protection philosophies and testing criteria within the region, when installations impact multiple entities. The SPCS serves as an important forum for sharing subject matter expert guidance and lessons learned / best practices for equipment issues and protection coordination.

FRCC Critical Infrastructure Protection Subcommittee (CIPS)
The purpose of the FRCC CIPS is to enhance the physical and cyber security of the critical BES infrastructure in the FRCC Region, with an emphasis on protecting, preventing, limiting and recovering from malicious activities directed at the FRCC critical energy infrastructure. The CIPS provides guidance to the OC on matters of critical energy infrastructure security, including cyber and physical security. The CIPS provides advice to the OC including implementation of all applicable FRCC RC CIP-002 through CIP-009 Reliability Standards.

Major 2015 Cost Impacts

The FRCC's proposed 2015 Members Services budgeted expenses and net fixed assets are $8,391,982, which is a $935,987 or 12.6% increase over the 2014 budgeted expenses. The cost impacts by function of this increase are:

Planning Committee (PC)
The Member Services Planning Committee (PC) expenses for 2015 are made up of the PC Committee budget, as well as the administrative costs to provide support personnel for implementation of the FRCC Planning Authority (PA) functions and all other Member Services PC activities. In 2015, staff will spend additional time enhancing FRCC steady state planning studies and has budgeted $150,000 for additional stability studies to prepare to meet the requirements of the new NERC Transmission Planning (TPL) Standard. In addition, staff is expected to add one FTE in 2015 to support the implementation of FERC Order 1000 as recommended by the PC.

The 2015 PC budget is developed based on the activities of the Resource Working Group (RWG), the Stability Working Group (SWG) and the Transmission Working Group (TWG). These budgets are primarily for the labor involved in coordination activities performed by member representatives, software and meeting costs.

Operating Committee (OC)
The Member Services Operating Committee (OC) expenses for 2015 are made up of a 2015 OC budget as well as the administrative costs to provide support personnel for implementation of the FRCC Reliability Coordinator (RC) functions and other Member Services OC activities. In 2015, staff will spend additional time coordinating activities with member companies to ensure continued reliability and compliance with changing NERC Reliability Standards.

The 2015 OC budget is developed based primarily on the activities of the Operating Reliability Subcommittee (ORS), the Telecommunications Subcommittee (TS), the Fuel Reliability Working Group (FRWG) and the Critical Infrastructure Protection Subcommittee (CIPS). These budgets are related to, or in support of both the FRCC Reliability Coordinator (RC) and Member Services entity's reliability functions and includes consulting costs, contract costs, computer software purchases and expenses to support the associated activities. These budgets do not include FRCC staff salaries or associated personnel costs.

The administrative costs associated with the FRCC OC support personnel include FRCC staff that support implementation of the FRCC RC functions and staff that support overall OC activities. The staff includes dedicated employees as well as shared employees.

Funding Sources and Requirements — Explanation of Increase (Decrease)

- **Personnel Expenses** – The increase in FTEs is attributed to an additional employee in the planning area to support new long range planning activities, the effect of a complete year for the 2014 addition to staff to support the Reliability Coordinator function that was budgeted to be filled in mid-2014 and the result of the implementation of a succession plan for a key accounting position.
- **Operating Expenses** – The increase in Operating Expenses is attributed to increases in consultant and contractor costs for the RC and PA functions.

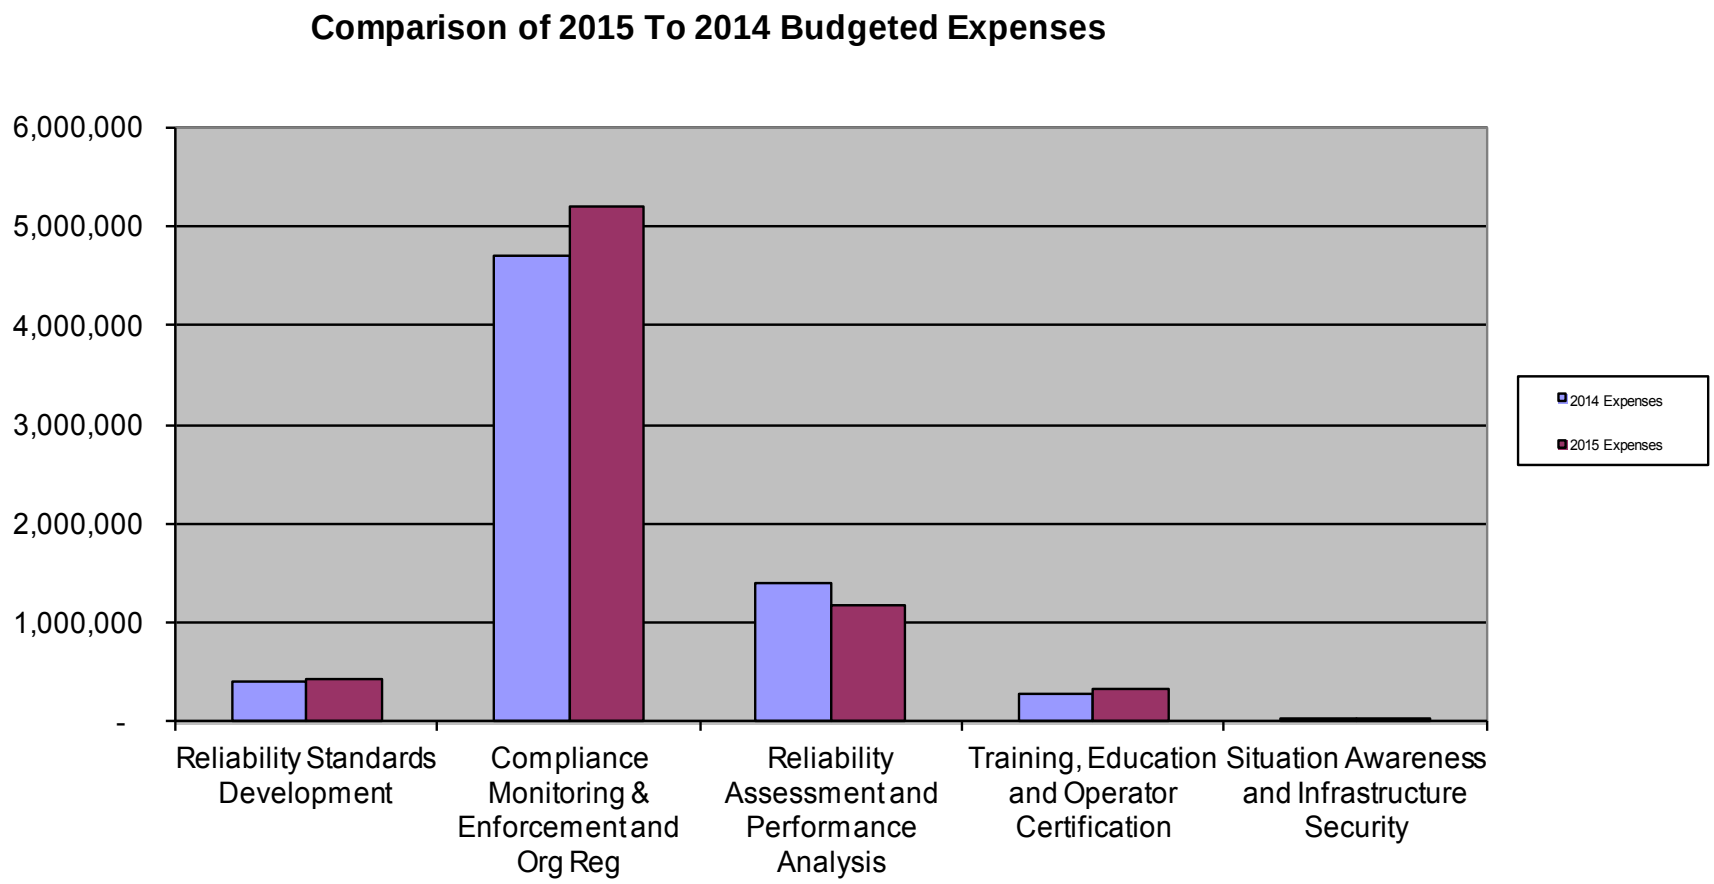
Total Statutory Funding (Equals Total Expenses)	6,793,288	7,162,232	5.4%	368,944

2015 to 2014 RE Division Comparative Budgeted Funding



2015 RE Division Overview

- The FRCC will continue to evaluate the adequacy of its resources and to evaluate efficiencies in its processes in order to continue to carry out its delegated responsibilities.

- The FRCC will continue to align itself and support the ERO Strategic Plan for goals, activities and major activities which include:
  - Support of the RAI with training and implementation for compliance and enforcement staff.
  - Support NERC's plan to develop RSAW's concurrent with Reliability Standards.
  - Work with NERC and the other RE's to provide guidance to registered entities on CIP V5.
  - Work to refine and revise procedures and processes to eliminate duplication, increase operating efficiencies, enhance ERO-wide consistency and to achieve measurable reliability outcomes.

2015 RE Division Risks

- Roll out of RAI may require significantly more staff time than budgeted
- Compliance Software costs may be higher than budgeted due to RAI or unplanned NERC projects
- Additional costs may be incurred to implement recommendations from the FRCC Security Assessment Initiative
- As always, there could be a Compliance Hearing

2015 Proposed RE Division Working Capital Policy

- Working Capital and operating reserve requirements shall be one (1) month of the total annual budget
- A 1.5 million line of credit is available for short term and other risks that may be needed to bridge budget cycles and approved assessments.
- Working Capital shall be utilized to satisfy projected annual cash flow and cash balance requirements.
- Operating reserves shall be utilized to satisfy known contingencies where the specific timing and amount is uncertain.

FRCC Proposed 2015 Total Budget Compared to 2014

	2015 Budget	2014 Budget	$ Change	% Change
Regional Entity Division Expenses W/Fixed Assets	$ 7,162,233	$ 6,793,289	$368,944	5.4%
Member Services Division Expenses W/Fixed Assets	8,391,982	7,455,995	935,987	12.6%
Total Expenses	$15,554,214	$14,249,283	$1,304,931	9.2%
Other Funding – Workshops & Fees	388,459	391,419	2,960	(0.8%)
Cash Reserve (Requirement)/(Surplus)	534,812	1,110,046	575,234	(51.8%)
Penalty Sanctions	153,000	343,000	190,000	(55.4%)
Total FRCC Funding Assessment	$14,477,943	$12,404,818	$2,073,125	16.7%

2015 BP&B Summary

- **Regional Entity**
  - Budget increase of 5.4%
  - 0 new Staff
  - 0.5 increased FTEs

- **Member Services**
  - Budget increase of 12.6%
  - 1 new Staff
  - 1.5 increased FTEs

NPCC 2015 Draft 1

Business Plan & Budget

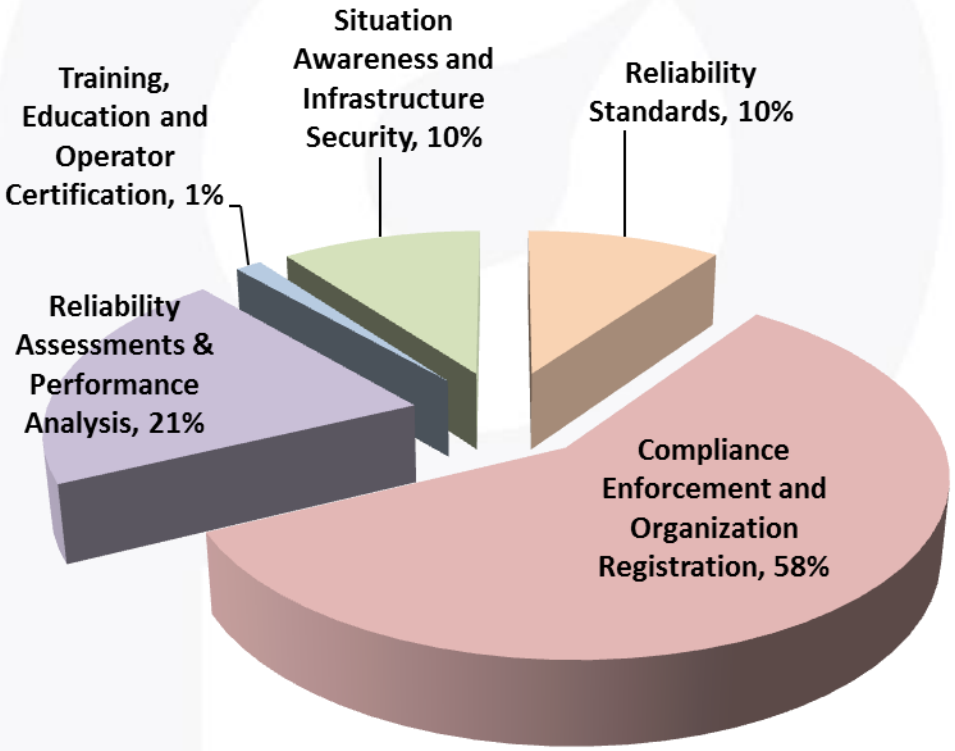
Presentation to NERC FAC
May 21, 2014

Jessica Hala
Manager, Finance and Accounting

2015 Budget Overview

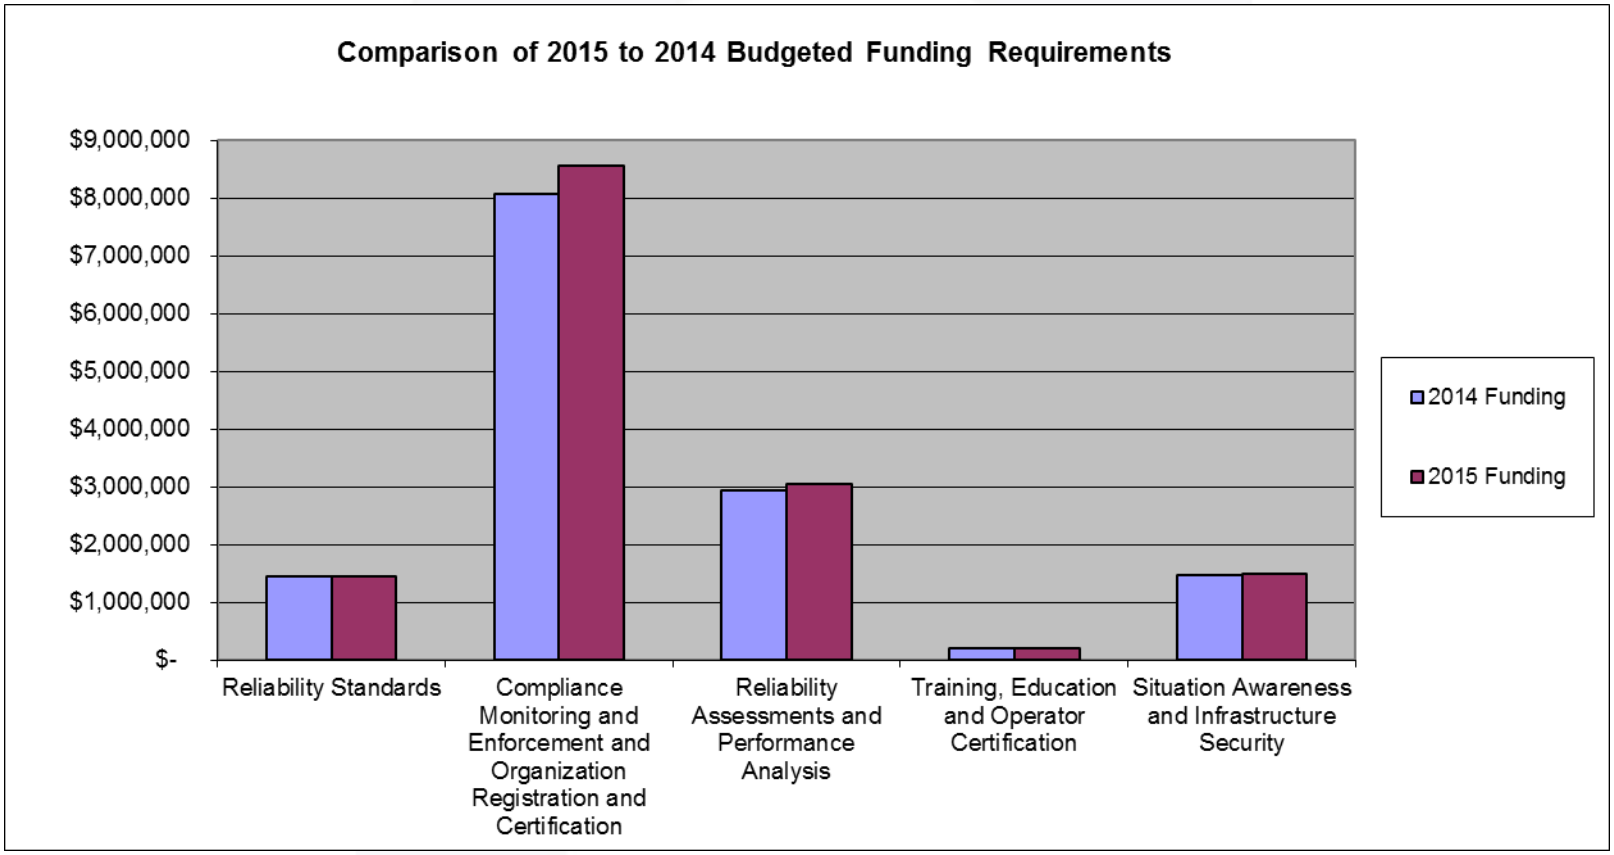
- Staffing Flat
  - 39 FTEs (Regional Entity Division 36.86, Criteria Services Division 2.14)
  - Currently one open position in Standards program area
- Salaries
  - Average wage package increase of 3%
  - Vacancy rate of 2% based on recent trends (currently one open position after 6 months fully staffed)
- Change in Operating Reserves requirement from fixed 8.33% (30 days) to a range between 8.33% and 25.00% (90 days) to provide more stability in annual funding assessments

2015 Total Resources by Program Area Regional Entity (RE) Division



Summary Comparison by Program

Regional Entity (RE) Division



2014-2015 RE Budget Comparison

	2015	2014	Variance	% Variance	Explanation
Funding					
Assessments	14,078,378	13,611,880	466,498	3.43%

[1]A shared FTE is defined as an employee who performs both Regional Entity and Criteria Services division functions.

Resource Adequacy

- Resource assessment and reprioritization from the 2014 Business Plan and Budget has been conducted and will continue through 2015.

- Full impact of Reliability Assurance Initiative (RAI), Risk Assessment, Internal Control Evaluation, and CIP V5 implementation is currently unknown
  - Compliance staffing, in combination with increase in contractors, is expected to be adequate
- Full impact of revised BES definition implementation is currently unknown
  - RAPA staffing, in combination with increase in contractors, is expected to be adequate to address BES identification/exception requests

Process Improvements

- Implementation of CEAP in NERC Standards Development Process
- Utilization of consistent audit checklist and handbook with audits informed by evaluation of entity risk profile
- Enhanced FFT and introduction of compliance exception principles
- Expedited processing of self-reports
- Increased scheduling rigor in settlement processing
- Implementation of efficient BES Notification and Exception Processing
- Improved integration of Events Analysis processing across ERO

Alignment of RE and ERO

- Fully aligned with ERO Enterprise Strategic Plan and Performance Metrics
- Functional initiatives/activities within program areas references applicable ERO goals within the business plan using footnotes
- CS Division continues to support international, interconnected BPS reliability through compliance monitoring with more-stringent, regionally-specific reliability criteria

Efficiency and Controlling Costs

- Ongoing efforts to hold more meetings on site and via conference call or webinar.
- Limiting number of staff attending offsite meetings.
- Continued expansion of pre-audit processing to contain the time required of an audit team to be on-site in order to complete an audit and, therefore, to complete audits more cost-efficiently.

Working Capital and Operating Reserves

- Change in Operating Reserves requirement from fixed 8.33% (30 days) to a range between 8.33% and 25.00% (90 days) to provide more stability in annual funding assessments.

- Working Capital requirement remains unchanged with a targeted level of 8.33% (30 days) of the annual budget.

- No utilization of reserves is contemplated; Board authorization would be required

2015 Overview of Total NPCC Resource Requirements

Due to the international nature of NPCC, the total resource requirements including both Regional Entity division and Criteria Services division are identified above. The individual divisional explanations are contained in subsequent sections.

NPCC proposes to increase its total funding requirement from $14,818,588 to $15,458,599 in 2015, an increase of $640,011 or 4.3%. The proposed 2015 funding requirements will be satisfied by a Regional Entity division assessment of $14,078,378 and Criteria Services division fees of $1,035,221, an overall increase of 3.5% compared to the 2014 total assessments and fees of $14,601,588. NPCC believes that the Region remains an effective provider of Regional Entity and Criteria Services division functions. NPCC's corporate culture centers on consistent delivery of excellent results at a cost that is considerate of the longstanding tradition in the Northeast of affordable and reliable electricity.

Organizational Overview

Northeast Power Coordinating Council, Inc. (NPCC) is a 501(c)(6) not-for-profit corporation in the state of New York responsible for promoting and improving the reliability of the international, interconnected bulk power systems in Northeastern North America through (i) the development of Regional Reliability Standards and compliance assessment and enforcement of continent-wide and Regional Reliability Standards, coordination of system planning, design and operations, and assessment of reliability (collectively, Regional Entity activities), and (ii) the establishment of Regionally-specific criteria, and monitoring and enforcement of compliance

with such criteria (collectively, criteria services activities). NPCC provides the functions and services for Northeastern North America of a cross-border Regional Entity through a Regional Entity division, as well as Regionally-specific criteria services for Northeastern North America through a criteria services division. NPCC's website is www.npcc.org.

The NPCC Region covers nearly 1.2 million square miles and is populated by more than 56 million people. NPCC U.S. includes the six New England states and the state of New York. NPCC Canada includes the provinces of Ontario, Québec and the Maritime provinces of New Brunswick and Nova Scotia. In total, from a net energy for load perspective, NPCC is approximately 45% U.S. and 55% Canadian. With regard to Canada, approximately 70% of Canadian net energy for load is within the NPCC Region.

Effective January 1, 2012, NPCC executed an Amended and Restated Regional Delegation Agreement with the North American Electric Reliability Corporation (NERC) that delegates to NPCC certain responsibilities and authorities of a cross-border Regional Entity as defined by *Section 215* of the Federal Power Act in the U.S. In addition, NPCC has executed Memoranda of Understanding or Agreements with Canadian provincial regulatory and/or governmental authorities in Ontario, Québec, New Brunswick and Nova Scotia.

In this 2015 business plan, NPCC has included activities consistent with NERC initiatives including the implementation of the revised BES definition, risk-based registration, the Reliability Assurance Initiative, and expanded training for compliance auditing.

It is imperative that NPCC maintain its ability to carry out delegated authorities and responsibilities. NPCC has a flat 2015 targeted staffing level of 39 power industry professionals and support personnel. Details of the 2015 business plans and budget for each program area are included in Section A for the Regional Entity division. The 2015 Regional Entity division schedules are shown in Section B. Section C details the 2015 criteria services division business plan and budget.

Membership and Governance

NPCC monitors approximately 300 registered entities and some 602 functions in the Region for compliance with mandatory Reliability Standards. NPCC currently has approximately 78 members. There are two categories of membership, General and Full. The two categories distinguish between Regional Entity delegated services that are provided in support of the U.S. FERC and Canadian provincial MOUs or Agreements with regulatory and/or governmental authorities, and Criteria Services which FERC references as U.S. non-delegated activities.

General Membership is voluntary and is open to any person or entity, including any entity participating in the Registered Ballot Body of the Electric Reliability Organization (ERO) that has an interest in the reliable operation of the Northeastern North American bulk power system. General Members which are also registered entities within the NPCC Region are subject to compliance with Reliability Standards, consistent with their registration, and also receive additional services from the Regional Entity division of NPCC.

Full Membership is available to Members which are already General Members and participate in electricity markets in the Northeast. Independent system operators (ISOs), Regional transmission organizations (RTOs), Transcos and other organizations or entities that perform the Balancing Authority function operating in Northeastern North America are expected to be Full Members of NPCC. The New York State Reliability Council and any other sub-regional

reliability councils which may be formed are also expected to be Full Members. Full Members are subject to compliance with Regionally-specific more stringent reliability criteria for their generation and transmission facilities on which faults or disturbances can have a significant adverse impact outside of the local area and which are identified utilizing a reliability impact-based methodology, in addition to Reliability Standards, and receive additional services from the Criteria Services division of NPCC, which is not funded through the ERO.

Since January 1, 2012 NPCC is governed by a Board of Directors consisting of seven stakeholder voting sectors consisting of a maximum of two directors per sector, an independent sector consisting of two independent directors, an independent Board Chair with voting rights to preclude board deadlocks, and the President and CEO. Within NPCC, no two sectors can control and no one sector can block action. The voting sectors on the NPCC Board of Directors include:

Sector 1) Transmission Owners
Sector 2) Reliability Coordinators
Sector 3) Transmission Dependent Utilities, Distribution Companies, Load Serving Entities
Sector 4) Generator Owners
Sector 5) Marketers, Brokers and Aggregators
Sector 6) Regulators
Sector 7) Sub-Regional Reliability Councils, Customers, other Regional Entities and Interested Entities
Sector 8) Independent

A Finance and Audit Committee (FAC), a Pension Committee (PC), a Corporate Governance and Nominating Committee (CGNC), and a Management Development and Compensation Committee (MDCC) advise the Board on finance, governance, compensation and human resource matters. The Board endorses a non-employee, Certified Public Accountant for election by the NPCC Members as Treasurer of the corporation. The Treasurer chairs the FAC and works with the Chief Operating Officer who provides oversight of the finances of the corporation. The Treasurer reports to the Board on the corporation's financial position, on FAC activities, on tax code requirements, and on independent annual audit results and accounting practices.

The Regional Standards Committee (RSC), the Compliance Committee (CC), the Reliability Coordinating Committee (RCC), and the Public Information Committee, consistent with their approved scopes, are responsible for various reliability issues. The RSC, CC and RCC also provide technical policy recommendations to the Board. All General and Full Members are eligible for representation on the technical committees.

Industry technical experts from within the membership provide valuable input to the Board through various working groups and task forces as well as the committees. The *Amended and Restated Bylaws* establishes NPCC's independence from users, owners and operators of the bulk power system through the enhanced governance structure while providing fair stakeholder representation in the election of the Board of Directors and officers. The members, from each of the seven stakeholder voting sectors, vote to elect directors in their respective sector. The *Amended and Restated Bylaws* establish criteria for board service for both stakeholder and independent directors. Independent Directors are drawn from diverse backgrounds and possess a broad range of industry expertise, perspectives, experiences, skill sets and knowledge to contribute to the effective functioning of a hybrid board structure.

Compliance and enforcement activities are carried out by the NPCC compliance staff and are independent of all users, owners and operators of the international bulk electric system. Compliance activities are governed in the United States by the *Amended and Restated Regional Delegation Agreement* between NERC and NPCC, delegating portions of NERC's authority as the ERO to NPCC. NPCC compliance activities in Canada are governed by an individual provincial Memorandum of Understanding (MOU) or Agreements with each province providing the unique parameters for compliance and enforcement activities for each of the provinces. A MOU between the Independent Electricity System Operator in Ontario (IESO), NERC and NPCC establishes roles and responsibilities with regard to that province. NPCC, NERC and the New Brunswick Energy and Utilities Board are parties to a MOU that sets forth reliability activities for New Brunswick. The Régie de l'énergie, NERC and NPCC executed an Agreement regarding the development of electric power transmission Reliability Standards and a program for the monitoring of the application of these standards for Québec. NPCC, NERC and Nova Scotia executed a MOU that sets forth the mutual understanding of the parties in relation to the approval and implementation of NERC Reliability Standards and NPCC Regional reliability criteria for the province of Nova Scotia.

International Foundation

The Regional Entity functions and services differ according to particular regulatory backstop:

a) U.S. Foundation

The Federal Energy Regulatory Commission (FERC) certified NERC as the Electric Reliability Organization (ERO) on July 20, 2006. The ERO is responsible for developing and enforcing reliability standards within the United States. In executing part of its responsibilities, NERC delegates authority to the Regional Entities to perform certain functions through delegation agreements. Ensuring the reliability of the bulk power system in the state of New York and the six New England States was delegated from NERC to NPCC through the Amended and Restated Regional Delegation Agreement.

b) Ontario

On February 5, 2010, NERC, NPCC and the IESO amended and restated their earlier MOU, dated November 29, 2006, setting forth their mutual understanding as regards NERC's and NPCC's status in Ontario with respect to standard and criteria development, compliance enforcement, and other related matters. The IESO, whose statutory responsibilities include making and enforcing reliability standards, and making and enforcing Ontario market rules that govern the IESO-controlled grid and the wholesale electricity market, was established April 1, 1999 as the Independent Electricity Market Operator in Ontario under the *Electricity Act, 1998* (Ontario). The IESO is subject to the regulatory oversight of the Ontario Energy Board (OEB).

Among other things, the MOU recognizes that NERC and NPCC are standards authorities under the *Electricity Act, 1998* (Ontario). Additionally, under the authority of that same legislation, and as memorialized in the MOU, the NERC reliability standards and NPCC reliability criteria have effect in Ontario. However a 2008 amendment to the Electricity Act, 1998 (Ontario) allows the OEB to review these standards and criteria and issue orders preventing their implementation and remanding them back to NERC and NPCC.

The IESO is subject to compliance monitoring and enforcement by NPCC. The IESO is also subject to compliance monitoring and enforcement of the Ontario market rules by the IESO's Market Assessment and Compliance Division (MACD) that operates at arm's length from the IESO's business units. The MOU notes that where MACD, NERC, and NPCC engage in

investigations pursuant to their respective mandates regarding compliance, MACD can request to take the lead. Moreover, of the three, MACD is the only entity that can assess financial penalties for any Ontario market participant's or the IESO's non-compliance with Ontario market rules, which includes non-compliance with NERC standards and NPCC criteria.

The MOU provides for a peer review process to promote the common compliance and enforcement objectives of NERC/NPCC and MACD. From the perspective of NPCC and NERC, this process, in part, is meant to assure registered entities outside of Ontario that the MACD program is rigorous, thorough and reliable.

The IESO is subject to NPCC assessments of compliance, including audits, as well as NPCC remedial action directives to correct non-compliance. In the event that the IESO disagrees with NPCC's finding of a violation or associated assessment of sanctions in connection with standards and criteria, the IESO has a right to a compliance hearing with NPCC.

c) Québec

The Régie de l'énergie, NERC and NPCC are parties to the May 8, 2009 *Agreement on the Development of Electric Power Transmission Reliability Standards and of Procedures and a Program for the Monitoring of the Application of These Standards for Québec* (the Agreement). Under the terms of the Agreement, the Régie de l'énergie , which is charged with ensuring the reliability of the electric transmission in Québec, retained NPCC and NERC as experts to develop reliability standards and monitoring program procedures for the Province.

The Régie de l'énergie is a public body established by the *Act respecting the Régie de l'énergie* (the Act). Pursuant to its authority under the Act, the Régie de l'énergie, through a series of decisions in 2007, designated Hydro-Québec TransÉnergie (HQTE) as the Reliability Coordinator for Québec. In accordance with its mandate and as recognized in the Agreement, it is this entity that is responsible for the filing with the Régie de l'énergie for approval of reliability standards in Québec. HQTE has filed for the approval of certain reliability standards and the Régie de l'énergie has begun the proceedings required to make such reliability standards mandatory in Québec.

The Agreement contemplates the execution of a second agreement that will detail the mandates granted by the Régie de l'énergie to NPCC and NERC with respect to the implementation of the procedures and program for the monitoring of the application of electric power transmission Reliability Standards in Québec and the provision of opinions and recommendations to the Régie in this regard. The second agreement is currently being negotiated by the Régie de l'énergie, NPCC and NERC. The intent, once all the appropriate authorizations are in place, is that NPCC and NERC will act as the Régie's agents in all compliance monitoring and enforcement activities through the implementation of a Québec specific compliance monitoring and enforcement program.

Currently, as there are only a limited number of mandatory standards that have come into effect, and as the second agreement and all the appropriate authorizations covering compliance monitoring and enforcement arrangements are not in place, there has been limited mandatory compliance activity under the formal Québec regime. However, the Hydro-Québec companies, including Hydro-Québec TransÉnergie and Hydro-Québec Production have been subject to voluntarily compliance monitoring, including comprehensive audits by NPCC. Additionally, NPCC has and continues to proceed with its reliability assurance activities within Québec,

including but not limited to events analysis, Reliability Assessment and Performance Analysis and compliance investigations, consistent with the NPCC *Amended and Restated Bylaws*.

d) New Brunswick

The New Brunswick Energy and Utilities Board ("EUB") and NPCC entered into an Agreement dated October 1, 2013, whereby NPCC provides services for the EUB. The EUB is a not-for-profit corporation which was established on October 1, 2004 under the Electricity Act (NB) and charged with developing and administering the wholesale electricity market and maintaining reliability of the integrated power system in New Brunswick.

Effective October 1, 2013, the Electricity Act (NB) and implementing regulations (together, "NB Electricity Act") amended how Reliability Standards are approved, monitored, and enforced in the province of New Brunswick. The NB Electricity Act designates NPCC as a compliance body and NERC as a standards body within the meaning of the NB Electricity Act. The October 1, 2013 Agreement between NPCC and the EUB is intended to be the preliminary step with respect to the implementation of the NB Electricity Act.

With respect to the approval of reliability standards, the NB Electricity Act provides that all of the NERC Reliability Standards that were effective in New Brunswick prior to October 1, 2013 continue to be effective in New Brunswick after October 1, 2013. Additionally, the New Brunswick Power Corporation (formed from several amalgamating corporations) ("NBPC") is required to file for approval, modification, or retirement of NERC Reliability Standards 60 days after a NERC Reliability Standard is approved, modified, or retired by the Federal Energy Regulatory Commission ("FERC"). The EUB rules on the filed Reliability Standard after considering (a) the potential impact on the reliability of the bulk power system, (b) the potential cost and benefits (c) the public interest, and (d) any other factors that the NBUEB considers relevant. The Electricity Act requires the NBEUB to notify NPCC and NERC of an application by the NBPC with respect to reliability standards and provide for a 60 day comment period. The NBEUB is required to approve the reliability standards if there are not substantive modifications proposed from the FERC approved NERC Reliability Standard and there were no substantive comments filed. Amendments to the reliability standard to make them compatible with New Brunswick or Canadian law are considered non-substantive. The approval of reliability standards may be subject to a hearing for several reasons, including substantive comments from NPCC or NERC.

With respect to the monitoring and enforcement of the Reliability Standards in New Brunswick, the NB Electricity Act requires NPCC to identify entities that must register with the EUB in the New Brunswick specific registry. Additionally, NPCC is required to carry out the compliance monitoring and assessment for the EUB and assist and advise the enforcement for the EUB, including financial penalties. NPCC is also permitted to carry out or exercise any power in the implementing regulations that is specific to the EUB. Additionally, NPCC has the powers of an inspector, which permits NPCC to audit and spot check entities within New Brunswick.

e) Nova Scotia

Nova Scotia Power Incorporated (NSPI), NPCC and NERC are parties to a May 11, 2010 Memorandum of Understanding regarding the approval and implementation of mandatory NERC reliability standards and NPCC Regional reliability criteria. Pursuant to the MOU's terms, NERC and NPCC filed standards and criteria with the Nova Scotia Utility and Review Board (NSUARB) for approval on June 30, 2010 and June 29, 2010, respectively. A decision from the NSUARB on both NERC and NPCC filings was rendered on July 20, 2011. Hence, the

standards and criteria are mandatory in Nova Scotia and NSPI will be subject to the NERC compliance monitoring and enforcement program, as implemented by NPCC.

NPCC will conduct compliance activities with respect to the standards and then forward any non-compliance information and recommendations to the NSUARB for use in enforcement proceedings. Enforcement will be administered by the NSUARB which will, among other things, determine whether a violation has occurred and, if so, what remedial measures or non-monetary penalties should be imposed.

Regional Entity Division Functional Scope

NPCC's Regional Entity division functions in support of the ERO include:

- Active participation in the development of North American Reliability Standards for the bulk electric system, and as needed development of Reliability Standards applicable within the NPCC cross-border Regional Entity
- Monitoring and enforcement of approved Reliability Standards, including the registration of responsible entities, and as needed certification of such entities
- Assessment of the present and future reliability of the bulk power system
- Operational coordination and situation awareness support
- Event analysis and identifying lessons learned to improve reliability
- Effective training and education of reliability personnel
- Promoting the protection of critical electric infrastructure

In recognition of the delegated compliance role of Regional Entities as an important means to enhancing reliability, NPCC has designated a significant percentage of its staff resources to compliance monitoring and enforcement. NPCC has also developed and deployed a robust set of online tools for gathering data, analysis, and tracking of compliance information to support its ability to carry out its responsibilities in a cost effective manner.

NPCC has organized the remaining staff into program areas consistent with EPAct 2005 to address the other functions listed above. These experts in operations, planning and reliability analysis assist registered entities in assessing and improving reliability. It is in support of these areas that NPCC engages the majority of industry experts on its technical committees.

2015 Key Assumptions and 2015 Goals and Key Deliverables

NERC and the eight Regional Entities collaborated in the development of a common operating model with complementary roles and responsibilities, an ERO Enterprise Strategic Plan, and a set of business planning assumptions, goals, metrics and key deliverables for the 2014 through 2017 period. The results from that collaboration are included as a set of Shared Business Plan and Budget Assumptions that will be contained in Exhibit A to the NERC 2015 Business Plan and Budget and may be referenced by the users of this document. In each of the following program area sections footnotes are used to reference the specific ERO Enterprise Goals that NPCC's activities support.

2015 Overview of Regional Entity Division Cost Impacts

NPCC proposes to increase its Regional Entity division funding requirement from $13,828,880 to $14,423,378 in 2015, an increase of $594,498 or 4.3%. The proposed Regional Entity division assessment of $14,078,378 to support the budget is an increase of 3.4% compared to the 2014 assessment of $13,611,880.

2014 Projections

Current year projections are taken into consideration in development of the budget. Expenses are currently projected to be on budget or slightly under budget in all areas. 2014 Projections reflect expectations based on the first quarter statement of activities. It is anticipated that projections could change throughout 2014 and would be reflected in each subsequent quarter's statement of activities.

Summary by Program

Program	Budget 2014	Projection 2014	Budget 2015	Variance 2015 Budget v 2014 Budget	Variance %
Reliability Standards	$ 1,447,330	$ 1,447,330	$ 1,456,129	$ 8,799	0.6%
Compliance Monitoring and Enforcement and Organization Registration and Certification	$ 8,079,371	$ 8,079,371	$ 8,568,145	$ 488,774	6.0%
Reliability Assessments and Performance Analysis	$ 2,942,339	$ 2,942,339	$ 3,053,923	$ 111,585	3.8%
Training, Education and Operator Certification	$ 195,855	$ 195,855	$ 199,010	$ 3,154	1.6%
Situation Awareness and Infrastructure Security	$ 1,464,111	$ 1,464,111	$ 1,501,332	$ 37,221	2.5%
Total	$ 14,129,006	$ 14,129,006	$ 14,778,539	$ 649,533	4.6%

Total Funding Requirement	$1,447,330	$1,456,129	$8,799

Program Scope and Functional Description

The NPCC Reliability Standards program operates in accordance with NPCC's filed and approved Delegation Agreement "Exhibit C", and NERC Rules of Procedure Section 300. The program supports the ERO standards program area roles and responsibilities by providing supporting activities for the development of clear, concise, sustainable, high quality and technically sound mandatory "results based" reliability standards which provide for an adequate level of reliability in a timely and efficient manner. The primary objective of NPCC's program area is to support the development of ERO standards which establish threshold requirements for ensuring the bulk electric system is planned, operated, and maintained in a manner that minimizes risks of cascading failures, avoids damage to major equipment, is responsive to risks, or limits interruptions of bulk power supply. At a Regional level, the program develops Regional Reliability Standards and ensures that Regional reliability criteria, contained in the form of Directories, are not inconsistent with any applicable NERC and Regional Reliability Standards. The NPCC Reliability Standards program also supports and participates in the development, revision, and maintenance of NERC Reliability Standards, initiates new regional or continent wide reliability standards when necessary, and provides a forum for the comprehensive review and improvement of existing and developing standards.

The NPCC Reliability Standards Program Area supports the reliability of the bulk electric system by:

- Facilitating active participation of NPCC Regional industry stakeholders in all NERC Reliability Standards activities to promote the development of results based, cost effective quality standards in a timely and efficient manner.
- Promote awareness by holding workshops and conducting Regional Standards Committee meetings to inform and educate stakeholders.
- Internally and informally training staff for the new and developing standards through meetings.
- Regional coordination activities with Standards Program Areas from other Regions.

- Development and maintenance of Regional Standards as necessary to address Regional reliability related issues or risks and ensure those standards are not inconsistent with the NERC continent wide standards. These Regional standards contain requirements that are more stringent, add specificity to or augment the NERC Continent-wide standards.
- NPCC maintains and abides by the NPCC Regional Standards Processes Manual assuring compliance with all FERC filed documents with respect to standards development.

Funding Drivers and Reliability Benefits

- Expanded Scope of Standards activities
    - Utilize NPCC RSC, Task Forces and Working Groups to comment on developing NERC Standards to ensure they are results based and directionally consistent with the Independent Experts Review Panel Report (IERP)[1]
    - Develop process for ensuring lessons learned from Event Analysis are evaluated for any gaps in standards or criteria[2]
    - Responding to increasing amount of FERC Rulings, NOPRs, preliminary staff assessments, and FERC issued Directives[3]
    - Providing support for increased standard development activities as outlined in the NERC 2014-2016 Reliability Standards Development Plan and assuming an active role in the newly formed NERC Project Management Oversight Subcommittee ("PMOS")
    - Participating in informal activities of standards development to promote consensus early in project development and provide technical guidance
    - Providing a forum for all NPCC representatives on the NERC drafting teams
    - Actively coordinating and reviewing Reliability Standards Audit Worksheets (RSAW) for correctness
    - Provide NPCC Regional point of contact for the new Reliability Issues Steering Committee ("RISC") to provide emerging and existing BES reliability related risks and potential gaps in the existing NERC standards
- Increased Number of Standards Projects
    - Active NERC Projects in the standards area are also expected to increase to address FERC outstanding directives.
    - The concept of informal development was introduced in 2013 and will be expanded to include more standards development projects in 2015 requiring more technical support, participation, and facilitation.
    - NERC has developed procedures and processes to allow it to revise standards in a more expeditious manner that may need clarification or address some deficiency.
    - NPCC is assisting with the Project Management Oversight Subcommittee (PMOS) which is responsible for managing the development of NERC standards projects and tracking Paragraph 81 Phase 2 retirement candidates

[1] In support of ERO Goal 1a Develop Standards which are clear, responsive to reliability and security risks, practical to implement, and cost-effective

[2] In support of ERO Goal 1aDevelop Standards which are clear, responsive to reliability and security risks, practical to implement, and cost-effective

[3] In support of ERO Goal 1a Develop Standards which are clear, responsive to reliability and security risks, practical to implement, and cost-effective

  - Promote and assist with the Cost Effective Analysis Process ("CEAP") to ensure standards have the most cost effective requirements which meet the reliability objectives of standards under development[4]

- Further resources required to evaluate the standards from a "cost benefit" and also a "cost effectiveness" perspective will be required.
- NERC Reliability Standards will continue to require Violation Risk Factors (VRFs) to be developed and NERC is reviewing additional levels of VRF and development of a Sanction Matrix which is envisioned to replace the Violation Severity Levels (VSLs).
- Expanded efforts to educate and inform stakeholders in the areas of NERC and NPCC Regional Standards through NPCC Workshops and with anticipated additional forums such as increases in the amount of Internet based meetings and technical conferences. [5]

2015 Key Assumptions

- Facilitate stakeholder review, comment on, and develop ballot recommendations or list of Regional issues, for all NERC Reliability Standards Projects under informal or formal development or revision prior to the end of ballots
  - NERC and NPCC benefit from NPCC's Regional coordination consisting of a broad stakeholder review process and development of consensus recommendations to assure proposed standards will support international reliability and provide appropriate reliability objectives for the Continent-wide standards
  - Coordinate a comprehensive review of the results based standards initiative processes and standards being implemented
  - Conduct and obtain training for performing Quality Reviews of standards at both the Regional level and to assist the ERO with analysis of the continent wide standards
  - Coordinate the review of all Reliability Standards Audit Worksheets during their postings for comment for potential expansion of their associated standard's requirements
  - Refine the NPCC triage process to assess posted standards and related material to ensure it is properly routed to and addressed by the appropriate NPCC technical or process resources.
- Participate in the stakeholder efforts to develop Standards Authorization Requests (SARs) and Regional SARs to further improve standards in response to any potential inadequacies in reliability or to improve standards
- Monitor and participate in the drafting of key NERC Reliability Standards-CIP, Protections Systems, Balancing Control Performance, and Frequency Response, etc.
  - The NPCC monitoring of the development of standards helps to ensure reliability requirements that are clear, measureable, and enforceable and support international reliability in the Northeast
- Continue with the development and maintenance of a set of NPCC Phase II Directories not inconsistent with the NERC Reliability Standards which clearly delineate the more stringent NPCC criteria requirements

[4] In support of ERO Goal 1a Develop Standards which are clear, responsive to reliability and security risks, practical to implement, and cost-effective

[5] In support of ERO Goal 1a Develop Standards which are clear, responsive to reliability and security risks, practical to implement, and cost-effective

  - The combination of North American and Regional Reliability Standards with the more-stringent NPCC Regional criteria provides for consistency and operational clarity while providing robust defense in–depth, results based, standards to ensure BES reliability
  - Ensure no redundancies exist between the criteria found in the NPCC Directories and the ERO standards
  - Retire Directories that have been overtaken by improved NERC standards
  - Continually file the more stringent requirements with the New York State Department of Public Service and Canadian Provinces as applicable
- Review reliability requirements of ERO and NPCC Regional Standards, NPCC Criteria and ensure consistency, remove redundancies, adopt Functional Model language and ensure requirements are "results based"
  - The unambiguous assignment of reliability requirements to specific functional entities benefits international reliability
  - Participate in the continuing refinement of the Functional Model to capture evolving issues essential to reliability and new objectives in the industry, i.e. demand resource operator, planning functions, new activities yet to be identified such as those associated with Smart Grid, "Synchro-Phasor" technology, etc.
  - Participate in the continual improvement of the NERC standards development processes and initiatives such as the CEAP, PMOS and Single Portal Project.
  - Contribute to the improvement of process related to NERC providing interpretations.
- Review all FERC orders and Provincial regulations as they relate to the standards, their revision and adoption
  - Northeast reliability benefits from careful analyses of governmental orders or actions adopting standards to assure consistency in interpretation
  - Review rulings that are issued and all FERC Directives for potential reliability related issues
  - Conduct and support Regulatory/Governmental Provincial filings on a periodic basis based on individual Provincial Laws and requirements outlined in the Memorandum of Understandings for each Province.
- Enhance NPCC standards website pages to provide uniform and clear information to the stakeholders while also providing the historical and archived information to support NERC and FERC approvals and expanding requirements

2015 Goals and Key Deliverables

The Reliability Standards program goals and objectives for 2015 are grouped into seven categories:

1) Participate in the ERO Results-Based Standards Development

- Participate in the development and revision of the NERC three year work plan through review, commenting and drafting activities
- Participate in the Standards Committee Strategic initiatives to develop results based standards that will provide a defense in depth, complete the standards due for 5 year review, and address all existing and outstanding FERC Directives.
- Support the implementation of the NERC Board of Trustees ("BOT") resolutions specifically supporting the timeliness, cost effectiveness, timely development, and quality of new standards

- Coordinate the development of ERO Reliability Standards within NERC's three-year standards work plan with the emphasis placed on reducing the amount of new FERC Directives issues by closer coordination with the Commission staff
- Conduct thorough reviews of all NERC standards being developed or revised and coordinate comments for Northeastern North America driving consensus to the extent possible
- Facilitate and enhance the NERC Cost Effective Analysis Procedure both within NPCC throughout the industry
- Conduct thorough reviews of all Industry requested NERC Formal Interpretations of standards and develop and promote the NERC Informal Guidance Process, a comprehensive process to deal with all standards related questions, e.g. Single Portal
- NPCC staff along with NPCC solicited Regional drafting team volunteers, will participate in the drafting of all ERO standards affecting or potentially affecting reliability in the Eastern Interconnection and provide support for review and development of comments and propose improvements with specific emphasis on CIP
- NPCC and its members will review and coordinate potential comment on FERC preliminary staff assessments as appropriate
- Participate in ballots for ERO standards and provide consensus recommendations to the NPCC Members of the NERC Registered Ballot Body or provide a list of issues to allow the Members to cast a ballot based on Regional concerns prior to the end of the ballots
- Review and develop issues on FERC Notice of Proposed Rulemakings for any and all standards related issues as appropriate
- Coordinate and evaluate proposed standards utilizing NPCC's Regional technical task forces, working groups and committees
- Educate and notify stakeholders and regulators about issues related to standards development through various means such as webinars and workshops
- Provide outreach to industry trade groups to educate and drive consensus such as the North American Generator Forum and North American Transmission Forum
- Provide a forum for NPCC review of proposed and posted documents from the NERC Critical Infrastructure Protection Committee (CIPC) and NPCC Task Force on Infrastructure Security and Technology (TFIST)
- Provide support to NERC's strategy in the prioritization, identification, scheduling and development of NERC directed Regional Reliability Standards
- Participate in NERC's Standards Committee standards prioritization process, to identify immediate standards needs and prioritization based on need
- Participate in the NERC RISC by providing a Regional point of contact for all potential reliability related risks and gaps within the Northeast or as noted by NPCC stakeholders
- Participate in and provide support to critical standards, such as UVLS, Voltage and Reactive Control, Real Time Tools, Frequency Response, etc.
- Identify and initiate Regional Variances to the NERC Reliability Standards as soon as possible, allowing incorporation into the continent wide standard at its inception
- Identify potential drivers for standards revisions based on revisions to the BES to a bright line criteria and any document revisions required as a result of consideration of the "Exception Process".
- Support additional standards workload from further economic stimulus, i.e. standards on integrating variable generation resources or EHV backbone, Smart Grid, Electric Vehicles or "Synchro-Phasor" projects as necessary

- Provide continued input and leadership to NERC, based on NPCC experiences, regarding strategy for developing cost effectiveness analysis for standards and support activities to enhance this to identify "benefits" for the draft standards.
- Provide support and assistance to the ERO for conducting Quality Review activities on NERC continent-wide standards as possible
- Continually file the NPCC Directories with the Canadian Provincial Regulatory Authorities within the NPCC "footprint", on an as needed basis, as the directories are developed and revised and as the Provinces establish procedures and agreements with NPCC.
- Continue to develop new and innovative processes to better utilize the limited internal and external resources in the Region to enable sufficient technical review of posted standards and related materials
- Support the ERO and the relationships with FERC and the provincial governmental authorities for standards development activities as necessary to accomplish the ERO goals and objectives
- Support the development of system protection and control, communication, transmission operation standards and other critical standards efforts.

2) Regional Standards Development

- NPCC does not anticipate developing further Regional Standards but reserves the right to do so if a reliability issue exists that is not appropriate for Continent-wide development and also will perform clarifications as needed to existing approved Regional Standards.
- Draft any additional standard NERC directs NPCC to develop to meet an urgent reliability related needs, i.e. Geomagnetic disturbance system hardening
- Accomplish all directives of ERO and governmental and/or regulatory authorities with regard to Regional Standards development and procedures
- Adhere to and surpass, where practical, the 2014-2016 NERC Work plan milestones as they pertain to targets for the Regional Standards
- Respond to any FERC Directives that may arise as a result of the filing of NPCC's Regional Standards with the FERC or any Provincial "directives" that may be issued by the Canadian Regulatory Authorities

3) Standards Improvement

- Achieve NPCC reliability goals and objectives by initiating, participating in, and efficiently completing standards related activities
- Leverage internet and web based tools functionality to ensure inter-Regional consistency and quality of Regional Reliability Standards
- Establish long-term strategy for standards improvement and initiate implementation
- Continually identify additional future Regional Standard opportunities if Continent-wide standards are not an appropriate solution
- Ensure the topics addressed by the Reliability Standards parallel changing industry needs
- Participate in reliability metrics activities to identify potential measures for benchmarking of reliability to determine if an adequate level of reliability is being achieved
- Support and develop cost-benefit analysis activities to determine if any potential incremental increases in costs of implementing a standard have sufficient enough reliability benefit to implement that standard

4) Coordination of review of RSAWs

- Develop a process to review the RSAWs consisting of subject matter experts to determine if the RSAWs are technically representative of the standard's requirements and also to review the evidence suggested in the RSAW for satisfactory compliance assessment
- The Regional Standards Committee ("RSC") will oversee and provide the results of the coordination to the appropriate NERC SDT charged with development of the RSAW

5) Business Practices Interface

- Coordinate the review of standards through NPCC RSC, staff, and other members participating in activities of the North American Electric Standards Review Board (NAESB)
- Identify potential market related issues for Regional Standards through NPCC RSC coordination and reviews

6) Opportunities for Process Improvement

- Identify efficiencies for a coordinated NERC standards development process and NPCC Regional Standards Development Procedure and recommend revisions as applicable to either process
- Refine the NERC and NPCC CEAP s to evaluate the costs and effectiveness of proposed new and revised reliability standards to achieve an adequate level of reliability and a steady state set of standards
- Participate in any potential revision and redrafting of the NERC Standards Development Process to consider expedited standards development and cost effectiveness analysis and maintaining the ANSI Accreditation for standards development
- Participate in the enhancement of the Single Portal on the NERC website to provide one stop shopping for stakeholders seeking answers to questions.
- Identify potential future processes to obtain expedited interpretations
- Identify expedited processes for adjusting NERC glossary terms
- Identify refinements for credentialing standard drafting team members to ensure the correct subject matter experts are developing the standards at both the Regional level and the ERO level.
- Establish targets for NERC and NPCC standards procedure improvement and support initiation of implementation of the strategy
- Streamline and improve the Regional Standards program tools and IT based solutions
- Refine the records retention programs to ensure sufficient documentation exists for regulatory approvals
- Develop document management systems to allow the efficient and effective revisions of documents, control of authorship and security of documents
- Identify improvements in process for feedback loops to ensure that event analysis and investigation lessons learned and compliance issues involving violations are fed into the standards program area, as appropriate for review and potential consideration when revising standards
- Support the creation of an ERO standards database, available to industry and online, to identify and review issues related to all approved and developing standards
- Participate in the Functional Model Working Group activities to refine functions, tasks and responsibilities of applicable entities
- Solicit and provide outreach to FERC in the Regional Standards Development Processes

7) Communications

- Improve automated notifications process to assure awareness of dates and proceedings of all standard development activities
- Strengthen the relationship with the industry's technical committees to ensure adequate input to standards development, such as the North American Generator Forum.
- Participate in NPCC and NERC workshops as necessary, to promote awareness and educate the industry
- Develop and institute a consensus building and notification process(es) for engaging stakeholders and providing immediate notification for the need to review standards. Provide the associated coordination for this review utilizing subject matter experts, both internal and external to the Regional Entity staff
- Promote the reliability objectives of the NERC standards as appropriate to the NPCC members of the NERC Registered Ballot Body in order to achieve consensus and support of beneficial standards and to promote the "One-Enterprise" model.

Technically excellent, results based standards that enhance reliability and are developed in a timely and efficient fashion, require the full participation of the right industry experts from all Regional Entities when developing Reliability Standards. The NPCC RSC promotes the drafting team process and solicits drafting team members from appropriate NPCC technical bodies and others in the industry and adjoining Regional Entities. In addition the NPCC RSC works with the individual NERC standards developers to participate in Regional outreach and coordination of issues at each NPCC RSC meeting.

NPCC RSC will also assist in providing notifications and announcements to NPCC participants in the Northeastern North America NERC Registered Ballot Body of important applicable deadlines for ballot pool registration and for casting ballots thereby enhancing participation, promulgation of important information and increasing awareness. In the fourth quarter of 2014 NERC will "roll out" a new Standards Balloting System (SBS). This new system will require training and an implementation communication plan. NERC will develop the training and NPCC will assist in providing it throughout the Northeast. The SBS will require all users to reregister to cast ballots as well as submit comments. This support will enhance efficiency of the NERC procedure and help to ensure the necessary quorums are present at ballot and help to clean up the registered ballot body list. NPCC will also, when practical, promote important standards and the requirements of those standards through various communications.

NPCC will also participate in the development and revision of standards as directed by FERC, Canadian provincial and other regulatory and/or governmental authorities. FERC to date has identified numerous NERC Reliability Standards needing further work and has issued numerous Directives appearing in FERC Orders. In 2013 FERC also issued remanded interpretations and standards which require NERC to address commissions concerns as outlined in the associated Orders. These remands have created a need for NERC to review existing processes and determine approaches going forward. NPCC will support these efforts and will lead the review and potential revision of the NERC Interpretation process. These standards needing revision are delineated in the 2014 – 2016 NERC Reliability Standards Development Plan, and will be ready to be reviewed and revised throughout 2015.

NPCC will provide support and coordination of NERC standards development activities as outlined in the 2014-2016 Reliability Standards Development Plan and the Standards Committee and ERO strategic goals and initiatives.

Regional Standards Development

The NPCC currently has two FERC approved Regional standards, Disturbance Monitoring and Underfrequency Load Shedding. NPCC has undertaken the review of the Disturbance Monitoring standard for adequacy from the perspective of a "bright line" BES definition and currently developing PRC-002-2 Disturbance Monitoring continent wide standard. This review of the standard and proposed revision to the standard will be performed in the 2014-2015 timeframe. In addition there are two other Regional standards that NPCC may review to determine if they should move forward into active formal development. These Regional Standards will include, but not be restricted to the following:

- Special Protection Systems (SPS) scheduled to begin development in 2014
  Balancing Authority Controls (BA - Reserve Sharing)

Whether NPCC pursues these Regional standard will depend in large part to how comprehensive their associated continent-wide standards are. NPCC will review the continent wide standards as they are develop, participating in those activities and providing supporting subject matter expertise as it is available.

Based on the portion of professional/technical staff time and other resources devoted to Reliability Standards development, NPCC estimates that it will expend approximately 10 percent of its resources on this activity.

Funding Sources and Requirements — Explanation of Increase (Decrease)

Funding Sources (Other than ERO Assessments)

- U.S. Penalty Sanctions remitted from 7/1/13 through 6/30/14 reduce U.S. LSE designee assessments for 2015.

Personnel Expenses

- NPCC anticipates no need to hire additional personnel in this program area in 2015.
- Salaries expense reflects implementation of recommendations of NPCC's Management Development and Compensation Committee, which were based on an independent compensation study.
- Benefits expense decreased due to more staff opting out of company sponsored health insurance for superior coverage through prior employer or spouse.
- Retirement expense decreased due to transition of employees formerly accruing benefits under the defined benefit plan to receiving defined contribution benefits in 2015.

Meeting and Travel Expenses

- Meeting expenses will be minimized due to a continued effort to keep costs down by holding more meetings via WebEx and teleconferences, at the NPCC offices or member facilities when possible, as well as lower meeting space rental rates through negotiations. However, meeting volume is expected to increase in 2015. Travel expenses due to continued practice of advance bookings, adjustments to class of hotel used, increased meetings at NPCC's offices, and meetings conducted via teleconference will be held to a minimum. Conference calls and Internet meetings, which are budgeted as a part of G&A and then allocated to the direct programs through indirect expenses, will be conducted for business when practical.

Operating Expenses and Indirect Expenses

- 2015 Reliability Standards program funding is driven by the need for additional activities to support NERC standards activity to achieve a results based, adequate, set of steady state standards, FERC activity and increased number of rulings and directives are anticipated as a result of the NERC three year work plan. NPCC anticipates expanded activity and plans to prioritize the efforts of existing resources to meet this expanded workload to support reliability and the ERO Strategic Goals. In addition, as standards reviews increase in number, there may be a need to have contractors assist due to constrained resources of NPCC Staff and members.

- NPCC total overhead expenses, such as office rent and office costs will be charged to the Administrative Services Programs and then reallocated proportionately based on FTE to the programs through Indirect Expenses.

Other Non-Operating Expenses

- None

Fixed Asset Additions

- None

Reliability Standards Program

Funding sources and related expenses for the Reliability Standards section of the 2015 business plan are shown in the table below.

Statement of Activities and Capital Expenditures 2014 Budget & Projection, and 2015 Budget						
Reliability Standards						
		2014 Budget	2014 Projection	Variance 2014 Projection v 2014 Budget Over(Under)	2015 Budget	Variance 2015 Budget v 2014 Budget Over(Under)
Funding

Compliance Monitoring and Enforcement and Organization Registration and Certification Program

Compliance Monitoring and Enforcement and Organization Registration and Certification Program Resources (in whole dollars)	2014 Budget	2015 Budget	Increase (Decrease)
Total FTEs	16.00	16.00	0.00
Direct Expenses	$5,080,485	$5,440,048	$359,564
Indirect Expenses	$3,034,462	$3,064,686	$30,225
Other Non-Operating Expenses	$0	$0	$0
Inc(Dec) in Fixed Assets	($35,575)	$63,410	$98,985
Total Funding Requirement	$8,079,371	$8,568,145	$488,774

Program Scope and Functional Description

The Compliance Monitoring and Enforcement and Organization Registration and Certification Program (CORC) Program scope covers: 1) the identification, registration and certification of those entities responsible for meeting the NERC Reliability Standards and any approved Regional Standards; 2) the implementation of the NERC Compliance Monitoring and Enforcement Program (CMEP) in the United States, including the compliance monitoring, assessment and enforcement of NERC Reliability Standards and Regional Reliability Standards. and 3) the implementation of compliance monitoring, assessment and enforcement recommendations in accordance with individual executed MOUs or Agreements in the Canadian Provinces of Ontario, Québec, New Brunswick and Nova Scotia.

The NPCC Compliance Committee (CC) is charged with providing objective stakeholder policy input to NPCC's implementation of the CMEP in the U.S. and compliance related activities under the above mentioned MOUs in the NPCC portion of Canada. With regard to NERC Reliability Standards and Regional Reliability Standards, the CC provides an oversight role of the independent NPCC compliance staff's implementation of the CMEP. In this oversight role the CC will review and endorse the processes used by the NPCC compliance staff in the conduct of the CMEP.

The NPCC compliance staff makes the initial and final determination of alleged violations and determines appropriate penalties and sanctions in accordance with the NERC *Sanction Guidelines*. To accomplish this objective, NPCC's compliance staff is further divided into four sub- program areas: Compliance Implementation and Registration; Compliance Audit Program; Compliance Enforcement; and Compliance Investigation:

Compliance Implementation and Registration

The Compliance Implementation and Registration sub-program is responsible for:

a) Identifying for registration, using a risk based registration model, all entities that are required to meet the NERC and Regional Reliability Standards. During the course of this activity, regular communication with registered entities is promoted through face-to face meetings, compliance workshops, teleconferences and email;
b) Development and maintenance of all CMEP Compliance Procedures, Compliance Instructions and all other CMEP related documentation;
c) Development and maintenance of Performance Metrics that are used to measure the quality and effectiveness of CMEP Implementation and its impact on the reliability of the Bulk Electric System;
d) Coordinating the implementation of NPCC Compliance Staff responsibilities as they pertain to the executed MOU with each of the Canadian Provinces in the NPCC Region.
e) Day-to-day implementation of the CMEP;
f) Development of annual CMEP Implementation Plan;
g) Monitoring and assessment of self-certification, self-report, exception reporting, periodic data and complaint submittals;
h) Development and maintenance of CMEP Data Administration Application (CDAA);
i) Development and maintenance of compliance website.
j) Support the anticipated expansion of the number of registered entities in NPCC due to the implementation of the FERC Order related to the definition of Bulk Electric System
k) Conduct Entity Impact Evaluations. Conduct certification(s) of newly identified Transmission Operators (TOPs), as needed.
l) Maintain database of BES assets subject to NERC and NPCC Reliability Standards
m) Participation on various NERC and NPCC working groups to remain apprised of changes to Compliance processes, and commonality of registration, monitoring, auditing, and enforcement approaches.

Compliance Audit Program

The Compliance Audit Program is charged with conducting both on-site and off-site compliance audits, and spot checks, of NERC Reliability Standards in accordance with the NERC Rules of Procedure and associated NPCC procedures developed under the NPCC Compliance Implementation Program. These audits are performed on the basis of risk to the BES. The yearly schedule is produced consistent with Risk Assessment of registered entities and the frequency of their last audit. The schedule is posted annually on NERC and NPCC public websites. Flexibility may be used in the predefined frequency based on the risk assessment and performance based assessment of each entity scheduled for an audit, and changes requiring certification. The audits are led by qualified senior NPCC Staff and the audit teams prepare public and non-public audit reports with their findings, including the identification of any possible violations. Contents and processing of the reports are in accordance with NERC directives for audit reporting. Specific lessons learned are factored into the audit program to promote continuous improvement and are presented at workshops in conjunction with the Compliance Implementation Program. The comprehensive spot-check program is established based on the NERC actively monitored list, NPCC's assessment of self-certifications, follow–ups on entities who have previously violated a Reliability Standard, follow-up on entities that have been involved in a significant system event, and other requirements which at the discretion

of NPCC could pose a higher risk to reliability if not followed properly. The schedule for Spot Checks is not public.

Resources from the Compliance Audit Program are also used to implement the Certification process for entities intending to register as new TOPs, BAs or RCs, as well as certification reviews of changes made by existing TOPs, BAs and RCs that meet the threshold requiring same. These actions are performed in support of the Compliance Registration Program which encompasses the Certification process. Resources for this activity, which is independent of the audit process, depend on the scope, function, and location of the entity being certified.

Compliance Investigation

A Compliance Investigation (CI) may be initiated at any time by NPCC in response to a system disturbance, complaint, or possible violation of a Reliability Standard identified by any other means. The CI process requires the establishment of an investigation team that coordinates with NERC and FERC as necessary; and also coordinates with the Situation Awareness Program Area.

Compliance Enforcement

In processing identified violations NPCC Compliance Enforcement will strive to promote both timeliness and transparency of compliance results, including those efforts associated with meeting the enforcement metrics described below. In addition NPCC will promote the use of self-identification of non-compliance and implementation of discretion, including increased utilization of streamlined tracks such as FFT and discretion as shown below.

Compliance Enforcement responsibilities:

a) Issuing all Notices as described in the CMEP including the Notice of Possible Violation (NOPV), Notice of Find, Fix and Track (FFT) Treatment; Notice of Alleged Violation (NOAV), and the Notice of Confirmed Violation (NOCV);
b) Conducting comprehensive enforcement investigations based on the facts and circumstances related to all possible violations of Reliability Standards, whether identified in an audit, a self-report, complaint, or other source, and determining whether further action is warranted;
c) Reviewing, approving, submitting to NERC and tracking the progress of all mitigation plans /mitigating activities associated with confirmed violations;
d) Coordinating settlement activities once they have been initiated and submitting settlement agreements to NERC for approval;
e) Identifying and processing candidates for the FFT Process;
f) Participating in the Hearing Process by representing NPCC before the Hearing Body. Compliance Hearings would be conducted at NPCC under the supervision of a qualified, independent hearing officer contracted by NPCC;
g) Issuing Remedial Action Directives when appropriate; and
h) Implementing of the Reliability Assurance Initiative (RAI), including :
    i. Notifying the registered entity, within 60 days on average, whether a non-compliance will proceed through enforcement, be treated as a compliance exception or additional information is needed (“Triage”);
    ii. Utilizing the Aggregation of Minimal Risk Process; and
    iii. Utilizing the Enforcement Discretion Process.

A set of enforcement metrics, that include those metrics included in the ERO Corporate Goals, are produced that cover the following:

a. Caseload Index and Violation Aging
b. Mitigation Aging
c. Percentage of self-identified violations
d. Percentage of minimal and moderate risk violations through FFT, SNOP or discretion

Each of these metrics will have target values defined that are consistent with those target values identified in the ERO Corporate Goals.

2015 Key Assumptions and Cost Impacts

2014	Projected 2015
3 Large On-Site Audits	4 Large On-Site Audits
0 Medium On-Site Audits	0 Medium On-Site Audits
3 Small On-Site Audits	3 Small On-Site Audits
12 On-Site CIP Audits	4 On-Site CIP Audits
20 Large Off-Site Audits	8 Large Off-Site Audits
7 Medium Off-Site Audits	21 Medium Off-Site Audits
7 Small Off-Site Audits	10 Small Off-Site Audits
22 Off-Site CIP Audits	24 Off-Site CIP Audits
300 Spot Checks	350 Spot Checks
8 On-site TFE Part B reviews	4 TFE Part B Reviews
200 Violations (Estimated)	200 Violations (Estimated)
Settlements Covering 100 Violations	Settlements Covering 100 Violations
2 Hearings (Unbudgeted)	2 Hearings (Unbudgeted)
1 CI (Estimated)	1 CI (Estimated)
0 Entity Certifications	2 Entity Certifications

- Regarding the Compliance Audit Program, Technical Feasibility Exception (TFE) reviews are conducted both on-site at the entity's facility and at the NPCC offices when possible. TFE's continue to be requested as entities replace and install new equipment/devices/components that meet the criteria set forth in Rules of Procedure Appendix 4D. Compliance estimates 4 on-site reviews will be performed in 2015.

- Increases in Audit costs reflect Risk Assessment activity that is the basis for audit scoping. The Risk Assessment includes an assessment of an entity's Internal Controls which will be used for future audits in the scoping and frequency of engagements.
- Potential increases due to the newly identified role related to implementing the QCMEP in Quebec and the continuing role of implementing the NB CMEP in New Brunswick.

- The 2015 Business Plan projects no increases in Enforcement Processing activities over the 2014 Budget.
- The 2015 Business Plan projects the need for 1 Compliance Investigation. These Compliance Investigations are manpower intensive for NPCC staff (requiring allocation of more resources and potentially higher than normal costs) since previous Compliance Investigations have also included entities outside of NPCC's footprint for which NPCC is the Compliance Enforcement Authority.

2015 Goals and Key Deliverables

- Conduct 2015 CMEP consistent with the Reliability Assurance Initiative, incorporating Risk Assessment; Internal Control assessment; Aggregation of Minimal Risk Violations; and Enforcement Discretion and all NERC Reliability Standards contained in the NERC actively-monitored list for 2015 and any approved and applicable Regional Reliability Standards
  - Process identified violations as effectively as possible, including the timely identification of a violation, timely issuance of violation notices including the NOPV; the Notice of Alleged Violation and the NOCV
  - Implement settlement process when applicable and send proper notifications to NERC and FERC
  - Conduct necessary Hearings related to resolution of outstanding disputes regarding violations and/or sanctions. Send results of hearings to NERC and FERC[17];
- Continue to enhance the settlement process by modifying existing practices and adopting new practices to reduce the duration of settlement negotiations without sacrificing the rigor and quality of the negotiated settlements. Develop and analyze appropriate performance metrics that track settlement process duration and utilize results of analysis to further enhance process.
- Implement compliance responsibilities identified in the approved Canadian MOUs[18];
- Annual report to NERC and Régie on NPCC implementation of QCMEP
- Annual report to NERC and New Brunswick Electric Utility Board (EUB) on NPCC implementation of NB CMEP.
- Review and revise NPCC Compliance Registry based on a risk-based approach[19] ;
- Evaluate CMEP and Canadian entity compliance program implementation with the objective of establishing a long-term strategy for compliance improvement, and initiate the implementation of the long term strategy[20];
- Provide NPCC Regional Entity input, through participation in appropriate NERC compliance committees, on policy and implementation issues related to compliance and enforcement including the development of compliance elements for all new or revised NERC Reliability Standards[21];

[17] In support of ERO Goal 2. Be a strong enforcement authority that is independent, without conflict of interest, objective and fair.
[18] In support of ERO Goal 3. Promote a culture of compliance that supports reliability excellence within industry.
[19] In support of ERO Goal 2. Be a strong enforcement authority that is independent, without conflict of interest, objective and fair.
[20] ERO Goal 2. Be a strong enforcement authority that is independent, without conflict of interest, objective and fair.
[21] ERO Goal 6. Promote a culture of reliability excellence.

- Provide required information to NERC on a timely basis including reporting of alleged violations and confirmed violations[22];
- Track the progress of, report status of, and approve mitigation plans[23];
- Conduct 2015 Compliance Audit Schedule based on risk to the BES and number of registered entities (Each audit covers a single registered entity that could be audited for multiple Functional Model types that they are registered for and is done in accordance with the 2015 Compliance Audit Program schedule)[24] ; and promote RAI initiatives by:
    - Utilizing the Audit Checklist and Auditor's Handbook for all on-site and off-site audits
    - Preparing a Risk Assessment and Internal Control Assessment for all on-site audits[25];
- In addition, 28 registered entities will be audited for the requirements of the version in place for CIP 002 to CIP 009. These will be separate audits. On-site CIP audits may be combined with the normally scheduled 2015 on-site audits[26];
- A spot check can be viewed as a limited unscheduled small off-site compliance audit that will be utilized to verify self-certification submittals that have been done earlier in the year or other requirements based on factors as described in the Compliance Audits section. In 2015 the number of spot checks to be done is estimated to be 350[27] ;
- Assure that NPCC Staff is trained to conduct Compliance Audits including CIP Compliance Audit training[28];
- Assure that NPCC Staff is trained to conduct Certification of entities intending to Register as BA, RC or TOP for the first time, or Certification Reviews of changes by existing BAs, RCs or TOPs that meet the criteria requiring a Certification Review[29];
- NPCC is working with the other Regions to access, train and perform certifications (and re-certification) in an effort to be consistent across the ERO[30] ;
- Continue to actively perform a risk profile of each entity prior to audit and upon completion of an audit, continue to identify risk and reliability gaps[31] ;

[22] ERO Goal 2. Be a strong enforcement authority that is independent, without conflict of interest, objective and fair.
[23] ERO Goal 2. Be a strong enforcement authority that is independent, without conflict of interest, objective and fair.; ERO Goal 5. Be accountable for mitigating reliability risks.
[24] In support of ERO Goal 3a. and 3b. Promote a culture of compliance that supports reliability excellence within industry.
[25] In support of ERO Goal 3. Promote a culture of compliance that supports reliability excellence within industry.
[26] In support of ERO Goal 3. Promote a culture of compliance that supports reliability excellence within industry.
[27] In support of ERO Goal 3. Promote a culture of compliance that supports reliability excellence within industry.
[28] In support of ERO Goal 3. Promote a culture of compliance that supports reliability excellence within industry.
[29] In support of Goal 2a. Be a strong enforcement authority that is independent, without conflict of interest, objective, and fair, and promote a culture of reliability excellence through risk-informed compliance monitoring and enforcement. a. The ERO registers and deregisters entities commensurate with risk to the BES and ensures all key reliability entities are certified to have essential capabilities.
[30] In support of Goal 2a. Be a strong enforcement authority that is independent, without conflict of interest, objective, and fair, and promote a culture of reliability excellence through risk-informed compliance monitoring and enforcement. a. The ERO registers and deregisters entities commensurate with risk to the BES and ensures all key reliability entities are certified to have essential capabilities.
[31] In support of Goal 4a. Identify the most significant risks to reliability, be accountable for mitigating reliability risks, and promote a culture of reliability excellence. a. Risks are identified and prioritized based on reliability impacts, cost and practicality of assessments, projected resources, and emerging issues.

- Develop and implement compliance reform via the Reliability Assurance Initiative (RAI) by being an integral participant in committees and workgroups involved in the RAI[32];
- Promote a culture of compliance that addresses reliability risks of NPCC registered entities by using reliability gap analysis. Assess and evaluate registered entity's Internal Controls as part of the audit and spot check process[33];
- Continue to expand the use of discretion through the utilization of compliance exception. [34] ;
- NPCC will collaborate with NERC to promote better coordination, planning, delivery and management of training efforts across the enterprise through a unified learning management system (LMS), without adversely impacting region-specific training requirements;
- Continue to implement physical security outreach and Cyber Security outreach by visiting four registered entity sites to perform an assessment of their physical security, evaluate their Cyber Security and supply recommendations for improvements[35];
- Enhance the CDAA to expand its capabilities from both the registered entity perspective and the NPCC Compliance Staff perspective[36];
- Conduct 2015 Compliance Workshops and interim information sessions for registered entities as necessary as a part of Training and Education program area[37].

Adopt and promote practices to enhance the benefits of the self-reporting of violations by both the Regional Entity and the registered entity. This would include improvement to the registered entity internal processes used for identifying and submitting self-reports (e.g. adoption of an aggregated approach for submittal of self-reports, etc.), improvement in the way Regional Entities process self-reports and the streamlining and standardizing of the amount and type of data needed to evaluate a self-report.

[32]In support of Goal 3a. Promote a culture of compliance that supports reliability excellence within industry. a. Industry has effective procedures and programs to monitor, detect, correct, report, and prevent compliance, reliability, and security issues.

[33]In support of Goal 3a and 4a Goal 3. Promote a culture of compliance that supports reliability excellence within industry. Industry has effective procedures and programs to monitor, detect, correct, report, and prevent compliance, reliability, and security issues. Goal 4. Identify the most significant risks to reliability, be accountable for mitigating reliability risks, and promote a culture of reliability excellence. a. Risks are identified and prioritized based on reliability impacts, cost and practicality of assessments, projected resources, and emerging issues.

[34]In support of Goal 2b. Goal 2. Be a strong enforcement authority that is independent, without conflict of interest, objective, and fair, and promote a culture of reliability excellence through risk-informed compliance monitoring and enforcement. 2.b. The ERO holds industry accountable for violations that create serious risk to the BES; resulting actions are timely and transparent to industry.

[35]In support of Goal 4c. Goal 4. Identify the most significant risks to reliability, be accountable for mitigating reliability risks, and promote a culture of reliability excellence. 4.c. ERO supports industry situational awareness and cybersecurity preparedness and provides independent reliability information to policy makers.

[36]In support of Goal 5c. Goal 5. Improve transparency, consistency, quality, and timeliness of results; operate as a collaborative enterprise; and improve efficiencies and cost-effectiveness. 5.c. The ERO internal risks are understood and managed; ERO processes are effective, efficient, and continuously improved.

[37]In support of Goal 5a. Goal 5. Improve transparency, consistency, quality, and timeliness of results; operate as a collaborative enterprise; and improve efficiencies and cost-effectiveness. 5.a. The ERO acts in a coordinated and collaborative manner with stakeholders.

Based on the portion of professional/technical staff time and other resources devoted to Compliance monitoring and enforcement and organizational registration and certification, NPCC estimates that it will expend 58 percent of its resources on this activity.

Funding Sources and Requirements — Explanation of Increase (Decrease)

Funding Sources (Other than ERO Assessments)

- U.S. Penalty Sanctions remitted from 7/1/13 through 6/30/14 reduce U.S. LSE designee assessments for 2015.

Personnel Expenses

- NPCC anticipates no need to hire additional personnel in this program area in 2015.
- Salaries expense reflects implementation of recommendations of NPCC's Management Development and Compensation Committee, which were based on an independent compensation study.
- Benefits expense decreased due to more staff opting out of company sponsored health insurance for superior coverage through prior employer or spouse.
- Retirement expense decreased due to transition of employees formerly accruing benefits under the defined benefit plan to receiving defined contribution benefits in 2015.

Meeting and Travel Expenses

- Meeting expenses will be minimized due to a continued effort to keep costs down by holding more meetings via teleconference, at the NPCC offices or member facilities, combining or appending meetings to other mandatory training/meetings, as well as lower meeting space rental rates through negotiations. Travel expenses due to continued practice of advance bookings, adjustments to class of hotel used, increased meetings at NPCC's offices, and meetings conducted via teleconference will be held to a minimum, however, the amount of activity is expected to increase in 2015. Conference calls and internet meetings, which are budgeted as a part of G&A and then allocated to the direct programs through indirect expenses, will be conducted for business when possible.

Operating Expenses and Indirect Expenses

- Consultant and contractor costs increased due to increased workload related to the initial implementation of RAI, incorporating Risk Assessment and Internal Control assessment. Without this one time ramp up in RAI endeavors for 2015, contractor costs would have remained relatively flat. These joint ERO Enterprise initiatives are intended to benefit the registered entities, Regional Entities and NERC. With a risk and performance based assessment of each registered entity, audits will transition to a periodicity more reflective of the risk profile of the entity such that some audits will be more in-depth while others may have a reduced scope which will require less independent contractor resources.

- NPCC total overhead expenses, such as office rent and office costs, will be charged to the Administrative Services Programs and then reallocated proportionately based on FTE to the programs through Indirect Expenses.

Other Non-Operating Expenses

- None

Fixed Asset Additions

- Software development costs related to CMEP Data Administration Application (CDAA) and Compliance Issues Tracking System (CITS) enhancements are projected to continue into 2015.

Compliance Monitoring and Enforcement and Organization Registration and Certification Program

Funding sources and related expenses for the compliance enforcement and organization registration and certification section of the 2015 business plan are shown in the table below.

Statement of Activities and Capital Expenditures
2014 Budget & Projection, and 2015 Budget
Compliance Monitoring and Enforcement and Organization Registration and Certification

	2014 Budget	2014 Projection	Variance 2014 Projection v 2014 Budget Over(Under)	2015 Budget	Variance 2015 Budget v 2014 Budget Over(Under)
Funding					
ERO Funding					
ERO Assessments	$ 7,991,503	$ 7,991,503	$ -	$ 8,406,767	$ 415,263

Inc(Dec) in Fixed Assets	($52,315)	($21,349)	$30,967
Total Funding Requirement	$2,942,339	$3,053,923	$111,585

Program Scope and Functional Description

NPCC, through its top technical committee, the Reliability Coordinating Committee (RCC), integrates the deliverables of its Task Force's and Working Group's Reliability Assessment and Performance Analysis related activities. Consistent with the applicable NERC Reliability Standards, these efforts include:

- Reviewing the adequacy of the NPCC systems to supply load considering forecast demand, installed and planned supply and demand resources and required reserves in accordance with NPCC Reliability Directory No. 1 and other related reliability directories; and,
- Assessing the impact of planned transmission and resource additions or modifications on NPCC system reliability in accordance with NPCC Reliability Directory No. 1 and other related reliability directories.

Seasonal assessments of the overall NPCC resource adequacy assessments are performed and possible actions to mitigate any potential problems are identified. NPCC reviews operations and disturbances both internal and external to the Region in order to identify any lessons to be learned and recommends any necessary follow-up actions.

If appropriate, enhancements to Regional Standards or NPCC's more stringent, Regionally-specific reliability requirements are also recommended. NPCC promotes and conducts both inter-Area and inter-Regional studies to enhance reliability and operational effectiveness, and provides a forum for the discussion and coordination of operating issues within the NPCC Region and with other Regions.

2015 Key Assumptions

Support of identified key NERC Reliability Assessment and Performance Analysis (RAPA) projects; [38] NERC and Regional Entities will gather data or perform analysis in support of U.S. Federal and NERC initiatives, such as:

- Report Recommendation from the "*NERC Special Reliability Assessment Interim Report: Effects of Geomagnetic Disturbances (GMD) on the Bulk Power System*", including:
  i. enhancing system models in support of the study of GMD impacts;
  ii. Enhancing GMD notification procedures; and,
  iii. Determining optimum locations for monitoring capability on transformers, based on studies and operational experience.
- Follow-up study from the recommendations of the "*2013 NERC Special Reliability Assessment: Increasing Dependence on Natural Gas for Electric Power – Phase II: A Vulnerability and Scenario Assessment for the North American Bulk Power System;*"
- System frequency response analysis; and,
- Assessing reliability issues resulting from compliance to final EPA environmental regulations, reliable integration of new technologies as renewable energy, smart grid, energy storage, and/or reliability assessment of increased penetration of electric vehicles.

In support of NERC's 2015 Business Plan and Budget Program Area Services and Activities, NPCC will continue to:

- Vet proposed and future metric development, collection, and analysis with industry stakeholders and identify and spotlight trends through assessments of the availability data systems and metrics (e.g., TADS, DADS, GADS, TADS, SED, etc.)
- Conduct post-seasonal assessments (Summer and Winter) and additional scenario and special reliability assessments as required. Specialized contractors may be used to complete detailed analysis to support scenario assessments. Special reliability assessments currently proposed may include: changes in resource mix due to environmental regulations, electric/gas system interdependency, delays in proposed transmission development in the reliable integration of renewable resources.

In addition, NPCC supports:

- Development of NERC's Reliability Assessment Data System (RADS), [39] for the reporting and validation of the NERC Reliability Assessment Subcommittee Seasonal and Long-Term Reliability Assessment data requirements.

[38] In support of ERO Goal 4.- Identify the most significant risks to reliability, be accountable for mitigating reliability risks, and promote a culture of reliability excellence

[39] In support of ERO Goal 5.c - The ERO internal risks are understood and managed; ERO processes are effective, efficient, and continuously improved.

- Evaluation of a common set of probabilistic reliability indices and probabilistic-based work products to supplement the NERC Long-Term Reliability Assessments;
- Coordination with event analysis, lesson learned [40] and model validation activities. [41] Specialized contractors may be used to complete detailed analysis to support model data collection and validation;
- Support of NERC PMO IT deployments; [42] and,
- Provide support and technical input for related BES risks identified by the NERC Reliability Issues Steering Committee (RISC). [43]

Definition of the Bulk Electric System (BES) Definition [44]

Implementation of the Bulk Electric System (BES) definition and Exception Process as of the July 1, 2014 BES Effective Date is not expected to significantly impact resources requirements in this program area for 2015. NPCC's 2014 survey of its registered entities did not indicate that an overwhelming number of NPCC BES Exception requests would be sought based on the filed BES Definition. Based on the Commission approved BES Definition [45] and the NPCC BES 2014 survey results, the 2015 RAPA personnel should be sufficient to process any NPCC BES Exception requests received in 2015.

NPCC will use the NERC PMO developed BESnet application and related BES reference and guidance documents to assist industry in the implementation of the BES definition approved by the Federal Energy Regulatory Commission. The BES reference and guidance documents, processes and tool are designed to provide industry with certainty and clarity about the implementation of the revised BES definition.

The procedure to request an exception from application of the BES definition is set forth in Appendix 5C to the NERC Rules of Procedure, effective July 1, 2014. The REMG formed the BES Exception Process Working Group (BEPWG) in 2012 – comprised of representations from the eight Regional Entities and NERC staff - to help create an efficient and effective Regional mechanism for processing Entity self-determined BES notifications and BES Exception requests. The activities of the BEPWG are expected to continue in 2015, in order to provide a Regional forum for consistent Regional BES Exception request review and 'lessons learned.'

[40] In support of ERO Goal 4.b - Events and system performance are consistently analyzed for sequence, cause, and remediation to identify reliability risks and trends and lessons learned.
[41] In support of ERO Goal 4.d - Reliability models and data accurately represent system behavior and are shared among stakeholders.
[42] In support of ERO Goal 5.c - The ERO internal risks are understood and managed; ERO processes are effective, efficient, and continuously improved.
[43] In support of ERO Goal 4.a - Risks are identified and prioritized based on reliability impacts, cost and practicality of assessments, projected resources, and emerging issues.
[44] In support of ERO Goal 2.a - The ERO registers and deregisters entities commensurate with risk to the BES and ensures all key reliability entities are certified to have essential capabilities.
[45] FERC Order Accepting the Revised [BES] Definition at: http://www.nerc.com/pa/RAPA/BES%20DL/2014-03-20%20BES%20-%20FERC%20Order%20Approving%20Revised%20Definition.pdf

Eastern Interconnection Reliability Assessment Group [46]

The primary function of the Eastern Interconnection Reliability Assessment Group (ERAG) is to augment reliability of the bulk-power system in the Eastern Interconnection through periodic reviews of generation and transmission expansion. These assessments are conducted by the ERAG Steering Committees. In addition, ERAG has the responsibility to develop the annual set of seasonal and future steady state and dynamic simulation base cases for use by the Regional Entities and other industry groups in the Eastern Interconnection. This is done through the ERAG Multi-Regional Modeling Working Group (MMWG). NPCC participates in the ERAG activities as one of the six Eastern Interconnection Regional Entities.

NPCC RAPA staff participates with the ERAG Management Committee and acts as the liaison between the ERAG MMWG and the NPCC SS-37 Working Group; activities include:

Management Committee Activities

- ✓ Oversee the steady state and dynamic simulation base case development;
- ✓ Make necessary changes to the modeling of governor-turbine control systems to achieve frequency response that more closely reflects actual response during system frequency deviation events. Oversee ERAG Multi-Regional Modeling Working Group (MMWG) changes to the dynamics base cases;
- ✓ Continue the review of the NERC governor survey information to assess how to revise the governor-turbine plant control models at most generators;
- ✓ Review the 2015 Summer and 2015-2016 Winter Assessments, including, the MRSS (MRO-RFC-SERC-SPP) and the R-N (RFC-NPCC) Assessments of anticipated inter-Regional, inter-Balancing Authority transfer limit conditions and sensitivities;
- ✓ Participate in discussions with NERC staff, North American Transmission Forum, NERC System Analysis and Modeling Subcommittee, FERC staff and possibly North American Generation Forum representatives regarding base case modeling improvements and future general industry modeling improvements;
- ✓ Develop ERAG Strategic Direction (i.e. anticipated new developments in MMWG process and system assessments); and,
- ✓ Confirm MMWG cases and assessments continue to have sufficient protections in place for use and transmittal of confidential data and information.

Multi-Regional Modeling Working Group Items

- ✓ Complete the steady state and dynamic simulation base cases for the 2015 series of cases;
- ✓ Complete necessary changes to the modeling of governor-turbine control systems to achieve frequency response that more closely reflects actual response during system frequency deviation events;
- ✓ Continue the review of the NERC governor survey information to assess how to revise the governor-turbine plant control models at most generators. Recommend the necessary changes in the models for specific generators;
- ✓ Incorporate dispatch information into the future and seasonal ERAG MMWG base cases so that the dispatches are more closely aligned with economic dispatch practices;

[46] In support of ERO Goal 4.d - Reliability models and data accurately represent system behavior and are shared among stakeholders.

- ✓ Determine how the Regional MMWG case development processes will change due to the use of the new web-based System Dynamics Data Base program;
- ✓ Verify procedures in the MMWG manual are followed;
- ✓ Check and confirm that the dynamic model data passes all applicable checks and acceptance criteria. Include 60 second steady state simulation of each case to detect numerical errors; and,
- ✓ Apply changes to the MMWG dynamics case so they are available for interconnection dynamics studies.

System Assessments Items

- ✓ Completion of 2015 Summer and 2015-2016 Winter Assessments, including, the MRSS and the R-N Assessments of anticipated inter-Regional, inter-Balancing Authority transfer limit conditions and sensitivities; and,
- ✓ Take additional steps to achieve consistency among the MRSS and the R-N study forums assessments and practices. Make additional recommendations to the ERAG Management Committee on how to complete this process.

NERC [47]

Through its Task Forces and Working Groups, NPCC will continue to provide the NPCC Regional perspective with active NPCC RAPA staff participation on the NERC Planning and Operating Committees and key related NERC Subcommittees, Task Forces and Working Groups:

- ✓ Reliability Assessment Data Working Group (RADWG);
- ✓ Protection System Mis-operations Task Force (PSMTF);
- ✓ Spare Equipment Database Task Force (SEDTF);
- ✓ Demand Response Availability Data System Working Group (DADSWG);
- ✓ Generating Availability Data System Working Group (GADSWG);
- ✓ Transmission Availability Data System Working Group (TADSWG);
- ✓ Model Validation Working Group (MVWG);
- ✓ Reliability Assessment Subcommittee (RAS) - Seasonal and Long-Term Reliability Assessments;
- ✓ System Analysis and Modeling Subcommittee (SAMS);
- ✓ Performance Analysis Subcommittee (PAS);
- ✓ Regional support and coordination of the NERC:
  - o Generator Availability Data System (GADS);
  - o Demand Availability Data System (DADS);
  - o Transmission Availability Data System (TADS);
  - o Spare Equipment Data Base System (SEDS);
- ✓ Incorporating any probabilistic reliability metrics required for the 2015 NERC Long-Term Reliability Assessment through the NPCC 2015 Long Range Adequacy Overview;
- ✓ Providing analytic support to ERO-RAPA group for the:
  - o Analysis of Relay and Special Protection System mis-operations;
  - o Regional coordination of data required for the calculation of metrics proposed by the NERC Reliability Metrics Working Group; and,
  - o Other activities as directed by the ERO-Executive Management Group.

[47] In support of ERO Goal 4 - Identify the most significant risks to reliability, be accountable for mitigating reliability risks, and promote a culture of reliability excellence.

As well as:

- ✓ Updating the NPCC Electric System Map; Producing the annual NPCC Load, Capacity, Energy, Fuels, and Transmission (LCEFT) Report
- ✓ Liaison with the New York Defensive Strategies Working Group in coordination and implementation of Synchro-Phasor measurement devices on the NPCC and neighboring systems and monitor related efforts of the NERC North American Synchro-Phasor Initiative;
- ✓ Processing BES Exception requests received through the BES Exception Process;
- ✓ Participating in on-going NERC analysis of the Eastern Interconnection Frequency Response;
- ✓ Developing NPCC guidelines for load modeling in system reliability studies;
- ✓ Conducting NPCC resource adequacy assessments addressing impacts of emerging reliability issues identified by NERC (e.g., environmental requirements, gas-electric system interdependency, distributed generation, delays in transmission plans, etc.);
- ✓ Coordinating any resulting NPCC inter-Area reliability analyses required to assess the proposed integration of related large-scale renewable resource proposals from Regional activities;
- ✓ Completing the 2015 NERC Seasonal (and post Seasonal) Reliability Assessments; and,
- ✓ Completing the 2015 NERC Long-Term Reliability Assessment.

2015 Goals and Key Deliverables

Task Force on Coordination of Planning

The primary mission of the NPCC Task Force on Coordination of Planning (TFCP) is to promote reliability through the coordination of NPCC Area and NERC planning processes and activities. In addition, the TFCP provides technical support regarding operating expertise to the NPCC Regional Standards Committee and the NPCC Compliance Committee as requested.

TFCP activities include, but are not limited to:

- Leading the NPCC Task Force review of the revision of NPCC criteria, guidelines, and procedures related to planning, and of those documents which provide for the uniform implementation, interpretation and monitoring of compliance with criteria, guidelines and procedures related to planning.
- Supporting the NPCC Directory Project by either drafting, reviewing or approving directories.
- Coordinating, monitoring, reviewing, and making recommendations on proposed or modified Special Protection Systems.
- Facilitating Wide-Area Planning by supporting the Joint ISO/RTO Planning Committee Activities, implementation of the Northeast Planning Protocol, and performing any NPCC interconnection reliability analyses, as required.
- Reviewing the overall reliability of the NPCC Areas and performing multi-Area probabilistic reliability assessments.
- Identifying and assisting in the development of new Regional Reliability Standards.
- Assisting the NPCC Compliance Subcommittee, to monitor and coordinate the compliance efforts of the Areas with NPCC planning documents and registered entities with NERC Reliability Standards.

- Reviewing the Standards Authorization Requests and NERC Reliability Standards as well as participating in the NERC process. Educating and informing NPCC membership and registered entities of developments.
- Ensuring coordination of data and assumptions for conducting NPCC planning studies (i.e. load forecasts, reserve requirements, DOE EIA 411 data, and new facilities)
- Monitoring the activities of other NPCC Task Forces to ensure coordination with planning activities.
- Reviewing the adequacy of the NPCC systems to supply load considering forecast demand, installed and planned supply and demand resources and required reserve margins in accordance with NPCC Directory No. 1 based on a schedule set forth in the Reliability Assessment Program.
- Coordinating the review of the compliance of future Area plans with the Basic Criteria, including an analysis of resource and transmission system additions, and the potential inter-Area effects of special protection systems, in accordance with NPCC Reliability Directory No.1 based on a schedule set forth in the Reliability Assessment Program. (Specific projects, which in the opinion of the Task Force could have an impact on the reliability of the NPCC Bulk Power System, may be reviewed outside of the set schedule).

Key TFCP Reliability Assessment and Performance Analysis Deliverables

- ✓ Coordinating activities related to reactive power and voltage control practices, which includes Under Voltage Load Shedding (UVLS) with the Task Force on Coordination of Operation and the Task Force on System Studies to ensure that developments in the NERC Planning Committee and its Subcommittees are addressed.
- ✓ Monitoring the actions of the NERC Performance Analysis Subcommittee (PAS).
- ✓ Monitoring the actions of the NERC System Analysis and Modeling Subcommittee (SAMS).
- ✓ Overseeing the A-10 BPS Implementation Plan.
- ✓ Overseeing the summer 2015 and winter 2015-2016 NPCC multi-area probabilistic reliability evaluations.
- ✓ Overseeing the 2015 NPCC Long-Range Adequacy Overview.
- ✓ Evaluating and approving Balancing Authority Area Transmission Reviews.
- ✓ Coordinating, monitoring, reviewing, and making recommendations on the retirement of existing in-service Special Protection Systems (SPS); and the implementation of proposed new or modified Special Protection Systems.
- ✓ Review the NPCC SPS criteria with respect to proposed NERC SPS Standards.
- ✓ Monitoring industry practices and making recommendations to NPCC on transmission adequacy standards related to intermittent generation such as wind or solar-voltaic.
- ✓ Reviewing and giving direction to other task forces on changes required to the Underfrequency Load Shedding (UFLS) program required to take into account increasing amounts of distribution connected generation and/or intermittent generation.
- ✓ Evaluating and recommending approval of NPCC Balancing Authority Area Resource Adequacy Assessments.
- ✓ Monitoring the developments in demand resources, energy efficiency, distributed generation and conservation methods including all intermittent renewable resources.
- ✓ Conducting resource adequacy assessment studies addressing emerging reliability issues as identified by the NERC Planning Committee (e.g., environmental requirements, etc.)
- ✓ Supporting Joint ISO/RTO Planning Committee activities.

- ✓ Facilitating Wide-Area Planning through participation in Regional and coordinating any resulting required inter-Area Reliability Assessment of the proposed integration related large-scale renewable resource proposals.
- ✓ Completion of the NERC 2015 Long-Term Reliability Assessment.
- ✓ Completion of the 2015 Review of NPCC Interconnection Assistance Reliability Benefits Study.
- ✓ Review NERC Events Analysis Lessons Learned for consideration in TFCP activities and processes.

Task Force on System Studies

The primary mission of the NPCC Task Force on System Studies (TFSS) is to provide active overall coordination of system studies of the reliability of the interconnected bulk power systems and for the review of certain NPCC documents. In addition, the TFSS provides technical support regarding operating expertise to the NPCC Regional Standards Committee and the NPCC Compliance Committee as requested.

The activities of the TFSS include, but are not limited to:

- Participating with the Task Force on Coordination of Planning, the Task Force on Coordination of Operation, and the Task Force on System Protection in reviews of the NPCC Reliability Directory No.1 and other NERC Reliability Standards and NPCC criteria, guidelines, procedures and documents which provide for the uniform implementation, interpretation and monitoring of conformance to criteria, guidelines and procedures related to system studies.
- Conducting NPCC Balancing Authority Area Reviews, in accordance with NPCC Reliability Directory No. 1, based on material presented by the Balancing Authority Areas. These reviews will assess the impact of planned transmission and resource additions or modifications on system reliability, and determine the Balancing Authority Area's conformance with the NPCC Basic Criteria.
- Reviewing and approving changes to Balancing Authority Areas' lists of bulk power system elements, in accordance with the *Classification of Bulk Power System Elements* (Document A-10). Annually review and update the NPCC BPS List.
- Reviewing and classifying new and modified Special Protection Systems, in accordance with NPCC Reliability Directory No. 7. Annually reviewing and updating the NPCC Special Protection System List.
- Conducting such load flow, transient stability, and other studies as required analyzing the overall reliability of the planned bulk power transmission systems of NPCC and the interconnections between NPCC and other Regional reliability organizations. As a part of this effort, analyze potential inter-Area effects of Special Protection Systems.
- Conducting analytical studies as appropriate to support the coordination of system planning, system operation and system protection in NPCC.
- Maintaining, through the SS-37 Working Group, a library of load flow base cases and associated dynamics data, for use in and support of Balancing Authority Area Reviews, overall transmission assessments, operational studies, inter-Regional studies, etc. Coordinate this effort with the NERC inter-Regional base case development process.
- In conjunction with other Task Forces, reviewing major system disturbances to ascertain the adequacy of the interconnected systems. Also, reviewing any associated recommendations for system modifications and considering the need for criteria changes.

- Identifying and recommending improved system study techniques. This includes, but is not limited to, the following:
  - improved techniques and models for power system simulation;
  - improved techniques for power system Reliability Assessment;
- Conducting a periodic review of the adequacy of the NPCC underfrequency load shedding program. Annually reviewing and updating the NPCC underfrequency load shedding database.
- Maintaining a listing and monitoring the status of major transmission and generation projects within NPCC.
- Maintaining liaison with other NPCC Task Forces and report to the Reliability Coordinating Committee as required.
- Monitoring the work of industry research and development organizations such as the IEEE, Canadian Electricity Association, Electric Power Research Institute, CIGRE and other technical organizations.
- Annually developing updates to the NPCC Electric System Map

Key TFSS Reliability Assessment and Performance Analysis Deliverables:

- ✓ Conducting Balancing Authority Area reviews, in accordance with the *Guidelines for NPCC Area Transmission Reviews* (Appendix B of NPCC Reliability Directory No. 1), based on material presented by the Balancing Authority Areas. These reviews assess the impact of planned transmission and resource additions or modifications on system reliability, and determine the Area's conformance with the NPCC Basic Criteria. Through the Area Transmission Reviews, re-evaluate the performance and classification of existing SPSs and Dynamic Control Systems as appropriate.
- ✓ Reviewing and classifying new and modified Special Protection Systems, in accordance with NPCC Reliability Directory No. 7 *Procedure for NPCC Review of New or Modified Bulk Power System Special Protection Systems* as required.
- ✓ Reviewing and approving changes to the Balancing Authority Areas' lists of bulk power system elements, in accordance with the *Classification of Bulk Power System Elements* (Document A-10), as required.
- ✓ Updating the NPCC Bulk Power System List.
- ✓ Through the ad hoc Load Modeling Task Force, address the recommendations from the SS-38 Load Modeling White Paper regarding the use of dynamic load models for transient stability analysis.
- ✓ Perform the Overall NPCC Transmission Assessment.
- ✓ Reviewing and updating NPCC Undervoltage Load Shedding Database.
- ✓ Participation in on-going NERC analysis of the Eastern Interconnection Frequency Response.
- ✓ Through the SS-37 Working Group, develop the annual library of power flow base cases and associated dynamic models for use by NPCC members and input into the development of the MMWG library of power flow and dynamic cases and databases for the Eastern Interconnection
  - i. Final development of NPCC power flow models for 2015
  - ii. Final development of NPCC dynamic models for 2015
  - iii. Address wind modeling issues including maintaining a database of NPCC wind models for use in the MMWG library of power flow and dynamic cases and databases for the Eastern Interconnection.
- ✓ Annually performing event replication and exercise the procedure. Reviewing existing Regional criteria and procedures for validation of data used in power flow and dynamic

simulations by benchmarking against actual system performance. If the existing criteria or procedures are found to be deficient, propose changes to provide for adequate data validation

- ✓ Updating the NPCC SS-37 Working Group Procedure Manual and other related documents including the Master Tie line Data, and Interchange Schedule, as required.
- ✓ Providing mid-term updates to the Library of NPCC/MMWG cases
- ✓ Enhancing the governor modeling on a unit by unit basis suitable for use in the system simulation.
- ✓ Annually reviewing and updating a list of NPCC underfrequency load shedding.
- ✓ Coordinate activities with those of the New York State Defensive Strategies Working Group, regarding the coordination and implementation of Synro-Phasor measurement devices.
- ✓ Incorporate NPCC guidelines for load and power system modeling approved by the RCC
- ✓ Classification of Bulk Power System Elements.
- ✓ Participate at Siemens PTI User Group meetings to provide PSSE program enhancements
- ✓ Supporting Regional system studies to integrate large-scale renewable resources.
- ✓ Provide support to NERC Event Analysis process, as needed.
- ✓ Develop updates to the NPCC Electric System Map.
- ✓ Provide support to the NERC Model Validation Working Group (MVWG) as needed.
- ✓ Review NERC Events Analysis Lessons Learned for consideration in TFSS activities and processes.

Task Force on System Protection (TFSP)

The purpose of the NPCC Task Force on System Protection (TFSP) is to promote the reliable and efficient operation of the interconnected bulk power systems in Northeastern North America through the establishment of directories, criteria, guidelines, and procedures and coordination of design, relative to the protection associated with the bulk power systems. In addition, the TFSP provides technical support regarding operating expertise to the NPCC Regional Standards Committee and the NPCC Compliance Committee as requested.

The Reliability Assessment and Performance Analysis activities of the TFSP include, but are not limited to:

- Assessing proposed protection systems and special protection systems in accordance with NPCC Reliability Directory No. 4 and No. 7.
- Reviewing and analyzing the performance of protection systems following selected major power system disturbances and events, inside as well as outside NPCC in accordance with NPCC Reliability Directory No. 4. Issue recommendations for changes to NPCC Documents, as appropriate.
- Providing technical advice on protection issues to NPCC and coordinate with other Task Forces on the application of Intelligent Electronic Devices (IEDs) that include functions related to energy management systems in addition to their protective functions, in order to safeguard the integrity of the protective functions.
- Through the SP-7 Working Group, review, on a quarterly basis all protection system (including special protection system) misoperations reported to NPCC.
- Reviewing and assessing significant protection issues of common interest or informational value.
- Reviewing and assessing regulatory and industry based documents as they relate to system protection.

- Maintaining an effective liaison with North America groups working in the protection areas (for example: NERC System Protection & Control Subcommittee.)
- Exchanging information with other power pools, Regional Reliability Councils, Regional Transmission Organizations and other industry groups on matters concerned with system protection.
- Identifying the need for special studies and new documents, recommend action to the Reliability Coordinating Committee.

Key TFSP Reliability Assessment and Performance Analysis Deliverables:

- ✓ Assessing proposed protection systems and special protection systems for compliance with NPCC Directory No. 4 and No. 7 criteria.
- ✓ Reviewing and analyzing the performance of protection systems in power system disturbances and events, brought to the attention of the Task Force, inside as well as outside NPCC in accordance with *Procedures for Task Force on System Protection Review of Disturbances* (Document C-30). Issuing recommendations for changes to NPCC Documents, as appropriate.
- ✓ Develop a new NPCC Directory for Disturbance Monitoring Equipment for related criteria, guides and procedures.
- ✓ Participate or serve as lead Task Force in the development and/or implementation of Regional Reliability Standards.
- ✓ Providing support to the NERC Event Analysis process as required.
- ✓ Participate in the ongoing development and submission of NPCC input into the development of related NERC Reliability Standards.
- ✓ Conducting any follow-up to the bulk power system protection risk assessment as directed by the Reliability Coordinating Committee.
- ✓ Through the SP-7 Working Group, monitor the review of protection system (including special protection system) mis-operations as they occurred in the NPCC Region and participation in providing the NPCC input for NERC Metric ALR4-1 on Protection Mis-operations.
- ✓ Monitor and review industry activities on the mitigation of the effects of SMD on protection systems. Report to RCC on any significant findings.
- ✓ Review mitigations and/or progress reports for BPS Risk Reduction Implementation at each meeting and annually report to the RCC on the status of this implementation.
- ✓ Participate in the development and submission of NPCC inputs/comments into the development of protection related NERC technical documents.
- ✓ Review best practices from its members and industry to pull together design considerations for the new IEC 61850 protection implementation with the output being possible additions to NPCC Directory No. 4 and Directory No. 7.
- ✓ Review NERC Events Analysis Lessons Learned for consideration in TFSP activities and processes.

Task Force on Coordination of Operation

The NPCC Task Force on Coordination of Operation (TFCO) facilitates the coordination of operations among the NPCC Reliability Coordinator areas and adjacent NERC Regions to enhance the reliability of the bulk power system. In addition, the TFCO provides technical support regarding operating expertise to the NPCC Regional Standards Committee and the NPCC Compliance Committee as requested.

The activities of the NPCC TFCO include, but are not limited to:

- Conducting seasonal reviews of the overall reliability of the generation and transmission systems in NPCC, and coordinating these efforts with parallel assessments conducted by the NPCC Task Force on Coordination of Planning and by NERC. Reviewing the operational preparedness of NPCC and recommending possible actions to mitigate any potential problems identified for each operating period.
- Reviewing operations and system disturbances and providing any necessary follow-up, including the recommendation of remedial or mitigating actions.
- Facilitating the reliable operational integration of new bulk power system facilities.
- Coordinating the development of operating NPCC requirements and procedures affecting the reliability and operability of the bulk power system in coordination with, and as directed by, NERC and NPCC.
- Promoting and sponsoring inter-Balancing Authority Area and inter-Regional studies to enhance reliability and operational effectiveness of the bulk power system.
- Providing coordination of operating issues with other NPCC Task Forces and other Regions.
- Reviewing, and acting upon, NERC actions, motions and recommendations in relation to the operation of the power system.
- Formulating the position of the TFCO on NERC Standards, and providing this position to the NPCC Regional Standards Committee as appropriate.
- Providing assistance as requested by the NPCC Regional Standards Committee in the development of Regional Standards and Directories.
- Providing assistance as requested by the NPCC Compliance Committee in monitoring and coordinating the compliance efforts of the registered entities of NPCC.

Key TFCO Reliability Assessment and Performance Analysis Deliverables:

- ✓ Review and analyze the performance of Simultaneous Activation of Reserve implementation following an event to enhance the process. Manage the implementation of action items emanating from the NERC report, "High-Impact, Low-Frequency Event Risk to the North American Bulk Power System-June 2010," and its subsequent reports:
  - ➢ Severe Impact Resilience Severe Impact Resilience Task Force
  - ➢ Geomagnetic Disturbance Task Force
  - ➢ Cyber Attack Task Force
  - ➢ Spare Equipment Database Task Force
  - ➢ Smart Grid Task Force
- ✓ Monitor the development of the NERC North American Synchro-Phasor Initiative in its effort to establish an effective control monitoring tool.
- ✓ Provide assistance to the NPCC Regional Standards Committee in the second phase of the NPCC directories process.
- ✓ Review NPCC Reliability Coordinator Area Restoration Plans.
- ✓ Complete the NPCC 2015 summer and winter Operational Reliability Assessments.
- ✓ Completion of the NERC 2015 Seasonal Reliability Assessments.
- ✓ Review NERC Events Analysis Lessons Learned for consideration in TFCO activities and processes.
- ✓ Support the implementation of the NERC Cyber Standards, as required.

NPCC Regulatory/Governmental Affairs Advisory Group

The purpose of the NPCC Regulatory/Governmental Affairs Advisory Group is to promote NPCC interaction and coordination with Federal/State/Provincial governmental and/or regulatory agencies on a coordinated Regional basis, and identify and develop policy input for NPCC and Northeast Regional governmental and/or regulatory bodies.

The NPCC Governmental/Regulatory Affairs Advisory Group provides a forum where industry and governmental and/or regulatory representatives can exchange views and strive to develop consensus policy recommendations on reliability issues specific to the NPCC Region (Northeastern United States and Eastern Canada) and share actionable information among NPCC, NERC and other related governmental and/or regulatory agencies related to Regional energy and reliability matters.

Based on the portion of professional/technical staff time and other resources devoted to Reliability Assessment and Performance Analysis, NPCC estimates that it will expend 21 percent of its resources on these activities.

Funding Sources and Requirements — Explanation of Increase (Decrease)

Funding Sources (Other than ERO Assessments)

- U.S. Penalty Sanctions remitted from 7/1/13 through 6/30/14 reduce U.S. LSE designee assessments for 2015.

Personnel Expenses

- NPCC anticipates no need to hire additional personnel in this program area in 2015.
- Salaries expense reflects implementation of recommendations of NPCC's Management Development and Compensation Committee, which were based on an independent compensation study.
- Benefits expense decreased due to more staff opting out of company sponsored health insurance for superior coverage through prior employer or spouse.
- Retirement expense decreased due to transition of employees formerly accruing benefits under the defined benefit plan to receiving defined contribution benefits in 2015.

Meeting and Travel Expenses

- While the amount of activity continues to increase in 2015, due to the volume of work described above, meeting expenses will be minimized to the extent possible due to continued efforts to keep costs down by holding meetings via conference calls and internet meetings, which are budgeted as a part of G&A and then allocated to the direct programs through indirect expenses, conducting meetings at the NPCC offices or member facilities, as well as negotiating lower meeting space rental rates.

Operating Expenses and Indirect Expenses

- NPCC total overhead expenses, such as office rent and office costs will be charged to the Administrative Services Programs and then reallocated proportionately based on FTE to the programs through Indirect Expenses.

Other Non-Operating Expenses

- None

Fixed Asset Additions

- None

Reliability Assessment and Performance Analysis Program

Funding sources and related expenses for the Reliability Assessment and Performance Analysis section of the 2015 business plan are shown in the table below.

Statement of Activities and Capital Expenditures
2014 Budget & Projection, and 2015 Budget
Reliability Assessment and Performance Analysis

Training, Education, and Operator Certification Program

Training, Education, and Operator Certification Program Resources (in whole dollars)	2014 Budget	2015 Budget	Increase (Decrease)
Total FTEs	0.10	0.10	0.00
Direct Expenses	$177,787	$180,222	$2,434
Indirect Expenses	$18,965	$19,154	$189
Other Non-Operating Expenses	$0	$0	$0
Inc(Dec) in Fixed Assets	($897)	($366)	$531
Total Funding Requirement	$195,855	$199,010	$3,154

Program Scope and Functional Description

The NPCC Training, Education, and Operator Certification program supports NERC Rules of Procedure Section 900. The program provides education and training necessary to understand and operate the bulk electric system. The target audience of the program is bulk power system operating personnel - including system operations personnel, operations support personnel (engineering and information technology), supervisors and managers, and training personnel. This program also supports the administration of records necessary to maintain status as a NERC Continuing Education provider. NPCC staff training and development is incorporated within each respective program area.

Training Program Background and Description

NPCC establishes and coordinates programs for system operator training relating to inter-Reliability Coordinator area matters, criteria, terminology, standards and operating procedures and instructions. It develops and conducts training seminars, held twice yearly, at which potential operational problems for the coming season are discussed, the implementation of NPCC standards and procedures are discussed, significant disturbances are reviewed for lessons to be learned and table-top drills and communication and coordination exercises are conducted. The seminars promote camaraderie and better communication among system operators from the NPCC Reliability Coordinator Areas.

NPCC shares, evaluates and proposes new techniques and training aids as they become available; reviews opportunities to consolidate training among the NPCC Reliability Coordinators, which includes opportunities to share training material and training sessions and exchanges information on internal methods of system operator selection and training.

In addition, NPCC participates in the activities of the NERC Staff Training Group (STG). The main objective of the NERC STG is to coordinate the development of Regional Entity and NERC staff training and registered entity education materials to support and continually enhance reliability across North America for the benefit of all bulk electric system users, owners, and operators. The main focus of this group has been on NERC compliance auditor training.

Funding Drivers and Reliability Benefits

- Provide two high-quality continuing education seminars for system operators
    - System operators participating in the Seminars get exposure to NPCC issues and current industry operations topics, review recent NPCC or major external disturbances, discuss projected conditions for the coming summer or winter peak season and participate in hands on "table top exercises" pertaining to system operation practices. PJM operators also attend and participate in these seminars.
    - Seminar attendees also receive Continuing Education Hours (CEHs) and each Balancing Authority Area utilizes the seminar content by including it in their internal training programs to provide CEHs to all system operators
    - The seminars help to improve system operation coordination through better camaraderie among operators
- Review and revise the curriculum of the training seminars to better emphasize NERC standards, Regional Standards and business practices, NPCC wide-area operations and Regionally-specific criteria and procedures.[48]
- Enhance the system operator's awareness and knowledge of the standards, criteria and procedures they apply in real time operation.[49]
- Provide more sharing of new training approaches, exchange of information on internal methods of system operator selection, training material and training sessions.
    - Enhance efficiency and cost savings in the training programs in the NPCC Balancing Authority Areas
- Provide a forum among NPCC Reliability Coordinator / Balancing Authority (RC / BA) Areas for sharing of approaches to meet the requirements of the NERC PER standards. The sharing of approaches used by some NPCC Areas to address the PER-005-1, Requirement 3.1 on Training using simulator technology has been especially valuable to CO-2 Working Group members.
- Determine what changes would be needed for the NPCC Reliability Coordinator / Balancing Authority Areas to meet proposed expanded Systematic Approach to Training (SAT) requirement for operations support staff in PER-005-2.

2015 Key Assumptions

NPCC will conduct two workshops in 2015, for NPCC Stakeholders, for the express purpose of providing the most current and applicable information related to the development of NERC and Regional Reliability Standards and the implementation of the Compliance Monitoring and Enforcement Program (CMEP). These workshops are specifically designed, primarily through the conduct of targeted breakout class room sessions and presentations on current industry related activities, to provide for the most efficient exchange of information between the NPCC Compliance and Standards Staff and the NPCC Stakeholders. Presentations in the past have been conducted by FERC, NERC and Stakeholder representatives in addition to NPCC Staff members. To supplement these workshops, NPCC is also considering expanding the use of on-

[48] In support of ERO goal 4.b. Provide lessons learned and recommendations from events and identified risks.
[49] In support of ERO goal 4.b. Analyze significant events to identify gaps in standards, compliance effectiveness, registration, and risk controls effectiveness.

line webinars. These webinars will focus on a specific topic pertinent to developments related to compliance program implementation, standards development or technical topics.

NPCC also regularly conducts spring and fall System Operator Seminars. These seminars involve system operators from the NPCC Reliability Coordinator / Balancing Authority Areas and PJM. These will be held in early May and early November.

With the exception of meeting expenses, it is proposed that the NPCC resources to support Training and Education will remain virtually unchanged for the calendar year. In 2015, to be consistent with NERC and other Regional Entities, NPCC will charge for participation in NPCC workshops in an effort to defray some of the costs.

2015 Goals and Key Deliverables

- Prepare and conduct the spring and autumn NPCC System Operator Seminars
- Review approaches to reliability related-task definition, task instruction, and instruction tracking on an individual basis. Coordinate the effects of the PER-005-2 expanded SAT training requirements within the NPCC RC / BA Area programs.
- Expand the content of the Reliability Coordinator training programs, based on the new requirements generated by PER-005-2.
- Continue collaboration and sharing of the intended RC / BA approaches, experiences and materials to task identification and training development associated with NERC Standard PER-005-2.
- Create and expand the restricted-access NPCC repository of training resources and learning verification activities addressing fundamental power system topics, training methods and operation procedure training exercises, which may be shared as elements of operator training in compliance with NERC Standard PER-005, “System Personnel Training”.
- Participate in NERC Staff Training Group activities and provide NPCC input to the development of training policies by this group.

Based on the portion of professional/technical staff time and other resources devoted to training, education, and operator certification, NPCC estimates that it will expend 1 percent of its resources on this activity.

Funding Sources and Requirements — Explanation of Increase (Decrease)

Funding Sources (Other than ERO Assessments)

- U.S. Penalty Sanctions remitted from 7/1/13 through 6/30/14 reduce U.S. LSE designee assessments for 2015.

Personnel Expenses

- NPCC anticipates no need to hire additional personnel in this program area in 2015.
- Salaries expense reflects implementation of recommendations of NPCC's Management Development and Compensation Committee, which were based on an independent compensation study.
- Benefits expense decreased due to more staff opting out of company sponsored health insurance for superior coverage through prior employer or spouse.
- Retirement expense decreased due to transition of employees formerly accruing benefits under the defined benefit plan to receiving defined contribution benefits in 2015.

Operating Expenses and Indirect Expenses

- NPCC total overhead expenses, such as office rent and office costs will be charged to the Administrative Services Programs and then reallocated proportionately based on FTE to the programs through Indirect Expenses.

Other Non-Operating Expenses

- None

Fixed Asset Additions

- None

Training, Education, and Operator Certification Program

Situation Awareness and Infrastructure Security Program

Situation Awareness and Infrastructure Security Program Resources (in whole dollars)	2014 Budget	2015 Budget	Increase (Decrease)
Total FTEs	3.00	3.00	0.00
Direct Expenses	$922,070	$937,689	$15,619
Indirect Expenses	$568,962	$574,629	$5,667
Other Non-Operating Expenses	$0	$0	$0
Inc(Dec) in Fixed Assets	($26,920)	($10,986)	$15,935
Total Funding Requirement	$1,464,111	$1,501,332	$37,221

Program Scope and Functional Description

The Situation Awareness and Infrastructure Security Program is the combination of near real time awareness of conditions on the bulk power system with the programs necessary to increase the physical and cyber security of the electricity infrastructure, including the operation and maintenance of tools and other support services for the benefit of Reliability Coordinators and the system operators within the registered entities. Maintaining the real-time awareness of conditions on the interconnected bulk power systems by the NPCC Reliability Coordinator is critical to maintaining reliable operation within NPCC, including the communication of information concerning system conditions and abnormal events among the neighboring system operators responsible for the reliable operation of the bulk power systems. When a disturbance does occur, it is critical to use the event as a learning opportunity and provide a forum for the active coordination of reliability and operation among the NPCC Reliability Coordinator areas and neighboring NERC Regions to enhance the reliability of the interconnected bulk power system through the lessons to be learned which can be gleaned from such an event.

Event Analysis Program[50]

NERC and the industry pursue three avenues in the analysis of a disturbance: the identification of lessons to be learned, a formal cause code analysis and a review of applicable standards.

The Event Analysis Program recognizes that many events which occur on the bulk power system beyond the routine reporting requirements previously in place can have varying levels of significance to the electric system, providing otherwise unrealized lessons to be learned from these events and the trending of such events to identify possible reliability concerns. By integrating a "bottom-up" approach to a disturbance review within the framework of the NERC Event Analysis Program, consistency, comparability, flexibility and timeliness in the event analysis process will be promoted by NPCC, the registered entities and NERC in a collaborative initiative. Upon the identification of an event, the goal of the Event Analysis Program is to:

- identify what transpired;
- categorize the event within the NERC Event Analysis Program;

[50] In support of ERO Goal 4.b. Events and system performance are consistently analyzed for sequence, cause, and remediation to identify reliability risks and trends and lessons learned.

- establish the sequence of events;
- understand the essential root causes of the event;
- identify recommendations or corrective actions; and
- develop and disseminate to the industry, lessons to be learned so that the operational reliability of the bulk power system can be further enhanced.

In assessing any system event, it is recognized that, if the timely dissemination of lessons learned from an event or disturbance is to be realized, any potential compliance implications associated with an event must be addressed and dismissed. Throughout an event analysis effort, to make this process successful and complete, and to solidify the "bottom-up" approach, registered entities are encouraged to establish a liaison between the event analysis and compliance functions internal to the registered entity during the event analysis process. This serves to facilitate the development of a registered entity compliance self-assessment report which will perform a sufficiency review of the reliability standards deemed applicable to the event, assisting in the self-reporting of possible violations should any be discovered.

To complete this effort, the entity, the Region and NERC staff collaborate to assess the NERC Event Analysis Report and perform a formal cause code analysis, identifying a root cause and complementing any lessons learned gathered from the disturbance.

The adoption by NERC of the Event Analysis Program brings clarity and certainty about what system events are relevant to analyze and to what level of detail, targeting potential vulnerabilities to the reliability of the bulk power system for detailed and in depth analysis; only concise and succinct reviews are desired for more minor events. It also delineates the expectations of roles and responsibilities of the registered entities, NPCC and NERC in a uniform review of system disturbances by the industry, and, ultimately, the program promotes the timely development and dissemination of valuable lessons learned to the industry. The identification and tracking of emerging common elements in system events will further distinguish trends which may be of concern to reliability. By rigorously pursuing the lesser events on the system and learning from these disturbances, the larger event can be avoided or mitigated.

NPCC Staff works step-by-step with the registered entity in the total event analysis process, permitting the entity to assume the primary role in the initial analysis, the development of lessons learned which may benefit the industry and the Standards sufficiency review.

NERC Alert Process[51]

NPCC Staff works with the registered entities to appropriately respond to the NERC Alert system, a process through which notifications of potential threats to electric reliability are disseminated to the industry with the expectations placed on the entity proportional to the severity of the Alert being issued.

NPCC Staff is also working closely with the NERC Staff to incorporate greater efficiencies, industry input and precision into the NERC proposal for a more streamlined NERC Alert process which can disseminate critical information to the appropriate Subject Matter Expert within the organization who can promptly act on the alert.

[51] In support of ERO Goal 4.c. ERO supports industry situational awareness and cybersecurity preparedness and provides independent reliability information to policy makers.

Operational Status[52]

On an ongoing, but non-real time basis, NPCC monitors the operational status of the bulk power system and coordinates normal and pre-emergency communication, awareness and assistance in addition to the same during an emergency among the Reliability Coordinators within NPCC and its neighboring RCs: the New Brunswick Power Corporation, Hydro-Québec TransÉnergie, the ISO New England, Inc., the New York ISO and the Independent Electricity System Operator in Ontario. The industry is notified of significant bulk power system events that have occurred in one Reliability Coordinator Area, and which have the potential to impact reliability in other NPCC Reliability Coordinator Areas or Regions external to NPCC. These events include contingencies on the bulk power system, potential shortfalls of operating reserve, operating problems, potential security threats and potential threats or disruptions to the cyber systems.

The "NPCC Emergency Preparedness Conference Call Procedures" provide a mechanism that enables the Reliability Coordinator in NPCC, and, as circumstances may require, their counterparts in neighboring Regions, to rapidly communicate the status of current operating conditions, to facilitate the procurement of assistance during emergency conditions and to identify potential physical or cyber threats to the system.

Items of particular concern that can be discussed during the calls may include, but are not limited to, the following: anticipated weather conditions critical to the system or systems experiencing or projecting resource deficiencies; load forecast; largest first and second contingencies; potential need for emergency transfers; operating reserve requirements and expected available operating reserve capacity deficiencies; potential fuel shortages or potential fuel supply disruptions which could lead to energy shortfalls; identified or projected voltage conditions; status of short term transactions; additional capability available within four hours and additional capability available within twelve hours; generator outages; significant transmission outages; expected transfer limits and limiting elements; anticipated implementation of NERC Transmission Loading Relief (TLR); changes in the status of relay protection systems; arming of special protection systems not normally armed; and/or the application of abnormal operating procedures.

NPCC has also established a daily conference call to serve as a complement to the NPCC Emergency Preparedness Conference Call. The participants of the call are the Reliability Coordinators within NPCC and its neighboring RCs, the Midwest ISO and PJM. The conference call is implemented through a bridge, the initiation of the call quickly ringing all pre-selected telephones simultaneously. The goal of the call is to alert all Reliability Coordinators of emerging problems. If no system difficulties are anticipated for the day, no unnecessary information is to be discussed. Subjects for discussion are limited to credible events which could impact the ability of an entity to serve its load and meet its operating reserve obligations or would impose a burden to the interconnection, including the following: Projected Load; Adverse Weather; Operating Reserve; Generation; Transmission; and Sabotage. If conditions worsen in the course of the day, the NPCC Emergency Preparedness Conference Call will be implemented.

NPCC monitors the status of the bulk power system through the NERC Situational Awareness-FERC, NERC, Regions (SAFNR) initiative, a near real-time operating display for the United States portion of the Reliability Coordinators footprints of North America. Transmission voltage

[52] In support of ERO Goal 4.c. ERO supports industry situational awareness and cybersecurity preparedness and provides independent reliability information to policy makers.

levels of 230 kV and above are displayed, and the tool provides the ability to "drill down" to detailed bus information.

To ensure the capability for continued voice communications among NPCC and its Reliability Coordinators, a satellite telephone network was also established, and it is tested on a monthly basis. This back-up communications system will function in the event of a collapse of the Public Switched Telephone Network (PSTN), and cross-border voice communications can still be maintained among the Canadian Reliability Coordinators of NPCC and the Reliability Coordinators in the United States.

Critical Infrastructure Objectives

NPCC's critical infrastructure objectives are defined within the scope of the NPCC Task Force on Infrastructure Security & Technology, (TFIST) and include, but are not confined to:

- Providing a forum for NPCC review of proposed and posted documents from the NERC Critical Infrastructure Protection Committee (CIPC)
- Representing and advocating NPCC's position in the activities of NERC groups involved in the development and/or implementation of physical and cyber security

NPCC's 2015 critical infrastructure goals and objectives, as identified by the 2014-2015 Work Plan of the Task Force on Infrastructure Security and Technology include, but are not confined to:

- Oversee the implementation of version 5 of the CIP Standards
- Monitor the Homeland Security Information Network (HSIN), ES-ISAC, Critical Information Protection Information Sharing (CIPIS), NERC Alerts and Canadian Information Sharing and share information with CO-8[53]
- Coordinate Cyber Protection activities, discussions and hold workshops as may be required to maintain Cyber Security of BES Cyber Assets.[54]
- Provide continued support and participation in NERC's Critical Infrastructure Protection Committee (CIPC)[55]
- Review and submit comments on NERC proposed Reliability Standards, modified Reliability Standards, proposed Guidelines and modified Guidelines related to Infrastructure Security and Technology
- Keep current on all governmental agencies regarding applicable security recommendations and requirements, and other applicable security and reliability recommendations and keep the RCC and its committees appropriately informed, e.g. Sector Specific Plan.
- Develop and maintain levels of expertise in those areas of concern to the task force through activities such as periodic workshop presentations, seminars, and meetings, open to the general NPCC membership[56].
- Regarding the Cross Border Emergency Telecommunications recommendation
    - Continue to annually report to RCC on this testing

[53] In support of ERO Goal 5.b. Issue and track security recommendations to protect the bulk power system (related to 5.a.ii.)

[54] In support of ERO Goal 1. b. Facilitate smooth transition of new standards (e.g., CIP Version 5); and ERO Goal 3.a. Initiate compliance phase-in learning periods for new standards

[55] In support of ERO Goal 5.a. Manage risk control initiatives to be completed by ERO and coordinate other initiatives with industry (e.g., relay misoperations, situational awareness, human error, cyber attack)

[56] In support of ERO Goal 5.b. Expand the use and value of security threat and vulnerability information sharing, analytics, and analysis

    - Continue to support CO-8's monthly testing
- Assess the telecommunications industry's desire to convert Frame Relay customers to Multiprotocol Label Switching (MPLS) and potentially provide recommendations to RCC

System Operations Security Objectives

NPCC's system operations security objectives are defined within the scope of the NPCC Task Force on Coordination of Operation (TFCO) and include, but are not confined to:

- Coordinating inter-Regional pre-emergency actions in the event of a threat to the security of the Northeastern North American bulk power supply system[57]
- Assisting in the development of real time operating tools assuring cyber security concerns are addressed[58]

NPCC's 2015 operational situation awareness goals and objectives, as identified by the 2014-2015 Work Plan of the NPCC Task Force on Coordination of Operation (TFCO) include, but are not confined to:

- Continue to monitor the reliable implementation of version 5 of the Cyber Standards.[59]
- Work directly with applicable NPCC Task Forces to provide an in depth assessment of Lessons Learned unique to the NPCC members and NPCC criteria.

2015 Key Assumptions

- The monitoring of Lessons Learned will be a major focus of NERC in 2015.
- Critical infrastructure protection will fully integrate the requirements of version 5 of the Cyber Standards in 2015.

2015 Goals and Key Deliverables

- Continue to monitor the reliable implementation of version 5 of the Cyber Standards.
- Work directly with applicable NPCC Task Forces to provide an in depth assessment of Lessons Learned unique to the NPCC members and NPCC criteria.
- Establish a unique NPCC Event Analysis web site to post NPCC Lessons Learned.
- Contribute to the reduction of Category 3 events and no Category 4 or 5 events in NPCC- by disseminating to the RCC compiled information on NPCC Region specific, as well as industry wide, event related causal analysis and analysis of Lessons Learned.[60]

Based on the portion of professional/technical staff time and other resources devoted to situation awareness and infrastructure security, NPCC estimates that it will expend 10 percent of its resources on this activity.

[57] In support of ERO Goal 5.b.Issue and track security recommendations to protect the bulk power system (related to 5.a.ii.)

[58] In support of ERO Goal 5.a. Manage risk control initiatives to be completed by ERO and coordinate other initiatives with industry (e.g., relay misoperations, situational awareness, human error, cyber attack)

[59] In support of ERO Goal 5.a. Manage risk control initiatives to be completed by ERO and coordinate other initiatives with industry (e.g., relay misoperations, situational awareness, human error, cyber attack)

[60] In support of ERO Goal 4.b. Provide lessons learned and recommendations from events and identified risks

Funding Sources and Requirements — Explanation of Increase (Decrease)

Funding Sources (Other than ERO Assessments)

- U.S. Penalty Sanctions remitted from 7/1/13 through 6/30/14 reduce U.S. LSE designee assessments for 2015.

Personnel Expenses

- NPCC anticipates no need to hire additional personnel in this program area in 2015.
- Salaries expense relects implementation of recommendations of NPCC's Management Development and Compensation Committee, which were based on an independent compensation study.
- Benefits expense decreased due to more staff opting out of company sponsored health insurance for superior coverage through prior employer or spouse.
- Retirement expense decreased due to transition of employees formerly accruing benefits under the defined benefit plan to receiving defined contribution benefits in 2015.

Operating Expenses and Indirect Expenses

- NPCC total overhead expenses, such as office rent and office costs will be charged to the Administrative Services Programs and then reallocated proportionately based on FTE to the programs through Indirect Expenses.
- Consultants and contracts expense increase in support of NPCC's efforts to assess and improve system frequency and generator governor response.

Other Non-Operating Expenses

- None

Fixed Asset Additions

- None

Situation Awareness and Infrastructure Security Program

Funding sources and related expenses for the situation awareness and infrastructure security section of the 2015 business plan are shown in the table below.

Administrative Services

Administrative Services Program Resources (in whole dollars)	2014 Budget	2015 Budget	Increase (Decrease)
Total FTEs	9.00	9.00	0.00
Total Direct Expenses	$5,689,616	$5,746,287	$56,671
Other Non-Operating Expenses	$0	$0	$0
Inc(Dec) in Fixed Assets	$0	$0	$0
Less: Other Funding Sources	$0	$0	$0
Total Allocation to Regional Entity Division Programs as Indirect Expenses	($5,283,757)	($5,336,385)	($52,629)
Total Allocation to Criteria Services Division Programs as Indirect Expenses	($405,859)	($409,902)	($4,043)
Funding Requirement for Working Capital and Operating Reserves	($300,126)	($355,161)	($55,035)

Program Scope and Functional Description

Administrative services support the previously identified five program areas of: reliability standards; compliance monitoring and enforcement and organization registration and certification; training, education, and operator certification; reliability assessment and performance analysis; and situation awareness and infrastructure security. Administrative services consist of: technical committees and members' forums; general and administrative; legal and regulatory; information technology; human resources; and finance and accounting.

Methodology for Allocation of Administrative Services Expenses to Programs

NPCC total overhead expenses, such as office rent and office costs, will be charged to the Administrative Services Programs and then reallocated proportionately based on FTE to the programs through Indirect Expenses.

Funding Sources and Requirements — Explanation of Increase (Decrease)

Personnel Expenses

- NPCC anticipates no need to hire additional personnel in this program area in 2015.
- Salaries expense reflect implementation of recommendations of NPCC's Management Development and Compensation Committee, which were based on an independent compensation study.
- Benefits expense decreased due to more staff opting out of company sponsored health insurance for superior coverage through prior employer or spouse.
- Retirement expense decreased due to transition of employees formerly accruing benefits under the defined benefit plan to receiving defined contribution benefits in 2015.

Administrative Services

Funding sources and related expenses for the Administrative Services section of the 2015 business plan are shown in the table below.

Technical Committees and Member Forums

Technical Committees and Members Forum Program Resources (in whole dollars)	2014 Budget	2015 Budget	Increase (Decrease)
Total FTEs	0.50	0.50	0.00
Total Direct Expenses	$75,711	$73,779	($1,932)
Other Non-Operating Expenses	$0	$0	$0
Inc(Dec) in Fixed Assets	$0	$0	$0
Working Capital Requirement	$0	$0	$0

Program Scope and Functional Description

The success of the NPCC programs depends on the active and direct volunteerism and participation of its members. The stakeholders are the source of expertise in the industry. To promote the reliable and efficient operation of the interconnected bulk power systems in Northeastern North America, NPCC invites high level policy makers from Federal, Provincial and State regulatory and/or governmental authorities and senior executives within NPCC and NERC to identify and discuss emerging issues related to the reliability of the NPCC Region.

2015 Key Assumptions

- NPCC's standing committee and subgroup structure for effective stakeholder involvement will continue in 2015
- NPCC will continue to utilize methods to encourage active involvement in its Regional programs that require less stakeholder travel and face-to-face meetings, as the economy improves in 2015
- NPCC will continue to invest in technology and innovation to allow efficient collaboration on technical issues related to reliability

2015 Goals and Key Deliverables

The 2015 NPCC General Meeting provides an opportunity for NPCC Members to meet high level policy makers from Federal, Provincial and State regulatory and/or governmental authorities and senior NERC and NPCC executives to discuss topics related to the reliable planning and operation of the power system, including consideration of emerging reliability, critical infrastructure and environmental issues.

2015 Public Information Committee Goals and Objectives

The objective of the NPCC Public Information Committee is to highlight and summarize NPCC activities and accomplishments in the past year, disseminate and coordinate the appropriate release of information to the media, respond to related requests for information, and coordinate with related NPCC Area, NERC media and public information activities. Activities anticipated for include, but are not limited to:

- Conducting the Media Event – release of the Summer 2015 NPCC Reliability Assessment

- Participation in NERC Regional communication initiatives:
    - Regional communications teleconferences as required
    - Coordination of Emergency or Blackout communications plans
    - Coordination with other NERC activities as required (i.e., situation awareness, event analysis, reliability assessments, etc.)

Total Direct Expenses	$621,004	$628,183	$7,179
Other Non-Operating Expenses	$0	$0	$0
Inc(Dec) in Fixed Assets	$0	$0	$0
Working Capital Requirement	$0	$0	$0

Program Scope and Functional Description

NPCC's professional legal services provide counsel to the President and CEO, Board of Directors, Vice President and COO, Treasurer and staff on a wide range of legal and regulatory matters including legislation, corporate law, code of conduct, confidentiality, governance, employment law, tax matters, contract law and other areas affecting NPCC. Regulatory counsel provides legal advice to advance significant corporate policy and strategic planning initiatives and also provides legal support to other program areas on matters arising in connection with the performance of NPCC's delegated functions. Regulatory counsel drafts agreements and pleadings and provides interpretations of relevant statutes, regulations, court opinions, and regulatory decisions of FERC, state agencies and provincial authorities. Outside counsel, as necessary, reviews items filed with the governmental agencies for legal sufficiency, maintains relationships with U.S. and Canadian jurisdictions and provides contract review.

Information Technology

Information Technology Program Resources (in whole dollars)	2014 Budget	2015 Budget	Increase (Decrease)
Total FTEs	3.00	3.00	0.00
Total Direct Expenses	$1,037,624	$1,111,674	$74,050
Other Non-Operating Expenses	$0	$0	$0
Inc(Dec) in Fixed Assets	$0	$0	$0
Working Capital Requirement	$0	$0	$0

Program Scope and Functional Description

NPCC's Information Technology services ensure information assets and the environment in which they operate are secure and in conformance to NPCC IT Policies and Procedures. NPCC maintains an offsite backup server for continuity of essential operations in the event that its primary location is unavailable.

2015 Key Assumptions

- Continue to develop and maintain the compliance portal through collaboration with other Regions and NERC (CUG).
- Achieve greater consistency with the other Regions and NERC by participating in the NERC IT Steering Group (ITSG) and deriving the efficiencies and cost savings which may result from the projects of this group.[61]
    - The ERO EMG identifies and prioritizes ERO-wide applications to be developed under a PMO housed at NERC. The NERC IT budget does not supplant the Regional Entities' need for IT expenditures for specific regional projects, but to the extent that agreed-upon ERO Enterprise applications provide greater efficiencies, there should not be any unnecessary, redundant expenditures at the regional level.
- Support the Event Analysis program through continued participation in the tools used for the tracking and analysis of system events.[62]
- Support the Bulk Electric System Exception Process "BEP" to enable and facilitate tracking and processing of exceptions submitted.[63] Maintenance of the BESNET support services such as updates, patching, coordinating issues with NERC.
- Support Cyber Security Reviews done by compliance to provide advisory role during those reviews.

[61] ERO Goal 7.b. Develop test and deploy ERO enterprise applications, platform and database

[62] ERO Goal 6.b. Evaluate event disturbances using phasor measurements and other methods to assess sufficiency of data and models;
ERO Goal 4.b. Provide lessons learned and recommendations from events and identified risks;
ERO Goal 4.b. Merge event driven databases and cause codes into one (e.g., event analysis, TADS, GADS, relay mis-operations)

[63] ERO Goal 2.a. Develop and implement BES exception process.

2015 Goals and Key Deliverables

Responsibilities encompass a variety of complex technical, administrative, and supervisory work in the development, installation, and maintenance of information technology systems. IT goals include, but are not limited to:

- Create an information security program and environment aimed at reducing breach of security risks
- Determine long-term software and systems needs and hardware acquisitions
- Develop and implement information security standards and procedures
- Ensure all information systems are functional and secure, and that all applications running on those systems meet business requirements for performance, availability, and security
- Plan and implement organization-wide information systems, services, and network facilities, including local area networks, wide-area networks, and peripheral systems
- Provide outreach and education to NPCC members in IT best practices
- Continually improve Disaster Recovery policies and practices to ensure continuity of service

Funding Sources and Requirements — Explanation of Increase (Decrease)

Human Resources

Human Resources Program Resources (in whole dollars)	2014 Budget	2015 Budget	Increase (Decrease)
Total FTEs	1.00	1.00	0.00
Total Direct Expenses	$178,931	$183,817	$4,886
Other Non-Operating Expenses	$0	$0	$0
Inc(Dec) in Fixed Assets	$0	$0	$0
Working Capital Requirement	$0	$0	$0

Program Scope and Functional Description

NPCC has assembled an exceptional team of highly qualified employees to carry out the activities of NPCC. The human resources function, in adherence with applicable federal and state laws, designs, plans, and implements human resources policies and procedures, including staffing, compensation, benefits, employee relations, and training and development.

An enhanced employee time tracking system was implemented in 2013 based on FERC audit recommendations. Employee time tracking and reporting is also handled by the human resources program area.

Funding Sources (Other than ERO Assessments)

- Not applicable

Operating Expenses and Indirect Expenses

- NPCC total overhead expenses, such as office rent and office costs will be charged to the Administrative Services Programs and then reallocated proportionately based on FTE to the programs through Indirect Expenses.

Other Non-Operating Expenses

- None

Fixed Asset Additions

- None

Accounting and Finance

Accounting and Finance Program Resources (in whole dollars)	2014 Budget	2015 Budget	Increase (Decrease)
Total FTEs	1.00	1.00	0.00
Total Direct Expenses	$482,991	$494,544	$11,554
Other Non-Operating Expenses	$0	$0	$0
Inc(Dec) in Fixed Assets	$0	$0	$0
Working Capital Requirement	$0	$0	$0

Program Scope and Functional Description

The accounting and finance function directs the overall financial plans and accounting practices of the organization; oversees treasury, accounting, budget, tax, and audit activities; and oversees financial and accounting system controls and standards. NPCC uses a CPA firm to prepare its unaudited statements of activities and financial statements for quarterly reviews. Independent audits have identified this system as a best practice.

2015 Goals and Key Deliverables

The objectives are to provide or obtain the financial and accounting services for NPCC and coordinate with NERC requirements:

- Utilize the NERC System of Accounts for consistency
- Utilize an accrual method of accounting for consistency with NERC in methodology
- Cash Management
- Budget Development using the NERC budget template formats
- Forecasts and Projections
- Alignment of NPCC Committees, Task Forces and Working Groups with the programs
- Payroll and expense administration
- Preparation of unaudited Quarterly Financial Statements
- IRS Reporting
- Annual Independent Audit initiated by the Regional Entity

Funding Sources and Requirements — Explanation of Increase (Decrease)

Funding Sources (Other than ERO Assessments)

- Not applicable

Operating Expenses and Indirect Expenses

- NPCC total overhead expenses, such as office rent and office costs will be charged to the Administrative Services Programs and then reallocated proportionately based on FTE to the programs through Indirect Expenses.

Other Non-Operating Expenses

- None

Fixed Asset Additions

- None

Regional Entity Assessment Analysis

In the area of assessments there are distinct funding mechanisms as outlined in the following table. For the Regional Entity division, the North American Electric Reliability Corporation (NERC) will assess load serving entities (LSEs) or their designees (within NPCC the designees are the Balancing Authority Areas (BAAs) for New York, New England, New Brunswick, Nova Scotia, Ontario and Québec) based upon 2013 proportional Net Energy for Load (NEL) and other specific program area funding arrangements and make quarterly remittances to the Regional Entity on or about the 15th day of January, April, July and October. For funding associated with the criteria services division, the Independent System Operators/Balancing Authority Areas (ISO/BAAs) will be assessed by NPCC for their proportional share of the divisional budget based upon 2012 NEL within the Region. Non ISO/BAA Full Members will be assessed no membership fee.

NPCC Cost Allocation Methodology

The accompanying table provides information regarding cost allocation for both the Regional Entity division and the criteria services division of NPCC, including the details associated with the funding of the Compliance Program within the RE division. For purposes of determining assessments to support NPCC's resource requirements, costs are allocated among the BAAs within NPCC as the designees for the load-serving-entities in New York, New England, Ontario, Québec, New Brunswick and Nova Scotia (Column A-1).

In order to reflect and respect the international membership and nature of NPCC, the compliance responsibilities and authorities within the U.S., and the specific compliance responsibilities within each of the Canadian provinces within NPCC, the attendant costs of portions of the compliance program differ among the areas within the Regional Entity. Within the U.S. portion of NPCC all costs attributable to delegated (statutory) functions performed by NPCC, including all compliance functions, are assessed based on a NEL allocation. Within the Canadian portion of NPCC those costs attributable to compliance functions performed by NPCC on behalf of provincial governmental and/or regulatory authorities are allocated consistent with the unique Memoranda of Understanding or Agreements that have been entered into for those provinces. To address these different compliance regimes, NPCC developed a composite cost allocation methodology that allocates compliance costs on a fair and equitable basis within the Regional Entity.

As an initial step of that methodology, the NEL for each of the BAAs and their relative percentage to the NPCC total NEL is calculated for the most recent year for which data is available, the second previous year (Columns B-1 and C-1, respectively). In order to establish the RE division funding requirements for each balancing authority area on a NEL basis for all programs except for compliance (Column F-1), the proposed expenses and fixed assets of all other programs are calculated (Column D-1) and the adjustment for the RE division cash reserve requirement is identified (Column E-1). Any penalty monies received from NPCC registered entities within the U.S. prior to June 30th of the year preceding the business plan and budget year are then allocated among the NPCC program areas based on their FTE ratio and between the U.S. BAAs based on their relative NELs (Columns B-1a., C-1a. and G-1, respectively). Consistent with each of the Canadian provincial MOUs and agreements, all penalty monies resulting from compliance actions within Canada, if any, would remain within the applicable province. The total budgeted fees for NPCC workshop participation are indicated as a credit

(Column H-1), with the resultant addition being the RE division assessment, without the compliance program costs, calculated on a NEL basis (Column I-1).

In accordance with the *NPCC Amended and Restated Bylaws* the CS division proposed expenses and fixed assets of all programs are calculated (Column J-1) and the adjustment for the CS division cash reserve requirement is identified (Column K-1), with the resultant addition being the CS division funding requirement and assessment, calculated on a NEL basis (Column L-1).

For costs associated with the RE division compliance program, NPCC's allocation methodology apportions X% of the costs for the program, attributed to CORC Fundamentals (CF), between the BAAs in the United States and Canada on a NEL basis (Column B-2).

Audits and Investigations (AI) related costs, representing X% of the costs of the compliance program, are allocated between U.S. and Canadian BAAs in NPCC, and among the Canadian provinces, using an audit-based methodology (Columns C-2a., C-2c., and D-2b., respectively). The audit-based methodology incorporates relative costs based on categories of compliance audits which are reflective of their size and complexity, as well as the differing compliance program implementation models that are utilized in NPCC due to the international nature of the Regional Entity. The portion allocated to the U.S. BAAs in NPCC is calculated using the audit-based methodology, and this amount is then re-allocated between the New York and New England BAAs based on their relative NEL (Columns C-2b. and D-2a.).

The remaining X% of the costs of the compliance program represent Mitigation and Enforcement (ME) related costs and are allocated between U.S. and Canadian BAAs in NPCC, and among the Canadian provinces, using an enforcement activity based methodology, (Columns E-2a., E-2c., and F-2b., respectively). Based on historical data, NPCC reviewed each BAAs percentage of violations, mitigation plans and settlement agreements to determine each BAAs total average percentage of enforcement activities. The portion allocated to the U.S. BAAs in NPCC is calculated using the enforcement activity based methodology, and this amount is then re-allocated between the New York and New England BAAs based on their relative NEL (Columns E-2b. and F-2a.).

Any penalty monies received from NPCC registered entities within the U.S. by June 30th of the year preceding the business plan and budget year are then allocated among the NPCC program areas based on their FTE ratio and between the U.S. BAAs based on their relative NELs, and then added to the total compliance program expenses and fixed assets to yield a total compliance program assessment (Columns C-1a., H-2, G-2 and I-2, respectively).

Finally, the total RE division funding requirements and assessments by BAA are tabulated and the total funding requirements and assessments for NPCC, both the RE and CS divisions, are combined (Column M).

Reserve Balance

Table B-1 – Reserve Balance

Working Capital and Operating Reserve Analysis 2014-2015
REGIONAL ENTITY DIVISION

	Total Reserve	Operating Reserve	Working Capital
Beginning Total Reserve, December 31, 2013	**5,245,194**	4,013,698	1,231,496
Plus: 2014 ERO Funding (from LSEs or designees)	13,611,880	13,611,880	0
Plus: 2014 Other funding sources	217,000	217,000	0
Less: 2014 Projected expenses & capital expenditures	(14,129,006)	(14,129,006)	0
Projected Total Reserve, December 31, 2014	**4,945,068**	**3,713,572**	**1,231,496**
Desired Total Reserve, December 31, 2015 [1]	**4,589,907**	3,358,411 [2]	1,231,496 [3]
31.06% of Total Regional Entity Budget of $14,778,539			
Less: Projected Working Capital and Operating Reserve, December 31, 2014	(4,945,068)	(3,713,572)	(1,231,496)
Increase(decrease) in assessments to achieve desired Total Reserve	**(355,161)**	(355,161)	0

2015 Expenses and Capital Expenditures	14,778,539
Less: Penalty Sanctions [4]	(281,000)
Less: Other Funding Sources	(64,000)
Adjustment to achieve desired Total Reserve balance	(355,161)
2015 Assessment	**14,078,378**

[1] Total Reserve within a range of 16.67% - 33.33% of Budget.
[2] Operating Reserve within a range from 8.33% to 25.00% of Budget. $3,358,411 represents 22.72% of the 2015 budget of $14,778,539
[3] Working Capital equal to 8.33% of Budget. $1,231,496 represents 8.33% of the 2015 budget of $14,778,539
[4] Represents collections prior to June 30, 2014.

Explanation of Changes in Reserve Policy from Prior Year

On October 29, 2013 NPCC's Board of Directors approved management's proposed Working Capital and Operating Reserve Policy. The policy calls for a range between 8.33% (30 days) and 25.00% (90 days) rather than the specific required level of Operating Reserves of 8.33%. This range will allow for more stability in Assessments. The Working Capital required balance remains unchanged at 8.33% (30 days).

Breakdown by Statement of Activity Sections

The following detailed schedules are in support of the Regional Entity division Statement of Activities on page 13 of the 2015 Business Plan and Budget. All significant variances have been disclosed by program area in the preceding pages.

Penalty Sanctions

U.S. penalty monies received prior to June 30, 2014 are to be used to offset assessments in the 2015 Budget, as documented in the NERC Policy – Accounting, Financial Statement, and Budgetary Treatment of Penalties Imposed and Received for Violations of Reliability Standard. Penalty monies received from July 1, 2014 through June 30, 2015 will be used to offset U.S. load serving entity designee assessments in the 2016 Budget.

All penalties received prior to June 30, 2014 are detailed below, including date received and the penalty amount.

Allocation Method: U.S. penalty sanctions received have been allocated to the following Regional Entity division programs to reduce assessments: Reliability Standards; Compliance Monitoring & Enforcement and Organization Registration & Certification; Reliability Assessments and Performance Analysis; Training, Education and Operator Certification; and Situation Awareness and Infrastructure Security. U.S. penalty sanctions are allocated based upon the number of FTEs in the Program divided by the aggregate total FTEs in the Programs receiving the allocation.

Table B-2 – Penalty Sanctions

Penalty Sanctions Received Prior to June 30, 2014	Date Received	Amount Received
Penalty Payment 1	7/5/2013	$ 50,000.00
Penalty Payment 2	7/5/2013	$ 10,000.00
Penalty Payment 3	7/5/2013	$ 30,000.00
Penalty Payment 4	7/5/2013	$ 25,000.00
Penalty Payment 5	9/4/2013	$ 7,000.00
Penalty Payment 6	10/16/2013	$ 25,000.00
Penalty Payment 7	11/1/2013	$ 5,000.00
Penalty Payment 8	1/8/2014	$ 25,000.00
Penalty Payment 9	3/6/2014	$ 14,000.00
Penalty Payment 10	4/30/2014	$ 90,000.00
Total Penalties Received		**$ 281,000.00**

Retirement					
Pension Contribution	$ 590,892	$ 590,892	$ 353,723	$ (237,169)	-40.1%
Employee Savings Plan	$ 478,469	$ 478,469	$ 644,290	$ 165,821	34.7%
Savings Admin	$ 32,000	$ 32,000	$ 32,000	$ -	0.0%
Deferred Compensation	$ 23,000	$ 23,000	$ 60,000	$ 37,000	160.9%
Total Retirement	$ 1,124,361	$ 1,124,361	$ 1,090,013	$ (34,348)	-3.1%
Total Personnel Costs	**$ 8,850,160**	**$ 8,850,160**	**$ 8,929,041**	**$ 78,881**	**0.9%**
FTEs	36.86	36.86	36.86	-	0.0%
Cost per FTE					
Salaries	$ 160,370	$ 160,370	$ 168,080	$ 7,710	4.8%
Payroll Taxes	$ 10,426	$ 10,426	$ 10,505	$ 79	0.8%
Benefits	$ 38,803	$ 38,803	$ 34,086	$ (4,717)	-12.2%
Retirement	$ 30,504	$ 30,504	$ 29,572	$ (932)	-3.1%
Total Cost per FTE	**$ 240,102**	**$ 240,102**	**$ 242,242**	**$ 2,140**	**0.9%**

Explanation of Significant Variances –2015 Budget versus 2014 Budget

- The increase in Salaries reflects an overall general wage increase of 3%, at risk (variable incentives) compensation at less than 100% of program levels, and implementation of recommendations of NPCC's Management Development and Compensation Committee, which were based on an independent compensation study.
- Benefits expense decreased due to more staff opting out of company sponsored health insurance for superior coverage through prior employer or spouse.
- Pension contribution decreased while employee savings plan increased due to transition of employees formerly accruing benefits under the defined benefit plan to receiving defined contribution benefits in 2015.
- The decrease in Employment Agency Fee is due to no planned staff additions in 2015. Agencies would be used only to fill positions vacated during the year.
- A 2% vacancy factor is assumed based on historical vacancy trends.

Table B-5 – Consultants and Contracts

Consultants	Budget 2014	Projection 2014	Budget 2015	Variance 2015 Budget v 2014 Budget	Variance %

Total Consultants and Contracts	**$ 1,924,433**	**$ 1,924,433**	**$ 2,342,000**	**$ 417,567**	**21.7%**

Explanation of Significant Variances –2015 Budget versus 2014 Budget

- Compliance Enforcement and Organization Registration and Certification consultant and contractor costs increased due to increased workload related to the initial implementation of the RAI, incorporating Risk Assessment and Internal Control assessment. Without this one time ramp up in RAI endeavors for 2015, contractor costs would have remained relatively flat. These joint ERO Enterprise initiatives are intended to benefit the registered entities, Regional Entities and NERC. With a risk and performance based assessment of each registered entity, audits will transition to a periodicity more reflective of the risk profile of the entity such that some audits will be more in-depth while others may have a reduced scope which will require less independent contractor resources.

- Reliability Assessment and Performance Analysis contracts expense increase is related to implementation of the revised BES definition.

Table B-6 – Office Rent

Office Rent	Budget 2014	Projection 2014	Budget 2015	Variance 2015 Budget v 2014 Budget	Variance %
Office Rent	$ 654,772	$ 654,772	$ 645,000	$ (9,772)	-1.5%

NPCC Regionally-Specific Criteria Services Background

NPCC Criteria Services division activities are based on the development, maintenance and promulgation of Regionally-specific more stringent criteria as well as criteria establishing resource adequacy requirements within the Region. These criteria contain requirements which are more stringent and more specific than the existing NERC Reliability Standards requirements. These criteria require continual evaluation to ensure they are "not inconsistent with" any NERC reliability standards.

Membership and Governance

Full members are subject to compliance with Regionally-specific criteria, in addition to continent-wide Reliability Standards, and receive criteria-related services from the Criteria Services division.

Full Members, aside from those who perform the Balancing Authority function, are not assessed an annual membership fee. Those that perform Balancing Authority functions are assessed and remit a proportional net energy for load share of expenses for criteria services. NPCC would also directly assign criteria service division costs to a Balancing Authority Area or entity, where significant costs are incurred for that Balancing Authority Area. The funding for NPCC's Criteria Services division is approved by the NPCC Board of Directors.

Criteria Services Division Functional Scope

Through its Criteria Services division, NPCC promotes the reliable and efficient operation of the international, interconnected bulk power systems in Northeastern North America through the establishment of Regionally-specific criteria, and monitoring and enforcement of compliance with such criteria.

NPCC provides Full Members with Regional reliability assurance services, and acts as the vehicle through which States and Provinces can fulfill their political mandates, with respect to resource adequacy, as well as overseeing the Northeastern North American electric infrastructure.

Major 2015 Assumptions and Cost Impacts

The Criteria Services division services are expected to remain stable throughout 2015 when compared to the Regional Entity division.

- The Criteria Compliance Enforcement Program (CCEP) review and evaluation process has matured and been enhanced after its inception in 2012. Criteria Compliance submittals to the CC are done as necessary.
- Past non-compliances, if any, followed the due process stated in the CCEP-1 process document and proper resolution/enforcement action taken.

2015 Primary Goals and Objectives

- Review, maintain, and revise the NPCC Regional Reliability Directories to facilitate compliance assessments and ensure the Criteria portions of the Directories are "not inconsistent" with, nor duplicative with, the approved and effective NERC Standards.
- The criteria services division and CCEP Working Group (reporting to the Compliance Committee) will work with the various Task Forces to develop Criteria Compliance Reporting Forms for additional NPCC Directories to ensure that the more stringent or Regionally-specific criteria is being met.
- The criteria services division and CCEP working group will work with TFCO, TFCP, TFSS, and TFSP to review criteria and measures within each specific NPCC Directory to identify and develop them into specific reporting forms for approval.
- Review impact of Bulk Electric System definition on Directory and Criteria content and compliance reporting.
- Review impact of Sector or NPCC organizational changes on the Directory and Criteria review, enforcement and arbitration processes
- Assist Legal with preparation of revised Directories for Regulatory filings with the individual Provinces in accordance with their respective Memorandum of Understandings (MOUs) as well as the State of New York Public Service Commission
- Facilitate any requested interpretations for NPCC Criteria with the necessary subject matter experts and identify potential opportunities for clarifications of the Criteria.

NPCC Reliability Directory Maintenance and Development

The NPCC Regional Reliability Directories were developed to demonstrate that the NPCC more stringent criteria are not inconsistent with the NERC Reliability Standards as mandated by the NERC Rules of Procedure. The Directory project was also undertaken to remove any redundancies with the NERC Reliability Standards and to clearly delineate the more stringent NPCC criteria requirements. In 2013 the directories were further reviewed and revision of the directories is underway to transition the criteria language into a "requirement type" format. This further revision facilitates the NPCC Region's CCEP and ensures the continued delineation of the more stringent and more specific Regional criteria from the latest approved and effective set of NERC ERO standards.

In 2015, work will proceed with maintenance and revision of the Directories to address any future redundancies with NERC or NPCC Reliability Standards as well as the continued need for additional more stringent or specific NPCC Regional criteria requirements as new NERC Reliability Standards are developed and existing standards are revised. NPCC will continue to rely on contractors for subject matter expertise on an as-needed basis throughout 2015. The amount of Regional documents being converted into Directories and the maintenance of the Directories require subject matter expert input. In addition, changes will be necessary to bring the Phase II Directory project to completion. This project will require significant resources to translate the existing criteria language into "requirements" that are clear, concise and measurable. Also a standards template will be applied to the existing Directories to make them more consistent with the look of the standards. As NERC standards improve, the need for NPCC Directories and amount of criteria contained therein will gradually decrease over time however in the interim, significant review is necessary to ensure the criteria remain "not inconsistent with" the NERC standards as outlined in the NERC Rules of Procedure.

The following Directories will either be under revision or reviewed for further development based on a schedule set forth in the NPCC Reliability Assessment Program:

Operations and Planning Directories

Directory #1, *Basic Criteria for Design and Operation of Interconnected Power Systems*
This directory documents NPCC's Regionally-specific, more stringent criteria, and demonstrates coordination and consistency with all the existing NERC TPL, BAL, IRO, INT, MOD, TOP, PRC and VAR standards. The NPCC Task Force on Coordination of Planning will lead a multi-disciplinary working group, consisting of operations and planning subject matter experts to review and revise this directory to reflect the FERC ruling on TPL and other TOP changes.

Directory #2, *Emergency Operations*
This directory documents NPCC's Regionally-specific, more stringent criteria, and demonstrates coordination and consistency with all the existing NERC EOP and TOP standards. The NPCC Task Force on Coordination of Operation will lead this review and revision.

Directory # 3, *Maintenance Requirements for BPS Protection*
This Directory documents NPCC's Regionally-specific, more stringent criteria, and demonstrates coordination and consistency with certain applicable NERC PRC standards. The NPCC Task Force on System Protection will lead this review and revision.

Directory # 4, *BPS Protection*
This Directory documents NPCC's Regionally-specific, more stringent criteria, and demonstrates coordination and consistency with certain applicable NERC PRC standards. The NPCC Task Force on System Protection will lead this review and revision.

Directory # 5, *Operating Reserve Requirements*
This directory documents NPCC's Regionally-specific, more stringent criteria, and demonstrates coordination and consistency with all the existing applicable NERC BAL, INT, and IRO standards. The NPCC Task Force on Coordination of Operation will lead this review and revision.

Directory # 7, *Special Protection Systems*
This Directory documents NPCC's Regionally-specific, more stringent criteria for application and approval of SPS. The NPCC Task Force on System Protection will lead this review and revision.

Directory # 8 System Restoration
This Directory documents NPCC's Regionally-specific, more stringent criteria with which each applicable entity must plan for and perform power system restoration following a major or a total blackout, and demonstrates coordination and consistency with applicable NERC EOP standards. The NPCC Task Force on Coordination of Operation will lead this review and revision.

Directory # 9, *Verification of Generator Gross and Net Reactive Power Capability*
This Directory documents NPCC's Regionally-specific, more stringent criteria for verifying the Gross Reactive Power
Capability and Net Reactive Power Capability of generators or generating facilities. The NPCC Task Force on Coordination of Operation will lead this review and revision.

Directory # 11, *Disturbance Monitoring*, This directory documents NPCC's Regionally-specific, more stringent criteria, and demonstrates coordination and consistency with certain existing NERC PRC standards. The NPCC Task Force on System Protection will lead this review and revision until such time as the NPCC PRC-002-01 Disturbance Monitoring Regional Standard is adopted by FERC and the applicable governmental authorities.

Directory # 12, *UFLS Program*, This directory documents NPCC's Regionally-specific, more stringent criteria, and demonstrates coordination and consistency with certain existing NERC and NPCC developing PRC standard(s). The NPCC Task Force on System Studies will lead this review and revision until such time as the NPCC PRC-006-01 UFLS Regional Standard is approved by the NPCC membership, NERC BOT, the FERC and all the applicable governmental authorities in the Provinces of Canada within NPCC's footprint.

NPCC Criteria Compliance Background

The NPCC criteria services division promotes the reliable operation of the bulk power system through implementation of a comprehensive compliance program. The compliance program that includes monitoring, assessing and enforcing compliance with more stringent, Regionally specific NPCC Criteria requirements, is known as the NPCC Criteria Compliance and Enforcement Program (CCEP) described in process document CCEP-1. This program was developed by the criteria services division and the CCEP Working Group under the purview of the NPCC Compliance Committee. The products of this program support the various Task Forces in their assessments of the NPCC Directories in meeting their goals for the Reliability Coordinating Committee as stated in Section A of this Business Plan.

The more stringent, Regionally-specific NPCC Criteria requirements reflect the unique operational and planning aspects of the bulk power system within the NPCC Region and are included in the NPCC "A" documents and their successors, the NPCC Directories.

NPCC issues non-monetary sanctions to enforce compliance with NPCC Criteria.

- The CCEP program is described in document CCEP-1, *NPCC Criteria Compliance and Enforcement Program (CCEP) Process Document*
- The implementation plan is described in document CCEP-2, *Implementation Plan for 2011 NPCC Criteria Compliance and Enforcement Program*
- On April 5, 2011, the above became effective upon Full Member approval of CCEP-1, and CCEP-2 and retired the following
    - NPCC Criteria A-8, Reliability Compliance and Enforcement Program (RCEP)
    - NPCC Guide B-22, Guidelines for Implementation of the NPCC Inc. Compliance Program
    - NPCC Procedure C-32, Review Process for NPCC Reliability Compliance Enforcement Program
    - Each of the above have been annotated as "retired effective 4/5/11 upon Full Member approval of CCEP-1… and CCEP-2…" on the NPCC public website

The CCEP-1 document

- recognizes the applicability of NPCC's Regionally-specific, more stringent reliability criteria to the Full Members of NPCC, consistent with the *Amended and Restated ByLaws*, and respects the provisions of the several Canadian Memoranda of Understanding in the execution of the processes described
- provides a comprehensive CCEP Process Diagram showing the process of evaluating and approving Criteria Certification submittals, and additional processes and responsibilities in the event that non-compliances, disputes and sanctions arise
- describes the roles and responsibilities of Reporting Members, CC, RCC and Enforcement Panel in the compliance review and enforcement process
- describes Levels of Non-Compliance, associated non-monetary Sanctions, Lateness Policy and the Arbitration/Dispute Resolution process
- addresses Mitigation Plans for any violations under the enforcement process; and
- lists the mandatory Certification Forms to be submitted for review by the Task Forces to ensure compliance with NPCC Directories are being met

The CCEP currently requires annual submittal of Certification Forms by the Reliability Coordinators and Balancing Authorities to confirm compliance with various NPCC Directories. Currently the required Certification forms are for Directory #1- *Area Transmission Review*, Directory #8 - *Key Facility List*, Directory #9 – *Generator Real Power Verification*, Directory #10 - *Verification of Generator Gross and Net Reactive Power Capability*, and Directory #12 - *UFLS Program Requirements*. In 2014 NPCC anticipates expansion of the CCEP to include compliance assessment activities to all active Directories.

The CCEP identifies those specific NPCC Directories that are subject to monitoring, assessment and enforcement. These Directories also are subject to NPCC Criteria Compliance Audits.

The NPCC Compliance Committee (CC) has final approval of compliance assessments related to CCEP. The CCEP describes the roles and responsibilities of committees and panels used to resolve contested compliance and/or sanction or penalty determinations related to NPCC Directories.

Explanation of Significant Variances – 2015 Budget versus 2014 Budget

Personnel Expenses

- Salaries expense reflects implementation of recommendations of NPCC's Management Development and Compensation Committee, which were based on an independent compensation study.

Less: Projected Working Capital Reserve Balance December 31, 2014	(741,220)	(652,465)	(88,755)
Increase(decrease) in assessments to achieve desired Total Reserve	(94,220)	(99,581)	5,361
2015 Funding requirement for expenses and fixed asset additions	1,129,441		
Adjustment to achieve desired Working Capital and Operating Reserve balance	(94,220)		
2015 Funding and reserve requirement	1,035,221		

Explanation of Changes in Reserve Policy from Prior Year

On October 29, 2013 NPCC's Board of Directors approved management's proposed Working Capital and Operating Reserve Policy. The policy calls for a range between 8.33% (30 days) and 25.00% (90 days) rather than the specific required level of Operating Reserves of 8.33%. This range will allow for more stability in Assessments. The Working Capital required balance remains unchanged at 8.33% (30 days).
