-GTC supports the comments submitted by the NRECA with regard to the applicability, requirements, and implementation of the draft standard. - GTC requests revision to the requirement language or addition of guidance around the phrasing of “unique characteristics” in R4 to address whether all equipment within an identified substation has to be assessed in R4 or if an entity has the option to focus their threat and vulnerability assessment on specific facilities in the substation which were identified as causing the adverse effects described in R1. -GTC is concerned that the language of the standard and rationale around the use of the term “unaffiliated” in R2 and R6 does not provide sufficient clarity for a registered entity to have confidence in the consistent applicability and auditability of the requirement. GTC suggests additional examples or requirement language to consider whether: -entities that are not under the same corporate parent but which have contractual obligations between each other would be considered “unaffiliated” - organizations or teams made up of representatives of multiple utilities with no one utility having a controlling interest in the findings of the group would be considered “unaffiliated”
Yes
-GTC supports the comments submitted by the NRECA with regard to the applicability, requirements, and implementation of the draft standard. -GTC suggests that in M2 the word “communications” be changed to “notifications” to follow the language of the requirement. -GTC suggests that in M2 and M6 the measures should be updated to include evidence of the qualifications and independence of the respective review teams. -GTC suggests that M6 the measures should be updated to include evidence of the implementation of procedures for information protection used during the third-party review.

It should be clear that the applicability section of the standard is only intended to provide a valid, technically sound basis to be used as the ‘starting point’ to those transmission facilities or stations that should be included in the risk assessment. We suggest the following modifications: 4.0 Applicability: 4.1 Functional Entities: 4.1.1 Transmission Owner that owns any facilities identified in the following sections (4.1.1.1 through 4.1.1.4) will be required to perform the risk assessment and risk assessment validation as outlined in R1 and R2 of this standard. Should the risk assessment identify critical assets then the Transmission Owner is subject to the remaining requirements (R3 through R6) of the standard. 4.1.2 Transmission Operator
No
While we support using the CIP-002-5.1 criteria as a starting point for applicability of the draft standard, we do have concerns with the inclusion of the phrase “within an Interconnection” in R1. FERC Order RD14-6 directs that "[a] critical facility is one that, if rendered inoperable or damaged, could have a critical impact on the operation of the interconnection through instability, uncontrolled separation or cascading failures on the Bulk-Power System". By introducing the word “within,” the Standard could inadvertently draw widely different interpretations of how to assess risks to the BPS. In practice, this could open up the potential for the inclusion of regional or localized transmission impacts, which we believe is in contrast with the Commission intended scope in the Order. As a result, we suggest that the wording in R1 be modified to the following: “A critical facility is one that, if rendered inoperable or damaged, could result in widespread instability, uncontrolled separation or cascading failures widespread across significant portions of an Interconnection". Alternatively, we recommend clarifying in the guidance documents that ‘widespread’ and ‘within an Interconnection’ proposed words are intended to apply to impacts to the BPS that reaches deep into the Interconnection, and not affecting a small portion of an Interconnection. For example, if an Interconnection has relatively small Balancing Authorities (BAs), ‘widespread’ would need to be interpreted as impacts that would be crossing several, i.e. more than two, of those BAs in order to be considered ‘widespread’.

SRP supports comments submitted by APPA.
No
SRP supports comments submitted by APPA with the following additions: The time frame for completion of the initial risk assessment required in Requirement R1 is not identified in the standard, only in the implementation plan. This may be a point of confusion for entities that fail to fully read and understand the implementation plan. If possible, could the drafting team revise the language of Requirement R1 to make this clear? The periodicity of the risk assessments required by Requirement 1 and the time frame that the risk assessments appear to not align. The risk assessment is required to include Transmission stations and Transmission substations that exist as well as those planned to be in service within 24 months. However, the periodicity for conducting future risk assessments is every 30 calendar months or every 60 calendar months if the prior risk assessment did not identify any Transmission stations or Transmission substations. This potentially leaves a gap of six to 36 months where facilities may not have been assessed. In R2 it is not clear that the primary control center must also be verified, but in subsequent requirements it implies or states that it should be. If the intent in R2 is that the primary control center should also be verified, then it should state so in R2.2 and R2.3 in addition to stating stations and substations. Third Party Verifiers: SRP recommends removal of the concept of third party verifiers and adherence to the existing, and well-functioning, audit program of FERC, NERC and the Regional Entities. If, at any time, modification to the compliance and audit program in regards to any or all of the standards are deemed necessary, such modification can be proposed, evaluated and implemented with due process to ensure no unintended adverse impacts. SRP is concerned that use of third party verifiers to verify, or opine on compliance, both undermines the foundational structure of the FERC/NERC/Regional Entity audit program and introduces additional risk for the safeguarding of critical facility information on physical threats and vulnerabilities. The national audit program for the mandatory Reliability Standards is founded on compliance, self-reporting and a range of audit types, including spot checks and regularly-scheduled audits by NERC and Regional Entities. There are no facts to support abandonment of this foundation in favor of the introduction of a non-authoritative mid-layer of inspection by third parties. Third party verifiers are not authorized to verify compliance. As such, a Registered Entity derives no concrete benefit from a third party verifier's expressions of agreement or disagreement with the Registered Entity's compliance activities. Notwithstanding the theoretical value of another's opinions on whether one has properly or fully complied with the requirements of CIP-014, there are sound and compelling reasons to forego requiring such opinions at the expense of owners. On the other hand, as demonstrated

with other standards, Registered Entities readily retain expert consultants as needed to help them evaluate and resolve all manner of compliance challenges. This standard is no different in the sense that outside subject matter experts already are being retained as needed by the party bearing compliance responsibilities. Introducing third parties does not guarantee value-added subject matter experts versed in the nuanced and individualistic profiles on critical facilities. The Transmission Owner already is required both by law and sound business practices to be versed in physical security risks and potential vulnerabilities of critical facilities. The owner both knows which are its critical facilities and is best suited to identify the optimal means and methods to protect them. There are overwhelming incentives for Registered Entities to evaluate and take all appropriate steps to ensure continued reliability of the bulk electric system and reliable service to electric customers. Critically, neither the owner nor FERC/NERC/Regional Entities can rely on the findings of third party verifiers: the approved program of compliance audits will continue regardless and without regard to the findings of third party verifiers. Confidentially of the highly sensitive information produced, gathered, used and maintained for compliance with this standard is critical. Wholesale introduction of a new subset of entities who would routinely gain access to such information poses additional challenges to information safekeeping. Absent demonstrable need, granting access to physical risk and vulnerabilities information introduces unnecessary risk. With any access, vulnerabilities for inappropriate use or further unauthorized access occur. Prudent industry practices dictate non-disclosure absent demonstrable need to know or compelling benefits from such disclosure. Here there is no record of need or benefits.

Yes
Section C “Compliance” 1.4 (page 13) which states “...all evidence will be retained at the TO and TOP facilities.” is contradictory with NERC Compliance Monitoring and Enforcement practices which allow data to be exchanged with and sent to Regional Entities such as in pre-Audit data requests and Mitigation Plans. In addition, this would be burdensome for the TO/TOP because the 3rd party verifying/reviewing entities would need to be on-site and potentially incur travel expense.

SCE has concerns with both Requirement R1 and Requirement R3. In Requirement R1, SCE recommends that the verbiage be changed from “…that if rendered inoperable or damaged could result in widespread instability...” to “...that if damaged to the point of being rendered inoperable could result in widespread instability..." SCE requests this change to reduce ambiguity in the application of the word "damaged." In addition, language should be added to R1 that specifies: “…system instability such as uncontrolled separation or cascading within 15 minutes of compromise…,” as a 15-minute window would align with criteria in the CIP standards used to determine critical facilities. In the guidance section for R1, SCE would suggest changing the text from “…remedial action schemes (RAS) or special protection

systems (SPS)" to "…special protection systems (SPS)…," because as used in the NERC Glossary of Terms, a RAS is included as a type of SPS. In addition, SCE requests that R1 be revised to include specific examples and criteria for the risks to be measured. For instance, SCE believes the following could be among the examples and criteria specifically included: (a) Thermal overloads beyond facility emergency ratings; (b) Voltage deviation exceeding ± 10%; (c) Cascading outage/Voltage collapse; and (d) Frequency below under-frequency load shed points. With respect to Requirement R3, SCE requests that additional guidance be provided on how a "primary control center" should be identified, as that term in used in both Requirements R1.2 and R3. SCE also asks the team to consider changing the notification requirement in R3 from seven(7) to thirty(30) days in order to allow sufficient time for the transmission owner and transmission operator to perform the required communication.
No
SCE has concerns with Requirements R4, R5, and R6 that will be described below. With respect to Requirement R4, SCE notes that entities are required to "…conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s)…" SCE requests the inclusion of additional guidance or examples of threats and potential vulnerabilities that an entity may want to consider. This will allow entities to perform a threat assessment and develop preventative measures that are commensurate with the intent of the standard. In addition, SCE requests additional guidance on physical security plans that allow for flexibility to deal with emergent threats. With respect to Requirement R5, SCE believes that in the guidance section, the drafting team should consider referencing standards that are used by security professionals or organizations, in order to ensure that the criteria to identify appropriate countermeasures to potential threats and physical attacks are evaluated along similar themes across industry. SCE also requests that the team consider rephrasing R5.1 from "Resiliency or security measures designed to deter, detect, delay, assess, communicate, and respond…" to describe the control, to "…deter, detect and delay, and also assess, communicate, and respond…" With respect to Requirement R6, SCE requests that the team consider rewording Requirement R6.1 from "Each Transmission Owner and Transmission Operator…" to "Each Transmission Owner or Transmission Operator, with facilities identified as a result of R2,…"

R2 Comment: Suggest removal of the requirement for a third party risk assessment verification. Verifications already occur as part of internal compliance programs in CIP-002 and when audited by the Region. What if the assessment is performed by a third party, do you have to get another third party to verify? This creates a significant administrative burden, even if the Standard will only apply to a small number of entities and facilities. R3 (pg. 8) "…the Transmission Owner shall, within seven calendar days following completion of Requirement R2, notify…" Comment: Seven calendar days may be too short a time requirement, consider 10-14 days
Yes
R4 (pg. 9) "…shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s)…" Comment: Consider stating "…conduct a physical security risk assessment to identify and evaluate potential threats and vulnerabilities…" The assessment should identify the potential threats and vulnerabilities to evaluate and implement the necessary protective, detective and corrective countermeasures R5 (pg. 10) states to develop and implement a documented security plan (s) within 120 calendar days of completion of R2 (unaffiliated third party verify the risk assessment form R1). Furthermore, R5.1 states to address the potential threats and vulnerabilities from R4. 120 days to implement the countermeasures may not be enough time (logistics, procurement, installation timelines, approvals, etc.). Comment: Could they say "…shall develop and begin implementation of a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s) within 120 calendar days…" because in R5.3 it requires a timeline for implementing the enhancements. 6.1.1. (pg.11) "An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification." Comment: Shouldn't require a specific certification, should say something like "The third party must include in their review the qualifications of the staff performing the review." R6.1.2 (pg. 11) "An entity or organization approved by the ERO." Comment: What criteria is the ERO using to approve entities or organizations? The approval process needs to be spelled out. R6.1.3 (pg. 11) "An entity or organization with demonstrated law enforcement, government, or military physical security expertise" Comment: Does this mean we can use Law Enforcement agencies or firms with retired law enforcement personnel?
Yes
Compliance 1.2 (pg. 13) Comment: can they clarify by being less wordy and just start by saying "The responsible entities shall retain documentation as evidence for three years", followed by the rest in less words?

Yes

Introduction The proposed standard provides adequate flexibility with respect to the risk assessments and security evaluations and plans. This allows the industry to capitalize on their experience in these matters, while also accommodating changes that warrant consideration. Applicability Section The applicability scope is reasonable in terms of identifying the appropriate functional entities to address physical security concerns. Similarly, the proposed standard establishes a reasonable approach for identifying the scope of facilities by 1) initially defining an objective set based on the CIP-002-5.1 criteria, and then 2) refining that set based on analyses that assess the relationship of those facilities to specific, system conditions/impacts metrics – i.e. widespread instability, uncontrolled separation, or Cascading within an Interconnection.
Yes
R1 R1 in conjunctions with the Applicability section is a reasonable approach for identifying the scope of facilities subject to R2 – R6. R2 Imposing a verification requirement is a reasonable way to facilitate an effective outcome in terms of identifying facilities that meet the impact thresholds established in R1. Requiring the use of an unaffiliated third party is reasonable because it mitigates the potential for inadvertent error in study work. Finally, allowing the verification to occur concurrently or subsequently, and leaving that decision to the discretion of the relevant functional entities, is appropriate. The functional entities should have the discretion to determine the most effective means of performing the verification. R2.1 requires that the verifying entity be either 1) a registered RC, PC or TP, or 2) another entity with appropriate planning or analysis experience. This is a reasonable approach that provides appropriate flexibility with respect to third party verification options. It also addresses the different operational and planning structures that comprise the North American electric grid – i.e. organized market regions where different entities can perform the different NERC registered functional roles (ISOs/RTOs) and vertically integrated regions where all the relevant roles under the standard may be performed by a single entity and, therefore, would require the use of an independent third party to perform the unaffiliated verification. R2.2 requires the third party verification to either confirm the TO analysis under R1, or, alternatively, recommend that facilities be added or deleted (the IRC assumes that a verification can confirm some results and also add facilties or remove facilities). Although R2.2 establishes a reasonable standard – i.e. verify TO results or recommend changes - the IRC offers the following comments. The requirement, as written, imposes the obligation on the third party verifying entity. However, the TO is the responsible entity under the standard – i.e. the TO is required to obtain the third party verification. The language should be revised to clarify that the relevant actionable obligation (to obtain the third party verification) lies with the TO. The next issue raised by R2.2 is the timing. The IRC appreciates the importance of the issues being addressed by the proposed standard and the goal of implementing the standard and the relevant processes contained therein in a timely fashion. However, practically speaking, 90 days may be difficult to meet depending on the number of Transmission Owners that require verification from a single Registered Entity. For example, in organized markets there may be numerous TOs all selecting their PC to verify. To the extent implicated in reviews under the standard, IRC members would make best efforts to perform any relevant verifications. This comment is merely intended to highlight the potential resource impacts

under the proposed 90 day timeline. The IRC proposes the following revisions to mitigate the issues in R2.2 described above. 2.2. The third party verification shall either verify the Transmission Owner's risk assessment performed under Requirement R1 or recommend the addition or deletion of a Transmission station(s) or Transmission substation(s). The Transmission Owner shall ensure the verification is completed within a mutually agreed upon timeframe between the Transmission Owner and the third party but no longer than 180 calendar days following the completion of the Requirement R1 risk assessment. R3 R3 obligates the TO to notify a TOP that has operational control of a control center associated with a facility identified pursuant R1 and verified under R2. R3.1 requires similar notification if a facility is removed via those processes. The standard may benefit from including the draft guidance into the R3 rationale section that clarifies that operational control means the ability to take action that affects the physical status of the facility, and that it does not include directive control, which relies upon another entity to take operational action to change the status of the facility. The guidance document addresses this issue, but the SDT could add clarifying language to the rationale section of R3, similar to the language in the guidance document and/or the language in the R1 rationale section, which reads in relevant part: "… identify the primary control center that operationally controls that Transmission station or Transmission substation (i.e., the control center whose electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker, compared to a control center that only has the ability to monitor the Transmission station and Transmission substation and, therefore, must coordinate direct physical action through another entity)."
The IRC has no comments on R4-R6.

APPA
Paul Haase
Agree
The stated purpose of draft CIP-014-1 Physical Security is: To identify and protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. Public Utilities subject to state Open Records Acts are concerned that records produced, gathered, used and maintained as evidence of compliance with this standard may be subject to disclosure under applicable state laws. To protect this critical information from disclosure, we suggest adding a provision to the Introduction section of the proposed standard that designates the produced, gathered, used and maintained records related to compliance with this standard as exempt from disclosure. Alternatively, we suggest the addition of Requirements to protect the records and information from disclosure. Proposed language for a new #7 in the Introduction Section: 7. Critical Facilities Information Records and related information concerning critical facilities, physical infrastructure, including risk assessments

and evaluation of physical threats and vulnerabilities, as produced, gathered, used or maintained for compliance with mandatory Reliability Standards, are intended to be kept confidential by the owner of the records and information, those entities with authorized access, and any agency charged with examination of such records and information pursuant to Section 215 of the Federal Power Act. All such identified records and information are also intended to be exempt from public disclosure. Consistent with that premise, the purpose of the cyber and physical security Reliability Standards are to identify and protect facilities that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or cascading within an interconnection. Consequently, records and information detailing the physical infrastructure, including records and information related to the risk assessments and evaluation of physical threats and vulnerabilities conducted under this Reliability Standard and all records and information produced, gathered, used and maintained for compliance with this Reliability Standard shall be considered critical facilities information and are intended to be exempt from disclosure under public records laws. Nothing in this section or the Reliability Standards is intended to eliminate other lawful methods of access to such records and information. Proposed Requirement Language (new subrequirements): R1 1.3 The Transmission Owner will keep confidential all records and information related to the risk assessments conducted under this standard. R3 3.4 The Transmission Owner will keep confidential all records and information related to the risk assessments conducted under Requirement R1 of this standard. R4 4.1 The Transmission Owner will keep confidential all records and information related to the evaluation of physical threats and vulnerabilities to each of its transmission substation(s) and primary Control Center(s) identified in Requirement R1 conducted under this standard.
Individual
David Francis
MISO
Yes
MISO supports the proposed applicability section and agrees that other entities do not need to be included. In particular, MISO would not support application of this Standard to Reliability Coordinators or Balancing Authorities, as these entities' control centers are adequately protected with regard to physicial security under CIP-006-3c and its successor standard. Moreover, these control centers are subject to the requirements of EOP-008-1 including the transfer functional control to backup facilities. MISO therefore agrees that the focus of CIP-014-1 should be those facilities that are not otherwise fully protected by CIP-006-3c, such as those that do not not rely entirely on Critical Cyber Assets to maintain reliability.
No
MISO recognizes that the Commission mandated third-party verification of the risk assessment required under R1, however the current language of R2 requires modification to address several concerns MISO has with regard to its potential role as a verifying entity. While MISO has every confidence that it can perform risk assessment verifications in a safe, responsible, and accurate manner, the combination of a high number of requests requiring

verification within a relatively short period of time presents some concerns to MISO regarding its resource allocation and availability. In particular, MISO recommends that the SDT add language limiting the universe of Transmission Owners/Operators that can seek verification from a particular verifying entity (potentially by geographical region or contractual or functional relationship) as well as modify the 90 day requirement to take into account that a single entity may have more requests than it can feasibly complete in such a short time period. An example of language that MISO could support is language that would allow a verifying entity and the requesting Transmission Owners/Operators to agree upon an appropriate completion date beyond the 90 days where the 90 day period will not allow completion of a robust verification due to resource constraints by the berifying entity. Finally, MISO respectfully requests that the SDT consider adding language to Requirement R2 that would allow verifying entities to limit liability related to both enforcement actions within the jurisdiction of FERC, NERC, and the Regional Entities and other actions that could be brought against verifying entities in other jurisdictions and venues unless it is shown that the entity lacked good faith or was grossly negligent.

Sergio Banuelos
Tri-State Generation and Transmission Association, Inc.
No
The drafting team may want to consider language referencing the CIP-002 Critereon rather than outright copying it in order to prevent changing multiple standards as the CIP-002 standard evolves. CIP-002-5.1 Attachment 1: Overall Application gave guidance on how to treat joint ownership facilities. Tri-State feels that this new standard would also benefit from such guidance.
No
Rather than making it the Responsible Entity’s responsibility to find a third party to verify its assessment, Tri-State believes it would better suit the industry and the standard if R2 required either the Reliability Coordinator or Regional Entity to request TO's assessments on an intervaled basis. This meets the requirements of the March 7 FERC Order. Allowing the requirement to be broad enough to allow third party paid consultants with “transmission planning or analysis experience” creates a conflict of interest and contradicts the draft standard’s requirements for the use of “unaffiliated third part[ies]”. If third party – other than NERC or the RE – verification of the assessment is required by the standard, then this is effectively two audits (and two 3rd party assessments) on the same requirement. Additionally, it does not seem appropriate (or potentially even legal) for a third party (other than NERC or RE) to be able to add or remove facilities from a critical facilities list as the

standard is currently drafted. Tri-State recommends that rather than 30 months and 60 month risk assessment intervals for R1.1, they should be a more straightforward 36 months and 72 months respectfully in order to be consistent withnormal auditing time periods of three years. This will make the intervals easier to track with internal programs and controls.
No
Tri-State disagrees that the FERC order specifically forces the drafting team to have a requirement for 3rd party verification. The order uses the word “should,” not “shall” or “require.” Tri-State would argue that 3rd party verification would/will occur during scheduled audit times. Again if the drafting team feels a need to require an additional 3rd party verification, it should require the Regional Entity or Reliability Coordinator to request the plans.
Yes
While the FERC Order RD14-6 paragraph 13 does require NERC to file a proposed standard within 90 days, footnote 8 only requires that the proposed standard include timelines for certain elements, without specificity for what those timeframes should be. The bright line CIP version 5 applicability that is used within this standard became effective 02-03-14 and was giving industry 24 months to implement. The CIP-014 draft appears to assume those bright line considerations are already completed for industry and provides just over 6 months to complete an additional assessment to remain compliant. Without specific implementation timeframes provided by FERC, and to stay in closer alignment to the expected completion dates for CIP v5, Tri-State is recommending no less than a one year after this standard becomes effective for the R1 risk assessment to be completed.

4. Applicability: BPA believes that the medium list for HV transmission entities will result in numerous facilities having to be protected (all 500 kV) contrary to the drafting team comment that not many facilities will be deemed critical. 4.1. Functional Entities: BPA recommends that this section reference the criteria of CIP-002-5.1 for a “medium impact rating,” instead of re-stating it without citation. Otherwise it is confusing. For example, the source of the tabulated weighting criteria is unclear and it is difficult to know there is a connection to any previous or established standards.
No

R1 Terminology: Although the term “risk assessment” in this section is in alignment with language in the FERC order, BPA recommends that it be revised to consequence or impact assessment. This is a physical security standard, and the term risk assessment should be reserved for the physical security risk section of this standard and align with security industry use of the term. BPA believes the basic intent of R1 is to identify substation facilities that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection can create unacceptable consequences to the BES and not to assess risk of the event happening. Also, BPA suggests that additional sub-requirements be added to provide clarity on what system conditions and performance criteria or methodology need to be considered in order to determine what stations and substations will be deemed critical. Similar language found in existing standards would be helpful. Examples: FAC-010-2.1 (System Operating Limits Methodology for the Planning Horizon), R1-R3; FAC-013-2 (Assessment of Transfer Capability in the Near-Term Planning Horizon), R1; TPL-001-4 (Transmission System Planning Performance Requirements), R1-R6; TPL-004-0a (System Performance Following Extreme BES Events), R1. "R1 1.1. Subsequent risk assessments shall be performed:" BPA recommends revising R1 1.1 to: “Each Transmission Owner shall review their BES Impact Assessments once every 60 months for any transmission stations or transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an interconnection after completion of the initial assessment.” Justification: This would consolidate the two bulleted actions and make them equally applicable. BPA has been doing substation facility impact and security risk assessments for the past 15 years and our experience is that the criticality of a substation facility does not change once ranked; once it is determined critical it will always be critical particularly when information is used in a physical security risk assessment. A 5 year interval would be a more appropriate interval for this type of assessment as it would always be case of identifying new facilities and not excluding ones previously identified. "R2. Each Transmission Owner shall have an unaffiliated third party verify the risk assessment performed under Requirement R1. The verification may occur concurrent with or after the risk assessment performed under Requirement R1. [VRF: Medium; Time-Horizon: Long-term Planning]" BPA recommends revising R2 first sentence to: "R2 Each Transmission Owner shall verify the impact assessment performed under requirement R1 by a third party entity other than the owner or operator." Justification: This fully aligns with the requirements of the FERC order by using the requirements of the FERC order. BPA believes the introduction of a requirement of an unaffiliated reviewer is reaching beyond the requirements established by the FERC order, and this requirement will dilute the quality of an impact assessment. It will limit the types of entities that can perform an independent review, and directs use of resources that may not be capable of assessing all physical risks within an electrical facility. BPA proposes that the word unaffiliated be removed from this standard and replaced with language that describes the degree of separation from the facility owning entity to be considered a third party entity other than the owner or operator. Based on the definition provided in this draft “unaffiliated” is especially troublesome for federal government-owned transmission networks and facilities because it could be interpreted as excluding the entire federal government from eligibility as a third party entity to the federal government

transmission owner. Also, BPA believes industry peer reviews should be encouraged and considered as meeting the requirement. Reviews by industry peers are known to be beneficial to the entity receiving the review and for the entity performing the review or audit. Enabling industry peer reviews would not only meet the intent of an independent review but also accelerate continuous learning and translation of the most effective security approaches into widespread use. Please note that the FERC order only recommends this verification as it is stated as “should” and not as “shall.” "R.3 For a primary control center(s) identified by the Transmission Owner according to Requirement R1 and verified according to Requirement R2 that is not under the operational control of the Transmission Owner, the Transmission Owner shall, within seven calendar days following completion of Requirement R2, notify the Transmission Operator that has operational control of the primary control center of such identification and the date of completion of Requirement R2. [VRF: Lower; Time- Horizon: Long-term Planning]" BPA recommends revising the 7 day requirement in R3 and R3 3.1 to 30 calendar days. Justification: This information is not that time critical at this stage, and one week will not be enough time to complete all notifications.

No

R4. BPA agrees with the requirements to develop a threat assessment and physical security plan. BPA also agrees with the inclusion of governmental agencies with physical security expertise as threat assessment and physical security plan reviewers as noted in R6 (Section R6.1.3.) However, BPA requests that the drafting team clarify the scope and purpose of third party reviews should they remain as part of the standard. BPA disagrees that third party reviews will increase reliability and notes the draft standard exceeds the scope of the FERC order Paragraph 11. BPA believes that each entity is in the best position to evaluate threats to its facilities and determine appropriate mitigation plans. Nonetheless if third review is deemed necessary, BPA believes that it should be allowed to have another federal agency perform its third party review. In other words, for purposes of this standard, another federal agency would be deemed to be “unaffiliated” with BPA. Keeping this information within the federal government will decrease the risk of inappropriate disclosure of such information. BPA believes that non-disclosure agreements with non-federal parties may be a poor substitute for this because they can only be enforced once a disclosure is made. At that point, it is often too late and the information is available to a wider audience than intended. "R5. Each Transmission Owner that owns or has operational control of a Transmission station, Transmission substation, or primary control center identified in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3 that the Transmission Operator’s primary control center has operational control of an identified Transmission station or Transmission substation, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s) within 120 calendar days following the completion of Requirement R2. The physical security plan(s) shall include the following attributes: [VRF: High; Time-Horizon: Long-term Planning]" BPA recommends revising the 120 day requirement in R5 to 12 calendar months. Justification: This information is important to get right as security designs and enhancements will be built from this plan. 120 days is not be enough time to develop a complete and effective security plan

and incorporate finalized threat assessments. "R6 Each Transmission Owner that owns or operates a Transmission station, Transmission substation, or primary control center identified in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3 that the Transmission Operator's primary control center has operational control of an identified Transmission station or Transmission substation, shall have an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5. The review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5. [VRF: Medium; Time-Horizon: Long-term Planning]" BPA recommends revising R6 first sentence to: "R6 Each Transmission Owner shall verify the risk assessment performed under requirement R4 by a third party entity other than the owner or operator." Justification: BPA believes the proposed revision fully aligns with the requirements of the FERC order by using the requirements of the FERC order. The introduction of a requirement of an unaffiliated reviewer is reaching beyond the requirements established by the FERC order, and this requirement will dilute the quality of a risk assessment. It will limit the types of entities that can perform an independent review, and directs use of resources that may not be capable of assessing all physical risks within an electrical facility. BPA proposes the word unaffiliated be removed from this standard and replaced with language that describes the degree of separation from the facility owning entity to be considered a third party entity other than the owner or operator. Based on the definition provided in this draft "unaffiliated" is especially troublesome for federal government owned transmission networks and facilities because it could be interpreted as excluding the entire federal government from eligibility as a third party entity to the government transmission owner. Also, industry peer reviews should be encouraged and considered as meeting the requirement. Reviews by industry peers are known to be beneficial to the entity receiving the review and for the entity performing the review or audit. Enabling industry peer reviews would not only meet the intent of an independent review but also accelerate continuous learning and translation of the most effective security approaches into wide spread use. Please note that the FERC order only recommends this verification as it is stated as "should" and not as "shall."

Yes

The current draft requiring "unaffiliated" third party review is more restrictive than the requirements language in the FERC order and meeting an unaffiliated requirement will be problematic for federally owned power and transmission systems. Paragraph 8 of the order: "Thus, the Reliability Standards should require the owners or operator to tailor their evaluation to the unique characteristics of the identified critical facilities and the type of attacks that can be realistically contemplated. NERC should also consider in the standards development process requiring owners and operators to consult with entities with appropriate expertise as part of this evaluation process." BPA's interpretation of the FERC order is that consultation with peer entities would be acceptable methods for review of evaluation processes. In fact the order by its wording encourages such consultations without restriction as to business or corporate relationships. The draft standard limits and excludes highly qualified security and technical expertise found across the industry and within entities

corporate and governmental structures, hierarchies and partnerships where vast levels of experience, training and ability exist. The “unaffiliated” requirement forces entities to seek expertise where there may or may not be such expertise and where there is no track record of such expertise. The term “unaffiliated” and any reference to that level of separation between entities are completely void from the order and should be removed from the draft standard. Paragraph 11 of the FERC order: “In addition, the risk assessment used by an owner or operator to identify critical facilities should be verified by an entity other than the owner or operator. Such verification could be performed by NERC, the relevant Regional Entity, a Reliability Coordinator, or another entity.” BPA believes the draft standard limits and excludes highly qualified security and technical expertise found across the industry and within entities corporate and governmental structures, hierarchies and partnerships where vast levels of experience, training and ability exist. The “unaffiliated” requirement forces entities to seek expertise where there may or may not be such expertise and where there is no track record of such expertise. The term “unaffiliated” and any reference to that level of separation between entities are completely void from the order and should be removed from the draft standard.

In general, the overall method employed in the draft standard is reasonable. The draft standard has adopted a reasonable level of specificity, without being overly prescriptive. The use of unaffiliated verifying experts is a positive element in the draft standard. In general, the balancing authority or reliability coordinator for the transmission area in question is the best verifying expert. In the event the utilities disagree with the assessments of the unaffiliated verifying entities at any point in the process (for example see section 2.3, second bullet point), not only should the transmission owner or utility be required to document their technical rationale, but the standard should further delineate a process for resolving this disagreement. With respect to Rule R1, Section 1.1, the drafting group should consider whether there should be language added to the standard detailing a process whereby the 30 or 60 month intervals should be accelerated in the event of serious intervening situations. With respect to Rule R2, Section 2.1, the description of “an entity that has transmission planning or analysis experience” is overly vague and should be further clarified, or that the use of this type of expert should be limited to certain small transmission owners. With respect to Rule R2, section 2.4, the language requiring “non-disclosure” agreements is important and a positive element in the draft standard.

In general, the overall method employed in the draft standard is reasonable. The draft standard has adopted a reasonable level of specificity, without being overly prescriptive. The use of unaffiliated verifying experts is a positive element in the draft standard. In general, we believe that the balancing authority or reliability coordinator for the transmission area in question is the best verifying expert. In the event the utilities disagree with the assessments of the unaffiliated verifying entities at any point in the process (for example see section 2.3,

second bullet point), not only should the transmission owner or utility be required to document their technical rationale, but the standard should further delineate a process for resolving this disagreement. Section 5.1 of the draft refers to “resiliency”. Does this term refers to actions such as building redundancy or improving protective schemes, as opposed to direct physical protection activities? The standard should clarify the meaning of the term resiliency. Section 4.1 of the draft refers to “unique characteristics.” Assuming this consideration includes availability of spares and ease of repair, the language is acceptable. With respect to Rule 5, section 5.2, the drafting group should consider language requiring the security plan to include contact and coordinating information for other utilities or important stakeholders, in addition to law enforcement. With respect to Rule R6, section 6.4 the language requiring “non-disclosure” agreements is important and a positive element in the draft standard. Section 4.2 lists the elements to be considered in evaluating the potential threats and vulnerabilities to physical attack, and specifically states "[p]rior history or attack on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events and ...". We suggest that in additional to geographic proximity, that the section add language concerning "similarity of geographic characteristics". While geographic proximity, is a factor, ease of accessibility, layout and geographic contour, of an attacked facility is also important, if not more so.

No Comment.
Yes
Although the FERC order contains language that a third party verification occur, this type of verification is not used anywhere else in NERC reliability standards for similar activities (e.g. CIP-002 classification). ATCO Electric (AET)respectfully requests that the review be allowed to be performed by qualified in-house Engineering groups who already perform these functions. Mandating a third party verification presents a risk to timelines and the implementation of the other requirements.
Yes
AET agrees with the flexible approach outlined by the draft standard and respectfully offers these following comment for the drafting team’s consideration: R4 – Please consider altering the wording of the final sentence of R4 to “The evaluation shall consider, at a minimum, the following:”. This allows additional flexibility for entities with existing physical security assessment programs to continue to include those extra elements within their plans. R5 – For the timeframe dependency please consider altering the dependent requirement to R4 instead of R2. Within the rationale section the drafting team concedes that R4 must be completed prior to commencing R5 and the drafting team also states that R4 does not state when the evaluation must occur, only that it must occur in time to meet R5. AET respectfully suggests

that a linear progression be established just as in R1, R2, and R3. This would require a timeline be added to R4 for the completion of the physical security risk assessment (AET suggests 120 calendar days from the completion of R2). AET also respectfully suggests that R5 then be made dependent on the completion of R4 (AET suggest 120 calendar days from the completion of R4). R6 – Please consider the removal of the required certifications in R6.1.1. The FERC order specifies that the risk assessment be reviewed by "[…] or another entity with appropriate expertise" and does not specify any particular qualifications. In addition, no other CIP standard calls for specific certifications or qualifications. Neither engineering focused requirements (e.g. CIP-002) or cyber security focused requirements (e.g. CIP-003, 005, 007) specify that those requirements be reviewed or implemented by designated engineers or certified security practitioners (e.g. CISSP). The due diligence required of the entity will determine the level of rigor that that entity is comfortable with defending and should not be included in the standard.

Los Angeles Department of Water and Power (LADWP)
Yes
LADWP requests the Drafting Team to make the following changes: - For Secion 4, you may want to add Transmission Planner and Planning Coordinator to the applicability. These functions may have responsibility on at least R1 and R2. - Secion 4.1.1.1 – Add "(AC or DC)" as follows: "Transmission Facilities operated at 500 kV (AC or DC) or higher….."
No
LADWP requests the Drafting Team to make the following changes: - For R1, additional time is needed to make sure studies are fully completed and reviewed by TO and its applicable governing authorities. Add ", which is due 30 calendar days after the effective date of the standard" to R1 as follows: "R1. Each Transmission Owner shall perform an initial risk assessment, which is due 30 calendar days after the effective date of the standard and subsequent risk assessments of its Transmission stations and Transmission substations (existing and……" - For R1, change "24 months" to " 30 months" to align the assessment with subsequent risk assessments. - For R2.1, The term "unaffiliated" needs to be defined in the standard to avoid any misinterpretation. - For R2.2, change the "90 calendar days" to "120 calendar days" to allow sufficient time to resolve differences if Planning Coordinator, Transmission Planner or Reliability Coordinator are addressing other deadlines.

No
LADWP requests the Drafting Team to make the following changes: - For R5, replace the word “implement” with “complete” to avoid confusion as to whether the plan needs to be implemented within the timeline provided - For R5.1, the word “Resiliency” needs to be defined in the standard to avoid any misinterpretation. Resiliency means different things to different people - For R5.1, add the language “, mitigate the impacts of,” to the requirement as follows: “5.1. Resiliency or security measures designed to deter, detect, delay, assess, communicate, mitigate the impacts of, and respond…..” - For R5.4, change the requirement language to read as follows: “5.4. Provisions to evaluate evolving physical threats to the Transmission station(s), Transmission substation(s), or primary control center(s), and their corresponding security counter measures. “ This sub-requirement should allow for the TO to revise its already-reviewed security plan within the 30-month cycle without necessarily having to make arrangements for a third party review of the revised plan (although it may do so if TO so desires) and without creating an additional 30-month cycle review that the normal course – this is a matter of efficiency and due diligence to address evolving threats - For 6.1, as previously mentioned, the word “unaffiliated” needs to be defined in the standard to avoid any misinterpretation. - For 6.1.3, change the requirement as follows: “6.1.3. A governmental agency with physical security expertise, which could be a City Department in which the utility resides that requires a review to be performed.” This clarification allows for additional flexibility of independent governmental agencies reviews. - For 6.1.4, change the requirement as follows: “6.1.4. An entity or organization with demonstrated law enforcement, government, or military physical security expertise, such as the local police department in which the utility resides that requires a review to be performed.” This clarification allows for additional flexibility of independent entities or organizations reviews - For R6, add 6.1.5 with the following language: “6.1.5. A peer utility review group with demonstrated law enforcement, government, or military physical security expertise This clarification allows for additional flexibility of other Planning Coordinator, Transmission Planner or Reliability Coordinator review the work of their peers. In the alternative, expand to include Planning Coordinator, Transmission Planner or Reliability Coordinator with law enforcement, government, or military physical security expertise. - For 6.2, change the “90 calendar days” to “120 calendar days” to provide sufficient time to determine reasonable and sound recommendations. - For 6.3, chance the “90 calendar days” to “120 calendar days” to provide sufficient time to address any modifications recommended.

R2.1 puts an unreasonable burden on registered PC and TP. R2.2 which puts the burden of ensuring that the unaffiliated third party review is completed in 90 calendar days on the TO. As a TO PNM can't force another registered entity or third party to complete anything with a specified amount of time and according to the RSAW if the verification is not completed within 90 days then the TO is not in compliance with the requirement. The standard should require registered NERC entities to complete the unaffiliated review and those entities should be included as applicable functional entities and R2.2 should apply to the reviewing entity.

We agree with the approach identified in R1 through R3, however we have the following comments regarding the SCOPE of the verification review required by R2.2: • The scope of the 3rd party verification is not well defined. What is the expectation and scope of the verification review? What level of quality is expected/required? Is the Transmission Owner responsible for scoping the verification process to ensure the review meets the required level of review? • Very little guidance is provided on the scope of the review. The scope of the review and verification work would need to be well understood before taking this verification work on. Is a technical analysis required as part of the review and verification process on the part of the 3rd party verifying the Transmission Owner's risk assessment and list of critical facilities, or is it simply to review the risk assessment and list of critical facilities that the Transmission Owner has provided to the 3rd party reviewer, based on their current knowledge of the transmission system from performing prior transmission planning studies? Will NERC be providing additional guidance regarding the scope of work required for verification by a 3rd party?

Yes
We support the applicability proposed by CIP-014-1.
No
We do not support the Standard as written today. We agree with the scope and content of the SAR. However, we are concerned with Requirement 6. Requirement 6 requires entities to seek out third parties to review their new physical security protection plans. We don't believe that entities should be obligated to seek assistance from third party individuals. This includes consultants or another unassociated entity. The purpose of the regions, NERC, and FERC are to provide a review of an entities compliance to Standards through the audit and self-certification process. No other Reliability Standards require an entity to use third parties to determine compliance or sufficiency of compliance documentation. We believe that this obligation may place some entities in difficult financial situation and could have a negative impacts in assuring that proper third party entities are being used. Should FERC, NERC, or WECC determine that entities are not following the spirit of the Standard than they may request a modification in a future Standard revision. We will support this Standard if Requirement 6 is removed.
No
We do not support the Standard for the same reason above. We do not support a third party review requirement other than that of the existing Standards. That is a review by FERC, NERC or the appropriate region.
Yes
We would like to address proposed comments by APPA that additional Standards are added to address confidentiality. We do not agree with APPA's position. The functional model requires registered functions to work together to secure reliability. Already, as a result of CIP Standards, vital communications between the Distribution Providers/Load Serving Entities and the Balancing Authorities and/or Transmission Operators have been compromised. Often, The Balancing Authorities and Transmission Operators are in fear of sharing important information with the Distribution Providers and/or Load Serving Entities because they feel they could be subject to a CIP violation. In some cases the Distribution Providers and Transmission Operators even share facilities. Having a requirement that prevents sharing vital information on physical security would simply not work and therefore we do not support APPA's comments.

Comments Received from Herb Schrayshuen

Question 1 – Response: No

Comments: The applicability of the standard is to Transmission Owners and Transmission Operators. Generating plants sites where the facilities production capability exceeds 1000 MW or other suitably larger amount should be included.

Question 2 – Response: No

Comments: In Requirement R1 the use of the term ‘transmission analysis’ and ‘transmission analyses’ in order to identify which substations should have a security plan is vague The TPL standards extreme cases should be used to clearly describe the specific required elements of the analysis. Failure to specify how the analysis is to be done will lead to inconsistencies in the analysis and thereby difficulty for audits of the standard.

In Requirement R2 the use of the word ‘unaffiliated’ introduces ambiguity. There needs to be an understanding (through the standard but if not feasible through RSAW or other tool-e.g. guideline) what “unaffiliated” means.

The term "unaffiliated" is not required because the NERC Reliability Functional model already ensures the independence between the TO/TOP and the verifying entities.

Question 4 – Response: Yes

Comments: The Implementation Plan can be read that it obligates applicable entities to complete the initial risk assessment in Requirement R1, on or before the effective date of the standard. The implementation plan should be adjusted.

The following is a suggestion to facilitate reading of the standard and stay whitn defined terms without introfucing new terms which are undefined: For all requirements: Replace the expression "Transmission stations and Transmission substations" with "Transmission facilities". Otherwise, please explain why such a distinction is necessary.

While the requirement for unaffiliated third party verification of the physical security plan is something required by the FERC in its order, the mandate is misguided and will lead to security breaches while at the same time adding no incremental value to the physical security plan. The utility, which owns the assets, is already highly incentivized to put together a good security plan to avoid loss of its facilities to terrorism without third party verification. The utility may decide to use security consultants to help develop the plan if it involves new, state of the art physical security topics outside the utilities experience base. On balance the third party verification requirement outlined in R6 regarding the physical security plan is unneeded.

Additional comment received from Marcus Pelt, Southern Company

"The wording of Requirement R2.s, as it stands currently, could be interpreted to place requirements on the unaffiliated third party verifier when the responsible entity is actually the Transmission Owner. Southern recommends that R2.2 be reworded as follows to address this concern:

Proposed R2.2
2.2 The responsible Transmission Owner shall ensure the unaffiliated third party verification is completed within 90 calendar days following the completion of the Requirement R1 risk assessment. The unaffiliated third party verification may, but is not required to, include recommended additions or deletions of Transmission station(s) or Transmission substation(s)."

Consideration of Comments

Project 2014-04 Physical Security

The Project 2014-04 Physical Security Standard Drafting Team (SDT) thanks all commenters who submitted comments on the CIP-014-1 standard. The standard was posted for a 15-day formal comment period from April 10-24, 2014. Stakeholders were asked to provide feedback on the standard and associated documents through a special electronic comment form. There were 136 sets of responses, including comments from approximately 240 different people from approximately 165 companies representing all 10 of the Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the project page.

Summary Consideration:

The SDT has reviewed all comments and made the following non-substantive changes to the standard to incorporate stakeholder recommendations:

- Part 4.1.1 is modified:

  4.1.1 Transmission Owner that owns ~~any of the following~~ **a Transmission station or Transmission substation that meets any of the following criteria**:

- The applicability exemption contained Section 4 is modified:

  Exemption: Facilities **in a "protected area," as defined in 10 C.F.R. § 73.2,** within the scope of a security plan approved **or accepted** by the Nuclear Regulatory Commission **are not subject to this Standard;** or**, Facilities within the scope of a security plan approved by** the Canadian Nuclear Safety Commission are not subject to this Standard.

- Requirement R1 is modified:

  R1. Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria specified in Applicability Section 4.1.1. The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify ~~any~~ **the** Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. *[VRF: High; Time-Horizon: Long-term Planning]*

- Measure M1 is modified:

  M1. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the risk assessment of its Transmission stations and Transmission

substations (existing and planned to be in service within 24 months) that meet the criteria in Applicability Section 4.1.1 as specified in Requirement R1. **Additionally, examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the identification of the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment as specified in Requirement R1, Part 1.2.**

- Requirement R2 Part 2.2 is modified:

2.2 The unaffiliated ~~verifying entity~~ **third party verification** shall ~~either~~ verify the Transmission Owner's risk assessment performed under Requirement R1**,** ~~or recommend~~ **which may include recommendations** for the addition or deletion of a Transmission station(s) or Transmission substation(s). The Transmission Owner shall ensure the verification is completed within 90 calendar days following the completion of the Requirement R1 risk assessment.

- Requirement R2 Part 2.4 is modified:

2.4 Each Transmission Owner shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information ~~exchanged with~~ **made available to** the unaffiliated **third party verifier** ~~verifying entity~~ **and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.**

- Measure M2 is modified:

M2. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner completed an unaffiliated third party verification of the Requirement R1 risk assessment and satisfied all of the applicable provisions of Requirement R2, including, if applicable, documenting the technical basis for not modifying the Requirement R1 identification as specified under Part 2.3. **Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 2.4.**

- Requirement R3 is modified:

R3. For a primary control center(s) **of a Transmission station or Transmission substation** identified ~~by a transmission owner~~ according to Requirement R1**, Part 1.2 that a) operationally controls an identified Transmission Station or Transmission substation** ~~and~~ verified according to Requirement R2, **and b)** ~~that~~ is not under the operational control of the Transmission Owner, the Transmission Owner shall, within seven calendar days following completion of Requirement R2, notify the Transmission Operator that has operational control of the primary control center of such identification and the date of completion of Requirement R2. *[VRF: Lower; Time-Horizon: Long-term Planning]*

- Measure M3 is modified:

M3. Examples of acceptable evidence may include, but are not limited to, dated written or electronic **notifications or** communications that the Transmission Owner notified each Transmission Operator, as applicable, according to Requirement R3.

- Requirement R4 is modified:

R4. Each Transmission Owner that ~~owns or operates~~ **identified** a Transmission station, Transmission substation, or **a** primary control center ~~identified~~ in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3 ~~that the Transmission Operator's primary control center has operational control of an identified Transmission station or Transmission substation~~, shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2. The evaluation shall consider the following: *[VRF: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

- Requirement R4 Part 4.2 is modified:

4.2 Prior history ~~or~~ **of** attack on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and

- Requirement R4 Part 4.3 is modified:

4.3 Intelligence or threat warnings **received** from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), U.S. federal and/or Canadian governmental agencies, or their successors.

- Requirement R5 is modified:

R5. Each Transmission Owner that ~~owns or has operational control of~~ **identified** a Transmission station, Transmission substation, or primary control center ~~identified~~ in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3 ~~that the Transmission Operator's primary control center has operational control of an identified Transmission station or Transmission substation~~, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s). **The physical security plan(s) shall be developed** within 120 calendar days following the completion of Requirement R2 **and executed according to the timeline specified in the physical security plan(s)**. The physical security plan(s) shall include the following attributes: *[VRF: High; Time-Horizon: Long-term Planning]*

- Requirement R5 Part 5.1 is modified:

5.1 Resiliency or security measures designed **collectively** to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities ~~based on the results~~ of **identified during** the evaluation conducted in Requirement R4.

- Requirement R5 Part 5.3 is modified:

5.3 A timeline for ~~implementing~~ **executing** the physical security enhancements and modifications specified in the physical security plan.

- Measure M5 is modified:

M5. Examples of evidence may include, but are not limited to, dated written or electronic documentation of its physical security plan(s) that covers their respective identified and verified Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R5, and additional evidence demonstrating ~~implementation~~ **execution** of the physical security plan **according to the timeline specified in the physical security plan.**

- Requirement R6 is modified:

R6. Each Transmission Owner that ~~owns or operates~~ **identified** a Transmission station, Transmission substation, or primary control center ~~identified~~ in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3 ~~that the Transmission Operator's primary control center has operational control of an identified Transmission station or Transmission substation~~, shall have an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5. The review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5. *[VRF: Medium; Time-Horizon: Long-term Planning]*

- Requirement R6 Part 6.1 is modified:

6.1 Each Transmission Owner and Transmission Operator shall select an unaffiliated third party reviewer from the following:

- ~~6.1.1~~ An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.
- ~~6.1.2~~ An entity or organization approved by the ERO.
- ~~6.1.3~~ A governmental agency with physical security expertise.

- ~~6.1.4~~ An entity or organization with demonstrated law enforcement, government, or military physical security expertise.

- Requirement R6 Part6.3 is modified:

  6.3 If the unaffiliated **third party** ~~reviewing entity~~ **reviewer** recommends changes to the evaluation performed under Requirement R4 or security plan(s) developed under Requirement R5, the Transmission Owner or Transmission Operator shall, within 60 calendar days of the completion of the unaffiliated third party review, for each recommendation:

- Requirement R6 Part6.4 is modified:

  6.4 Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information ~~exchanged with~~ **made available to** the unaffiliated reviewing entity **and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure**.

- Measure M6 is modified:

  M6. Examples of evidence may include, but are not limited to, written or electronic documentation that the Transmission Owner or Transmission Operator had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 as specified in Requirement R6 including, if applicable, documenting the reasons for not modifying the evaluation or security plan(s) in accordance with a recommendation under Part 6.3. **Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 6.4.**

A summary response to each comment follows each question. Please note that because common issues were grouped together in the summaries, an individual's comment may have been addressed in the summary for a question that is different from the question in which they submitted the comment; the SDT encourages reviewers to read all summary responses.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at mark.lauby@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/comm/SC/Documents/Appendix_3A_StandardsProcessesManual.pdf

Index to Questions, Comments, and Responses

1. Applicability: The applicability of proposed CIP-014-1 starts with those Transmission Owners that own Transmission facilities that meet the bright line criteria in Reliability Standard CIP-002-5.1 for a "medium impact" rating. The drafting team did not modify these criteria in their use under CIP-014-1, as they have been previously approved by stakeholders, NERC, and FERC. The SDT sought to ensure that entities could apply the same set of criteria to assist with identification of facilities under CIP Version 5 and proposed CIP-014-1. The team determined that slightly modified criteria could possibly result in confusion in application. The drafting team considered several other alternatives to refine the scoping in the applicability section, such as a particular kV threshold in addition to the other criteria; however, after significant discussion, the team found no technical or reliability basis for providing such limitiation. Importantly, by virtue of application of Requirement R1, the scope of the standard only applies to Transmission Owners that have Transmission stations and Transmission substations that meet the "medium impact" criteria from CIP-002-5.1, and their associated primary control centers. Furthermore, the standard drafting team expects many who are "applicable" to the standard will not identify facilities through their Requirement R1 risk assessment and Requirement R2 verification that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. In those cases, the entity only performs Requirements R1 through R2. When that results in a null set, Requirement R1 additionally provides that subsequent risk assessments may occur less frequently. Similarly, while Transmission Operators are also listed in the applicability section, by virtue of application of the requirements, only certain Transmission Operators that are notified under the standard's Requirement R3 have obligations under the standard. Do you agree with the applicability section? If not, please provide specific recommendations, ensuring to articulate how your suggested approach would not limit the applicability in such a manner as to inadvertently miss a facility that should be covered under the standard as specified in the FERC order on physical security. 27

2. Requirements R1 through R3: The first three requirements of CIP-014-1 require Transmission Owners to: (1) perform risk assessments to identify through transmission planning analysis those Transmission stations and Transmission substations that meet the "medium impact" criteria from CIP-002-5.1, and their associated primary control centers, that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection; (2) arrange for a third party verification (as directed in the order) of the identifications; and (3) notify certain Transmission Operators of identified primary control centers that operationally control the identified and verified Transmission stations and Transmission substations. The requirements provide the periodicity for satisfying these obligations. Only an

entity that owns or operates one or more of the identified facilities has further obligations in Requirements R4 through R6. If an entity identifies a null set after applying Requirements R1 through R2, the rest of the standard does not apply. Do you agree with this approach? If not, please articulate how an alternative approach addresses the directives specified in the order on physical security. 60

3. Requirements R4 through R6: The final three requirements of CIP-014-1 require (1) the evaluation of potential threats and vulnerabilities of a physical attack to the facilities identified and verified according to the earlier requirements, (2) the development and implementation of a security plan(s) designed in response to the evaluation, and (3) a third party review of the evaluation and security plan(s) (as directed in the order). Do you agree with this approach? If not, please articulate how an alternative approach addresses the directives specified in the order on physical security. 111

4. Do you have input on other areas of the standard or implementation plan not discussed in the questions above? If so, please provide them here, recognizing that you do not have to provide a response to all questions. Please limit your response to 300 words or less. 152

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 — Regional Reliability Organizations, Regional Entities

If you support the comments submitted by another entity and would like to indicate you agree with their comments, please select "agree" below and enter the entity's name in the comment section (please provide the name of the organization, trade association, group, or committee, rather than the name of the individual submitter).

Organization	Agree	Supporting Comments of "Entity Name"
Central Iowa Power Cooperative	Agree	ACES
MA Dept. of Public Utilities	Agree	Agree with the comments made by NPCC.
Massachusetts Municipal Wholesale Electric Company	Agree	American Public Power Association
Transmission Agency of Northern California	Agree	American Public Power Association
Eugene Water & Electric Board	Agree	American Public Power Association (APPA)
City of Austin dba Austin Energy	Agree	American Public Power Association (APPA). In addition, Austin Energy states the following:The stated purpose of draft CIP-014-1 Physical Security is: To identify and protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. Public Utilities subject to state Open Records Acts are concerned that records produced, gathered, used and maintained as evidence of compliance with this Standard may be subject to disclosure under state open records laws. To protect this critical information from disclosure, we suggest adding a provision to the Introduction section of the proposed standard designating the produced, gathered, used and maintained records related to compliance with

Organization	Agree	Supporting Comments of "Entity Name"
		this Standard as exempt from disclosure. Alternatively, we suggest the addition of Requirements to protect the records and information from disclosure.

Public Utility District No.1 of Snohomish County	Agree	Salt River Project ("SRP")
ERTF	Agree	The following comments are in agreement with LPPC and ERTF as well as comment from our own entity LCRA: o Use of "primary control center" is ambiguous (R1.2 and others); o Unaffiliated third party review needs to be longer than 90-days, suggestion to be 180-days (R2.2); o Issue with non-disclosure agreement vs. Public Power's obligation to disclose information (R2.4); o Expansion of the Security Plan third-party reviewer to include those functions that are identified in Requirement 2.1 (R6.1). o The standard does not address substations/stations that are owned by multiple Transmission Owners. LCRA TSC recommends adding language describing NERC's expectations associated with jointly-owned substations/stations or substation/stations with multiple asset owners.
APPA	Agree	The stated purpose of draft CIP-014-1 Physical Security is: To identify and protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. Public Utilities subject to state Open Records Acts are concerned that records produced, gathered, used and maintained as evidence of compliance with this standard may be subject to disclosure under applicable state laws. To protect this critical information from disclosure, we suggest adding a provision to the Introduction section of the proposed standard that designates the produced, gathered, used and maintained records related to compliance with this standard as exempt from disclosure. Alternatively, we suggest the addition of Requirements to protect the records and information from disclosure. Proposed language for a new #7 in the Introduction Section: 7. Critical Facilities Information Records and related information concerning critical facilities, physical infrastructure,

Organization	Agree	Supporting Comments of "Entity Name"
		including risk assessments and evaluation of physical threats and vulnerabilities, as produced, gathered, used or maintained for compliance with mandatory Reliability Standards, are intended to be kept confidential by the owner of the records and information, those entities with authorized access, and any agency charged with examination of such records and information pursuant to Section 215 of the Federal Power Act. All such identified records and information are also intended to be exempt from public disclosure. Consistent with that premise, the purpose of the cyber and physical security Reliability Standards are to identify and protect facilities that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or cascading within an interconnection. Consequently, records and information detailing the physical infrastructure, including records and information related to the risk assessments and evaluation of physical threats and vulnerabilities conducted under this Reliability Standard and all records and information produced, gathered, used and maintained for compliance with this Reliability Standard shall be considered critical facilities information and are intended to be exempt from disclosure under public records laws. Nothing in this section or the Reliability Standards is intended to eliminate other lawful methods of access to such records and information. Proposed Requirement Language (new subrequirements): R1 1.3 The Transmission Owner will keep confidential all records and information related to the risk assessments conducted under this standard. R3 3.4 The Transmission Owner will keep confidential all records and information related to the risk assessments conducted under Requirement R1 of this standard. R4 4.1 The Transmission Owner will keep confidential all records and information related to the evaluation of physical threats and vulnerabilities to each of its transmission substation(s) and primary Control Center(s) identified in Requirement R1 conducted under this standard.

Seminole Electric Cooperative, Inc.		National Rural Electric Cooperative Association (NRECA)
Public Utility District No. 2 of Grant County, WA		Public Utility District No. 2 of Grant County, WA

1. **Applicability: The applicability of proposed CIP-014-1 starts with those Transmission Owners that own Transmission facilities that meet the bright line criteria in Reliability Standard CIP-002-5.1 for a "medium impact" rating. The drafting team did not modify these criteria in their use under CIP-014-1, as they have been previously approved by stakeholders, NERC, and FERC. The SDT sought to ensure that entities could apply the same set of criteria to assist with identification of facilities under CIP Version 5 and proposed CIP-014-1. The team determined that slightly modified criteria could possibly result in confusion in application. The drafting team considered several other alternatives to refine the scoping in the applicability section, such as a particular kV threshold in addition to the other criteria; however, after significant discussion, the team found no technical or reliability basis for providing such limitation. Importantly, by virtue of application of Requirement R1, the scope of the standard only applies to Transmission Owners that have Transmission stations and Transmission substations that meet the "medium impact" criteria from CIP-002-5.1, and their associated primary control centers. Furthermore, the standard drafting team expects many who are "applicable" to the standard will not identify facilities through their Requirement R1 risk assessment and Requirement R2 verification that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. In those cases, the entity only performs Requirements R1 through R2. When that results in a null set, Requirement R1 additionally provides that subsequent risk assessments may occur less frequently. Similarly, while Transmission Operators are also listed in the applicability section, by virtue of application of the requirements, only certain Transmission Operators that are notified under the standard's Requirement R3 have obligations under the standard. Do you agree with the applicability section? If not, please provide specific recommendations, ensuring to articulate how your suggested approach would not limit the applicability in such a manner as to inadvertently miss a facility that should be covered under the standard as specified in the FERC order on physical security.**

Summary Consideration: The SDT thanks all commenters. All comments have been reviewed and changes that the SDT considers appropriate were incorporated into a subsequent revision. Part 4.1.1 was changed to clarify that applicable TO's are those that own transmission stations or transmission substations meeting the criteria in 4.1.1.1 through 4.1.1.4. The exemption for nuclear facilities was changed to provide more specific criteria in terms of the security plans under Nuclear Regulatory Commission or Canadian Nuclear Safety Commission jurisdiction. Several additions were made to the guidance section of the standard to address stakeholder concerns. A summary of comments and the SDT's response is provided**:**

- **Several commenters suggested adding verbiage to the applicability regarding the Transmission Operator to refer to Requirement R3.** The SDT considered this wording during its deliberations and determined it was not necessary as Requirement R3 is explicit in its applicability to only certain Transmission Operators. The SDT notes that, in general, Requirements are not included in the applicability Section of the standard.

- **One commenter suggested applying the standard to Reliability Coordinators (RC) and only the Transmission Operators the RCs deem critical.** The majority of stakeholders concur with the applicability as written. This suggested revision would be a major shift in philosophy and thus the SDT will not make the change.
- **Some commenters suggested that the Reliability Coordinator, Planning Coordinator and Transmission Planner should be added to the Applicability Section.** During the initial deliberations, the SDT considered requiring RCs, PCs and TPs to conduct the R2.2 verification but developed an alternative that was included in the original standard, given that it did not believe it was appropriate or necessary to require RCs, PCs or TPs to be required to conduct the R2.2 verification. R2.2 may be performed by a variety of entities or consultants. It is the responsibility of the Transmission Owner or Transmission Operator to ensure that the third party agreements are written with performance requirements to meet the time-line of R2.2.
- **Several stakeholders had comments about confidentiality, especially with respect to federal and state public disclosure laws applicable to registered entities, such as state regulatory agencies and municipal entities.** The SDT has drafted language in Requirement R2, Part 2.4, Requirement R6, Part 6.4 and Section 1.4 of the Compliance section of the standard to address confidentiality. Specifically, Compliance Section 1.4 states:

  Additional Compliance Information

  "Confidentiality: To protect the confidentiality and sensitive nature of the evidence for demonstrating compliance with this standard, all evidence will be retained at the Transmission Owner's and Transmission Operator's facilities."

Requirement R2, Part 2.4 now provides:

> Each Transmission Owner shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated verifying entity and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

Lastly, Requirement R6, Part 6.4 now provides:

> Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated reviewing entity and from any other form of public disclosure and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

Collectively, these provisions are designed to protect sensitive and confidential information from public disclosure consistent with the intent of paragraph 11 of the FERC order on physical security. Because the scope and intent of NERC standards is to set forth the requirements that owners, operators and users must follow to help protect the reliability of the Bulk-Power System,

the SDT concluded that it is beyond the scope of NERC Reliability Standards to specify whether certain information is exempt from U.S. or Canadian federal or state public disclosure laws. However, the SDT included language in Parts 2.4 and Parts 6.4 of the standard to clarify that entities shall have procedures to protect or exempt sensitive or confidential information developed under the standard from public disclosure. The SDT believes that responsible entities have existing mechanisms for safeguarding confidential or sensitive information used to comply with existing NERC Reliability Standards and also recognizes that there are other forums that can address the applicability of this information to public disclosure laws.

- **Several commenters had concerns with the term "collector bus" as used in the applicability.** The SDT notes that this language was copied directly from the CIP-002-5.1 standard. The SDT has also added language to the Guidelines and Technical Basis section to clarify the use of the term collector bus.
- **Several commenters suggested making revisions to the table in 4.1.1.2.** The SDT notes that this was copied directly from CIP-002-5.1. This language was used to mirror those Transmission Facilities that meet the bright line criteria for "Medium Impact" Transmission Facilities under Attachment 1 of Reliability Standard CIP-002-5.1.
- **One commenter suggested revising the applicability to indicate that only a Transmission Owner "that owns any facilities identified in the following sections (4.1.1.1 through 4.1.1.4) will be required to perform the risk assessment and risk assessment validation as outlined in R1 and R2 of this standard."** The SDT notes that this is addressed in the Guidelines and Technical Basis section and that the requirements make this clear.
- **Several commenters requested additional guidance regarding "unaffiliated" third party reviewers.** The SDT has provided additional guidance in the Guidelines and Technical Basis section as well as revisions to Requirement R2, Part2.2 and the Rationale for R2.
- **Some commenters have concerns and recommended that the Applicability section reference the criteria of CIP-002-5.1 for a "medium impact rating" instead of re-stating it and questioned certain aspects of the applicability.** The SDT believes that the Standard and Guidelines and Technical Basis section clearly indicates that the risk assessment is to only identify a Transmission station or Transmission substation that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. The SDT notes that this was copied directly from CIP-002-5.1. This language was used to mirror those Transmission Facilities that meet the bright line criteria for "Medium Impact" Transmission Facilities under Attachment 1 of Reliability Standard CIP-002-5.1.
- **Some commenters disagree with the decision to limit applicability to only the primary control center.** The SDT believes that providing physical security for the primary control center and not back-up control centers is sufficient to protect the control of the critical Transmission stations and Transmission substations. Back-up control centers are not applicable, as they are already considered a form of resiliency and intentionally redundant.

- **Some commenters believed that the SDT did not go far enough in the applicability of facilities, in particular with respect to physical locations where critical cyber systems are housed and high impact control centers.** The SDT disagrees as the standard follows the FERC Order and employs a risk assessment designed to identify a Transmission station or Transmission substation that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. Such a scope is different than the scope of other CIP standards to protect cyber assets.
- **Some commenters question why generation assets are exempt from analysis and verification required by Requirements R1 and R2.as they assert that some generation assets, if rendered inoperable, could result in widespread instability, uncontrolled separation, or Cascading.** The SDT considered whether to include Generator Operators and Generator Owners in the proposed Reliability Standard and decided not to include them as applicable entities. First, the FERC Order does not explicitly mention generation assets, and the order is reasonably understood to focus on the most critical Transmission Facilities. Second, the proposed Reliability Standard accounts for the loss of generation resources as explained in the Guidelines and Technical Basis section. A determination of whether a Transmission station or Transmission substation that meets CIP-002-5.1's medium impact criteria could, if rendered inoperable or damaged, result in widespread instability, uncontrolled separation, or Cascading within an Interconnection will consider the impact of the loss of generation at those Transmission stations or Transmission substations. Specifically, the transmission analysis or analyses conducted under Requirement R1 will take into account the impact of the loss of generation. As such it is not necessary to include Generator Operators and Generator Owners to ensure that the impact of loss of generation is considered.
- **One commenter disagreed with the SDT that many entities that are applicable to the standard will not identify facilities through their Requirement R1 risk assessment and Requirement R2 verification that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection.** The SDT members were selected based on their expertise. To more explicitly or in greater detail explain their statements related to the number of Transmission stations or Transmission substations that will be identified in R1 would likely disclose information that is confidential and contrary to national security. In the order, FERC states this opinion in paragraph 12 as well.
- **One stakeholder commented that the standard is too complicated of a draft standard for a 90 day consensus and that it should be simplified by altering the basic approach of the standard.** While the SDT appreciates suggestions on altering the basic approach, it believes it struck the right balance to be consistent with and responsive to the FERC Order and provide for an applicability that has been approved by stakeholders and regulators.
- **Some commenters had concerns regarding the language in the Exemption regarding nuclear facilities.** The SDT has added clarifying language to the exemption to address these concerns.
- **One commenter questioned why a Transmission Owner must go through requirements R1 and R2 before determining whether or not the remaining requirements apply.** TOs that meet the applicability criteria (Section 4) need to perform the risk assessment (R1) and have it verified (R2) regardless of their size. This will identify the critical stations. This concept is provided

in the first paragraph of the Guidelines and Technical Basis section of the standard: "Only those TOs with Transmission stations or Transmission substations identified in the risk assessment (and verified under Requirement R2) have performance obligations under Requirements R3 through R6."

- **Many commenters requested additional guidance regarding Transmission Facility, Transmission station and Transmission substation**. The SDT has added clarifying language to the Guidelines and Technical Basis section of the standard.
- **Several commenters suggested that the SDT use the defined term "Control Center" in the standard.** The SDT deliberated this during the development of the standard but did not believe that it was clearly applicable to this standard because a Control Center includes the RC, BA and GOP. These entities are not applicable under this standard. The SDT has decided to retain the original language.
- **One commenter suggested adding the primary control center to the applicability section of the standard.** The SDT deliberated this in previous meetings but decided it was not appropriate. The SDT will retain the existing applicability as we believe that stakeholder consensus has been achieved.
- **Several commenters had concerns with the requirements language regarding the timing components.** The SDT has added language to the guidance to help clarify these issues. The SDT believes that the timelines are aggressive but achievable. Please see responses to specific timing requirements in other questions below.
- **One commenter suggested adding "AC and DC" to the applicability.** The SDT does not believe that this is necessary as the voltage levels shown imply this.

Organization	Yes or No	Question 1 Comment
Foundation for Resilient Societies	No	1. Reliability Coordinators (RCs) would be exempted under the draft standard. Not all Reliability Coordinators are Transmission Operators or Owners. Peak Reliability, Midcontinent ISO, and Southwest Power Pool would be exempted because they are not in the NERC Compliance Registry as Transmission Operators or Owners. (MISO is not a Reliability Coordinator under its MRO registration.) The following standards apply to Reliability Coordinators but not Transmission Operators and Owners: Standard EOP-006-2 - "System Restoration Coordination"; Standard EOP-002-3.1 - "Capacity and Energy Emergencies" (Applies to Balancing Authorities, Reliability Coordinators, and Load-Serving Entities); Standard IRO-009-1 - "Reliability Coordinator Actions to Operate Within IROLs"; Standard IRO-015-1 - "Notifications and Information Exchange

Organization	Yes or No	Question 1 Comment
		Between Reliability Coordinators." The Joint U.S.-Canada report on the 2003 Blackout concluded that insufficient wide-area control, such as that provided by Reliability Coordinators, was a contributing factor to the blackout. Yet the Standard Drafting Team has disregarded these findings in exempting Reliability Coordinators. It is a fallacy to believe that only entities with direct control of substations need protection from physical attack. If critical substations and their Reliability Coordinators are attacked in a coordinated manner, what entity will lead system restoration? It is essential that Reliability Coordinators are designated as responsible entities, both to protect their own facilities and to enable their authority to review the adequacy of physical security capabilities for operating utilities in their coordinating areas. Key findings of the joint U.S.-Canada Outage Task Force on the August 2003 blackout demonstrated the need for the Reliability Coordinators to actively supervise operating entities both to meet essential operating needs and to assure adequate regional visibility. See U.S.-Canada Power System Outage Task Force Report (April 2004). <http://energy.gov/sites/prod/files/oeprod/DocumentsandMedia/BlackoutFinal-Web.pdf>2. Balancing Authorities would be exempted under the standard. According to the NERC Compliance Registry, there are 19 Balancing Authorities that are not also Transmission Operators or Owners. The following standards apply to Balancing Authorities but not to Transmission Operators or Owners: Standard BAL-001-2 - "Real Power Balancing Control Performance"; Standard BAL-002-1 - "Disturbance Control Performance"; Standard BAL-003-1 - "Frequency Response and Frequency Bias Setting"; Standard BAL-004-0 - "Time Error Correction"; Standard EOP-002-3.1 - "Capacity and Energy Emergencies"; Standard IRO-006-5 - "Reliability Coordination - Transmission Loading Relief". If critical substations and their Balancing Authorities are attacked in a coordinated manner, what entity will balance demand and generation and manage the emergency, especially if the attack causes a regional load imbalance?3. Generator Operators would be exempted under the proposed standard. Generator Operators have vulnerable and hard-to-replace Generator Step Up

Organization	Yes or No	Question 1 Comment
		(GSU) Transformers, just as Transmission Operators have these transformers. Generation facilities could present contingencies in excess of spinning reserves, especially in congested areas with import of large megawatts of power over long transmission lines. Hence, Generator Operators should be included in mandatory physical security protection standards.4. The standard does not require modeled contingency planning for scenarios of physical attack. Contingency planning for physical attack should include megawatt capacity of all generators at single generation facility, not just failure of some individual units at the facility.5. Without explicit modeling for physical attack, some substations may fall through the cracks under "Aggregate Weighted Value" methodology in the standard. Physical attack of multiple transformers is different than the random failures planned for under the standard N-1 criterion. We have already seen attack on multiple transformers and their circuits at the Metcalf substation. The standard's criterion for violation of IROL limits would not be valid if the IROL limits assume random failures rather than coordinated physical attack.6. Some "High Impact" control centers would be exempt under the standard. Examples include the control centers for Peak Reliability, MISO, and SPP. In all, these control centers manage power for 141 million Americans. Control centers for Reliability Coordinators, Balancing Authorities, and Generator Operators are included in the "High Impact" Criteria for CIP-002-5.1 How can the standard drafting team take the CIP-002-5.1 criteria for substations but not control centers of Reliability Coordinators, Balancing Authorities, and Generator Operators? FERC Directive RD14-6-000 specifically requires protection of critical control centers in Footnote 6: "... the Commission expects that critical facilities generally will include, but not be limited to, critical substations and critical control centers."7. While FERC Directive RD14-6-000 [146 FERC Â¶61,166] did not require specific security measures, it could have been reasonably expected that NERC would have developed specific measures to be applied on an as-needed basis. Nonetheless, the draft standard contains no specific requirements or even suggested guidelines for physical security measures. Such measures

Organization	Yes or No	Question 1 Comment
		might include: Opaque Fencing; Concrete Jersey Barriers; Motion Sensors; License Plate Scanners; Intentional Electromagnetic Interference (IEMI) Detectors; Gunfire Locators; Limiting of Close Public Access, Including Recreational Access; Armed Private Guards; Police Details; Deployment of National Guard Troops; Better Stocking of Spares-e.g., Transformer Bushings and Radiators; Equipment Monitoring and Redundant Telemetry to Control Centers. Instead, the standard relies upon self-devised security measures without prioritization or other guidance.8. The Metcalf incident unambiguously showed the value of equipment monitoring in mitigating physical attack on power transformers. Gunfire locators, had they been installed at Metcalf, could have alerted system operators to the attack in real-time, allowing prompt dispatch of law enforcement. Intentional Electromagnetic Interference (IEMI) Detectors could likewise provide real-time warning. If threat sensors with reliable and cyber-protected alerts are not part of a physical security system, it will be impossible to mobilize time-urgent countermeasures and impractical to take precautionary measures at other at-risk facilities vulnerable to coordinated attack.9. Intentional Electromagnetic Interference should be a physical threat included in the standard, because IEMI attack could occur in the physical proximity of facilities and could cause permanent physical damage in additional to temporary upset. IEMI detectors are a cost-effective measure as these devices cost approximately $15,000 per unit.10. The Metcalf Incident was both a physical attack and a cyber denial-of-service attack. The need for linkage between physical and cyber is explicitly called for in the RD14-6-000 Order of March 7, 2014, para 5, footnote 3. The implementation plan under this Order must require responsible entities to identify and protect cyber assets that link facilities and control centers that are otherwise identified as critical to the reliability of the BES. Communications and Network entities routinely provide hardened and alternate routing for military, other government and the Defense Industrial Base and their services should be an explicit requirement for Physical Security Standards that apply to any units and control centers that are identified

Organization	Yes or No	Question 1 Comment
		by Responsible Entities as critical to the Reliability of the BES.11. Review and certification of security plans, as proposed in the draft standard, does not necessarily provide a level of independence that would be prudent or credible to the public. Regional Entities or Reliability Coordinators for any facilities under their jurisdiction should be the primary authorities to review and approve security plans. Governmental authorities should have the ability to audit security plans.12. Improvements to the standard that we suggest would be marginal additions of facilities and their equipment and therefore would be cost-effective. We propose inclusion of primary and backup control centers for Peak Reliability, MISO, and SPP-an increase of 6 control centers as compared to approximately 200 already included Transmission Operator control centers. We propose inclusion of 19 additional Balancing Authorities as compared to 114 Balancing Authorities in total. There are only 50 non-nuclear generation facilities in the United States with nameplate capacity of 2 GW or more-this number is a rough approximation of the number of generation facilities that modeling might show to be capable of causing cascading outage if successfully attacked.13. RD14-6-000 directs NERC to submit for approval a physical security standard that would apply to the most critical facilities of the Bulk Electric System. The Standard Drafting Team has narrowly interpreted “critical facilities” to mean transmission facilities and directly linked control centers. We disagree with this narrow interpretation. Given the NERC interpretation and the 90 day deadline for standard development, NERC’s draft standard holds tightly to the most minimal facilities and therefore has significant gaps in protection as we describe in our foregoing comments. Some of these gaps, such as the exemption of Reliability Coordinators and Balancing Authorities, are so fundamental that they should be addressed immediately. For other gaps, we ask that NERC open a Standard Authorization Request (SAR) for a Phase Two physical security standard. This follow-on Phase Two standard should require modeling of BES operations sufficient to ensure identification of facilities that could cause cascading outage, single points of failure, data connectivity needs, and other processes and

Organization	Yes or No	Question 1 Comment
		technologies essential to grid protection-in short, a standard designated CIP-014 Version 2. An approved SAR for a Phase Two standard should be concurrent with NERC Board of Trustees approval of the current standard in development.
Florida Keys Electric Cooperative	No	o Stations and substations should be clearly understood within the standard, not just through a guidance document or rationale. It is FKEC's understanding that a "station" equates to a switchyard that does not include transformers; and a "substation" is a facility that does include transformers. This should be addressed at the beginning of the standard document to ensure clear understanding throughout the standard. o Do stations and substations focus only on certain key assets or all assets within the facility? Some assets could be those used for local distribution and/or be below 100kV. Clarity on this is required in order to understand the full scope and appropriateness of the standard.
Ciy of Garland	No	Applicability:The applicability section for Transmission Operators under section 4.1.2 should be explicitly limited to each TOP that operates a primary Control Center and receives a verified notification under Requirement R3. As written each TOP would be required to certify on each compliance contact that it has not been notified that it operates an applicable primary control center. The following edited text would accomplish that objective:4.1.2 Transmission Operator that operates a primary Control Center and receives notice from a Transmission Owner under Requirement R3.Please state clearly the Transmission Operator of a primary control center is not responsible for conducting a risk assessment under R1 or arranging for third party verification of the risk assessment under R2.
Black Hills Corporation Entities	No	Black Hills Corporation (referred to as BHC hereafter) believes that Section 4.1.1 has appropriate applicability specifics, but Section 4.1.2 only says "Transmission Operator", which initially implies a much greater scope. Request that similar to

Organization	Yes or No	Question 1 Comment
		Section 4.1.1 styling, Section 4.1.2 alternatively state “Transmission Operators notified by a Transmission Owner according to Requirement R3.”
Nebraska Public Power District	No	Due to the imposed time constraints and expedited development of this standard, sufficient time isn’t available to develop more realistic criteria for determining applicable substations creating unnecessary work and expense for transmission planners and reviewers.
Georgia System Operations Corporation	No	Georgia System Operations Corporation (GSOC) appreciates all the effort going into the draft of CIP-014-1 Physical Security Reliability Standard.GSOC supports the comments submitted by NRECA.
Georgia Transmission Corporation	No	Georgia Transmission Corporation (GTC) supports the efforts of the drafting team and believes that their efforts to create the CIP-014 Standard are moving in the right direction. GTC supports the comments submitted by the NRECA with regard to the applicability, requirements, and implementation of the draft standard.
OPG	No	In the applicability section of the proposed standard, does the exemption refer to the Nuclear Generation Facility or the Transmission facility to which the Nuclear Generation Facility is connected? In Canada the Canadian Nuclear Safety Commission has no jurisdiction over the Transmission Owner/Operator; therefore the intent of the standard has to be made clear on this point.
Modesto Irrigation District	No	MID agrees that maintaining selection criteria consistent with CIP-002-5 is a prudent approach. However, if a facility is worthy of protection against a cyber attack, why is that same facility not worthy of consideration and evaluation for a potential physical attack? Inclusion of 'widespread instability, uncontrolled separation, or Cascading within an Interconnection' as an additional criteria is also prudent. These criteria focus on the immediate impact of the physical attack. What is missing is the longer term impact - if serious physical damage is

Organization	Yes or No	Question 1 Comment
		the result, can the damaged system perform adequately during subsequent peak loading periods?MID understands that these changes would extent the scope of the standards coverage beyond what was included in the FERC order. MID would like to respectfully suggest that the FERC order is a step in the right direction but did not fully consider all of the potential physical attacks that could cause 'widespread instability, uncontrolled separation, or Cascading within an Interconnection' or impair long term reliability of the system. MID feels that in responding to the FERC order, it would be acceptable to 'do the right thing' and step up to the challenge and evaluate all facilities identified in CIP-002-5 as high or medium impact the system against possible physical attacks.
New Brunswick Power Corporation	No	New Brusnwick Power (NB Power) agrees with the "applicability section" but not with portions of the preamble above, in question 1, which expands beyond applicability and states that "Furthermore, the standard drafting team expects many who are "applicable" to the standard will not identify facilities through their Requirement R1 risk assessment and Requirement R2 verification that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection." To our knowledge there is no evidence to support the standards drafting teams statement that they expect that many of the applicable entities will not identify facilities through R1 and R2. FERC's statement that "we anticipate that the number of facilities identified as critical will be relatively small compared to the number of facilities that comprise the Bulk-Power System" is not sufficient evidence. NB Power is concerned that the cost impact of this standard may be underestimated as a result of this view that the number of critical facilities will be small. Please see comments below with respect to R1 and R2.
Rayburn Country Electric Cooperative	No	Overall comment is this is too complicated of a draft standard for a 90 day consensus!Keep it simple. I agree with the functional entitiy that is identified however, I would add GO to address any "critical" switchyards that may exist that are not owned by a TO.I also agree with the scoping of the facilities similar

Organization	Yes or No	Question 1 Comment
		to the CIP V5 criteria with the following exception, apparently a list already exists for the substations that should be considered "high" do they deserve an alternative approach to what is within this standard?Altering the existing basic approach as follows:Since the FERC order allowed for “One or More Reliability Standards”, it would be appropriate to address the “High “ facilities separate from the “Medium Facilities”. This approach would make it an easier task to file the “high standard” within the 90 days then follow with the “medium later”. Thus giving more time, latitude and maneuverability to address issues that arise specific to those facilities.
Con Edison and Orange & Rockland	No	Reliability Coordinator, Planning Coordinator and Transmission Planner should be added to the Applicability Section. That will obligate these entities to meet the 90 day review period stipulated in R2.2, if they are identified as a verifying entity by the Transmission Owner.
Clark Public Utilities	No	Section 4.1.2 of the Applicability section states “Transmission Operator.” This reference in the Applicability section should be more specific based on the the actual conditions under which CIP-014 would be applicable to a Transmission Operator. Clark suggests the referense should be revised to “Transmission Operators that have operational control over the primary control center of a Transmission station or Transmission substation identified in section 4.1.1.”
Southwest Power Pool Regional Entity	No	SPPRE does not agree with the applicability because it excludes certain facilities that could pose a significant risk to the BPS reliability if rendered inoperable or damaged as a result of a physical attack. Other facilities that should be applicable are those where high impact BES Cyber Systems are found. Additionally, any Special Protection System and automatic load shedding system capable of shedding 300 Mw or more should be included. Reference CIP-002-5 Attachment 1 (Impact Rating Criteria 1.1, 1.2, 1.4,2.9, and 2.10). SPPRE also

Organization	Yes or No	Question 1 Comment
		disagrees with the decision to limit applicability to only the primary control center.
National Rural Electric Cooperative Association (NRECA)	No	Stations and substations should be clearly understood within the standard, not just through a guidance document or rationale. It is NRECA's understanding that a "station" equates to a switchyard that does not include transformers; and a "substation" is a facility that does include transformers. This should be addressed at the beginning of the standard document to ensure clear understanding throughout the standard.Do stations and substations focus only on certain key assets or all assets within the facility? Some assets could be those used for local distribution and/or be below 100kV. Clarity on this is required in order to understand the full scope and appropriateness of the standard.
Northeast Power Coordinating Council	No	The applicability of the draft standard should be expanded to incude Planning Coordinators in addition to Transmission Owners and Transmission Operators. While NPCC agrees that TOs and TOPs simple application of the screening criteria to determine which facilities need analysis, they may not be able to conduct a complete analysis. The SDT should consider that Transmission Owners in some cases do not have the ability to conduct an analysis with a "wide area" view of consequences. Smaller TOs or TOPs only have an outside equivalent representation of the BES and could need help conducting their analyses. Consideration should be given to allow them to conduct the studies in conjunction with PCs.
EF Cass Consulting Inc.	No	the applicability section table should be modified by either removing the 500kV line or making it a 3000 value. By giving it a 0 value in the table it send a different message than the text indicating all 500kV facilities are in. Also, in the draft RSAW Compliance Assessment approach for R1, it would appear that a Transmission Owner needs to comply with R1 and R2 in order to determine if the standard applies to them. If an entity is required to have a process for determining applicability then it needs to be a requirement. The applicability

Organization	Yes or No	Question 1 Comment
		section should produce a yes or no answer. I spoke with Nick Webber of WECC and his response back was "Much like the requirement of all entities to apply CIP-002, all entities registered as for the TO function must complete CIP-014-1 R1 and R2. Each TO must complete R1 to determine if R3-R6 apply. The TO then must subsequently have that R1 assessment reviewed as required in R2." An entity should not have to comply with 2 of the requirements in order to determine if the standard applies to them. If all TOs are expected to comply with R1 and R2, then move the criteria into the requirement, if that is not the intent, clarify that once an entity reviews the applicability section and determines the standard does not apply they are finished. The rationale for requirement R1 indicates the criteria is in R1 when it is actually in the Applicability section.
Bureau of Reclamation	No	The Bureau of Reclamation (Reclamation) believes that the Transmission Planner, Planning Coordinator, and Reliability Coordinator should be included in the Applicability section of the standard and should be responsible for reviewing the Transmission Owner's risk assessment (BES impact assessment).
Tri-State Generation and Transmission Association, Inc.	No	The drafting team may want to consider language referencing the CIP-002 Critereon rather than outright copying it in order to prevent changing multiple standards as the CIP-002 standard evolves.CIP-002-5.1 Attachment 1: Overall Application gave guidance on how to treat joint ownership facilities. Tri-State feels that this new standard would also benefit from such guidance.
Omaha Public Power District	No	The Omaha Public Power District (OPPD), suggests replacing the term "primary control center", using the NERC defined term "Control Center", with "primary Control Center".
NCPA Compliance Management Operating Committee	No	The Standard Drafting Team (SDT) estimates that relatively few Transmission Owners (perhaps 30 or less) will have Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability or uncontrolled separation. The Applicability section creates a lot of

Organization	Yes or No	Question 1 Comment
		work for many TOs an TOPS to identity those 30 or less transmission stations out of the 55,000 substations. The SDT might consider a higher level of applicability as was done for EOP-010-1, Geomagnetic Disturbance Operations i.e. apply the standard to Reliability Coordinators (RC) and only the Transmission Operators the RCs deem critical.This would be a more efficeint filtering process. Benefits of such an approach would be (1)Simplification and tighter security of critical information and informaton sharing (2) streamling and simplicaton of requirements for unaffiliated third party review, for example one reviewer could handle the risk assessment, vulnerability and threat assessment and review of security plans (combines requirements R2 & R6 together) (3)Time and resources of the entity could be more efficiently and economically managed as all reviews could be handled by a single Reviewer in a continuous manner rather than starting a stopping for different phases. (4) Saves many entities who would fall out of the process after going through the first three requirements. I expect RCs, ISOs and Regional Entities already know this
Kansas City Power & Light	No	There is a use of the term "critical" being used in several NERC Standards, which can cause unintended confusion. Since the applicability of this draft Standard is derived from the approved CIP-002-5.1, can this proposed Standard be added as a revision to CIP-002-5.1?
Utility Services	No	We have seen in the previous versions of the CIP standards that “Risk Assessments” are not performed consistently, and create more problems than they solve, and even violation determinations. The solution in CIP-014 to this inherent problem seems to just add another level of review, but there is no guarantee of consistency within these assessments. Additionally, it seems the drafting team is suggesting a single assessment (“Concurrent with R1 study” specified in R2), this this might eliminate the review stage all together. A clear applicability section with a “brightline” approach would be more appropriate and consistent with the progression of the CIP standards overall. Otherwise, what prevents an auditor from making a determination that the assessment

Organization	Yes or No	Question 1 Comment
		performed was not sufficient or incomplete, even with a 3rd party validation? Entities need a clear definition to avoid the problems of the past. If the drafting team wants to limit the scope of Facilities this could be detailed in the "Exemptions" portion of the "Applicability" section of the standard. 1. The "Exemption" section needs to be clarified. If this applies to the entire section number it 4.2. If it is only applicable to the last bullet it is under give it the appropriate number (4.1.2.1)Suggested re-write4. Applicability:4.1. Functional Entities:4.1.1 Transmission Owner4.1.2 Transmission Operator4.2. Applicable Facilities: The following Facilities, systems, and equipment, owned or operated by each Responsible Entity in 4.1 above are those to which these requirements are applicable. 4.2.1 Transmission Facility operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.4.2.2 Transmission Facility that operate between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.ADD TABLE HERE4.2.3 Transmission Facility at a single station or substation location that is identified by its Reliability Coordinator, Planning Coordinator, or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.4.2.4 Transmission Facility at a single station or substation whose unplanned unavailability would result in the loss of at least 3000 MW of generation.4.2.5 Control Center that controls:4.2.5.1 Transmission Facilities identified by

Organization	Yes or No	Question 1 Comment
		identification under 4.2.1 through 4.2.4; or4.2.5.2 Two or more Facilities which contain a Cyber System(s) which have been identified as a High or Medium Impact BES Cyber System.4.2.6 Exemptions: 4.2.6.1 All facilities regulated by the Nuclear Regulatory Commission or Canadian Nuclear Safety Commission.4.2.6.2 Transmission station or substation connected to only one other Transmission station or substation.4.2.6.3 Transmission station or substation that does not operate above 200kV.4.2.6.4 control centers not designated as a "primary control center"
SPP Standards Review Group	No	We have some concern with the undefined term 'collector bus facility'. Without a definition for collector bus facility some may consider the entire switchyard at a generating station as a collector bus facility. We do not believe the drafting team intended this to be the case. Therefore, some additional clarification may be needed for the term.
Public Utitliy District No. 1 of Cowlitz County, WA	No	We strongly disagree with applicability statements being outlined in the requirement. We support APPA's recommendation to further define TOP applicability in section 4.1.2 to avoid nuisance compliance certifications.
Western Electricity Coordinating Council	No	WECC questions why generation assets are exempt from analysis and verification required by Requirements R1 and R2. It is possible that some generation assets, if rendered inoperable, could result in widespread instability, uncontrolled separation, or Cascading.WECC recommends removing the 500 kV line in the Weighted Value table. All 500 kV facilities are to be assessed per Applicability Section 4.1.1.1 and including 500 kV lines in the table in applicability section 4.1.1.2 with a zero value seems more likely to add confusion than to provide clarifying information.Applicability section 4.1.2 makes it look like the standard is applicable to all Transmission Operators. WECC suggests adding some clarifying language to indicate that the standard is only applicable to Transmission

Organization	Yes or No	Question 1 Comment
		Operators notified per Requirement R3. This may serve to make the standard more acceptable to Transmission Operators in general.
Herb Schrayshuen	No	The applicability of the standard is to Transmission Owners and Transmission Operators. Generating plants sites where the facilities production capability exceeds 1000 MW or other suitably larger amount should be included.
Bonneville Power Administration	Yes	4. Applicability: BPA believes that the medium list for HV transmission entities will result in numerous facilities having to be protected (all 500 kV) contrary to the drafting team comment that not many facilities will be deemed critical. 4.1. Functional Entities: BPA recommends that this section reference the criteria of CIP-002-5.1 for a "medium impact rating," instead of re-stating it without citation. Otherwise it is confusing. For example, the source of the tabulated weighting criteria is unclear and it is difficult to know there is a connection to any previous or established standards.
Idaho Power Co.	Yes	4.1.2. Seems vague in its description lending the reader to believe that TOPs are in scope at all times which is inconsistent with guidance later in the standard which states they are only required to perform actions when informed they are in scope by a TO. Further Clarification is needed in this section.
American Public Power Association (APPA)	Yes	APPA supports approval of the proposed physical security standard, subject to the technical clarifications and corrections shown below. These comments were developed by APPA staff based on extensive input from a diverse group of members utilities that will be subject to the proposed standard once it is approved. Please see also the individual comments of APPA members.CONTROL CENTER - Use the defined term "Control Center" by capitalizing as "primary Control Center" or explain why lower case "primary control center" is different and needs to be used in the standard. Consider inserting "with operational control" after primary Control Center, to express the intent of the text box Rationale for Requirement R1 that the control center must be capable of taking

Organization	Yes or No	Question 1 Comment
		electronic actions that can cause direct physical actions at the identified station or substation. Please also clarify whether the periodic use of a backup control center as the entity's primary control center would make R4 and R5 applicable to both the primary and backup control centers.UNAFFILIATED - needs to be either defined or a footnote needs to be added to the standard to explain that "unaffiliated means that the selected verifying or reviewing entity cannot be a corporate affiliate," as stated in the guidance section.CONFIDENTIALITYPublicly Owned Utilities subject to state Open Records Acts are concerned that records produced, gathered, used and maintained as evidence of compliance with this standard may be subject to disclosure under applicable state laws. To protect this critical information from disclosure, we suggest adding a provision to the Introduction section of the proposed standard that designates the produced, gathered, used and maintained records related to compliance with this standard as exempt from disclosure. Alternatively, we suggest the addition of Requirements to protect the records and information from disclosure. Proposed language for a new #7 in the A. Introduction section, after 6. Background:7. Critical Facilities InformationRecords and related information concerning critical facilities physical infrastructure, including risk assessments and evaluation of physical threats and vulnerabilities, as produced, gathered, used or maintained for compliance with mandatory Reliability Standards, are intended to be kept confidential by the owner of the records and information, those entities with authorized access, and any organization or agency charged with examination of such records and information pursuant to Section 215 of the Federal Power Act. All such identified records and information are also intended to be exempt from public disclosure. Consistent with that premise, the purpose of the cyber and physical security Reliability Standards are to identify and protect facilities that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or cascading within an interconnection. Consequently, records and information detailing the physical infrastructure, including records and information related to the risk assessments

Organization	Yes or No	Question 1 Comment
		and evaluation of physical threats and vulnerabilities conducted under this Reliability Standard and all records and information produced, gathered, used and maintained for compliance with this Reliability Standard shall be considered critical facilities information and are intended to be exempt from disclosure under public records laws. Nothing in this section or the Reliability Standards is intended to eliminate other lawful methods of access to such records and information. ALTERNATIVE PROPOSED REQUIREMENT LANGUAGE ADDITIONS:R1.3 The Transmission Owner will keep confidential all records and information related to the risk assessments conducted under this standard.R3.2 The Transmission Owner will keep confidential all records and information related to the notifications conducted under Requirement R3 and R3.1 of this standard. R4.4 The Transmission Owner and each applicable Transmission Operator will keep confidential all records and information related to the evaluation of physical threats and vulnerabilities to each of its transmission substation(s) and primary Control Center(s) identified in Requirement R1. APPA suggests technical edits to Requirements R2.4 and R6.4 to insert "or made available to" after "exchanged with." This change would clarify that sensitive or confidential information does not have to be actively "exchanged" between entities to be subject to the protections directed under Requirements R2.4 and R6.4. APPLICABILITY 4.1.2 - The applicability section for Transmission Operators under section 4.1.2 should be explicitly limited to each TOP that operates a primary Control Center and receives a verified notification under Requirement R3. As written each TOP would be required to certify on each compliance contact that it has not been notified that it operates an applicable primary control center. The following edited text would accomplish that objective:4.1.2 Transmission Operator that operates a primary Control Center and receives notice from a Transmission Owner under Requirement R3.Please also confirm that the Transmission Operator of a primary control center is not responsible for conducting a risk assessment under R1 or arranging for third party verification of the risk assessment under R2.

Organization	Yes or No	Question 1 Comment
The Empire District Electric Company	Yes	EDE feels this is the right approach on selecting a threashold for applicability to this standard.
ISO/RTO Standards Review Committee	Yes	IntroductionThe proposed standard provides adequate flexibility with respect to the risk assessments and security evaluations and plans. This allows the industry to capitalize on their experience in these matters, while also accommodating changes that warrant consideration. Applicability SectionThe applicability scope is reasonable in terms of identifying the appropriate functional entities to address physical security concerns. Similarly, the proposed standard establishes a reasonable approach for identifying the scope of facilities by 1) initially defining an objective set based on the CIP-002-5.1 criteria, and then 2) refining that set based on analyses that assess the relationship of those facilities to specific, system conditions/impacts metrics - i.e. widespread instability, uncontrolled separation, or Cascading within an Interconnection.
National Grid	Yes	It should be clear that the applicability section of the standard is only intended to provide a valid, technically sound basis to be used as the 'starting point' to those transmission facilities or stations that should be included in the risk assessment.We suggest the following modifications:4.0 Applicability:4.1 Functional Entities:4.1.1 Transmission Owner that owns any facilities identified in the following sections (4.1.1.1 through 4.1.1.4) will be required to perform the risk assessment and risk assessment validation as outlined in R1 and R2 of this standard. Should the risk assessment identify critical assets then the Transmission Owner is subject to the remaining requirements (R3 through R6) of the standard. 4.1.2 Transmission Operator
ITC	Yes	ITC agrees with utilizing, as a starting point, the CIP-002-5.1 "medium impact" rating to determine the facilities needing enhanced physical security. As ITC indicated in its comments to FERC in Docket No. RD14-6, these new physical security Standards must be developed in a coordinated manner to avoid

Organization	Yes or No	Question 1 Comment
		duplicative, overlapping, or contradictory requirements among the various existing Reliability Standards that cover a similar if not an identical set of assets. By ensuring "that entities could apply the same set of criteria to assist with identification of facilities under CIP Version 5 and proposed CIP-014-1," the SDT has fully met our expectations with respect to the applicability of the standard.
Los Angeles Department of Water and Power (LADWP)	Yes	LADWP requests the Drafting Team to make the following changes:- For Secion 4, you may want to add Transmission Planner and Planning Coordinator to the applicability. These functions may have responsibility on at least R1 and R2.- Secion 4.1.1.1 - Add "(AC or DC)" as follows: "Transmission Facilities operated at 500 kV (AC or DC) or higher....."
Public Utility District No. 2 of Grant County, WA	Yes	Language contained in R1 does not align the performance of risk assessments of Transmission stations and Transmission substations with the actual commissioning or energization of such facilities. To ensure that risk assessments and subsequent risk assessments address existing and planned Transmission stations and Transmission substations to be in service within a risk assessment window the following edits are recommended to R1:R1. Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 30 months) ..1.1. Subsequent risk assessments shall be performed at least once every 30 calendar months. (this would apply to all applicable TOs) GCPD also supports comments made by APPA regarding the insertion of the language addressing Confidentiality and treatment of Critical Facilities Information. GCPD's suggested language is as follows: Risk assessments and evaluations of physical threats and vulnerabilities, as produced, gathered, used or maintained for compliance with mandatory Reliability Standards, are intended to be kept confidential by the owner of the records and information, those entities with authorized access, and any organization or agency charged with examination of such records and information pursuant to

Organization	Yes or No	Question 1 Comment
		Section 215 of the Federal Power Act. All such identified records and information are also intended to be exempt from public disclosure.
MidAmerican Energy Holding Company	Yes	MidAmerican Energy Holdings Company (MEHC) agrees with the applicability section.
MISO	Yes	MISO supports the proposed applicability section and agrees that other entities do not need to be included. In particular, MISO would not support application of this Standard to Reliability Coordinators or Balancing Authorities, as these entities' control centers are adequately protected with regard to physicial security under CIP-006-3c and its successor standard. Moreover, these control centers are subject to the requirements of EOP-008-1 including the transfer functional control to backup facilities. MISO therefore agrees that the focus of CIP-014-1 should be those facilities that are not otherwise fully protected by CIP-006-3c, such as those that do not not rely entirely on Critical Cyber Assets to maintain reliability.
ATCO Electric	Yes	No Comment.
SERC CIPC	Yes	Recommend that the drafting team include the Transmission Planner who would be performing the risk assessment in the applicability as discussed in R1.
ReliabilityFirst	Yes	ReliabilityFirst supplies the following comments for consideration:1. ReliabilityFirst believes there may be a perceived disconnect between the Applicability Section and Requirements 5 and 6. Requirements 5 and 6 introduce new requirements surrounding the Transmission Owners "primary control center" though the "primary control center" is not listed within the Applicability section as an asset the Transmission Owner owns that is included in the standard. Consideration may be given to adding "primary control center" under section 4.1.1. [Note: Since "Control Center" is a NERC defined term, this term should be capitalized throughout the standard.]2. Applicability section 4.1.1.4 -

Organization	Yes or No	Question 1 Comment
		ReliabilityFirst believes the term “as essential” is ambiguous and may cause unintended compliance monitoring implications. ReliabilityFirst recommends the following for consideration: “Transmission Facilities identified [in] Nuclear Plant Interface Requirements [which provide offsite power].” ReliabilityFirst believes the recommended language addresses the intent of the SDT.
San Diego Gas & Electric	Yes	San Diego Gas & Electric (SDG&E) agrees that it is appropriate to start with those Transmission Owners that own Transmission facilities that meet the bright line criteria in Reliability Standard CIP-002-5.1 for a “medium impact” rating. However, SDG&E believes that it would be prudent to simply refer to the CIP-002-5.1 Impact Rating Criteria rather than restating it in CIP-014 Standard. Being more specific that this Standard is applicable to Transmission Owners that have any facilities identified as “medium impact” facilities under CIP-002-5.1 Attachment 1, Inpact Rating Criteria 2.4, 2.5, 2.6 and 2.7, would be clearer and more consistent with the general way that CIP-003-5 through CIP-011-5 are built upon the identification of “critical” facilities made in CIP-002-5.1. Linking the two explicitly, rather than simply restating the same language, would prevent the possibility that differences could creep into the rules over time as each Standard is modified.
Seattle City Light	Yes	Seattle City Light supports the Question 1 comments of APPA, with one exception in the area of Confidentiality. Seattle's comments about Confidentiality, in place of APPA's comments on this topic, follow.CONFIDENTIALITYThe stated purpose of draft CIP-014-1 Physical Security is: To identify and protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. Public Utilities subject to state Open Records Acts are concerned that records produced, gathered, used and maintained as evidence of compliance with this standard may be subject to disclosure under applicable state laws. To protect this critical

Organization	Yes or No	Question 1 Comment
		information from disclosure, we suggest adding a provision to the Introduction section of the proposed standard that designates the produced, gathered, used and maintained records related to compliance with this standard as exempt from disclosure. Alternatively, we suggest the addition of Requirements to protect the records and information from disclosure. Proposed language for a new #7 in the Introduction Section:7. Critical Facilities InformationRecords and related information concerning critical facilities physical infrastructure, including risk assessments and evaluation of physical threats and vulnerabilities, as produced, gathered, used or maintained for compliance with mandatory Reliability Standards, are intended to be kept confidential by the owner of the records and information, those entities with authorized access to the records and information, and any agency charged with examination of such records and information pursuant to Section 215 of the Federal Power Act. All such identified records and information are also intended to be exempt from public disclosure. Consistent with that premise, the purpose of the cyber and physical security Reliability Standards are to identify and protect facilities that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or cascading within an interconnection. Consequently, records and information detailing the physical infrastructure, including records and information related to the risk assessments and evaluation of physical threats and vulnerabilities conducted under this Reliability Standard and all records and information produced, gathered, used and maintained for compliance with this Reliability Standard shall be considered critical facilities information and are intended to be exempt from disclosure under public records laws. Nothing in this section or the Reliability Standards is intended to eliminate other lawful methods of access to such records and information. Proposed Requirement Language:R1.3 Records and information related to the risk assessments conducted under this standard that are designated confidential by the Transmission Owner are [intended to be] exempt from public disclosure.R3.2 Records and information related to the risk assessments conducted under

Organization	Yes or No	Question 1 Comment
		Requirement R1 of this standard that are designated confidential by the Transmission Owner are [intended to be] exempt from public disclosure. R4.4 Records and information related to the evaluation of physical threats and vulnerabilities to each of its Transmission station(s), Transmission substation(s), and/or Control Center(s) identified in Requirement R1 conducted under this standard that are designated confidential by the Transmission Owner or Transmission Operator are [intended to be] exempt from public disclosure.
Arizona Public Service Company	Yes	See related comments under Requirement 2 below.
Seminole Electric Cooperative, Inc.	Yes	Seminole supports the comments by NRECA. Additionally, Seminole supports the use of CIP-002-5 medium impact criteria for use in CIP-014. CIP-002-5 has at least one issue that will apply to CIP-014 as well. There are multiple ways to interpret the phrase Transmission Facility. One example is clarifying what is in the scope of a Transmission Facility. The definition or other documentation should state that the substation is exclusive of the criticality of any connected substation and clarify that a Transmission Facility as used here does not include Transmission Lines.
Salt River Project	Yes	SRP supports comments submitted by APPA.
Northeast Utilities	Yes	Standard Drafting Team should define the term widespread. NU suggests the following definition:Widespread - An event that causes voltage collapse, Cascading and/or instability that results in uncontrolled separation across significant portions of the Interconnection. The registered entity shall use regional criteria to evaluate.
PNM Resources	Yes	Support the comments submitted by EEI.
Texas RE	Yes	The applicability should include the TP, PC, RC, and the unaffiliated entity as they are noted in this standard.

Organization	Yes or No	Question 1 Comment
PPL NERC Registered Affiliates	Yes	These comments are submitted on behalf of the following PPL NERC Registered Affiliates: Louisville Gas and Electric Company and Kentucky Utilities Company; PPL Electric Utilities Corporation, PPL EnergyPlus, LLC; PPL Generation, LLC; PPL Susquehanna, LLC; and PPL Montana, LLC. The PPL NERC Registered Affiliates are registered in six regions (MRO, NPCC, RFC, SERC, SPP, and WECC) for one or more of the following NERC functions: BA, DP, GO, GOP, IA, LSE, PA, PSE, RP, TO, TOP, TP, and TSP.The PPL NERC Registered Affiliates support the draft standard. As members of EEI, we also support the comments being submitted by EEI. In addition, we have provided specific comments that we believe would add clarity to the standards and simplify the requirements. We urge the SDT to consider our comments and incorporate them as appropriate when developing the final standard that will be balloted. Comments: Section 4.1.1.2 includes in the applicability Transmission Owners that own Transmission Facilities that are operating between 200kV and 499 kV at a single station or substation, where the station or substation is connected at 200kV or higher voltages to three or more other Transmission stations or substations and has an "aggregated weighted value" exceeding 3000 according to the table set forth in section 4.1.1.2. Because section 4.1.1.1 covers transmission facilities operated at 500 kV and above and section 4.1.1.2 only references Facilities operating between 200 kV and 499 kV, the fourth row in the table in section 4.1.1.2 referencing voltages of "500kV and above" is unnecessary and should be removed.
NRG Energy, Inc.	Yes	This standard should not address generation interconnection facilities because the BES is designed to withstand the loss of generation facilities through the use of regional reserves.
Southern Indiana Gas & Electric Company d/b/a Vectren Energy Delivery of Indiana, Inc.	Yes	Vectren supports the use of the CIP-002-5.1 medium impact criteria. This approach focuses on the facilities that could have a true adverse impact to the Bulk Electric System and provides consistency with approved standards.

Organization	Yes or No	Question 1 Comment
Hydro One	Yes	We agree with the Applicablity. R1 has provided flexibility in the assessment method.
Independent Electricity System Operator	Yes	We agree with the inclusion of the Transmission Owners and Transmission Operators as they have the obligations to conduct an evaluation of the potential threats and vulnerabilities to a physical attack on each of their respective transmission stations/control centres.
ACES Standards Collaborators	Yes	We support a clear and defined “bright line” criteria that has been industry vetted and FERC approved as the starting point for the risk assessment in R1.
Cooper Compliance Corp	Yes	We support the applicability proposed by CIP-014-1.
Western Area Power Administration	Yes	Western agrees with what we understand as the applicability, based on the CIP-014 Workshops. However, we have some concern with the undefined term ‘collector bus facility’. Without a definition for collector bus facility we are concerned that some parties may consider the entire switchyard at a generating station as a collector bus facility. Based on the discussion during the CIP-014 Workshops we do not believe the drafting team intended this to be the case. Therefore, some additional clarification may be needed for the term.
Vermont Transco LLC	Yes	While we do agree with the need for the standard and the importance of it we do have comments on the proposed standard. The intention of this standard is to protect those facilities that are most critical to the bulk electric system. The CIP-002-5.1 criteria brings into play many facilities that while deemed critical to an entity are not likely critical to this standards definition and would not cause wide area impact.
Consumers Energy Company	Yes	With Michigan situated as a peninsula, Michigan infrastructure may be at a lesser risk, based on the limited number of interconnect avenues into and out of our system. Meaning the highest level of criticality likely would be identified as

Organization	Yes or No	Question 1 Comment
		those key interconnect points, and not the entirety of our system. From our experience with the blackout of August 2003, BES implications were centered in southeast Michigan and although affected, we were able to successfully minimize/sustain our base load generation requirements. Any substation targeted in Michigan may not have a cascading effect on the BES.

Encari		Historically, FERC and NERC have taken the position that redundancy is not an acceptable criterion to exempt a Critical Cyber Asset from mandated physical or

Organization	Yes or No	Question 1 Comment
		cyber controls. Redundancy is not supposed to be a factor in the determination of the criticality; instead redundancy is used to improve reliability and availability. This principle should be extended to the protective measures applicable to control centers under CIP-014-1. So long as both the primary control center and backup control centers meet the bright line criteria for a medium impact rating under CIP-002-5.1, the protections under CIP-014-1 should apply equally to both the primary and backup control centers.
APPA		SMUD supports the APPA comments and is specifically concerned that records and information developed and maintained under each of the requirements for this standard are afforded the necessary protection through an introduced section, #7 Critical Facilities Information. We respectfully ask the Standard Drafting Team to ensure that AUTHORIZED ACCESS to information pertains to ANY RECORD AND INFORMATION associated with the Physical Security Standard.

2. **Requirements R1 through R3: The first three requirements of CIP-014-1 require Transmission Owners to: (1) perform risk assessments to identify through transmission planning analysis those Transmission stations and Transmission substations that meet the "medium impact" criteria from CIP-002-5.1, and their associated primary control centers, that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection; (2) arrange for a third party verification (as directed in the order) of the identifications; and (3) notify certain Transmission Operators of identified primary control centers that operationally control the identified and verified Transmission stations and Transmission substations. The requirements provide the periodicity for satisfying these obligations. Only an entity that owns or operates one or more of the identified facilities has further obligations in Requirements R4 through R6. If an entity identifies a null set after applying Requirements R1 through R2, the rest of the standard does not apply. Do you agree with this approach? If not, please articulate how an alternative approach addresses the directives specified in the order on physical security**.

Summary Consideration: The SDT thanks all commenters. All comments have been reviewed and changes that the SDT considers appropriate were incorporated into a subsequent revision. Requirement R2, Part 2.2 was reworded to align with the intended applicable entity. Language was added to Requirement R2, Part 2.4 to specify that the TO must develop procedures to protect or exempt sensitive or confidential information developed pursuant to the standard from public disclosure. A change was made to Requirement R3 to accurately state which primary control centers are included in the requirement. Corresponding changes were made to each measure. Several additions and clarifications were made to the Guidelines and Technical Basis section based on stakeholder comments. A summary of comments and the SDT's response is provided:

- **Requirement R1. Commenters suggested removal or changes to the term 'Risk Assessment' in R1.** The SDT maintained language consistent with the FERC Order.
- **Requirement R1. Commenters recommended additions to the Guidelines and Technical Basis section to clarify the term 'primary control center'.** The SDT has added language to the Guidelines and Technical Basis section to clarify a primary control center.
- **Requirement R1. Commenters asked for clarification on the type of analysis required for a risk assessment, recommended specific TPL approaches, proposed N-1 analysis for long lead time replacement equipment, and recommended use of IROL criteria.** The SDT has written the requirements to allow flexibility for the TO to include risks that it believes are realistic. The resulting physical security plan is to be designed to protect the assets, including any long lead-time assets. Specifically, in Requirement 5, Part 5.1, the standard identifies resiliency as an appropriate consideration when drafting a physical security plan. A TO may use IROL criteria but the SDT intends for the standard to provide flexibility.
- **Requirement R1. Commenters suggested alternate periodicity.** The SDT believes the specified periodicity is reasonable and will identify assets in a timely manner. The SDT notes that the periodicity is aggressive but achievable. The SDT considered a balance

of risk to the BPS and burden to the responsible entity when developing the periodicity. If the TO does not identify Transmission station or Transmission substation in its risk assessment, then the periodicity changes to 60 months.

- **Requirement R1. A commenter suggested removing the requirement to include facilities that are planned to be in service within 24 months and replacing it with a requirement to update the risk assessment prior to addition of a new Transmission station or Transmission substation.** The SDT chose the language of R1 so that entities would have a fixed starting point for risk assessment of existing stations as well as those planned to be operational within 24 months from the assessment date. The TO may perform additional assessments prior to adding facilities as the standard does not preclude additional assessments. Verification of additional risk assessments conducted more frequently than the periodicity prescribed in the standard is not required.
- **Requirement R2. Commenters recommended removing third party verification, changes to entities in Requirement R2, Part 2.1, additions of PC, TP, and RC to the applicability, limiting verification to the Regional Entities based on confidentiality concerns, or not permitting the same organization that conducted the risk assessment in Requirement R1 to be a verifier.** The third party verifier and reviewer are specified in the FERC Order. The SDT believes its approach with verifiers and reviewers is consistent with the FERC Order. The SDT believes the most reliability benefit will come from providing flexibility to TOs rather than adding prescription, even for purposes of making compliance easier. The SDT discussed many options with respect to the risk assessment and the confidentiality of information. The team reached consensus with the proposed requirements that provide flexibility in who performs the risk assessment and verifications while protecting the confidentiality of information.
- **Requirement R2. Commenters indicated that the term 'unaffiliated' was not sufficiently clear. Federal government-owned entities stated the SDT's definition of unaffiliated could exclude other agencies.** The Guidelines and Technical Basis section explains the SDT's use of the term unaffiliated. It was amended to more clearly indicate that a government-owned utility could use another government entity to satisfy the verification required by R2. The following was added: "The prohibition on registered entities using a corporate affiliate to conduct the verification, however, does not prohibit a governmental entity (e.g., a city, a municipality, a U.S. federal power marketing agency, or any other political subdivision of U.S. or Canadian federal, state or provincial governments) from selecting as the verifying entity another governmental entity within the same political subdivision. For instance, a U.S. federal power marketing agency may select as its verifier another U.S. federal agency to conduct its verification so long as the selected entity has transmission planning or analysis experience. Similarly, a Transmission Owner owned by a Canadian province can use a separate agency of that province to perform the verification. The verifying entity, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit."
- **Requirement R2. Commenters indicated additional guidance on protecting sensitive or confidential information was needed.** The Guidelines and Technical Basis section has been revised to address the concern. Please see response to this concern in Question 1 above.

- **Requirement R2. A commenter asked the SDT to clarify whether third party verification was required for a minor revision to the Requirement R1 risk assessment.** As stated in the requirements, the risk assessment shall be performed at least once every 30 calendar months (or 60 calendar months if no assets were identified in the previous risk assessment) and verified within 90 calendar days of completion. Entities are not precluded from performing additional actions outside the context of the standard requirements.
- **Requirement R2. Commenter proposed alternate language to Requirement R2, Part 2.2 to be consistent with applicability of the standard.** The SDT agreed and made this clarifying change.
- **Requirement R2. Commenters suggested changes to requirements for documenting recommendations from the third party verifier.** The SDT believes it is appropriate to document the TO's response on all recommendations from the verifier, even if the verifier is recommending the removal of an asset from the list developed in Requirement R1.
- **Requirement R2. Some commenters indicated the timeline was too short.** The SDT believes the timeline is aggressive but achievable and further supports stakeholder consensus.
- **Requirement R3. A commenter proposed adding clarification to the Guidelines and Technical Basis section on what operational control means.** The SDT has added a description to the Guidelines and Technical Basis section.
- **Requirement R3. A commenter stated that 7 days was an unnecessarily short timeline.** The SDT believes that the notification is important for reliability since the necessary subsequent actions for developing a security plan may not be triggered until the notification has occurred.

Organization	Yes or No	Question 2 Comment
ACES Standards Collaborators	No	(1) Conceptually, we agree with this approach but have identified the following issues and concerns. (2) R1 requires additional clarification. The Guidelines and Technical Basis section states that the "bright line" criteria in applicability section is used to identify an initial set of stations and substations that must be further evaluated in R1. It is our understanding that if a TO owns one 500 kV transmission station and no other transmission facilities, then that 500 kV station would meet the applicability section 4.1.1.1 criteria. The TO would be required to perform a risk assessment to identify if that facility was rendered inoperable, it could result in widespread instability, uncontrolled separation, or Cascading in an Interconnection. In other words, if the applicability section is met, the TO must perform a risk assessment, but the remainder of the standard (R4-R6) would not apply unless loss of the Facility would result in widespread instability, uncontrolled separation or Cascading. Please confirm if our understanding of applying the requirements is the correct approach. (3) We see a significant compliance risk created by Requirement R2 and question why the unafilliated third party verification cannot be integrated into the Regional Entity compliance monitoring and enforcement processes to minimize costs and limit access to highly sensitive information. The third party verification creates a compliance problem outside of the TO's control because the TO is dependent on a third-party for regulatory compliance and there is no obligation on any of the third parties (i.e. RC, PC) identified in the standard to verify the risk assessment. Thus, the TO will have to rely on consultants to perform the verification. Since all TOs will be working towards the same efffective date, there will be a backlog and the reviews may not be completed by the timelines established in the standard. Review by consultants also will increase the number of people with access to highly sensitive information. While this concern can be partially mitigated through confidentiality agreements, the more people that have the information, the higher the probability the information will be released, whether intentional or unintentional, to persons that should not have the information. All of these issues could be resolved if NERC and Regional Entities conducted the review. The review could be performed as part of a spot check of the standard 90 days after the initial effective date. If NERC or the Regional Entity disagree with the approach or

Organization	Yes or No	Question 2 Comment
		believe additional facilities should be added, RAI would give them the flexibility to treat the issue as not impactful to compliance as long as the TO resolved the issue within a certain time period. This approach would result in a reduced cost impact on industry and minimize the distribution of highly confidential information reducing the likelihood of information leaks. As an alternative, we suggest that a companion requirement that compels either the RC or PC to perform the verification. This would also reduce the costs impacts and distribution of sensitive information since these entities will already be familiar with the TOs they are verifying and will already have access to highly sensitive information. (4) Regarding R3, this requirement does not warrant a 7-day timeline. This is not a near real-time issue. We suggest 30 days as a reasonable notification period.
Ameren	No	(1) Regarding R3 and R3.1, we believe that the 7 day requirement is too short and 30 days would be more appropriate to notify other utilities. (2) R4 should have wording added to the requirement that the R4 evaluation is to be completed 120 days after the completion of R2. Then, the R5 wording should be changed so that the R5 physical security plans should be completed 120 days after the R4 evaluation is completed.
Utility Services	No	1. What is a Transmission "station"? What is the definition of station and what is it intended to cover that substation does not. Generally in the NERC glossary "station" is associated with Generation, not Transmission. 2. There is a concern between R1 and R5. a. R1 states that substations planned to be in service within 24 months should be identified, which would presumably be for stations under construction. b. R5 will then require a Physical Security plan to be in place within 120 days of identification, regardless of the current status of the station. c. Possibly adjust language to allow sites under construction to have the later of 120 days or the operation date of the station. 3. R1.2 should be reworded: "The TO shall identify the primary Control Center with operational authority of each Facility identified in the R1 risk assessment."4. R2, if the assessments are concurrent, could this be a joint effort, with the result being 1 report? 5. R2.1, "unaffiliated" needs some clarification. Is this unaffiliated with the TO in any way? Could the TO use their Planning Coordinator,

Organization	Yes or No	Question 2 Comment
		Transmission Planner or RC for the assessment, or do they need to seek out an entity from another region?
David Kiguel	No	1. For clarity suggest that the word “verify” be changed to “confirm” in sub-requirement 2.2 so that it reads: “The unaffiliated verifying entity shall either confirm the Transmission Owner’s risk assessment performed under Requirement R1 or recommend the addition or deletion of a Transmission station(s) or Transmission substation(s).2. Sub-requirement 3.1 should cover both, addition and removal of elements from the identified facilities list. Suggest changing to:”In the case of addition(s) to, or removal(s) from the identified Transmission stations or Transmission substations list developed under Requirement R1 and verified/modified according to Requirement R2, the Transmission Owner shall, within seven calendar days following the verification or the subsequent risk assessment, notify the Transmission Operator that has operational control of the primary control center of the change(s).”
Texas RE	No	1. For R1, the Transmission Owner is not the appropriate entity to conduct the type of transmission analysis that the requirement describes. It seems like a more logical process would be for the Transmission Planner to conduct an analysis of all substations meeting the applicability in 4.1.1.1 thru 4.1.1.4, and then, if the removal of a substation results in Cascading, instability, or uncontrolled separation, the TP will then notify the TO & TOP to conduct the security threat evaluation per R4 at only those substations identified by the TP.2. R1 - A “risk assessment” pertains to the physical security of Transmission Facilities while a “risk-based assessment” pertains to identification of Critical Assets and Critical Cyber Assets. The two phrases are too similar in meaning to each other, but possess differing meanings and intents.3. For R2, if the approach described in #1 is accepted, it may also satisfy R2 in those cases where the TP is independent from the TO. The independent verification would also be the responsibility of the TP, utilizing another TP, the PC, the RC, or an unaffiliated entity as described in the current language.4. For R3, if the approach described in #1 is accepted, the initial notification to the TOP would originate from the TP.

Organization	Yes or No	Question 2 Comment
South Carolina Electric and Gas	No	A) The FERC order directs that the risk assessment used by an owner or operator to identify critical facilities should be verified by an entity other than the owner or operator. It does not require verification of the specific or particular facilities identified. Therefore, SCE&G believes this section should be clarified and specifically state that the assessment itself (i.e. the methodology used by the owner or operator) be verified and not the facilities.B) SCE&G would like the drafting team to comment on the liabilities a NERC registered entity may assume as the third party when they are used to verify the risk assessment. Specifically, if in a future audit the owner or operator's assessment is found noncompliant, then would the independent NERC registered third party entity suffer any noncompliance as well? It is important for NERC registered entities to understand their compliance risks as third parties before they agree to perform independent verification of other entities assessments.
Florida Keys Electric Cooperative	No	o Comments: R1.1 - FKEC recommends that the 30 months timeframe be revised to 36 months as an annual focus is more straight forward than a 2.5 year focus and it's easier to track for internal programs and controls. 60 months should also be increased to 72 months to maintain the double timeframe that currently exists in the draft requirement. o R2 - The March 7 FERC order does not require an owner or operator to select an entity to verify its critical facilities assessment. The order uses the word "should," not "shall" or "require." The rationale for R2 is not accurate in this sense and should be revised to match the language in the order. Additional clarity is needed regarding what "verify" means in the standard. Guidance and rationale is helpful, but does not carry to legal weight of the standard language. o R2.1 - This section should explicitly include NERC and the Regional Entity (RE) as a potential verifying entity. NERC and the RE should be obligated to perform this role if the owner or operator requests them to do so under this standard. There should not be a direct or indirect requirement to mandate the registered entity to hire a third party to verify the assessment portion of the standard. If a registered entity wants to hire a third party, that should be a decision the registered entity makes, but is not required for standard compliance. If a third party, other than NERC or the RE, verification of the assessment

Organization	Yes or No	Question 2 Comment
		is required by the standard, then this is effectively two audits on the same requirement. Additionally, it does not seem appropriate (or potentially even legal) for a third party (other than NERC or RE) to be able to add or remove facilities from a critical facilities list as the standard is currently drafted. o Are there enough non-NERC/RE third parties available for what is likely to be a high demand for services, especially if there's a short time period as currently drafted? This is similar to the shortage of vendors that industry faced in theNERC facility ratings alert responses. o How is "transmission planning or analysis experience" judged by NERC compliance and enforcement? This language could be very difficult to comply with depending on the purview of the auditor.o If a registered entity hires a third party to develop and complete an assessement as required in the standard, can that third party also verify the registered entity's assessment? As drafted, the current standard could be read to require two third party entities to be hired - this would be unreasonable and the standard should be revised to clarify that only one third party would be needed to comply with the standard. o R2.2 - This requirement appears to require the third party entity to comply with language in the requirement. This does not seem to be appropriate or legal. The drafting team should revise the language to redirect the compliance burden to the NERC registered entity. In addition, the 90 day requirement could be difficult to comply with if there is a shortage of third party entities to contract with. Consideration should be given to revising this requirement to prevent a registered entity being found in violation of a requirement due to circumstances not under its control. o R2.4 - The words "exchanged with" should be changed to "made available to" in order to clarify that information may not be exchanged, but rather presented for viewing only, to a third party entity o R3.1 - The 7 day requirement appears to be unnecessarily short and not immediately necessary for BES reliability. FKEC believes 30 days is more appropriate timeframe for this requirement.
Black Hills Corporation Entities	No	Although BHC agrees with the overall approach, it has significant concerns regarding the use of the term "risk assessment" without a clear definition of intent. CIP-002 regulatory expectations in the Western interconnect for RBAM have consistently referred to the classic risk definition as "risk" times "probability". However, the further

Organization	Yes or No	Question 2 Comment
		expectation is that the probability of an event is assumed to be 100%, such that the "risk" them becomes equal to the "impact". CIP-014 does not currently lay out the same expectations, which could allow Transmission Owners and other affected (or unaffiliated) parties to disagree over the role of "proabability" in defining risk.This problem can be resolved in the CIP-014 draft by:1. leaving the risk assessment language as is, but adding the above statements about "probability" of occurrence being 100%, or2. changing all references of 'risk assessment' in the standard, to 'impact assessment', or3. leave the risk assessment language as is, but make it clear that CIP-014 is deviating from the historical CIP-002 RBAM definition of risk, such that the probability of the event can change the perceived risk (and that such an interpretation is congruent with the FERC order. This last option seems to be closest to the intent of Paragraph 8 in the FERC directive, but represents a significant departure from past NERC CIP guidance, and needs to be highlighted as such.As written, the TO has exclusive determination say in identifying applicable Transmission stations, substations and primary control centers. R2 speaks to a third party verification of that assessment, but Black Hills believes that coordination of the BES would be better served by having the TO & TOP reach a consensus on the assessment, prior to having the assessment validated by a third party.Requirement 2.1 directs the Transmission Owner to select an unaffiliated Planning Coordinator, Transmission Planner, or Reliability Coordinator to conduct the third-party assessment. Firstly, Planning Coordinator does not appear in the NERC functional registry and should not be casually equated with the TP and RC functions; without first equating the Planning Coordinator to the PA function per the NERC glossary. Secondly, none of these NERC functional entity designations appear in the applicability section of the standard. Therefore, it can be assumed that the unaffiliated PC, TP, or RC are not obligated to conduct the assessment themselves, but rather the assessment is conducted by mutual agreement of the TO and unaffiliated PC, TP, or RC acting as third-party assessor. If this is not the correct assumption, then the PC, TP, and RC functions should be noted in the applicability section. If the Transmission Owner is affiliated with the Transmission Planner and Planning Coordinator, then the third-party review should be performed by the entity's Reliability Coordinator.The reference to "primary control center" is adequately

Organization	Yes or No	Question 2 Comment
		explained in the rationale section of R1, but confusion between it and “back-up control centers”, “emergency dispatch center”, and those control centers that can only monitor status seem to justify an up-front definition in the standard. Recommend that a special definitions section be added, or the term be clearly defined at its first instance in Section 3.R2.4 could benefit from some added guidance regarding the protection of sensitive or confidential information. Is the intent to employ the entity’s baseline confidentiality banner, or something more robust such as that required by CIP-003-3 R4 or CIP-011-1. The latter seems more appropriate for this CIP standard.
NCPA Compliance Management Operating Committee	No	Applicability is a key issue here. Comments to question 1 apply here as well. Why subject all Transmission Owners who may meet the "medium impact under CIP-002-5.1 to a third pary review for all medium impact stations and substations when only 30 stations will be affected (please define the difference between a Transmission station and Transmission substation. A third party review is appropriate for the 30 or so stations involved, but seems excessive for all owners to obtain third party review when the expectation is that 30 out of 55,000 are te ones of real concern. NCPA elected to have an independent third party risk asssessment and vulnerability assessment performed at its 5 generation facilities and control center. The assessment cost is approximately $150K and takes about 9 months to complete. NCPA'a assets are also low impact. The risk assessment, vulnerability and threat assessments and development of the security plans are able to performed by the same third party reviewer that flows together without interruption. The way in which the requirements are structured creates alot of consultants or third party reviewers running around, with 99% of them stopping work after R3. How much money will be spend for that and for what purpose? There has to be a better way segregate the 99% from the 1% where the real concern is.
Flathead Electric Cooperative, Inc.	No	Do not support the third party requirements, seems like a full employment effort by security consultants and others. Administratively burdensome and time-consuming at the expense of actual security improvements.

Organization	Yes or No	Question 2 Comment
Florida Municipal Power Agency	No	FMPA commends the efforts of the SDT to lay out an excellent process for risk assessment in accordance with the FERC Order in such a short time frame. We only have few comments. WHAT DOES “CONTROL CENTER” MEANIs there a signifance for not using the capitalized term of Control Center throughout the standard? It seems to FMPA that the defined term “Control Center” ought to be used. If the intent is that “control center” and “Control Center” mean two different things, then, what does “control center” mean? If the intent is to include large TOs that may be part of a large TOP, such as a large utility in an RTO, that do not have Control Centers; then, FMPA recommends using a different term such as “the location of the SCADA system that has remote control of breakers associated with the identified substation/station” or similar might avoid confusion.WHAT DOES “UNAFFILIATED” MEANThe term “unaffiliated” may be a source of ambiguity and conflict without further definition. For instance, dictionary.com defines affiliated as: “being in close formal or informal association; related” So, this would imply that peer members of the Transmission Forum are affiliated, which we do not believe is the intent of the SDT. FMAP believes the SDT’s intent is as Black’s Law Dictionary defines affiliate: “1. A corporation that is related to another corporation by shareholdings or other means of control; a subsidiary, parent, or sibling corporation. 2. One who controls, is controlled by, or is under common control with an issuer of a security.”; which would mean that peers within the Transmission Forum are unaffiliated, but subsidiaries of a company are affiliated, or members of a Joint Action Agency are affiliated. It also aligns with FERC’s definitions for Affiliate in their market based rates regulations 18 C.F.R. 35.36(a)(9) and in the Pro Forma OATT. FMPA suggests using a footnote to clarify use of the term unaffiliated, such as “Use of the term unaffiliated is in relation to Black’s Law Disctionary defition for affiliated: ‘1. A corporation that is related to another corporation by shareholdings or other means of control; a subsidiary, parent, or sibling corporation. 2. One who controls, is controlled by, or is under common control with an issuer of a security.’”PROPER QUALIFICATIONS FOR RISK ASSESSMENT VERIFICATIONFMPA appreciates the challenges of defining qualification for independent verifiers while offering registered entities a broad choice for selection. We interpret that

Organization	Yes or No	Question 2 Comment
		requirements R2 and R6 grant the applicable entity sole authority to choose the 3rd party verifier as long as they meet the qualifications contained within those requirements. Is FMPA correct in that interpretation?CHANGE MANAGEMENT OF THE RISK ASSESSMENTThe standard is somewhat ambiguous on what happens if the responsible entity chooses to revise it's risk assessment of R1 sooner than the required 30 or 60 calendar months. Does every minor revision to the risk assessment require another 3rd party review? Or would only major system changes (e.g., due to adding a major new investment in the power system like a new 500 kV line) require review? Or regardless of system changes, would the review occur once every 30/60 months? FMPA suggests clarification to R2 to say that minor revisions to the risk assessment due to minor power system changes in between the 30/60 month periods do not need a separate 3rd party verification.
Georgia System Operations Corporation	No	GSOC supports the comments submitted by both Georgia Transmission Corporation (GTC) and NRECA
Georgia Transmission Corporation	No	-GTC supports the comments submitted by the NRECA with regard to the applicability, requirements, and implementation of the draft standard.-GTC is concerned that the language of the standard and rationale around the use of the term "unaffiliated" in R
Hydro QuÃ©bec TransÃ‰nergie	No	Hydro-Quebec TransEnergie (HQT) agrees with this approach but requests that the SDT remove the term "unaffiliated" from Requirements R2 and R6.1HQT notes that the term "unaffiliated" is not used in FERC Order 146. Paragraph 11 of the Order states "In addition, the risk assessment used by an owner or operator to identify critical facilities should be verified by an entity other than the owner or operator." Moreover, it appears that it is not FERC's intent to introduce this restriction regarding the choice of a third party. HQT therefore believes that the use of the term "unaffiliated" goes above and beyond what was stipulated in the FERC Order.Furthermore, the term "unaffiliated" is not required because the NERC Reliability Functional model already ensures the independence between the TO/TOP and the verifying entities (RC, PC and TP) that the SDT is seeking in the draft standard. The Reliability Model uses the term

Organization	Yes or No	Question 2 Comment
		"functional entity" to apply to a class of entities without making reference to specific organizations that register as functional entities.For some Canadian jurisdictions, the use of the term "unaffiliated" renders the standard more stringent due to the fact that certain Canadian entities such as Hydro-QuÃ©bec TransÃ‰nergie are simultaneously registered as TO, TOP, PC and RC. For integrated modeled entities, the restriction of available options that would otherwise be available (such as selecting a PC, TP or RC for the risk assessment verification under R2), makes it difficult to identify an entity with the required expertise capable of performing the reviews stipulated in the standard. HQT believes that the risk assessment of a TO should only be verified by the RC or the PC that has supervision (real-time or planning) over the said TO's assets because only the RC or the PC can ensure a comprehensive approach to critical facility identification that considers the reliability of an entire area.For these reasons, HQT believes that the expression "third party" alone is sufficient and consistent with the expressed concerns in the FERC Order.
Rayburn Country Electric Cooperative	No	I agree with the risk assessment in concept, the standard has far too many requirements and sub requirements to accomplish the task. Since initial analysis apparently this has already been done for the "High Risk" stations, a more efficient approach would be for the RC to perform the analysis based on the criteria mentioned to validate findings and find any second contingency facilities that may not have been identified. Since the RC is the "Reliability Coordinator", this is your third party identifying facilities without bias... Determinations will be based on an engineering basis utilizing standard uniform criteria across North America.The same analysis occurs for all entities within all regions, no variations this would yield consistency! Then the RC notify the entities that they have facilities that have been identified. (much like other NERC standards)Thus the information on which facilities have been identified would disseminated and controlled in a much more secure and better controlled environment while still maintaining the quality and consistency of the study needed.

Organization	Yes or No	Question 2 Comment
New Brunswick Power Corporation	No	In general, a TO may not have the capability to conduct a risk assessment to determine if an identified facility that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. Such an assessment requires a wide area view of the Interconnection. It is proposed that the risk assessment be conducted by a PC, or RC for the area in which the facility is located. Doing so would satisfy the third party verification requirement as the TO would not be conducting the analysis. It is the opinion of NB Power that the technical details concerning the transmission analysis, in the proposed standard, are overly vague. This could lead to an inconsistent application of the analysis between entities as well as create obstacles with consensus concerning the proposed 3rd party verification. NB Power suggests a clear analysis methodology be drafted to establish a common basis for study criteria with the ability for each entity to apply additional specific requirements for their respective area.For corporate bodies, such as a vertically integrated utilities, that are registered as the RC, TOP, PC, TP and TO for a particular area, it is the opinion of NB Power that the requirement for unaffiliated 3rd party verification is overly stringent and of little value. The verifying party is limited to entities that have transmission planning or analyses experience, or, are registered as a PC, TP, or, RC from an adjacent area. NB Power is of the view that there are no unaffiliated entities with sufficient knowledge of the local transmission system to provide a meaningful verification within a 90 day period.As a government owned utility, NB Power is required to follow procurement processes which will make it difficult to meet the 90 day period for the third party verification. NB Power is also concerned that it could be non-compliant with the requirement if the third party fails to meet its obligation. While NB Power can mitigate the financial risk of that event it would still result in a recorded non-compliance.It is the opinion of NB Power that the proposed standard does not sufficiently address a disagreement resolution process between the TO and the unaffiliated verifying 3rd party in requirement R2.3. NB Power believes that documenting the technical basis for not following the recommendations of the unaffiliated verifying 3rd party without guidance on what constitutes valid technical reasons presents a compliance and enforcement gap where both the entity

Organization	Yes or No	Question 2 Comment
		and an auditor may not be able to come to consensus. NB Power suggests the SDT develop guidance concerning compliance and enforcement of this requirement indicating acceptable technical reasoning for not following the 3rd parties recommendations.
Kansas City Power & Light	No	In R1, we have concerns about the ambiguity associated with the term "assessments". Can you provide examples of the types of assessments that would be acceptable to meet R1 and that would be CIP audit worthy in the future. We have the same concern in R2 with the term "third-party". Will there be a list of pre-approved third party contractors or will the RE's review and approve a third-party at the request of the registered entity prior to their use in the verification process as described in R2?
Central Hudson Gas & Electric Corporation	No	In regards to R2.2 as currently drafted, the unaffiliated verifying entity should have to ensure verification within 90 days and not the TO, since it is that entity performing the verification.In regards to R2.3 as currently drafted, there appears to be a lack of an appeals process in cases of disagreement between the unaffiliated verifying entity and the TO concerning the recommendations formulated by the unaffiliated verifying entity.
ITC	No	ITC believes that limiting physical security requirements in CIP-014-1 to those substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection does not adequately raise the bar for critical infrastructure protection of valuable and strategic substation assets. Indeed, those substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection certainly warrant additional physical protection. However, so does any other substation asset deemed critical through the cybersecurity initiatives already in place through applicable companion Reliability Standards. If a substation is deemed critical through the CIP-002-5 screening process, it at a minimum, should warrant an “evaluation of potential threats and vulnerabilities of a physical attack to the facilities (CIP-014-1 R4). ITC supports using the brightline test criteria of CIP-002-5, as noted in

Organization	Yes or No	Question 2 Comment
		our comments for Question 1, above, but also feels that all substation assets passing the brightline test criteria should move directly to R4 for an assessment of threats and vulnerabilities, eliminating the need for R1 and R2. This has the benefit of using industry-vetted, bright-line criteria that creates valuable consistency between physical and cybersecurity assessment practices. This does not undermine the Commission's three-part requirement for addressing physical security, but rather allows the responsible entity to meet the Commission's first requirement (identification of critical assets) by using the same critical asset identification criteria for physical and cybersecurity. ITC believes if a facility is critical enough to warrant cybersecurity protection, then it should also warrant physical security and that the requirements should not be so narrowly defined to ignore the importance of substations beyond those few whose individual loss causes cascading outages. This simplified approach avoids potential contradictory and duplicative requirements between existing CIP standards, and would allow this standard to focus exclusively on physical security aspects and not on asset identification
Los Angeles Department of Water and Power (LADWP)	No	LADWP requests the Drafting Team to make the following changes:- For R1, additional time is needed to make sure studies are fully completed and reviewed by TO and its applicable governing authorities. Add ", which is due 30 calendar days after the effective date of the standard" to R1 as follows:"R1. Each Transmission Owner shall perform an initial risk assessment, which is due 30 calendar days after the effective date of the standard and subsequent risk assessments of its Transmission stations and Transmission substations (existing and....."- For R1, change "24 months" to " 30 months" to align the assessment with subsequent risk assessments.- For R2.1, The term "unaffiliated" needs to be defined in the standard to avoid any misinterpretation. - For R2.2, change the "90 calendar days" to "120 calendar days" to allow sufficient time to resolve differences if Planning Coordinator, Transmission Planner or Reliability Coordinator are addressing other deadlines.
Dominion	No	Measure M1 - R1.2 -- Measure M1 does not address sub-requirement R1.2 which requires the Transmission Owner to identify the primary control center that

Organization	Yes or No	Question 2 Comment
		operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment. Dominion recommends the SDT determine whether M1 should include the control center.R2.3 - Relative to R2.3, Dominion does not agree that the TO should have to document the technical basis for retaining assets that have been suggested for removal by the third party.R3 - Dominion suggests R3 be revised to strike the words 'and verified according to Requirement R2', and changing R2 to R1.2 in the next two instances where R2 is mentioned. This is due to the reason there is nothing included in R2 that requires verifing primary control centers.
MISO	No	MISO recognizes that the Commission mandated third-party verification of the risk assessment required under R1, however the current language of R2 requires modification to address several concerns MISO has with regard to its potential role as a verifying entity. While MISO has every confidence that it can perform risk assessment verifications in a safe, responsible, and accurate manner, the combination of a high number of requests requiring verification within a relatively short period of time presents some concerns to MISO regarding its resource allocation and availability. In particular, MISO recommends that the SDT add language limiting the universe of Transmission Owners/Operators that can seek verification from a particular verifying entity (potentially by geographical region or contractual or functional relationship) as well as modify the 90 day requirement to take into account that a single entity may have more requests than it can feasibly complete in such a short time period. An example of language that MISO could support is language that would allow a verifying entity and the requesting Transmission Owners/Operators to agree upon an appropriate completion date beyond the 90 days where the 90 day period will not allow completion of a robust verification due to resource constraints by the berifying entity. Finally, MISO respectfully requests that the SDT consider adding language to Requirement R2 that would allow verifying entities to limit liability related to both enforcement actions within the jurisdiction of FERC, NERC, and the Regional Entities and other actions that could be brought against verifying entities in other jurisdictions and venues unless it is shown that the entity lacked good faith or was grossly negligent.

Organization	Yes or No	Question 2 Comment
Omaha Public Power District	No	OPPD, in general, is in agreement with the approach taken in CIP-014-1 for identifying critical Transmssion stations and substations. We agree that risk assessment be conducted using transmission planning analysis, however, we suggest that this standard identifies what applicable planning analysis is used. We think the TPL standards provide the ability for the Transmission Owners to determine the worst case extreme event for identifying critical transmission stations and substations. OPPD believes that leaving R1 open and vague would encourage various interpretations of the term 'transmission planning analysis' as it applies to a 'risk assessment'. This may place the industry and the ERO in the same position as they were with the ealier versions of CIP-002 and the associated RBAM. Referencing the applicable TPL standards attemptes to remove some of this ambiguity by providing a more concise framework to evaluate those worst case extreme events. Furthermore, since TPL standards associated transmission planning analyses are performed in coordination with the PCs, risk assessment verification by PCs/RCs will not require a re-assessment of a study that has already been performed. We suggest that the SDT consider specifically defining 'transmission planning analysis' to avoid repeat of the uncertainty and vagueness associated with the CIP-002 RBAM. OPPD asks the SDT to consider revising requirement R1 as following: R1. Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria specified in Applicability Section 4.1.1. The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify any Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. The transmission planning analysis shall be based on the applicable portion(s) of the TPL standards and specifically referenced. [VRF: High; Time-Horizon: Long-term Planning]1.1. Subsequent risk assessments shall be performed: o At least once every 30 calendar months for a Transmission Owner that has identified in its previous risk assessment (as verified according to Requirement R2) one or more Transmission stations or Transmission substations that if rendered

Organization	Yes or No	Question 2 Comment
		inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection; or o At least once every 60 calendar months for a Transmission Owner that has not identified in its previous risk assessment (as verified according to Requirement R2) any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. 1.2. The Transmission Owner shall identify the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment.
Ciy of Garland	No	R1 - The auditors should be limited to verifying that a study was completed using the assumptions agreed to by both the TO and the reviewer. The auditor should accept any study and assumptions jointly agreed to by the TO and the reviewer without requiring additional engineering justifications as to why one type of study was used instead of the auditor's preferred methodology. To summarize and echo FERC Commissioner Norris in his clarifying statement, included with the FERC Order that is the basis of the CIP-014 Standard, that if the Planning Studies indicate a transmission solution that would cause the substation to no longer cause the cascading outage that the transmission project could be initiated in lieu of the security plan. The additional transmission solution would potentially add other operational benefits other than just "security" and therefore may be more practical than the security plan in R4 through R6. In the guidance document, statements should be made that a TO may make additional planning studies at any time prior to the 30 months and if the third party reviewer concurs the updated study no longer shows a cascading event, whether due to changing grid conditions or system improvements, the standard would no longer apply including the continued implementation of the security plan. The TO should also notify the owner of the primary control center the substation no longer causes a cascading event.R2 - Timelines to complete third party verification under R2.2 and third party review under R6.2 are both too short. Increase 90 days to 120 days or 180 days. a. Verifying entities may recommend that the Transmission Owner conduct additional planning studies to confirm asset identifications such as interactions between BES

Organization	Yes or No	Question 2 Comment
		Elements in adjacent Transmission Owner footprints. A 90-day time limit may not provide sufficient time to conduct and verify a revised or supplemental BES assessment.b. For security reviews, conducting an accurate and meaningful review with sound recommendations applicable to a specific TPs facts and circumstances may require additional time for assessment and discussions with the TO. A short review window is more likely to lead to misunderstandings, or disagreements with the TO which in turn could lead to discrepancies or improper application of the assessment requiring justification. This could cause the reviewer to avoid making recommendations that should be considered by the TO and improve the TO's assessment.c. As currently written, it appears if the TO disagrees with the reviewer's comments and writes a technical reason why he believes the original conclusion were correct, the recommendation(s) by the reviewer may be rejected and the TO's decision is final. Although I agree with this position it may be interpreted differently by the auditors. Please clarify which was the intent of the SDT.R3 - No comments
Bonneville Power Administration	No	R1 Terminology: Although the term "risk assessment" in this section is in alignment with language in the FERC order, BPA recommends that it be revised to consequence or impact assessment. This is a physical security standard, and the term risk assessment should be reserved for the physical security risk section of this standard and align with security industry use of the term. BPA believes the basic intent of R1 is to identify substation facilities that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection can create unacceptable consequences to the BES and not to assess risk of the event happening.Also, BPA suggests that additional sub-requirements be added to provide clarity on what system conditions and performance criteria or methodology need to be considered in order to determine what stations and substations will be deemed critical. Similar language found in existing standards would be helpful. Examples: FAC-010-2.1 (System Operating Limits Methodology for the Planning Horizon), R1-R3; FAC-013-2 (Assessment of Transfer Capability in the Near-Term Planning Horizon), R1; TPL-001-4 (Transmission System Planning Performance Requirements), R1-R6; TPL-004-0a (System Performance Following Extreme BES Events), R1."R1 1.1. Subsequent risk

Organization	Yes or No	Question 2 Comment
		assessments shall be performed:" BPA recommends revising R1 1.1 to: “Each Transmission Owner shall review their BES Impact Assessments once every 60 months for any transmission stations or transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an interconnection after completion of the initial assessment.” Justification: This would consolidate the two bulleted actions and make them equally applicable. BPA has been doing substation facility impact and security risk assessments for the past 15 years and our experience is that the criticality of a substation facility does not change once ranked; once it is determined critical it will always be critical particularly when information is used in a physical security risk assessment. A 5 year interval would be a more appropriate interval for this type of assessment as it would always be case of identifying new facilities and not excluding ones previously identified."R2. Each Transmission Owner shall have an unaffiliated third party verify the risk assessment performed under Requirement R1. The verification may occur concurrent with or after the risk assessment performed under Requirement R1. [VRF: Medium; Time-Horizon: Long-term Planning]"BPA recommends revising R2 first sentence to: "R2 Each Transmission Owner shall verify the impact assessment performed under requirement R1 by a third party entity other than the owner or operator." Justification: This fully aligns with the requirements of the FERC order by using the requirements of the FERC order. BPA believes the introduction of a requirement of an unaffiliated reviewer is reaching beyond the requirements established by the FERC order, and this requirement will dilute the quality of an impact assessment. It will limit the types of entities that can perform an independent review, and directs use of resources that may not be capable of assessing all physical risks within an electrical facility. BPA proposes that the word unaffiliated be removed from this standard and replaced with language that describes the degree of separation from the facility owning entity to be considered a third party entity other than the owner or operator. Based on the definition provided in this draft “unaffiliated” is especially troublesome for federal government-owned transmission networks and facilities because it could be interpreted as excluding the entire federal government from eligibility as a third party entity to the federal government transmission owner.Also, BPA believes industry peer reviews should be

Organization	Yes or No	Question 2 Comment
		encouraged and considered as meeting the requirement. Reviews by industry peers are known to be beneficial to the entity receiving the review and for the entity performing the review or audit. Enabling industry peer reviews would not only meet the intent of an independent review but also accelerate continuous learning and translation of the most effective security approaches into widespread use. Please note that the FERC order only recommends this verification as it is stated as “should” and not as “shall.”"R.3 For a primary control center(s) identified by the Transmission Owner according to Requirement R1 and verified according to Requirement R2 that is not under the operational control of the Transmission Owner, the Transmission Owner shall, within seven calendar days following completion of Requirement R2, notify the Transmission Operator that has operational control of the primary control center of such identification and the date of completion of Requirement R2. [VRF: Lower; Time-Horizon: Long-term Planning]" BPA recommends revising the 7 day requirement in R3 and R3 3.1 to 30 calendar days. Justification: This information is not that time critical at this stage, and one week will not be enough time to complete all notifications.
National Rural Electric Cooperative Association (NRECA)	No	R1.1 - NRECA recommends that the 30 months timeframe be revised to 36 months as an annual focus is more straightforward than a 2.5 year focus and it’s easier to track for internal programs and controls. 60 months should also be increased to 72 months to maintain the double timeframe that currently exists in the draft requirement.R2 - The March 7 FERC order does not require an owner or operator to select an entity to verify its critical facilities assessment. The order uses the word “should,” not “shall” or “require.” The rationale for R2 is not accurate in this sense and should be revised to match the language in the order. Additional clarity is needed regarding what “verify” means in the standard. Guidance and rationale is helpful, but does not carry to legal weight of the standard language. R2.1 - This section should explicitly include NERC and the Regional Entity (RE) as a potential verifying entity. NERC and the RE should be obligated to perform this role if the owner or operator requests them to do so under this standard. There should not be a direct or indirect requirement to mandate the registered entity to hire a third party to verify the assessment portion of the standard. If a registered entity wants to hire a third party, that should be a decision the

Organization	Yes or No	Question 2 Comment
		registered entity makes, but is not required for standard compliance. If a third party, other than NERC or the RE, verification of the assessment is required by the standard, then this is effectively two audits on the same requirement. Additionally, it does not seem appropriate (or potentially even legal) for a third party (other than NERC or RE) to be able to add or remove facilities from a critical facilities list as the standard is currently drafted. Are there enough non-NERC/RE third parties available for what is likely to be a high demand for services, especially if there's a short time period as currently drafted? This is similar to the shortage of vendors that industry faced in the NERC facility ratings alert responses. How is "transmission planning or analysis experience" judged by NERC compliance and enforcement? This language could be very difficult to comply with depending on the purview of the auditor. If a registered entity hires a third party to develop and complete an assessement as required in the standard, can that third party also verify the registered entity's assessment? As drafted, the current standard could be read to require two third party entities to be hired - this would be unreasonable and the standard should be revised to clarify that only one third party would be needed to comply with the standard.R2.2 - This requirement appears to require the third party entity to comply with language in the requirement. This does not seem to be appropriate or legal. The drafting team should revise the language to redirect the compliance burden to the NERC registered entity. In addition, the 90 day requirement could be difficult to comply with if there is a shortage of third party entities to contract with. Consideration should be given to revising this requirement to prevent a registered entity being found in violation of a requirement due to circumstances not under its control. R2.4 - The words "exchanged with" should be changed to "made available to" in order to clarify that information may not be exchanged, but rather presented for viewing only, to a third party entityR3.1 - The 7 day requirement appears to be unnecessarily short and not immediately necessary for BES reliability. NRECA believes 30 days is more appropriate timeframe for this requirement.
PNM Resources	No	R2.1 could place an unreasonable burden on entities registered as PC and TP. R2.2 which puts the burden of ensuring that the unaffiliated third party review is completed

Organization	Yes or No	Question 2 Comment
		in 90 calendar days on the TO. As a TO an entity cannot compel another registered entity or third party to complete anything with a specified amount of time and according to the RSAW if the verification is not completed within 90 days then the TO is not in compliance with the requirement. The standard should require registered NERC entities to complete the unaffiliated review and those entities should be included as applicable functional entities and R2.2 should apply to the reviewing entity.
PNM Resources	No	R2.1 puts an unreasonable burden on registered PC and TP. R2.2 which puts the burden of ensuring that the unaffiliated third party review is completed in 90 calendar days on the TO. As a TO PNM can't force another registered entity or third party to complete anything with a specified amount of time and according to the RSAW if the verification is not completed within 90 days then the TO is not in compliance with the requirement. The standard should require registered NERC entities to complete the unaffiliated review and those entities should be included as applicable functional entities and R2.2 should apply to the reviewing entity.
Tri-State Generation and Transmission Association, Inc.	No	Rather than making it the Responsible Entity's responsibility to find a third party to verify its assessment, Tri-State believes it would better suit the industry and the standard if R2 required either the Reliability Coordinator or Regional Entity to request TO's assessments on an intervaled basis. This meets the requirements of the March 7 FERC Order. Allowing the requirement to be broad enough to allow third party paid consultants with "transmission planning or analysis experience" creates a conflict of interest and contradicts the draft standard's requirements for the use of "unaffiliated third part[ies]". If third party - other than NERC or the RE - verification of the assessment is required by the standard, then this is effectively two audits (and two 3rd party assessments) on the same requirement. Additionally, it does not seem appropriate (or potentially even legal) for a third party (other than NERC or RE) to be able to add or remove facilities from a critical facilities list as the standard is currently drafted.Tri-State recommends that rather than 30 months and 60 month risk assessment intervals for R1.1, they should be a more straightforward 36 months and 72

Organization	Yes or No	Question 2 Comment
		months respectfully in order to be consistent withnormal auditing time periods of three years. This will make the intervals easier to track with internal programs and controls.
Bureau of Reclamation	No	Reclamation agrees with this approach. However, to promote consistent identification of critical facilities within an interconnection, Reclamation believes that the third-party review should be conducted by the Transmission Owner (TO)'s Planning Coordinator or Transmission Planner. If the Transmission Owner is also the Transmission Planner and Planning Coordinator, the third-party review should be performed by the Reliability Coordinator. Reclamation also suggests that the drafting team modify the term "risk assessment" to "BES impact assessment." In the physical security community, the term "risk assessment" generally refers to "The process of assessing security-related risks from internal and external threats to an entity, its assets, or personnel." See ASIS International, General Security Risk Assesment Guideline (2002), http://www.scnus.org/local_includes/downloads/9200.pdf. In its filing to FERC, NERC can explain that it adopted the term "BES impact assessment" so it is clear that the initial evaluation is of risk to the BES if the substation is rendered inoperable or damaged. Reclamation also recommends revising R1.1 to require subsequent risk assessments every 60 months for all Transmission Owners. Reclamation believes that periodic risk assessments are necessary, but has not seen evidence that the costs associated with updating risk assessments every 30 months rather than every 60 months would provide commensurate reliability benefits. Reclamation recommends that the drafting team update R1.1 to state, "Each Transmission Owner shall review their BES Impact Assessments once every 60 months for any transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an interconnection after completion of the initial assessment."
SERC CIPC	No	Recommend that the Transmission Planner perform the risk assessment in R1 instead of the Transmission Owner. Need further clarification and examples for the term "unaffiliated". Would "peer" reviews studies that do not have a single registered entity with controlling interest suffice as an "unaffiliated" third party reviewer? What role

Organization	Yes or No	Question 2 Comment
		does the SDT envision the ERO (including regional entities) playing in the review process?
Foundation for Resilient Societies	No	Same answer as provided to Question 1.
Southern California Edison Company	No	SCE has concerns with both Requirement R1 and Requirement R3. In Requirement R1, SCE recommends that the verbiage be changed from “...that if rendered inoperable or damaged could result in widespread instability...” to “...that if damaged to the point of being rendered inoperable could result in widespread instability..." SCE requests this change to reduce ambiguity in the application of the word "damaged." In addition, language should be added to R1 that specifies: “...system instability such as uncontrolled separation or cascading within 15 minutes of compromise...,” as a 15-minute window would align with criteria in the CIP standards used to determine critical facilities. In the guidance section for R1, SCE would suggest changing the text from “...remedial action schemes (RAS) or special protection systems (SPS)” to “...special protection systems (SPS)...,” because as used in the NERC Glossary of Terms, a RAS is included as a type of SPS. In addition, SCE requests that R1 be revised to include specific examples and criteria for the risks to be measured. For instance, SCE believes the following could be among the examples and criteria specifically included: (a) Thermal overloads beyond facility emergency ratings; (b) Voltage deviation exceeding Â± 10%; (c) Cascading outage/Voltage collapse; and (d) Frequency below under-frequency load shed points.With respect to Requirement R3, SCE requests that additional guidance be provided on how a "primary control center" should be identified, as that term in used in both Requirements R1.2 and R3. SCE also asks the team to consider changing the notification requirement in R3 from seven(7) to thirty(30) days in order to allow sufficient time for the transmission owner and transmission operator to perform the required communication.

Organization	Yes or No	Question 2 Comment
Southern Indiana Gas & Electric Company d/b/a Vectren Energy Delivery of Indiana, Inc.	No	Specifically, Vectren recommends that R2 be removed from the draft standard, for the reasons set out in this Comment. And that an approach similar to that used for evaluation of designations under CIP 002 Version 3 be adopted for review of the required risk assessment. Vectren urges FERC and NERC to designate registered Planning Coordinators, Transmission Planners, or Reliability Coordinators as the approved verifiers for entity risk assessments AND to establish clear criteria for verifiers, so that NERC auditors can apply a uniform set of criteria to their after the fact assessment of verifier qualifications. As written, these provisions lack the specificity necessary to provide clear direction to entities, increasing the risk of later non-compliance. Such a risk is ironic and unacceptable in requirements that purport to provide a review of risk assessments. Under these draft requirements entities have no assurance that any third party verifier they might select will be considered "qualified" by FERC, NERC or NERC auditors who might review the results later - leaving entities at grave risk of compliance violations if FERC, NERC or any other regulatory body later disagrees with the entity's selection of a third party verifier. Vectren strongly urges NERC and FERC to establish criteria for those who might seek to be designated third party verifiers, rather than leave assessment of qualifications to an after the fact review during a NERC audit or spot check. A lack of certainty leads here by necessity to a lack of confidence in the result, which Vectren surmises was not the intent of FERC or the drafters.
Southwest Power Pool Regional Entity	No	SPPRE believes that greater clarity is required with respect to the risk assessment to be performed. At a minimum an extreme contingency study needs to be performed that takes out the entire facility, all voltages present. The study should also not consider any operating guides or other mitigation when evaluating the impact of the outage. In Section 2.3 technical basis should be changed to engineering basis. Additionally, the unaffliated verifying entity should not be the party performing the original study, under the principle that an auditor cannot audit ones own work; to do so would not be consistent with the expectation of verification by an unaffiliated entity.

Organization	Yes or No	Question 2 Comment
Salt River Project	No	SRP supports comments submitted by APPA with the following additions:The time frame for completion of the initial risk assessment required in Requirement R1 is not identified in the standard, only in the implementation plan. This may be a point of confusion for entities that fail to fully read and understand the implementation plan. If possible, could the drafting team revise the language of Requirement R1 to make this clear?The periodicity of the risk assessments required by Requirement 1 and the time frame that the risk assessments appear to not align. The risk assessment is required to include Transmission stations and Transmission substations that exist as well as those planned to be in service within 24 months. However, the periodicity for conducting future risk assessments is every 30 calendar months or every 60 calendar months if the prior risk assessment did not identify any Transmission stations or Transmission substations. This potentially leaves a gap of six to 36 months where facilities may not have been assessed.In R2 it is not clear that the primary control center must also be verified, but in subsequent requirements it implies or states that it should be. If the intent in R2 is that the primary control center should also be verified, then it should state so in R2.2 and R2.3 in addition to stating stations and substations.Third Party Verifiers:SRP recommends removal of the concept of third party verifiers and adherence to the existing, and well-functioning, audit program of FERC, NERC and the Regional Entities. If, at any time, modification to the compliance and audit program in regards to any or all of the standards are deemed necessary, such modification can be proposed, evaluated and implemented with due process to ensure no unintended adverse impacts. SRP is concerned that use of third party verifiers to verify, or opine on compliance, both undermines the foundational structure of the FERC/NERC/Regional Entity audit program and introduces additional risk for the safeguarding of critical facility information on physical threats and vulnerabilities. The national audit program for the mandatory Reliability Standards is founded on compliance, self-reporting and a range of audit types, including spot checks and regularly-scheduled audits by NERC and Regional Entities. There are no facts to support abandonment of this foundation in favor of the introduction of a non-authoritative mid-layer of inspection by third parties. Third party verifiers are not authorized to verify compliance. As such, a Registered

Organization	Yes or No	Question 2 Comment
		Entity derives no concrete benefit from a third party verifier's expressions of agreement or disagreement with the Registered Entity's compliance activities. Notwithstanding the theoretical value of another's opinions on whether one has properly or fully complied with the requirements of CIP-014, there are sound and compelling reasons to forego requiring such opinions at the expense of owners. On the other hand, as demonstrated with other standards, Registered Entities readily retain expert consultants as needed to help them evaluate and resolve all manner of compliance challenges. This standard is no different in the sense that outside subject matter experts already are being retained as needed by the party bearing compliance responsibilities.Introducing third parties does not guarantee value-added subject matter experts versed in the nuanced and individualistic profiles on critical facilities. The Transmission Owner already is required both by law and sound business practices to be versed in physical security risks and potential vulnerabilities of critical facilities. The owner both knows which are its critical facilities and is best suited to identify the optimal means and methods to protect them. There are overwhelming incentives for Registered Entities to evaluate and take all appropriate steps to ensure continued reliability of the bulk electric system and reliable service to electric customers. Critically, neither the owner nor FERC/NERC/Regional Entities can rely on the findings of third party verifiers: the approved program of compliance audits will continue regardless and without regard to the findings of third party verifiers.Confidentially of the highly sensitive information produced, gathered, used and maintained for compliance with this standard is critical. Wholesale introduction of a new subset of entities who would routinely gain access to such information poses additional challenges to information safekeeping. Absent demonstrable need, granting access to physical risk and vulnerabilities information introduces unnecessary risk. With any access, vulnerabilities for inappropriate use or further unauthorized access occur. Prudent industry practices dictate non-disclosure absent demonstrable need to know or compelling benefits from such disclosure. Here there is no record of need or benefits.

Organization	Yes or No	Question 2 Comment
FortisBC	No	The audit provides an independent review of an entity's application of the standard and therefore, an additional third party review should not be required as described in R2.It is agreed that if a null set is identifed, the rest of the standard does not apply.
Western Electricity Coordinating Council	No	The periodicity for risk assessments and the forward looking time frame for including planned substations do not match. Entities are only required to consider stations planned in the next 24 months, while the risk assessment is applied on a 30 month cycle, or a 60 month cycle if the entity previously identified a null list of applicable stations. This potentially leaves a 6 to 36 month gap. We would encourage the SDT to match the periodicity of the application to the planned implementation window or include language requiring any new asset be evaluated under R1.WECC notes that the time frame for completion of the initial risk assessment required in Requirement R1 is not identified in the standard, only in the implementation plan. This may be a point of confusion for entities that fail to fully read and understand the implementation plan. WECC suggests that at a minimum NERC and the Regions engage in extensive outreach to ensure that the Transmission Owners are aware of this and that if possible the drafting team revise the language of Requirement R1 to make this clear.Requirement R2, part 2.2 appears to be assigning responsibilities to the unaffiliated verifying entity (registered Planning Coordinator, Transmission Planner, or Reliability Coordinator) yet these entities are not included in the applicability section. If these entities are to be held accountable in the standard for actions, why are they not included in the applicability section?
Northeast Power Coordinating Council	No	The Rationale Box for Requirement R2 stipulates that "'unaffiliated' means that the selected verifying entity cannot be a corporate affiliate (i.e., the verifying entity cannot be an entity that controls, is controlled by, or is under common control with, the Transmission o(O)wner)." This conflicts with Requirement R2 Part 2.1 which lists "A registered Planning Coordinator, Transmission Planner, or Reliability Coordinator; or An entity that has transmission planning or analysis experience" as those qualifications for an unaffiliated verifying entity. Clarification is needed that an Independent System

Organization	Yes or No	Question 2 Comment
		Operator that has operating authority over an entity is eligible to be the unaffiliated verifying entity.
None	No	The SDT has not factored in the resiliency concerns stated in the FERC order. Many of the facilities selected by the initial screening process will have long lead time equipment that if damaged will be out of service for several months. The assessment process needs to consider the operational risks during the time that the TO is waiting for replacement equipment. R1 should be amended to include the following sub-requirement.If the facility being studied has long lead time items, i.e. 4 months or greater, the study must include an N-1 analysis for the widespread instability, uncontrolled separation, or Cascading within an Interconnection test.In addition, the premise for this standard is a physical attack resulting in faulted equipment. There is no mention of the assessment being conducted for the Facilities under fault conditions and in many cases under delayed clearing.R1 should be amended to include the following sub-requirement.The analysis of the subject Facility must include dynamic simulation of faulted conditions with delay cleared for the most severe contingency within the Facility.The phrase "instability, uncontrolled separation, or Cascading" is core to the definition of Interconnected Reliability Operating Limit (IROL). Every RC and PC has an IROL methodology under the FAC standards. R1 should be amended to include the following sub-requirement.The test for instability, uncontrolled separation, or Cascading must be consistent with the IROL methodology established by PCs and RCs under FAC-010 and FAC-011.
SPP Standards Review Group	No	The Standard intentionally does not provide specific methodologies regarding the type of analyses needed to be conducted for the assessments in R1. This leaves the door open to very different interpretations across the industry. We suggest the drafting team consider specifying analyses such as those contained in the TPL standards. This would eliminate confusion within the industry and provide clear direction for those conducting the analyses. We suggest adding the following sentence at the end of R1. “These analyses will include consideration of the entire loss of the Transmission stations and Transmission substations specified in Applicability Section 4.1.1 taken

Organization	Yes or No	Question 2 Comment
		individually, one at a time." While not specifically referencing the TPL standards (currently enforceable TPL-004-0a, R1 and TPL-001-4, R3 to be enforced in 2016) which cover the loss of switching stations and substations, this language provides guidance regarding the type of analyses to be conducted in the assessments. We strongly suggest that the SDT expand on this addition to R1 in the guidance document to provide needed clarification to the industry.
Westar Energy	No	The Standard intentionally does not provide specific methodologies regarding the type of analyses needed to be conducted for the assessments in R1. This leaves the door open to very different interpretations across the industry. We suggest the drafting team consider specifying analyses such as those contained in the TPL standards. This would eliminate confusion within the industry and provide clear direction for those conducting the analyses. We suggest adding the following sentence at the end of R1. "These analyses will include consideration of the entire loss of the Transmission stations and Transmission substations specified in Applicability Section 4.1.1 taken individually, one at a time." While not specifically referencing the TPL standards (currently enforceable TPL-004-0a, R1 and TPL-001-4, R3 to be enforced in 2016) which cover the loss of switching stations and substations, this language provides guidance regarding the type of analyses to be conducted in the assessments.
Nebraska Public Power District	No	The third party verification is unnecessary and should be deleted from the standard. There is no other unaffiliated third party that has knowledge and expertise comparable with the incumbent Transmission Planner who develops the detailed models, performs the reliability assessments, and develops the required long term plans for the Transmission Owner on an annual basis. If the verification remains in the standard, 90 calendar days is not a sufficient amount of time to complete verification. A Transmission Planner may ask a Planning Authority (PA) to review its risk assessments, but the same PA will likely be asked to review multiple utilities. Recommend at least 180 days to complete the verification.

Organization	Yes or No	Question 2 Comment
Encari	No	There should be a strong, rebuttable presumption that an applicable Transmission Facility requires physical protection owing to its classification under the bright-line "medium impact" rating criteria under CIP-002-5.1 (which is repeated in the Applicability section of CIP-014-1 for Transmission Facilities). The utility of a risk assessment could be recognized, however, as justification for rebutting the presumed need for a set of mandated physical security measures.
Consumers Energy Company	No	We agree to the approach, however, our concern is around protection of information shared between the entity and the third party. There should be a requirement within the standard that requires the third parties to protect the information and not leave it up to the entities.
Cooper Compliance Corp	No	We do not support the Standard as written today. We agree with the scope and content of the SAR. However, we are concerned with Requirement 6. Requirement 6 requires entities to seek out third parties to review their new physical security protection plans. We don't believe that entities should be obligated to seek assistance from third party individuals. This includes consultants or another unassociated entity. The purpose of the regions, NERC, and FERC are to provide a review of an entities compliance to Standards through the audit and self-certification process. No other Reliability Standards require an entity to use third parties to determine compliance or sufficiency of compliance documentation. We believe that this obligation may place some entities in difficult financial situation and could have a negative impacts in assuring that proper third party entities are being used. Should FERC, NERC, or WECC determine that entities are not following the spirit of the Standard than they may request a modification in a future Standard revision. We will support this Standard if Requirement 6 is removed.
Independent Electricity System Operator	No	While the proposed R1 to R3 collectively meet the FERC requirements for having an entity to identify the critical facilities and having the assessments of such identification verified, we believe it is more appropriate that the 3rd party verification be performed by NERC registered entities only (which could be the Reliability Coordinator, Planning

Organization	Yes or No	Question 2 Comment
		Coordinator or Transmission Planner). An entity that has transmission planning or analysis experience may only have an outside equivalent representation of the BES and their ability to conduct an analysis with a "wide area" view of consequences may not be possible. As such, we suggest to revise Requirement 2.1 by eliminating the second bullet point : "An entity that has transmission planning or analysis experience".
National Grid	No	While we support using the CIP-002-5.1 criteria as a starting point for applicability of the draft standard, we do have concerns with the inclusion of the phrase "within an Interconnection" in R1. FERC Order RD14-6 directs that "[a] critical facility is one that, if rendered inoperable or damaged, could have a critical impact on the operation of the interconnection through instability, uncontrolled separation or cascading failures on the Bulk-Power System". By introducing the word "within," the Standard could inadvertently draw widely different interpretations of how to assess risks to the BPS. In practice, this could open up the potential for the inclusion of regional or localized transmission impacts, which we believe is in contrast with the Commission intended scope in the Order.As a result, we suggest that the wording in R1 be modified to the following:"A critical facility is one that, if rendered inoperable or damaged, could result in widespread instability, uncontrolled separation or cascading failures widespread across significant portions of an Interconnection".Alternatively, we recommend clarifying in the guidance documents that 'widespread' and 'within an Interconnection' proposed words are intended to apply to impacts to the BPS that reaches deep into the Interconnection, and not affecting a small portion of an Interconnection. For example, if an Interconnection has relatively small Balancing Authorities (BAs), 'widespread' would need to be interpreted as impacts that would be crossing several, i.e. more than two, of those BAs in order to be considered 'widespread'.
Herb Schrayshuen	No	In Requirement R1 the use of the term 'transmission analysis' and 'transmission analyses' in order to identify which substations should have a security plan is vague The TPL standards extreme cases should be used to clearly describe the specific required elements of the analysis. Failure to specify how the analysis is to be done will lead to inconsistencies in the analysis and thereby difficulty for audits of the standard.

Organization	Yes or No	Question 2 Comment
		In Requirement R2 the use of the word 'unaffiliated' introduces ambiguity. There needs to be an understanding (through the standard but if not feasible through RSAW or other tool-e.g. guideline) what "unaffiliated" means. The term "unaffiliated" is not required because the NERC Reliability Functional model already ensures the independence between the TO/TOP and the verifying entities.
ATCO Electric	Yes	Although the FERC order contains language that a third party verification occur, this type of verification is not used anywhere else in NERC reliability standards for similar activities (e.g. CIP-002 classification). ATCO Electric (AET)respectfully requests that the review be allowed to be performed by qualified in-house Engineering groups who already perform these functions. Mandating a third party verification presents a risk to timelines and the implementation of the other requirements.
American Public Power Association (APPA)	Yes	APPA supports approval of the proposed physical security standard, subject to the technical clarifications and corrections shown below. These comments were developed by APPA staff based on extensive input from a diverse group of members utilities that will be subject to the proposed standard once it is approved. Please see also the individual comments of APPA members.TIMELINES to complete third party verification under R2 and third part review under R6 are both too short. Increase 90 days to 120 days or 180 days. Verifying entities may recommend that the Transmission Owner conduct additional planning studies to confirm asset identifications such as interactions between BES Elements in adjacent Transmission Owner footprints. A short 90-day time limit may not be sufficient time to conduct and verify a revised or supplemental BES assessment. For security reviews, conducting a meaningful review with sound recommendations applicable to a specific TO's or TOP's facts and circumstances may also take time along with necessary discussions with the TO. A short review window is more likely to lead to disagreements with the TO which in turn would lead to discrepancies that would need to be justified - which in turn might cause the reviewer

Organization	Yes or No	Question 2 Comment
		to avoid making proposals that should be considered by the TO or pressure on the TO to accept recommendations that could be improved upon.R1 GUIDANCE - TRANSMISSION PLANNING BASE CASES: Please revise the Guidance for R1 to clarify that TOs should start their initial and subsequent risk assessments with a common regional or area transmission planning base case used for transmission planning purposes. The base case should include existing BES stations and substations and those planned to be in service within 24 months within the region or area, to ensure forward-looking risk assessments and security planning.R2 VERIFICATION - Third party verification of third party risk assessments conducted under R1: some medium sized TOs with applicable transmission stations and substations may contract with a third party consultant to conduct necessary BES risk assessments, to ensure accurate and comprehensive consideration of the risk of widespread cascading, instability and uncontrolled separation. Such entities seek clarification that a single expert risk assessment study, in conjunction with a verification by an unaffiliated PC, TP or RC would suffice.
Arizona Public Service Company	Yes	AZPS generally agrees with the approach of the standard as drafted. The following comments relate to suggested modifications for Requirements 1-3.AZPS suggests that the drafting team modify the term “risk assessment” to “BES impact assessment” in Requirements 1-3. The term risk assessment is not a defined term in the NERC Glossary of Terms. It is used in other CIP standards (CIP-002, and CIP-004) each with a different context. Changing the term to “BES impact assessment” ensures that the risks will be categorized and evaluated correctly.Requirement 2.1 directs the Transmission Owner to select a Planning Coordinator, Transmission Planner, or Reliability Coordinator to conduct the third-party assessment. However, none of these NERC functional entity designations appear in the applicability section of the standard. Thus it is assumed that the entities listed above are not obligated to conduct the assessment once selected but rather the assessment is conducted by mutual agreement. AZPS suggests that the drafting team provide clarifying language in the requirement to indicate that the assessment is conducted by mutual agreement between the Transmission Owner and the third-party assessor.AZPS is concerned that the term “primary control center” will

Organization	Yes or No	Question 2 Comment
		be confused with the NERC Glossary Term “Control Center.” The definition of Control Center is partially defined as “monitor and control the BES...”. The rationale for Requirement 1 introduces the term “operationally control” in its definition of primary control center which is further defined to mean “causing direct physical action”. The concept of monitoring is explicitly excluded from this definition. To avoid confusion, AZPS suggests that the drafting team define the term primary control center or adopt a new term that clearly differentiates itself from the common term “control center”.
FirstEnergy	Yes	FirstEnergy supports the proposed requirements R1 through R3.
Idaho Power Co.	Yes	Further clarification is needed on several points. There is no specificity to provide consistency with how the "risk assessment" should be performed or what methodology or components to the methodology should be used. Additionally, there is no defined meaning of "widespread instability, uncontrolled separation, or Cascading within an Interconnection." Does this refer to regionally identified IROLs or some other objective criteria or only based on the analysis performed? Additionally, there is no mechanism built into R3 to allow for a dispute between a TO and a TOP if they disagree on a particular station or substation as there is in the third party reviews under R2 and R6 where there is a mechanism to disagree with the reviewer.
Public Utitliy District No. 1 of Cowlitz County, WA	Yes	However, the TOP does not receive any relief from R1-R2 null set(s) and will be required to provide attestations to auditors and yearly certification of the absence of any notice from Transmission Owners.
MidAmerican Energy Holding Company	Yes	MEHC agrees with the R1 through R3 approach. However, MEHC suggests the following changes to improve the standards as written:The term “unafilliated third party” is used in R2 and in R6, but in parts 2.1, 2.3 and 2.3. “unaffiliated verifying entity” and in part 6.3 “unaffiliated reviewing entity” is used. Unless the intent was that the terms have different meanins, it is suggested that “unafilliated third party” be used throughout the standard.

Organization	Yes or No	Question 2 Comment
NRG Energy, Inc.	Yes	NRG agrees the approach described in Requirements 1 through 3 address the directives specified in FERC Docket No. RD14-6-000. However, NRG does have concerns with the standard as currently composed and offers the following points it believes will improve the standard if implemented: o Primary control centers are referenced in the "purpose" of the standard, but are not included in the "applicability" section. For clarity, NRG suggests the addition of section 4.1.1.5, stating "Control Centers and backup Control Centers associated with the Transmission stations and Transmission substations identified in requirements 4.1.1.1 through 4.1.1.4." o R1 directs that the Transmission Owner to perform an initial risk assessment with subsequent studies and include an unaffiliated third party to verify the risk assessment performed. NRG is concerned the standard does not indicate how information shared under this Requirement will be protected and held in confidence. NRG believes the information subject to this standard should be treated as Critical Energy Infrastructure Information (CEII). o R1 is vague in providing guidance as to the criteria to be used in developing the risk assessment. NRG appreciates this is intentional to allow flexibility in developing the assessment. However, this results in the potential for a determination of non-compliance during the audit process. NRG suggests reliance on the CIP-002 standard used for defining Critical Assets, which is based on solid metrics. o R2 seems to allow the same third party to perform both the initial risk assessment and the review of the initial risk assessment, potentially negating the need for a separate review. o R2.2 calls for review of the results of the initial risk assessment by an unaffiliated third party. The standard provides no guidance regarding the criteria (assumptions, contingencies, etc.) to be used for this review, which could provide results differing from the initial assessment. More objective measures should be incorporated.
Xcel Energy	Yes	Overall Xcel Energy agrees with the approach, but we offer the following items for consideration of the Standard Drafting Team.R1 requires an assessment of facilities, including those to be in service within the next 24 months, followed by an additional review every 30 or 60 months. If a facility is brought into service, it is unclear when the review should be performed due to the 6 month gap between the in service date and

Organization	Yes or No	Question 2 Comment
		the review. R2 requires a Transmission Owner to have an unaffiliated third party "verify" the risk assessment performed under R1. By contrast, R6 requires each Transmission Owner to have an unaffiliated entity "review" the evaluation performed under R4 and the security plan under R5. Xcel Energy recognizes that use of "verify" and "review" reflects the Commission's wording, but it would be helpful if the standard explained the difference between the two terms, if there is a difference.The 90 days prescribed by R2 to obtain third party verification may be too restrictive due to the availability and/or capacity of applicable resources. The standard requirement which imposes the action/deliverable by a third party, but the accountability to the TO/TOP, is also a cause for concern. It might be better to have the timing of R1 and R2 combined as this would enable flexibility of performing the assessment and completing the third party verification within the overall timeframe desired. We also suggest the Regional Entities or NERC be considered as parties that can provide third party verification and contract out if desired. It would also be helpful to expressly clarify in R2.1 that an "entity with transmission planning or analysis experience" could include a peer TO/TOP or a panel of employees from peer TO/TOPs, for example from the North American Transmission Forum. Allowing peer review would assist in identification and dissemination of best practices, we believe.R2.3 requires documentation of any recommendation to add or remove facilities as recommended by the verifying entity, but does not specify if any actions are required if no recommendations are made. Since the VRFs reference various levels of severity based upon documentation of recommendations, it would seem beneficial to allow a "no recommendations" option. Also, it is unclear if there are specific criteria the third party reviewer should utilize to review/verify and make recommendations if facilities are to be added or removed. While an entity could indicate why recommendations were or were not adopted, it would be useful to have verification criteria defined more clearly. R3 seems to be unclear in whether TOs or TOPs have operational control over facilities. In order to more clearly identify that TOPs have operational control, R3 should indicate that the TO shall notify the TOP of the identified facility.

Organization	Yes or No	Question 2 Comment
Peak Reliability	Yes	Peak believes the RC entity should perform the R2 verification because the RC has the wide-area view in the Western Interconnection. The alternative would be to have individual transmission entities perform varied verifications, which could result in inconsistent methodologies and results.
ISO/RTO Standards Review Committee	Yes	R1R1 in conjunctions with the Applicability section is a reasonable approach for identifying the scope of facilities subject to R2 - R6.R2Imposing a verification requirement is a reasonable way to facilitate an effective outcome in terms of identifying facilities that meet the impact thresholds established in R1. Requiring the use of an unaffiliated third party is reasonable because it mitigates the potential for inadvertent error in study work. Finally, allowing the verification to occur concurrently or subsequently, and leaving that decision to the discretion of the relevant functional entities, is appropriate. The functional entities should have the discretion to determine the most effective means of performing the verification. R2.1 requires that the verifying entity be either 1) a registered RC, PC or TP, or 2) another entity with appropriate planning or analysis experience. This is a reasonable approach that provides appropriate flexibility with respect to third party verification options. It also addresses the different operational and planning structures that comprise the North American electric grid - i.e. organized market regions where different entities can perform the different NERC registered functional roles (ISOs/RTOs) and vertically integrated regions where all the relevant roles under the standard may be performed by a single entity and, therefore, would require the use of an independent third party to perform the unaffiliated verification. R2.2 requires the third party verification to either confirm the TO analysis under R1, or, alternatively, recommend that facilities be added or deleted (the IRC assumes that a verification can confirm some results and also add facilties or remove facilities). Although R2.2 establishes a reasonable standard - i.e. verify TO results or recommend changes - the IRC offers the following comments. The requirement, as written, imposes the obligation on the third party verifying entity. However, the TO is the responsible entity under the standard - i.e. the TO is required to obtain the third party verification. The language should be revised to clarify that the

Organization	Yes or No	Question 2 Comment
		relevant actionable obligation (to obtain the third party verification) lies with the TO. The next issue raised by R2.2 is the timing. The IRC appreciates the importance of the issues being addressed by the proposed standard and the goal of implementing the standard and the relevant processes contained therein in a timely fashion. However, practically speaking, 90 days may be difficult to meet depending on the number of Transmission Owners that require verification from a single Registered Entity. For example, in organized markets there may be numerous TOs all selecting their PC to verify. To the extent implicated in reviews under the standard, IRC members would make best efforts to perform any relevant verifications. This comment is merely intended to highlight the potential resource impacts under the proposed 90 day timeline. The IRC proposes the following revisions to mitigate the issues in R2.2 described above. 2.2. The third party verification shall either verify the Transmission Owner's risk assessment performed under Requirement R1 or recommend the addition or deletion of a Transmission station(s) or Transmission substation(s). The Transmission Owner shall ensure the verification is completed within a mutually agreed upon timeframe between the Transmission Owner and the third party but no longer than 180 calendar days following the completion of the Requirement R1 risk assessment. R3R3 obligates the TO to notify a TOP that has operational control of a control center associated with a facility identified pursuant R1 and verified under R2. R3.1 requires similar notification if a facility is removed via those processes. The standard may benefit from including the draft guidance into the R3 rationale section that clarifies that operational control means the ability to take action that affects the physical status of the facility, and that it does not include directive control, which relies upon another entity to take operational action to change the status of the facility. The guidance document addresses this issue, but the SDT could add clarifying language to the rationale section of R3, similar to the language in the guidance document and/or the language in the R1 rationale section, which reads in relevant part:"... identify the primary control center that operationally controls that Transmission station or Transmission substation (i.e., the control center whose electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker, compared to a control center that only has the

Organization	Yes or No	Question 2 Comment
		ability to monitor the Transmission station and Transmission substation and, therefore, must coordinate direct physical action through another entity).”
Pacific Gas and Electric Company	Yes	R2 Comment: Suggest removal of the requirement for a third party risk assessment verification. Verifications already occur as part of internal compliance programs in CIP-002 and when audited by the Region. What if the assessment is performed by a third party, do you have to get another third party to verify? This creates a significant administrative burden, even if the Standard will only apply to a small number of entities and facilities.R3 (pg. 8) “...the Transmission Owner shall, within seven calendar days following completion of Requirement R2, notify...” Comment: Seven calendar days may be too short a time requirement, consider 10-14 days
Basin Electric Power Cooperative (BEPC)	Yes	R2 - A concern to consider is whether there is an adequate pool of unaffiliated third party verifiers to meet the 90 day timeframe. Possible solutions would include (1) increase the 90 day requirement to six months; or (2) Revise the requirement to allow the NERC Registered Entity to notify the appropriate Regional Entity of the verifier pool constraint and request the Regional Entity act as the verifier or specify an acceptable alternative.
Public Utility District No. 2 of Grant County, WA	Yes	R2 references primary control center(s). Since Control Center is a NERC defined term GCPD suggests that all references to the Control Center be capitalized within the Standard and that “primary” be defined within the standard to not include “back-up” Control Center(s).
Exelon	Yes	R2.1 Drafting Team could consider adding a note to R2 Guidance section similar to that which is included in the recently approved MOD-032 standard.”Planning Authority and Planning Coordinator" (hereafter collectively referred to as “Planning Coordinator”)combines “Planning Authority” with “Planning Coordinator” in the list of applicable functional entities. The NERC Functional Model lists “Planning Coordinator” while the registration criteria lists “Planning Authority” and they are not yet

Organization	Yes or No	Question 2 Comment
		synchronized. Until that occurs, the proposed standard applies to both Planning Authority and Planning Coordinator."
ReliabilityFirst	Yes	ReliabilityFirst supplies the following comments for consideration:1.Requirement R1 - ReliabilityFirst believes there may be a gap in the timing of performing the risk assessment for new Transmission stations and Transmission substations which are planned outside the 24 month window as required in Requirement R1. For example, as written, if a new Transmission stations or Transmission substation is planned for month 25, it would not be included within the initial risk assessment. Thus, there is a potential for this new Transmission stations or Transmission substation to not be assessed for 30 calendar months (for a Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable ...) or 60 calendar months (for a Transmission Owner that has not identified in its previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability..." With the potential gap in assessing new Transmission stations and Transmission substations being so long, ReliabilityFirst believes reliability may be compromised. For these reasons, ReliabilityFirst recommends the following for consideration: "Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 30 months)..." and including a new bullet under Part 1.1 which states "At least prior to the implementation of all new Transmission stations and Transmission substations (if not assessed within the initial or subsequent risk assessment)"2. Requirement R3 part 3.1 - From a standards writing perspective, if there is only one sub-part, ReliabilityFirst recommends including it within the Parent requirement R3. Typically sub-parts are only included if there are more than one.
Northeast Utilities	Yes	Requirement 1 should match that language in the FERC order and not limit the assessment to Transmission System analysis and allow for an opportunity to apply

Organization	Yes or No	Question 2 Comment
		technical expertise and judgment prior to the Transmission System analysis. We agree to Requirement 2 and Requirement 3.
PPL NERC Registered Affiliates	Yes	Requirement 1: 1. Requiring completion of an initial risk assessment for Transmission stations and substations planned to be in service within 24 months can lead to audit difficulties. Planned in service dates often change for a variety of internal or external reasons. It is requested that the SDT consider changing this language to a more easily identifiable trigger such as requiring the risk assessment to be performed before a new Transmission station or substation is energized. 2. Does the R1 risk analysis require consideration of the impact of loss of lines with voltages below 200 kV in an identified Transmission station or substation? 3. It is unclear when the R.1 risk assessment needs to be completed. This should be clarified.4. The wording in the Rationale for Requirement 1 box identifies the primary control center, but it also notes that control center electronic actions can cause direct physical actions at the Transmission station and substation. This would typically implicate the backup control center as well because the backup control center will have similar functional capabilities. There appears to be a disconnect between the use of the term primary control center and the parenthetical that follows which appears to include any control center that performs the listed functions.
San Diego Gas & Electric	Yes	SDG&E agrees with this approach. A facility's identification as "medium impact" does not necessarily mean that the facility, if rendered inoperable or damaged could result in widespread instability, uncontrolled separation or Cascading within an Interconnection. Application of a risk assessment will ensure that CIP-014-1 is focused on the facilities that are most critical to the system.
Seattle City Light	Yes	Seattle City Light supports the Question 2 comments of APPA as well as the additional comments of Salt River Project (SRP) regarding 3rd party verification.Third Party Verifiers (SRP):SRP recommends removal of the concept of third party verifiers and adherence to the existing, and well-functioning, audit program of FERC, NERC and the Regional Entities. If, at any time, modification to the compliance and audit program in

Organization	Yes or No	Question 2 Comment
		regards to any or all of the standards are deemed necessary, such modification can be proposed, evaluated and implemented with due process to ensure no unintended adverse impacts. SRP is concerned that use of third party verifiers to verify, or opine on compliance, both undermines the foundational structure of the FERC/NERC/Regional Entity audit program and introduces additional risk for the safeguarding of critical facility information on physical threats and vulnerabilities. The national audit program for the mandatory Reliability Standards is founded on compliance, self-reporting and a range of audit types, including spot checks and regularly-scheduled audits by NERC and Regional Entities. There are no facts to support abandonment of this foundation in favor of the introduction of a non-authoritative mid-layer of inspection by third parties. Third party verifiers are not authorized to verify compliance. As such, a Registered Entity derives no concrete benefit from a third party verifier's expressions of agreement or disagreement with the Registered Entity's compliance activities. Notwithstanding the theoretical value of another's opinions on whether one has properly or fully complied with the requirements of CIP-014, there are sound and compelling reasons to forego requiring such opinions at the expense of owners. On the other hand, as demonstrated with other standards, Registered Entities readily retain expert consultants as needed to help them evaluate and resolve all manner of compliance challenges. This standard is no different in the sense that outside subject matter experts already are being retained as needed by the party bearing compliance responsibilities.Introducing third parties does not guarantee value-added subject matter experts versed in the nuanced and individualistic profiles on critical facilities. The Transmission Owner already is required both by law and sound business practices to be versed in physical security risks and potential vulnerabilities of critical facilities. The owner both knows which are its critical facilities and is best suited to identify the optimal means and methods to protect them. There are overwhelming incentives for Registered Entities to evaluate and take all appropriate steps to ensure continued reliability of the bulk electric system and reliable service to electric customers. Critically, neither the owner nor FERC/NERC/Regional Entities can rely on the findings of third party verifiers: the approved program of compliance audits will continue regardless and without regard to the findings of third party verifiers.Confidentially of

Organization	Yes or No	Question 2 Comment
		the highly sensitive information produced, gathered, used and maintained for compliance with this standard is critical. Wholesale introduction of a new subset of entities who would routinely gain access to such information poses additional challenges to information safekeeping. Absent demonstrable need, granting access to physical risk and vulnerabilities information introduces unnecessary risk. With any access, vulnerabilities for inappropriate use or further unauthorized access occur. Prudent industry practices dictate non-disclosure absent demonstrable need to know or compelling benefits from such disclosure. Here there is no record of need or benefits.
Seminole Electric Cooperative, Inc.	Yes	Seminole supports the comments by NRECA. Additionally, Seminole agrees with this approach. As this standard is based on the same standards as the impact ratings in CIP-002, it would be cleaner to identify any facility that is determined critical under the Assessment with a separate (non-exclusive) impact rating such high physical impact and use this term for applicability for R3-R6. If an entity has a qualified third party perform the R1 assessment on behalf of or in cooperation with the registered entity, does this also meet the requirement R2? Note that the draft RSAW, not under review here, states that R1 and R2 may occur concurrently. R2.4 is redundant with the information protection requirements in CIP-011-1. It would be appropriate to note that this information is included in the materials subject to enforcement under CIP-011-1 R1.
Vermont Transco LLC	Yes	Specifically the filtering of assets. While starting with CIP-002-5.1 as a starting point, the amount of analysis and assessment to determine if these facilities are critical and applicable to this standard may not be possible in the timeline proposed for this standard if a full transmission planning analysis will be needed. Many planning analysis performed previously by entities were not assessed to the specific defininition included in this requirement and therefore could require considerable work to be performed to analyze. The wording suggests that a full transmission planning assessment should be performed for all CIP-002-5.1 facilities and not to just those an entity feels may cause wide area impact.What if you do not agree with the third parties review of your

Organization	Yes or No	Question 2 Comment
		assessment? what evidence will be required to prove that you do not need to agree with their assessment?If an entity identifies a facility as critical does this require that the control center operating this facility must also have a full physical security plan per the requirements later in the standard?
Hydro One	Yes	Subsequent risk assessments should be performed every 36 months (to align with CIP requirements) instead of every 30 months. The FERC Order allows for the verification to be completed by NERC, the Regional Entity, an RC or another entity. The standard only identifies that the verification can be completed by a registered Planning Coordinator, Transmission Planner, or Reliabity Coordinator, or an entity with transmission planning and analysis experience; it does not mention NERC or the regional entity.
Portland General Electric	Yes	The following comments relate to suggested modifications for Requirements 1-3 -PGE believes the 90-day period to ensure verification of the risk assessment is too short. It will be difficult for every Transmission Owner to establish a contract with an unaffiliated verifying entity during the implementation time period. In addition, the current wording of the standard puts the obligation on the Transmission Owner to make sure that the assessment is done within 90 days, even though by definition they cannot have control over that timeline. Therefore, PGE proposes replacing the R2.2 language, "[t]he Transmission Owner shall ensure the verification is completed within 90 calendar days following the completion of the Requirement R1 risk assessment," with the language, "[t]he Transmission Owner shall ensure that any agreement executed with the unaffiliated verifying entity stipulate that the verification be completed by a date that is not later than 90 calendar days from the completion of the Requirement R1 risk assessment."In addition, Requirement R3 provides no mechanism for the Transmission Operator who operates a primary control center identified by a different Transmission Owner to disagree with that identification. PGE proposes including similar language to that in R2.3 to allow for the Transmission Operator to

Organization	Yes or No	Question 2 Comment
		document the technical basis for not identifying its primary control center as an asset to be protected.
Virginia State Corporation Commission	Yes	There does not seem to be any timeframe within which the initial assessment is to be completed under R1, nor when the 30 and 60 month periods for subsequent reassessments under R1.1 are to begin and conclude.
California ISO	Yes	We agree with the approach identified in R1 through R3, however we have the following comments regarding the SCOPE of the verification review required by R2.2: o The scope of the 3rd party verification is not well defined. What is the expectation and scope of the verification review? What level of quality is expected/required? Is the Transmission Owner responsible for scoping the verification process to ensure the review meets the required level of review? o Very little guidance is provided on the scope of the review. The scope of the review and verification work would need to be well understood before taking this verification work on. Is a technical analysis required as part of the review and verification process on the part of the 3rd party verifying the Transmission Owner's risk assessment and list of critical facilities, or is it simply to review the risk assessment and list of critical facilities that the Transmission Owner has provided to the 3rd party reviewer, based on their current knowledge of the transmission system from performing prior transmission planning studies? Will NERC be providing additional guidance regarding the scope of work required for verification by a 3rd party?
Western Area Power Administration	Yes	Western agrees with the approach of using Requirements R1 and R2 to identify whether an entity is subject to Requirements R4-R6. However, we suggest that the drafting team modify the term "risk assessment" to "BES impact assessment." In the physical security community, the term "risk assessment" generally refers to "The process of assessing security-related risks from internal and external threats to an entity, its assets, or personnel." See ASIS International, General Security Risk Assessment Guideline (2002), http://www.scnus.org/local_includes/downloads/9200.pdf. In its filing to FERC, NERC

Organization	Yes or No	Question 2 Comment
		can explain that it adopted the term “BES impact assessment” so it is clear that the initial evaluation is of risk to the BES if the substation is damaged or rendered inoperable.Western recommends revising R1 1.1 to: “Each Transmission Owner shall review their BES Impact Assessments once every 60 months for any transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an interconnection after completion of the initial assessment.” This would consolidate the two bulleted actions and make them equally applicable. We believe a 60 month interval would be a more appropriate period for this type of assessment.Western suggest the drafting team clarify requirement 2.1, which directs the Transmission Owner to select a Planning Coordinator, Transmission Planner, or Reliability Coordinator to conduct the third-party assessment; however, these NERC functional entity designations do not appear in the applicability section of the standard. We also suggest reconsidering the short 90-day period to ensure verification of the risk assessment. This may not allow every Transmission Owner to establish a contract with an unaffiliated verifying entity during the standard’s implementation time period.

California Public Utilities Commission: Safety and Enforcenment Division		In general, the overall method employed in the draft standard is reasonable. The draft standard has adopted a reasonable level of specificity, without being overly prescriptive.The use of unaffiliated verifying experts is a positive element in the draft standard. In general, the balancing authority or reliability coordinator for the transmission area in question is the best verifying expert. In the event the utilities disagree with the assessments of the unaffiliated verifying entities at any point in the process (for example see section 2.3, second bullet point), not only should the transmission owner or utility be required to document their technical rationale, but the standard should further delineate a process for resolving this disagreement. With respect to Rule R1, Section 1.1, the drafting group should consider whether there should be language added to the standard detailing a process whereby the 30 or 60 month intervals should be accelerated in the event of serious intervening situations. With respect to Rule R2, Section 2.1, the description of “an entity that has transmission planning or analysis experience” is overly vague and should be further clarified, or that the use of this type of expert should be limited to certain small transmission owners. With respect to Rule R2, section 2.4, the language requiring “non-disclosure” agreements is important and a positive element in the draft standard.

3. **Requirements R4 through R6: The final three requirements of CIP-014-1 require (1) the evaluation of potential threats and vulnerabilities of a physical attack to the facilities identified and verified according to the earlier requirements, (2) the development and implementation of a security plan(s) designed in response to the evaluation, and (3) a third party review of the evaluation and security plan(s) (as directed in the order). Do you agree with this approach? If not, please articulate how an alternative approach addresses the directives specified in the order on physical security.**

Summary Consideration: The SDT thanks all commenters. All comments have been reviewed and changes that the SDT considers appropriate were incorporated into a subsequent revision. Language to describe the responsible entities for Requirements R4 through R6 was made consistent. Changes were made to clarify factors to be considered by the responsible entity in Parts 4.2 and 4.3. Requirement R5 was reworded to clearly indicate the SDT's intent for security plans to be developed within 120 days of completing Requirement R2 and executed according to the timeline specified in the security plan. Requirement R6, Part 6.1 was changed to clearly indicate that one or more of the criteria must be met. Corresponding changes were made to the measures in the standard. Several additions were made to the Guidelines and Technical Basis section. A summary of comments and the SDT's response is provided:

- **Requirement R4. Various changes were recommended to the parts in Requirement R4 that describe factors to be considered in evaluating threats and vulnerabilities. Some commenters recommended deleting Parts 4.1 to 4.3. Some suggested adding additional language for clarity or to limit factors that must be considered.** Parts 4.1 through 4.3 provide considerations to be used by an entity in determining what threats may be 'realistically contemplated', as directed in the FERC Order. As written, Requirement R4 provides owners with appropriate requirements to develop a tailored evaluation process that takes into account factors such as location, size, function, existing protections, and attractiveness as a target. A clarifying change was made to Part 4.2 to now read "Prior history of attack…"
- **Requirement R4. A commenter recommended modifying Part 4.1 to focus the threat assessments on only those elements within a Transmission station or Transmission substation that affect the reliability of the BES.** The proposed standard satisfies FERC directives to address risks from physical attack on facilities as described in footnote 6 of the Order. A threat assessment must be performed for the entire Transmission station or Transmission substation. As noted in the Guidelines and Technical Basis section for Requirement R5, "While most security measures will work together to collectively harden the entire site, some may be allocated to protect specific critical components. For example, if protection from gunfire is considered necessary, the entity may only install ballistic protection for critical components, not the entire site."
- **Requirement R5. Commenters asked for clarification on the 120-day time requirement to develop and implement a physical security plan, and the timeline required by Part 5.3 for implementing physical security enhancements or modifications.** Requirement R5 was reworded to clearly indicate the SDT's intentions. Physical security plans required by R5 must be developed within 120 calendar days of the completion of Requirement R2. This plan must include a timeline for executing physical security

enhancements and modifications according to Part 5.3, which may extend to a period determined by the responsible entity. The Guideline and Technical Basis section was also updated to clearly state the SDT's intentions.

- **Requirement R5. Commenters proposed alternate language for Part 5.1, indicated that requirements needed to be more specific, or proposed a specific technical solution.** The SDT accepted those revisions that it believes add clarity and are consistent with NERC Security Guidelines. The proposed standard meets the requirements of FERC's Order in a manner that supports reliability. FERC recognized that a "one-size-fits-all," prescriptive approach to protecting the Bulk Power System from physical security threats would not provide the most benefit. Like all standards, proposed CIP-014-1 is technology neutral. The SDT has provided several references and guiding documents in the guidelines section.
- **Requirement R5. Some commenters proposed removing Part 5.2 (Law enforcement contact and coordination information).** The SDT believes law enforcement contact and coordination information required by Part 5.2 is an essential element of a physical security plan and does not agree that it should be removed. EOP-004-2 includes law enforcement as an example of an organization to be included in an entity's event reporting Operating Plan, which may not meet the reliability objectives of a physical security plan developed to meet the requirements of CIP-014-1.
- **Requirement R5. A commenter recommended that the standard establish specific sequencing for the implementation of the physical security plans required in R5 to follow the review of the physical security plans required in R6.** The SDT believes the standard as written appropriately requires the responsible entities to implement physical security plans in a timely manner and does not support a establishing a timeline that places implementation after review. The SDT also recognizes that entities may develop the physical security plans and have them reviewed concurrently as explained in the Guidelines and Technical Basis section, which would satisfy the commenter's proposed sequencing. .
- **Requirement R6. Some commenters did not support the requirement for third party review or recommended changes to language or organizations listed in Part6.1.** The requirement for third party reviews satisfies the FERC directive and is intended to provide for an added level of physical security expertise beyond the responsible entity in the development of security plans. The SDT agreed with recommendations to change the list in Part 6.1 from numbers (6.1.X) to bullets to reflect their intent that an acceptable third party reviewer did not need to meet each criteria in the list. The SDT agrees that the credentials cited in Part 6.1 are not an exhaustive source of professional certifications. The SDT did not agree that the ERO should be the only authorized reviewer, and did not agree that any other specific additions to the list were necessary. The most appropriate third party reviewer for a given entity may vary based on the entity's specific circumstances and assets; collectively the list in Part 6.1 provides the necessary flexibility for all applicable entities. The suggested addition of a peer review group with physical security expertise is not explicitly necessary as such a reviewer could be utilized with ERO approval. A specific process is not required for the ERO to exercise its authority to approve a reviewing entity under Part 6.1.
- **Requirement R6. Commenters asked for clarification on whether third party reviews are required for plan revisions.** The SDT intends for all periodic review requirements for Requirements R4 and R5 to be addressed by meeting the 30 calendar month

review requirement of Requirement R1 and following the timelines in subsequent requirements. Changes or modifications made within the 30-month period are not specifically required to be reviewed by a third party.

- **Requirement R6. Some commenters indicated that a resolution process was needed or sought clarification for responding to reviewer recommendations.** The requirement for third party reviews as written provides for an added level of physical security expertise beyond the individual entity in the development of the required security plans. The Transmission Owner or Transmission Operator that created the physical security plan is ultimately responsible for physical security of the facility and thus makes the final determination on accepting the recommendations of a reviewer. The SDT believes that in documenting this determination as required in Part 6.3, the responsible entity should clearly explain their considerations and, if appropriate, an alternate approach that achieves the desired result.
- **Requirement R6. Commenters expressed concerns over potential for mishandling confidential or sensitive information.** The SDT agrees that the consequence of mishandling sensitive information is serious and has included methods that a responsible entity could use in complying with the standard in the Guidelines and Technical Basis section.
- **Requirement R6. A commenter proposed an exemption from Requirement R6 for federal entities that have an inspector general.** The SDT does not agree that the proposed exemption would meet the directives in FERC Order, Paragraph 11, which specifies that the review be conducted by an entity other than the owner or operator with appropriate physical security expertise. An Inspector General may be acceptable as a reviewer under Requirement R6 as long as they have the necessary expertise and is an unaffiliated third party. Please see clarifications in the Guidelines and Technical Basis section regarding affiliation.
- **Timelines for Requirements R5 and R6. Some commenters indicated that the standard did not allow sufficient time to complete the requirements.** The SDT believes that the timeline for Requirements R5 and R6 is aggressive but achievable.

Organization	Yes or No	Question 3 Comment
ACES Standards Collaborators	No	(1) We see a significant risk of the compromise of highly sensitive information created by Requirement R6 and question why the unaffiliated third party review cannot be integrated into the ERO compliance monitoring and enforcement processes. There is no compliance obligation on these third parties to complete the review within the required timelines, which could subject the TO to potential compliance violations. Furthermore, there is a limited set of companies with qualified personnel capable of performing this review. Given that all of the Transmission Owners will be working toward the same effective date of the standard, it is highly likely that a backlog of work would occur. Furthermore, review of the evaluations by consultants will increase the

Organization	Yes or No	Question 3 Comment
		the number of people with access to higly senstivie information. While this concern can be partially mitigated through confidentiality agreements, the more people that have the information, the higher the probability the information will be released, whether intentional or unintentional, to persons that should not have the information. To resolve this inssue, NERC and Regional Entities could hire qualified personnel to perform these reviews. NERC and Regional Entities could perform a spot check of the standard 90 days after the initial effective date. If NERC or the Regional Entity disagree with the approach or believe additional facilities should be added, RAI would give them the flexibility to treat the issue as not impactful to compliance as long as the TO resolve the issue within a certain time period. This approach would result in a reduced cost impact on industry and minimize the distribution of highly confidential information reducing the likelihood of information leaks. (2) How can the 'cost to benefit to risk to the BES' be measured consistently across each facility, region and risk? Does a Registered Entity have to authority to not implement a 'recommendation' from a third party based upon a cost to benefit to risk analysis? (3) Given that third parties are required to evaluate critical facility information, further guidance is needed for the required controls to prevent unintended release of highly sensitive and confidential information. What is the risk to the Registered Entity if the information does get leaked? Is this a violation to the Registered Entity, even if the leaked information was not caused by the Registered Entity? We are concerned that if this information were to be leaked, the Registered Entity could be liable for increased risk of attack, additional time and costs to address the leak and could impact the BES due to changes in operations from shutting down those facilities.(4) Part 4.2 has a potential "prove the negative" issue. How do you prove that you considered similar facilities particularly when similar facilities could includes other company's facilities. To resolve this issue we suggest replacing "similar" with "nearby facilities" or "asset owner's other facilities in the area". (5) Part 4.3 could be interpreted as requiring consideration of all threat and intelligence information including information that is not relevant to a given area. To remedy this issue, we recommend using the term "current and local" to describe the types of intelligence and threats that must be considered.(6) We believe that Part 5.2 is redundant to the EOP-004-2 - Event Reporting, especially Attachment 2 Event

Organization	Yes or No	Question 3 Comment
		Reporting Form line 4. Please consider removing and comparing the standard in its entirety to EOP-004-2 to avoid unnecessary duplication.(7) For Part 5.4, please modify the language to clarify that it only applies to facilities identified as a result of application of Requirements R1 and R2.(8) For Part 6.1 please modify "... from the following" to "... from one of the following". This will make it perfectly clear that only one entity must be selected.
Manitoba Hydro	No	(1) Manitoba Hydro has concerns about the need to have a third party to review or verify risk assessments and physical security plans. It is unclear at this point what measures or counter measures are being alluded to here as far as protecting critical assets such as lines and towers. This may potentially be financially burdensome as well as questionably effective.(2) Also missing in the standard is conflict resolution between a TO and this third party reviewer. Clarification should be provided on who weighs in on this and how NERC audits a system that has been verified by a third party. As currently drafted it appears that the third party reviewer/verifier would have no liability under the standard.
Texas RE	No	1. The sequence and timelines for R5 and R6 need to be reviewed. R5 states the TO "shall develop and implement" the security plan within 120 calendar days of completion of R2. R6 states the 3rd party evaluation can occur concurrently with or after completion of R5. It seems like the 3rd party evaluation should be completed before the plan is implemented in R5, otherwise the entity may be planning for or implementing measures that may not be appropriate for the risk level.2. R6 also 3. Also, who evaluates the implementation phase of security plan and whether or not it was implemented correctly or if the plan was effective? There should be an entity assigned for this task. There should be an exercise (like GridEx) to test the plan.4. The third party reviewer could be the same entity in R2 and R6. This could be a question of independence. It also does not indicate the third party actually verifies the implementation of the security plan(s) in R6. This does not permit the Compliance Enforcement Agency to place reliance upon the work of the third party.

Organization	Yes or No	Question 3 Comment
Georgia System Operations Corporation	No	o GSOC supports the comments submitted by both GTC and NRECA. o In addition, GSOC suggests in R4.2 changing "Prior history or attacks on" to Prior history of physical security related events at" to better describe the subrequirement. o GSOC suggests in R6, last sentence, changing the word "development" to "developed" in order to be consistent with the word "performed" in the same sentence.
Florida Keys Electric Cooperative	No	o It's unclear how an auditor will judge compliance with R4 and its subrequirementsas it will be uncertain what an owner or operation is aware of regarding prior history, intelligence information, etc. The language should be revised to clarify the compliance expectations and also taking into consideration that each TO and TOP may have a varied exposure to the items identified in the requirements. o R5.1 - FKEC strongly recommends the removal of "Resiliency or security" as this is not needed for the requirement and resiliency will be next to impossible to audit. o 5.3 - After the word "modifications " add ",if any," as this is a possibile outcome. o R6 - Same as comments on R2 in Question 2 above. and R2.1. o R6.1.1 - NERC standards should not endorse, or appear to endorse, ASIS or its certifications in a requirement. This should be removed. There could be other certifications that an entity may have that provides for the necessary skills under this standard. o R6.1.2 - It is highly unlikely that the ERO is not going to approve consultants for industry use. This should be removed. o R6.1.3 - All government agencies have physical security expertise for their own facilities; that doesn't mean they can be an adequate reviewer under this standard. This should be removed. o R6.1.4 - It is unclear and not auditable whether an entity has demonstrated expertise. This language should be removed.
Flathead Electric Cooperative, Inc.	No	Again, do not support the third party review requirements. Already an auditable standard approach.
Florida Municipal Power Agency	No	Again, FMPA commends the SDT for a job well done. Just a few minor comments.See response to question 1 concerning use of the terms "control center" and "unaffiliated".CHANGE MANAGEMENT OF THE VULNERABILITY ASSESSMENT AND SECURITY PLANSimilar to our comments regarding change management of the risk

Organization	Yes or No	Question 3 Comment
		assessment, it is ambiguous as to how we would implement change management related to the vulnerability assessment and security plans.R4 has no periodicity requirement, but, instead seems to require responsible entities to continuously reevaluate their vulnerability assessments in response to events listed in bullets 4.1, 4.2 and 4.3. If the entity changes their vulnerability assessment to include new threats, does every revision require a new 3rd party review? How do we come to agreement what constitutes a valid "trigger" for a new vulnerability assessment? It seems to imply that each of us would need to have an independent 3rd party on retainer to review our assessment of every intelligence or threat warning from governmental or regulatory agencies, or new attacks that each entity becomes aware of. Is that the intent? If so, what consititues a "warning", e.g., is it an "official" warning through some sort of official channel, such as a NERC Alert? If so, what happens if an entity decided to act on an "unofficial warning", such as a media release, to revise their vulnerability assessment - would that also need a 3rd party review? FMPA suggest clarifying 4.3 with "Official intelligence or threat warnings ...".R5 seems overly ambitious. 120 days, or 4 months, is not a lot of time to perform a vulnerability assessment and develop and implement a security plan, especially in response to a newly identified threat vector/warning, and especially considering that a revised security plan may include capital investments in measures like new enclosures, vehice barriers, or the like. Is the intent that a security plan could be a phased approach, e.g., implement an interim security plan within 120 days while future improvements to that plan take longer? If so, then the language of the requirement ought to reflect that intent. FMPA suggest a modification to R5 such as: "... shall develop and implement the first phase of a documented physical security plan(s) ... within 120 calendar days ..."In addition, R5 does not seem to fit temporally with R2 and R4 well. R2 requires periodic risk assessments every 30/60 months. R4 seems to require changes to vulnerability assessments in response to newly known threat vectors. The timing of R5 refers to R2: "... within 120 calendar days following the completionof R2" with no reference to a revision to the vulnerability assessment. This causes FMPA to belevie that revisions to the security plan as a result of a new threat vector and a revised vulnerability assessment of R4 would not need to be required until 120 days following the next

Organization	Yes or No	Question 3 Comment
		periodic risk assessment of R2. Is that the intent?If that is the intent, if an entity chooses to revise the security plan earlier, would that then need an 3rd party verification at that time, or at the time of the periodic risk assessment?
Black Hills Corporation Entities	No	BHC has the same concern with R4 as expressed in the opening comment of the previous section regarding the definition risk assessment. The tailored evaluation required by FERC directive paragraph 8 introduces a probability of less than 100%, which is in conflict with prior NERC guidance on risk definition. As previously noted, if the unique probability of a threat is to be taken into consideration along with the impact, this change from CIP-002-3 expectation should be clearly highlighted. In addition, the inclusion of probability in the risk assessment will increase disagreements between unaffiliated entities, which will require a mechanism for resolution.BHC questions R4.2: The current language states “Prior history or attack”. BHC believes this opening should state “Prior history of attack” because the current language does not provide an indication of what ‘prior history’ is being referred to.BHC agrees with the AZPS suggestion that a sector specific threat source be utilized to aggregate and disseminate threat information to ensure that relevant and timely data is analyzed consistently across the regions, which would also improve the auditability of the standard as well by removing the subjectivity associated with an unbounded number of threat sources. BHC believes that the 120 day requirement for R5 should be limited to the development of the security plan, and that full implementation should be dependent on the complexity of the plan. Implementation timing of the entity’s plan should be approved by the applicable RC. Provisions could be added for temporarily derating the facility, if the implementation timing were considered by the RC to be excessively long. By mandating a 120 day implementation, entity’s security plans may be down-sized to meet the 120 day implementation window, rather than to meet the potential threats and vulnerabilities at the facility. If “implementing” only means the specific deliverables of R5.1, R5.2, R5.3, and R5.4 (i.e. the timeline required by R5.3 is created, but not executed), then “implementation” needs to be more clearly defined.BHC has a further concern that R5.1 language reads too close to the “Identify, Assess, Correct” language already remanded by FERC in the CIP v5 standards.

Organization	Yes or No	Question 3 Comment
		Alternative language for R5.1 might be "Resiliency or security measures designed to prevent potential physical threats and vulnerabilities based on the results of the evaluation conducted in Requirement R4." This simplification is not expected to change entities efforts, but could be more appealing to FERC.BHC agrees with the reasoning of AZPS to simplify R6.1 to read: "Each Transmission Owner and Transmission Operator shall select an unaffiliated third-party reviewer with electric industry physical security expertise." If this language consolidation is not acceptable, then alternatively recommend that Section 6.1.1 be expanded to include other similar certification providers, e.g. the National Sheriffs' Association Institute for Homeland Security offers a Certified homeland protection Professional (CHPP) designation (https://ndpci.us/certification/CHPP_Certifications.php), so as not to appear preferential.
City of Garland	No	Clarification - R6.2: Need to clarify that "completing the security plan(s)" does not include completing the tasks outlined in the time line developed in R5.3 - the time line is required to be complete as part of the plan but not the tasks in the time line.
Tennessee Valley Authority	No	Comment: Proposed language to be added to the end on Requirement 6:This Requirement shall not apply to any Federal corporation or agency that meets any of the criteria in Requirement 6.1 and that has an Inspector General, pursuant to the Inspector General Act Amendments of 1988, appointed by the President of the United States and charged with oversight responsibility for such Federal corporation or agency.Comment: Recommend adding "with electric utility experience" as a reviewer qualification to 6.1.3 and 6.1.4.Rationale: There should be a common standardizing qualification such as PSP, CPP, or electric utility experience that applies across the sub requirements of R6 that entities and the ERO can use as criteria to qualify unaffiliated third party reviewers.
Western Electricity Coordinating Council	No	From a compliance perspective, WECC notes that the criterion identified in R4 is too vague to enable a consistent approach across regions or even entities. Identifying a basic set of attack vectors that must be considered (ie: direct fire ballistic attack,

Organization	Yes or No	Question 3 Comment
		indirect fire attack, explosive device attack, vehicle-borne attack, arson/incendiary attack) fosters a far more consistent approach while allowing the entity the flexibility to tailor their assessment and security plan to the unique characteristics and threat landscape of their asset(s). WECC is concerned that the language of Requirement R5 is confusing or contratictory. Requirement R5 requires the applicable entity to "develop and implement" a documented physical security plan...within 120 calendar days following the completion of Requirement R2. However, part 5.3 requires a timeline for "implementing" the physical security enhancements and modifications specified in the physical security plan. WECC questions whether Requirement R5 requires the physical security plan to be "developed" or "developed and implemented" within 120 calendar days following the completion of Requirement R2. If Requirement R5 requires "development and implementation" within 120 calendar days following the completion of Requirement R2, what is the purpose of the timeline for implementing the physical security enhancements and modifications specified in the physical security plan required by part 5.3?
Georgia Transmission Corporation	No	-GTC supports the comments submitted by the NRECA with regard to the applicability, requirements, and implementation of the draft standard.- GTC requests revision to the requirement language or addition of guidance around the phrasing of "unique charact
None	No	It is recognized that a one-size-fits all approach is not practical. However the proposed directives as to what should be included in physical security plans are so general that little is likely to change from current practices that are insufficient to protect very critical high risk substations. The only language directive in CIP-01401 is listed on Pg. 10, R5 para 5.1. More definitive guidelines must be outlined if improvements are to really be achieved.The utility industry has used real-time remote monitoring of substation equipment for reliability purposes for decades. Similar technology is available for the very important physical security function. The following sentence needs to be added at the end of paragraph 5.1. "Security measures must include isolation zones of sufficient size covering approaches to substations, in addition to monitoring inside substation fenced areas, to detect both attempted and actual

Organization	Yes or No	Question 3 Comment
		penetration of critical sites and the surrounding buffer areas. The areas must be patrolled with real time monitoring & assessment equipment designed to provide live and playback/recorded video that must be automatically presented to alarm station operators. Detection equipment must include gunshot detectors. Sufficient real-time surveillance must be provided to allow sufficient time to implement a tactical response plan to minimize and interrupt threats."
National Rural Electric Cooperative Association (NRECA)	No	It's unclear how an auditor will judge compliance with R4 and its subrequirements as it will be uncertain what an owner or operation is aware of regarding prior history, intelligence information, etc. The language should be revised to clarify the compliance expectations and also taking into consideration that each TO and TOP may have a varied exposure to the items identified in the requirements.R5.1 - NRECA strongly recommends the removal of "Resiliency or security" as this is not needed for the requirement, and resiliency will be next to impossible to audit.5.3 - After the word "modifications " add ",if any," as this is a possibile outcome.R6 - Same as comments on R2 in Question 2 above. and R2.1. R6.1.1 - NERC standards should not endorse, or appear to endorse, ASIS or its certifications in a requirement. This should be removed. There could be other certifications that an entity may have that provides for the necessary skills under this standard.R6.1.2 - It is highly unlikely that the ERO is going to approve consultants for industry use. This should be removed.R6.1.3 - All government agencies have physical security expertise for their own facilities; that doesn't mean they can be an adequate reviewer under this standard. This should be removed.R6.1.4 - It is unclear and not auditable whether an entity has demonstrated expertise. This language should be removed.
Los Angeles Department of Water and Power (LADWP)	No	LADWP requests the Drafting Team to make the following changes:- For R5, replace the word "implement" with "complete" to avoid confusion as to whether the plan needs to be implemented within the timeline provided- For R5.1, the word "Resiliency" needs to be defined in the standard to avoid any misinterpretation. Resiliency means different things to different people- For R5.1, add the language ", mitigate the impacts of," to the requirement as follows:"5.1. Resiliency or security measures designed to deter,

Organization	Yes or No	Question 3 Comment
		detect, delay, assess, communicate, mitigate the impacts of, and respond.....”- For R5.4, change the requirement language to read as follows:”5.4. Provisions to evaluate evolving physical threats to the Transmission station(s), Transmission substation(s), or primary control center(s), and their corresponding security counter measures. “This sub-requirement should allow for the TO to revise its already-reviewed security plan within the 30-month cycle without necessarily having to make arrangements for a third party review of the revised plan (although it may do so if TO so desires) and without creating an additional 30-month cycle review that the normal course - this is a matter of efficiency and due diligence to address evolving threats- For 6.1, as previously mentioned, the word “unaffiliated” needs to be defined in the standard to avoid any misinterpretation.- For 6.1.3, change the requirement as follows: “6.1.3. A governmental agency with physical security expertise, which could be a City Department in which the utility resides that requires a review to be performed.”This clarification allows for additional flexibility of independent governmental agencies reviews.- For 6.1.4, change the requirement as follows: “6.1.4. An entity or organization with demonstrated law enforcement, government, or military physical security expertise, such as the local police department in which the utility resides that requires a review to be performed.”This clarification allows for additional flexibility of independent entities or organizations reviews- For R6, add 6.1.5 with the following language: “6.1.5. A peer utility review group with demonstrated law enforcement, government, or military physical security expertise This clarification allows for additional flexibility of other Planning Coordinator, Transmission Planner or Reliability Coordinator review the work of their peers.In the alternative, expand to include Planning Coordinator, Transmission Planner or Reliability Coordinator with law enforcement, government, or military physical security expertise.- For 6.2, change the “90 calendar days” to “120 calendar days” to provide sufficient time to determine reasonable and sound recommendations.- For 6.3, chance the “90 calendar days” to “120 calendar days” to provide sufficient time to address any modifications recommended.

Organization	Yes or No	Question 3 Comment
New Brunswick Power Corporation	No	NB Power is concerned with the 120 day timeline to implement a physical security plan that would meet the third party verification requirements. Having limited knowledge of physical security issues NB Power will likely rely on the third party verifier to work with NB Power in developing a security plan. NB Power is not aware of any analysis that was done to ensure that there is enough capacity within the “physical security industry” to support the work load increase resulting from the approval of this standard and as such is concerned that 120 days may be insufficient.NB Power is concerned that it could be non-compliant with R6.2 if the third party fails to meet its obligation. While NB Power can mitigate the financial risk of that event it would still result in a recorded non-compliance.It is the opinion of NB Power that the proposed standard does not sufficiently address a disagreement resolution process between the TO and the unaffiliated reviewing 3rd party in requirement. NB Power believes that documenting the technical basis for not following the recommendations of the unaffiliated reviewing 3rd party without guidance on what constitutes valid technical reasons presents a compliance and enforcement gap where both the entity and an auditor may not be able to come to a consensus. NB Power suggests the SDT develop guidance concerning compliance and enforcement of this requirement indicating acceptable technical reasoning for not following the 3rd party’s recommendations.
Rayburn Country Electric Cooperative	No	Once the in scope facilities have been identified, it would be best for the entites to use the same resources for the evaluation of “Potential Threats” since this language has endless possibilities.i.e. Aerial attack, induced seismic events to name a few to illustrate "Potential". I favor the wording of "reasonable risks"The FBI, DOE or DHS should be involved in the discussion with the entities in lieu of a third party who is only subject to confidentiality agreements and also has interests beyond mitigating the true risks.
Ciy of Garland	No	R4 - Sub requirement 4.1 should be modified to include specific language focusing the security study to those elements within the substation that can affect the reliability of the BES. The security plan should protect those elements of the substation as

Organization	Yes or No	Question 3 Comment
		identified in the planning study in R1 that could cause the cascade or other unacceptable event identified in R1. Many substations identified in these studies are very large geographically and potentially very expensive to protect elements that may be located 30 to 50 feet above the ground. If these elements are determined to be critical they should be protected. If not, there is no justifiable reason to expend the resources to protect these devices. The security plans should concentrate on the protection of elements that could actually cause a cascading event, otherwise large expenditures may be made while adding no benefit or improvement to the reliability of the BES. R4.1 should read:4.1. Unique characteristics of the identified and verified Transmission station(s), Transmission substation(s), and primary control center(s) including the identified elements within the station, substation or control center, that need to be protected that could initiate the cascading collapse identified by the planning study in R1;Under both R4 and R5 clarification should be provided to the auditors affirming that auditors do not need the work papers, or backup information used in preparing the security plan, it is preferable auditors be allowed to only view the plan on site and not be allowed to take a copy of the plan for their files due to the sensitive nature of the security plan. Having copies of the security plans of critical targets consolidated into the files of the auditing entity increases the security risk to the plan and identified assets do to a security beach or accidental release of the file. While having one security plan of a critical location is a security risk in and of itself, having a compilation of security plans by one entity becomes a national security risk.R5 - states in part that each TO and TOP "shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s) within 120 calendar days following the completion of Requirement R2." The "and implement" should be deleted. It should be made clear the facilities, additional employees or other measure identified in the plan are not required to be in place at the end of the 120 days. The requirement should be clearly stated that a timeline needs to be developed as part of the plan and the TO and TOP will implement the plan per the timeline identified in the plan. The implementation may require several years to get through budget cycles, procurement, installation and implementation.R6 - The standard should make clear the auditor is not

Organization	Yes or No	Question 3 Comment
		to audit the security plan for its content or appropriateness, but to confirm a security plan has been developed and that particular security plan has been reviewed by a qualified entity. It should also be clear that a TO could expand its actual security beyond that identified in the approved/reviewed plan without requiring an additional review of such modification. Example:The original, approved plan had card readers on the doors and cameras within the yard. During the 30 months until the next required review, the TO added motion detectors as additional security measures at the substation even though they were not required in the initial security plan. The installation of additional monitoring or security measures beyond those in the approved plan should not initiate the need for a new security plan or third party review.
Bonneville Power Administration	No	R4. BPA agrees with the requirements to develop a threat assessment and physical security plan. BPA also agrees with the inclusion of governmental agencies with physical security expertise as threat assessment and physical security plan reviewers as noted in R6 (Section R6.1.3.) However, BPA requests that the drafting team clarify the scope and purpose of third party reviews should they remain as part of the standard. BPA disagrees that third party reviews will increase reliability and notes the draft standard exceeds the scope of the FERC order Paragraph 11. BPA believes that each entity is in the best position to evaluate threats to its facilities and determine appropriate mitigation plans. Nonetheless if third review is deemed necessary, BPA believes that it should be allowed to have another federal agency perform its third party review. In other words, for purposes of this standard, another federal agency would be deemed to be “unaffiliated” with BPA. Keeping this information within the federal government will decrease the risk of inappropriate disclosure of such information. BPA believes that non-disclosure agreements with non-federal parties may be a poor substitute for this because they can only be enforced once a disclosure is made. At that point, it is often too late and the information is available to a wider audience than intended. "R5. Each Transmission Owner that owns or has operational control of a Transmission station, Transmission substation, or primary control center identified in Requirement R1 and verified according to Requirement R2, and each

Organization	Yes or No	Question 3 Comment
		Transmission Operator notified by a Transmission Owner according to Requirement R3 that the Transmission Operator's primary control center has operational control of an identified Transmission station or Transmission substation, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s) within 120 calendar days following the completion of Requirement R2. The physical security plan(s) shall include the following attributes: [VRF: High; Time-Horizon: Long-term Planning]" BPA recommends revising the 120 day requirement in R5 to 12 calendar months. Justification: This information is important to get right as security designs and enhancements will be built from this plan. 120 days is not be enough time to develop a complete and effective security plan and incorporate finalized threat assessments."R6 Each Transmission Owner that owns or operates a Transmission station, Transmission substation, or primary control center identified in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3 that the Transmission Operator's primary control center has operational control of an identified Transmission station or Transmission substation, shall have an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5. The review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5. [VRF: Medium; Time-Horizon: Long-term Planning]" BPA recommends revising R6 first sentence to: "R6 Each Transmission Owner shall verify the risk assessment performed under requirement R4 by a third party entity other than the owner or operator." Justification: BPA believes the proposed revision fully aligns with the requirements of the FERC order by using the requirements of the FERC order. The introduction of a requirement of an unaffiliated reviewer is reaching beyond the requirements established by the FERC order, and this requirement will dilute the quality of a risk assessment. It will limit the types of entities that can perform an independent review, and directs use of resources that may not be capable of assessing all physical risks within an electrical facility. BPA proposes the word unaffiliated be removed from this standard and replaced with language that describes the degree of

Organization	Yes or No	Question 3 Comment
		separation from the facility owning entity to be considered a third party entity other than the owner or operator. Based on the definition provided in this draft "unaffiliated" is especially troublesome for federal government owned transmission networks and facilities because it could be interpreted as excluding the entire federal government from eligibility as a third party entity to the government transmission owner.Also, industry peer reviews should be encouraged and considered as meeting the requirement. Reviews by industry peers are known to be beneficial to the entity receiving the review and for the entity performing the review or audit. Enabling industry peer reviews would not only meet the intent of an independent review but also accelerate continuous learning and translation of the most effective security approaches into wide spread use. Please note that the FERC order only recommends this verification as it is stated as "should" and not as "shall."
Virginia State Corporation Commission	No	R4.2 requires each Transmission Owner of an identified facility to "consider" and "Prior history or attack on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events." Is such consideration to be given to other "similar facilities" of the specific Transmission Owner or of any Transmission Owner anywhere in North America? How will such "consideration" be possible if the scope of such consideration is intended to be the latter? R5 is fine, but R6 suffers from the same ambiguity as R4.
Dominion	No	R5 and R6 are written for the initial risk assessment and don't necessarily apply for subsequent risk assessments. Is the expectation that 3rd party reviews be performed for R4 and R5 every time R1/R2 is run, particularly if there are no changes? Dominion recommends that the SDT modify this in the event the R1 list changes (ie: add stations) to require a subsequent R4/R5 reassessment. If stations drop off, or no change to R1 list for subsequent assessments, then subsequent R4/R5 reassessment is not required.R6 - Through continuous improvement processes and lessons learned, there will be expected changes to the security plan(s). What changes are allowed to the security plan(s) without triggering a 3rd party review?

Organization	Yes or No	Question 3 Comment
Bureau of Reclamation	No	Reclamation agrees with the requirements to develop a threat assessment and physical security plan. Reclamation also agrees with the inclusion of governmental agencies with physical security expertise as threat assessment and physical security plan reviewers. However, Reclamation does not believe that the proposed requirements will allow adequate time for a comprehensive review. Reclamation suggests that at least 180 days would be a more appropriate timeframe for a detailed threat analysis and physical security plan review. Reclamation also requests that the drafting team clarify the scope of third party reviews of these threat assesments and physical security plans, perhaps by adding additional detail to the Guidance and Technical Basis section. Reclamation is not convinced that third-party reviews will increase reliability. Reclamation believes that each entity is in the best position to evaultate threats to its facilities and determine appropriate mitigation plans. Reclamation is concerned that the well-intentioned third-party review mandated by the order could result in classified or national security related information falling into the wrong hands. Reclamation does not believe that non-disclosure agreements will adequately protect this sensitive information.Reclamation believes that audits by regional entities in essence provide a “third-party” review of an entity’s threat assessments and physical security plans.
SERC CIPC	No	Recommend adding electric utility experience to 6.1.3 and 6.1.4. Consider removing the requirement for CPP and PSP certifications. Rationale: Numerous other mandatory enforceable standards (e.g. MTSA, CFATS, and CT-PATS) that do not require specific certifications nor are we aware of similar certifications in cyber elsewhere in the CIP standards. Suggest clarification of “electric utility experience” and “physical security experience” to allow the ERO and registered entities to justifiably select authorized third party reviewers.
Northeast Power Coordinating Council	No	Regarding Part 5.1, the requirement states that the security measures should be designed to deter, detect, delay, assess, communicate and respond to potential physical threats. NPCC suggests removing the obligation to ‘deter’ from this Part and establish a separate Part that addresses deterrence and very basic specifics regarding

Organization	Yes or No	Question 3 Comment
		what constitutes deterrence. The new Part could describe how an entity should implement deterrence and consider some minimum auditable criteria; for example, Consider and Implement measures designed to deter potential physical threats including 1) perimeter control 2) motion detection 3) lighting 4) access control. In this manner the ambiguity surrounding the term 'deter' is eliminated. Part 5.3 should allow flexibility to modify the time line. Suggest that Entities should 1) have a master Physical Security Plan; 2) have the flexibility to accomplish mitigation activities associated with the results of the vulnerability assessment, and 3) capture those mitigation plans under a separate mitigation plan (similar to the action plans for Cyber Assets vulnerability assessments) or include "associated modifications to the time line".
Kansas City Power & Light	No	Same comments about "third-party" from Question 2.
NCPA Compliance Management Operating Committee	No	Same line of reasoning as given in the response to the question 2. If the Applicability Section were changed R1, R3, R4,and R5 could be combined together and R2 and R6 could be combined together. This simplifies the standard and gets to the heart of the Reliability Concern without creating a Consulting industry to perform third party reviews.(If you don't like the suggestion, maybe I found a new business opportunity)
Southern California Edison Company	No	SCE has concerns with Requirements R4, R5, and R6 that will be described below.With respect to Requirement R4, SCE notes that entities are required to "...conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s)..." SCE requests the inclusion of additional guidance or examples of threats and potential vulnerabilities that an entity may want to consider. This will allow entities to perform a threat assessment and develop preventative measures that are commensurate with the intent of the standard. In addition, SCE requests additional guidance on physical security plans that allow for flexibility to deal with emergent threats. With respect to Requirement R5, SCE believes that in the guidance section, the drafting team should consider referencing standards that are used by security

Organization	Yes or No	Question 3 Comment
		professionals or organizations, in order to ensure that the criteria to identify appropriate countermeasures to potential threats and physical attacks are evaluated along similar themes across industry. SCE also requests that the team consider rephrasing R5.1 from “Resiliency or security measures designed to deter, detect, delay, assess, communicate, and respond...” to describe the control, to "...deter, detect and delay, and also assess, communicate, and respond..." With respect to Requirement R6, SCE requests that the team consider rewording Requirement R6.1 from “Each Transmission Owner and Transmission Operator...” to “Each Transmission Owner or Transmission Operator, with facilities identified as a result of R2,...”
Southern Indiana Gas & Electric Company d/b/a Vectren Energy Delivery of Indiana, Inc.	No	Specifically, Vectren recommends that R6 be removed from the draft standard, for the reasons set out in this Comment. And that an approach similar to that used for evaluation of designations under CIP 002 Version 3 be adopted for review of the required risk assessment. Vectren urges FERC and NERC to establish clear criteria for verifiers, so that NERC auditors can apply a uniform set of criteria to their after the fact assessment of verifier qualifications. As written, these provisions lack the specificity necessary to provide clear direction to entities, increasing the risk of later non-compliance. Such a risk is ironic and unacceptable in requirements that purport to provide a review of risk assessments. Under these draft requirements entities have no assurance that any third party verifier they might select will be considered “qualified” by FERC, NERC or NERC auditors who might review the results later - leaving entities at grave risk of compliance violations if FERC, NERC or any other regulatory body later disagrees with the entity’s selection of a third party verifier. Vectren strongly urges NERC and FERC to establish criteria for those who might seek to be designated third party verifiers, rather than leave assessment of qualifications to an after the fact review during a NERC audit or spot check. A lack of certainty leads here by necessity to a lack of confidence in the result, which Vectren surmises was not the intent of FERC or the drafters.

Organization	Yes or No	Question 3 Comment
Southwest Power Pool Regional Entity	No	SPPRE disagrees with the inclusion of Requirement 4.2. Prior history is not a predictor of future events and could result in critical facilities not being protected until after a sucessful first damaging attack with adverse BES reliability impact. Requirement 5.3 should be a project plan with measurable milestones for implementing the physical security enhancements and modifications.
Salt River Project	No	SRP supports comments submitted by APPA with the following additions:Third Party Verifiers:SRP recommends removal of the concept of third party verifiers and adherence to the existing, and well-functioning, audit program of FERC, NERC and the Regional Entities. If, at any time, modification to the compliance and audit program in regards to any or all of the standards are deemed necessary, such modification can be proposed, evaluated and implemented with due process to ensure no unintended adverse impacts. SRP is concerned that use of third party verifiers to verify, or opine on compliance, both undermines the foundational structure of the FERC/NERC/Regional Entity audit program and introduces additional risk for the safeguarding of critical facility information on physical threats and vulnerabilities. The national audit program for the mandatory Reliability Standards is founded on compliance, self-reporting and a range of audit types, including spot checks and regularly-scheduled audits by NERC and Regional Entities. There are no facts to support abandonment of this foundation in favor of the introduction of a non-authoritative mid-layer of inspection by third parties. Third party verifiers are not authorized to verify compliance. As such, a Registered Entity derives no concrete benefit from a third party verifier's expressions of agreement or disagreement with the Registered Entity's compliance activities. Notwithstanding the theoretical value of another's opinions on whether one has properly or fully complied with the requirements of CIP-014, there are sound and compelling reasons to forego requiring such opinions at the expense of owners. On the other hand, as demonstrated with other standards, Registered Entities readily retain expert consultants as needed to help them evaluate and resolve all manner of compliance challenges. This standard is no different in the sense that outside subject matter experts already are being retained as needed by the party bearing compliance

Organization	Yes or No	Question 3 Comment
		responsibilities.Introducing third parties does not guarantee value-added subject matter experts versed in the nuanced and individualistic profiles on critical facilities. The Transmission Owner already is required both by law and sound business practices to be versed in physical security risks and potential vulnerabilities of critical facilities. The owner both knows which are its critical facilities and is best suited to identify the optimal means and methods to protect them. There are overwhelming incentives for Registered Entities to evaluate and take all appropriate steps to ensure continued reliability of the bulk electric system and reliable service to electric customers. Critically, neither the owner nor FERC/NERC/Regional Entities can rely on the findings of third party verifiers: the approved program of compliance audits will continue regardless and without regard to the findings of third party verifiers.Confidentially of the highly sensitive information produced, gathered, used and maintained for compliance with this standard is critical. Wholesale introduction of a new subset of entities who would routinely gain access to such information poses additional challenges to information safekeeping. Absent demonstrable need, granting access to physical risk and vulnerabilities information introduces unnecessary risk. With any access, vulnerabilities for inappropriate use or further unauthorized access occur. Prudent industry practices dictate non-disclosure absent demonstrable need to know or compelling benefits from such disclosure. Here there is no record of need or benefits.
David Kiguel	No	Sub-requirement 6.1.1: While Certified Protection Professional (CPP) or Physical Security Professional (PSP) might be recognized certifications in the U.S.A., that is not necessarily the case across the Canadian Provinces. Recommend to add: “or equivalent in those jurisdictions where such certifications are not recognized.”Sub-requirement 6.4: In addition to the non-disclosure agreements referred to in this sub-requirement, the standard should specify that the reviewing individuals having access to the confidential information must have security clearance and training, similar to the requirement in other CIP standards. Also, the security clearance must be obtained according to the established procedures in the respective jurisdiction.

Organization	Yes or No	Question 3 Comment
Encari	No	The approach taken by the Nuclear Regulatory Commission, which prescribes specific physical protections for nuclear plants and materials in 10 CFR Part 73, is instructive. Applicable Transmission Facilities, which are subject to common potential threats and vulnerabilities, warrant minimum physical security protective measures. Physical security plans should incorporate those prescribed protective measures unless a responsible entity can establish that its validated security plan provides a comparable level of protection required by the Standard.
Hydro QuÃ©bec TransÃ‰nergie	No	The same comments regarding the term "unaffiliated" in Question 2 above apply to R6.HQT believes that the SDT should remain general about the security measures that should be put in place. Requirement R5.1 states "Resiliency or security measures designed to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities based on the results of the evaluation conducted in Requirement R4." We believe that rather than the standard dictate what type of measures are to be implemented, it should be rephrased to remain general and use similar language that is used in paragraph 9 of the FERC order. Suggest rewording the requirement to "Resiliency or security measures designed to protect against potential physical threats and vulnerabilities based on the results of the evaluation conducted in Requirement R4.".
Foundation for Resilient Societies	No	The third party review is not adequately specified. The Joint U.S.-Canada Outage Tasf Force Report (April 2004) determined that lack of Reliability Coordinator oversight, and legal authority, contributed to inadequate supervision of transmission operators, and reduced visibility of regional inadequacies. See our comment to Question 1 for our view that Reliability Coordinators and Balancing Authorities must be involved.
FortisBC	No	The third party review of the security plan does not guarantee an objective evaluation as they would be funded by the requesting entity. The standard could state that the entity should follow an industry standard technical guideline.The audit provides an independent review of an entity's application of the industry standard technical

Organization	Yes or No	Question 3 Comment
		guideline and therefore, an additional third party review should not be required as described in R6.
Tri-State Generation and Transmission Association, Inc.	No	Tri-State disagrees that the FERC order specifically forces the drafting team to have a requirement for 3rd party verification. The order uses the word “should,” not “shall” or “require.” Tri-State would argue that 3rd party verification would/will occur during scheduled audit times. Again if the drafting team feels a need to require an additional 3rd party verification, it should require the Regional Entity or Reliability Coordinator to request the plans.
Consumers Energy Company	No	We agree to the approach, however, our concern is around protection of information shared between the entity and the third party. There should be a requirement within the standard that requires the third parties to protect the information and not leave it up to the entities.
Public Utitliy District No. 1 of Cowlitz County, WA	No	We are very concerned with the preferential endorsement this Standard affords to ASIS International. We know of at least one other security organization that offers a security certification: the Certified Homeland Protection Professional (CHPP) designation form the National Sheriffs' Association Institute for Homeland Security. If this requirement is left unchanged, FERC's statutory obligation in determining a proposed reliability standard is "not unduly discriminatory or preferential" may trigger the standard to be remanded back to NERC. It is for this concern, and only this concern Cowlitz votes negative. However, Cowlitz plans to vote affirmative in the final Ballot, regardless of any concerns to allow NERC to meet FERC requirements.
Cooper Compliance Corp	No	We do not support the Standard for the same reason above. We do not support a third party review requirement other than that of the existing Standards. That is a review by FERC, NERC or the appropriate region.

Organization	Yes or No	Question 3 Comment
self	No	While the reqirement for unafflilated third party verification of the security plan is required by the FERC order, I believe the mandate will lead to future security compromises.
Western Area Power Administration	Yes	: We recommend striking the qualifier regarding the ASIS “Certified Protection Professional or Physical Security Professional” from the standard R6-6.1.1 as it is inclusive of only one organization and may not provide the best support for each entity . Simply having these certifications does not guarantee the necessary knowledge to perform this unique work. We believe the language does not support the intent of the FERC Order as identified in paragraph 11.We request the Drafting Team clarify the scope of the third party review process identified in R6 and tie the requirement to a specific and established method as consistent in accepted practices, such as the ISO processes. We recommend the third party review process be clarified as a review of the primary entity’s adherence to their established processes in evaluating threats and vulnerably, as well as their security plan(s). We believe the current audits conducted by the regional entities satisfy the third party review process as identified in the FERC Order, paragraph 11.We do not believe R6-6.4 adequately protects the sensitive information contained in the risk, threat, and vulnerability assessments, or the security plan(s). These reports may contain sensitive and/or classified information, or otherwise information that if released would jeopardize the BES, with little to no penalty for an offending party.
Utility Services	Yes	1. R4, what is the time frame for the evaluations? Is this to be conducted during the 30 or 60 month cycle outlined in R2 or more frequently? 2. R6.1, These are all “or” statements and 6.1.1 through 6.1.4 should be bullets, not numbers (this is outlined in the CIP-002-5 page 6, and should maintain consistency with the CIP standards format). 3. R6, Does the ERO have to approve of the third party reviewer? Is there going to be a criteria to determine “demonstrated physical security expertise”?
ATCO Electric	Yes	AET agrees with the flexible approach outlined by the draft standard and respectfully offers these following comment for the drafting team’s consideration:R4 - Please

Organization	Yes or No	Question 3 Comment
		consider altering the wording of the final sentence of R4 to "The evaluation shall consider, at a minimum, the following:". This allows additional flexibility for entities with existing physical security assessment programs to continue to include those extra elements within their plans.R5 - For the timeframe dependency please consider altering the dependent requirement to R4 instead of R2. Within the rationale section the drafting team concedes that R4 must be completed prior to commencing R5 and the drafting team also states that R4 does not state when the evaluation must occur, only that it must occur in time to meet R5. AET respectfully suggests that a linear progression be established just as in R1, R2, and R3. This would require a timeline be added to R4 for the completion of the physical security risk assessment (AET suggests 120 calendar days from the completion of R2). AET also respectfully suggests that R5 then be made dependent on the completion of R4 (AET suggest 120 calendar days from the completion of R4).R6 - Please consider the removal of the required certifications in R6.1.1. The FERC order specifies that the risk assessment be reviewed by "[...] or another entity with appropriate expertise" and does not specify any particular qualifications. In addition, no other CIP standard calls for specific certifications or qualifications. Neither engineering focused requirements (e.g. CIP-002) or cyber security focused requirements (e.g. CIP-003, 005, 007) specify that those requirements be reviewed or implemented by designated engineers or certified security practitioners (e.g. CISSP). The due diligence required of the entity will determine the level of rigor that that entity is comfortable with defending and should not be included in the standard.
American Public Power Association (APPA)	Yes	APPA supports approval of the proposed physical security standard, subject to the technical clarifications and corrections shown below. These comments were developed by APPA staff based on extensive input from a diverse group of members utilities that will be subject to the proposed standard once it is approved. Please see also the individual comments of APPA members.R4 CLARITY - Under R4, combining the applicability of this requirement to both TOs and TOPs with applicable control centers within a single sentence is confusing and could be read to imply that a TOP that is affiliated with a TO must arrange for a separate third party review. We recommend

Organization	Yes or No	Question 3 Comment
		revising R4 to read as follows:R4 Each Transmission Owner that owns a Transmission station or Transmission substation identified in Requirement R1 and verified according to Requirement R2, shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s) and Transmission substation(s), identified in Requirement R1 and verified according to Requirement R2. Each Transmission Operator notified by a Transmission Owner according to Requirement R3 that the Transmission Operator's primary control center has operational control of an identified Transmission station or Transmission substation, shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to their primary control center identified in Requirement R1 and verified according to Requirement R2. The evaluation shall consider the following: [VRF: Medium; Time-Horizon: Operations Planning, Long-term Planning] R4.2 TYPO - Please change: "Prior history or attack..." to "Prior history OF attack..." Make conforming edits to the RSAW. 30-MONTH CYCLE - Identification of new threats and vulnerabilities in R5.4 does not change the 30-month cycle for conducting reliability studies and security evaluations: The standard needs to make clear that the security plan needs to take into account threats and vulnerabilities that are known at the time the plan is developed and the approved plan is capable of addressing new threats and vulnerabilities as they emerge, but that there is no NERC requirement to revise the plan between 30 month cycles and for the NERC CEA to audit such revisions. The TO should apply its existing security plans and procedures to evaluate and mitigate evolving security threats. The TO may also revise the security plan in mid-cycle if it so chooses without arranging for a third party review, but that action does not obviate its obligation to conduct the "subsequent" risk assessment and threat evaluation and security plan on the 30 month cycle. The CEA will audit the processes the TO uses to develop its plans, rather than the content of the plans.REQUIREMENT R5 CLARITY - R5 states in part that each TO and TOP "shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s) within 120 calendar days following the completion of Requirement R2." Please change "implement" to "complete." The use of implement can easily be read to require the actual

Organization	Yes or No	Question 3 Comment
		implementation of physical security measures within 120 days, rather than the completion of the security plan, starting the 90 day clock for unaffiliated third party review under R6. In contrast, R6 states that: "The review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5."
Arizona Public Service Company	Yes	AZPS generally agrees with the approach of the standard as drafted. The following comments relate to suggested modifications or clarifications for Requirements 4-6.AZPS is concerned that Requirement 4.3, which requires the Transmission Owner to evaluate threat warnings from a myriad of sources, will result in inconsistent application by entities. The threat sources need to be consistent, and the threats evaluated must be relevant. AZPS suggests that a sector specific threat source be utilized to aggregate and disseminate threat information to ensure that relevant and timely data is analyzed consistently across the regions. This would also improve the auditability of the standard as well by removing the subjectivity associated with an unbounded number of threat sources. Requirement 6 requires Transmission Owners to secure a third-party review of the security plan developed under Requirements 4 and 5. AZPS strongly supports the development of security measures to protect critical substations. However, AZPS believes that requirements 6.1.1 through 6.1.4 add a level of specificity that does not provide an improved reliability benefit and has the potential to create a bottleneck that would make compliance within the short 90-day timeframe very difficult. AZPS contends that the most important quality of the third party reviewer is electric industry physical security expertise. Further, AZPS does not believe that the CPP or PSP certifications provide additional value from a realiability standpoint since neither certification has a sector specific focus. For these reasons AZPS would suggest that 6.1 be simplified to read: "Each Transmission Owner and Transmission Operator shall select an unaffiliated third-party reviewer with electric industry physical security expertise."
Tampa Electric Company	Yes	Comments to R5Tampa Electric Company appreciates the excellent work of the standard drafting team (SDT). They and their support staffs have evidently worked

Organization	Yes or No	Question 3 Comment
		very hard to produce in a very short time a family of documents that create a workable framework for improving the physical security of Transmission substations and primary Control Centers. We also commend NERC and the SDT for reaching out to the industry through a live a technical conference and by conducting a series Webinars in local and national venues. Moreover, we fully support the intent of the SDT as it has been articulated so well in the technical conference, in NERC and FRCC Webinars and in EEI and NATF conference calls. Unfortunately, there is a critical ambiguity in the text of requirement R5 that is problematic and needs to be addressed by the SDT. Our main concern is that requirement R5 literally reads that all provisions of the security plans for our primary control center and for all our substations and switchyards, including the installation and construction of any physical security upgrades, must be completed "within 120 calendar days following the completion of Requirement R2." Such a requirement may well be impossible to meet depending on the extent of the upgrades, the need for facility outages, and the number of locations that are affected.Members of the SDT have made it very clear in the Webinars and conference calls that they did not intend this result. Instead, the SDT intended to require registered entities, "within 120 calendar days following the completion of Requirement R2," to develop and document plans that include definite timelines for completing any security upgrades that are necessary to protect against the vulnerabilities and threats that are identified under requirement R4. Given that the text of R5 is contrary to the intent of the SDT, Tampa Electric urges the SDT to clarify that, in many cases, the completion of all mitigation work may take place on longer timelines, and that implementation of a security plan does not require the completion of all mitigation work. This clarification can be accomplished in the guidance document to the standard or by our preference, editing the text of the standard and issue a revised standard for a second ballot. Removing "and implement" from the text of requirement R5 should remove the ambiguity and conform the text to the intent of the SDT. This edit, combined with R5.3 expresses the SDT's intent on this issue: R5. Each Transmission Owner that owns or has operational control of a Transmission station, Transmission substation, or primary control center identified in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to

Organization	Yes or No	Question 3 Comment
		Requirement R3 that the Transmission Operator's primary control center has operational control of an identified Transmission station or Transmission substation, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s) within 120 calendar days following the completion of Requirement R2. The physical security plan(s) shall include the following attributes: [VRF: High; Timeâ€ Horizon: Longâ€ term Planning]5.3. A timeline for implementing the physical security enhancements and modifications specified in the physical security plan.
FirstEnergy	Yes	FirstEnergy supports the proposed requirements R4 through R6 but offers two comments: 1) In regard to the inclusion of "primary control centers," we suggest the team add language within the Guidelines and Technical Basis section for requirement R4 and potentially the inclusion of an additional FAQ item to document some of the team's feedback provided during the webinar sessions. During the webinar the team provided a good explanation of how CIP-014 is uniquely different than physical protections provided under CIP-006 and that CIP-014 provides perimeter protection of the primary control center location or site and not just the subset of the control center that may house cyber assets protected under CIP-006. 2) Regarding requirement R5, during the industry webinars it became evident that there is some confusion associated with the word "implement" as used in the statement "shall develop and implement a documented security plan(s)" and that some industry stakeholders questioned if implement intended completion of all identified tasks stated within the plan(s). While FirstEnergy understood the requirement as described by the team during the webinars, to alleviate any confusion and better clarify the intended application, FirstEnergy suggests changing "implement" to "initiate" or "issue" so that it reads "shall develop and initiate a documented security plan(s)". This wording may better align with part 5.3 and the guidance provided in the Guidelines and Technical Basis section that states "Entities have the flexibility to prioritize the implementation of the various resiliency or security measures in their security plan according to risk, resources, or other factors."

Organization	Yes or No	Question 3 Comment
Idaho Power Co.	Yes	Further clarification is needed on several points. 4.2 & 4.3 leave open much room for interpretation under audit to say you did or didn't consider a particular source or threat. There is also some consternation over the use of "potential threat" in this requirement. There are a great many potential threats many that are so remote and nearly impossible to protect against that the risk does not outweigh the cost. It seems like these sub-requirements are a potential audit findings trap by the way they are worded. There are also no criteria specified for what the unaffiliated third party will be looking for in their review of the entity's evaluation. There is a great deal of concern for how these third parties will be able to handle or be willing to handle the influx of these reviews especially considering the short 90 day timeframe listed in 6.2.
Public Utility District No. 2 of Grant County, WA	Yes	GCPD appreciates the flexibility built into the Standard language that allows tailored evaluations of potential threats and vulnerabilities to its own facilities. GCPD supports APPA's suggested edits to the Standard to enhance clarity of requirements under R4, R4.1 & R4.2.In addition, APPA's suggested removal of “and implement” under R5 clarifies that the intent of R5 is to develop the physical security plan, not fully implement the plan within 120 calendar days. This would better align the Standard language contained in R5.3.
Vermont Transco LLC	Yes	how long will and entity have to complete their plans designed due to the evaluation of threats? It appears that the standard is saying that you must develop a plan and a timeline to complete your actions associated with the plan. What if a timeline needs to be adjusted at some point, will an entity have to notify their RRO? Or just track all changes and their need to provide to an auditor during a full audit of the standard?
Portland General Electric	Yes	In Requirement R4 the phrase “owns or operates” is used for the first time. If Transmission Owner Entity A is also a Transmission Operator of a line it does not own, and that line was identified by Transmission Owner Entity B in Requirement R1 and verified according to Requirement R2, Entity A could be responsible for evaluating and protecting that line under this wording. However, there is no mechanism built into the standard to communicate this information or to allow the Transmission Operator to

Organization	Yes or No	Question 3 Comment
		dispute the decision. In addition, Requirement R4.2 should be changed to "[p]rior history of attack."In addition, in Requirement R4.3, the current wording places an unrealistic and unclear burden on every Transmission Owner to monitor intelligence or threat warnings from an open-ended list of sources. We recommend changing the wording from "[i]intelligence or threat warnings from sources" to "[i]intelligence or threat warnings received from sources" to narrow the obligation to information that the Transmission Owner actually received from its monitoring activities.In addition, in Requirement R5, the phrase "owns or has operational control over" is used for the first time. It's not clear why this needs to be different from the "owns or operates" in Requirement R4. Consistent terms should be used to decrease potential confusion.In addition, as above, PGE believes that the 90-day period to review each entity's evaluation and security plan is too short. Again, we propose replacing the R6.2 language, "[t]he Transmission Owner or Transmission Operator, respectively, shall ensure that the unaffiliated third party review is completed within 90 calendar days of completing the security plan(s) developed in Requirement R5," with the language, "[t]he Transmission Owner or Transmission Operator, respectively, shall ensure that any agreement executed with the unaffiliated verifying entity stipulate that the verification be completed by a date that is not later than 90 calendar days from completing the security plan(s) developed in Requirement R5."
MidAmerican Energy Holding Company	Yes	MEHC agrees with the R4 through R6 approach. However, MEHC suggests the following changes to improve the standards as written: The following rewording of R5 is recommended to clarify that the "build out" of security enhancement schedule. R5 Each Transmission Owner that owns or has operational control of a Transmission station, Transmission substation, or primary control center identified in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3 that the Transmission Operator's primary control center has operational control of an identified Transmission station or Transmission substation, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s). The plan shall be completed

Organization	Yes or No	Question 3 Comment
		within 120 calendar days following the completion of Requirement R2. Implementation of the plan shall be as documented in the plan.
NRG Energy, Inc.	Yes	NRG agrees the approach described in Requirements 4 through 6 addresses the directives specified in FERC Docket No. RD14-6-000. However, NRG does have concerns with the standard as currently composed and offers the following points it believes will improve the standard if implemented: o R5.1 provides no guidelines or examples of how to combat certain threats, or even what threat thresholds require accounting for. NRG appreciates the flexibility built into the requirement. However, NRG is concerned this flexibility could result in "interpretation" issues during future audits of compliance with the standard. o The ability to meet the time horizon commitment for providing the third party assessment of the vulnerabilities and security plan are contingent upon the availability of certified parties that can adequately perform these assessments. NRG is concerned there may be a lack of qualified resources available to the industry to complete the necessary reviews within the required time frame. o Because the reliability of the bulk power system depends on numerous susbstations all across the nation, it would be more effective to increase the monitoring of the grid to ensure timely, effective re-routing of power when a disruption occurs. o Minimum physical standards should be established within the security plan that include industrial standard chain link fencing with barbed wire topguards; gates secured with chains and locks (not the alloy metal collar around a post); signage that clearly states No Trespassing every 100 ft., or on each perimeter side at small footprints; cameras that are monitored by the appropriate transmission control center, security control center or a contract central monitoring service and capable night viewing to be able to identify intruders.
Minnesota Power	Yes	Overall Minnesota Power agrees with the approach laid out by the Standard Drafting Team in Requirements 4-6, but requests that the SDT consider modifying the wording of R5.1 as follows.Resiliency or security measures designed to deter, detect, delay, assess, communicate, or respond to potential physical threats and vulnerabilities based on the results of the evaluation conducted in Requirement R4.An auditor could

Organization	Yes or No	Question 3 Comment
		interpret the use of “and” in “...deter, detect, delay, assess, communicate, and respond...” to mean that each resiliency or security measure be designed to meet all of these, where we believe and hope that the intent of the sub-Requirement is that the resiliency or security measure identified in the physical security plan be designed to “...deter, detect, delay, assess, communicate, or respond...”, while recognizing that it may meet more than one.
Xcel Energy	Yes	Overall Xcel Energy agrees with the approach, but we offer the following items for consideration of the Standard Drafting Team.The rational for R4 and R5.1 indicate that there is no required timeframe to complete the evaluation of the potential threats and vulnerabilities to identified facilities, but it does indicate the linkage of completing this when the physical security plan developed as part of R5 and within 120 days of completion of R2. We suggest that it might be more efficient to combine R4 and R5 or clearly show the linkage to reduce confusion about the timing of these two activities. Maybe the standard should require entities to develop a physical security plan after the risk assessment is completed, not after a verification of facilities as specified in R2. If R2 returns a null set, this seems ambiguous as we may still be required to have a physical security plan, even if blank. Since R4 would only be considered applicable if the R2 risk assessment process identifies facilities, referencing R4 in R5 would seem more intuitive.R5.2 states that the physical security plan must include law enforcement’s contact and coordination information. However, guidance on law enforcement and coordination has already been established with the adoption of EOP-004-2. It is also unclear by what is meant by “coordination”. Since reporting a physical threat to a Facility is a requirement of EOP-004-2 and in order to remove ambiguity around the word coordination, we propose changing R5.2 to read “notification of law enforcement consistent with EOP-004-2”. This would avoid potential confusion whether the R5.2 requirement is different than the EOP-004-2 requirement.R6.1, While there will be some regional variances, if an entity spans multiple regions or even some governmental agency jurisdictions, what protection does an entity have against reviewer discrepancies or differences? For example, the Xcel Energy registered entities anticipate using a common risk assessment methodology, and similar security plans. It

Organization	Yes or No	Question 3 Comment
		would be efficient to have a single evaluator provide the review for all three Xcel Energy registered entities. It would also be important for Regional Entities to apply consistent criteria when auditing the risk assessments and security plans.R6.1.2, if the ERO does not meet any or some parts of the criteria established in R6.1, it is uncertain how the ERO will be able to determine and approve an organization that does. Our security department, like the departments at other utilities of similar size, consists of a mix of multiple CPP and/or PSP holders, prior law enforcement professionals and several career military experts, including nuclear military asset security. It would seem that resources within the industry are the most knowledgeable resources available to evaluate physical security plans, given the criteria, and would have more utility specific knowledge than outside entities. Similar to our comments regarding R2.1, since the industry has the most knowledge on threats and vulnerabilities, and means to prevent them, we again propose adding an option to allow for industry (but non-affiliated) peer review of the physical security evaluation, either directly or through a group organization such as the North American Transmission Forum. Allowing peer review is likely to assist in identifying and disseminating best practices, thereby improving security. R6.3. Similar to our comments regarding R2.3, if no recommendations are made for changes to the evaluation by the unaffiliated reviewing entity, does this conclusion need be documented? Since some of VRFs are built off this requirement, it would seem to follow that all aspects be included to ensure certainty for the industry.
Pacific Gas and Electric Company	Yes	R4 (pg. 9) "...shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s)..." Comment: Consider stating "...conduct a physical security risk assessment to identify and evaluate potential threats and vulnerabilities..." The assessment should identify the potential threats and vulnerabilities to evaluate and implement the necessary protective, detective and corrective countermeasures R5 (pg. 10) states to develop and implement a documented security plan (s) within 120 calendar days of completion of R2 (unaffiliated third party verify the risk assessment form R1). Furthermore, R5.1 states to address the potential threats and vulnerabilities from R4. 120 days to implement

Organization	Yes or No	Question 3 Comment
		the countermeasures may not be enough time (logistics, procurement, installation timelines, approvals, etc.). Comment: Could they say "...shall develop and begin implementation of a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s) within 120 calendar days..." because in R5.3 it requires a timeline for implementing the enhancements. 6.1.1. (pg.11) "An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification." Comment: Shouldn't require a specific certification, should say something like "The third party must include in their review the qualifications of the staff performing the review." R6.1.2 (pg. 11) "An entity or organization approved by the ERO." Comment: What criteria is the ERO using to approve entities or organizations? The approval process needs to be spelled out. R6.1.3 (pg. 11) "An entity or organization with demonstrated law enforcement, government, or military physical security expertise" Comment: Does this mean we can use Law Enforcement agencies or firms with retired law enforcement personnel?
ReliabilityFirst	Yes	ReliabilityFirst supplies the following comments for consideration:1. Requirement R5 - ReliabilityFirst requests clarification on why the term "primary control center" is used throughout the document instead of just "control center", as it seems both a primary and secondary control center would be of equal importance (and have similar vulnerabilities) to reliability.
PPL NERC Registered Affiliates	Yes	Requirement 5:In the VSL table, does implemented mean complete execution of the plan including any necessary construction, or does it mean having initiated the plan but not necessarily completed all planned construction? There are only 10 days between VSLs. Requirement 6:1. Similar to Requirement 2.3, the sub-requirements under Requirement 6.1 should be bullets, not individual sub-requirements. 2. Does R6 require subsequent third-party reviews when the security plan is revised? If so, what are the criteria?

Organization	Yes or No	Question 3 Comment
San Diego Gas & Electric	Yes	SDG&E agrees that an evaluation of potential threats and vulnerabilities of a physical attack to the facilities identified in R1 through R3 of the Standard is appropriate. Security threats and vulnerabilities can, and will vary from location to location and such differences must be accounted for in a robust security plan. It is appropriate and necessary that the Standard not mandate a one-size-fits-all approach, but requires entities to take into account the unique characteristics of each facility. SDG&E understands the Federal Energy Regulatory Commission's concern addressed by its Paragraph 11 directive that the Standard must have the analysis verified by an independent third party. While SDG&E believes it has in-house experts capable of performing such an analysis (as required by R4) and developing a Physical Security plan (as required by R5) adequately, SDG&E appreciates that verification by a third party, essentially a "second opinion," can serve to ensure a robust analysis of the physical security threats and vulnerabilities of facilities identified in Requirements R1 through R3. SDG&E appreciates the broad definition under R6.1 of what qualifies as a "unaffiliated third party reviewer." A list that unnecessarily limits possible reviewers could: 1) result in a bottleneck as too few potential reviewers are available for the industry to use; and 2) result in increased costs and a tight market for reviewers results in higher prices for their services.
Seattle City Light	Yes	Seattle City Light supports the Question 3 comments of APPA.
Seminole Electric Cooperative, Inc.	Yes	Seminole supports the comments by NRECA. Additionally, Seminole agrees with this approach. Requirements R4.1, 4.2, and 4.3 should be moved to the guidelines and technical basis as there is excessive flexibility provided to the auditor for concluding whether the evaluation is adequate and potential that an auditor may choose to determine that identification of events was inadequate. R5.2 requiring law enforcement contact information is redundant with EOP-004-2 R1. If an entity has a qualified third party perform the R5 security planning on behalf of or in cooperation with the registered entity, does this also meet the requirement R5? R6.4 is redundant with the information protection requirements in CIP-011-1. It would be appropriate to

California Public Utilities Commission: Safety and Enforcenment Division		In general, the overall method employed in the draft standard is reasonable. The draft standard has adopted a reasonable level of specificity, without being overly prescriptive.The use of unaffiliated verifying experts is a positive element in the draft standard. In general, we believe that the balancing authority or reliability coordinator for the transmission area in question is the best verifying expert. In the event the utilities disagree with the assessments of the unaffiliated verifying entities at any point in the process (for example see section 2.3, second bullet point), not only should the transmission owner or utility be required to document their technical rationale, but the standard should further delineate a process for resolving this disagreement. Section

Organization	Yes or No	Question 3 Comment
		5.1 of the draft refers to “resiliency”. Does this term refers to actions such as building redundancy or improving protective schemes, as opposed to direct physical protection activities? The standard should clarify the meaning of the term resiliency.Section 4.1 of the draft refers to “unique characteristics.” Assuming this consideration includes availability of spares and ease of repair, the language is acceptable.With respect to Rule 5, section 5.2, the drafting group should consider language requiring the security plan to include contact and coordinating information for other utilities or important stakeholders, in addition to law enforcement.With respect to Rule R6, section 6.4 the language requiring “non-disclosure” agreements is important and a positive element in the draft standard. Section 4.2 lists the elements to be considered in evaluating the potential threats and vulnerabilities to physical attack, and specifically states "[p]rior history or attack on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events and ...". We suggest that in additional to geographic proximity, that the section add language concerning "similarity of geographic characteristics". While geographic proximity, is a factor, ease of accessibility, layout and geographic contour, of an attacked facility is also important, if not more so.
ISO/RTO Standards Review Committee		The IRC has no comments on R4-R6.

4. **Do you have input on other areas of the standard or implementation plan not discussed in the questions above? If so, please provide them here, recognizing that you do not have to provide a response to all questions. Please limit your response to 300 words or less.**

Summary Consideration: The SDT appreciates all the additional comments submitted. All comments have been reviewed and changes that the SDT considers appropriate were incorporated into a subsequent revision. Several additions and clarifications were made to the Guidelines and Technical Basis section. A summary of comments and the SDT's response is provided. Note that some of the comments were previously addressed in preceding sections; the SDT's response is not repeated here.

- **Commenters suggested clarification of general terms including control center, primary control center, back-up control center, and widespread.** The SDT provided clarifications in the Guidelines and Technical Basis section.
- **A commenter recommended providing guidance for jointly owned substations.** The SDT has added commentary in the Guidelines and Technical Basis section to addresses joint ownership.
- **A commenter stated that the standard should explicitly allow a single plan to be developed to meet CIP-006 and CIP-014 requirements.** The SDT is aware that there may be a CIP-014-1 and CIP-006-5 physical security plan that differ, given that one is protecting against threats to cyber assets and another is protecting against physical threats. It is also aware the equipment and perimeters of protection will in many cases be significantly different between cyber assets being protected under CIP-006-5 and physical assets under CIP-014-1. Given these different purposes, the SDT believes it is appropriate to keep the physical security plans separate.
- **A commenter recommended providing clarification in the Guidelines and Technical Basis section to avoid placing risk on a verifier who is also a registered entity.** The SDT agrees that verifiers are not subject to violation of CIP-014-1. The plain language of CIP-014-1 in no way implicates that a verifier or reviewer, even if a registered entity, can be found in violation of CIP-014-1 for the work they do as a verifier or reviewer. Also, the language of Part 2.2 was revised to alleviate this concern.
- **A commenter suggested applying Cost Effectiveness Analysis Process (CEAP) to the standard.** The proposed Standard provides TOs and TOPs the ability to consider different methods to physically protect Transmission substations and stations and primary control centers implicated by this Standard. Therefore, the SDT believes that the application of CEAP is not needed.
- **Commenters proposed changing the implementation plan so that compliance with Requirement R1 would not occur simultaneously with the effective date of the standard.** The SDT considered alternate implementations but believes the proposed Implementation Plan provides entities sufficient time to complete Requirement R1 and strikes a balance between risk to the BPS and burden to the responsible entity.
- **A commenter recommended a SAR be developed to examine additional physical security issues and include additional entities in the physical security standards.** The SDT's scope is set forth in its SAR, and will work within that scope. The SDT considered and does not see the need to require the inclusion of RCs and BAs in the proposed Standard. Under the BA, EOP, IRO and TOP

standard families, RCs and BAs already have Real-time communication and oversight requirements, and the SDT does not see a need to duplicate those in CIP-014-1.

- Commenters provided editorial feedback on the VRF and VSL table that was accepted by the SDT where agreed.
- Commenters provided recommended changes to the RSAW which have been provided to the RSAW team.
- Commenters made suggestions regarding general readability of the standard; the SDT accepted recommendations where appropriate.

Organization	Yes or No	Question 4 Comment
FirstEnergy	No	FirstEnergy supports the proposed standard and appreciates the teams consideration of our comments intended to help clarify a few areas of the standard. FirstEnergy appreciates the team's efforts in producing a quality standard within an expeditious schedule and believes the team has provided a product that meets the core expectations described by the FERC Order.
ACES Standards Collaborators	No	Thank you for your time and consideration.
Ameren	No	We recommend adding language in the implementation guidance around the application of the terms 'control center', 'primary control center', and 'transmission station' in the draft standard.Obviously, there are a wide variety of understandings on these terms and additional clarity will help companies' ability to perform under the requirements. Considering that these terms have generic application to bulk power system reliability, the project timeline does not afford time for carefulconsideration of various facts and circumstances that might inform content offormal NERC defined terms.Also, we recommend that the standard drafting team (SDT) consider additions or changes to theimplementation guidance that will clarify several questions on the timing of the various implementation stages of the standard, including particularly that security plans are subject to change over time for a broad

Organization	Yes or No	Question 4 Comment
		range of reasons. In addition, we ask the SDT to consider clarifications in implementation guidance that, in many cases, the completion of all mitigation work may take place on longer timelines, and that implementation of a security plan does not require the completion of all mitigation work.
Duke Energy	Yes	(1) Duke Energy suggests that language should be incorporated either in the proposed standard or RSAW to allow for the flexibility in modifying the timeline specified in R5.3. We believe there are unforeseen circumstances that could occur which would result in the proposed timeline shifting from the intended completion date.Examples include, but are not limited to:a. Unplanned outage of transmission or generation facilities that results in canceling scheduled work.b. BES reliability concerns should the facility be out of service for a short or extended period of time.c. Third party vendor's availability in implementing recommendations made by an entity or unaffiliated third party verifier.For these reasons, we believe a provision is needed to allow for this type of flexibility in modifying the timeline specified in R5.3.
Manitoba Hydro	Yes	(1) R6.1 - It is not clear whether only one or all of the qualifications in Section 6.1.1 through 6.1.4 must be met. Accordingly, R6.1 should be rephrased to refer to "one of the following".
Utility Services	Yes	1 "primary control center" is confusing. NERC has a defined term "Control Center" which is intentionally not being used. What is the intent of not using the defined term? If the undefined term remains in use more clarity needs to be given on "primary control center".2. what is the definition of "widespread?" Does this mean outside of a Balancing Authority Area, outside of a Region or outside of an interconnection? More clarity is needed in the term. Additionally, TO's may not have the data required to perform this type of assessment. There needs to be process in place for the TOs to obtain the data required to perform the appropriate assessment. 3. The SDT should review projects such as PRC-006 or MOD C, and define groups within the requirements to reduce the length of requirements. For example R4 could be reduced to the following, making the requirement easier to read and adding much

Organization	Yes or No	Question 4 Comment
		needed clarity: “Each Applicable Entity shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Applicable Facilities as identified in R1 and verified in R2. The evaluation shall consider the following:... “RSAW Comment:R1 “Evidence Requested” section doesn’t provide a time frame for the first assessment, no assessment prior to effective date will be considered, but there must be an assessment completed before the effective date to be complaint. This is a catch 22.
MidAmerican Energy Holding Company	Yes	1. The standard anticipates the potential for joint responsibility in involving transmission operator control centers for substations identified by transmission owners. It is suggested that additional guidance be provided regarding joint ownership of substations The following addition to the first paragraph under the Requirement R1 heading which is similar to an aswer to this questions in the webinars is suggested: For substations that are jointly owned the owners may jointly designate one of the joint owners to perform the risk assessment for that substation. 2. It is suggested that a clarification be made to the RSAW with regard to the following question: “ As a result of your risk assessment, do you own any Transmission stations/substations, either existing or planned in the next 24 months, meeting the applicability requirements of 4.1.1?” By referring to risk assessment this seems to imply the stations/substations identified after the completion of the requirement R1 risk assessment rather than just the applicability requirements. It is suggested that the words “as a result of your risk assessment” be deleted from this question. 3. Item 3. in the guidance for Requirement R2 seems to actually be guidance for Requirement R1. However, it does not provide useful guidance for Requirement R1; therefore, it should be removed. The guidance for Requirement R1 that gives the TO discretion to choose its own methods and criteria is preferred.4. The following modification to one of the sentences in the “Performing Risk Assessment” section of the guidance document is suggested: “Using engineering judgment, the Transmission Owner should develop criteria (e.g. imposing a fault near

Organization	Yes or No	Question 4 Comment
		the removed substation) to identify a contingency resulting in potential widespread instability, uncontrolled separation or Cascading within an Interconnection."
American Public Power Association (APPA)	Yes	APPA supports approval of the proposed physical security standard, subject to the technical clarifications and corrections shown below. These comments were developed by APPA staff based on extensive input from a diverse group of members utilities that will be subject to the proposed standard once it is approved. Please see also the individual comments of APPA members.See comments on definitions under Question 1.RSAW for R1 poses the following question: "As a result of your risk assessment, do you own any Transmission stations/substations, either existing or planned in the next 24 months, meeting the applicability requirements of 4.1.1?" This question combines a multi-step process into a single question that cannot be answered as yes or no by many TOs. Please break the RSAW for R1 into three discrete questions:1...Do you own any Transmission stations/substations, either existing or planned in the next 24 months, meeting the applicability requirements of 4.1.1?2...Have you conducted a risk assessment of each applicable station or substation identified under Applicability section 4.1.1.?3...Did the risk assessment identify one or more Transmission station(s) and/or Transmission substation(s) that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection?RSAW R1 evidence request text from near the top of page 6: (R1) Provide the current and the immediately preceding risk assessments conducted after the enforceable date of this Standard (i.e. any risk assessments conducted prior to the effective date of this standard are not relevant). The draft Implementation Plan states that the risk assessment required by R1 "must be completed on or before the effective date of the standard," yet the RSAW language provided above seems to exclude such an assessment.RSAW R1 "Note to Auditor" on page 7: "Review entity's answer to the above Question and if the auditor can verify the answer is 'no,' Requirements R3-R6 do not apply and no further audit testing of Requirements R3-R6 is necessary." The text appears to reference the following question from page 6: "As a result of your risk assessment, do you own any Transmission stations/substations, either existing or planned in the next 24 months,

Organization	Yes or No	Question 4 Comment
		meeting the applicability requirements of 4.1.1?" This question is poorly worded, because TOs not meeting the applicability requirements of 4.1.1 are effectively exempt from this standard and do not need to perform a risk assessment.RSAW R3 "Question" on page 11: Please reword to add the following all caps text: "Are THERE any primary control centers identified in Requirement R1, Part 1.2 THAT ARE not under operational control of your NERC registration? RSAW R4 "Compliance Assessment Approach" on page 14: Change "or" to "OF" (R4 Part 4.2) "Prior history OF attack..." See the language used in the Guidelines and Technical Basis on page 31 of the standard.RSAW R5 "Note to Auditor" on page 16 states: "Auditor should cross reference the Transmission stations/substations and primary Control Centers identified in the risk assessment performed under Requirement R1 to the evaluation prescribed in Requirement R4 and the security plan(s) prescribed in Requirement R5 to ensure the plan addresses vulnerabilities that would facilitate physical attacks that have a high probability or likelihood of occurrence." The requirements of the standard do not address "probability" or "likelihood" of occurrence, so these factors should not be in scope of the compliance audit. Rather, auditors should address whether the security plan is complete and the TO or TOP addresses the issues raised by the third-party reviewer.
American Transmission Company, LLC	Yes	ATC supports the draft standard, with the realization that the aggressive time line has raised a broad range of issues or ambiguities resulting from the use of vague language or generic terms. While ATC understands the necessity for this approach, given the compressed timeframe directed by the FERC Order, the project's condensed timeline may not have afforded for the necessary and careful consideration of these terms. Improved guidance around the application of generic terms would increase clarity and help the industry. ATC also supports a follow up effort commensurate with typical standards drafting processes and timeframes to allow for further consideration, improvement, and cleaner language to assure effective implementation of the standard. An example of language like this is in Requirement R1, which includes the vague terminology of "widespread instability, uncontrolled separation, or Cascading." Risk assessment findings can vary

Organization	Yes or No	Question 4 Comment
		significantly depending on the assumptions, criteria, and methodology used for the assessment, and a more thoughtful use of terms could provide for a more uniform risk assessment basis.
Encari	Yes	CIP-014-1 should expressly permit one well-coordinated physical security plan for a Transmission Facility. As proposed, there could be a separate physical security plan under CIP-006-5 for BES Cyber Systems within an applicable Transmission Facility and potentially another physical security plan for the Transmission Facility as whole under CIP-014-1.
Southern Company: Southern Company Services, Inc.;Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation and Energy Marketing	Yes	Clarification should be made in the implementation guidance for CIP-014-1 that Verifiers who are also Registered Entities in functions applicable to CIP-014, are not subject to penalty under the requirements of CIP-014 due to verification duties performed at the request of a responsible Transmission Owner and/or Operator.
Tampa Electric Company	Yes	Comments: Comments to DefinitionsTampa Electric also urges the SDT to define certain terms that appear in the standard: 1) “Transmission substation” and “Transmission station,” 2) “collector bus,” and 3)”primary control center. There terms are not defined in the NERC Glossary and may not have definitions that are universally accepted by the industry. “Transmission substation” and “Transmission station”Many industry practitioners use the term “Transmission substation” generally, whether or not any transformers are installed in the facility they are describing. Other practitioners apply the term “Transmission substation” only to facilities that include transformers. The standard implicitly uses the term “Transmission station” in reference to transmission switching arrangements that do not involve transformers. However, the more commonly used term for a transmission switching arrangement that does not include transformers is

Organization	Yes or No	Question 4 Comment
		"Transmission switchyard." NERC addressed this issue in the Guidelines and Technical Basis section of CIP-002-5. The SDT could easily carry that text over to the Guidelines and Technical Basis section of CIP-014-1. However, it would be better to add definitions for "Transmission substation" and "Transmission station" to the Glossary of Terms Used in NERC Reliability Standards. The relevant text in CIP-002-5 is copied below for the convenience of the SDT.CIP-002-5 Guidelines and Technical Basis clarifications of "Transmission stations" and "Transmission substations" The SDT uses the phrases "Transmission Facilities at a single station or substation" and "Transmission stations or substations" to recognize the existence of both stations and substations. Many entities in industry consider a substation to be a location with physical borders (i.e. fence, wall, etc.) that contains at least an autotransformer. Locations also exist that do not contain autotransformers, and many entities in industry refer to those locations as stations (or switchyards). Therefore, the SDT chose to use both "station" and "substation" to refer to the locations where groups of Transmission Facilities exist."Collector bus""Collector bus" is another term that is not defined in the NERC Glossary and that may not have a definition that is universally accepted by the industry. "Collector bus" appears in 4.1.1.1 and in 4.1.1.2. of CIP-014-1 in text that was carried over from CIP-002-5.4.1.1 Transmission Owner that owns any of the following:4.1.1.1 Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility. [Underlines added]4.1.1.2 Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a

Organization	Yes or No	Question 4 Comment
		Transmission Facility, but is part of the generation interconnection Facility. [Underlines added]If “Collector bus” is not defined or clarified, some TOs may conclude that some part of every transmission substation or switchyard that receives the output of a generator(s) is excluded from the scope of the standard. However, that is not the case nor the intent of the SDT. Therefore, the drafting team should consider whether it should define or clarify in the guidance document, the term “collector bus” “Primary control center”The NERC Glossary defines “Control Center” in this manner:One or more facilities hosting operating personnel that monitor and control the Bulk Electric System (BES) in real-time to perform the reliability tasks, including their associated data centers, of: 1) a Reliability Coordinator, 2) a Balancing Authority, 3) a Transmission Operator for transmission Facilities at two or more locations, or 4) a Generator Operator for generation Facilities at two or more locations.What might not be clear for the purposes of CIP-014-1 is what exactly distinguishes a “primary control center” from other alternate “Control Centers.” Some registered entities can operate substations from multiple locations. Often, there is one self-designated “main control center” or “primary control center” for which there might be multiple alternate or “backup control centers.” Given that alternate or backup control centers have capabilities that are comparable to so-called main control centers, it might not be clear in some systems whether “primary control center” in CIP-014-1 applies to more than one Control Center.The SDT can solve this problem by adding a definition of “primary control center” to the NERC Glossary or by adding text to CIP-014 that for each critical substation the TO or TOP can designate any Control Center as the “primary control center.”
Pacific Gas and Electric Company	Yes	Compliance 1.2 (pg. 13) Comment: can they clarify by being less wordy and just start by saying “The responsible entities shall retain documentation as evidence for three years”, followed by the rest in less words?
Public Utitliy District No. 1 of Cowlitz County, WA	Yes	Cowlitz commends the SDT's effort in a very difficult situation.

Organization	Yes or No	Question 4 Comment
Ciy of Garland	Yes	Definitions:primary control center - although not capitalized and therefore not a defined term, it is used in this standard in requirements 1, 3, 4, 5, and 6. The same term "primary control center" (again not capitalized) is used with a completely different meaning in standards EOP-008 in requirements 1.3, 1.5, 1.6, 2, 3, 4 and 7.1. Similarly "primary control room" is used in EOP-005 requirement 5 and in EOP-006 requirement 6 and is defined as the control center from which a TOP normally operates as opposed to the backup center. In CIP-014, it is defined/implied to be the control center that actually controls the circuit breakers at two or more substations. o If the term “primary control center” is used there will be confusion over the different meanings within the NERC Reliability Standards. o A completely different term should be used such as “primary local control center” or “primary transmission operations center”. The SDT apparently meant a "facility that has direct Supervisory Control". The term should be defined completely in the standard and should become a defined term within the Glossary of Terms used in NERC Reliability Standards. Proposed defined term:Primary Transmission Operations Center - One or more Transmission Owner or Transmission Operator facilities hosting operations personnel having primary operational real-time control of the BES elements in one or more remotely located substations using SCADA, EMS or other electronic means.”Please clarify whether these security plans are also required at any backup control center. Many of these control centers are generally not manned on a 24 by basis.unaffiliated - should be either defined or a footnote needs to be added to the Standard to explain that unaffiliated - means the selected verifying or reviewing entity cannot be a corporate affiliate, as stated in the guidance document. o Would two entities that do not have a direct ownership stake in each other but both are parties to an ownership in a third organization be considered to be unaffiliated? Example: Two utilities each have an ownership of a joint power plant but no ownership of each other. o What if they both had no ownership of the third party but both had purchase contracts with a third party? An explanation needs to be in the standard and not in the separate guidance document.

Organization	Yes or No	Question 4 Comment
Consumers Energy Company	Yes	Develop a requirement to protect information shared between entities and third party organizations. Requirement number 6 should be revised to state "...third party reviewer that is either..." 6.1.1 or 6.1.2 or 6.1.3 or 6.1.4. R6 seems vague and should be revised
Edison Electric Institute	Yes	EEI supports the draft standard CIP-014-1 as fully responsive to the FERC March 7 order. The project has moved along a very aggressive timeline and naturally raises a broad range of practical and implementation issues. Based on extensive discussions with member companies, EEI recommends that the standard drafting team (SDT) consider additions or changes to the implementation guidance that will clarify for companies several questions on the timing of the various implementation stages of the standard, including especially that security plans are subject to change over time for a broad range of reasons. In addition, EEI asks the SDT to consider clarifications in implementation guidance that, in many cases, the completion of all mitigation work may take place on longer timelines, and that implementation of a security plan does not require the completion of all mitigation work.Observing the many meetings and webinars that have taken place recently, EEI also recommends that the SDT consider adding language in the implementation guidance around the application of the terms 'control center,' 'primary control center,' and 'transmission station' in the draft standard. Obviously, there are a wide variety of understandings on these terms and additional clarity will help companies' ability to perform under the requirements. Considering that these terms have generic application to bulk power system reliability, the project timeline does not afford time for careful consideration of various facts and circumstances that might inform content of formal NERC defined terms.
SPP Standards Review Group	Yes	Effective Date:The use of the term 'implement' needs clarification . To some implement means installed and in-service. To others it could mean a work in progress. The SDT recognized this confusion in the webinars on April 17 and we encourage them to modify the language to more clearly indicate the intent of the

Organization	Yes or No	Question 4 Comment
		drafting team. VSLs:Capitalize Part 2.3 in the Lower, Moderate and High VSLs for R2.Insert 'and verified according to Requirement 2' following the reference to Requirement R1 in all the VSLs for R5.Delete 'and modify or' in the last High VSL for R6.Guidelines and Technical Basis:Replace 'drafting team' with 'SDT' in the last paragraph under Section 4 Applicability on Page 27. Make the same change in the last paragraph on Page 32 under Requirment R6.Capitalize Remedial Action Schemes (RAS) and Special Protection Systems (SPS) in the paragraph at the top of Page 29. These are defined terms in the Glossary.Insert 'Transmission', capitalize 'Owner' and delete 'or operator' in the 1st paragraph under Requirement R2 on Page 29.Make 'outage' plural in Bullet c. at the top of Page 30.Capitalize 'Transmission Owner' in the 4th bullet in the middle of Page 30.Capitalize 'Owner' in the 1st line of the paragraph immediately preceeding Requirement R3.Insert 'Requirement' in front of R5 in the last line of the paragraph immediately preceeding Requirement R6.Spell out TO and TOP throughout the document. RSAW:The parenthetical statement in the 1st row of the table under Evidence Requested for R1 that states '...any risk assessments conducted prior to the effective date of this standard are not relevant...' is inconsistent with the statement on the Consideration of Issue or Directive in response to paragraph 12 of the FERC order. It states there 'This means that the initial risk assessment required by Requirement R1, must be completed on or before the effective date of the standard.' We believe the latter is consistent with the view expressed by SDT members on the two webinars conducted on April 17. This is also inconsistent with the posted Implementation Plan in which it states "The initial risk assessment required by CIP-014-1, Requirement R1, must be completed on or before the effective date of the standard." Additionally, this is inconsistent with others standards in that action is sometimes taken prior to the effective date of the standard in order to be compliant when the standard becomes effective.Replace 'with' with 'within' in the 3rd row of the table under Compliance Assessment Approach Specific to CIP-014-1, R2. This is the row for R2, Part 2.2.Use lower case control center in the Note to Auditor box at the bottom of the table under Compliance Assessment Approach Specific to CIP-014-1, R4.The phrase 'and compensating mitigating

Organization	Yes or No	Question 4 Comment
		measures' in the 4th row in the table under Evidence Requested for R6 goes beyond the requirement in the standard. The requirement only calls for the reasons for not modifying the security plan according to the reviewer recommendations. It doesn't require the Responsible Entity to specify how it will mitigate the discrepancy.
Westar Energy	Yes	Effective Date:The use of the term 'implement' needs clarification . To some implement means installed and in-service. To others it could mean a work in progress. The SDT recognized this confusion in the webinars on April 17 and we encourage them to modify the language to more clearly indicate the intent of the drafting team. VSLs:Capitalize Part 2.3 in the Lower, Moderate and High VSLs for R2.Insert 'and verified according to Requirement 2' following the reference to Requirement R1 in all the VSLs for R5.Delete 'and modify or' in the last High VSL for R6.Guidelines and Technical Basis:Replace 'drafting team' with 'SDT' in the last paragraph under Section 4 Applicability on Page 27. Make the same change in the last paragraph on Page 32 under Requirment R6.Capitalize Remedial Action Schemes (RAS) and Special Protection Systems (SPS) in the paragraph at the top of Page 29. These are defined terms in the Glossary.Insert 'Transmission', capitalize 'Owner' and delete 'or operator' in the 1st paragraph under Requirement R2 on Page 29.Make 'outage' plural in Bullet c. at the top of Page 30.Capitalize 'Transmission Owner' in the 4th bullet in the middle of Page 30.Capitalize 'Owner' in the 1st line of the paragraph immediately preceeding Requirement R3.Insert 'Requirement' in front of R5 in the last line of the paragraph immediately preceeding Requirement R6.Spell out TO and TOP throughout the document. RSAW:The parenthetical statement in the 1st row of the table under Evidence Requested for R1 that states '...any risk assessments conducted prior to the effective date of this standard are not relevant...' is inconsistent with the statement on the Consideration of Issue or Directive in response to paragraph 12 of the FERC order. It states there 'This means that the initial risk assessment required by Requirement R1, must be completed on or before the effective date of the standard.' 		assessment required by CIP-014-1, Requirement R1, must be completed on or before the effective date of the standard." Additionally, this is inconsistent with others standards in that action is sometimes taken prior to the effective date of the standard in order to be compliant when the standard becomes effective.Replace 'with' with 'within' in the 3rd row of the table under Compliance Assessment Approach Specific to CIP-014-1, R2. This is the row for R2, Part 2.2.Use lower case control center in the Note to Auditor box at the bottom of the table under Compliance Assessment Approach Specific to CIP-014-1, R4.The phrase 'and compensating mitigating measures' in the 4th row in the table under Evidence Requested for R6 goes beyond the requirement in the standard. The requirement only calls for the reasons for not modifying the security plan according to the reviewer recommendations. It doesn't require the Responsible Entity to specify how it will mitigate the discrepancy.
Florida Municipal Power Agency	Yes	FMPA has concerns for the RSAW and the lack of direction to auditors from the RSAW concerning the scope of their review. The auditor should not have a subjective decision regarding the sufficiency of the risk assessment, vulnerability assessment or security plan of the TO/TOP. The unaffiliated 3rd party is the source of qualified expert subjective opinion on the sufficiency of the risk assessment, vulnerability assessment and security plan. As such, the RSAW ought to clearly define the scope of the auditor's review of the risk assessment, vulnerability assessment and security plan. FMPA suggests rewording the "Compliance Assessment Approach"portions of the RSAW that call for these reviews to read something like the following (specific to R1):Review the entity's risk assessment to answer the following:a. Were all of the entity's assets, existing and planned to be in service within 24 months of the date of the documented risk assessment, and applicable to the standard (Applicability Section 4.1.1), included in the assessment?b. Was a transmission analysis or transmission analyses identified and documented to evaluate whether any applicable Transmission station(s) and Transmission substation(s), if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection? The auditor is not to evaluate the sufficiency of such analyses; but rather whether such analysis was documented.c. Was the assessment

Organization	Yes or No	Question 4 Comment
		conducted within the timeframes identified in bullet 1.1?d. Was the primary control center(s) identified in accordance with bullet 1.2?
Public Utility District No. 2 of Grant County, WA	Yes	GCPD feels that the implementation schedule is somewhat arbitrary and demonstating compliance with the implementation schedule conflicts with language contained in the proposed RSAW.GCPD supports RSAW edits as proposed by APPA to address these discrepancies.GCPD proposes the following edits to Requirement language addressing implementation timing to allow for enforceable and auditable time lines not dependent upon the unique completion date of the initial risk assessments conducted by the RE.2.2. ...The Transmission Owner shall ensure the verification of the initial risk assessment performed under Requirement R1 is completed within 90 calendar days following the effective date of this Standard.Subsequent risk assessments shall have verifications completed within 90 calendars days of completion of the risk assessment.R5. ...and primary Control Center(s) within 210 calendar days following the effective date of this Standard. Changes to recognized applicable facilities under this Standard as identified under Requirement R1 and verified according to Requirement R2, shall require review of the physical security plan(s) within 90 calendar days of completion of associated risk assessments. ...General commentary: in October 2012 the Cost Effective Analysis Process (CEAP) was approved for a “pilot”. The NERC CEAP was intended to integrate cost consideration and effectiveness into the development of new and revised standards. The first phase of the CEAP was to be implemented during the SAR stage to determine cost impact and identify “order of magnitude” or potentially egregious costs, to determine if a proposed standard will meet or exceed an adequate level of reliability, and what potential risks are being mitigated. The second phase was to be conducted later in the standard development process and afford the industry the opportunity to offer more cost efficient solutions that may be equally effective to achieving the reliability intent of the draft standard. This report would be posted at the time the standard is balloted. The report was intended to present the data collected in a manner which will provide the industry with representative cost implementation and effectiveness information to allow a more informed choice

Organization	Yes or No	Question 4 Comment
		during balloting. Based upon the urgent nature of this Standard, phase two would need to be applied. The CIP-014 Standard requires costs to be incurred to comply with Requirement R5. In addition, there may be substantial costs incurred to implement the Physicial Security Plan(s). The CIP-014 Standard is an ideal standard upon which to exercise the CEAP. The information resulting from the CEAP would be beneficial not only to government officials, but also the industry as a whole.
Georgia System Operations Corporation	Yes	GSOC supports the comments submitted by NRECA
Georgia Transmission Corporation	Yes	-GTC supports the comments submitted by the NRECA with regard to the applicability, requirements, and implementation of the draft standard.-GTC suggests that in M2 the word “communications” be changed to “notifications” to follow the language of t
GridWise Alliance	Yes	GWA includes electric utilities, information and communications technology service and equipment providers, Independent System Operators (ISOs) and Regional Transmission Organizations (RTOs), academic institutions, and energy consulting firms. GWA appreciates the acknowledgment in the Order of the significant efforts that industry already is undertaking to enhance the resilience of the electric grid and thereby protect the grid from a range of threats, including physical, cyber, natural, and other hazards. Industry has been working in close partnership with various levels of government to enhance grid protection, reliability, resilience, and security. This collaboration is ongoing and should be fostered for the future.As you are aware, the electric grid is dynamic in nature. Electric grid owners and operators are making investments to enhance the reliability and resiliency of the grid, and are actively managing the operation of the grid to prevent outages and to restore power expeditiously, when outages do occur. As this process moves forward, GWA wants to underscore the importance that the result not be overly burdensome or inhibit innovation. It is important that the risk assessment process indeed be limited to truly “critical” infrastructure that is deemed essential to the functioning of the bulk electric

Organization	Yes or No	Question 4 Comment
		system. This will help ensure that protection measures are reasonable and cost-effective, as well as cost-sensitive, to help minimize costs to industry and also to consumers, who ultimately must bear the costs of these investments. Industry is working hard to monitor and stay ahead of the myriad threats that could arise - physical, natural, cyber, and otherwise - recognizing that the types of threats and the motivations of potential actors continue to change over time. NERC should partner with FERC to ensure that an all-hazards approach to addressing risk is undertaken going forward. We appreciate the Order's acknowledgement of the vital need to protect confidential and sensitive information. Yet, we are concerned about the nature of information-sharing under this Order, and what protections and assurances, in fact, would be implemented to prevent the inappropriate sharing of confidential information. While also recognizing the need to protect the confidentiality of such sensitive information, we also note that it is important to ensure that information sharing is facilitated between the government and the private sector, as well as within the private sector. Vendors who supply critical systems and equipment are incorporated into this process, since continued coordination and cooperation among all the stakeholders is essential.
Rayburn Country Electric Cooperative	Yes	I think the standard IF broken up into 2 standards (High, Med) should provide clearer guidance as to the expectations of the plans content. Similar to the issues that arose with the Low assets in CIP V5 . Give basic structure and content to be addressed to give FERC the assurance the specific concerns have been met.
Minnkota Power Cooperative	Yes	In the "Draft_RSAW_CIP-014-1_v1_2014_0409.pdf" document, on page 4 of 22, there is a Note to Auditors Concerning Third Party Verifications and Reviews. In this section there is a mention to the "concept of reliance means using the work of others to avoid duplication of efforts". While the reference to "duplication" was in regards to unaffiliated third party verifications and reviews, we appreciate the SDT be congnitive of "duplication of efforts" as their developing the Standard and the RSAW. With the very restrictive timeframe for which the development of the Standard was required, this concept can get lost. We did see another area in the Standard CIP-014-1 R5.2,

Organization	Yes or No	Question 4 Comment
		which may be considered “duplication of efforts”. CIP-014-1 R5.2 states, the TO/TOP should have in their physical security plan(s) law enforcement contact and coordination information. On June 20, 2013, FERC approved Reliability Standard EOP-004-2, which identified types of reportable events and thresholds for reporting, requires responsible entities to have an operating plan for reporting applicable events to NERC and other entities (including law enforcement), and requires reporting of threshold events with a 24 hour period (Docket No. RD13-3-000). This Standard covers the need to incorporate law enforcement contacts in the operating plan. Requesting this type of information in both the operating plan required in EOP-004-2 and physical security plan in CIP-014-1 is a “duplication of efforts”. MPC believes the intent for CIP-014-1 was to identify and mitigate physical security risks, while the intent for EOP-004-2 is to improve reliability of the BES by requiring the reporting of events by Responsible Entities. MPC suggests removing Requirement 5.2 in CIP-014-1.
Western Area Power Administration	Yes	In the VSL for requirement R5, in all four severity levels, states that the security plans need to be developed for the facilities “identified in requirement R1”. However Requirement R5 only requires the plans to be developed for facilities ‘identified in Requirement R1 and verified according to Requirement R2,”. The VSL should be modified to include the statement ‘and verified according to Requirement R2.The first row in the Table, in the RSAW, describing the evidence required in requirement R1, it states that any risk assessments conducted prior to the effective date of this standard are not relevant. The Implementation Plan states that “The initial risk assessment required by CIP-014-1, Requirement R1, must be completed on or before the effective date of the standard.” There appears to be a conflict between these two statements, unless the intent is that the initial risk assessment needs to be completed on the effective date. Also, normally, unless the implementation plan provides a different time line, you need to be compliant by the effective date.In the RSAW for requirement R6 the fourth row in the Evidence Requested table, it asks for evidence that includes the “reasons or compensating mitigating measures for not implementing the recommendations for the reviewing party.” Requirement R6.3 of

Organization	Yes or No	Question 4 Comment
		the standard only requires the Transmission Owner or Transmission Operator to "Document the reason(s) for not modifying the evaluation or security plan(s) consistent with the recommendation." These two statements should be clarified in order to ensure consistent enforcement.
American Electric Power	Yes	It is AEP's understanding that regarding R5, the phrase "develop and implement a documented physical security plan...within 120 calendar days" means that, within 120 days, the physical security plan must be completed and that the entity is working toward implementing the plan and does not mean that the plan must be fully implemented within 120 days. AEP urges the clarification of that expectation within R5 so that the requirement is unambiguous. Regarding R6.4, please clarify whether the procedures for protecting sensitive or confidential information would include suitable terms and conditions within a third party contract.
Northeast Power Coordinating Council	Yes	It is NPCC's expectation that RAI concepts will be applied to the operating and enforcement of this standard.
Omaha Public Power District	Yes	OPPD believes that the third-party verifications in requirements R2 and R6, to be performed once every 60 calendar months, not each time when a risk assessment analysis or security plan is changed that does not significantly change the facilities identified or the associated security plan. The transmission entity can still perform analysis and update security plan accordingly as required by this standard, however, the third-party verification should be reserved for major changes to the assessment or the plan or otherwise be done every 60 calender months.
Lincoln Electric System	Yes	R1 - It appears the intent of R1 is for a TO (which meets the applicability section 4.1.1) to perform a risk assessment (as defined in the standard) on only those substations that meet the applicability section 4.1.1, not all substations owned by a TO which meets the applicability section 4.1.1 description; however this is not 100% clear. The verbiage of the second sentence in R1 states "The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses

Organization	Yes or No	Question 4 Comment
		designed to identify any Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection." The use of the word "any" in this sentence has led some to believe that a TO (which meets the applicability section 4.1.1 description) will have to assess all of their substations, even those that do not meet the section 4.1.1 description. To address this possible issue, LES recommends replacing the word "any" in R1 with "applicable".R2 - Smaller TOs may not have the in-house resources to perform the risks assessments required in R1, and may need to contract with a third party to perform these assessments. If the performing third party is not affiliated with the TO, is a second unaffiliated third party verification required as stated in R2? Please revise the requirement to address this situation.
Bureau of Reclamation	Yes	Reclamation is concerned that the term "primary control center" will become confused with the NERC Glossary term "Control Center." As indicated by the use of the term "monitor" in the definition of Control Center, Reclamation does not believe that the concept of "operational control" has been equated with "causing direct physical action" to date. To avoid confusion, Reclamation suggests that the drafting team replace the R1 phrase "primary control center that operationally controls eachTransmission station or Transmission substation" with the phrase "primary control center that physically controls each Transmission station or Transmission substation."
City of Garland	Yes	Recommendation # 1 - Include the timeline diagram located in the FAQ document titled "CIP-014 Physical Security Process Flow" in the Guideline and Technical Basis section of the standard. This diagram clearly demonstrates the timing between the different requirements. Because of the subsequent risk analysis's in R1, verifications in R2, and potentially the processes outlined in R3, R4, R5, & R6, questions on timing (answered by the diagram) potentially will arise throughout the life of the standard. Recommendation # 2 - Add the words "catastrophic failure" to the Purpose statement. On a webinar, there was discussion concerning the Purpose statement and it was stated a number of times that "widespread instability, uncontrolled

Organization	Yes or No	Question 4 Comment
		separation" meant to convey the concept of "catastrophic" - there will be a lot of folks involved in the implementation of the standard who did not hear the webinar comments.Recommendation # 3 - Rather than the term "primary control center" used in all the proposed requirements, use a different term or phrase such as the "facility that has direct Supervisory Control". The word "direct" in the recommendation of "direct Supervisory Control" should replace the need for the word "primary" - primary makes one think of primary and backup (which is not addressed in the standard). The concern with using primary control center, even though "control center" is not capitalized, brings up a mental picture of primary (and backup) Control Centers as defined in the NERC glossary. The standard should be straight forward, not using terms that can be confused.
Seattle City Light	Yes	Seattle City Light supports the Question 4 comments of APPA.
Salt River Project	Yes	Section C "Compliance" 1.4 (page 13) which states "...all evidence will be retained at the TO and TOP facilities." is contradictory with NERC Compliance Monitoring and Enforcement practices which allow data to be exchanged with and sent to Regional Entities such as in pre-Audit data requests and Mitigation Plans. In addition, this would be burdensome for the TO/TOP because the 3rd party verifying/reviewing entities would need to be on-site and potentially incur travel expense.
Con Edison and Orange & Rockland	Yes	Section: PurposeComment: Use of term "primary control center" should be clarified. If an entity has a primary control center and a redundant back up control center, is the back up control center also in scope for CIP-014? Requirement 1: is the intent of the Standard that the R1 risk assessment be applied to transmission stations or substations identified under Applicability 4.1.1.4, as meeting NPIRs? Requirement 4: If under Requirement R4 a Transmission Owner owns or operates a single substation that employs multiple voltage levels, then which portions of that substation would be covered by CIP-014-1 and the Entity's physical security plan, and which would not be covered? Requirement 5: Consideration of transmission system "resiliency" is more

Organization	Yes or No	Question 4 Comment
		appropriate to be applied during the R1 risk assessment, as opposed to the R5 physical security plan. Recommend moving references to resiliency to R1.
Texas RE	Yes	Several places in the standard refer to notifying the Transmission Operator for stations that meet the higher risk profiles. However, the language is not clear as to what is expected from the Transmission Operators when a physical security incident occurs at one of those substations during real-time operations. Finally, this entire process can exceed four hundred days, which is excessive.
Xcel Energy	Yes	Since existing criteria from CIP-002-5.1 is used to identify facilities in scope, Xcel Energy suggests the addition of the proposed requirements be incorporated to CIP-006-5 (rather than in an entirely new standard) to more closely align and standardize the oversight of R3 and R6. In addition, this would centralize all physical security requirements within a single Standard. Additionally, there is a significant amount of language in the requirements to specify the affected parties. We suggest the Standard Drafting Team seek opportunities to more concisely outline the applicability and the subsequent obligations in the requirements, to improve ease of understanding. We see an opportunity for the audit or risk functions of the Regional Entities to align with the third party review criteria established in the proposed standard. Although the expertise to perform this function may not currently be in place, the Regional Entities could easily develop the knowledge and expertise, and the reviews could naturally integrate within their other review and assessment activities.Overall, the standard is very comprehensive as drafted and it is balanced in a manner that allows for maximum flexibility. Consistent with NERC's evolution to results-based standards, it is appropriate for the standard to focus on the desired results of increased security of critical facilities, rather than mandating rigid actions that may or may not be suitable for individual facilities and entities. Allowing industry the latitude to design its own mitigating measures ensures those measures will be the most practical and cost effective as appropriate for the particular nature of each facility. The flexibility of this proposed standard is the best opportunity for the industry to execute a comprehensive solution based on assessments and security

Organization	Yes or No	Question 4 Comment
		that relies on the unique design and characteristics of the operating systems of each utility.
Nebraska Public Power District	Yes	Since we are using CIP-002-5 for identifying Transmission stations and substations, the confidential information for these facilities is already protected under CIP-011-1 Information Protection. CIP-014-1, requirements 2.4 and 6.4 are redundant with already approved requirements and are not needed. Adding requirements for protecting sensitive or confidential information in this standard will create confusion and double jeopardy. CIP-006-5 covers physical security and any information pertaining to the substations identified through the CIP-002-5 criteria. CIP-011-1 already protects this information.Due to the expedited development of this standard, sufficient time isn't available to provide clear requirements in the standard to evaluate compliance. The RSAW does contain language that will help, but the RSAW isn't the enforceable document and can be changed without industry approval. We've learned from implementing the other CIP standards that auditors can take a completely different position than what was meant by the drafting team with little recourse for utilities.
Southwest Power Pool Regional Entity	Yes	SPPRE recommends that subsequent risk assessments should be peformed at least every 36 calendar months regardless of whether previous risk assessments had identified critical facilities. It is more important to identify facilities that should be on the list than those that might not need to be on the list anymore.
PNM Resources	Yes	Support the comments submitted by EEI
Bonneville Power Administration	Yes	The current draft requiring "unaffiliated" third party review is more restrictive than the requirements language in the FERC order and meeting an unaffiliated requirement will be problematic for federally owned power and transmission systems. Paragraph 8 of the order: "Thus, the Reliability Standards should require the owners or operator to tailor their evaluation to the unique characteristics of the identified critical facilities and the type of attacks that can be realistically

Organization	Yes or No	Question 4 Comment
		contemplated. NERC should also consider in the standards development process requiring owners and operators to consult with entities with appropriate expertise as part of this evaluation process." BPA's interpretation of the FERC order is that consultation with peer entities would be acceptable methods for review of evaluation processes. In fact the order by its wording encourages such consultations without restriction as to business or corporate relationships. The draft standard limits and excludes highly qualified security and technical expertise found across the industry and within entities corporate and governmental structures, hierarchies and partnerships where vast levels of experience, training and ability exist. The "unaffiliated" requirement forces entities to seek expertise where there may or may not be such expertise and where there is no track record of such expertise. The term "unaffiliated" and any reference to that level of separation between entities are completely void from the order and should be removed from the draft standard.Paragraph 11 of the FERC order: "In addition, the risk assessment used by an owner or operator to identify critical facilities should be verified by an entity other than the owner or operator. Such verification could be performed by NERC, the relevant Regional Entity, a Reliability Coordinator, or another entity." BPA believes the draft standard limits and excludes highly qualified security and technical expertise found across the industry and within entities corporate and governmental structures, hierarchies and partnerships where vast levels of experience, training and ability exist. The "unaffiliated" requirement forces entities to seek expertise where there may or may not be such expertise and where there is no track record of such expertise. The term "unaffiliated" and any reference to that level of separation between entities are completely void from the order and should be removed from the draft standard.
Hydro QuÃ©bec TransÃ‰nergie	Yes	The following are suggestions to facilitate reading of the standard, as well as its future translation: All requirements: Replace the expression "Transmission stations and Transmission substations" with "Transmission facilities". Otherwise, please explain why such a distinction is necessary.R1: Remove "transmission analysis" from the sentence "The initial and subsequent risk assessments shall consist of

Organization	Yes or No	Question 4 Comment
		transmission analysis or transmission analyses designed to ..." We believe this repetition is unnecessary.R2.2: The first part applies to an entity that is not subject to the standard and should be removed from the standard.R2.3: Replace the word "identification" with "assessment". Remove the word "either"Rephrase R4, R5 and R6 (add "a"): " ...a transmission substation, or a primary control center".R4 and R5: Remove the part "...that the Transmission Operator's primary control center has operational control of an identified Transmission station or Transmission substation". It only complicates the reading of the requirement (the TOP is not notified by the TO unless it has operational control over an asset identified in R1). If the first parts of R4, R5 and R6 are intended to identify the functional entities to which the requirement applies, we suggest "... and each Transmission Operator notified by a Transmission Owner under requirement R3, shall ..." for the TOP portion (line 3 to 6 of R4, R5 and R6). We believe that it would greatly improve clarity and readability of the requirements.R6.1: rephrase to "from one of the following". Furthermore, the numbers 6.1.1 to 6.1.4 should be replaced with bullets as is the case in R1.1, R2.1, and R2.2. Rephrase R6.1 and R6.1.1 to reflect the language used in the rationale. We believe limiting the reviewer to someone with a CPP or PSP certification goes beyond what the FERC order requesting. Suggest rephrasing to "with appropriate expertise of the evaluation performed".Guidelines and Technical Basis on requirement R1: HQT agrees with the fact that the TO has discretion to choose the specific method to establish the risk assessment, and that it is relevant that the Guidelines proposes examples. However, the proposed example of "removing all lines to a single Transmission station" seems to present a very stringent impact considering a physical attack on a facility. We ask the SDT to propose others less stringent examples that would be more in line with realistic physical attack, such as loss of a large section according to physical organisation of the facility, or loss of all main transformers, etc.
NCPA Compliance Management Operating Committee	Yes	The Implementation Plan is too agressive. I cite NCPA experience as described in our response to question 2. I find it interesting the the CIP-version 5 standards have

Organization	Yes or No	Question 4 Comment
		essentially a two year implementation plan for medium and high assets and yet this proposed standard has a 6 month implementation plan.
David Kiguel	Yes	The Implementation Plan obligates applicable entities to complete the initial risk assessment in Requirement R1, on or before the effective date of the standard. While performing and completing the vulnerability assessment before the effective date of the standard may constitute a recommended good practice, from a statutory perspective, compliance with the standard before its effective date may not be enforceable in all jurisdictions. An entity cannot be found in violation of the standard at a time when the standard is not yet effective. Recommend changing the implementation plan to require completion of the assessment after the effective date of the standard.
South Carolina Electric and Gas	Yes	The requirement for unaffiliated third party verification throughout this standard is not consistent with other NERC Reliability Standard verification requirements. SCE&G is concerned that this standard sets precedence for future standard third party verification which would be very costly, confusing and burdensome.
Basin Electric Power Cooperative (BEPC)	Yes	The SDT should be applauded for the diligent work performed in short order to meet the requirements of the FERC order RD14-6-000 while allowing flexibility in the manner the Registered Entity may be compliant.
Idaho Power Co.	Yes	There is great concern related to information protection related to turning over information concerning vulnerabilities of the grid and related facilities to outside parties. Even with the use of NDAs, these third parties are not subject to the same NERC reliability standards (i.e. CIP standards, information protection, etc) as the entities, will not be audited on their information protection practices, and may have no accountability to the regulators in the event of a disclosure of sensitive information, inadvertent or otherwise. It is a concern that the TO is responsible for 3rd party verification to be completed within a tight 90 day window, especially considering the critical infrastructure information being exchanged. Contractual

Organization	Yes or No	Question 4 Comment
		exchanges and negotiations could impede upon the 90 day window. Also, TO's may need time to review the R2 study results and possibly mitigate study discrepancies. The date R1 needs to be performed is unclear. Does it need to be performed within a certain amount of time after the effective date? The implementation plan states that the initial risk assessment must be performed on or before the effective date of the standard. However, the RSAW for R1 states that "any risk assessments conducted prior to the effective date of this standard are not relevant." Does this mean the initial risk assessment must be performed “on” the actual effective date of the standard? Is there a basis for the short notification window in R3? The seven calendar days window for the TO to notify the TOP seems quite short. Additionally, there is a discrepancy in the review timeframes in R1 in which a look ahead of 24 months is required for stations and substations that are in the planning process but the risk assessments are performed every 30 months leaving a 6 month gap in the analysis. It would also seem more intuitive and consistent with other CIP standards to have the risk assessment requirement performed on an even year rather than a 30 month basis (i.e. 36 months.)
Pepco Holdings Inc.	Yes	There seems to be a conflict between the RSAW, Consideration of Issues or Directives and the Timeline included in the FAQ. To meet the overall timeline for the entire standard, the risk assessment must be started prior to the Effective date of the standard. There should be no prohibition for completion of the Risk Assessment prior to the Effective date of the standard.The FAQ Timeline states:”Initial performance of R1 must be complete on or before the effective date of the standard...”The Consideration of Issues or Directives #12: “...This means that the initial risk assessment required by Requirement R1, must be completed on or before the effective date of the standard. The initial performance of Requirements R2 through R6 must be completed according to the timelines specified in those requirements after the effective date of the proposed Reliability Standard...”The RSAW under R1 Evidence Requested states: “Provide the current and the immediately preceding risk

Organization	Yes or No	Question 4 Comment
		assessments conducted after the enforceable date of this Standard (i.e. any risk assessments conducted prior to the effective date of this standard are not relevant)."
EF Cass Consulting Inc.	Yes	This standard has the perceived importance of protecting national security and being so critical as to expedite its development through modification of nearly all associated controls. I agree physical security of critical facilities is of paramount concern but not at the expense of producing a sound standard. After listening to two of the webinars it is clear to me that the majority of the entities responsible for ultimately complying with this standard and those that will enforce the requirements are unclear as to what is required. I would suggest running it past the "Experts" for their review prior to the first vote.
ITC	Yes	Transmission systems tend to have facilities for which inoperability, while not causing immediate system failure or separation, would nonetheless leave the system in a degraded state. This degraded state will require system operators to reconfigure the system in a way to mitigate the loss of such facilities, but at that point, a new group of facilities could effectively become "critical" as that term is currently defined in CIP-014-1. For example, the loss of a given substation may cause several transformers to be inoperable, and with the long lead time for replacement components, the transmission owner would realistically need to plan for the substation to be out of service for an extended period of time. During this time in which the substation is out of service, a second tier of assets may exist for which inoperability would now cause separation or failure of the type that would afford them a "critical" designation as currently defined under CIP-014-1. This condition would persist for as long as the original equipment was out of service. If the SDT were to adopt ITC's proposed modifications to R1 (see above), this would not be an issue, since all CIP-002-5 substations would already be covered by CIP-014-1. However, if the SDT chooses not to adopt ITC's proposal, the SDT should consider whether entities should assess the transmission system in this new degraded condition to determine if new critical assets are created due to the degraded condition (i.e., a reapplication of the analysis performed in the current R1 to determine if the loss of a particular substation causes

Organization	Yes or No	Question 4 Comment
		widespread cascading.) The Standard could also trigger additional transmission system studies to determine if the transmission system remains reliable during the extended period in which the critical assets remain out of service.
Florida Keys Electric Cooperative	Yes	Under the implementation plan for R1, how can compliance with a standard be required prior to the effective date of the standard? The drafting team should reconsider this element of the implementation plan. If included in future drafts, a legal opinion from the NERC General Counsel should accompany this issue for stakeholder consideration.
National Rural Electric Cooperative Association (NRECA)	Yes	Under the implementation plan for R1, how can compliance with a standard be required prior to the effective date of the standard? The drafting team should reconsider this element of the implementation plan. If included in future drafts, a legal opinion from the NERC General Counsel should accompany this issue for stakeholder consideration.
SERC CIPC	Yes	Until the process of the standards has more fully matured there should not be a presecribed methodology for conducting the Security Vulnerability Assesments (SVAs) as long as generally accepted criteria as well as as stated in the standard in 4.1, 4.2, and 4.3 are followed in the development of the evaluation and plan(s).The comments expressed herein represent a consensus of the views of the above named members of the SERC CIPC only and should not be construed as the position of the SERC Reliability Corporation, or its board or its officers.
Southern Indiana Gas & Electric Company d/b/a Vectren Energy Delivery of Indiana, Inc.	Yes	Vectren recognizes that this drafting effort required significant contraction of drafting and approval processes, and Vectren appreciates the work of the drafting team. Vectren is supportive of the goals of the standard, supports R1, R3, R4 and R5. Vectren urges the drafting team, NERC and FERC to remove entirely or add detail to the requirements R2 and R6, and to add specific audit criteria in the RSAWs, so that

Organization	Yes or No	Question 4 Comment
		entities can have some confidence that their risk assessments performed in good faith, will be considered compliant with this Standard.
Foundation for Resilient Societies	Yes	We recognize that FERC has established a 90-day review process, and that NERC has worked to meet the tight deadline. Hence, the Foundation for Resilient Societies asks NERC to develop a SAR for Physical Security Standards - Phase 2. In this process, analytical modeling should be undertaken to identify and prioritize physical security risks that include cyber vulnerabilities, and that relate to the need for reliable warning and communications via redundant channels to control centers and to law enforcement. It should not be acceptable to exclude Regional Coordinators and Balancing Authorities, both groups needing to review and perhaps upgrade their own physical security, and both groups playing key roles in oversight of the operating entities, both TOs and GOs, whose physical security may be essential to prevent long-term outages through coordinated attacks. For additional materials prepared by the Foundation for Resilient Societies, contact the FERC staff designated to assist NERC with standard setting in FERC Docket RD14-6-000.
PPL NERC Registered Affiliates	Yes	We recommend that the SDT include a timeline within the standard which includes all required steps.
Cooper Compliance Corp	Yes	We would like to address proposed comments by APPA that additional Standards are added to address confidentiality. We do not agree with APPA's position. The functional model requires registered functions to work together to secure reliability. Already, as a result of CIP Standards, vital communications between the Distribution Providers/Load Serving Entities and the Balancing Authorities and/or Transmission Operators have been compromised. Often, The Balancing Authorities and Transmission Operators are in fear of sharing important information with the Distribution Providers and/or Load Serving Entities because they feel they could be subject to a CIP violation. In some cases the Distribution Providers and Transmission Operators even share facilities. Having a requirement that prevents sharing vital

Organization	Yes or No	Question 4 Comment
		information on physical security would simply not work and therefore we do not support APPA's comments.
Western Electricity Coordinating Council	Yes	WECC believes that the proposed standard addresses the FERC Order and has voted affirmative to approve CIP-014-1. However, as noted in our comments above we believe there is opportunity for enhancements and clarification that if implemented would improve the standard and still meet the FERC Order. WECC encourages the drafting team to consider implementation of these suggestions prior to the final ballot or NERC to submit a SAR for consideration of these suggestions immediately after approval of the standard.
Tri-State Generation and Transmission Association, Inc.	Yes	While the FERC Order RD14-6 paragraph 13 does require NERC to file a proposed standard within 90 days, footnote 8 only requires that the proposed standard include timelines for certain elements, without specificity for what those timeframes should be. The bright line CIP version 5 applicability that is used within this standard became effective 02-03-14 and was giving industry 24 months to implement. The CIP-014 draft appears to assume those bright line considerations are already completed for industry and provides just over 6 months to complete an additional assessment to remain compliant. Without specific implementation timeframes provided by FERC, and to stay in closer alignment to the expected completion dates for CIP v5, Tri-State is recommending no less than a one year after this standard becomes effective for the R1 risk assessment to be completed.
Hydro One	Yes	Will FERC accept R2.3 and R6.3, which allows the TO or TOP to document why they are not following the recommendations from the verification? The FERC Order did not suggest this.It is extremely important that all jurisdictions follow the same standard, so that the mitigation of risk to physical security is consistent. Having some jurisdictions who follow a more stringent standard will increase costs to ratepayers in those jurisdictions.The standard should provide a definition for "unaffiliated".

Organization	Yes or No	Question 4 Comment
Colorado Springs Utilities	Yes	
Empire District Electric Company	Yes	
OPG	Yes	
The Empire District Electric Company	Yes	
Herb Schrayshuen	Yes	The Implementation Plan can be read that it obligates applicable entities to complete the initial risk assessment in Requirement R1, on or before the effective date of the standard. The implementation plan should be adjusted. The following is a suggestion to facilitate reading of the standard and stay whitn defined terms without introfucing new terms which are undefined: For all requirements: Replace the expression "Transmission stations and Transmission substations" with "Transmission facilities". Otherwise, please explain why such a distinction is necessary. While the requirement for unaffiliated third party verification of the physical security plan is something required by the FERC in its order, the mandate is misguided and will lead to security breaches while at the same time adding no incremental value to the physical security plan. The utility, which owns the assets, is already highly incentivized to put together a good security plan to avoid loss of its facilities to terrorism without third party verification. The utility may decide to use security consultants to help develop the plan if it involves new, state of the art physical security topics outside the utilities experience base. On balance the third party verification requirement outlined in R6 regarding the physical security plan is unneeded.
NIPSCO		In R2 we are not sure who would do the verification. On one of the webinars a member of PJM suggested that another PJM member could be a candidate. However

Organization	Yes or No	Question 4 Comment
		it is likely that a PJM member is not a PC, TP or RC as prescribed in the requirement; that role is performed by PJM itself. Any further guidance would be welcome; we do not consider this a "show stopper".The hard work that went into putting this project together in such a short time frame is appreciated, thanks.

Additional comment received from Marcus Pelt, Southern Company

“The wording of Requirement R2.s, as it stands currently, could be interpreted to place requirements on the unaffiliated third party verifier when the responsible entity is actually the Transmission Owner. Southern recommends that R2.2 be reworded as follows to address this concern:

END OF REPORT

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. Nominations for the Standard Drafting Team (SDT) for Project 2014-04 Physical Security were solicited March 13-18, 2014, and the SDT was appointed by the Standards Committee on March 21, 2014.
2. Technical Conference was held April 1, 2014.
3. The draft standard was posted, pursuant to a Standards Committee authorized waiver, for a 15-day Formal Comment Period with a 5-day Initial Ballot April 10-24, 2014.

Description of Current Draft

This is the second draft of the proposed Reliability Standard, and it is being posted for final ballot. This draft includes proposed requirements to meet the directives issued in the FERC order issued March 7, 2014, in Docket No. RD14-6-000, *Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (2014).

Anticipated Actions	Anticipated Date
5-day Final Ballot, pursuant to a Standards Committee authorized waiver.	May 1, 2014
BOT Adoption.	May 2014
File with applicable Regulatory Authorities.	No later than June 5, 2014

Version History

Version	Date	Action	Change Tracking
1.0	TBD	Effective Date	New

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the NERC Glossary of Terms used in Reliability Standards (Glossary) are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

A. Introduction

1. Title: Physical Security

2. Number: CIP-014-1

3. Purpose: To identify and protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection.

4. Applicability:

4.1. Functional Entities:

4.1.1 Transmission Owner that owns a Transmission station or Transmission substation that meets any of the following criteria:

4.1.1.1 Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

4.1.1.2 Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

Voltage Value of a Line	Weight Value per Line
less than 200 kV (not applicable)	(not applicable)
200 kV to 299 kV	700
300 kV to 499 kV	1300
500 kV and above	0

4.1.1.3 Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Coordinator, or

Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

4.1.1.4 Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements.

4.1.2 Transmission Operator.

Exemption: Facilities in a "protected area," as defined in 10 C.F.R. § 73.2, within the scope of a security plan approved or accepted by the Nuclear Regulatory Commission are not subject to this Standard; or, Facilities within the scope of a security plan approved or accepted by the Canadian Nuclear Safety Commission are not subject to this Standard.

5. Effective Dates:

CIP-014-1 is effective the first day of the first calendar quarter that is six months beyond the date that this standard is approved by applicable regulatory authorities, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. In those jurisdictions where regulatory approval is not required, CIP-014-1 shall become effective on the first day of the first calendar quarter that is six months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

6. Background:

This Reliability Standard addresses the directives from the FERC order issued March 7, 2014, *Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (2014), which required NERC to develop a physical security reliability standard(s) to identify and protect facilities that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection.

B. Requirements and Measures

R1. Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria specified in Applicability Section 4.1.1. The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify the Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. *[VRF: High; Time-Horizon: Long-term Planning]*

1.1. Subsequent risk assessments shall be performed:

- At least once every 30 calendar months for a Transmission Owner that has identified in its previous risk assessment (as verified according to Requirement R2) one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection; or
- At least once every 60 calendar months for a Transmission Owner that has not identified in its previous risk assessment (as verified according to Requirement R2) any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection.

1.2. The Transmission Owner shall identify the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment.

M1. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the risk assessment of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria in Applicability Section 4.1.1 as specified in Requirement R1. Additionally, examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the identification of the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment as specified in Requirement R1, Part 1.2.

Rationale for Requirement R1:

This requirement meets the FERC directive from paragraph 6 in the order on physical security to perform a risk assessment to identify which facilities if rendered inoperable or damaged could impact an Interconnection through widespread

instability, uncontrolled separation, or cascading failures. It also meets the portion of the directive from paragraph 11 for periodic reevaluation by requiring the risk assessment to be performed every 30 months (or 60 months for an entity that has not identified in a previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection).

After identifying each Transmission station and Transmission substation that meets the criteria in Requirement R1, it is important to additionally identify the primary control center that operationally controls that Transmission station or Transmission substation (*i.e.,* the control center whose electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker, compared to a control center that only has the ability to monitor the Transmission station and Transmission substation and, therefore, must coordinate direct physical action through another entity).

R2. Each Transmission Owner shall have an unaffiliated third party verify the risk assessment performed under Requirement R1. The verification may occur concurrent with or after the risk assessment performed under Requirement R1. *[VRF: Medium; Time-Horizon: Long-term Planning]*

2.1. Each Transmission Owner shall select an unaffiliated verifying entity that is either:

- A registered Planning Coordinator, Transmission Planner, or Reliability Coordinator; or
- An entity that has transmission planning or analysis experience.

2.2. The unaffiliated third party verification shall verify the Transmission Owner's risk assessment performed under Requirement R1, which may include recommendations for the addition or deletion of a Transmission station(s) or Transmission substation(s). The Transmission Owner shall ensure the verification is completed within 90 calendar days following the completion of the Requirement R1 risk assessment.

2.3. If the unaffiliated verifying entity recommends that the Transmission Owner add a Transmission station(s) or Transmission substation(s) to, or remove a Transmission station(s) or Transmission substation(s) from, its identification under Requirement R1, the Transmission Owner shall either, within 60 calendar days of completion of the verification, for each recommended addition or removal of a Transmission station or Transmission substation:

- Modify its identification under Requirement R1 consistent with the recommendation; or

- Document the technical basis for not modifying the identification in accordance with the recommendation.

2.4. Each Transmission Owner shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third party verifier and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M2. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner completed an unaffiliated third party verification of the Requirement R1 risk assessment and satisfied all of the applicable provisions of Requirement R2, including, if applicable, documenting the technical basis for not modifying the Requirement R1 identification as specified under Part 2.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 2.4.

Rationale for Requirement R2:

This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring verification by an entity other than the owner or operator of the risk assessment performed under Requirement R1.

This requirement provides the flexibility for a Transmission Owner to select registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term “unaffiliated” means that the selected verifying entity cannot be a corporate affiliate (*i.e.*, the verifying entity cannot be an entity that controls, is controlled by, or is under common control with, the Transmission owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit. The term “unaffiliated” is not intended to prohibit a governmental entity from using another government entity to be a verifier under Requirement R2.

Requirement R2 also provides the Transmission Owner the flexibility to work with the verifying entity throughout the Requirement R1 risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could coordinate with their unaffiliated verifying entity to perform a Requirement R1 risk assessment to satisfy both Requirement R1 and Requirement R2 concurrently.

Planning Coordinator is a functional entity listed in Part 2.1. The Planning Coordinator and Planning Authority are the same entity as shown in the NERC Glossary of Terms Used in NERC Reliability Standards.

R3. For a primary control center(s) identified by the Transmission Owner according to Requirement R1, Part 1.2 that a) operationally controls an identified Transmission station or Transmission substation verified according to Requirement R2, and b) is not under the operational control of the Transmission Owner: the Transmission Owner shall, within seven calendar days following completion of Requirement R2, notify the Transmission Operator that has operational control of the primary control center of such identification and the date of completion of Requirement R2. *[VRF: Lower; Time-Horizon: Long-term Planning]*

3.1. If a Transmission station or Transmission substation previously identified under Requirement R1 and verified according to Requirement R2 is removed from the identification during a subsequent risk assessment performed according to Requirement R1 or a verification according to Requirement R2, then the Transmission Owner shall, within seven calendar days following the verification or the subsequent risk assessment, notify the Transmission Operator that has operational control of the primary control center of the removal.

M3. Examples of acceptable evidence may include, but are not limited to, dated written or electronic notifications or communications that the Transmission Owner notified each Transmission Operator, as applicable, according to Requirement R3.

Rationale for Requirement R3:

Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first identifying which Transmission stations and Transmission substations meet the criteria specified by Requirement R1, as verified according to Requirement R2. This requirement is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1, Part 1.2 of a Transmission station or Transmission substation verified according to Requirement R2 receives notice of such identification so that the Transmission Operator may timely fulfill its resulting obligations under Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include notice of the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or the verification process under Requirement R2.

R4. Each Transmission Owner that identified a Transmission station, Transmission substation, or a primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement

R1 and verified according to Requirement R2. The evaluation shall consider the following: *[VRF: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

4.1. Unique characteristics of the identified and verified Transmission station(s), Transmission substation(s), and primary control center(s);

4.2. Prior history of attack on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and

4.3. Intelligence or threat warnings received from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), U.S. federal and/or Canadian governmental agencies, or their successors.

M4. Examples of evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner or Transmission Operator conducted an evaluation of the potential threats and vulnerabilities of a physical attack to their respective Transmission station(s), Transmission substation(s) and primary control center(s) as specified in Requirement R4.

Rationale for Requirement R4:

This requirement meets the FERC directive from paragraph 8 in the order on physical security that the reliability standard must require tailored evaluation of potential threats and vulnerabilities to facilities identified in Requirement R1 and verified according to Requirement R2. Threats and vulnerabilities may vary from facility to facility based on factors such as the facility's location, size, function, existing protections, and attractiveness of the target. As such, the requirement does not mandate a one-size-fits-all approach but requires entities to account for the unique characteristics of their facilities.

Requirement R4 does not explicitly state when the evaluation of threats and vulnerabilities must occur or be completed. However, Requirement R5 requires that the entity's security plan(s), which is dependent on the Requirement R4 evaluation, must be completed within 120 calendar days following completion of Requirement R2. Thus, an entity has the flexibility when to complete the Requirement R4 evaluation, provided that it is completed in time to comply with the requirement in Requirement R5 to develop a physical security plan 120 calendar days following completion of Requirement R2.

R5. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall develop and implement a documented physical

security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s). The physical security plan(s) shall be developed within 120 calendar days following the completion of Requirement R2 and executed according to the timeline specified in the physical security plan(s). The physical security plan(s) shall include the following attributes: *[VRF: High; Time-Horizon: Long-term Planning]*

5.1. Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.

5.2. Law enforcement contact and coordination information.

5.3. A timeline for executing the physical security enhancements and modifications specified in the physical security plan.

5.4. Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).

M5. Examples of evidence may include, but are not limited to, dated written or electronic documentation of its physical security plan(s) that covers their respective identified and verified Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R5, and additional evidence demonstrating execution of the physical security plan according to the timeline specified in the physical security plan.

Rationale for Requirement R5:

This requirement meets the FERC directive from paragraph 9 in the order on physical security requiring the development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

R6. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall have an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5. The review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5. *[VRF: Medium; Time-Horizon: Long-term Planning]*

6.1. Each Transmission Owner and Transmission Operator shall select an unaffiliated third party reviewer from the following:

- An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.
- An entity or organization approved by the ERO.
- A governmental agency with physical security expertise.
- An entity or organization with demonstrated law enforcement, government, or military physical security expertise.

6.2. The Transmission Owner or Transmission Operator, respectively, shall ensure that the unaffiliated third party review is completed within 90 calendar days of completing the security plan(s) developed in Requirement R5. The unaffiliated third party review may, but is not required to, include recommended changes to the evaluation performed under Requirement R4 or the security plan(s) developed under Requirement R5.

6.3. If the unaffiliated third party reviewer recommends changes to the evaluation performed under Requirement R4 or security plan(s) developed under Requirement R5, the Transmission Owner or Transmission Operator shall, within 60 calendar days of the completion of the unaffiliated third party review, for each recommendation:

- Modify its evaluation or security plan(s) consistent with the recommendation; or
- Document the reason(s) for not modifying the evaluation or security plan(s) consistent with the recommendation.

6.4. Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third party reviewer and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M6. Examples of evidence may include, but are not limited to, written or electronic documentation that the Transmission Owner or Transmission Operator had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 as specified in Requirement R6 including, if applicable, documenting the reasons for not modifying the evaluation or security plan(s) in accordance with a recommendation under Part 6.3. Additionally,

examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 6.4.

Rationale for Requirement R6:

This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring review by an entity other than the owner or operator with appropriate expertise of the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5.

As with the verification required by Requirement R2, Requirement R6 provides Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout the Requirement R4 evaluation and the development of the Requirement R5 security plan(s). This would allow entities to satisfy their obligations under Requirement R6 concurrent with the satisfaction of their obligations under Requirements R4 and R5.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence during an on-site visit to show that it was compliant for the full time period since the last audit.

The Transmission Owner and Transmission Operator shall keep data or evidence to show compliance, as identified below, unless directed by its Compliance Enforcement Authority (CEA) to retain specific evidence for a longer period of time as part of an investigation.

The responsible entities shall retain documentation as evidence for three years.

If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records, subject to the confidentiality provisions of Section 1500 of the Rules of Procedure and the provisions of Section 1.4 below.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints Text

1.4. Additional Compliance Information

Confidentiality: To protect the confidentiality and sensitive nature of the evidence for demonstrating compliance with this standard, all evidence will be retained at the Transmission Owner's and Transmission Operator's facilities.

Guidelines and Technical Basis

Section 4 Applicability

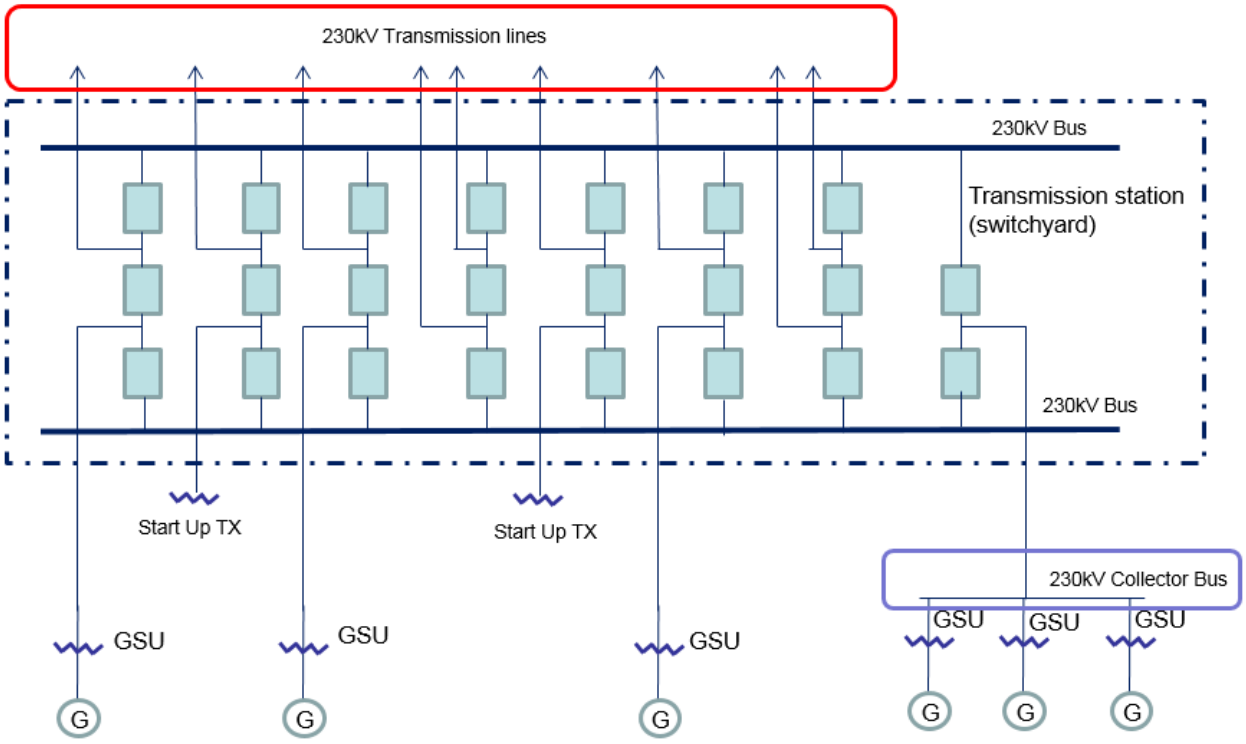
The purpose of Reliability Standard CIP-014-1 is to protect Transmission stations and Transmission substations, and their associated primary control centers that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. To properly include those entities that own or operate such Facilities, the Reliability Standard CIP-014-1 first applies to Transmission Owners that own Transmission Facilities that meet the specific criteria in Applicability Section 4.1.1.1 through 4.1.1.4. The Facilities described in Applicability Section 4.1.1.1 through 4.1.1.4 mirror those Transmission Facilities that meet the bright line criteria for "Medium Impact" Transmission Facilities under Attachment 1 of Reliability Standard CIP-002-5.1. Each Transmission Owner that owns Transmission Facilities that meet the criteria in Section 4.1.1.1 through 4.1.1.4 is required to perform a risk assessment as specified in Requirement R1 to identify its Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. The Standard Drafting Team (SDT) expects this population will be small and that many Transmission Owners that meet the applicability of this standard will not actually identify any such Facilities. Only those Transmission Owners with Transmission stations or Transmission substations identified in the risk assessment (and verified under Requirement R2) have performance obligations under Requirements R3 through R6.

This standard also applies to Transmission Operators. A Transmission Operator's obligations under the standard, however, are only triggered if the Transmission Operator is notified by an applicable Transmission Owner under Requirement R3 that the Transmission Operator operates a primary control center that operationally controls a Transmission station(s) or Transmission substation(s) identified in the Requirement R1 risk assessment. A primary control center operationally controls a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical action at the identified Transmission station or Transmission substation, such as opening a breaker, as opposed to a control center that only has information from the Transmission station or Transmission substation and must coordinate direct action through another entity. Only Transmission Operators who are notified that they have primary control centers under this standard have performance obligations under Requirements R4 through R6. In other words, primary control center for purposes of this Standard is the control center that the Transmission Owner or Transmission Operator, respectively, uses as its primary, permanently-manned site to physically operate a Transmission station or Transmission substation that is identified in Requirement R1 and verified in Requirement R2. Control centers that provide back-up capability are not applicable, as they are a form of resiliency and intentionally redundant.

The SDT considered several options for bright line criteria that could be used to determine applicability and provide an initial threshold that defines the set of Transmission stations and Transmission substations that would meet the directives of the FERC order on physical security (*i.e.*, those that could cause widespread instability, uncontrolled separation, or Cascading within

an Interconnection). The SDT determined that using the criteria for Medium Impact Transmission Facilities in Attachment 1 of CIP-002-5.1 would provide a conservative threshold for defining which Transmission stations and Transmission substations must be included in the risk assessment in Requirement R1 of CIP-014-1. Additionally, the SDT concluded that using the CIP-002-5.1 Medium Impact criteria was appropriate because it has been approved by stakeholders, NERC, and FERC, and its use provides a technically sound basis to determine which Transmission Owners should conduct the risk assessment. As described in CIP-002-5.1, the failure of a Transmission station or Transmission substation that meets the Medium Impact criteria could have the capability to result in exceeding one or more Interconnection Reliability Operating Limits (IROLs). The SDT understands that using this bright line criteria to determine applicability may require some Transmission Owners to perform risk assessments under Requirement R1 that will result in a finding that none of their Transmission stations or Transmission substations would pose a risk of widespread instability, uncontrolled separation, or Cascading within an Interconnection. However, the SDT determined that higher bright lines could not be technically justified to ensure inclusion of all Transmission stations and Transmission substations, and their associated primary control centers that, if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. Further guidance and technical basis for the bright line criteria for Medium Impact Facilities can be found in the Guidelines and Technical Basis section of CIP-002-5.1.

Additionally, the SDT determined that it was not necessary to include Generator Operators and Generator Owners in the Reliability Standard. First, Transmission stations or Transmission substations interconnecting generation facilities are considered when determining applicability. Transmission Owners will consider those Transmission stations and Transmission substations that include a Transmission station on the high side of the Generator Step-up transformer (GSU) using Applicability Section 4.1.1.1 and 4.1.1.2. As an example, a Transmission station or Transmission substation identified as a Transmission Owner facility that interconnects generation will be subject to the Requirement R1 risk assessment if it operates at 500kV or greater or if it is connected at 200 kV – 499kV to three or more other Transmission stations or Transmission substations and has an "aggregate weighted value" exceeding 3000 according to the table in Applicability Section 4.1.1.2. Second, the Transmission analysis or analyses conducted under Requirement R1 should take into account the impact of the loss of generation connected to applicable Transmission stations or Transmission substations. Additionally, the FERC order does not explicitly mention generation assets and is reasonably understood to focus on the most critical Transmission Facilities. The diagram below shows an example of a station.



Also, the SDT uses the phrase "Transmission stations or Transmission substations" to recognize the existence of both stations and substations. Many entities in industry consider a substation to be a location with physical borders (i.e. fence, wall, etc.) that contains at least an autotransformer. Locations also exist that do not contain autotransformers, and many entities in industry refer to those locations as stations (switching stations or switchyards). Therefore, the SDT chose to use both "station" and "substation" to refer to the locations where groups of Transmission Facilities exist.

On the issue of joint ownership, the SDT recognizes that this issue is not unique to CIP-014-1, and expects that the applicable Transmission Owners and Transmission Operators will develop memorandums of understanding, agreements, Coordinated Functional Registrations, or procedures, etc., to designate responsibilities under CIP-014-1 when joint ownership is at issue, which is similar to what many entities have completed for other Reliability Standards.

The language contained in the applicability section regarding the collector bus is directly copied from CIP-002-5.1, Attachment 1, and has no additional meaning within the CIP-014-1 standard.

Requirement R1

The initial risk assessment required under Requirement R1 must be completed on or before the effective date of the standard. Subsequent risk assessments are to be performed at least once every 30 or 60 months depending on the results of the previous risk assessment per Requirement R1, Part 1.1. In performing the risk assessment under Requirement R1, the

Transmission Owner should first identify their population of Transmission stations and Transmission substations that meet the criteria contained in Applicability Section 4.1.1. Requirement R1 then requires the Transmission Owner to perform a risk assessment, consisting of a transmission analysis, to determine which of those Transmission stations and Transmission Substations if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. The standard does not mandate the specific analytical method for performing the risk assessment. The Transmission Owner has the discretion to choose the specific method that best suites its needs. As an example, an entity may perform a Power Flow analysis and stability analysis at a variety of load levels.

Performing Risk Assessments

The Transmission Owner has the discretion to select a transmission analysis method that fits its facts and system circumstances. To mandate a specific approach is not technically desirable and may lead to results that fail to adequately consider regional, topological, and system circumstances. The following guidance is only an example on how a Transmission Owner may perform a power flow and/or stability analysis to identify those Transmission stations and Transmission substations that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. An entity could remove all lines, without regard to the voltage level, to a single Transmission station or Transmission substation and review the simulation results to assess system behavior to determine if Cascading of Transmission Facilities, uncontrolled separation, or voltage or frequency instability is likely to occur over a significant area of the Interconnection. Using engineering judgment, the Transmission Owner (possibly in consultation with regional planning or operation committees and/or ISO/RTO committee input) should develop criteria (e.g. imposing a fault near the removed Transmission station or Transmission substation) to identify a contingency or parameters that result in potential widespread instability, uncontrolled separation, or Cascading within an Interconnection. Regional consultation on these matters is likely to be helpful and informative, given that the inputs for the risk assessment and the attributes of what constitutes widespread instability, uncontrolled separation, or Cascading within an Interconnection will likely vary from region-to-region or from ISO-to-ISO based on topology, system characteristics, and system configurations. Criteria could also include post-contingency facilities loadings above a certain emergency rating or failure of a power flow case to converge. Available special protection systems (SPS), if any, could be applied to determine if the system experiences any additional instability which may result in uncontrolled separation. Example criteria may include:

(a) Thermal overloads beyond facility emergency ratings;

(b) Voltage deviation exceeding ± 10%; or

(c) Cascading outage/voltage collapse; or

(d) Frequency below under-frequency load shed points

Periodicity

A Transmission Owner who identifies one or more Transmission stations or Transmission substations (as verified under Requirement R2) that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection is required to conduct a risk assessment at least once every 30 months. This period ensures that the risk assessment remains current with projected conditions and configurations in the planned system. This risk assessment, as the initial assessment, must consider applicable planned Transmission stations and Transmission substations to be in service within 24 months. The 30 month timeframe aligns with the 24 month planned to be in service date because the Transmission Owner is provided the flexibility, depending on its planning cycle and the frequency in which it may plan to construct a new Transmission station or Transmission substation to more closely align these dates. The requirement is to conduct the risk assessment at least once every 30 months, so for a Transmission Owner that believes it is better to conduct a risk assessment once every 24 months, because of its planning cycle, it has the flexibility to do so.

Transmission Owners that have not identified any Transmission stations or Transmission substations (as verified under Requirement R2) that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection are unlikely to see changes to their risk assessment in the Near-Term Planning Horizon. Consequently, a 60 month periodicity for completing a subsequent risk assessment is specified.

Identification of Primary Control Centers

After completing the risk assessment specified in Requirement R1, it is important to additionally identify the primary control center that operationally controls each Transmission station or Transmission substation that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. A primary control center "operationally controls" a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker.

Requirement R2

This requirement specifies verification of the risk assessment performed under Requirement R1 by an entity other than the owner or operator of the Requirement R1 risk assessment.

A verification of the risk assessment by an unaffiliated third party, as specified in Requirement R2, could consist of:

1. Certifying that the Requirement R1 risk assessment considers the Transmission stations and Transmission substations identified in Applicability Section 4.1.1.

2. Review of the model used to conduct the risk assessment to ensure it contains sufficient system topology to identify Transmission stations and Transmission substations that if rendered inoperable or damaged could cause widespread instability, uncontrolled separation, or Cascading within an Interconnection.
3. Review of the Requirement R1 risk assessment methodology.

This requirement provides the flexibility for a Transmission Owner to select from unaffiliated registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term unaffiliated means that the selected verifying entity cannot be a corporate affiliate (*i.e.,* the verifying or third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit.

The prohibition on registered entities using a corporate affiliate to conduct the verification, however, does not prohibit a governmental entity (e.g., a city, a municipality, a U.S. federal power marketing agency, or any other political subdivision of U.S. or Canadian federal, state, or provincial governments) from selecting as the verifying entity another governmental entity within the same political subdivision. For instance, a U.S. federal power marketing agency may select as its verifier another U.S. federal agency to conduct its verification so long as the selected entity has transmission planning or analysis experience. Similarly, a Transmission Owner owned by a Canadian province can use a separate agency of that province to perform the verification. The verifying entity, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

Requirement R2 also provides that the "verification may occur concurrent with or after the risk assessment performed under Requirement R1." This provision is designed to provide the Transmission Owner the flexibility to work with the verifying entity throughout (*i.e.,* concurrent with) the risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could collaborate with their unaffiliated verifying entity to perform the risk assessment under Requirement R1 such that both Requirement R1 and Requirement R2 are satisfied concurrently. The intent of Requirement R2 is to have an entity other than the owner or operator of the facility to be involved in the risk assessment process and have an opportunity to provide input. Accordingly, Requirement R2 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the risk assessment and subsequently has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the risk assessment.

Characteristics to consider in selecting a third party reviewer could include:

- Registered Entity with applicable planning and reliability functions.
- Experience in power system studies and planning.
- The entity's understanding of the MOD standards, TPL standards, and facility ratings as they pertain to planning studies.

- The entity's familiarity with the Interconnection within which the Transmission Owner is located.

With respect to the requirement that Transmission owners develop and implement procedures for protecting confidential and sensitive information, the Transmission Owner could have a method for identifying documents that require confidential treatment. One mechanism for protecting confidential or sensitive information is to prohibit removal of sensitive or confidential information from the Transmission Owner's site. Transmission Owners could include such a prohibition in a non-disclosure agreement with the verifying entity.

A Technical feasibility study is not required in the Requirement R2 documentation of the technical basis for not modifying the identification in accordance with the recommendation.

On the issue of the difference between a verifier in Requirement R2 and a reviewer in Requirement R6, the SDT indicates that the verifier will confirm that the risk assessment was completed in accordance with Requirement R1, including the number of Transmission stations and substations identified, while the reviewer in Requirement R6 is providing expertise on the manner in which the evaluation of threats was conducted in accordance with Requirement R4, and the physical security plan in accordance with Requirement R5. In the latter situation there is no verification of a technical analysis, rather an application of experience and expertise to provide guidance or recommendations, if needed.

Parts 2.4 and 6.4 require the entities to have procedures to protect the confidentiality of sensitive or confidential information. Those procedures may include the following elements:

1. Control and retention of information on site for third party verifiers/reviewers.
2. Only "need to know" employees, etc., get the information.
3. Marking documents as confidential
4. Securely storing and destroying information when no longer needed.
5. Not releasing information outside the entity without, for example, General Counsel sign-off.

Requirement R3

Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first completing the risk assessment specified by Requirement R1 and the verification specified by Requirement R2. Requirement R3 is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1 receive notice so that the Transmission Operator may fulfill the rest of the obligations required in Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include within the notice the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk

assessment under Requirement R1 or as a result of the verification process under Requirement R2.

Requirement R4

This requirement requires owners and operators of facilities identified by the Requirement R1 risk assessment and that are verified under Requirement R2 to conduct an assessment of potential threats and vulnerabilities to those Transmission stations, Transmission substations, and primary control centers using a tailored evaluation process. Threats and vulnerabilities may vary from facility to facility based on any number of factors that include, but are not limited to, location, size, function, existing physical security protections, and attractiveness as a target.

In order to effectively conduct a threat and vulnerability assessment, the asset owner may be the best source to determine specific site vulnerabilities, but current and evolving threats may best be determined by others in the intelligence or law enforcement communities. A number of resources have been identified in the standard, but many others exist and asset owners are not limited to where they may turn for assistance. Additional resources may include state or local fusion centers, U.S. Department of Homeland Security, Federal Bureau of Investigations (FBI), Public Safety Canada, Royal Canadian Mounted Police, and InfraGard chapters coordinated by the FBI.

The Responsible Entity is required to take a number of factors into account in Parts 4.1 to 4.3 in order to make a risk-based evaluation under Requirement R4.

To assist in determining the current threat for a facility, the prior history of attacks on similarly protected facilities should be considered when assessing probability and likelihood of occurrence at the facility in question.

Resources that may be useful in conducting threat and vulnerability assessments include:

- NERC Security Guideline for the Electricity Sector: Physical Security.
- NERC Security Guideline: Physical Security Response.
- ASIS International General Risk Assessment Guidelines.
- ASIS International Facilities Physical Security Measure Guideline.
- ASIS International Security Management Standard: Physical Asset Protection.
- Whole Building Design Guide - Threat/Vulnerability Assessments.

Requirement R5

This requirement specifies development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Requirement R5 specifies the following attributes for the physical security plan:

- *Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.*

  Resiliency may include, among other things:

  a. System topology changes,

  b. Spare equipment,

  c. Construction of a new Transmission station or Transmission substation.

  While most security measures will work together to collectively harden the entire site, some may be allocated to protect specific critical components. For example, if protection from gunfire is considered necessary, the entity may only install ballistic protection for critical components, not the entire site.

- *Law enforcement contact and coordination information.*

  Examples of such information may be posting 9-1-1 for emergency calls and providing substation safety and familiarization training for local and federal law enforcement, fire department, and Emergency Medical Services.

- *A timeline for executing the physical security enhancements and modifications specified in the physical security plan.*

  Entities have the flexibility to prioritize the implementation of the various resiliency or security enhancements and modifications in their security plan according to risk, resources, or other factors. The requirement to include a timeline in the physical security plan for executing the actual physical security enhancements and modifications does not also require that the enhancements and modifications be completed within 120 days. The actual timeline may extend beyond the 120 days, depending on the amount of work to be completed.

- *Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).*

  A registered entity's physical security plan should include processes and responsibilities for obtaining and handling alerts, intelligence, and threat warnings from various sources. Some of these sources could include the ERO, ES-ISAC, and US and/or Canadian federal agencies. This information should be used to reevaluate or consider changes in the security plan and corresponding security measures of the security plan found in R5.

  Incremental changes made to the physical security plan prior to the next required third party review do not require additional third party reviews.

Requirement R6

This requirement specifies review by an entity other than the Transmission Owner or Transmission Operator with appropriate expertise for the evaluation performed according to

Requirement R4 and the security plan(s) developed according to Requirement R5. As with Requirement R2, the term unaffiliated means that the selected third party reviewer cannot be a corporate affiliate (*i.e.,* the third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Operator). A third party reviewer also cannot be a division of the Transmission Operator that operates as a functional unit.

As noted in the guidance for Requirement R2, the prohibition on registered entities using a corporate affiliate to conduct the review, however, does not prohibit a governmental entity from selecting as the third party reviewer another governmental entity within the same political subdivision. For instance, a city or municipality may use its local enforcement agency, so long as the local law enforcement agency satisfies the criteria in Requirement R6. The third party reviewer, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

The Responsible Entity can select from several possible entities to perform the review:

- *An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.*

  In selecting CPP and PSP for use in this standard, the SDT believed it was important that if a private entity such as a consulting or security firm was engaged to conduct the third party review, they must tangibly demonstrate competence to conduct the review. This includes electric industry physical security experience and either of the premier security industry certifications sponsored by ASIS International. The ASIS certification program was initiated in 1977, and those that hold the CPP certification are board certified in security management. Those that hold the PSP certification are board certified in physical security.

- *An entity or organization approved by the ERO.*

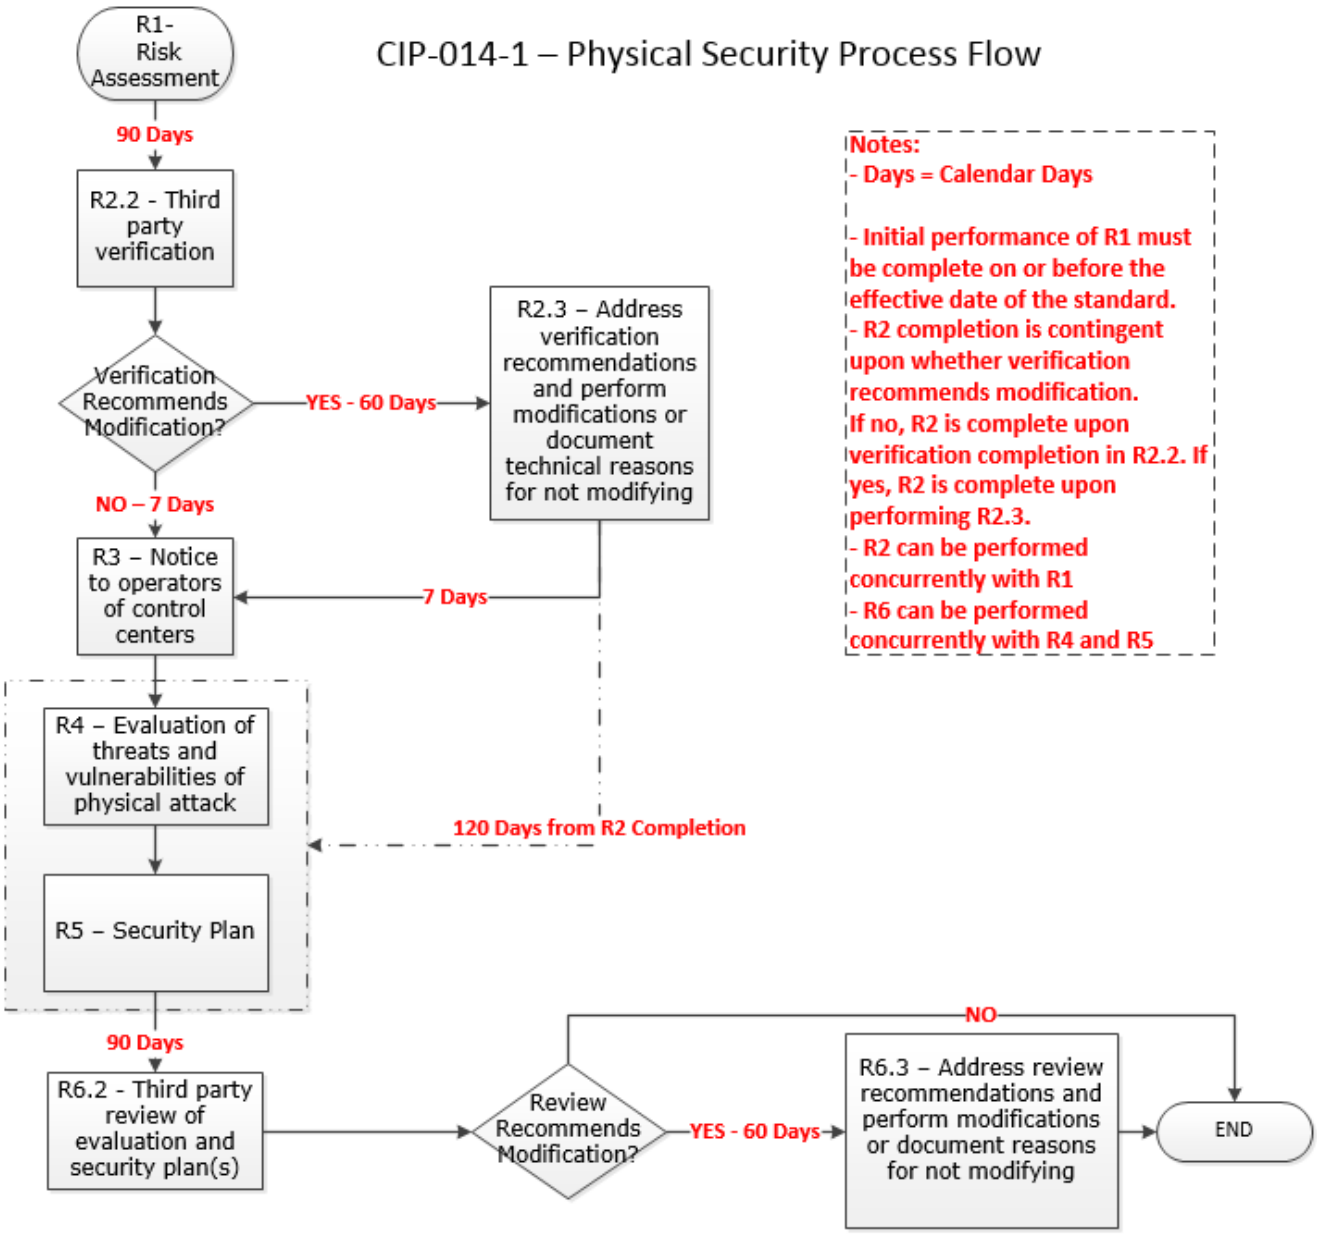
- *A governmental agency with physical security expertise.*

- *An entity or organization with demonstrated law enforcement, government, or military physical security expertise.*

As with the verification under Requirement R2, Requirement R6 provides that the "review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5." This provision is designed to provide applicable Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout (*i.e.,* concurrent with) the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5, which for some Responsible Entities may be more efficient and effective. In other words, a Transmission Owner or Transmission Operator could collaborate with their unaffiliated third party reviewer to perform an evaluation of potential threats and vulnerabilities (Requirement R4) and develop a security plan (Requirement R5) to satisfy Requirements R4 through R6 simultaneously. The

intent of Requirement R6 is to have an entity other than the owner or operator of the facility to be involved in the Requirement R4 evaluation and the development of the Requirement R5 security plans and have an opportunity to provide input on the evaluation and the security plan. Accordingly, Requirement R6 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the evaluation and develops the security plan itself and then has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the evaluation and develop the security plan.

Timeline



CIP-014-1 – Physical Security Process Flow
R1- Risk Assessment
90 Days
R2.2 - Third party verification
Verification Recommends Modification?
YES - 60 Days
R2.3 – Address verification recommendations and perform modifications or document technical reasons for not modifying
NO – 7 Days
R3 – Notice to operators of control centers
7 Days
R4 – Evaluation of threats and vulnerabilities of physical attack
120 Days from R2 Completion
R5 – Security Plan
90 Days
R6.2 - Third party review of evaluation and security plan(s)
Review Recommends Modification?
YES - 60 Days
NO
R6.3 – Address review recommendations and perform modifications or document reasons for not modifying
END
Notes:
- Days = Calendar Days
- Initial performance of R1 must be complete on or before the effective date of the standard.
- R2 completion is contingent upon whether verification recommends modification. If no, R2 is complete upon verification completion in R2.2. If yes, R2 is complete upon performing R2.3.
- R2 can be performed concurrently with R1
- R6 can be performed concurrently with R4 and R5

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. Nominations for the Standard Drafting Team (SDT) for Project 2014-04 Physical Security were solicited March 13-18, 2014, and the SDT was appointed by the Standards Committee on March 21, 2014.
2. Technical Conference was held April 1, 2014.
3. The draft standard was posted, pursuant to a Standards Committee authorized waiver, for a 15-day Formal Comment Period with a 5-day Initial Ballot April 10-24, 2014.

Description of Current Draft

This is the ~~first~~second draft of the proposed Reliability Standard, and it is being posted for ~~stakeholder comment and initial~~final ballot. This draft includes proposed requirements to meet the directives issued in the FERC order issued March 7, 2014, in Docket No. RD14-6-000, *Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (2014).

Anticipated Actions	Anticipated Date
~~15-day Formal Comment Period with a 5-day Initial Ballot, pursuant to a Standards Committee authorized waiver.~~	~~April 10, 2014~~
~~10-day Formal Comment Period with a~~ 5-day ~~Additional~~Final Ballot ~~(if necessary),~~ pursuant to a Standards Committee authorized waiver.	May 1, 2014
~~5-day Final Ballot, pursuant to a Standards Committee authorized waiver.~~	~~May 2014~~
BOT Adoption.	May 2014
File with applicable Regulatory Authorities.	No later than June 5, 2014

Version History

Version	Date	Action	Change Tracking
1.0	TBD	Effective Date	New

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the NERC Glossary of Terms used in Reliability Standards (Glossary) are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

A. Introduction

1. **Title:** Physical Security

2. **Number:** CIP-014-1

3. **Purpose:** To identify and protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection.

4. **Applicability:**

4.1. Functional Entities:

4.1.1 Transmission Owner that owns a Transmission station or Transmission substation that meets any of the following criteria:

4.1.1.1 Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

4.1.1.2 Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

Voltage Value of a Line	Weight Value per Line
less than 200 kV (not applicable)	(not applicable)
200 kV to 299 kV	700
300 kV to 499 kV	1300
500 kV and above	0

4.1.1.3 Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Coordinator, or

Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

4.1.1.4 Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements.

4.1.2 Transmission Operator.

Exemption: Facilities in a "protected area," as defined in 10 C.F.R. § 73.2, within the scope of a security plan approved or accepted by the Nuclear Regulatory Commission ~~or~~are not subject to this Standard; or, Facilities within the scope of a security plan approved or accepted by the Canadian Nuclear Safety Commission are not subject to this Standard.

5. Effective Dates:

CIP-014-1 is effective the first day of the first calendar quarter that is six months beyond the date that this standard is approved by applicable regulatory authorities, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. In those jurisdictions where regulatory approval is not required, CIP-014-1 shall become effective on the first day of the first calendar quarter that is six months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

6. Background:

This Reliability Standard addresses the directives from the FERC order issued March 7, 2014, *Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (2014), which required NERC to develop a physical security reliability standard(s) to identify and protect facilities that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection.

B. Requirements and Measures

R1. Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria specified in Applicability Section 4.1.1. The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify ~~any~~the Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. *[VRF: High; Time-Horizon: Long-term Planning]*

1.1. Subsequent risk assessments shall be performed:

- At least once every 30 calendar months for a Transmission Owner that has identified in its previous risk assessment (as verified according to Requirement R2) one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection; or

- At least once every 60 calendar months for a Transmission Owner that has not identified in its previous risk assessment (as verified according to Requirement R2) any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection.

1.2. The Transmission Owner shall identify the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment.

M1. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the risk assessment of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria in Applicability Section 4.1.1 as specified in Requirement R1. Additionally, examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the identification of the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment as specified in Requirement R1, Part 1.2.

Rationale for Requirement R1:

This requirement meets the FERC directive from paragraph 6 in the order on physical security to perform a risk assessment to identify which facilities if rendered inoperable or damaged could impact an Interconnection through widespread

instability, uncontrolled separation, or cascading failures. It also meets the portion of the directive from paragraph 11 for periodic reevaluation by requiring the risk assessment to be performed every 30 months (or 60 months for an entity that has not identified in a previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection).

After identifying each Transmission station and Transmission substation that meets the criteria in Requirement R1, it is important to additionally identify the primary control center that operationally controls that Transmission station or Transmission substation (*i.e.,* the control center whose electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker, compared to a control center that only has the ability to monitor the Transmission station and Transmission substation and, therefore, must coordinate direct physical action through another entity).

R2. Each Transmission Owner shall have an unaffiliated third party verify the risk assessment performed under Requirement R1. The verification may occur concurrent with or after the risk assessment performed under Requirement R1. *[VRF: Medium; Time-Horizon: Long-term Planning]*

2.1. Each Transmission Owner shall select an unaffiliated verifying entity that is either:

- A registered Planning Coordinator, Transmission Planner, or Reliability Coordinator; or
- An entity that has transmission planning or analysis experience.

2.2. The unaffiliated ~~verifying entity~~third party verification shall ~~either~~ verify the Transmission Owner's risk assessment performed under Requirement R1 ~~or recommend~~, which may include recommendations for the addition or deletion of a Transmission station(s) or Transmission substation(s). The Transmission Owner shall ensure the verification is completed within 90 calendar days following the completion of the Requirement R1 risk assessment.

2.3. If the unaffiliated verifying entity recommends that the Transmission Owner add a Transmission station(s) or Transmission substation(s) to, or remove a Transmission station(s) or Transmission substation(s) from, its identification under Requirement R1, the Transmission Owner shall either, within 60 calendar days of completion of the verification, for each recommended addition or removal of a Transmission station or Transmission substation:

- Modify its identification under Requirement R1 consistent with the recommendation; or

- Document the technical basis for not modifying the identification in accordance with the recommendation.

2.4. Each Transmission Owner shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information ~~exchanged with~~made available to the unaffiliated third party ~~verif~~verifier ~~ying entity~~ and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M2. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner completed an unaffiliated third party verification of the Requirement R1 risk assessment and satisfied all of the applicable provisions of Requirement R2, including, if applicable, documenting the technical basis for not modifying the Requirement R1 identification as specified under Part 2.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 2.4.

Rationale for Requirement R2:

This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring verification by an entity other than the owner or operator of the risk assessment performed under Requirement R1.

This requirement provides the flexibility for a Transmission Owner to select registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term "unaffiliated" means that the selected verifying entity cannot be a corporate affiliate (*i.e.*, the verifying entity cannot be an entity that controls, is controlled by, or is under common control with, the Transmission owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit. The term "unaffiliated" is not intended to prohibit a governmental entity from using another government entity to be a verifier under Requirement R2.

Requirement R2 also provides the Transmission Owner the flexibility to work with the verifying entity throughout the Requirement R1 risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could coordinate with their unaffiliated verifying entity to perform a Requirement R1 risk assessment to satisfy both Requirement R1 and Requirement R2 concurrently.

Planning Coordinator is functional entity listed in Part 2.1. The Planning Coordinator and Planning Authority are the same entity as shown in the NERC Glossary of Terms Used in NERC Reliability Standards.

R3. For a primary control center(s) identified by the Transmission Owner according to Requirement R1 ~~and~~ , Part 1.2 that a) operationally controls an identified Transmission station or Transmission substation verified according to Requirement R2 ~~that~~ , and b) is not under the operational control of the Transmission Owner~~,~~ : the Transmission Owner shall, within seven calendar days following completion of Requirement R2, notify the Transmission Operator that has operational control of the primary control center of such identification and the date of completion of Requirement R2. *[VRF: Lower; Time-Horizon: Long-term Planning]*

3.1. If a Transmission station or Transmission substation previously identified under Requirement R1 and verified according to Requirement R2 is removed from the identification during a subsequent risk assessment performed according to Requirement R1 or a verification according to Requirement R2, then the Transmission Owner shall, within seven calendar days following the verification or the subsequent risk assessment, notify the Transmission Operator that has operational control of the primary control center of the removal.

M3. Examples of acceptable evidence may include, but are not limited to, dated written or electronic notifications or communications that the Transmission Owner notified each Transmission Operator, as applicable, according to Requirement R3.

Rationale for Requirement R3:

Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first identifying which Transmission stations and Transmission substations meet the criteria specified by Requirement R1, as verified according to Requirement R2. This requirement is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1 ~~and~~ , Part 1.2 of a Transmission station or Transmission substation verified according to Requirement R2 receives notice of such identification so that the Transmission Operator may timely fulfill its resulting obligations under Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include notice of the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or the verification process under Requirement R2.

R4. Each Transmission Owner that ~~owns or operates~~ identified a Transmission station, Transmission substation, or a primary control center ~~identified~~ in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3 ~~that the Transmission Operator's primary control center has operational control of an identified Transmission station or Transmission substation~~, shall conduct an evaluation of the potential threats and

vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2. The evaluation shall consider the following: *[VRF: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

4.1. Unique characteristics of the identified and verified Transmission station(s), Transmission substation(s), and primary control center(s);

4.2. Prior history ~~or~~of attack on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and

4.3. Intelligence or threat warnings received from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), U.S. federal and/or Canadian governmental agencies, or their successors.

M4. Examples of evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner or Transmission Operator conducted an evaluation of the potential threats and vulnerabilities of a physical attack to their respective Transmission station(s), Transmission substation(s) and primary control center(s) as specified in Requirement R4.

Rationale for Requirement R4:

This requirement meets the FERC directive from paragraph 8 in the order on physical security that the reliability standard must require tailored evaluation of potential threats and vulnerabilities to facilities identified in Requirement R1 and verified according to Requirement R2. Threats and vulnerabilities may vary from facility to facility based on factors such as the facility's location, size, function, existing protections, and attractiveness of the target. As such, the requirement does not mandate a one-size-fits-all approach but requires entities to account for the unique characteristics of their facilities.

Requirement R4 does not explicitly state when the evaluation of threats and vulnerabilities must occur or be completed. However, Requirement R5 requires that the entity's security plan(s), which is dependent on the Requirement R4 evaluation, must be completed within 120 calendar days following completion of Requirement R2. Thus, an entity has the flexibility when to complete the Requirement R4 evaluation, provided that it is completed in time to comply with the requirement in Requirement R5 to develop a physical security plan 120 calendar days following completion of Requirement R2.

R5. Each Transmission Owner that ~~owns or has operational control of~~ identified a Transmission station, Transmission substation, or primary control center ~~identified~~ in

Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3 ~~that the Transmission Operator's primary control center has operational control of an identified Transmission station or Transmission substation~~, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s~~)~~). The physical security plan(s) shall be developed within 120 calendar days following the completion of Requirement R2~~.~~ and executed according to the timeline specified in the physical security plan(s). The physical security plan(s) shall include the following attributes: *[VRF: High; Time-Horizon: Long-term Planning]*

5.1. Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities ~~based on the results of~~identified during the evaluation conducted in Requirement R4.

5.2. Law enforcement contact and coordination information.

5.3. A timeline for ~~implementing~~executing the physical security enhancements and modifications specified in the physical security plan.

5.4. Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).

M5. Examples of evidence may include, but are not limited to, dated written or electronic documentation of its physical security plan(s) that covers their respective identified and verified Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R5, and additional evidence demonstrating ~~implementation~~ execution of the physical security plan according to the timeline specified in the physical security plan.

Rationale for Requirement R5:

This requirement meets the FERC directive from paragraph 9 in the order on physical security requiring the development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

R6. Each Transmission Owner that ~~owns or operates~~ identified a Transmission station, Transmission substation, or primary control center ~~identified~~ in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3 ~~that the Transmission Operator's primary control center has operational control of an identified Transmission station or~~

~~Transmission substation~~, shall have an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5. The review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5. *[VRF: Medium; Time-Horizon: Long-term Planning]*

6.1. Each Transmission Owner and Transmission Operator shall select an unaffiliated third party reviewer from the following:

~~**6.1.1.**~~ An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.

~~**6.1.2.**~~ An entity or organization approved by the ERO.

~~**6.1.3.**~~ A governmental agency with physical security expertise.

~~**6.1.4.**~~ An entity or organization with demonstrated law enforcement, government, or military physical security expertise.

6.2. The Transmission Owner or Transmission Operator, respectively, shall ensure that the unaffiliated third party review is completed within 90 calendar days of completing the security plan(s) developed in Requirement R5. The unaffiliated third party review may, but is not required to, include recommended changes to the evaluation performed under Requirement R4 or the security plan(s) developed under Requirement R5.

6.3. If the unaffiliated ~~reviewing entity~~third party reviewer recommends changes to the evaluation performed under Requirement R4 or security plan(s) developed under Requirement R5, the Transmission Owner or Transmission Operator shall, within 60 calendar days of the completion of the unaffiliated third party review, for each recommendation:

- Modify its evaluation or security plan(s) consistent with the recommendation; or
- Document the reason(s) for not modifying the evaluation or security plan(s) consistent with the recommendation.

6.4. Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information ~~exchanged with~~made available to the unaffiliated third party reviewer~~ing entity and from any other form of public disclosure~~ and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M6. Examples of evidence may include, but are not limited to, written or electronic documentation that the Transmission Owner or Transmission Operator had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 as specified in Requirement R6 including, if applicable, documenting the reasons for not modifying the evaluation or security plan(s) in accordance with a recommendation under Part 6.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 6.4.

Rationale for Requirement R6:

This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring review by an entity other than the owner or operator with appropriate expertise of the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5.

As with the verification required by Requirement R2, Requirement R6 provides Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer~~ing entity~~ throughout the Requirement R4 evaluation and the development of the Requirement R5 security plan(s). This would allow entities to satisfy their obligations under Requirement R6 concurrent with the satisfaction of their obligations under Requirements R4 and R5.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence during an on-site visit to show that it was compliant for the full time period since the last audit.

The Transmission Owner and Transmission Operator shall keep data or evidence to show compliance, as identified below, unless directed by its Compliance Enforcement Authority (CEA) to retain specific evidence for a longer period of time as part of an investigation.

The responsible entities shall retain documentation as evidence for three years.

If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records, subject to the confidentiality provisions of Section 1500 of the Rules of Procedure and the provisions of Section 1.4 below.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints Text

1.4. Additional Compliance Information

Confidentiality: To protect the confidentiality and sensitive nature of the evidence for demonstrating compliance with this standard, all evidence will be retained at the Transmission Owner's and Transmission Operator's facilities.

Guidelines and Technical Basis

Section 4 Applicability

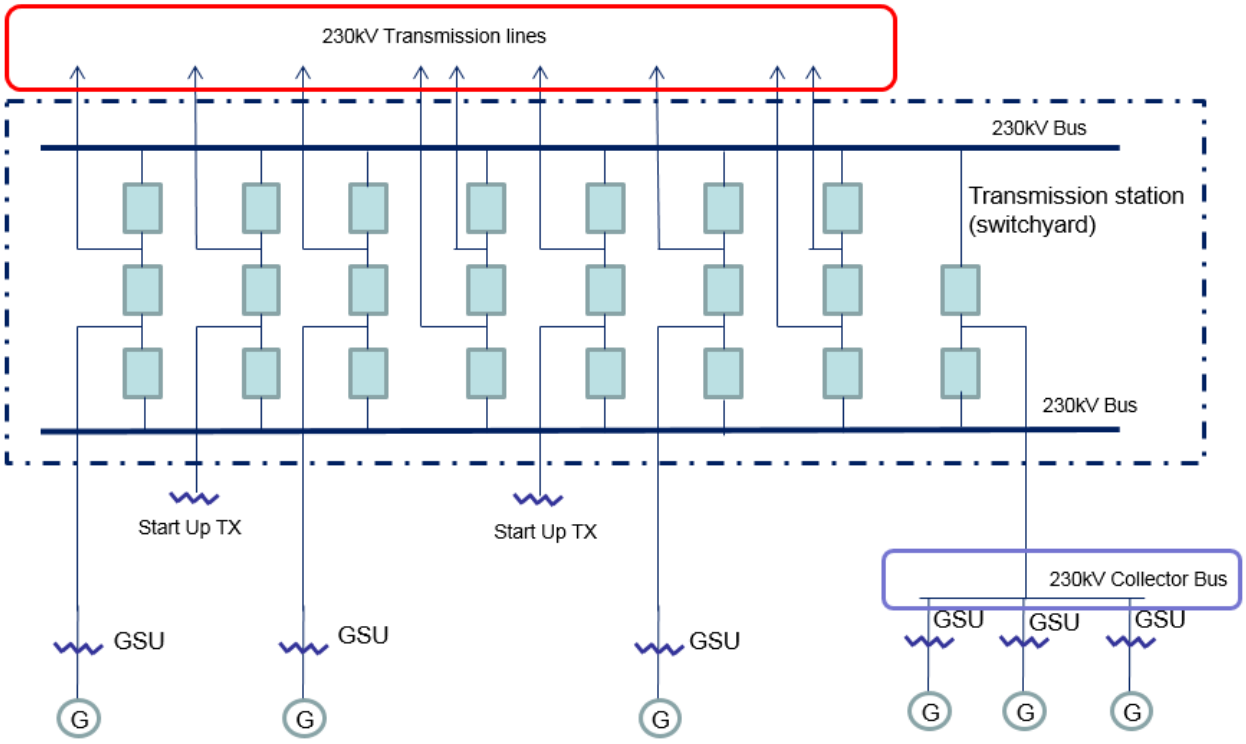
The purpose of Reliability Standard CIP-014-1 is to protect Transmission stations and Transmission substations, and their associated primary control centers~~,~~ that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. To properly include those entities that own or operate such Facilities, the Reliability Standard CIP-014-1 first applies to Transmission Owners ~~(TO)~~ that own Transmission Facilities that meet the specific criteria in Applicability Section 4.1.1.1 through 4.1.1.4. The Facilities described in Applicability Section 4.1.1.1 through 4.1.1.4 mirror those Transmission Facilities that meet the bright line criteria for "Medium Impact" Transmission Facilities under Attachment 1 of Reliability Standard CIP-002-5.1. Each ~~TO~~Transmission Owner that owns Transmission Facilities that meet the criteria in Section 4.1.1.1 through 4.1.1.4 is required to perform a risk assessment as specified in Requirement R1 to identify its Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. The Standard Drafting Team (SDT) expects this population will be small and that many ~~TOs~~Transmission Owners that meet the applicability of this standard will not actually identify any such Facilities. Only those ~~TOs~~Transmission Owners with Transmission stations or Transmission substations identified in the risk assessment (and verified under Requirement R2) have performance obligations under Requirements R3 through R6.

This standard also applies to Transmission Operators ~~(TOP).~~ A ~~TOP's~~Transmission Operator's obligations under the standard, however, are only triggered if the ~~TOP~~Transmission Operator is notified by an applicable ~~TO~~Transmission Owner under Requirement R3 that the ~~TOP~~Transmission Operator operates a primary control center that operationally controls a Transmission station(s) or Transmission substation(s) identified in the Requirement R1 risk assessment. A primary control center operationally controls a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical action at the identified Transmission station or Transmission substation, such as opening a breaker, as opposed to a control center that only has information from the Transmission station or Transmission substation and must coordinate direct action through another entity. Only ~~TOPs~~Transmission Operators who are notified that they have primary control centers under this standard have performance obligations under Requirements R4 through R6. In other words, primary control center for purposes of this Standard is the control center that the Transmission Owner or Transmission Operator, respectively, uses as its primary, permanently-manned site to physically operate a Transmission station or Transmission substation that is identified in Requirement R1 and verified in Requirement R2. Control centers that provide back-up capability are not applicable, as they are a form of resiliency and intentionally redundant.

The ~~drafting team~~SDT considered several options for bright line criteria that could be used to determine applicability and provide an initial threshold that defines the set of Transmission stations and Transmission substations that would meet the directives of the FERC order on

physical security (*i.e.*, those that could cause widespread instability, uncontrolled separation, or Cascading within an Interconnection). The SDT determined that using the criteria for Medium Impact Transmission Facilities in Attachment 1 of CIP-002-5.1 would provide a conservative threshold for defining which Transmission stations and Transmission substations must be included in the risk assessment in Requirement R1 of CIP-014-1. Additionally, the SDT concluded that using the CIP-002-5.1 Medium Impact criteria was appropriate because it has been approved by stakeholders, NERC, and FERC, and its use provides a technically sound basis to determine which Transmission Owners should conduct the risk assessment. As described in CIP-~~005-2~~002-5.1, the failure of a Transmission station or Transmission substation that meets the Medium Impact criteria could have the capability to result in exceeding one or more Interconnection Reliability Operating Limits (IROLs). The SDT understands that using this bright line criteria to determine applicability may require some Transmission Owners to perform risk assessments under Requirement R1 that will result in a finding that none of their Transmission stations or Transmission substations would pose a risk of widespread instability, uncontrolled separation, or Cascading within an Interconnection. However, the SDT determined that higher bright lines could not be technically justified to ensure inclusion of all Transmission stations and Transmission substations, and their associated primary control centers~~,~~ that, if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. Further guidance and technical basis for the bright line criteria for Medium Impact Facilities can be found in the Guidelines and Technical Basis section of CIP-002-5.1.

Additionally, the SDT determined that it was not necessary to include Generator Operators and Generator Owners in the Reliability Standard. ~~First, the transmission analysis or analyses conducted under Requirement R1 will~~First, Transmission stations or Transmission substations interconnecting generation facilities are considered when determining applicability. Transmission Owners will consider those Transmission stations and Transmission substations that include a Transmission station on the high side of the Generator Step-up transformer (GSU) using Applicability Section Parts 4.1.1.1 and 4.1.1.2. As an example, a Transmission station or Transmission substation identified as a Transmission Owner facility that interconnects generation will be subject to the Requirement R1 risk assessment if it operates at 500kV or greater or if it is connected at 200 kV – 499kV to three or more other Transmission stations or Transmission substations and has an "aggregate weighted value" exceeding 3000 according to the table in Applicability Section Part 4.1.1.2. Second, the Transmission analysis or analyses conducted under Requirement R1 should take into account the impact of the loss of generation connected to applicable Transmission stations or Transmission substations~~..~~. Additionally, the FERC order does not explicitly mention generation assets and is reasonably understood to focus on the most critical Transmission Facilities. The diagram below shows an example of a station.



Also, the SDT uses the phrase "Transmission stations or Transmission substations" to recognize the existence of both stations and substations. Many entities in industry consider a substation to be a location with physical borders (i.e. fence, wall, etc.) that contains at least an autotransformer. Locations also exist that do not contain autotransformers, and many entities in industry refer to those locations as stations (switching stations or switchyards). Therefore, the SDT chose to use both "station" and "substation" to refer to the locations where groups of Transmission Facilities exist.

On the issue of joint ownership, the SDT recognizes that this issue is not unique to CIP-014-1, and expects that the applicable Transmission Owners and Transmission Operators will develop memorandums of understanding, agreements, Coordinated Functional Registrations, or procedures, etc., to designate responsibilities under CIP-014-1 when joint ownership is at issue, which is similar to what many entities have completed for other Reliability Standards.

The language contained in the applicability section regarding the collector bus is directly copied from CIP-002-5.1, Attachment 1, and has no additional meaning within the CIP-014-1 standard.

Requirement R1

The initial risk assessment required under Requirement R1 must be completed on or before the effective date of the standard. Subsequent risk assessments are to be performed at least once

every 30 or 60 months depending on the results of the previous risk assessment per Requirement R1, Part 1.1. In performing the risk assessment under Requirement R1, the Transmission Owner should first identify their population of Transmission stations and Transmission substations that meet the criteria contained in Applicability Section 4.1.1. Requirement R1 then requires the Transmission Owner to perform a risk assessment, consisting of a transmission analysis, to determine which of those Transmission stations and Transmission Substations if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. The standard does not mandate the specific analytical method for performing the risk assessment. The Transmission Owner has the discretion to choose the specific method that best suites its needs. As an example, an entity may perform a Power Flow analysis and stability analysis at a variety of load levels.

Performing Risk Assessments

The Transmission Owner has the discretion to select a transmission analysis method that fits its facts and system circumstances. To mandate a specific approach is not technically desirable and may lead to results that fail to adequately consider regional, topological, and system circumstances. The following ~~is~~ guidance is only an example on how a Transmission Owner may perform a ~~traditional~~ power flow and/or stability analysis to identify those Transmission stations and Transmission substations that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. An entity could remove all lines, without regard to the voltage level, to a single Transmission station or Transmission substation and review the simulation results to assess system behavior to determine if Cascading of Transmission Facilities, uncontrolled separation, or voltage or frequency instability is likely to occur over a ~~wide~~significant area~~.~~ of the Interconnection. Using engineering judgment, the Transmission Owner (possibly in consultation with regional planning or operation committees and/or ISO/RTO committee input) should develop criteria (e.g. imposing a fault near the removed Transmission station or Transmission substation) to identify a contingency or parameters that result~~ing~~ in potential widespread instability, uncontrolled separation, or Cascading within an Interconnection. ~~For example, the criteria~~Regional consultation on these matters is likely to be helpful and informative, given that the inputs for the risk assessment and the attributes of what constitutes widespread instability, uncontrolled separation, or Cascading within an Interconnection will likely vary from region-to-region or from ISO-to-ISO based on topology, system characteristics, and system configurations. Criteria could also include post-contingency facilities loadings above a certain emergency rating or failure of a power flow case to converge. Available ~~remedial action schemes (RAS) or~~ special protection systems (SPS), if any, could be applied to determine if the system experiences any additional instability which may result in uncontrolled separation. Example criteria may include:

(a) Thermal overloads beyond facility emergency ratings;

(b) Voltage deviation exceeding ± 10%; or

(c) Cascading outage/voltage collapse; or

(d) Frequency below under-frequency load shed points

Periodicity

~~A TO~~A Transmission Owner who identifies one or more Transmission stations or Transmission substations (as verified under Requirement R2) that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection is required to conduct a risk assessment at least once every 30 months. This period ensures that the risk assessment remains current with projected conditions and configurations in the planned system. This risk assessment, as the initial assessment, must consider applicable planned Transmission stations and Transmission substations to be in service within 24 months. The 30 month timeframe aligns with the 24 month planned to be in service date because the Transmission Owner is provided the flexibility, depending on its planning cycle and the frequency in which it may plan to construct a new Transmission station or Transmission substation to more closely align these dates. The requirement is to conduct the risk assessment at least once every 30 months, so for a Transmission Owner that believes it is better to conduct a risk assessment once every 24 months, because of its planning cycle, it has the flexibility to do so.

~~TOs who~~Transmission Owners that have not identified any Transmission stations or Transmission substations (as verified under Requirement R2) that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection are unlikely to see changes to their risk assessment in the Near-Term Planning Horizon. Consequently, a 60 month periodicity for completing a subsequent risk assessment is specified.

Identification of Primary Control Centers

After completing the risk assessment specified in Requirement R1, it is important to additionally identify the primary control center that operationally controls each Transmission station or Transmission substation that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. A primary control center "operationally controls" a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker.

Requirement R2

This requirement specifies verification of the risk assessment performed under Requirement R1 by an entity other than the owner or operator of the Requirement R1 risk assessment.

A verification of the risk assessment by an unaffiliated third party, as specified in Requirement R2, could consist of:

1. Certifying that the Requirement R1 risk assessment considers the Transmission stations and Transmission substations identified in Applicability Section 4.1.1.
2. Review of the model used to conduct the risk assessment to ensure it contains sufficient system topology to identify Transmission stations and Transmission substations that if

rendered inoperable or damaged could cause widespread instability, uncontrolled separation, or Cascading within an Interconnection.

3. Review of the Requirement R1 risk assessment ~~method, which may include, for example, consideration of factors such as the following system performance criteria:~~methodology.

   ~~a. Thermal overloads beyond facility emergency ratings;~~

   ~~b. Voltage deviation exceeding ± 10%,~~

   ~~c. Cascading outage/Voltage collapse,~~

   ~~Frequency below under-frequency load shed points.~~

This requirement provides the flexibility for a Transmission Owner to select from unaffiliated registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term unaffiliated means that the selected verifying entity cannot be a corporate affiliate (*i.e.,* the verifying or ~~reviewing entity~~third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit.

The prohibition on registered entities using a corporate affiliate to conduct the verification, however, does not prohibit a governmental entity (e.g., a city, a municipality, a U.S. federal power marketing agency, or any other political subdivision of U.S. or Canadian federal, state, or provincial governments) from selecting as the verifying entity another governmental entity within the same political subdivision. For instance, a U.S. federal power marketing agency may select as its verifier another U.S. federal agency to conduct its verification so long as the selected entity has transmission planning or analysis experience. Similarly, a Transmission Owner owned by a Canadian province can use a separate agency of that province to perform the verification. The verifying entity, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

Requirement R2 also provides that the "verification may occur concurrent with or after the risk assessment performed under Requirement R1." This provision is designed to provide the Transmission Owner the flexibility to work with the verifying entity throughout (*i.e.,* concurrent with) the risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could ~~coordinate~~collaborate with their unaffiliated verifying entity to perform the risk assessment under Requirement R1 such that both Requirement R1 and Requirement R2 are satisfied concurrently. The intent of Requirement R2 is to have an entity other than the owner or operator of the facility to be involved in the risk assessment process and have an opportunity to provide input. Accordingly, Requirement R2 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the risk assessment and subsequently has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the risk assessment.

Characteristics to consider in selecting a ~~reviewing entity~~third party reviewer could include:

- Registered Entity with applicable planning and reliability functions.
- Experience in power system studies and planning.
- The entity's understanding of the MOD standards, TPL standards, and facility ratings as they pertain to planning studies.
- The entity's familiarity with the Interconnection within which the ~~transmission owner~~Transmission Owner is located.

With respect to the requirement that Transmission owners develop and implement procedures for protecting confidential and sensitive information, the Transmission Owner could have a method for identifying documents that require confidential treatment. One mechanism for protecting confidential or sensitive information is to prohibit removal of sensitive or confidential information from the ~~TO's~~Transmission Owner's site. Transmission Owners could include such a prohibition in a non-disclosure agreement with the verifying entity.

A Technical feasibility study is not required in the Requirement R2 documentation of the technical basis for not modifying the identification in accordance with the recommendation.

On the issue of the difference between a verifier in Requirement R2 and a reviewer in Requirement R6, the SDT indicates that the verifier will confirm that the risk assessment was completed in accordance with Requirement R1, including the number of Transmission stations and substations identified, while the reviewer in Requirement R6 is providing expertise on the manner in which the evaluation of threats was conducted in accordance with Requirement R4, and the physical security plan in accordance with Requirement R5. In the latter situation there is no verification of a technical analysis, rather an application of experience and expertise to provide guidance or recommendations, if needed.

Parts 2.4 and 6.4 require the entities to have procedures to protect the confidentiality of sensitive or confidential information. Those procedures may include the following elements:

1. Control and retention of information on site for third party verifiers/reviewers.
2. Only "need to know" employees, etc., get the information.
3. Marking documents as confidential
4. Securely storing and destroying information when no longer needed.
5. Not releasing information outside the entity without, for example, General Counsel sign-off.

Requirement R3

Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first completing the risk assessment specified by Requirement R1 and the verification specified by Requirement R2. Requirement R3 is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1 receive notice so that the Transmission Operator may fulfill the rest of the obligations required in Requirements

R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include within the notice the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or as a result of the verification process under Requirement R2.

Requirement R4

This requirement requires owners and operators of facilities identified by the Requirement R1 risk assessment and that are verified under Requirement R2 to conduct an assessment of potential threats and vulnerabilities to those Transmission stations, Transmission substations, and primary control centers using a tailored evaluation process. Threats and vulnerabilities may vary from facility to facility based on any number of factors that include, but are not limited to, location, size, function, existing physical security protections, and attractiveness as a target.

In order to effectively conduct a threat and vulnerability assessment, the asset owner may be the best source to determine specific site vulnerabilities, but current and evolving threats may best be determined by others in the intelligence or law enforcement communities. A number of resources have been identified in the standard, but many others exist and asset owners are not limited to where they may turn for assistance. Additional resources may include state or local fusion centers, U.S. Department of Homeland Security, Federal Bureau of Investigations (FBI), Public Safety Canada, Royal Canadian Mounted Police, and InfraGard chapters coordinated by the FBI.

The Responsible Entity is required to take a number of factors into account in Parts 4.1 to 4.3 in order to make a risk-based evaluation under Requirement R4.

To assist in determining the current threat for a facility, the prior history of attacks on similarly protected facilities should be considered when assessing probability and likelihood of occurrence at the facility in question.

Resources that may be useful in conducting threat and vulnerability assessments include:

- NERC Security Guideline for the Electricity Sector: Physical Security.
- NERC Security Guideline: Physical Security Response.
- ASIS International General Risk Assessment Guidelines.
- ASIS International Facilities Physical Security Measure Guideline.
- ASIS International Security Management Standard: Physical Asset Protection.
- Whole Building Design Guide - Threat/Vulnerability Assessments.

Requirement R5

This requirement specifies development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Requirement R5 specifies the following attributes for the physical security plan:

- *Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities ~~based on~~identified during the ~~results of the assessment~~evaluation conducted in Requirement R4.~~.~~.*

  Resiliency may include, among other things:

  a. System topology changes,

  b. Spare equipment,

  c. Construction of a new Transmission station or Transmission substation.

  While most security measures will work together to collectively harden the entire site, some may be allocated to protect specific critical components. For example, if protection from gunfire is considered necessary, the entity may only install ballistic protection for critical components, not the entire site.

- *Law enforcement contact and coordination information.*

  Examples of such information may be posting 9-1-1 for emergency calls and providing substation safety and familiarization training for local and federal law enforcement, fire department, and ~~EMS~~Emergency Medical Services.

- *A timeline for ~~implementing~~executing the physical security ~~resiliency or security measures~~enhancements and modifications specified in the physical security plan.*

  Entities have the flexibility to prioritize the implementation of the various resiliency or security ~~measures~~enhancements and modifications in their security plan according to risk, resources, or other factors. The requirement to include a timeline in the physical security plan for executing the actual physical security enhancements and modifications does not also require that the enhancements and modifications be completed within 120 days. The actual timeline may extend beyond the 120 days, depending on the amount of work to be completed.

- *Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).*

  A registered entity's physical security plan should include processes and responsibilities for obtaining and handling alerts, intelligence, and threat warnings from various sources. Some of these sources could include the ERO, ES-ISAC, and US and/or Canadian federal agencies. This information should be used to reevaluate or consider changes in the security plan and corresponding security measures of the security plan found in R5.

Incremental changes made to the physical security plan prior to the next required third party review do not require additional third party reviews.

Requirement R6

This requirement specifies review by an entity other than the ~~TO~~Transmission Owner or ~~TOP~~Transmission Operator with appropriate expertise for the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5. As with Requirement R2, the term unaffiliated means that the selected ~~reviewing entity~~third party reviewer cannot be a corporate affiliate (*i.e.,* the ~~reviewing entity~~third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Operator). A ~~reviewing entity~~third party reviewer also cannot be a division of the Transmission Operator that operates as a functional unit.

As noted in the guidance for Requirement R2, the prohibition on registered entities using a corporate affiliate to conduct the review, however, does not prohibit a governmental entity from selecting as the third party reviewer another governmental entity within the same political subdivision. For instance, a city or municipality may use its local enforcement agency, so long as the local law enforcement agency satisfies the criteria in Requirement R6. The third party reviewer, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

The Responsible Entity can select from several possible entities to perform the review:

- *An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.*

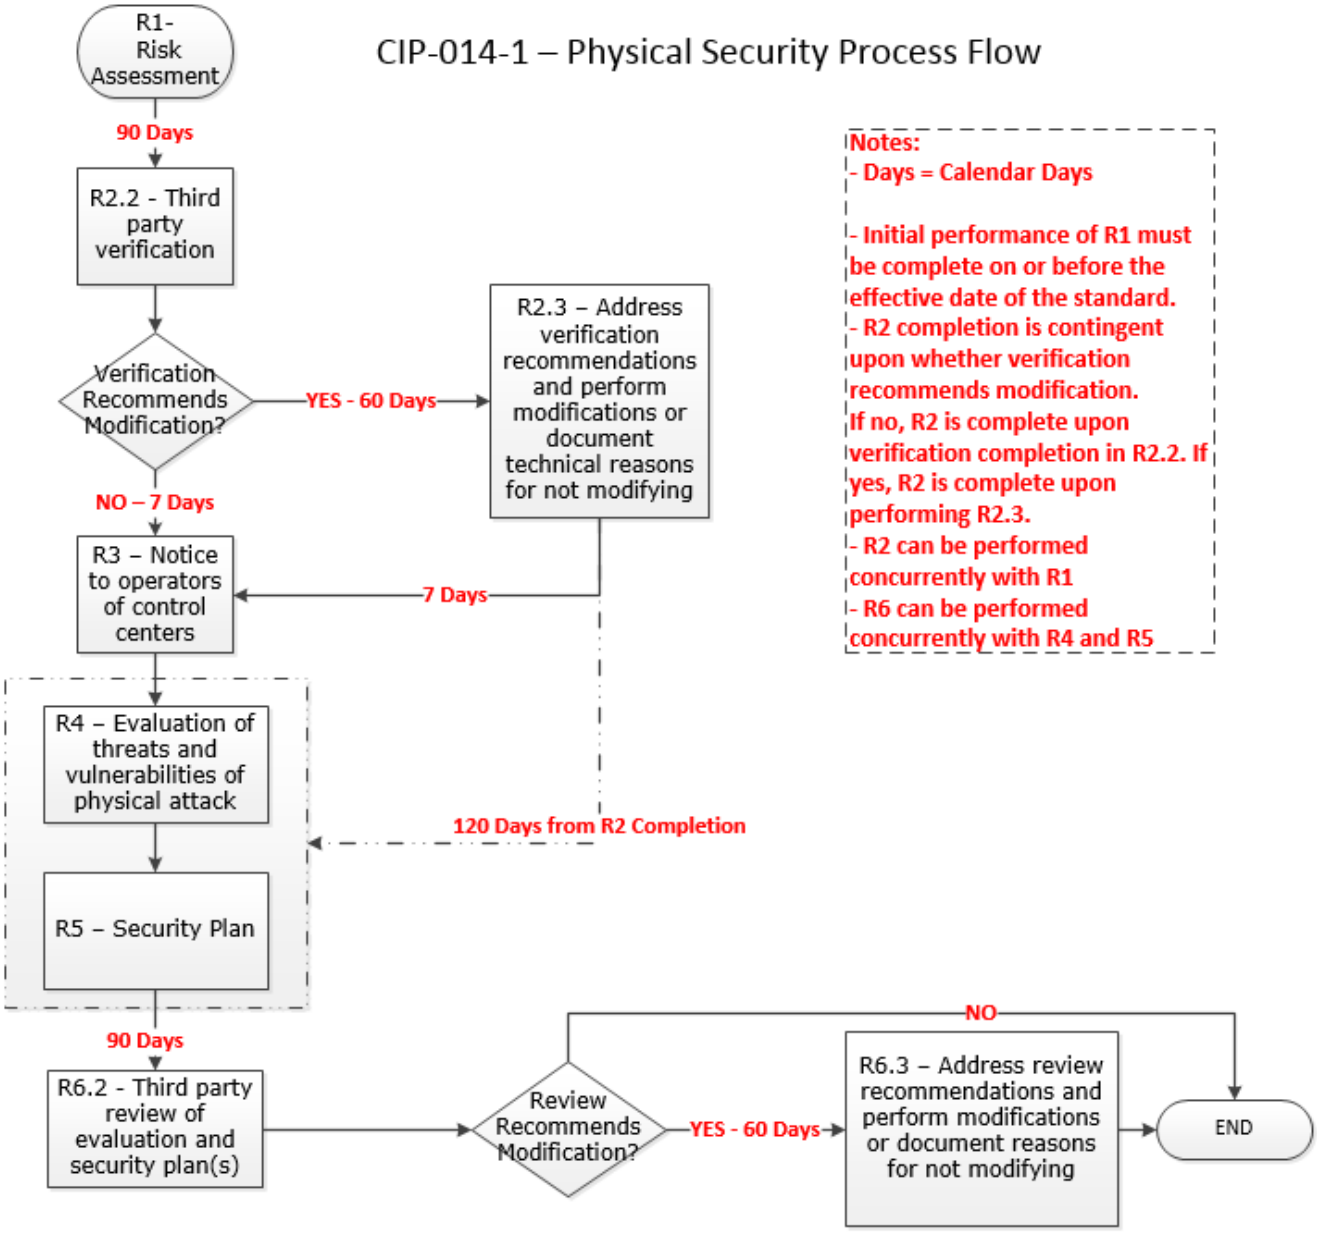
  In selecting CPP and PSP for use in this standard, the ~~drafting team~~SDT believed it was important that if a private entity such as a consulting or security firm was engaged to conduct the third party review, they must tangibly demonstrate competence to conduct the review. This includes electric industry physical security experience and either of the premier security industry certifications sponsored by ASIS International. The ASIS certification program was initiated in 1977, and those that hold the CPP certification are board certified in security management. Those that hold the PSP certification are board certified in physical security.

- *An entity or organization approved by the ERO.*
- *A governmental agency with physical security expertise.*
- *An entity or organization with demonstrated law enforcement, government, or military physical security expertise.*

~~A third party that contributes to the threat assessment and development of the security plan may also serve as the reviewer. As with Requirement R2, the Responsible Entity has~~As with the verification under Requirement R2, Requirement R6 provides that the "review may occur

concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5." This provision is designed to provide applicable Transmission Owners and Transmission Operators the flexibility to work with the ~~reviewing entity~~third party reviewer throughout (*i.e.,* concurrent with) the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5, which for some Responsible Entities may be more efficient and effective. In other words, a ~~TO~~Transmission Owner or ~~TOP~~Transmission Operator could ~~coordinate~~collaborate with their unaffiliated ~~reviewing entity~~third party reviewer to perform an evaluation of potential threats and vulnerabilities (Requirement R4) and develop a security plan (Requirement R5) ~~concurrently with review to satisfy Requirements R4 through R6 simultaneously.~~to satisfy Requirements R4 through R6 simultaneously. The intent of Requirement R6 is to have an entity other than the owner or operator of the facility to be involved in the Requirement R4 evaluation and the development of the Requirement R5 security plans and have an opportunity to provide input on the evaluation and the security plan. Accordingly, Requirement R6 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the evaluation and develops the security plan itself and then has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the evaluation and develop the security plan.

~~Timeline~~



CIP-014-1 – Physical Security Process Flow
R1- Risk Assessment
90 Days
R2.2 - Third party verification
Verification Recommends Modification?
YES - 60 Days
R2.3 – Address verification recommendations and perform modifications or document technical reasons for not modifying
NO – 7 Days
R3 – Notice to operators of control centers
7 Days
R4 – Evaluation of threats and vulnerabilities of physical attack
120 Days from R2 Completion
R5 – Security Plan
90 Days
R6.2 - Third party review of evaluation and security plan(s)
Review Recommends Modification?
YES - 60 Days
NO
R6.3 – Address review recommendations and perform modifications or document reasons for not modifying
END
Notes:
- Days = Calendar Days
- Initial performance of R1 must be complete on or before the effective date of the standard.
- R2 completion is contingent upon whether verification recommends modification. If no, R2 is complete upon verification completion in R2.2. If yes, R2 is complete upon performing R2.3.
- R2 can be performed concurrently with R1
- R6 can be performed concurrently with R4 and R5

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan for Project 2014-04

May 1, 2014

Approvals Requested
CIP-014-1 Physical Security

Prerequisite Approvals
None

Effective Date

New or Revised Standards
CIP-014-1 is effective the first day of the first calendar quarter that is six months beyond the date that this standard is approved by applicable regulatory authorities or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. In those jurisdictions where regulatory approval is not required, CIP-014-1 shall become effective on the first day of the first calendar quarter that is six months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

Standards for Retirement
None

Initial Performance of Periodic Requirements
The initial risk assessment required by CIP-014-1, Requirement R1, must be completed on or before the effective date of the standard. Subsequent risk assessments shall be performed according to the timelines specified in CIP-014-1, Requirement R1.

The initial performance of CIP-014-1, Requirements R2 through R6, must be completed according to the timelines specified in those requirements after the effective date of the proposed Reliability Standard, as follows:

- Requirement R2 shall be completed as follows:
    - Parts 2.1, 2.2, and 2.4 shall be completed within 90 calendar days of the effective date of the proposed Reliability Standard.
    - Part 2.3 shall be completed within 60 calendar days of the completion of performance under Requirement R2 part 2.2.

- Requirement R3 shall be completed within 7 calendar days of completion of performance under Requirement R2.
- Requirements R4 and R5 shall be completed within 120 calendar days of completion of performance under Requirement R2.
- Requirement R6 shall be completed as follows:
    - Parts 6.1, 6.2, and 6.4 shall be completed within 90 calendar days of completion of performance under Requirement R5.
    - Part 6.3 shall be completed within 60 calendar days of Requirement R6 part 6.2.

Consideration of Issues and Directives

Project 2014-04 - Physical Security

May 1, 2014

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
P.6. The Reliability Standards should require owners or operators of the Bulk-Power System to take at least three steps to address the risks that physical security attacks pose to the reliable operation of the Bulk-Power System. First, the Reliability Standards should require owners or operators of the Bulk-Power System to perform a risk assessment of their systems to identify their "critical facilities." A critical facility is one that, if rendered inoperable or damaged, could have a critical impact on the operation of the interconnection through instability, uncontrolled separation or cascading failures on the Bulk-Power System. Methodologies to determine these facilities should be based on objective analysis, technical expertise, and experienced judgment. The Commission is not requiring NERC to adopt a specific type of risk assessment, nor is the Commission requiring that a mandatory number of facilities be identified as critical facilities under the Reliability Standards. Instead, the Commission is directing NERC to develop Reliability	*Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (Mar. 7, 2014).	Requirement R1 of proposed Reliability Standard CIP-014-1 responds to this directive by requiring Transmission Owners to perform a risk assessment of its Transmission stations and substations that meet the criteria in Attachment 1 of CIP-002-5.1 for a Medium Impact rating to identify which of those Transmission stations and substations, if rendered inoperable or damaged as a result of a physical attack, could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. The Transmission Owner must also identify the primary control centers that operationally controls each identified Transmission station or Transmission substation. The standard drafting team (SDT) determined that the CIP-002-5 bright line would provide a conservative threshold for defining which Transmission stations and Transmission substations must be included in the risk assessment in Requirement R1 of CIP-014-1. If the Transmission Owner does not have any Transmission stations or Transmission substations that meet the Medium

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Standards that will ensure that owners or operators of the Bulk-Power System identify those facilities that are critical to the reliable operation of the Bulk-Power System such that if those facilities are rendered inoperable or damaged, instability, uncontrolled separation or cascading failures could result on the Bulk-Power System and thereby warrant the directive imposed here.		Impact rating, it is not subject to the proposed Reliability Standard and, in turn, would not have to conduct the risk assessment. Consistent with the Commission's directive, Requirement R1 does not require a specific methodology for identifying facilities that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection; rather, the requirement mandates that the risk assessment shall consist of a transmission analysis or transmission analyses to ensure that the risk assessment is based on objective analysis, technical expertise, and experienced judgment. Lastly, Requirement R1 identifies the periodicity for conducting the risk assessments.
7. Issuance of this directive will help provide for the resiliency and reliable operation of the Bulk-Power System. To that end, the proposed Reliability Standards should allow owners or operators to consider resilience of the grid in the risk assessment when identifying critical facilities, and the elements that make up those facilities, such as transformers that typically require significant time to repair or replace. As part of this process, owners or operators may consider elements of resiliency such as how the system is designed,	*Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (Mar. 7, 2014).	Requirement R1 provides Transmission Owners the flexibility to consider the resilience of their system when conducting their risk assessments. As noted above, Requirement R1 does not require a specific methodology for identifying their critical facilities and, in turn, allows an entity to use a methodology that considers how their system is designed, operated, and maintained, and the sophistication of recovery plans and inventory management.

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
operated, and maintained, and the sophistication of recovery plans and inventory management.		
8. In the second step, the Reliability Standards should require owners or operators of the identified critical facilities to evaluate the potential threats and vulnerabilities to those identified facilities. The threats and vulnerabilities may vary from facility to facility based on factors such as the facility's location, size, function, existing protections and attractiveness as a target. Thus, the Reliability Standards should require the owners or operators to tailor their evaluation to the unique characteristics of the identified critical facilities and the type of attacks that can be realistically contemplated. NERC should also consider in the standards development process requiring owners and operators to consult with entities with appropriate expertise as part of this evaluation process.	*Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (Mar. 7, 2014).	Requirement R4 of proposed Reliability Standard CIP-014-1 responds to this directive by requiring that the applicable Transmission Owner or Transmission Operator of facilities identified in accordance with Requirement R1 and verified in accordance with Requirement R2 conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s). Consistent with the Commission's directive to "tailor their evaluation to the unique characteristics of the identified critical facilities and the type of attacks that can be realistically contemplated," Requirement R4 states that the evaluation must consider: (1) the unique characteristics of the identified facilities; (2) prior history of attack on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and (3) intelligence or threat warnings received from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), U. S. federal and/or Canadian governmental agencies, or their successors.

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		Consistent with the Commission's statement that NERC should consider requiring owners and operators of identified facilities to consult with entities with appropriate expertise, Requirement R6 requires applicable Transmission Owners and Transmission Operators to select a third party to review their evaluation. This review may occur concurrently with or after the evaluation.
9. Third and finally, the Reliability Standards should require those owners or operators of critical facilities to develop and implement a security plan designed to protect against attacks to those identified critical facilities based on the assessment of the potential threats and vulnerabilities to their physical security. The Reliability Standards themselves need not dictate specific steps an entity must take to protect against attacks on the identified facilities. However, the Reliability Standards need to require that owners or operators of identified critical facilities have a plan that results in an adequate level of protection against the potential physical threats and vulnerabilities they face at the identified critical facilities.	*Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (Mar. 7, 2014).	Requirement R5 of proposed Reliability Standard CIP-014-1 responds to this directive by requiring the applicable Transmission Owner or Transmission Operator of facilities identified in accordance with Requirement R1 and verified in accordance with Requirement R2 to develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s). Consistent with the Commission's directive, Requirement R5 does not dictate specific steps an entity must take to protect against attacks on the identified facilities but requires applicable entities to develop a security plan that includes the following attributes to help ensure an adequate level of protection: (1) resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4; (2) law enforcement

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		contact and coordination information; (3) a timeline for executing the physical security enhancements and modifications specified in the physical security plan; and (4) provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).
10. All three steps of compliance with the Reliability Standard described above could contain sensitive or confidential information that, if released to the public, could jeopardize the reliable operation of the Bulk-Power System. Guarding sensitive or confidential information is essential to protecting the public by discouraging attacks on critical infrastructure. Therefore, NERC should include in the Reliability Standards a procedure that will ensure confidential treatment of sensitive or confidential information but still allow for the Commission, NERC and the Regional Entities to review and inspect any information that is needed to ensure compliance with the Reliability Standards.	*Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (Mar. 7, 2014).	To protect confidential or sensitive information, the Compliance Monitoring section of the standard provides that evidence demonstrating compliance with the standard must be retained at the applicable entities' facilities. Additionally, Requirements R2 and R6 require applicable entities to implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to third party verifiers and reviewers and to protect or exempt sensitive or confidential information developed pursuant to the standard from public disclosure.
11. In addition, the risk assessment used by an owner or operator to identify critical facilities should be verified by an entity other than the owner or operator. Such verification could be performed by NERC, the relevant Regional Entity, a	*Reliability Standards for Physical Security*	Requirements R2 and R6 respond to this directive. Under Requirement R3 Transmission Owners must have an unaffiliated third party verify the risk assessment performed under Requirement R1. The third party verifier must be either (1) a

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Reliability Coordinator, or another entity. The Reliability Standards should include a procedure for the verifying entity, as well as the Commission, to add or remove facilities from an owner's or operator's list of critical facilities. Similarly, the determination of threats and vulnerabilities and the security plan should also be reviewed by NERC, the relevant Regional Entity, the Reliability Coordinator, or another entity with appropriate expertise. Finally, the Reliability Standards should require that the identification of the critical facilities, the assessment of the potential risks and vulnerabilities, and the security plans be periodically reevaluated and revised to ensure their continued effectiveness. NERC should establish a timeline for when such reevaluations should occur.	*Measures*, 146 FERC ¶ 61,166 (Mar. 7, 2014).	registered Planning Coordinator, Transmission Planner, or Reliability Coordinator; or (2) an entity that has transmission planning or analysis experience. The requirement provides that the verification shall either verify the Transmission Owner's risk assessment or include recommendations for the addition or deletion of a Transmission station(s) or Transmission substation(s). The verification may occur concurrently with the Requirement R1 risk assessment but must be completed within 90 calendar days of the risk assessment. The Transmission Owner is required to either modify its identification based on the verifier's recommendation or, if it disagrees with the verifier's recommendations, document the technical basis for not modifying its identification. Similarly, under Requirement R6, applicable Transmission Owners and Operators must have an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5. The reviewing entity must be (1) an entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification; (2) an entity or organization approved by the ERO; (3) a governmental agency with physical security expertise; or (4) an entity or organization with demonstrated law

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		enforcement, government, or military physical security expertise. The third party review must be completed within 90 calendar days of completing the security plan(s) developed in Requirement R5. The applicable Transmission Owners and Transmission Operators are required to either modify their evaluation or security plan(s) consistent with the reviewer's recommendations or, if they disagree with the recommendations, document the reasons for not modifying. Consistent with the directive to establish a timeline for periodic reevaluation of the identification of facilities that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection, the assessment of the potential risks and vulnerabilities, and the security plans, the standard provides that Requirement R1 risk assessment should be performed at least once every 30 calendar months for those Transmission Owners that identified facilities in their previous risk assessment and once every 60 calendar months for those Transmission Owners that did not identify facilities in their previous risk assessment. Upon completion of each subsequent risk assessment, the applicable entities must satisfy the obligations under the remaining requirements.

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
12. Under the Reliability Standards, we anticipate that the number of facilities identified as critical will be relatively small compared to the number of facilities that comprise the Bulk-Power System. For example, of the many substations on the Bulk-Power System, our preliminary view is that most of these would not be "critical" as the term is used in this order. We do not expect that every owner and operator of the Bulk-Power System will have critical facilities under the Reliability Standard. We also recognize that the industry has engaged in longstanding efforts to address the physical security of its critical facilities. Thus, NERC should develop an implementation plan that requires owners or operators of the Bulk-Power System to implement the Reliability Standards in a timely fashion, balancing the importance of protecting the Bulk-Power System from harm while giving the owners or operators adequate time to meaningfully implement the requirements. NERC should file the plan with the Reliability Standards for Commission review.	*Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (Mar. 7, 2014).	The proposed Implementation Plan addresses this directive. As provided in the Implementation Plan, the standard becomes effective the first day of the first calendar quarter that is six months beyond the date that this standard is approved by applicable regulatory authorities or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. This means that the initial risk assessment required by Requirement R1, must be completed on or before the effective date of the standard. The initial performance of Requirements R2 through R6 must be completed according to the timelines specified in those requirements after the effective date of the proposed Reliability Standard, as follows: - Requirement R2, Parts 2.1, 2.2, and 2.4 shall be completed within 90 calendar days of the effective date of the proposed Reliability Standard. Requirement R2, Part 2.3 shall be completed within 60 calendar days of the completion of performance under Requirement R2 part 2.2. - Requirement R3 shall be completed within 7 calendar days of completion of performance under Requirement R2.

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		- Requirements R4 and R5 shall be completed within 120 calendar days of completion of performance under Requirement R2. - Requirement R6, Parts 6.1, 6.2, and 6.4 shall be completed within 90 calendar days of completion of performance under Requirement R5. Requirement R6, Part 6.3 shall be completed within 60 calendar days of Requirement R6 Part 6.2.

Consideration of Issues and Directives

Project 2014-04 - Physical Security

~~April 9~~May 1, 2014

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
P.6. The Reliability Standards should require owners or operators of the Bulk-Power System to take at least three steps to address the risks that physical security attacks pose to the reliable operation of the Bulk-Power System. First, the Reliability Standards should require owners or operators of the Bulk-Power System to perform a risk assessment of their systems to identify their "critical facilities." A critical facility is one that, if rendered inoperable or damaged, could have a critical impact on the operation of the interconnection through instability, uncontrolled separation or cascading failures on the Bulk-Power System. Methodologies to determine these facilities should be based on objective analysis, technical expertise, and experienced judgment. The Commission is not requiring NERC to adopt a specific type of risk assessment, nor is the Commission requiring that a mandatory number of facilities be identified as critical facilities under the Reliability Standards. Instead, the Commission is directing NERC to develop Reliability	*Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (Mar. 7, 2014).	Requirement R1 of proposed Reliability Standard CIP-014-1 responds to this directive by requiring ~~that each~~ Transmission ~~Owner~~Owners to perform a risk assessment of its Transmission stations and substations that meet the criteria in Attachment 1 of CIP-002-5.1 for a Medium Impact rating to identify which of those Transmission stations and substations, if rendered inoperable or damaged as a result of a physical attack, could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. The Transmission Owner must also identify the primary control centers that operationally controls each identified Transmission station or Transmission substation. The standard drafting team (SDT) determined that the CIP-002-5 bright line ~~was appropriate because it has been vetted with stakeholders, and approved by NERC and FERC. The SDT concluded it was~~would provide a ~~technically sound basis to determine~~conservative threshold for defining which

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Standards that will ensure that owners or operators of the Bulk-Power System identify those facilities that are critical to the reliable operation of the Bulk-Power System such that if those facilities are rendered inoperable or damaged, instability, uncontrolled separation or cascading failures could result on the Bulk-Power System and thereby warrant the directive imposed here.		Transmission ~~Owners should conduct~~stations and Transmission substations must be included in the risk assessment~~.~~ in Requirement R1 of CIP-014-1. If the Transmission Owner does not have any Transmission stations or Transmission substations that meet the Medium Impact rating, it is not subject to the proposed Reliability Standard and, in turn, would not have to conduct the risk assessment. Consistent with the Commission's directive, Requirement R1 does not require a specific methodology for identifying facilities that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection; rather, the requirement mandates that the risk assessment shall consist of a transmission analysis or transmission analyses to ensure that the ~~methodology~~risk assessment is based on objective analysis, technical expertise, and experienced judgment. Lastly, Requirement R1 identifies the periodicity for conducting the risk assessments.
7. Issuance of this directive will help provide for the resiliency and reliable operation of the Bulk-Power System. To that end, the proposed Reliability Standards should allow owners or operators to consider resilience of the grid in the risk assessment when identifying critical facilities, and the	*Reliability Standards for Physical Security Measures*, 146	Requirement R1 provides Transmission Owners the flexibility to consider the resilience of their system when conducting their risk assessments. As noted above, Requirement R1 does not require a specific methodology for identifying their critical facilities and, in turn, allows an entity to use a methodology that

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
elements that make up those facilities, such as transformers that typically require significant time to repair or replace. As part of this process, owners or operators may consider elements of resiliency such as how the system is designed, operated, and maintained, and the sophistication of recovery plans and inventory management.	FERC ¶ 61,166 (Mar. 7, 2014).	considers how their system is designed, operated, and maintained, and the sophistication of recovery plans and inventory management.
8. In the second step, the Reliability Standards should require owners or operators of the identified critical facilities to evaluate the potential threats and vulnerabilities to those identified facilities. The threats and vulnerabilities may vary from facility to facility based on factors such as the facility's location, size, function, existing protections and attractiveness as a target. Thus, the Reliability Standards should require the owners or operators to tailor their evaluation to the unique characteristics of the identified critical facilities and the type of attacks that can be realistically contemplated. NERC should also consider in the standards development process requiring owners and operators to consult with entities with appropriate expertise as part of this evaluation process.	*Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (Mar. 7, 2014).	Requirement R4 of proposed Reliability Standard CIP-014-1 responds to this directive by requiring that ~~each~~the applicable Transmission Owner ~~and~~or Transmission Operator ~~that owns or operates~~of facilities identified in accordance with Requirement R1 ~~(~~and verified ~~under~~in accordance with Requirement R2~~)~~ conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s). Consistent with the Commission's directive to "tailor their evaluation to the unique characteristics of the identified critical facilities and the type of attacks that can be realistically contemplated," Requirement R4 states that the evaluation must consider: (1) the unique characteristics of the identified facilities; (2) prior history ~~or~~of attack on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and (3) intelligence or

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		threat warnings received from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), U. S. federal and/or Canadian governmental agencies, or their successors. Consistent with the Commission's statement that NERC should consider requiring owners and operators of identified facilities to consult with entities with appropriate expertise, Requirement R6 requires applicable Transmission Owners and Transmission Operators to select a third party to review their evaluation. This review may occur concurrently with or after the evaluation.
9. Third and finally, the Reliability Standards should require those owners or operators of critical facilities to develop and implement a security plan designed to protect against attacks to those identified critical facilities based on the assessment of the potential threats and vulnerabilities to their physical security. The Reliability Standards themselves need not dictate specific steps an entity must take to protect against attacks on the identified facilities. However, the Reliability Standards need to require that owners or operators of identified critical facilities have a plan that results in an adequate level of protection against the	*Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (Mar. 7, 2014).	Requirement R5 of proposed Reliability Standard CIP-014-1 responds to this directive by requiring ~~that each~~the applicable Transmission Owner ~~and~~or Transmission Operator ~~that owns or operates~~of facilities identified in accordance with Requirement R1 ~~(~~and verified ~~under~~in accordance with Requirement R2~~)~~ to develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s). Consistent with the Commission's directive, Requirement R5 does not dictate specific steps an entity must take to protect against attacks on the identified facilities but requires applicable entities to develop a security plan that includes the following attributes to help ensure an adequate level of protection: (1)

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
potential physical threats and vulnerabilities they face at the identified critical facilities.		resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities ~~based on the results of~~identified during the evaluation conducted in Requirement R4; (2) law enforcement contact and coordination information; (3) a timeline for ~~implementing~~executing the physical security enhancements and modifications specified in the physical security plan; and (4) provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).
10. All three steps of compliance with the Reliability Standard described above could contain sensitive or confidential information that, if released to the public, could jeopardize the reliable operation of the Bulk-Power System. Guarding sensitive or confidential information is essential to protecting the public by discouraging attacks on critical infrastructure. Therefore, NERC should include in the Reliability Standards a procedure that will ensure confidential treatment of sensitive or confidential information but still allow for the Commission, NERC and the Regional Entities to review and inspect any information	*Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (Mar. 7, 2014).	To protect confidential or sensitive information, the Compliance Monitoring section of the standard provides that evidence demonstrating compliance with the standard must be retained at the applicable entities' facilities. Additionally, Requirements R2 and R6 require applicable entities to implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information ~~exchanged with the~~ made available to third party ~~verifier under Requirement R2~~verifiers and reviewers and to protect or ~~the reviewing entity under Requirement R6. These steps will help ensure that lists of critical facilities or other~~exempt sensitive ~~documents remain~~ or

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
that is needed to ensure compliance with the Reliability Standards.		confidential~~.~~ information developed pursuant to the standard from public disclosure.
11. In addition, the risk assessment used by an owner or operator to identify critical facilities should be verified by an entity other than the owner or operator. Such verification could be performed by NERC, the relevant Regional Entity, a Reliability Coordinator, or another entity. The Reliability Standards should include a procedure for the verifying entity, as well as the Commission, to add or remove facilities from an owner's or operator's list of critical facilities. Similarly, the determination of threats and vulnerabilities and the security plan should also be reviewed by NERC, the relevant Regional Entity, the Reliability Coordinator, or another entity with appropriate expertise. Finally, the Reliability Standards should require that the identification of the critical facilities, the assessment of the potential risks and vulnerabilities, and the security plans be periodically reevaluated and revised to ensure their continued effectiveness. NERC should establish a timeline for when such reevaluations should occur.	*Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (Mar. 7, 2014).	Requirements R2 and R6 respond to this directive. Under Requirement R3 Transmission Owners must have an unaffiliated ~~entity~~third party verify the risk assessment performed under Requirement R1. The third party verifier must be either (1) a registered Planning Coordinator, Transmission Planner, or Reliability Coordinator; or (2) an entity that has transmission planning or analysis experience. The requirement provides that the ~~verifying entity~~verification shall either verify the Transmission Owner's risk assessment or ~~recommend~~include recommendations for the addition or deletion of a Transmission station(s) or Transmission substation(s). The verification may occur concurrently with the Requirement R1 risk assessment but must be completed within 90 calendar days of the risk assessment. The Transmission Owner is required to either modify its identification based on the verifier's recommendation or, if it disagrees with the verifier's recommendations, document the technical basis for not modifying its identification. Similarly, under Requirement R6, applicable Transmission Owners and Operators must have an unaffiliated third party review the evaluation performed under Requirement R4 and the

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		security plan(s) developed under Requirement R5. The reviewing entity must be ~~either~~ (1) an entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification; (2) an entity or organization approved by the ERO; (3) a governmental agency with physical security expertise; or (4) an entity or organization with demonstrated law enforcement, government, or military physical security expertise. The third party review must be completed within 90 calendar days of completing the security plan(s) developed in Requirement R5. The applicable Transmission Owners and Transmission Operators are required to either modify their evaluation or security plan(s) consistent with the reviewer's recommendations or, if they disagree with the recommendations, document the reasons for not modifying. Consistent with the directive to establish a timeline for periodic reevaluation of the identification of facilities that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection, the assessment of the potential risks and vulnerabilities, and the security plans, the standard provides that Requirement R1 risk assessment should be performed at least once every 30 calendar months for those

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		Transmission Owners that identified facilities in their previous risk assessment and once every 60 calendar months for those Transmission Owners that did not identify facilities in their previous risk assessment. Upon completion of each subsequent risk assessment, the applicable entities must satisfy the obligations under the remaining requirements.
12. Under the Reliability Standards, we anticipate that the number of facilities identified as critical will be relatively small compared to the number of facilities that comprise the Bulk-Power System. For example, of the many substations on the Bulk-Power System, our preliminary view is that most of these would not be "critical" as the term is used in this order. We do not expect that every owner and operator of the Bulk-Power System will have critical facilities under the Reliability Standard. We also recognize that the industry has engaged in longstanding efforts to address the physical security of its critical facilities. Thus, NERC should develop an implementation plan that requires owners or operators of the Bulk-Power System to implement the Reliability Standards in a timely fashion, balancing the importance of protecting the Bulk-Power System from harm while giving the owners or operators adequate time to meaningfully implement the requirements. NERC should file	*Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (Mar. 7, 2014).	The proposed Implementation Plan addresses this directive. As provided in the Implementation Plan, the standard becomes effective the first day of the first calendar quarter that is six months beyond the date that this standard is approved by applicable regulatory authorities or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. This means that the initial risk assessment required by Requirement R1, must be completed on or before the effective date of the standard. The initial performance of Requirements R2 through R6 must be completed according to the timelines specified in those requirements after the effective date of the proposed Reliability Standard, as follows: - Requirement R2, Parts 2.1, 2.2, and 2.4 shall be completed within 90 calendar days of the effective date of the proposed Reliability Standard. Requirement R2, Part 2.3

Project 2014-04 - Physical Security		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
the plan with the Reliability Standards for Commission review.		shall be completed within 60 calendar days of the completion of performance under Requirement R2 part 2.2. - Requirement R3 shall be completed within 7 calendar days of completion of performance under Requirement R2. - Requirements R4 and R5 shall be completed within 120 calendar days of completion of performance under Requirement R2. - Requirement R6, Parts 6.1, 6.2, and 6.4 shall be completed within 90 calendar days of completion of performance under Requirement R5. Requirement R6, Part 6.3 shall be completed within 60 calendar days of Requirement R6 ~~part~~Part 6.2.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Project 2014-04: Physical Security

VRF and VSL Justifications for CIP-014-1

VRF and VSL Justifications – CIP-014-1, R1	
Proposed VRF	High
NERC VRF Discussion	Initial and subsequent risk assessments identify Transmission stations or Transmission substations that need to be assessed for threats and vulnerabilities and potential physical security measures. Since this is a Requirement in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition. This justifies a High VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the risk assessment periodicity and the identification of the primary control center that has operational control of Transmission stations and/or Transmission substations.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable CIP-002-5.1 R1, which deals with categorizing cyber systems, is assigned a High VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Transmission Owner performed an initial risk assessment but did so after the date specified in the implementation plan for performing the initial risk assessment but less than or equal to two calendar months after that date;

VRF and VSL Justifications – CIP-014-1, R1	
	OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 30 calendar months but less than or equal to 32 calendar months; OR The Transmission Owner that has not identified in its previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 60 calendar months but less than or equal to 62 calendar months.
Proposed Moderate VSL	The Transmission Owner performed an initial risk assessment but did so more than two calendar months after the date specified in the implementation plan for performing the initial risk assessment but less than or equal to four calendar months after that date; OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 32 calendar months but less than or equal to 34 calendar months; OR The Transmission Owner that has not identified in its previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 62 calendar months but less than or equal to 64 calendar months.
Proposed High VSL	The Transmission Owner performed an initial risk assessment but did so more than four calendar months after the date specified in

VRF and VSL Justifications – CIP-014-1, R1	
	the implementation plan for performing the initial risk assessment but less than or equal to six calendar months after that date; OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 34 calendar months but less than or equal to 36 calendar months; OR The Transmission Owner that has not identified in its previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 64 calendar months but less than or equal to 66 calendar months; OR The Transmission Owner performed a risk assessment but failed to include Part 1.2.
Proposed Severe VSL	The Transmission Owner performed an initial risk assessment but did so more than six calendar months after the date specified in the implementation plan for performing the initial risk assessment; OR The Transmission Owner failed to perform an initial risk assessment; OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after more than 36 calendar months; OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within

VRF and VSL Justifications – CIP-014-1, R1	
	an Interconnection failed to perform a risk assessment; OR The Transmission Owner that has not identified in its previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after more than 66 calendar months; OR The Transmission Owner that has not identified in its previous risk assessment any Transmission station and Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection failed to perform a subsequent risk assessment.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if the risk assessment is not performed or if the risk assessment is not performed within required intervals.
FERC VSL G3 Violation Severity Level	The language of the VSL directly mirrors the language in the corresponding requirement.

VRF and VSL Justifications – CIP-014-1, R1	
Assignment Should Be Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is assigned for a single instance of failing to submit perform a risk assessment.

VRF and VSL Justifications – CIP-014-1, R2	
Proposed VRF	Medium
NERC VRF Discussion	Unaffiliated third party verification of initial and subsequent risk assessments provides reinforcement that the risk assessment was performed with due consideration to risk to the bulk power system. Since this Requirement is in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. This justifies a Medium VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the unaffiliated third party verification including entities that may perform the verification, provisions for adding or removing Transmission stations and/or Transmission substations, and provisions for confidentiality of sensitive information.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable EOP-005-2 R6, which deals with verifying that its restoration plan accomplishes its intended function is assigned a medium VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but did so in more than 90 calendar days but less than or equal to 100 calendar days following completion of Requirement R1;

VRF and VSL Justifications – CIP-014-1, R2	
	OR The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 and modified or documented the technical basis for not modifying its identification under Requirement R1 as required by part 2.3 but did so more than 60 calendar days and less than or equal to 70 calendar days from completion of the third party verification.
Proposed Moderate VSL	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but did so more than 100 calendar days but less than or equal to 110 calendar days following completion of Requirement R1; Or The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 and modified or documented the technical basis for not modifying its identification under Requirement R1 as required by part 2.3 but did so more than 70 calendar days and less than or equal to 80 calendar days from completion of the third party verification.
Proposed High VSL	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but did so more than 110 calendar days but less than or equal to 120 calendar days following completion of Requirement R1; OR The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 and modified or documented the technical basis for not modifying its identification under Requirement R1 as required by part 2.3 but did so more than 80 calendar days from completion of the third party verification; OR The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but failed to modify or document the technical basis for not modifying its identification under R1 as required by part 2.3.
Proposed Severe VSL	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but did so more than 120 calendar days following completion of Requirement R1; OR The Transmission Owner failed to have an unaffiliated third party

VRF and VSL Justifications – CIP-014-1, R2	
	verify the risk assessment performed under Requirement R1; OR The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but failed to implement procedures for protecting information per Part 2.4.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if an unaffiliated third party verification is not performed or if the verification is not performed within prescribe timelines. The VSLs are also written indicating violation of the Requirement Part regarding protection of information.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The language of the VSL directly mirrors the language in the corresponding requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based	The VSL is assigned for a single instance of failing to have an unaffiliated third party verification performed; or failing to perform the verification within prescribe timelines; or failing to implement procedures to protect information.

VRF and VSL Justifications – CIP-014-1, R2	
on A Single Violation, Not on A Cumulative Number of Violations	

VRF and VSL Justifications – CIP-014-1, R3	
Proposed VRF	Lower
NERC VRF Discussion	Notifying the Transmission Operator that it has operational control of a Transmission station or Transmission substation identified in Requirement R1 and verified in Requirement R2 is necessary so that the Transmission Operator may begin performance of subsequent physical security requirements for the primary control center. This is a requirement that is administrative in nature and in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. This justifies a Lower VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the notification of the Transmission Operator regarding the removal of a Transmission station or Transmission substation.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable INT-006-4 R6, which deals with notifying other entities so that Confirmed Interchange may be implemented, is assigned a Lower VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Transmission Owner notified the Transmission Operator that operates the primary control center as specified in Requirement R3 but did so more than seven calendar days and less than or equal to nine calendar days following the completion of Requirement R2; OR The Transmission Owner notified the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R1 but did so more than seven calendar

VRF and VSL Justifications – CIP-014-1, R3	
	days and less than or equal to nine calendar days following the verification or the subsequent risk assessment.
Proposed Moderate VSL	The Transmission Owner notified the Transmission Operator that operates the primary control center as specified in Requirement R3 but did so more than nine calendar days and less than or equal to 11 calendar days following the completion of Requirement R2; OR The Transmission Owner notified the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R1 but did so more than nine calendar days and less than or equal to 11 calendar days following the verification or the subsequent risk assessment.
Proposed High VSL	The Transmission Owner notified the Transmission Operator that operates the primary control center as specified in Requirement R3 but did so more than 11 calendar days and less than or equal to 13 calendar days following the completion of Requirement R2; OR The Transmission Owner notified the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R1 but did so more than 11 calendar days and less than or equal to 13 calendar days following the verification or the subsequent risk assessment.
Proposed Severe VSL	The Transmission Owner notified the Transmission Operator that operates the primary control center as specified in Requirement R3 but did so more than 13 calendar days following the completion of Requirement R2; OR The Transmission Owner failed to notify the Transmission Operator that it operates a control center identified in Requirement R1; OR The Transmission Owner notified the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R1 but did so more than 13 calendar days following the verification or the subsequent risk assessment. OR The Transmission Owner failed to notify the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R1.

VRF and VSL Justifications – CIP-014-1, R3	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if notification is not made subject to the conditions of the requirement.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The language of the VSL directly mirrors the language in the corresponding requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is assigned for a single instance of failing to make the appropriate notification.

VRF and VSL Justifications – CIP-014-1, R4	
Proposed VRF	Medium
NERC VRF Discussion	Performing an evaluation of potential threats and vulnerabilities of a physical attack to each of respective Transmission station(s), Transmission substation(s), and primary control center(s) is necessary to ensure the physical security of those assets as well as the reliability of the bulk power system. Since this Requirement is in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. This justifies a Medium VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the evaluation of potential threats and vulnerabilities of a physical attack to Transmission stations and/or Transmission substations.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable CIP-007-5 R2, which deals with a patch management process for tracking, evaluating, and installing cyber security patches for applicable Cyber Assets, is assigned a Medium VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	N/A

VRF and VSL Justifications – CIP-014-1, R4	
Proposed Moderate VSL	The Responsible Entity conducted an evaluation of the potential physical threats and vulnerabilities to each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but failed to consider one of Parts 4.1 through 4.3 in the evaluation.
Proposed High VSL	The Responsible Entity conducted an evaluation of the potential physical threats and vulnerabilities to each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but failed to consider two of Parts 4.1 through 4.3 in the evaluation.
Proposed Severe VSL	The Responsible Entity failed to conduct an evaluation of the potential physical threats and vulnerabilities to each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1; OR The Responsible Entity conducted an evaluation of the potential physical threats and vulnerabilities to each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but failed to consider Parts 4.1 through 4.3.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if a responsible entity fails to conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) or failed to consider any of the Requirement Parts 4.1-4.3.

VRF and VSL Justifications – CIP-014-1, R4	
Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The language of the VSL directly mirrors the language in the corresponding requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is assigned for a single instance of failing to conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) or failing to consider any of the Requirement Parts 4.1-4.3.

VRF and VSL Justifications – CIP-014-1, R5	
Proposed VRF	High
NERC VRF Discussion	Development, implementation and execution of a documented physical security plan(s) that covers applicable Transmission station(s), Transmission substation(s), and primary control center(s) is necessary to ensure the physical security of those assets as well as the reliability of the bulk power system. Since this Requirement is in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition. This justifies a High VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the physical security plan for applicable Transmission stations, Transmission substations, or primary control centers.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable CIP-003-3 R4, which deals with implementing and documenting a program to identify, classify, and protect information associated with Critical Cyber Assets, is assigned a High VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Responsible Entity developed and implemented a documented physical security plan(s) that covers each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but did so more than 120 calendar days but less than or equal to 130 calendar days after completing Requirement R2;

VRF and VSL Justifications – CIP-014-1, R5	
	OR The Responsible Entity developed and implemented a documented physical security plan(s) that covers its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2 but failed to include one of Parts 5.1 through 5.4 in the plan.
Proposed Moderate VSL	The Responsible Entity developed and implemented a documented physical security plan(s) that covers each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but did so more than 130 calendar days but less than or equal to 140 calendar days after completing Requirement R2; OR The Responsible Entity developed and implemented a documented physical security plan(s) that covers its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2 but failed to include two of Parts 5.1 through 5.4 in the plan.
Proposed High VSL	The Responsible Entity developed and implemented a documented physical security plan(s) that covers each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but did so more than 140 calendar days but less than or equal to 150 calendar days after completing Requirement R2; OR The Responsible Entity developed and implemented a documented physical security plan(s) that covers its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2 but failed to include three of Parts 5.1 through 5.4 in the plan.
Proposed Severe VSL	The Responsible Entity developed and implemented a documented physical security plan(s) that covers each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but did so more than 150 calendar days after completing the verification in Requirement R2; OR The Responsible Entity failed to develop and implement a documented physical security plan(s) that covers its Transmission

VRF and VSL Justifications – CIP-014-1, R5	
	station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1. OR The Responsible Entity developed and implemented a documented physical security plan(s) that covers its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2 but failed to include Parts 5.1 through 5.4 in the plan.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if a responsible entity fails to develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s) or if the responsible entity failed to include any of the Requirement Parts 5.1-5.4.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The language of the VSL directly mirrors the language in the corresponding requirement.
FERC VSL G4 Violation Severity Level	The VSL is assigned for a single instance of failing to develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and

VRF and VSL Justifications – CIP-014-1, R5	
Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	primary control center(s) or failing to include any of the Requirement Parts 5.1-5.4.

VRF and VSL Justifications – CIP-014-1, R6	
Proposed VRF	Medium
NERC VRF Discussion	Unaffiliated third party review of the threat evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 provides reinforcement that these requirements were performed with due consideration to risk to the bulk power system. Since this Requirement is in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. This justifies a Medium VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the unaffiliated third party review including entities that may perform the review, timelines for completing the review and provisions for confidentiality of sensitive information.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable EOP-005-2 R6, which deals with verifying that its restoration plan accomplishes its intended function is assigned a medium VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but did so in more than 90 calendar days but less than or equal to 100 calendar days;

VRF and VSL Justifications – CIP-014-1, R6	
	OR The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 and modified or documented the reason for not modifying the security plan(s) as specified in Part 6.3 but did so more than 60 calendar days and less than or equal to 70 calendar days following completion of the third party review.
Proposed Moderate VSL	The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but did so in more than 100 calendar days but less than or equal to 110 calendar days; OR The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 and modified or documented the reason for not modifying the security plan(s) as specified in Part 6.3 but did so more than 70 calendar days and less than or equal to 80 calendar days following completion of the third party review.
Proposed High VSL	The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but did so more than 110 calendar days but less than or equal to 120 calendar days; OR The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 and modified or documented the reason for not modifying the security plan(s) as specified in Part 6.3 but did so more than 80 calendar days following completion of the third party review; OR The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but did not and modify or document the reason for not modifying the security plan(s) as specified in Part 6.3.
Proposed Severe VSL	The Responsible Entity failed to have an unaffiliated third party

VRF and VSL Justifications – CIP-014-1, R6	
	review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 in more than 120 calendar days; OR The Responsible Entity failed to have an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5; OR The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but failed to implement procedures for protecting information per Part 6.3.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if an unaffiliated third party review is not performed or if the review is not performed within prescribe timelines. The VSLs are also written indicating violation of the Requirement Part regarding protection of information.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the	The language of the VSL directly mirrors the language in the corresponding requirement.

VRF and VSL Justifications – CIP-014-1, R6	
Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is assigned for a single instance of failing to have an unaffiliated third party review performed; or failing to perform the review within prescribe timelines; or failing to implement procedures to protect information.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

DRAFT Reliability Standard Audit Worksheet[1]

CIP-014-1 – Physical Security

This section to be completed by the Compliance Enforcement Authority.

Audit ID:	Audit ID if available; or REG-NCRnnnnn-YYYYMMDD
Registered Entity:	Registered name of entity being audited
NCR Number:	NCRnnnnn
Compliance Enforcement Authority:	Region or NERC performing audit
Compliance Assessment Date(s)[2]:	Month DD, YYYY, to Month DD, YYYY
Compliance Monitoring Method:	[On-site Audit | Off-site Audit | Spot Check]
Names of Auditors:	Supplied by CEA

[1] NERC developed this Reliability Standard Audit Worksheet (RSAW) language in order to facilitate NERC's and the Regional Entities' assessment of a registered entity's compliance with this Reliability Standard. The NERC RSAW language is written to specific versions of each NERC Reliability Standard. Entities using this RSAW should choose the version of the RSAW applicable to the Reliability Standard being assessed. While the information included in this RSAW provides some of the methodology that NERC has elected to use to assess compliance with the requirements of the Reliability Standard, this document should not be treated as a substitute for the Reliability Standard or viewed as additional Reliability Standard requirements. In all cases, the Regional Entity should rely on the language contained in the Reliability Standard itself, and not on the language contained in this RSAW, to determine compliance with the Reliability Standard. NERC's Reliability Standards can be found on NERC's website. Additionally, NERC Reliability Standards are updated frequently, and this RSAW may not necessarily be updated with the same frequency. Therefore, it is imperative that entities treat this RSAW as a reference document only, and not as a substitute or replacement for the Reliability Standard. It is the responsibility of the registered entity to verify its compliance with the latest approved version of the Reliability Standards, by the applicable governmental authority, relevant to its registration status.

The NERC RSAW language contained within this document provides a non-exclusive list, for informational purposes only, of examples of the types of evidence a registered entity may produce or may be asked to produce to demonstrate compliance with the Reliability Standard. A registered entity's adherence to the examples contained within this RSAW does not necessarily constitute compliance with the applicable Reliability Standard, and NERC and the Regional Entity using this RSAW reserves the right to request additional evidence from the registered entity that is not included in this RSAW. Additionally, this RSAW includes excerpts from FERC Orders and other regulatory references. The FERC order cites are provided for ease of reference only, and this document does not necessarily include all applicable Order provisions. In the event of a discrepancy between FERC orders, and the language included in this document, FERC orders shall prevail.

[2] Compliance Assessment Date(s): The date(s) the actual compliance assessment (on-site audit, off-site spot check, etc.) occurs.

Applicability of Requirements *[RSAW developer to insert correct applicability]*

DRAFT

[3] Applicability is further defined to owners of transmission Facilities operated at 500 kV or higher (see section 4.1.1.1 of the Standard) and owners of certain transmission Facilities operating between 200 kV and 499 kV where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations, per section 4.1.1.2 of the Standard. In addition, sections 4.1.1.3 and 4.1.1.4 bring additional transmission Facilities identified as either critical to the derivation of Interconnection Reliability Operating Limits and Nuclear Plant Interface, respectively, within the purview of the standard. Please see the referenced sections of the Standard for additional details regarding applicability of the Requirements to Transmission Owners.

[4] Facilities in a "protected area," as defined in 10 C.F.R. § 73.2, within the scope of a security plan approved or accepted by the Nuclear Regulatory Commission are not subject to this Standard; or, Facilities within the scope of a security plan approved or accepted by the Canadian Nuclear Safety Commission are not subject to this Standard.

Note to Auditors Concerning Third Party Verifications and Reviews

Requirements R2 and R6 prescribe, respectively, unaffiliated third party verifications for Requirement R1 and unaffiliated third party reviews for Requirements R4 and R5. Auditors are encouraged to rely on the verifications and reviews performed in cases where the verifying or reviewing entities are qualified, unaffiliated with the audited entity, and the scope of their verification or review is clear. The concept of reliance means using the work of others to avoid duplication of efforts and is consistent with recognized professional auditing standards, which are required for Compliance Audits per NERC's Rules of Procedure. Reliance in the context of this Reliability Standard means using the Requirement R2 verifications and Requirement R6 reviews to reduce audit risk and the related rigor of audit testing for Requirements R1, R4, and R5. However, in cases where the verifying or reviewing entity lacks the qualifications specified in Requirement R2 for verifications or Requirement R6 for reviewers, the required unaffiliation from the audited entity, or where the scope of the third party entity's verification or review is unclear, auditors may need to apply audit testing of Requirements R1, R4, or R5. For this reason, the Evidence Requested and Compliance Assessment Approach Sections are still present in this RSAW for Requirements R1, R4, and R5. We anticipate those sections will also facilitate expectations for entities and their unaffiliated third party verifiers and reviewers, assist Electric Reliability Organization (ERO) auditors to understand the audit procedures applied by unaffiliated third party verifiers and reviewers, and provide transparency between ERO auditors and Industry, should circumstances require audit testing of Requirements R1, R4, or R5. Further, it is an objective of the ERO to have transparent Evidence Requests and Compliance Assessment Approaches for every enforceable standard, whether they are in audit scope or not.

DRAFT

R1 Supporting Evidence and Documentation

R1. Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria specified in Applicability Section 4.1.1.The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify the Transmission station(s) and Transmission substation(s) that, if rendered inoperable or damaged, could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection.

1.1. Subsequent risk assessments shall be performed:

- At least once every 30 calendar months for a Transmission Owner that has identified in its previous risk assessment (as verified according to Requirement R2)one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection; or
- At least once every 60 calendar months for a Transmission Owner that has not identified in its previous risk assessment (as verified according to Requirement R2) any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection.

1.2. The Transmission Owner shall identify the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment.

M1. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the risk assessment of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria in Applicability Section 4.1.1 as specified in Requirement R1. Additionally, examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the identification of the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment as specified in Requirement R1, Part 1.2.

Registered Entity Response (Required):

Question: Do you own any Transmission stations/substations, either existing or planned in the next 24 months, meeting the applicability requirements of Section 4.1.1? ☐ Yes ☐ No

☐ This entity does not have any applicable Transmission stations/substations.

☐ Other: [Provide explanation below]

[Include additional information regarding the question here, including the type of response and format of the response requested, as appropriate.]

[Note: A separate spreadsheet or other document may be used. If so, provide the document reference below.]

Compliance Narrative:

Provide a brief explanation of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
(R1) Provide the current and the immediately preceding dated risk assessments.
(R1) List of existing Transmission stations/substations that meet the criteria specified in Section 4.1.1.
(R1) List of Transmission stations/substations planned in the next 24 months that meet criteria specified in Section 4.1.1.
(R1 Part 1.2) List of primary control centers that operationally control each identified Transmission station/substation.

Registered Entity Evidence (Required):

The following information is required for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location of the evidence.					
File Name	**Document Title**	**Revision or Version**	**Document Date**	**Relevant Page(s) or Section(s)**	**Description of Applicability of Document**

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to CIP-014-1, R1

This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	(R1) Review entity's process for determining Transmission stations/substations subject to identification in accordance with Requirement R1, including weighting described in Section 4.1.1.2.
	(R1) Review entity's risk assessment process to determine the Transmission stations/substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an interconnection.
	(R1) Ensure entity's risk assessment process includes Transmission stations/substations planned in the next 24 months.

	(R1) Ensure risk assessment(s) covers each Transmission station/substation meeting applicability described in Section 4.1.
	(R1 Part 1.1) If applicable, review any prior risk assessments and verify whether or not Transmission stations/substations were identified.
	(R1 Part 1.1) Review evidence that risk assessment was performed and verify that it occurred within the past 30 months where items were identified in the previous risk assessment and 60 months where no items were identified in the previous risk assessment.

Note to Auditor: Review entity's answer to the above Question and if the auditor can verify the answer is 'no,' Requirements R3-R6 do not apply and no further audit testing of Requirements R3-R6 is necessary, unless the entity performs the Transmission Operator function for a station/substation meeting the criteria of Requirement R1 Part 1.2.

The 24 month period referenced for Transmission stations/substations planned to be in service is as of the date of the risk assessment not the date of the audit.

See above Note Concerning Third Party Verifications for important details regarding audit risk assessment and related rigor of audit procedures to be applied for this Requirement.

Auditor Notes:

DRAFT

R2 Supporting Evidence and Documentation

R2. Each Transmission Owner shall have an unaffiliated third party verify the risk assessment performed under Requirement R1. The verification may occur concurrent with or after the risk assessment performed under Requirement R1.

2.1. Each Transmission Owner shall select an unaffiliated verifying entity that is either:

- A registered Planning Coordinator, Transmission Planner, or Reliability Coordinator;
- An entity that has transmission planning or analysis experience.

2.2. The unaffiliated third party verification shall verify the Transmission Owner's risk assessment performed under Requirement R1, which may include recommendations for the addition or deletion of a Transmission station(s) or Transmission substation(s). The Transmission Owner shall ensure the verification is completed within 90 calendar days following the completion of the Requirement R1 risk assessment.

2.3. If the unaffiliated verifying entity recommends that the Transmission Owner add a Transmission station(s) or Transmission substation(s) to, or remove a Transmission station(s) or Transmission substation(s) from, its identification under Requirement R1, the Transmission Owner shall either, within 60 calendar days of completion of the verification, for each recommended addition or removal of a s Transmission station or Transmission substation::

- Modify its identification under Requirement R1 consistent with the recommendation; or
- Document the technical basis for not modifying the identification in accordance with the recommendation.

2.4. Each Transmission Owner shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated verifying entity and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M2. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner completed an unaffiliated third verification of the Requirement R1 risk assessment and satisfied all of the applicable provisions of Requirement R2, including, if applicable, documenting the technical basis for not modifying the Requirement R1 identification as specified under Part 2.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 2.4.

Registered Entity Response (Required):

Compliance Narrative:

Provide a brief explanation of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
(R2) Dated evidence of third party verification of the entity's risk assessment performed under Requirement R1.
(R2 Part 2.1) Documented qualifications of the verifying party.
(R2 Part 2.3) Recommendations, if any, of the verifying party related to Requirement R1 risk assessments.
(R2 Part 2.3) Documentation of modifications and implementation of recommendations or technical basis for not implementing recommendations of the verifying party.
(R2 Part 2.4) Evidence that procedures were implemented to protect sensitive and confidential information.

Registered Entity Evidence (Required):

The following information is required for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location of the evidence.					
File Name	**Document Title**	**Revision or Version**	**Document Date**	**Relevant Page(s) or Section(s)**	**Description of Applicability of Document**

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to CIP-014-1, R2

This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	(R2) Review evidence of third party verification of the entity's risk assessment and verify the following:
	(R2 Part 2.1) The reviewing entity is registered in accordance with Part 2.1 or has transmission planning or analysis experience.
	(R2 Part 2.2) Verification was completed within 90 calendar days of risk assessment.
	(R2 Part 2.3) Verifying entity's recommendations, if any, were used to modify the entity's Requirement R1 identification or the technical basis for not modifying the Requirement R1 identification is documented within 60 calendar days of completion of the verification.
	(R2 Part 2.4) Review non-disclosure agreement (or other evidence) to verify procedures for protecting sensitive or confidential information between the entity and third party were implemented.
Note to Auditor See Guidelines and Technical Basis section of the standard and Rationale for Requirement R2 associated with the Standard for additional details regarding the term 'unaffiliated.'	

The third party verification may occur concurrent with or after the risk assessment performed under Requirement R1.

Auditor Notes:

DRAFT

R3 Supporting Evidence and Documentation

R3. For a primary control center(s) identified by the Transmission Owner according to Requirement R1, Part 1.2 that a) operationally controls an identified Transmission station or Transmission substation verified according to Requirement R2, and b) is not under the operational control of the Transmission Owner, the Transmission Owner shall, within seven calendar days following completion of Requirement R2, notify the Transmission Operator that has operational control of the primary control center of such identification and the date of completion of Requirement R2.

3.1. If a Transmission station or Transmission substation previously identified under Requirement R1 and verified according to Requirement R2 is removed from the identification during a subsequent risk assessment performed according to Requirement R1 or a verification according to Requirement R2, then the Transmission Owner shall, within seven calendar days following the verification or the subsequent risk assessment, notify the Transmission Operator that has operational control of the primary control center of the removal.

M3. Examples of acceptable evidence may include, but are not limited to, dated written or electronic notifications or communications that the Transmission Owner notified each Transmission Operator, as applicable, according to Requirement R3.

Registered Entity Response (Required):

Question: Are there any primary control centers identified in Requirement R1, Part 1.2 that are not under operational control of your NERC registration? ☐ Yes ☐ No

[Note: A separate spreadsheet or other document may be used. If so, provide the document reference below.]

Compliance Narrative:

Provide a brief explanation of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
(R3) If applicable, dated communications with Transmission Operators demonstrating notification and the date of completion of Requirement R2.

Registered Entity Evidence (Required):

The following information is required for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location of the evidence.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to CIP-014-1, R3

This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	(R3) For each applicable primary control center identified in Requirement R1 Part 1.2 not under the control of the entity's registration, verify notification exists and contains the date of completion of Requirement R2.
	(R3 Part 3.1) For each Transmission station/substation removed under Part 3.1, ensure the responsible Transmission Operator was notified of the removal within seven calendar days of removal from identification.
Note to Auditor: Note the entity's response to the above Question. If auditor can verify the entity's answer of 'No,' then Requirement R3 is not applicable and no further audit testing is required.	

Auditor Notes:

.

R4 Supporting Evidence and Documentation

R4. Each Transmission Owner that identified a Transmission station, Transmission substation, or a primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2. The evaluation shall consider the following:

4.1. Unique characteristics of the identified and verified Transmission station(s), Transmission substation(s), and primary control center(s);

4.2. Prior history of attack on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and

4.3. Intelligence or threat warnings received from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), U.S. federal and/or Canadian governmental agencies, or their successors.

M4. Examples of evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner or Transmission Operator conducted an evaluation of the potential threats and vulnerabilities of a physical attack to their respective Transmission station(s), Transmission substation(s) and primary control center(s) as specified in Requirement R4.

Registered Entity Response (Required):

Compliance Narrative:

Provide a brief explanation of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
(R4) A description of the entity's process for executing the evaluation prescribed in Requirement R4.
(R4) Dated evidence of the evaluation prescribed in Requirement R4.

Registered Entity Evidence (Required):

The following information is required for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location of the evidence.					
File Name	**Document Title**	**Revision or Version**	**Document Date**	**Relevant Page(s) or Section(s)**	**Description of Applicability of Document**

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to CIP-014-1, R4

This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	(R4) Review evidence of evaluation and verify it considers the following:
	(R4) Potential threats and vulnerabilities as described in Requirement R4.
	(R4 Part 4.1) Unique characteristics as described in Requirement R4 Part 4.1.
	(R4 Part 4.2) Prior history of attack on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events.
	(R4 Part 4.3) Intelligence or warnings as described in Part 4.3.
Note to Auditor: See above Note Concerning Third Party Verifications for important details regarding audit risk assessment and related rigor of audit procedures to be applied for this Requirement. Auditor should cross reference the Transmission stations/substations and primary control centers identified in the risk assessment performed under Requirement R1 to the evaluation prescribed in Requirement R4 to ensure it is complete.	

Auditor Notes:

R5 Supporting Evidence and Documentation

R5. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center identified in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s). The physical security plan(s) shall be developed within 120 calendar days following the completion of Requirement R2 and executed according to the timeline specified in the physical security plan(s). The physical security plan(s) shall include the following attributes:

5.1. Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.

5.2. Law enforcement contact and coordination information.

5.3. A timeline for executing the physical security enhancements and modifications specified in the physical security plan.

5.4. Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).

M5. Examples of evidence may include, but are not limited to, dated written or electronic documentation of its physical security plan(s) that covers their respective identified and verified Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R5, and additional evidence demonstrating execution of the physical security plan according to the timeline specified in the physical security plan.

Registered Entity Response (Required):

Compliance Narrative:

Provide a brief explanation of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
(R5) Dated physical security plan(s).

Registered Entity Evidence (Required):

The following information is required for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location of the evidence.					
File Name	**Document Title**	**Revision or Version**	**Document Date**	**Relevant Page(s) or Section(s)**	**Description of Applicability of Document**

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to CIP-014-1, R5

This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	(R5) Review evidence and verify the physical security plan(s) covers the Transmission stations/substations and primary controls identified in Requirements R1 and/or R2, and verify plan was developed within 120 calendar days following the completion of Requirement R2 and executed according to the timeline specified in the physical security plan(s). In addition, verify the plan includes the following attributes:
	(R5 Part 5.1) Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.
	(R5 Part 5.2) Law enforcement contact and coordination information.
	(R5 Part 5.3) A timeline for executing physical security enhancements and modifications specified in the physical security plan.
	(R5 Part 5.4) Provisions to evaluate evolving physical threats, and their corresponding security measures in accordance with R5 Part 5.4
	(R5) Verify implementation of physical security plan(s). See 'Note to Auditor' for details.
Note to Auditor: See above Note Concerning Third Party Verifications for important details regarding audit risk assessment and related rigor of audit procedures to be applied for this Requirement. Auditor should cross reference the Transmission stations/substations and primary control centers identified in the risk assessment performed under Requirement R1 to the evaluation prescribed in Requirement R4 and the security plan(s) prescribed in Requirement R5 to ensure the plan addresses vulnerabilities to	

physical attacks per the evaluation conducted in Requirement R4.

Requirement R5 includes implementation of the security plan(s), which is not within the scope of the third party review described in Requirement R6. Auditors can gain reasonable assurance security plan(s) was/were implemented by determining if specific actions prescribed by the plan(s) have taken place within the timelines established by the plan(s). For example, if the plan calls for certain procedures to occur, then auditors could ask for evidence demonstrating the procedure has been implemented within the timeline established in the security plan. Also, if the plan calls for construction of a barrier, an auditor could verify evidence that such a barrier was constructed in accordance with the entity's timeline. As auditors should obtain reasonable, not absolute, assurance the plan(s) was/were implemented, testing implementation on a sample basis may be appropriate.

Auditor Notes:

DRAFT

R6 Supporting Evidence and Documentation

R6. Each Transmission Owner identifies a Transmission station, Transmission substation, or primary control center identified in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall have an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5. The review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5

6.1. Each Transmission Owner and Transmission Operator shall select an unaffiliated third party reviewer from the following:

- An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.
- An entity or organization approved by the ERO.
- A governmental agency with physical security expertise.
- An entity or organization with demonstrated law enforcement, government, or military physical security expertise.

6.2. The Transmission Owner or Transmission Operator, respectively, shall ensure that the unaffiliated third party review is completed within 90 calendar days of completing the security plan(s) developed in Requirement R5. The unaffiliated third party review may, but is not required to, include recommended changes to the evaluation performed under Requirement R4 or the security plan(s) developed under Requirement R5.

6.3. If the unaffiliated third party reviewer recommends changes to the evaluation performed under Requirement R4 or security plan(s) developed under Requirement R5, the Transmission Owner or Transmission Operator shall, within 60 calendar days of the completion of the unaffiliated third party review, for each recommendation:

- Modify its security plan(s) consistent with the recommendation; or
- Document the reason for not modifying the security plan(s) consistent with the recommendation

6.4. Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated reviewing entity and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M6. Examples of evidence may include, but are not limited to, written or electronic documentation that the Transmission Owner or Transmission Operator had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 as specified in Requirement R6 including, if applicable, documenting the reasons for not modifying the evaluation or security

plan(s) in accordance with a recommendation under Part 6.3. Examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 6.4

Registered Entity Response (Required):

Compliance Narrative:

Provide a brief explanation of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
(R6) Dated Evidence of unaffiliated third party review of entity's Requirement R4 evaluation and Requirement R5 security plan(s).
(R6 Part 6.1) Evidence that reviewing entity staff meets qualifications identified in Part 6.1.
(R6 Part 6.3) Recommendations of reviewing party related to Requirement R4 evaluation and Requirement R5 security plan.
(R6 Part 6.3) Dated documentation of modifications and implementation of recommendations or reasons and compensating mitigating measures for not implementing recommendations of the reviewing party.
(R6 Part 6.4) Evidence that procedures were implemented to protect sensitive and confidential information.

Registered Entity Evidence (Required):

The following information is required for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location of the evidence.					
File Name	**Document Title**	**Revision or Version**	**Document Date**	**Relevant Page(s) or Section(s)**	**Description of Applicability of Document**

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to CIP-014-1, R6

This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	(R6) Review evidence and verify the physical security plan(s) and the Requirement R4 evaluation have been reviewed by an unaffiliated third party. Also, review evidence and verify the following:
	(R6 Part 6.1) Reviewing party has the qualifications identified in Part 6.1.
	(R6 Part 6.2) Review is dated within 90 calendar days of completion of the Requirement R5 security plan.
	(R6 Part 6.3) Reviewing entity recommended changes to security plan(s) were made by entity or the reason(s) for not making the change(s) was/were documented within 60 calendar days of the completion of the unaffiliated third party review.
	(R6 Part 6.4) Review non-disclosure agreement (or other evidence) to verify procedures for protecting sensitive or confidential information between entity and third party were implemented.
Note to Auditor: The third party review may occur concurrent with or after the evaluation performed under Requirement R4 or the security plan develop under Requirement R5. See Guidelines and Technical Basis associated with the Standard for additional details related to qualifications of reviewing entities that may inform audited entities selection of a reviewing entity.	

Auditor Notes:

Additional Information:

Reliability Standard

The RSAW developer should provide the following information without hyperlinks. Update the information below as appropriate.

The full text of CIP-014-1 may be found on the NERC Web Site (www.nerc.com) under "Program Areas & Departments", "Reliability Standards."

In addition to the Reliability Standard, there is an applicable Implementation Plan available on the NERC Web Site.

In addition to the Reliability Standard, there is background information available on the NERC Web Site.

Capitalized terms in the Reliability Standard refer to terms in the NERC Glossary, which may be found on the NERC Web Site.

Sampling Methodology [If developer deems reference applicable]

Sampling is essential for auditing compliance with NERC Reliability Standards since it is not always possible or practical to test 100% of either the equipment, documentation, or both, associated with the full suite of enforceable standards. The Sampling Methodology Guidelines and Criteria (see NERC website), or sample guidelines, provided by the Electric Reliability Organization help to establish a minimum sample set for monitoring and enforcement uses in audits of NERC Reliability Standards.

Regulatory Language [Developer to ensure RSAW has been provided to NERC Legal for links to appropriate Regulatory Language – See example below]

E.g. FERC Order No. 742 paragraph 34: "Based on NERC's…….

E.g. FERC Order No. 742 Paragraph 55, Commission Determination: "We affirm NERC's…….

Selected Glossary Terms [If developer deems applicable]

The following Glossary terms are provided for convenience only. Please refer to the NERC web site for the current enforceable terms.

Revision History for RSAW

Version	Date	Reviewers	Revision Description
1	04/09/2014	Physical Security RSAW Task Force	New Document
2	05/01/2014	Physical Security RSAW Task Force	Revisions based on comments and changes to the standard.

[i] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

DRAFT

DRAFT Reliability Standard Audit Worksheet[1]

CIP-014-1 – Physical Security

This section to be completed by the Compliance Enforcement Authority.

Audit ID:	Audit ID if available; or REG-NCRnnnnn-YYYYMMDD
Registered Entity:	Registered name of entity being audited
NCR Number:	NCRnnnnn
Compliance Enforcement Authority:	Region or NERC performing audit
Compliance Assessment Date(s)[2]:	Month DD, YYYY, to Month DD, YYYY
Compliance Monitoring Method:	[On-site Audit | Off-site Audit | Spot Check]
Names of Auditors:	Supplied by CEA

[1] NERC developed this Reliability Standard Audit Worksheet (RSAW) language in order to facilitate NERC's and the Regional Entities' assessment of a registered entity's compliance with this Reliability Standard. The NERC RSAW language is written to specific versions of each NERC Reliability Standard. Entities using this RSAW should choose the version of the RSAW applicable to the Reliability Standard being assessed. While the information included in this RSAW provides some of the methodology that NERC has elected to use to assess compliance with the requirements of the Reliability Standard, this document should not be treated as a substitute for the Reliability Standard or viewed as additional Reliability Standard requirements. In all cases, the Regional Entity should rely on the language contained in the Reliability Standard itself, and not on the language contained in this RSAW, to determine compliance with the Reliability Standard. NERC's Reliability Standards can be found on NERC's website. Additionally, NERC Reliability Standards are updated frequently, and this RSAW may not necessarily be updated with the same frequency. Therefore, it is imperative that entities treat this RSAW as a reference document only, and not as a substitute or replacement for the Reliability Standard. It is the responsibility of the registered entity to verify its compliance with the latest approved version of the Reliability Standards, by the applicable governmental authority, relevant to its registration status.

The NERC RSAW language contained within this document provides a non-exclusive list, for informational purposes only, of examples of the types of evidence a registered entity may produce or may be asked to produce to demonstrate compliance with the Reliability Standard. A registered entity's adherence to the examples contained within this RSAW does not necessarily constitute compliance with the applicable Reliability Standard, and NERC and the Regional Entity using this RSAW reserves the right to request additional evidence from the registered entity that is not included in this RSAW. Additionally, this RSAW includes excerpts from FERC Orders and other regulatory references. The FERC order cites are provided for ease of reference only, and this document does not necessarily include all applicable Order provisions. In the event of a discrepancy between FERC orders, and the language included in this document, FERC orders shall prevail.

[2] Compliance Assessment Date(s): The date(s) the actual compliance assessment (on-site audit, off-site spot check, etc.) occurs.

Applicability of Requirements *[RSAW developer to insert correct applicability]*

	BA	DP	GO	GOP	IA	LSE	PA	PSE	RC	RP	RSG	TO	TOP	TP	TSP

Text entry area with white background:	Auditor-supplied information

DRAFT

[3] Applicability is further defined to owners of transmission Facilities operated at 500 kV or higher (see section 4.1.1.1 of the Standard) and owners of certain transmission Facilities operating between 200 kV and 499 kV where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations, per section 4.1.1.2 of the Standard. In addition, sections 4.1.1.3 and 4.1.1.4 bring additional transmission Facilities identified as either critical to the derivation of Interconnection Reliability Operating Limits and Nuclear Plant Interface, respectively, within the purview of the standard. Please see the referenced sections of the Standard for additional details regarding applicability of the Requirements to Transmission Owners.

[4] Facilities in a "protected area," as defined in 10 C.F.R. § 73.2, within the scope of a security plan approved or accepted by the Nuclear Regulatory Commission are not subject to this Standard; or, Facilities within the scope of a security plan approved or accepted by the Canadian Nuclear Safety Commission are not subject to this Standard.~~Facilities regulated by the Nuclear Regulatory Commission or Canadian Nuclear Safety Commission are not subject to this Standard.~~

Note to Auditors Concerning Third Party Verifications and Reviews

Requirements R2 and R6 prescribe, respectively, unaffiliated third party verifications for Requirement R1 and unaffiliated third party reviews for Requirements R4 and R5. Auditors are encouraged to rely on the verifications and reviews performed in cases where the verifying or reviewing entities are qualified, unaffiliated with the audited entity, and the scope of their verification or review is clear. The concept of reliance means using the work of others to avoid duplication of efforts and is consistent with recognized professional auditing standards, which are required for Compliance Audits per NERC's Rules of Procedure. Reliance in the context of this Reliability Standard means using the Requirement R2 verifications and Requirement R6 reviews to reduce audit risk and the related rigor of audit testing for Requirements R1, R4, and R5. However, in cases where the verifying or reviewing entity lacks the qualifications specified in Requirement R2 for verifications or Requirement R6 for reviewers, the required unaffiliation from the audited entity, or where the scope of the third party entity's verification or review is unclear, auditors may need to apply audit testing of Requirements R1, R4, or R5. For this reason, the Evidence Requested and Compliance Assessment Approach Sections are still present in this RSAW for Requirements R1, R4, and R5. We anticipate those sections will also facilitate expectations for entities and their unaffiliated third party verifiers and reviewers, assist Electric Reliability Organization (ERO) auditors to understand the audit procedures applied by unaffiliated third party verifiers and reviewers, and provide transparency between ERO auditors and Industry, should circumstances require audit testing of Requirements R1, R4, or R5. Further, it is an objective of the ERO to have transparent Evidence Requests and Compliance Assessment Approaches for every enforceable standard, whether they are in audit scope or not.

DRAFT

R1 Supporting Evidence and Documentation

R1. Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria specified in Applicability Section 4.1.1.The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify ~~any~~ the Transmission station(s) and Transmission substation(s) that, if rendered inoperable or damaged, could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection.

1.1. Subsequent risk assessments shall be performed:

- At least once every 30 calendar months for a Transmission Owner that has identified in its previous risk assessment (as verified according to Requirement R2)one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection; or
- At least once every 60 calendar months for a Transmission Owner that has not identified in its previous risk assessment (as verified according to Requirement R2) any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection.

1.2. The Transmission Owner shall identify the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment.

M1. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the risk assessment of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria in Applicability Section 4.1.1 as specified in Requirement R1. Additionally, e~~E~~xamples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the identification of the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment as specified in Requirement R1, Part 1.2.

Registered Entity Response (Required):

Question: ~~As a result of your risk assessment,~~ D~~d~~o you own any Transmission stations/substations, either existing or planned in the next 24 months, meeting the applicability requirements of Section 4.1.1? ☐ Yes ☐ No

☐ This entity does not have any applicable Transmission stations/substations.

☐ Other: [Provide explanation below]

[Include additional information regarding the question here, including the type of response and format of the response requested, as appropriate.]

[Note: A separate spreadsheet or other document may be used. If so, provide the document reference below.]

Compliance Narrative:

Provide a brief explanation of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
(R1) Provide the current and the immediately preceding dated risk assessments ~~conducted after the enforceable date of this Standard (i.e. any risk assessments conducted prior to the effective date of this standard are not relevant).~~.
(R1) List of existing Transmission stations/substations that meet the criteria specified in Section 4.1.1.
(R1) List of Transmission stations/substations planned in the next 24 months that meet criteria specified in Section 4.1.1.
(R1 Part 1.2) List of primary control centers that operationally control each identified Transmission station/substation.

Registered Entity Evidence (Required):

The following information is required for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location of the evidence.					
File Name	**Document Title**	**Revision or Version**	**Document Date**	**Relevant Page(s) or Section(s)**	**Description of Applicability of Document**

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to CIP-014-1, R1

This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	(R1) Review entity's process for determining Transmission stations/substations subject to identification in accordance with Requirement R1, including weighting described in Section 4.1.1.2.
	(R1) Review entity's risk assessment process to determine the Transmission stations/substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an interconnection.

	(R1) Ensure entity's risk assessment process includes Transmission stations/substations planned in the next 24 months.
	(R1) Ensure ~~a~~ risk assessment(s) covers~~was performed for~~ each Transmission station/substation meeting applicability described in Section 4.1.
	(R1 Part 1.1) If applicable, review any prior risk assessments and verify whether or not Transmission stations/substations were identified.
	(R1 Part 1.1) Review evidence that risk assessment was performed and verify that it occurred within the past 30 months where items were identified in the previous risk assessment and 60 months where no items were identified in the previous risk assessment.
Note to Auditor: Review entity's answer to the above Question and if the auditor can verify the answer is 'no,' Requirements R3-R6 do not apply and no further audit testing of Requirements R3-R6 is necessary, unless the entity performs the Transmission Operator function for a station/substation meeting the criteria of Requirement R1 Part 1.2 ~~and no further audit testing of Requirements R3-R6 is necessary~~. The 24 month period referenced for Transmission stations/substations planned to be in service is as of the date of the risk assessment not the date of the audit. **See above Note Concerning Third Party Verifications for important details regarding audit risk assessment and related rigor of audit procedures to be applied for this Requirement.**	

Auditor Notes:

R2 Supporting Evidence and Documentation

R2. Each Transmission Owner shall have an unaffiliated third party verify the risk assessment performed under Requirement R1. The verification may occur concurrent with or after the risk assessment performed under Requirement R1.

2.1. Each Transmission Owner shall select an unaffiliated verifying entity that is either:

- A registered Planning Coordinator, Transmission Planner, or Reliability Coordinator;
- An entity that has transmission planning or analysis experience.

2.2. The unaffiliated third party verification~~ying entity~~ shall ~~either~~ verify the Transmission Owner's risk assessment performed under Requirement R1, which may include ~~or~~ recommendations for the addition or deletion of a Transmission station(s) or Transmission substation(s). The Transmission Owner shall ensure the verification is completed within 90 calendar days following the completion of the Requirement R1 risk assessment.

2.3. If the unaffiliated verifying entity recommends that the Transmission Owner add a Transmission station(s) or Transmission substation(s) to, or remove a Transmission station(s) or Transmission substation(s) from, its identification under Requirement R1, the Transmission Owner shall either, within 60 calendar days of completion of the verification, for each recommended addition or removal of a s Transmission station or Transmission substation::

- Modify its identification under Requirement R1 consistent with the recommendation; or
- Document the technical basis for not modifying the identification in accordance with the recommendation.

2.4. Each Transmission Owner shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to ~~exchanged with~~ the unaffiliated verifying entity and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M2. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner completed an unaffiliated third verification of the Requirement R1 risk assessment and satisfied all of the applicable provisions of Requirement R2, including, if applicable, documenting the technical basis for not modifying the Requirement R1 identification as specified under Part 2.3. Additionally, e~~E~~xamples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 2.4.

Registered Entity Response (Required):

Compliance Narrative:

Provide a brief explanation of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
(R2) Dated evidence of third party verification of the entity's risk assessment performed under Requirement R1.
(R2 Part 2.1) Documented qualifications of the verifying party.
(R2 Part 2.3) Recommendations, if any, of the verifying party related to Requirement R1 risk assessments.
(R2 Part 2.3) Documentation of modifications and implementation of recommendations or technical basis for not implementing recommendations of the verifying party.
(R2 Part 2.4) Evidence that procedures were implemented to protect sensitive and confidential information.

Registered Entity Evidence (Required):

The following information is required for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location of the evidence.					
File Name	**Document Title**	**Revision or Version**	**Document Date**	**Relevant Page(s) or Section(s)**	**Description of Applicability of Document**

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to CIP-014-1, R2

This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	(R2) Review evidence of third party verification of the entity's risk assessment and verify the following:
	(R2 Part 2.1) The reviewing entity is registered in accordance with Part 2.1 or has transmission planning or analysis experience.
	(R2 Part 2.2) Verification was completed within 90 calendar days of risk assessment.
	(R2 Part 2.3) Verifying entity's recommendations, if any, were used to modify the entity's Requirement R1 identification or the technical basis for not modifying the Requirement R1 identification is documented within 60 calendar days of completion of the verification.
	(R2 Part 2.4) Review non-disclosure agreement (or other evidence) to verify procedures for protecting sensitive or confidential information between the entity and third party were implemented.
Note to Auditor See Guidelines and Technical Basis section of the standard and Rationale for Requirement R2 associated with the Standard for additional details regarding the term 'unaffiliated.'	

The third party verification may occur concurrent with or after the risk assessment performed under Requirement R1.

Auditor Notes:

DRAFT

R3 Supporting Evidence and Documentation

R3. For ~~a~~the primary control center(s) identified by the Transmission Owner according to Requirement R1, Part 1.2 that a) operationally controls an identified Transmission station or Transmission substation ~~and~~ verified according to Requirement R2, and b) ~~that~~ is not under the operational control of the Transmission Owner, the Transmission Owner shall, within seven calendar days following completion of Requirement R2, notify the Transmission Operator that has operational control of the primary control center of such identification and the date of completion of Requirement R2.

3.1. If a Transmission station or Transmission substation previously identified under Requirement R1 and verified according to Requirement R2 is removed from the identification during a subsequent risk assessment performed according to Requirement R1 or a verification according to Requirement R2, then the Transmission Owner shall, within seven calendar days following the verification or the subsequent risk assessment, notify the Transmission Operator that has operational control of the primary control center of the removal.

M3. Examples of acceptable evidence may include, but are not limited to, dated written or electronic notifications or communications that the Transmission Owner notified each Transmission Operator, as applicable, according to Requirement R3.

Registered Entity Response (Required):

Question: Are there any primary control centers identified in Requirement R1, Part 1.2 that are not under operational control of your NERC registration? ☐ Yes ☐ No

[Note: A separate spreadsheet or other document may be used. If so, provide the document reference below.]

Compliance Narrative:

Provide a brief explanation of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
(R3) If applicable, dated communications with Transmission Operators demonstrating notification and the date of completion of Requirement R2.

Registered Entity Evidence (Required):

The following information is required for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location of the evidence.					
File Name	**Document Title**	**Revision or Version**	**Document Date**	**Relevant Page(s) or Section(s)**	**Description of Applicability of Document**

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to CIP-014-1, R3

This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	(R3) For each applicable primary control center identified in Requirement R1 Part 1.2 not under the control of the entity's registration, verify notification exists and contains the date of completion of Requirement R2.
	(R3 Part 3.1) For each Transmission station/substation removed under Part 3.1, ensure the responsible Transmission Operator was notified of the removal within seven calendar days of removal from identification.
Note to Auditor: Note the entity's response to the above Question. If auditor can verify the entity's answer of 'No,' then Requirement R3 is not applicable and no further audit testing is required.	

Auditor Notes:

.

R4 Supporting Evidence and Documentation

R4. Each Transmission Owner that ~~owns or operates~~ identified a Transmission station, Transmission substation, or a primary control center ~~identified~~ in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3 ~~that the Transmission Operator's primary control center has operational control of an identified Transmission station or Transmission substation~~, shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2. The evaluation shall consider the following:

4.1. Unique characteristics of the identified and verified Transmission station(s), Transmission substation(s), and primary control center(s);

4.2. Prior history of ~~f~~ attack on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and

4.3. Intelligence or threat warnings received from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), U.S. federal and/or Canadian governmental agencies, or their successors.

M4. Examples of evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner or Transmission Operator conducted an evaluation of the potential threats and vulnerabilities of a physical attack to their respective Transmission station(s), Transmission substation(s) and primary control center(s) as specified in Requirement R4.

Registered Entity Response (Required):

Compliance Narrative:

Provide a brief explanation of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
(R4) A description of the entity's process for executing the evaluation prescribed in Requirement R4.
(R4) Dated evidence of the evaluation prescribed in Requirement R4.

Registered Entity Evidence (Required):

The following information is required for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location of the evidence.					
File Name	**Document Title**	**Revision or Version**	**Document Date**	**Relevant Page(s) or Section(s)**	**Description of Applicability of Document**

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to CIP-014-1, R4

This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	(R4) Review evidence of evaluation and verify it considers the following:
	(R4) Potential threats and vulnerabilities as described in Requirement R4.
	(R4 Part 4.1) Unique characteristics as described in Requirement R4 Part 4.1.
	(R4 Part 4.2) Prior history of ~~r~~ attack on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events.
	(R4 Part 4.3) Intelligence or warnings as described in Part 4.3.
Note to Auditor: See above Note Concerning Third Party Verifications for important details regarding audit risk assessment and related rigor of audit procedures to be applied for this Requirement. Auditor should cross reference the Transmission stations/substations and primary c~~C~~ontrol c~~C~~enters identified in the risk assessment performed under Requirement R1 to the evaluation prescribed in Requirement R4 to ensure it is complete.	

Auditor Notes:

R5 Supporting Evidence and Documentation

R5. Each Transmission Owner that identified ~~owns or has operational control of~~ a Transmission station, Transmission substation, or primary control center identified in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3 ~~that the Transmission Operator's primary control center has operational control of an identified Transmission station or Transmission substation~~, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s). The physical security plan(s) shall be developed within 120 calendar days following the completion of Requirement R2 and executed according to the timeline specified in the physical security plan(s). The physical security plan(s) shall include the following attributes:

5.1. Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities ~~based on the results of~~identified during the evaluation conducted in Requirement R4.

5.2. Law enforcement contact and coordination information.

5.3. A timeline for ~~implementing~~ executing the physical security enhancements and modifications specified in the physical security plan.

5.4. Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).

M5. Examples of evidence may include, but are not limited to, dated written or electronic documentation of its physical security plan(s) that covers their respective identified and verified Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R5, and additional evidence demonstrating ~~implementation~~ execution of the physical security plan according to the timeline specified in the physical security plan.

Registered Entity Response (Required):

Compliance Narrative:

Provide a brief explanation of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
(R5) Dated physical security plan(s).

Registered Entity Evidence (Required):

The following information is required for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location of the evidence.					
File Name	**Document Title**	**Revision or Version**	**Document Date**	**Relevant Page(s) or Section(s)**	**Description of Applicability of Document**

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to CIP-014-1, R5

This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	(R5) Review evidence and verify the physical security plan(s) covers the Transmission stations/substations and primary controls identified in Requirements R1 and/or R2, and verify plan was ~~implemented~~ developed within 120 calendar days following the completion of Requirement R2 and executed according to the timeline specified in the physical security plan(s). In addition, verify the plan includes the following attributes:
	(R5 Part 5.1) Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities ~~based on the results of~~identified during the evaluation conducted in Requirement R4.
	(R5 Part 5.2) Law enforcement contact and coordination information.
	(R5 Part 5.3) A timeline for ~~implementing~~ executing physical security enhancements and modifications specified in the physical security plan.
	(R5 Part 5.4) Provisions to evaluate evolving physical threats, and their corresponding security measures in accordance with R5 Part 5.4
	(R5) Verify implementation of physical security plan(s). See 'Note to Auditor' for details.
Note to Auditor: See above Note Concerning Third Party Verifications for important details regarding audit risk assessment and related rigor of audit procedures to be applied for this Requirement. Auditor should cross reference the Transmission stations/substations and primary c~~C~~ontrol c~~C~~enters	

identified in the risk assessment performed under Requirement R1 to the evaluation prescribed in Requirement R4 and the security plan(s) prescribed in Requirement R5 to ensure the plan addresses vulnerabilities ~~that would facilitate~~to physical attacks ~~that have a high probability or likelihood of occurrence~~per the evaluation conducted in Requirement R4.

Requirement R5 includes implementation of the security plan(s), which is not within the scope of the third party review described in Requirement R6. Auditors can gain reasonable assurance security plan(s) was/were implemented by determining if specific actions prescribed by the plan(s) have taken place within the timelines established by the plan(s). For example, if the plan calls for certain procedures to occur, then auditors could ask for evidence demonstrating the procedure has been implemented within the timeline established in the security plan. Also, if the plan calls for construction of a barrier, an auditor could verify evidence that such a barrier was constructed in accordance with the entity's timeline. As auditors should obtain reasonable, not absolute, assurance the plan(s) was/were implemented, testing implementation on a sample basis may be appropriate.

Auditor Notes:

DRAFT

R6 Supporting Evidence and Documentation

R6. Each Transmission Owner ~~that owns or operates~~identifies a Transmission station, Transmission substation, or primary control center identified in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3 ~~that the Transmission Operator's primary control center has operational control of an identified Transmission station or Transmission substation~~, shall have an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5. The review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5

6.1. Each Transmission Owner and Transmission Operator shall select an unaffiliated third party reviewer from the following:

- An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.
- An entity or organization approved by the ERO.
- A governmental agency with physical security expertise.
- An entity or organization with demonstrated law enforcement, government, or military physical security expertise.

6.2. The Transmission Owner or Transmission Operator, respectively, shall ensure that the unaffiliated third party review is completed within 90 calendar days of completing the security plan(s) developed in Requirement R5. The unaffiliated third party review may, but is not required to, include recommended changes to the evaluation performed under Requirement R4 or the security plan(s) developed under Requirement R5.

6.3. If the unaffiliated third party reviewer~~ing entity~~ recommends changes to the evaluation performed under Requirement R4 or security plan(s) developed under Requirement R5, the Transmission Owner or Transmission Operator shall, within 60 calendar days of the completion of the unaffiliated third party review, for each recommendation:

- Modify its security plan(s) consistent with the recommendation; or
- Document the reason for not modifying the security plan(s) consistent with the recommendation

6.4. Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information ~~exchanged~~ made available to ~~with~~ the unaffiliated reviewing entity ~~and from any other form of public disclosure~~ and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M6. Examples of evidence may include, but are not limited to, written or electronic documentation that the Transmission Owner or Transmission Operator had an unaffiliated third party review the evaluation

performed under Requirement R4 and the security plan(s) developed under Requirement R5 as specified in Requirement R6 including, if applicable, documenting the reasons for not modifying the evaluation or security plan(s) in accordance with a recommendation under Part 6.3. Examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 6.4.

Registered Entity Response (Required):

Compliance Narrative:

Provide a brief explanation of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
(R6) Dated Evidence of unaffiliated third party review of entity's Requirement R4 evaluation and Requirement R5 security plan(s).
(R6 Part 6.1) Evidence that reviewing entity staff meets qualifications identified in Part 6.1.
(R6 Part 6.3) Recommendations of reviewing party related to Requirement R4 evaluation and Requirement R5 security plan.
(R6 Part 6.3) Dated documentation of modifications and implementation of recommendations or reasons and compensating mitigating measures for not implementing recommendations of the reviewing party.
(R6 Part 6.4) Evidence that procedures were implemented to protect sensitive and confidential information.

Registered Entity Evidence (Required):

The following information is required for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location of the evidence.					
File Name	**Document Title**	**Revision or Version**	**Document Date**	**Relevant Page(s) or Section(s)**	**Description of Applicability of Document**

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to CIP-014-1, R6

This section to be completed by the Compliance Enforcement Authority

	The RSAW Developer will complete this section with a set of detailed steps for the audit process. See the RSAW Developer's Guide for more information.
	(R6) Review evidence and verify the physical security plan(s) and the Requirement R4 evaluation have been reviewed by an unaffiliated third party. Also, review evidence and verify the following:
	(R6 Part 6.1) Reviewing party has the qualifications identified in Part 6.1.
	(R6 Part 6.2) Review is dated within 90 calendar days of completion of the Requirement R5 security plan.
	(R6 Part 6.3) Reviewing entity recommended changes to security plan(s) were made by entity or the reason(s) for not making the change(s) was/were documented within 60 calendar days of the completion of the unaffiliated third party review.
	(R6 Part 6.4) Review non-disclosure agreement (or other evidence) to verify procedures for protecting sensitive or confidential information between entity and third party were implemented.
Note to Auditor: The third party review may occur concurrent with or after the evaluation performed under Requirement R4 or the security plan develop under Requirement R5. See Guidelines and Technical Basis associated with the Standard for additional details related to qualifications of reviewing entities that may inform audited entities selection of a reviewing entity.	

Auditor Notes:

Additional Information:

Reliability Standard

The RSAW developer should provide the following information without hyperlinks. Update the information below as appropriate.

The full text of CIP-014-1 may be found on the NERC Web Site (www.nerc.com) under "Program Areas & Departments", "Reliability Standards."

In addition to the Reliability Standard, there is an applicable Implementation Plan available on the NERC Web Site.

In addition to the Reliability Standard, there is background information available on the NERC Web Site.

Capitalized terms in the Reliability Standard refer to terms in the NERC Glossary, which may be found on the NERC Web Site.

Sampling Methodology [If developer deems reference applicable]

Sampling is essential for auditing compliance with NERC Reliability Standards since it is not always possible or practical to test 100% of either the equipment, documentation, or both, associated with the full suite of enforceable standards. The Sampling Methodology Guidelines and Criteria (see NERC website), or sample guidelines, provided by the Electric Reliability Organization help to establish a minimum sample set for monitoring and enforcement uses in audits of NERC Reliability Standards.

Regulatory Language [Developer to ensure RSAW has been provided to NERC Legal for links to appropriate Regulatory Language – See example below]

E.g. FERC Order No. 742 paragraph 34: "Based on NERC's…….

E.g. FERC Order No. 742 Paragraph 55, Commission Determination: "We affirm NERC's…….

Selected Glossary Terms [If developer deems applicable]

The following Glossary terms are provided for convenience only. Please refer to the NERC web site for the current enforceable terms.

Revision History for RSAW

Version	Date	Reviewers	Revision Description
1	04/09/2014	Physical Security RSAW Task Force	New Document
2	05~~4~~/01~~XX~~/2014	Physical Security RSAW Task Force	Revisions based on comments and changes to the standard.

[i] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

DRAFT

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

Project 2014-04 Physical Security
CIP-014-1

Final Ballot Now Open through May 5, 2014

Now Available

A final ballot of **CIP-014-1 – Physical Security** is now open through **8 p.m. Eastern on Monday, May 5, 2014.**

In an order issued March 7, 2014, the Federal Energy Regulatory Commission directed NERC to file a physical security standard within 90 days of the order (i.e. by June 5, 2014). On March 21, 2014, the NERC Standards Committee (SC) authorized a waiver of the standard development process, in accordance with Section 16 of the Standard Processes Manual, to meet this pending regulatory deadline. The SC approved to shorten this final ballot period from 10 days to 5 calendar days. (Section 4.9)

If you have questions please contact Stephen Crutchfield via email or by telephone at (609) 651-9455. Background information for this project can be found on the project page.

Instructions for Balloting

In the final ballot, votes are counted by exception. Only members of the ballot pool may cast a ballot; all ballot pool members may change their previously cast votes. A ballot pool member who failed to cast a ballot during the last ballot window may cast a ballot in the final ballot window. If a ballot pool member does not participate in the final ballot, that member's vote cast in the previous ballot will be carried over as that member's vote in the final ballot.

Members of the ballot pool associated with this project may log in and submit their vote for the standard by clicking here.

Next Steps

Voting results for the standard will be posted and announced after the ballot window closes. If approved, it will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

For more information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Wendy Muller, Standards Development Administrator, or at 404-446-2560.

Standards Announcement

Project 2014-04 Physical Security
CIP-014-1

Final Ballot Results

Now Available

A final ballot for **CIP-014-1 – Physical Security** concluded at **8 p.m. Eastern on Monday, May 5, 2014.**

The standard achieved a quorum and sufficient affirmative votes for approval. Voting statistics are listed below, and the Ballot Results page provides a link to the detailed results for the ballot.

Standard	Quorum / Approval
CIP-014-1	92.53% / 85.61%

Background information for this project can be found on the project page.

Next Steps
The standard will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

For information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Wendy Muller (via email), Standards Development Administrator, or at 404-446-2560.

Standard Drafting Team Roster

Project 2014-04 Physical Security

Standard Drafting Team

Name and Title	Company and Address	Contact Info	Bio
Susan Ivey Chair	2301 Market St. Philadelphia, PA 19103	215-841-4706 SusanO'Brien.Ivey@exeloncorp.com	Ms. Ivey is Vice President of the Transmission Strategy & Compliance of Exelon. She is responsible for oversight of the electric transmission systems of the Exelon Utilities of BGE, ComEd and PECO located in Baltimore, Chicago and Philadelphia, respectively. Ms. Ivey coordinates the efforts for electric transmission operations and long-term planning for all three companies, and manages the interface with regulatory authorities and all transmission interconnected third parties. Ms. Ivey oversees and administers the NERC Compliance Program for Exelon. She also leads the coordination of physical security practices across the Exelon Utilities to ensure alignment of strategies and programs for addressing security risks associated with the electric and gas businesses.
Lou Oberski Vice-Chair	Dominion Resources Services, Inc. 120 Tredegar St Richmond, VA 23219	804-819-2837 Lou.Oberski@dom.com	Mr. Oberski is Managing Director of the Regulation and NERC Compliance Policy for Dominion Resources Services, Inc. He is responsible for administration of all aspects of Dominion's corporate NERC compliance assurance programs and oversees Dominion's involvement at NERC and its sub-regions as well as FERC and RTO policy coordination for Dominion at PJM, ISO-New England and the MidContinent ISO. Prior to Mr. Oberski's current position, his career at Dominion covered increasing management responsibilities in transmission engineering, operations, planning and maintenance. The most recent 10 years have focused on developing, establishing and coordinating NERC and RTO policy at Dominion with a particular emphasis on generation supplier policy at NERC and RTOs. Mr. Oberski is a member of the North American Energy Standards Board, Board of Directors and past chair of its Executive Committee. He is also a member of EEI's Reliability Executive Advisory Committee, the SERC Board of Directors and SERC Board Executive Committee. Mr. Oberski has been employed by Dominion for 30 years and holds a Bachelor's degree in electrical engineering from Western Michigan University.
John Breckenridge	KCP&L 1200 Main Street 18th Floor KCMO 64106	816-654-1725 john.breckenridge@kcpl.com	Mr. Breckenridge is the Senior Manager of Corporate Security for Kansas City Power & Light based in Kansas City, MO. In his current capacity, Mr. Breckenridge directs the overall Corporate Security function to ensure security operations are in compliance with legal, regulatory, and company requirements. Corporate Security responsibilities

			include physical security, investigations, guard force management, protection operations, law enforcement liaison, enterprise-wide crisis management and business continuity planning. To be effective, Mr. Breckenridge uses his 25 plus years of military, criminal justice and industrial security experience to work with each functional department and business unit. Mr. Breckenridge began his career while in the U.S. Army, where he was instrumental in supporting many special security operations throughout the U.S. and in many countries, especially during his assignment in Europe. In addition to his eight-year career in the military, Mr. Breckenridge worked for six years in the Jackson County, MO. criminal justice system. During this time, Mr. Breckenridge specialized in security systems, close protection operations and special event security functions first with the Department of Corrections and then in conjunction with the Jackson County Courts. From 1993 until 2008, Mr. Breckenridge was the Director of Security and Chief Security Officer for Aquila Energy until Aquila was purchased by Kansas City Power & Light. Mr. Breckenridge is Board Certified in Security Management as a Certified Protection Professional, holds a BLA degree and a degree with an emphasis in Criminal Justice, and is a Licensed Private Investigator and an active member of several security related professional organizations. Mr. Breckenridge has been featured as a Guest Lecturer for successful business approaches to security issues and has also been featured in several trade and regional publications.
Ross Johnson	Capital Power	(780) 405-5542 rjohnson@capitalpower.com	Mr. Johnson, CPP is the Senior Manager of Security and Contingency Planning for Capital Power. He served in the Canadian Forces as an infantry and intelligence officer for 24 years. Since leaving the service in 2001, Mr. Johnson has been employed in several security-related leadership positions in aviation security, the offshore oil industry, and the electricity sector. Prior to joining Capital Power in 2009, Mr. Johnson was the Director of Security and Contingency Planning with EPCOR Utilities. Mr. Johnson is the author of Antiterrorism Planning and Threat Response, a book on the prevention of terrorist attacks. Mr. Johnson is a member of the NERC Critical Infrastructure Protection Committee, where he sits on the Executive Committee. He is also Chair of the Committee's Physical Security Working Group, and the leader of the Physical Security Roundtable Group. Mr. Johnson is Chair of the Canadian Electricity Association's Security and Infrastructure Protection Committee, and Chair of ASIS

			International's Petrochemical, Chemical, and Extractive Industries Security Council. Mr. Johnson has a Baccalaureate in Military Arts and Sciences with Distinction, and is board-certified in security management by ASIS International.
Kathleen Judge	National Grid 939 Southbridge Street, Worcester, MA 01610	(508) 860-6040 Kathleen.judge@nationalgrid.com	Ms. Judge is Director of Risk and Compliance for Security at National Grid, where she has worked for 25+ years. She is responsible for managing National Grid's strategies and best practices required to protect energy delivery facilities in accordance with governing security regulations in the US. As part of this Ms. Judge is actively engaged with state and federal regulatory authorities to shape policies and procedures. For example, at the federal level she works with the Infrastructure Security Compliance Division of DHS, the United States Coast Guard and the Pipeline Security Division of the Transportation Security Administration. Ms. Judge was also the chair of the American Gas Association Security Committee and currently serves as an AGA representative on the Oil & Natural Gas Sector Coordinating Council. She is also actively involved in the EEI Security Committee and serves on the Executive Steering Committee for the Long Island Sound Area Maritime Security Committee. In prior roles, she was responsible for, and a key member on, delivering Company's business plan for a deregulated energy market, serving as the strategic and operational expert on electricity restructuring for Massachusetts, Rhode Island, New Hampshire and New York. She was also an active member of the North American Energy Standards Board Retail Electric Quadrant, developing model business practices for deregulated marketplaces. Leading up to this, Ms. Judge was a key developer and implementer of an award winning renewable energy program in Massachusetts and Rhode Island. Ms. Judge holds a Masters of Business Administration degree from Nichols College.
Mike O'Neil	Florida Power & Light 700 Universe Blvd., Juno Beach, Fl. 33408	(561) 904-3503 mco0hwz@fpl.com	Mr. O'Neil is Director of the Power Delivery Compliance & Regulatory. He is responsible for business unit execution compliance to transmission based FERC requirements for FPL and NERC transmission reliability standards for FPL and NEER facilities throughout the country.
Stephen Pelcher	Santee Cooper One Riverwood Drive Moncks Corner, SC 29461	843-761-4016 srpelche@santeecooper.com	Mr. Pelcher is Deputy General Counsel Nuclear and Regulatory Compliance at Santee Cooper. Mr. Pelcher joined Santee Cooper in 1996. Prior to working for Santee Cooper, he was Senior Attorney for Duquesne Light Company in Pittsburgh (1990 to 1996). Mr. Pelcher has been a practicing attorney

			for more than 31 years and has worked in the electric utility industry for 24 years. Among other duties, Mr. Pelcher is the lead Santee Cooper company attorney in all matters within the jurisdiction of the FERC under Part II of the Federal Power Act; the lead company attorney relating to interpretation of requirements embedded within standards established by NERC under Section 215 of the Federal Power Act and current Chair of Santee Cooper's internal Reliability Standards Compliance Coordination Committee. Mr. Pelcher has a Bachelor of Arts degree in Philosophy from the University of Pittsburgh, College of Arts and Sciences; a Juris Doctor from the University of Pittsburgh, School of Law; and an LL.M (Taxation) from the Dickinson School of Law, Pennsylvania State University.
John Pespisa	Southern California Edison 2244 Walnut Grove Ave. Rosemead, Ca 91770	626-688-6291 John.pespisa@sce.com	Mr. Pespisa is Director of SCE's NERC Compliance program and Acting Director of SCE's Security Technology & Compliance group. Mr. Pespisa started his career with Southern California Edison in 1987, starting in transmission operations and electrical substations. Since then he has worked in positions of increasing responsibility including operation of SCE's bulk electric and distribution systems, and supervisory positions at SCE's Energy Control Center, including Manager of short term power marketing, and Manager of Real-Time Power Operations. In 2011, he moved to his current position as the Director of SCE's NERC Compliance Program In his current role he oversees SCE's compliance with federal Reliability Standards, which have been promulgated to ensure the safe, reliable operation of the power grid, and to protect the grid's critical infrastructure against cyber threats. Mr. Pespisa is a graduate of California State Los Angeles and hold degrees in Electrical Engineering and Business Management.
Robert Rhodes	Southwest Power Pool 201 Worthen Drive Little Rock, AR 72223	501-614-3241 rrhodes@spp.org	Mr. Rhodes is the Manager of Reliability Standards at Southwest Power Pool (SPP) where he has been employed since 2000. In his previous role at SPP he was Manager of Reliability Coordination for over 10 years. Prior to joining SPP, Mr. Rhodes worked at Progress Energy (Carolina Power & Light Company) in Raleigh, NC for over 26 years in various positions in transmission maintenance, operations and planning. In his current capacity, Mr. Rhodes works with SPP members, SPP staff and other industry experts to ensure that reliability standards necessary to maintain a reliable bulk electric system are in place. He coordinates SPP members and registered entities in the development, refinement, maintenance, communication, training and implementation of national and regional reliability standards and policies.

			Mr. Rhodes is active at NERC currently serving on the Operating Reliability Subcommittee (ORS), the ORS Executive Committee, the Resources Subcommittee, the Standards Committee Process Subcommittee, the Reliability Coordination Standard Drafting Team, the Operating Personnel Communications Protocols Standard Drafting Team and the TOP/IRO Revisions Standard Drafting Team. He has previously served on the Reliability Coordinator Working Group, the Interchange Distribution Calculator Working Group and was Vice Chair of the Distribution Factor Working Group. Additionally, he has served on committees, working groups and task forces in SPP, SERC and VACAR. Mr. Rhodes received an Associate in Science degree from Rockingham Community College in 1970, a Bachelor of Science degree in Electrical Engineering from North Carolina State University in 1972 and a Master of Engineering degree from Rensselaer Polytechnic Institute in 1974. He is a member of Tau Beta Pi, Eta Kappa Nu, Order of the Engineer, the Institute of Electrical and Electronics Engineers and its Power Engineering Society and the National Society of Professional Engineers. He is a NERC Certified System Operator (Reliability) and is a registered professional engineer in the State of North Carolina.
Allan Wick	Tri-State Generation & Transmission Association, Inc. 1100 W. 116th Ave., Westminster, CO 80234	303-254-3341 awick@tristategt.org	Mr. Wick is a 30 year security executive, 13 in the energy sector with a comprehensive industry perspective after working for an investor owned utility, independent system operator and now at a cooperative generation and transmission company - where he serves as their Enterprise Security Manager & Chief Security Officer. He is a member of the ASIS International Utilities Security Council and the WECC Physical Security Working Group since 2005. He also served for six years on the ASIS International Certification Board of Directors. Mr. Wick has designed and implemented enterprise-wide physical security programs for three different organizations, served as a drafting team member for five ANSI standards, and has authored a number of security related magazine articles and white papers. Mr. Wick received his MBA from Webster University and holds multiple security and business continuity certifications, including CPP, PSP, CBCP, CFE, and PCI.
Manho Yeung	Pacific Gas and Electric Company Mail Code N9G, P.O. Box 770000 San Francisco, California, 94177	415-973-7649 MxY6@pge.com	Mr. Yeung is Senior Director of System Planning and Reliability, for Pacific Gas and Electric Company and is responsible for electric transmission and distribution planning, asset and risk management and reliability improvements. Mr. Yeung oversees PG&E's capital investment plan in expanding, upgrading and modernizing its 18,500

			miles of electric transmission lines, 850 substations, and 140,000 miles of distribution lines. Mr. Yeung has been with Pacific Gas and Electric Company since 1980 and has over 30 years of energy policy, electric generation planning, electric T&D planning, asset and risk management, project management, engineering, and operations experience. Mr. Yeung received his Bachelor of Science degree in electric engineering from the Georgia Institute of Technology, and a Master of Science degree in electric engineering from the Santa Clara University. Manho is a registered professional electric engineer in the State of California.
Stephen Crutchfield Standards Developer	North American Electric Reliability Corporation 3353 Peachtree Road, NE, Suite 600 - North Tower Atlanta, GA 30326	609-651-9455 Stephen.crutchfield@nerc.net	Mr. Crutchfield is the lead NERC Staff Coordinator for Project 2014-04, Physical Security. Stephen began his career with NERC in May 2007. Prior to joining NERC, Mr. Crutchfield was a Project Manager with Shaw Energy Delivery Services, managing engineering and construction projects in the substation and transmission line fields. Mr. Crutchfield's background also includes experience with PJM as Manager of RTO Integration, working on the operations and markets integration of new members (AEP, ComEd, Dayton, Dominion and Duquesne) into PJM and southern seams operations issues with Progress Energy, Duke and TVA. Stephen also helped lead the team that was developing GridSouth in the dual roles of Organization Architect and Manager of Customer Support. Prior to GridSouth, Mr. Crutchfield was the Manager of Power System Operations Training at Progress Energy where he spent over 10 years training System Operators and Engineers. Overall, Stephen was with Progress Energy for 16 years. Mr. Crutchfield received his Bachelor of Arts in Physics from the University of Virginia and Masters of Science in Electrical Engineering from North Carolina State University. Stephen holds a Master of Science in Management degree, also from North Carolina State University. Mr. Crutchfield is also a member of the Institute of Electrical and Electronic Engineers and the Power and Energy Society.
Steven Noess Associate Director of Standards Development, Standards	North American Electric Reliability Corporation 3353 Peachtree Road, NE, Suite 600 - North Tower Atlanta, GA 30326	404-217-9691 steven.noess@nerc.net	Mr. Noess is Associate Director of Standards Development at the North American Electric Reliability Corporation (NERC) in Atlanta, GA, and has been employed by NERC since 2011. Prior to joining NERC, Mr. Noess was an attorney at the Minnesota Legislature. Before becoming an attorney, Mr. Noess was an officer in the United States Army. Mr. Noess has a bachelor's of science degree from the U.S. Military Academy, West Point, NY, and a law degree from the University of Minnesota Law School.

Mark Olson Standards Developer	North American Electric Reliability Corporation 3353 Peachtree Road, NE, Suite 600 - North Tower Atlanta, GA 30326	404-446-9760 Mark.olson@nerc.net	Mr. Olson is a Standards Developer at the North American Electric Reliability Corporation (NERC), and has been employed by NERC since 2012. Previously he was a career officer in the U.S. Navy where he served in various positions related to the operations and management of surface ships and naval personnel. Mr. Olson has a master's degree in electrical engineering from the Naval Postgraduate School and a bachelor's degree from the U.S. Naval Academy.
Brian Harrell Director, ES-ISAC Operations	Electricity Sector Information Sharing and Analysis Center North American Electric Reliability Corporation 1325 G Street NW, Suite 600 Washington, DC 20005	202-400-3003 office | 609-651-0671 (c) Brian.Harrell@nerc.net	Mr. Harrell is the Director, ES-ISAC Operations for the Electricity Sector Information Sharing and Analysis Center (ES-ISAC) at the North American Electric Reliability Corporation (NERC), joining NERC in August 2010. In this capacity he is responsible for managing situational awareness, incident management, and security coordination for the electricity sector through timely, reliable and secure information exchange. Mr. Harrell has 18 years of experience in the security industry serving in organizations such as law enforcement, military, and corporate security, among others. Mr. Harrell is formerly the NERC Director of Critical Infrastructure Protection Programs, as well as the CIP Manager for the SERC Reliability Corporation, where he oversaw electricity security related matters. Prior to joining SERC, Mr. Harrell was the Sector Security Specialist for the Infrastructure Security Compliance Division at the U.S. Department of Homeland Security (DHS). Brian specialized in securing high risk facilities and Continuity of Operations (COOP) for DHS. Mr. Harrell also served in the US Marine Corps as an Anti-Terrorism and Force Protection Instructor.
Bob Canada Manager, Outreach & Training	North American Electric Reliability Corporation 3353 Peachtree Road, NE, Suite 600 - North Tower Atlanta, GA 30326	404-446-9709 bob.canada@nerc.net	Mr. Canada presently serves as the Manager, Outreach and Training, at the NERC and is the staff support and Secretary to the Critical Infrastructure Protection Committee standing committee. Mr. Canada was previously employed in the electric industry for 32 years with Southern Company in various roles with corporate security and was Manager of Corporate Security at Georgia Power Company from March 1995 - December 2002. Responsibilities included corporate and internal investigations, physical security of employees and corporate assets. Mr. Canada directed alarm systems design and installation as well and was responsible for the overall corporate response for security at Georgia Power Co. He also directed the Georgia Power and Southern Company Security Planning for the Atlanta Olympic Games. Responsible for the development of the corporate security plan along with the

			implementation and daily operations included physical security of the transmission and distribution facilities supporting the Olympic venues, monitoring the protective countermeasures in place, consulting with Federal, State and Local Law Enforcement Agencies to protect the State, Metropolitan and Atlanta Electrical Infrastructure. Mr. Canada served two terms for the Southeastern Reliability Council (SERC) as the first Chairman of the Critical Infrastructure Protection Committee and represented SERC on the North American Electric Reliability Corporation's (NERC) Critical Infrastructure Committee (CIPC) as the Physical Security voting member. Subsequently, he was elected by the CIPC as a Vice Chair for four terms. Mr. Canada received his Bachelor's degree from West Georgia State University and also holds a Juris Doctor from the Woodrow Wilson College of Law.

May 9, 2014

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

North American Electric Reliability Corporation	**)** **)**	**Docket No. RM14-10-000**

SUPPLEMENTAL INFORMATION TO PETITION OF THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION FOR APPROVAL OF RELIABILITY STANDARD BAL-001-2—REAL POWER BALANCING CONTROL PERFORMANCE

Pursuant to Section 215(d)(1) of the Federal Power Act ("FPA")[1] and Section 39.5[2] of the Federal Energy Regulatory Commission's ("FERC" or "Commission") regulations, the North American Electric Reliability Corporation ("NERC")[3] hereby submits supplemental information to its April 2, 2014 petition for approval of proposed Reliability Standard BAL-001-2—Real Power Balancing Control Performance ("Petition").[4] NERC is providing this supplemental information in order to address the status of a Commission directive in Order No. 693 and update the Commission regarding the status of the field trial for proposed Reliability Standard BAL-001-2.

I. SUMMARY OF PROPOSED RELIABILITY STANDARD BAL-001-2

Proposed Reliability Standard BAL-001-2 defines Balancing Authority ACE Limits ("BAAL") which are unique for each Balancing Authority and provide dynamic limits for the Balancing Authority's ACE value as a function of the Interconnection frequency.[5] These ACE

---

1 16 U.S.C. § 824o (2006).

2 18 C.F.R. § 39.5 (2013).

3 The Commission certified NERC as the electric reliability organization ("ERO") in accordance with Section 215 of the FPA on July 20, 2006. *N. Am. Elec. Reliability Corp.*, 116 FERC ¶ 61,062 (2006).

4 The BAL-001 Reliability Standard is also commonly referred to as the "Control Performance Standard" and its two requirements are known as "Control Performance Standard 1" or "CPS 1" and "Control Performance Standard 2" or "CPS2." In the proposed BAL-001-2 Reliability Standard, the underlying performance aspect of the Requirement is unchanged and Requirement R1 is still commonly referred to as "CPS 1." Requirement R2 of the proposed BAL-001-2 Reliability Standard has been substantively changed and is commonly referred to as "BAAL."

5 "Balancing Authority ACE Limit" or "BAAL" was derived based on reliability studies and analysis which defined a Frequency Trigger Limit bound measured in Hz. The Frequency Trigger Limit is equal to Scheduled

limits are pre-established, vary as a function of the deviation of actual Interconnection frequency from the scheduled Interconnection frequency, and become more limiting as deviations become larger. One of the reliability benefits of the proposed Reliability Standard is that it allows Balancing Authorities to calculate their position within these boundaries on a Real-time basis and take action to support reliability. While the proposed BAL-001-2 Reliability Standard is applicable to Balancing Authorities, it is functionally an Interconnection-wide Reliability Standard.

Proposed Reliability Standard BAL-001-2 consists of two requirements that work together to ensure both long-term and short-term reliability. Requirement R1 (also commonly referred to as "CPS 1") is intended to measure how well a Balancing Authority is able to control its generation and load management programs, as measured by its ACE, to support its Interconnection's frequency over a rolling one-year period. Requirement R2 (also commonly referred to as "BAAL") is intended to enhance the reliability of each Interconnection by maintaining frequency within predefined limits under all conditions and includes a 30 consecutive clock-minute component.

The body of NERC Reliability Standards work together as an integrated whole to protect and preserve the reliability of the Bulk-Power System. In particular, the Resource and Demand Balancing ("BAL") Reliability Standards work together to address various aspects of interconnection frequency as it pertains to reliable operations. Reliability Standard BAL-001 controls Interconnection frequency within defined limits. Reliability Standard BAL-002 ensures

---

Frequency, plus or minus three times an Interconnection's Epsilon 1 value. Epsilon 1 is the root mean square targeted frequency error for each Interconnection, as recommended by the NERC Resources Subcommittee and approved by the NERC Operating Committee. Epsilon 1 values for each Interconnection are unique. When a Balancing Authority exceeds its BAAL, it is providing more than its share of risk that the Interconnection will exceed its Frequency Trigger Limit. When all Balancing Authorities are within their BAAL (high and low), the Interconnection frequency will be within its Frequency Trigger Limits.

that Balancing Authorities or Reserve Sharing Groups balance resources and demand and return Area Control Error to defined values. Reliability Standard BAL-003 provides consistent methods for measuring Frequency Response and determining the Frequency Bias Setting. In particular, these three BAL Reliability Standards work together because the components of Operating Reserve – frequency responsive reserve, Regulating Reserve and Contingency Reserve are always used in conjunction with one another.

II. SUPPLEMENTAL INFORMATION

A. The Proposed Reliability Standard BAL-001-2 Addresses a Commission Directive in Order No. 693

The proposed BAL-001-2 Reliability Standard addresses a Commission directive in Order No. 693 (at P 355) in an equally efficient and effective manner. In Order No. 693, the Commission noted that the BAL-002-0 Reliability Standard did not define a significant deviation or a reportable event. The Commission stated:

> we direct the ERO, through the Reliability Standards development process, to modify this Reliability Standard to define a significant deviation and a reportable event, taking into account all events that have an impact on frequency, e.g., loss of supply, loss of load and significant scheduling problems, which can cause frequency disturbances and to address how balancing authorities should respond. As suggested by NRC, this or a related Reliability Standard should also include a frequency response requirement. The present Control Performance Standards represent the monthly and yearly averages which are appropriate for measuring long-term trends but may not be appropriate for measuring short-term events. In addition, the measures should be available to the balancing authorities to assist in real-time operations.[6]

As the Commission noted in Paragraph 355 of Order No. 693, loss of supply, loss of load and significant scheduling problems, can cause frequency disturbances – all of which are captured by the limits established in proposed Reliability Standard BAL-001-2. By establishing safe

[6] Order No. 693 at P 355 (internal citation omitted).

operating frequency ranges, events that cause frequency disturbances are captured as deviations. While the Commission directed NERC to modify the BAL-002-0 Reliability Standard to address this issue, the revisions to proposed Reliability Standard BAL-001-2 are equally efficient and effective.

Under BAL-001-2, BAAL and CPS 1 work together to support Interconnection frequency. An entity is in violation of Requirement R2 of proposed Reliability Standard BAL-001-2 when it exceeds its BAAL for 30 consecutive clock-minutes or more. While entities could be out of limits for a time period less than that, this performance is captured by Requirement R1, which measures long-term trends. For example, if a Balancing Authority ACE is exactly equal to its BAAL, its CPS 1 under Requirement R1 is -700%. For each minute that the Balancing Authority exceeds its BAAL, or is operating close to its BAAL, it is accumulating substantial negative values of CPS 1 (under Requirement R1). Such negative values must then be balanced by substantially better performance by an entity -- and all of this performance is factored into compliance, given the manner in which Requirements R1 and R2 are interrelated.

When a Balancing Authority's operation is hurting Interconnection frequency, the BAAL gets tighter for the BA as the frequency moves away from 60 Hz. While an entity might not be in violation of Requirement R2 if it exceeds its BAAL for less than 30 consecutive clock-minutes, it may be in violation of Requirement R1. To the extent that a BA's operation is supporting frequency, both CPS 1 and BAAL do not require corrective action. However, operations in support of Interconnection frequency also cannot be excessive, as any change in Interconnection frequency could render such action outside of limits. The proposed Reliability Standard incentivizes applicable entities to stay within these limits.

One of the reliability benefits of the proposed BAL-001-2 Reliability Standard is that it now contains real-time requirements necessary for proper control by allowing Balancing Authorities

to calculate their position within pre-established boundaries on a real-time basis. The Commission noted in Order No. 693 that "while the control performance standard metric is useful in identifying trends relating to poor regulating practices, specification of minimum reserve requirements to be maintained at all times would complement the control performance standard metrics by providing real-time requirements necessary for proper control."[7] The proposed Reliability Standard allows Balancing Authorities to calculate their position within pre-established boundaries on a real-time basis and take action to support reliability. Proposed Requirement R1 addresses long-term reliability and proposed Requirement R2 addresses short-term reliability. Collectively, the two Requirements of the proposed Reliability Standard define limits and significant deviations that impact frequency.

As noted herein, the BAL Reliability Standards work closely together. Revisions to the BAL-002 Reliability Standard are currently in development and will complement the proposed revisions to the BAL-001-2 Reliability Standard and will also address the Commission's concerns in Order No. 693 regarding the need to define reportable events.

B. Status of Field Trial for Proposed Reliability Standard BAL-001-2

As NERC noted in its Petition, the field trial for proposed Reliability Standard is ongoing.[8] The participation of Balancing Authorities in the field trial is in the interest of reliability due to the improvements proposed in Reliability Standard BAL-001-2, which requires a Balancing Authority to balance its resources and demand in real-time. There are significant costs for

---

[7] Order No. 693 at P 397.

[8] Petition at p. 6. In January 2013, the Western Electricity Coordinating Council presented a report on the field trial at its Board of Directors meeting. *Available at*: http://www.wecc.biz/committees/BOD/20130123/Lists/Minutes/1/2013%2001%2023%20Board%20Packet.pdf, beginning at p. 32. The report states that no trends were noticed in both NERC Inadvertent Interchange and the Primary Inadvertent Interchange accumulations for the participating BAs in the Western Interconnection during the field trial.

entities that are associated with changing between the currently-effective BAL-001-1 Reliability Standard and the proposed BAL-001-2 Reliability Standard because energy management system ("EMS") changes are required and there may also be associated information technology changes required. In some cases, operators may require training to implement these changes. The widespread participation of Balancing Authorities has provided insight into how the changes in proposed Reliability Standard BAL-001-2 will impact reliability. Currently, there are 47 Balancing Authorities participating in the field trial (16 in the Eastern Interconnection, 29 in the Western Interconnection, ERCOT and Quebec). For these reasons, NERC supports the participation of additional Balancing Authorities in the field trial. A report on the field trial will be submitted to the Commission in this proceeding for informational purposes, by no later than July 31, 2014. The field trial will end for participating entities upon the effective date of Reliability Standard BAL-001-2.

Counsel for the North American Electric Reliability Corporation

Date: May 9, 2014

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

May 15, 2014

Ms. Kimberly D. Bose
Secretary
Federal Energy Regulatory Commission
888 First Street, NE
Washington, D.C. 20426

Re: Revisions to the Violation Risk Factors and Violation Severity Levels Assigned to Certain Critical Infrastructure Protection Reliability Standards
Docket No. RM13-5-000

Dear Secretary Bose:

In accordance with Order No. 791,[1] the North American Electric Reliability Corporation ("NERC") submits proposed revisions to certain Violation Risk Factors ("VRFs") and Violations Severity Levels ("VSLs") assigned to certain Critical Infrastructure Protection ("CIP") Reliability Standards for Federal Energy Regulatory Commission ("FERC" or "Commission") approval. Specifically, NERC proposes revisions to the VRFs assigned to:

- CIP-006-5, Requirement R3
- CIP-004-5.1, Requirement R4

NERC is also proposing revisions to the VSLs assigned to:

- CIP-003-5, Requirements R1 and R2
- CIP-004-5.1, Requirement R4
- CIP-008-5, Requirement R2
- CIP-009-5, Requirement R3

The proposed VRF and VSL revisions, provided in Attachment A hereto, are consistent with the Commission's directives in Order No. 791. NERC respectfully requests that the Commission approve the proposed VRF and VSL revisions as just, reasonable, not unduly discriminatory or preferential, and in the public interest.

[1] *Version 5 Critical Infrastructure Protection Reliability Standards*, Order No. 791, 145 FERC ¶ 61,160 (2013).

3353 Peachtree Road NE
Suite 600, North Tower
Atlanta, GA 30326
404-446-2560 | www.nerc.com

I. Background

In Order No. 791, FERC approved new and modified CIP Reliability Standards, referred to as the CIP version 5 Reliability Standards. Among other things, FERC directed NERC to file revisions to certain VRFs and VSLs assigned to certain CIP Reliability Standards.[2] In particular, FERC directed NERC to modify the VRF assignments for Reliability Standards CIP-006-5, Requirement R3 and CIP-004-5, Requirement R4 from Lower to Medium.[3] Additionally, the Commission directed "modification to the VSLs for certain CIP Reliability Standards to: (1) remove the "identify, assess, and correct" language from the text of the VSLs for the affected requirements; (2) address typographical errors; and (3) clarify certain unexplained elements."[4]

The Commission directed NERC to file the VRF revisions within 90 days of the effective date of Order No. 791.[5] The Commission did not set a timeframe for filing the VSL modifications. On March 19, 2014, the Commission granted NERC an extension of time until May 15, 2014 to file the VRF modifications.[6] The NERC Board of Trustees approved the proposed VRF and VSL revisions on May 7, 2014.

II. Notices and Communications

Notices and communications with respect to this filing may be addressed to the following:

Holly A. Hawkins
Assistant General Counsel
Shamai Elstein
Counsel
North American Electric Reliability Corporation

III. Proposed VRF and VSL Revisions

Consistent with the Commission's directives in Order No. 791, NERC is proposing to modify (i) the VRFs for CIP-006-5, Requirement R3 and CIP-004-5.1, Requirement R4; and (ii) the VSLs for CIP-003-5,

---

2 Order No. 791 at PP 181-84, 192-196, 205-210.

3 *Id*. at PP 181-84, 192-196.

4 *Id*. at P 205-210.

5 *Id*. at PP 184, 196.

6 *Notice of Extension of Time*, Docket No. RM13-5-000 (March 19, 2014).

Requirements R1 and R2; CIP-004-5.1, Requirement R4; CIP-008-5, Requirement R2; and CIP-009-5, Requirement R3. The following is a discussion of each of the proposed VRF and VSL Revisions.

With respect to the directive to modify the VSLs associated with the requirements that include the "identify, assess, and correct" language, NERC will submit such modifications when it modifies those requirements consistent with FERC's directive from Order No. 791 to remove or modify that language. There is a NERC standards development project, Project 2014-02 CIP Version 5 Revisions, underway to address the Commission directives from Order No. 791.

a. VSL for CIP-003-5, Requirements R1, R2 and R4

Reliability Standard CIP-003-5 addresses security management controls for cyber security. Requirement R1 of that standard governs management approval of policies on topics addressed in other CIP standards for medium and high impact BES Cyber Systems. Requirement R2 governs policies for low impact BES Cyber Systems. Consistent with the Commission directive,[7] proposes to revise the VSLs in CIP-003-5, Requirements R1 and R2 to eliminate redundant language.

The Commission also directed NERC to clarify that the VSLs assigned to Requirement R4 of CIP-003-5 include timeline gradations as set forth in the VSL contained in Exhibit A to the petition for approval of the CIP version 5 Reliability Standards.[8] NERC hereby clarifies that VSLs for CIP-003-5, Requirement R4 include the timeline gradations reflected in Exhibit A to the CIP version 5 petition and as reflected in Attachment A hereto.

b. VRF and VSL for CIP-004-5.1, Requirement R4

Reliability Standard CIP-004-5.1 addresses cyber security personnel and training requirements, and Requirement R4 of that standard obligates a responsible entity to have a process for authorizing access to BES Cyber System Information, including periodic verification that users and accounts are authorized and necessary. Consistent with the Commission's directive,[9] NERC proposes to revise the VRF for CIP-004-5.1, Requirement R4 from a "Lower" designation to a "Medium" designation. Additionally, NERC proposes to revise the VSL assignment for CIP-004-5.1, Requirement R4 to a percentage-based gradation consistent with the Commission's directive.[10]

c. VRF for CIP-006-5, Requirement R3

Reliability Standard CIP-006-5 addresses physical security of BES Cyber Systems, and Requirement R3 of that standard governs implementation of Physical Access Control System maintenance

7 Order No. 791 at P 206.

8 *Id*. at P 207.

9 *Id*. at PP 192-196.

10 *Id*. at P 208.

and testing programs. Consistent with the Commission's directive,[11] NERC proposes to revise the VRF for CIP-006-5, Requirement R3 from a "Lower" designation to a "Medium" designation.

d. VSL for CIP-008-5, Requirement R2

Reliability Standard CIP-008-5 addresses incident reporting and response planning for cyber security. Requirement R2 of that standard governs implementation of documented Cyber Security Incident response plans. Consistent with the Commission's directive,[12] NERC proposed to revise the severe VSL to reduce a gap in months between the high VSL and severe VSL.

e. CIP-009-5, Requirement R3

Reliability Standard CIP-009-5 addresses recovery plans for BES Cyber Systems. Requirement R3 of that standard governs maintenance of the recovery plans. Consistent with the Commission's directive,[13] NERC proposed to revise the timeframes contained in the VSLs from 90-210 days to 90-120 days, where appropriate.

IV. Conclusion

For the foregoing reasons, NERC respectfully requests that the Commission approve the proposed VRF and VSL revisions as just, reasonable, not unduly discriminatory or preferential, and in the public interest.

Respectfully submitted,

/S. Shamai Elstein

Holly A. Hawkins

Attachment A

CIP-003-5 Violation Risk Factor and Violation Severity Level Revisions

Clean and Redline

Clean

A. Introduction

1. Title: Cyber Security — Security Management Controls

2. Number: CIP-003-5

3. Purpose: To specify consistent and sustainable security management controls that establish responsibility and accountability to protect BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-003-5:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

5. Effective Dates:

1. **24 Months Minimum** – CIP-003-5, except for CIP-003-5, Requirement R2, shall become effective on the later of July 1, 2015, or the first calendar day of the ninth calendar quarter after the effective date of the order providing applicable regulatory approval. CIP-003-5, Requirement R2 shall become effective on the later of July 1, 2016, or the first calendar day of the 13th calendar quarter after the effective date of the order providing applicable regulatory approval.
2. In those jurisdictions where no regulatory approval is required, CIP-003-5, except for CIP-003-5, Requirement R2, shall become effective on the first day of the ninth calendar quarter following Board of Trustees' approval, and CIP-003-5, Requirement R2 shall become effective on the first day of the 13th calendar quarter following Board of Trustees' approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

6. Background:

Standard CIP-003-5 exists as part of a suite of CIP Standards related to cyber security. CIP-002-5 requires the initial identification and categorization of BES Cyber Systems. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1, and CIP-011-1 require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems. This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.

The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:

> Each Responsible Entity shall implement**, in a manner that identifies, assesses, and corrects deficiencies,** . . .

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in their documented processes, but they must address the applicable requirements. The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects

are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures provide examples of evidence to show documentation and implementation of the requirement. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

B. Requirements and Measures

R1. Each Responsible Entity, for its high impact and medium impact BES Cyber Systems, shall review and obtain CIP Senior Manager approval at least once every 15 calendar months for one or more documented cyber security policies that collectively address the following topics: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

- **1.1** Personnel & training (CIP-004);
- **1.2** Electronic Security Perimeters (CIP-005) including Interactive Remote Access;
- **1.3** Physical security of BES Cyber Systems (CIP-006);
- **1.4** System security management (CIP-007);
- **1.5** Incident reporting and response planning (CIP-008);
- **1.6** Recovery plans for BES Cyber Systems (CIP-009);
- **1.7** Configuration change management and vulnerability assessments (CIP-010);
- **1.8** Information protection (CIP-011); and
- **1.9** Declaring and responding to CIP Exceptional Circumstances.

M1. Examples of evidence may include, but are not limited to, policy documents; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.

R2. Each Responsible Entity for its assets identified in CIP-002-5, Requirement R1, Part R1.3, shall implement, in a manner that identifies, assesses, and corrects deficiencies, one or more documented cyber security policies that collectively address the following topics, and review and obtain CIP Senior Manager approval for those policies at least once every 15 calendar months: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

- **2.1** Cyber security awareness;
- **2.2** Physical security controls;
- **2.3** Electronic access controls for external routable protocol connections and Dial-up Connectivity; and
- **2.4** Incident response to a Cyber Security Incident.

An inventory, list, or discrete identification of low impact BES Cyber Systems or their BES Cyber Assets is not required.

M2. Examples of evidence may include, but are not limited to, one or more documented cyber security policies and evidence of processes, procedures, or plans that demonstrate the implementation of the required topics; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.

R3. Each Responsible Entity shall identify a CIP Senior Manager by name and document any change within 30 calendar days of the change. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. An example of evidence may include, but is not limited to, a dated and approved document from a high level official designating the name of the individual identified as the CIP Senior Manager.

R4. The Responsible Entity shall implement, in a manner that identifies, assesses, and corrects deficiencies, a documented process to delegate authority, unless no delegations are used. Where allowed by the CIP Standards, the CIP Senior Manager may delegate authority for specific actions to a delegate or delegates. These delegations shall be documented, including the name or title of the delegate, the specific actions delegated, and the date of the delegation; approved by the CIP Senior Manager; and updated within 30 days of any change to the delegation. Delegation changes do not need to be reinstated with a change to the delegator. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. An example of evidence may include, but is not limited to, a dated document, approved by the CIP Senior Manager, listing individuals (by name or title) who are delegated the authority to approve or authorize specifically identified items.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

- Compliance Audit
- Self-Certification
- Spot Checking
- Compliance Investigation
- Self-Reporting
- Complaint

1.4. Additional Compliance Information:

- None

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section “4. Applicability” of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section “4.1. Functional Entities” is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section “4.2. Facilities” defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term “Facilities” already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The number of policies and their specific language are guided by a Responsible Entity's management structure and operating conditions. Policies might be included as part of a general information security program for the entire organization, or as components of specific programs. The cyber security policy must cover in sufficient detail the nine topical areas required by CIP-003-5, Requirement R1. The Responsible Entity has the flexibility to develop a single comprehensive cyber security policy covering these topics, or it may choose to develop a single high-level umbrella policy and provide additional policy detail in lower level documents in its documentation hierarchy. In the case of a high-level umbrella policy, the Responsible Entity would be expected to provide the high-level policy as well as the additional documentation in order to demonstrate compliance with CIP-003-5, Requirement R1. Implementation of the cyber security policy is not specifically included in CIP-003-5, Requirement R1 as it is envisioned that the implementation of this policy is evidenced through successful implementation of CIP-004 through CIP-011. However, Responsible Entities are encouraged not to limit the scope of their cyber security policies to only those requirements from CIP-004 through CIP-011, but rather to put together a holistic cyber security policy appropriate to its organization. The assessment through the Compliance Monitoring and Enforcement Program of policy items that extend beyond the scope of CIP-004 through CIP-011 should not be considered candidates for potential violations. The Responsible Entity should consider the following for each of the required topics in its cyber security policy:

1.1 Personnel & training (CIP-004)

- Organization position on acceptable background investigations
- Identification of possible disciplinary action for violating this policy
- Account management

1.2 Electronic Security Perimeters (CIP-005) including Interactive Remote Access

- Organization stance on use of wireless networks
- Identification of acceptable authentication methods
- Identification of trusted and untrusted resources
- Monitoring and logging of ingress and egress at Electronic Access Points
- Maintaining up-to-date anti-malware software before initiating Interactive Remote Access
- Maintaining up-to-date patch levels for operating systems and applications used to initiate Interactive Remote Access
- Disabling VPN "split-tunneling" or "dual-homed" workstations before initiating Interactive Remote Access
- For vendors, contractors, or consultants: include language in contracts that requires adherence to the Responsible Entity's Interactive Remote Access controls

1.3 Physical security of BES Cyber Systems (CIP-006)

- Strategy for protecting Cyber Assets from unauthorized physical access
- Acceptable physical access control methods
- Monitoring and logging of physical ingress

1.4 System security management (CIP-007)

- Strategies for system hardening
- Acceptable methods of authentication and access control
- Password policies including length, complexity, enforcement, prevention of brute force attempts
- Monitoring and logging of BES Cyber Systems

1.5 Incident reporting and response planning (CIP-008)

- Recognition of Cyber Security Incidents
- Appropriate notifications upon discovery of an incident
- Obligations to report Cyber Security Incidents

1.6 Recovery plans for BES Cyber Systems (CIP-009)

- Availability of spare components

- Availability of system backups

1.7 Configuration change management and vulnerability assessments (CIP-010)

- Initiation of change requests
- Approval of changes
- Break-fix processes

1.8 Information protection (CIP-011)

- Information access control methods
- Notification of unauthorized information disclosure
- Information access on a need-to-know basis

1.9 Declaring and responding to CIP Exceptional Circumstances

- Processes to invoke special procedures in the event of a CIP Exceptional Circumstance
- Processes to allow for exceptions to policy that do not violate CIP requirements

The Standard Drafting Team (SDT) has removed requirements relating to exceptions to a Responsible Entity's security policies since it is a general management issue that is not within the scope of a reliability requirement. The SDT considers it to be an internal policy requirement and not a reliability requirement. However, the SDT encourages Responsible Entities to continue this practice as a component of its cyber security policy.

In this and all subsequent required approvals in the NERC CIP Standards, the Responsible Entity may elect to use hardcopy or electronic approvals to the extent that there is sufficient evidence to ensure the authenticity of the approving party.

Requirement R2:

As with Requirement R1, the number of policies and their specific language would be guided by a Responsible Entity's management structure and operating conditions. Policies might be included as part of a general information security program for the entire organization or as components of specific programs. The cyber security policy must cover in sufficient detail the four topical areas required by CIP-003-5, Requirement R2. The Responsible Entity has flexibility to develop a single comprehensive cyber security policy covering these topics, or it may choose to develop a single high-level umbrella policy and provide additional policy detail in lower level documents in its documentation hierarchy. In the case of a high-level umbrella policy, the Responsible Entity would be expected to provide the high-level policy as well as the additional documentation in order to demonstrate compliance with CIP-003-5, Requirement R2. The intent of the requirement is to outline a set of basic protections that all low impact BES Cyber Systems should receive without requiring a significant administrative and compliance overhead. The SDT intends that demonstration of this requirement can be reasonably accomplished through providing evidence of related processes, procedures, or plans. While the audit staff may choose to review an example low impact BES Cyber System, the SDT believes strongly that the current method (as of this writing) of reviewing a statistical sample of systems is not

necessary. The SDT also notes that in topic 2.3, the SDT uses the term "electronic access control" in the general sense, i.e., to control access, and not in the specific technical sense requiring authentication, authorization, and auditing.

Requirement R3:

The intent of CIP-003-5, Requirement R3 is effectively unchanged since prior versions of the standard. The specific description of the CIP Senior Manager has now been included as a defined term rather than clarified in the Standard itself to prevent any unnecessary cross-reference to this standard. It is expected that this CIP Senior Manager play a key role in ensuring proper strategic planning, executive/board-level awareness, and overall program governance.

Requirement R4:

As indicated in the rationale for CIP-003-5, Requirement R4, this requirement is intended to demonstrate a clear line of authority and ownership for security matters. The intent of the SDT was not to impose any particular organizational structure, but, rather, the Responsible Entity should have significant flexibility to adapt this requirement to their existing organizational structure. A Responsible Entity may satisfy this requirement through a single delegation document or through multiple delegation documents. The Responsible Entity can make use of the delegation of the delegation authority itself to increase the flexibility in how this applies to its organization. In such a case, delegations may exist in numerous documentation records as long as the collection of these documentation records provides a clear line of authority back to the CIP Senior Manager. In addition, the CIP Senior Manager could also choose not to delegate any authority and meet this requirement without such delegation documentation.

The Responsible Entity must keep its documentation of the CIP Senior Manager and any delegations up to date. This is to ensure that individuals do not assume any undocumented authority. However, delegations do not have to be re-instated if the individual who delegated the task changes roles or is replaced. For instance, assume that John Doe is named the CIP Senior Manager and he delegates a specific task to the Substation Maintenance Manager. If John Doe is replaced as the CIP Senior Manager, the CIP Senior Manager documentation must be updated within the specified timeframe, but the existing delegation to the Substation Maintenance Manager remains in effect as approved by the previous CIP Senior Manager, John Doe.

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for R1:

One or more security policies enable effective implementation of the standard's requirements. The purpose of policies is to provide a management and governance foundation for all requirements that apply to personnel who have authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems. The Responsible Entity can demonstrate through its policies that its management supports the accountability and responsibility necessary for effective implementation of the standard's requirements.

Annual review and approval of the cyber security policy ensures that the policy is kept up-to-date and periodically reaffirms management's commitment to the protection of its BES Cyber Systems.

Rationale for R2:

One or more security policies enable effective implementation of the standard's requirements. The purpose of policies is to provide a management and governance foundation for all requirements that apply to personnel who have authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems. The Responsible Entity can demonstrate through its policies that its management supports the accountability and responsibility necessary for effective implementation of the standard's requirements.

The language in Requirement R2, Part 2.3 ". . . for external routable protocol connections and Dial-up Connectivity . . ." was included to acknowledge the support given in FERC Order 761, paragraph 87, for electronic security perimeter protections "of some form" to be applied to all BES Cyber Systems, regardless of impact. Part 2.3 uses the phrase "external routable protocol connections" instead of the defined term "External Routable Connectivity," because the latter term has very specific connotations relating to Electronic Security Perimeters and high and medium impact BES Cyber Systems. Using the glossary term "External Routable Connectivity" in the context of Requirement R2 would not be appropriate because Requirement R2 is limited in scope to low impact BES Cyber Systems.

Review and approval of the cyber security policy at least every 15 calendar months ensures that the policy is kept up-to-date and periodically reaffirms management's commitment to the protection of its BES Cyber Systems.

Rationale for R3:

The identification and documentation of the single CIP Senior Manager ensures that there is clear authority and ownership for the CIP program within an organization, as called for in Blackout Report Recommendation 43. The language that identifies CIP Senior Manager responsibilities is included in the *Glossary of Terms used in NERC Reliability Standards* so that it may be used across the body of CIP standards without an explicit cross-reference.

FERC Order No. 706, Paragraph 296, requests consideration of whether the single senior manager should be a corporate officer or equivalent. As implicated through the defined term, the senior manager has "the overall authority and responsibility for leading and managing implementation of the requirements within this set of standards" which ensures that the senior manager is of sufficient position in the Responsible Entity to ensure that cyber security receives the prominence that is necessary. In addition, given the range of business models for responsible entities, from municipal, cooperative, federal agencies, investor owned utilities, privately owned utilities, and everything in between, the SDT believes that requiring the senior manager to be a "corporate officer or equivalent" would be extremely difficult to interpret and enforce on a consistent basis.

Rationale for R4:

The intent of the requirement is to ensure clear accountability within an organization for certain security matters. It also ensures that delegations are kept up-to-date and that individuals do not assume undocumented authority.

In FERC Order No. 706, Paragraphs 379 and 381, the Commission notes that Recommendation 43 of the 2003 Blackout Report calls for "clear lines of authority and ownership for security matters." With this in mind, the Standard Drafting Team has sought to provide clarity in the requirement for delegations so that this line of authority is clear and apparent from the documented delegations.

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated version number from -2 to -3 Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	Update to conform to changes to CIP-002-4 (Project 2008-06)
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-003-5. (Order becomes effective 2/3/14.)	
5	5/7/14	Adopted by the NERC Board of Trustees to modify VSLs for Requirements R1 and R2.	

Redline

A. Introduction

1. Title: Cyber Security — Security Management Controls

2. Number: CIP-003-5

3. Purpose: To specify consistent and sustainable security management controls that establish responsibility and accountability to protect BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-003-5:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

5. Effective Dates:

1. **24 Months Minimum** – CIP-003-5, except for CIP-003-5, Requirement R2, shall become effective on the later of July 1, 2015, or the first calendar day of the ninth calendar quarter after the effective date of the order providing applicable regulatory approval. CIP-003-5, Requirement R2 shall become effective on the later of July 1, 2016, or the first calendar day of the 13th calendar quarter after the effective date of the order providing applicable regulatory approval.
2. In those jurisdictions where no regulatory approval is required, CIP-003-5, except for CIP-003-5, Requirement R2, shall become effective on the first day of the ninth calendar quarter following Board of Trustees' approval, and CIP-003-5, Requirement R2 shall become effective on the first day of the 13th calendar quarter following Board of Trustees' approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

6. Background:

Standard CIP-003-5 exists as part of a suite of CIP Standards related to cyber security. CIP-002-5 requires the initial identification and categorization of BES Cyber Systems. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1, and CIP-011-1 require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems. This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.

The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:

> Each Responsible Entity shall implement**, in a manner that identifies, assesses, and corrects deficiencies,** . . .

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in their documented processes, but they must address the applicable requirements. The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects

are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures provide examples of evidence to show documentation and implementation of the requirement. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

B. Requirements and Measures

R1. Each Responsible Entity, for its high impact and medium impact BES Cyber Systems, shall review and obtain CIP Senior Manager approval at least once every 15 calendar months for one or more documented cyber security policies that collectively address the following topics: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

- **1.1** Personnel & training (CIP-004);
- **1.2** Electronic Security Perimeters (CIP-005) including Interactive Remote Access;
- **1.3** Physical security of BES Cyber Systems (CIP-006);
- **1.4** System security management (CIP-007);
- **1.5** Incident reporting and response planning (CIP-008);
- **1.6** Recovery plans for BES Cyber Systems (CIP-009);
- **1.7** Configuration change management and vulnerability assessments (CIP-010);
- **1.8** Information protection (CIP-011); and
- **1.9** Declaring and responding to CIP Exceptional Circumstances.

M1. Examples of evidence may include, but are not limited to, policy documents; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.

R2. Each Responsible Entity for its assets identified in CIP-002-5, Requirement R1, Part R1.3, shall implement, in a manner that identifies, assesses, and corrects deficiencies, one or more documented cyber security policies that collectively address the following topics, and review and obtain CIP Senior Manager approval for those policies at least once every 15 calendar months: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

- **2.1** Cyber security awareness;
- **2.2** Physical security controls;
- **2.3** Electronic access controls for external routable protocol connections and Dial-up Connectivity; and
- **2.4** Incident response to a Cyber Security Incident.

An inventory, list, or discrete identification of low impact BES Cyber Systems or their BES Cyber Assets is not required.

M2. Examples of evidence may include, but are not limited to, one or more documented cyber security policies and evidence of processes, procedures, or plans that demonstrate the implementation of the required topics; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.

R3. Each Responsible Entity shall identify a CIP Senior Manager by name and document any change within 30 calendar days of the change. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. An example of evidence may include, but is not limited to, a dated and approved document from a high level official designating the name of the individual identified as the CIP Senior Manager.

R4. The Responsible Entity shall implement, in a manner that identifies, assesses, and corrects deficiencies, a documented process to delegate authority, unless no delegations are used. Where allowed by the CIP Standards, the CIP Senior Manager may delegate authority for specific actions to a delegate or delegates. These delegations shall be documented, including the name or title of the delegate, the specific actions delegated, and the date of the delegation; approved by the CIP Senior Manager; and updated within 30 days of any change to the delegation. Delegation changes do not need to be reinstated with a change to the delegator. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. An example of evidence may include, but is not limited to, a dated document, approved by the CIP Senior Manager, listing individuals (by name or title) who are delegated the authority to approve or authorize specifically identified items.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

- Compliance Audit
- Self-Certification
- Spot Checking
- Compliance Investigation
- Self-Reporting
- Complaint

1.4. Additional Compliance Information:

- None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-003-5)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Medium**	The Responsible Entity documented and implemented one or more cyber security policies for its high impact and medium impact BES Cyber Systems, but did not address one of the nine topics required by R1. (R1) OR The Responsible Entity did not complete its review of the one or more documented cyber security policies for its high impact and medium impact BES Cyber Systems as required by R1 within 15 calendar months but did complete this review	The Responsible Entity documented and implemented one or more cyber security policies for its high impact and medium impact BES Cyber Systems, but did not address two of the nine topics required by R1. Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section “4. Applicability” of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section “4.1. Functional Entities” is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section “4.2. Facilities” defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term “Facilities” already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The number of policies and their specific language are guided by a Responsible Entity's management structure and operating conditions. Policies might be included as part of a general information security program for the entire organization, or as components of specific programs. The cyber security policy must cover in sufficient detail the nine topical areas required by CIP-003-5, Requirement R1. The Responsible Entity has the flexibility to develop a single comprehensive cyber security policy covering these topics, or it may choose to develop a single high-level umbrella policy and provide additional policy detail in lower level documents in its documentation hierarchy. In the case of a high-level umbrella policy, the Responsible Entity would be expected to provide the high-level policy as well as the additional documentation in order to demonstrate compliance with CIP-003-5, Requirement R1. Implementation of the cyber security policy is not specifically included in CIP-003-5, Requirement R1 as it is envisioned that the implementation of this policy is evidenced through successful implementation of CIP-004 through CIP-011. However, Responsible Entities are encouraged not to limit the scope of their cyber security policies to only those requirements from CIP-004 through CIP-011, but rather to put together a holistic cyber security policy appropriate to its organization. The assessment through the Compliance Monitoring and Enforcement Program of policy items that extend beyond the scope of CIP-004 through CIP-011 should not be considered candidates for potential violations. The Responsible Entity should consider the following for each of the required topics in its cyber security policy:

1.1 Personnel & training (CIP-004)

- Organization position on acceptable background investigations
- Identification of possible disciplinary action for violating this policy
- Account management

1.2 Electronic Security Perimeters (CIP-005) including Interactive Remote Access

- Organization stance on use of wireless networks
- Identification of acceptable authentication methods
- Identification of trusted and untrusted resources
- Monitoring and logging of ingress and egress at Electronic Access Points
- Maintaining up-to-date anti-malware software before initiating Interactive Remote Access
- Maintaining up-to-date patch levels for operating systems and applications used to initiate Interactive Remote Access
- Disabling VPN “split-tunneling” or “dual-homed” workstations before initiating Interactive Remote Access
- For vendors, contractors, or consultants: include language in contracts that requires adherence to the Responsible Entity’s Interactive Remote Access controls

1.3 Physical security of BES Cyber Systems (CIP-006)

- Strategy for protecting Cyber Assets from unauthorized physical access
- Acceptable physical access control methods
- Monitoring and logging of physical ingress

1.4 System security management (CIP-007)

- Strategies for system hardening
- Acceptable methods of authentication and access control
- Password policies including length, complexity, enforcement, prevention of brute force attempts
- Monitoring and logging of BES Cyber Systems

1.5 Incident reporting and response planning (CIP-008)

- Recognition of Cyber Security Incidents
- Appropriate notifications upon discovery of an incident
- Obligations to report Cyber Security Incidents

1.6 Recovery plans for BES Cyber Systems (CIP-009)

- Availability of spare components

- Availability of system backups

1.7 Configuration change management and vulnerability assessments (CIP-010)

- Initiation of change requests
- Approval of changes
- Break-fix processes

1.8 Information protection (CIP-011)

- Information access control methods
- Notification of unauthorized information disclosure
- Information access on a need-to-know basis

1.9 Declaring and responding to CIP Exceptional Circumstances

- Processes to invoke special procedures in the event of a CIP Exceptional Circumstance
- Processes to allow for exceptions to policy that do not violate CIP requirements

The Standard Drafting Team (SDT) has removed requirements relating to exceptions to a Responsible Entity's security policies since it is a general management issue that is not within the scope of a reliability requirement. The SDT considers it to be an internal policy requirement and not a reliability requirement. However, the SDT encourages Responsible Entities to continue this practice as a component of its cyber security policy.

In this and all subsequent required approvals in the NERC CIP Standards, the Responsible Entity may elect to use hardcopy or electronic approvals to the extent that there is sufficient evidence to ensure the authenticity of the approving party.

Requirement R2:

As with Requirement R1, the number of policies and their specific language would be guided by a Responsible Entity's management structure and operating conditions. Policies might be included as part of a general information security program for the entire organization or as components of specific programs. The cyber security policy must cover in sufficient detail the four topical areas required by CIP-003-5, Requirement R2. The Responsible Entity has flexibility to develop a single comprehensive cyber security policy covering these topics, or it may choose to develop a single high-level umbrella policy and provide additional policy detail in lower level documents in its documentation hierarchy. In the case of a high-level umbrella policy, the Responsible Entity would be expected to provide the high-level policy as well as the additional documentation in order to demonstrate compliance with CIP-003-5, Requirement R2. The intent of the requirement is to outline a set of basic protections that all low impact BES Cyber Systems should receive without requiring a significant administrative and compliance overhead. The SDT intends that demonstration of this requirement can be reasonably accomplished through providing evidence of related processes, procedures, or plans. While the audit staff may choose to review an example low impact BES Cyber System, the SDT believes strongly that the current method (as of this writing) of reviewing a statistical sample of systems is not

necessary. The SDT also notes that in topic 2.3, the SDT uses the term "electronic access control" in the general sense, i.e., to control access, and not in the specific technical sense requiring authentication, authorization, and auditing.

Requirement R3:

The intent of CIP-003-5, Requirement R3 is effectively unchanged since prior versions of the standard. The specific description of the CIP Senior Manager has now been included as a defined term rather than clarified in the Standard itself to prevent any unnecessary cross-reference to this standard. It is expected that this CIP Senior Manager play a key role in ensuring proper strategic planning, executive/board-level awareness, and overall program governance.

Requirement R4:

As indicated in the rationale for CIP-003-5, Requirement R4, this requirement is intended to demonstrate a clear line of authority and ownership for security matters. The intent of the SDT was not to impose any particular organizational structure, but, rather, the Responsible Entity should have significant flexibility to adapt this requirement to their existing organizational structure. A Responsible Entity may satisfy this requirement through a single delegation document or through multiple delegation documents. The Responsible Entity can make use of the delegation of the delegation authority itself to increase the flexibility in how this applies to its organization. In such a case, delegations may exist in numerous documentation records as long as the collection of these documentation records provides a clear line of authority back to the CIP Senior Manager. In addition, the CIP Senior Manager could also choose not to delegate any authority and meet this requirement without such delegation documentation.

The Responsible Entity must keep its documentation of the CIP Senior Manager and any delegations up to date. This is to ensure that individuals do not assume any undocumented authority. However, delegations do not have to be re-instated if the individual who delegated the task changes roles or is replaced. For instance, assume that John Doe is named the CIP Senior Manager and he delegates a specific task to the Substation Maintenance Manager. If John Doe is replaced as the CIP Senior Manager, the CIP Senior Manager documentation must be updated within the specified timeframe, but the existing delegation to the Substation Maintenance Manager remains in effect as approved by the previous CIP Senior Manager, John Doe.

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for R1:

One or more security policies enable effective implementation of the standard's requirements. The purpose of policies is to provide a management and governance foundation for all requirements that apply to personnel who have authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems. The Responsible Entity can demonstrate through its policies that its management supports the accountability and responsibility necessary for effective implementation of the standard's requirements.

Annual review and approval of the cyber security policy ensures that the policy is kept up-to-date and periodically reaffirms management's commitment to the protection of its BES Cyber Systems.

Rationale for R2:

One or more security policies enable effective implementation of the standard's requirements. The purpose of policies is to provide a management and governance foundation for all requirements that apply to personnel who have authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems. The Responsible Entity can demonstrate through its policies that its management supports the accountability and responsibility necessary for effective implementation of the standard's requirements.

The language in Requirement R2, Part 2.3 ". . . for external routable protocol connections and Dial-up Connectivity . . ." was included to acknowledge the support given in FERC Order 761, paragraph 87, for electronic security perimeter protections "of some form" to be applied to all BES Cyber Systems, regardless of impact. Part 2.3 uses the phrase "external routable protocol connections" instead of the defined term "External Routable Connectivity," because the latter term has very specific connotations relating to Electronic Security Perimeters and high and medium impact BES Cyber Systems. Using the glossary term "External Routable Connectivity" in the context of Requirement R2 would not be appropriate because Requirement R2 is limited in scope to low impact BES Cyber Systems.

Review and approval of the cyber security policy at least every 15 calendar months ensures that the policy is kept up-to-date and periodically reaffirms management's commitment to the protection of its BES Cyber Systems.

Rationale for R3:

The identification and documentation of the single CIP Senior Manager ensures that there is clear authority and ownership for the CIP program within an organization, as called for in Blackout Report Recommendation 43. The language that identifies CIP Senior Manager responsibilities is included in the *Glossary of Terms used in NERC Reliability Standards* so that it may be used across the body of CIP standards without an explicit cross-reference.

FERC Order No. 706, Paragraph 296, requests consideration of whether the single senior manager should be a corporate officer or equivalent. As implicated through the defined term, the senior manager has "the overall authority and responsibility for leading and managing implementation of the requirements within this set of standards" which ensures that the senior manager is of sufficient position in the Responsible Entity to ensure that cyber security receives the prominence that is necessary. In addition, given the range of business models for responsible entities, from municipal, cooperative, federal agencies, investor owned utilities, privately owned utilities, and everything in between, the SDT believes that requiring the senior manager to be a "corporate officer or equivalent" would be extremely difficult to interpret and enforce on a consistent basis.

Rationale for R4:

The intent of the requirement is to ensure clear accountability within an organization for certain security matters. It also ensures that delegations are kept up-to-date and that individuals do not assume undocumented authority.

In FERC Order No. 706, Paragraphs 379 and 381, the Commission notes that Recommendation 43 of the 2003 Blackout Report calls for "clear lines of authority and ownership for security matters." With this in mind, the Standard Drafting Team has sought to provide clarity in the requirement for delegations so that this line of authority is clear and apparent from the documented delegations.

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated version number from -2 to -3 Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	Update to conform to changes to CIP-002-4 (Project 2008-06)
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-003-5. (Order becomes effective 2/3/14.)	

CIP-004-5.1 Violation Risk Factor and Violation Severity Level Revisions

Clean and Redline

Clean

A. Introduction

1. Title: Cyber Security — Personnel & Training

2. Number: CIP-004-5.1

3. Purpose: To minimize the risk against compromise that could lead to misoperation or instability in the BES from individuals accessing BES Cyber Systems by requiring an appropriate level of personnel risk assessment, training, and security awareness in support of protecting BES Cyber Systems.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1. Balancing Authority

4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2. Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Interchange Coordinator or Interchange Authority

4.1.6. Reliability Coordinator

4.1.7. Transmission Operator

4.1.8. Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-004-5.1:

4.2.3.1. Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5. Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5 identification and categorization processes.

5. Effective Dates:

1. **24 Months Minimum** – CIP-004-5.1 shall become effective on the later of July 1, 2015, or the first calendar day of the ninth calendar quarter after the effective date of the order providing applicable regulatory approval.
2. In those jurisdictions where no regulatory approval is required, CIP-004-5.1 shall become effective on the first day of the ninth calendar quarter following Board of Trustees' approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

6. Background:

Standard CIP-004-5.1 exists as part of a suite of CIP Standards related to cyber security. CIP-002-5 requires the initial identification and categorization of BES Cyber Systems. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1 and CIP-011-1 require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems. This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:

> Each Responsible Entity shall implement**, in a manner that identifies, assesses, and corrects deficiencies,** . . .

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in their documented processes, but they must address the applicable requirements in the table. The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of

implementation of the documented processes and could be accomplished through other controls or compliance management activities.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5 identification and categorization processes.

- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5 identification and categorization processes.

- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.

- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.

- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.

B. Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in *CIP-004-5.1 Table R1 – Security Awareness Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-004-5.1 Table R1 – Security Awareness Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-5.1 Table R1 – Security Awareness Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Security awareness that, at least once each calendar quarter, reinforces cyber security practices (which may include associated physical security practices) for the Responsible Entity's personnel who have authorized electronic or authorized unescorted physical access to BES Cyber Systems.	An example of evidence may include, but is not limited to, documentation that the quarterly reinforcement has been provided. Examples of evidence of reinforcement may include, but are not limited to, dated copies of information used to reinforce security awareness, as well as evidence of distribution, such as: • direct communications (for example, e-mails, memos, computer-based training); or • indirect communications (for example, posters, intranet, or brochures); or • management support and reinforcement (for example, presentations or meetings).

R2. Each Responsible Entity shall implement, in a manner that identifies, assesses, and corrects deficiencies, a cyber security training program(s) appropriate to individual roles, functions, or responsibilities that collectively includes each of the applicable requirement parts in *CIP-004-5.1 Table R2 – Cyber Security Training Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M2. Evidence must include the training program that includes each of the applicable requirement parts in *CIP-004-5.1 Table R2 – Cyber Security Training Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-5.1 Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Training content on: 2.1.1. Cyber security policies; 2.1.2. Physical access controls; 2.1.3. Electronic access controls; 2.1.4. The visitor control program; 2.1.5. Handling of BES Cyber System Information and its storage; 2.1.6. Identification of a Cyber Security Incident and initial notifications in accordance with the entity's incident response plan; 2.1.7. Recovery plans for BES Cyber Systems; 2.1.8. Response to Cyber Security Incidents; and 2.1.9. Cyber security risks associated with a BES Cyber System's electronic interconnectivity and interoperability with other Cyber Assets.	Examples of evidence may include, but are not limited to, training material such as power point presentations, instructor notes, student notes, handouts, or other training materials.

CIP-004-5.1 Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Require completion of the training specified in Part 2.1 prior to granting authorized electronic access and authorized unescorted physical access to applicable Cyber Assets, except during CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, training records and documentation of when CIP Exceptional Circumstances were invoked.
2.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Require completion of the training specified in Part 2.1 at least once every 15 calendar months.	Examples of evidence may include, but are not limited to, dated individual training records.

R3. Each Responsible Entity shall implement, in a manner that identifies, assesses, and corrects deficiencies, one or more documented personnel risk assessment programs to attain and retain authorized electronic or authorized unescorted physical access to BES Cyber Systems that collectively include each of the applicable requirement parts in *CIP-004-5.1 Table R3 – Personnel Risk Assessment Program*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M3. Evidence must include the documented personnel risk assessment programs that collectively include each of the applicable requirement parts in *CIP-004-5.1 Table R3 – Personnel Risk Assessment Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-5.1 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to confirm identity.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to confirm identity.

CIP-004-5.1 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to perform a seven year criminal history records check as part of each personnel risk assessment that includes: 3.2.1. current residence, regardless of duration; and 3.2.2. other locations where, during the seven years immediately prior to the date of the criminal history records check, the subject has resided for six consecutive months or more. If it is not possible to perform a full seven year criminal history records check, conduct as much of the seven year criminal history records check as possible and document the reason the full seven year criminal history records check could not be performed.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to perform a seven year criminal history records check.

CIP-004-5.1 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Criteria or process to evaluate criminal history records checks for authorizing access.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to evaluate criminal history records checks.
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Criteria or process for verifying that personnel risk assessments performed for contractors or service vendors are conducted according to Parts 3.1 through 3.3.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's criteria or process for verifying contractors or service vendors personnel risk assessments.

CIP-004-5.1 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.5	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to ensure that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed according to Parts 3.1 to 3.4 within the last seven years.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process for ensuring that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed within the last seven years.

R4. Each Responsible Entity shall implement, in a manner that identifies, assesses, and corrects deficiencies, one or more documented access management programs that collectively include each of the applicable requirement parts in *CIP-004-5.1 Table R4 – Access Management Program. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M4. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-004-5.1 Table R4 – Access Management Program* and additional evidence to demonstrate that the access management program was implemented as described in the Measures column of the table.

CIP-004-5.1 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to authorize based on need, as determined by the Responsible Entity, except for CIP Exceptional Circumstances: 4.1.1. Electronic access; 4.1.2. Unescorted physical access into a Physical Security Perimeter; and 4.1.3. Access to designated storage locations, whether physical or electronic, for BES Cyber System Information.	An example of evidence may include, but is not limited to, dated documentation of the process to authorize electronic access, unescorted physical access in a Physical Security Perimeter, and access to designated storage locations, whether physical or electronic, for BES Cyber System Information.

CIP-004-5.1 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Verify at least once each calendar quarter that individuals with active electronic access or unescorted physical access have authorization records.	Examples of evidence may include, but are not limited to: • Dated documentation of the verification between the system generated list of individuals who have been authorized for access (i.e., workflow database) and a system generated list of personnel who have access (i.e., user account listing), or • Dated documentation of the verification between a list of individuals who have been authorized for access (i.e., authorization forms) and a list of individuals provisioned for access (i.e., provisioning forms or shared account listing).

CIP-004-5.1 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For electronic access, verify at least once every 15 calendar months that all user accounts, user account groups, or user role categories, and their specific, associated privileges are correct and are those that the Responsible Entity determines are necessary.	An example of evidence may include, but is not limited to, documentation of the review that includes all of the following: 1. A dated listing of all accounts/account groups or roles within the system; 2. A summary description of privileges associated with each group or role; 3. Accounts assigned to the group or role; and 4. Dated evidence showing verification of the privileges for the group are authorized and appropriate to the work function performed by people assigned to each account.

CIP-004-5.1 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Verify at least once every 15 calendar months that access to the designated storage locations for BES Cyber System Information, whether physical or electronic, are correct and are those that the Responsible Entity determines are necessary for performing assigned work functions.	An example of evidence may include, but is not limited to, the documentation of the review that includes all of the following: 1. A dated listing of authorizations for BES Cyber System information; 2. Any privileges associated with the authorizations; and 3. Dated evidence showing a verification of the authorizations and any privileges were confirmed correct and the minimum necessary for performing assigned work functions.

R5. Each Responsible Entity shall implement, in a manner that identifies, assesses, and corrects deficiencies, one or more documented access revocation programs that collectively include each of the applicable requirement parts in *CIP-004-5.1 Table R5 – Access Revocation*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning].*

M5. Evidence must include each of the applicable documented programs that collectively include each of the applicable requirement parts in *CIP-004-5.1 Table R5 – Access Revocation* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-5.1 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	A process to initiate removal of an individual's ability for unescorted physical access and Interactive Remote Access upon a termination action, and complete the removals within 24 hours of the termination action (Removal of the ability for access may be different than deletion, disabling, revocation, or removal of all access rights).	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form verifying access removal associated with the termination action; and 2. Logs or other demonstration showing such persons no longer have access.

CIP-004-5.1 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For reassignments or transfers, revoke the individual's authorized electronic access to individual accounts and authorized unescorted physical access that the Responsible Entity determines are not necessary by the end of the next calendar day following the date that the Responsible Entity determines that the individual no longer requires retention of that access.	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form showing a review of logical and physical access; and 2. Logs or other demonstration showing such persons no longer have access that the Responsible Entity determines is not necessary.

CIP-004-5.1 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For termination actions, revoke the individual's access to the designated storage locations for BES Cyber System Information, whether physical or electronic (unless already revoked according to Requirement R5.1), by the end of the next calendar day following the effective date of the termination action.	An example of evidence may include, but is not limited to, workflow or sign-off form verifying access removal to designated physical areas or cyber systems containing BES Cyber System Information associated with the terminations and dated within the next calendar day of the termination action.

CIP-004-5.1 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.4	High Impact BES Cyber Systems and their associated: • EACMS	For termination actions, revoke the individual's non-shared user accounts (unless already revoked according to Parts 5.1 or 5.3) within 30 calendar days of the effective date of the termination action.	An example of evidence may include, but is not limited to, workflow or sign-off form showing access removal for any individual BES Cyber Assets and software applications as determined necessary to completing the revocation of access and dated within thirty calendar days of the termination actions.

CIP-004-5.1 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.5	High Impact BES Cyber Systems and their associated: • EACMS	For termination actions, change passwords for shared account(s) known to the user within 30 calendar days of the termination action. For reassignments or transfers, change passwords for shared account(s) known to the user within 30 calendar days following the date that the Responsible Entity determines that the individual no longer requires retention of that access. If the Responsible Entity determines and documents that extenuating operating circumstances require a longer time period, change the password(s) within 10 calendar days following the end of the operating circumstances.	Examples of evidence may include, but are not limited to: • Workflow or sign-off form showing password reset within 30 calendar days of the termination; • Workflow or sign-off form showing password reset within 30 calendar days of the reassignments or transfers; or • Documentation of the extenuating operating circumstance and workflow or sign-off form showing password reset within 10 calendar days following the end of the operating circumstance.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

- Compliance Audit
- Self-Certification
- Spot Checking
- Compliance Investigation
- Self-Reporting
- Complaint

1.4. Additional Compliance Information:

- None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-004-5.1)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Lower**	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so less than 10 calendar days after the start of a subsequent calendar quarter. (1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so between 10 and 30 calendar days after the start of a subsequent calendar quarter. (1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so within the subsequent quarter but beyond 30 calendar days after the start of that calendar quarter. (1.1)	The Responsible Entity did not document or implement any security awareness process(es) to reinforce cyber security practices. (R1) OR The Responsible Entity did not reinforce cyber security practices and associated physical security practices for at least two consecutive calendar quarters. (1.1)
R2	**Operations Planning**	**Lower**	The Responsible Entity implemented a cyber security training program but failed to include one of the training	The Responsible Entity implemented a cyber security training program but failed to include two of the training content topics in Requirement Parts 2.1.1 through 2.1.9, and did not identify, assess	The Responsible Entity implemented a cyber security training program but failed to include three of the training content topics in Requirement Parts 2.1.1 through 2.1.9, and did not identify, assess	The Responsible Entity did not implement a cyber security training program appropriate to individual roles, functions, or responsibilities. Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. Furthermore,

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The security awareness program is intended to be an informational program, not a formal training program. It should reinforce security practices to ensure that personnel maintain awareness of best practices for both physical and electronic security to protect its BES Cyber Systems. The Responsible Entity is not required to provide records that show that each individual received or understood the information, but they must maintain documentation of the program materials utilized in the form of posters, memos, and/or presentations.

Examples of possible mechanisms and evidence, when dated, which can be used are:

- Direct communications (e.g., emails, memos, computer based training, etc.);
- Indirect communications (e.g., posters, intranet, brochures, etc.);
- Management support and reinforcement (e.g., presentations, meetings, etc.).

Requirement R2:

Training shall cover the policies, access controls, and procedures as developed for the BES Cyber Systems and include, at a minimum, the required items appropriate to personnel roles and responsibilities from Table R2. The Responsible Entity has the flexibility to define the training program and it may consist of multiple modules and multiple delivery mechanisms, but a single training program for all individuals needing to be trained is acceptable. The training can focus on functions, roles or responsibilities at the discretion of the Responsible Entity.

One new element in the training content is intended to encompass networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber Systems as per FERC Order No. 706, Paragraph 434. This is not intended to provide technical training to individuals supporting networking hardware and software, but educating system users of the cyber security risks associated with the interconnectedness of these systems. The users, based on their function, role or responsibility, should have a basic understanding of which systems can be accessed from other systems and how the actions they take can affect cyber security.

Each Responsible Entity shall ensure all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, complete cyber security training prior to their being granted authorized access, except for CIP Exceptional Circumstances. To retain the authorized accesses, individuals must complete the training at least one every 15 months.

Requirement R3:

Each Responsible Entity shall ensure a personnel risk assessment is performed for all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, prior to their being granted authorized access, except for program specified exceptional circumstances that are approved by the single senior management official or their delegate and impact the reliability of the BES or emergency response. Identity should be confirmed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. Identity only needs to be confirmed prior to initially granting access and only requires periodic confirmation according to the entity's process during the tenure of employment, which may or may not be the same as the initial verification action.

A seven year criminal history check should be performed for those locations where the individual has resided for at least six consecutive months. This check should also be performed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. When it is not possible to perform a full seven year criminal history check, documentation must be made of what criminal history check was performed, and the reasons a full seven-year check could not be performed. Examples of this could include

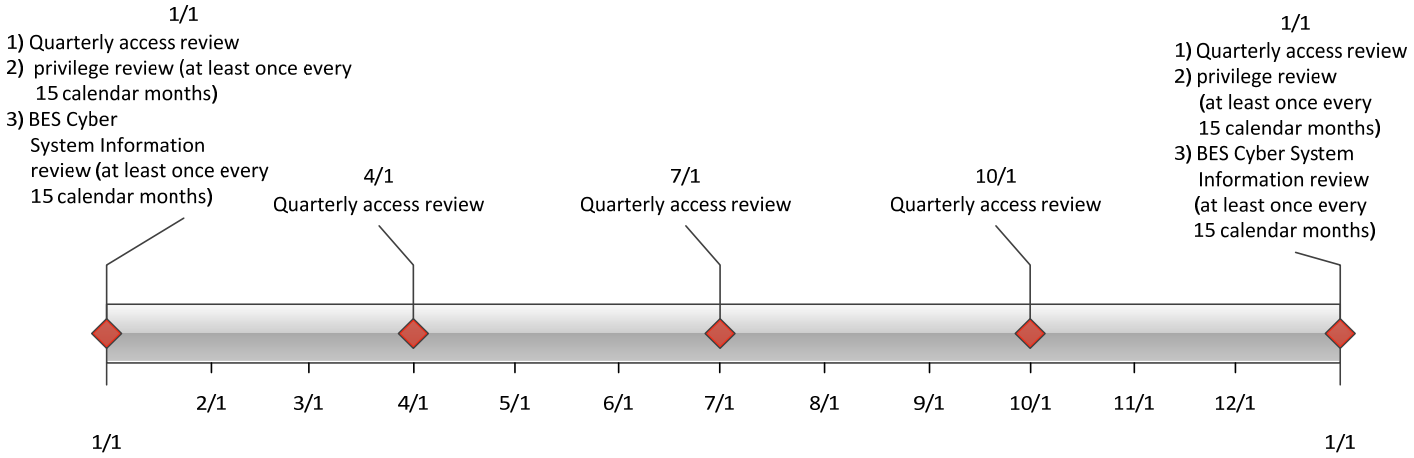
individuals under the age of 25 where a juvenile criminal history may be protected by law, individuals who may have resided in locations from where it is not possible to obtain a criminal history records check, violates the law or is not allowed under the existing collective bargaining agreement. The Responsible Entity should consider the absence of information for the full seven years when assessing the risk of granting access during the process to evaluate the criminal history check. There needs to be a personnel risk assessment that has been completed within the last seven years for each individual with access. A new criminal history records check must be performed as part of the new PRA. Individuals who have been granted access under a previous version of these standards need a new PRA within seven years of the date of their last PRA. The clarifications around the seven year criminal history check in this version do not require a new PRA be performed by the implementation date.

Requirement R4:

Authorization for electronic and unescorted physical access and access to BES Cyber System Information must be on the basis of necessity in the individual performing a work function. Documentation showing the authorization should have some justification of the business need included. To ensure proper segregation of duties, access authorization and provisioning should not be performed by the same person where possible.

This requirement specifies both quarterly reviews and reviews at least once every 15 calendar months. Quarterly reviews are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

The privilege review at least once every 15 calendar months is more detailed to ensure an individual's associated privileges are the minimum necessary to perform their work function



(i.e., least privilege). Entities can more efficiently perform this review by implementing role-based access. This involves determining the specific roles on the system (e.g., system operator, technician, report viewer, administrator, etc.) then grouping access privileges to the role and assigning users to the role. Role-based access does not assume any specific software and can be implemented by defining specific provisioning processes for each role where access group assignments cannot be performed. Role-based access permissions eliminate the need to perform the privilege review on individual accounts. An example timeline of all the reviews in Requirement R4 is included below.

Separation of duties should be considered when performing the reviews in Requirement R4. The person reviewing should be different than the person provisioning access.

If the results of quarterly or at least once every 15 calendar months account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that this error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

Requirement R5:

The requirement to revoke access at the time of the termination action includes procedures showing revocation of access concurrent with the termination action. This requirement recognizes that the timing of the termination action may vary depending on the circumstance. Some common scenarios and possible processes on when the termination action occurs are provided in the following table. These scenarios are not an exhaustive list of all scenarios, but are representative of several routine business practices.

Scenario	Possible Process
Immediate involuntary termination	Human resources or corporate security escorts the individual off site and the supervisor or human resources personnel notify the appropriate personnel to begin the revocation process.
Scheduled involuntary termination	Human resources personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Voluntary termination	Human resources personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Retirement where the last working day is several weeks prior to the termination date	Human resources personnel coordinate with manager to determine the final date access is no longer needed and schedule the revocation of access on the determined day.

Death	Human resources personnel are notified of the death and work with appropriate personnel to begin the revocation process.

Revocation of electronic access should be understood to mean a process with the end result that electronic access to BES Cyber Systems is no longer possible using credentials assigned to or known by the individual(s) whose access privileges are being revoked. Steps taken to accomplish this outcome may include deletion or deactivation of accounts used by the individual(s), but no specific actions are prescribed. Entities should consider the ramifications of deleting an account may include incomplete event log entries due to an unrecognized account or system services using the account to log on.

The initial revocation required in Requirement R5.1 includes unescorted physical access and Interactive Remote Access. These two actions should prevent any further access by the individual after termination. If an individual still has local access accounts (i.e., accounts on the Cyber Asset itself) on BES Cyber Assets, then the Responsible Entity has 30 days to complete the revocation process for those accounts. However, nothing prevents a Responsible Entity from performing all of the access revocation at the time of termination.

For transferred or reassigned individuals, a review of access privileges should be performed. This review could entail a simple listing of all authorizations for an individual and working with the respective managers to determine which access will still be needed in the new position. For instances in which the individual still needs to retain access as part of a transitory period, the entity should schedule a time to review these access privileges or include the privileges in the quarterly account review or annual privilege review.

Revocation of access to shared accounts is called out separately to prevent the situation where passwords on substation and generation devices are constantly changed due to staff turnover.

Requirement 5.5 specified that passwords for shared account are to the changed within 30 calendar days of the termination action or when the Responsible Entity determines an individual no longer requires access to the account as a result of a reassignment or transfer. The 30 days applies under normal operating conditions. However, circumstances may occur where this is not possible. Some systems may require an outage or reboot of the system in order to complete the password change. In periods of extreme heat or cold, many Responsible Entities may prohibit system outages and reboots in order to maintain reliability of the BES. When these circumstances occur, the Responsible Entity must document these circumstances and prepare to change the password within 10 calendar days following the end of the operating circumstances. Records of activities must be retained to show that the Responsible Entity followed the plan they created.

Rationale:

During the development of this standard, references to prior versions of the CIP standards and rationale for the requirements and their parts were embedded within the standard. Upon BOT approval, that information was moved to this section.

Rationale for R1:

Ensures that Responsible Entities with personnel who have authorized electronic or authorized unescorted physical access to BES Cyber Assets take action so that those personnel with such authorized electronic or authorized unescorted physical access maintain awareness of the Responsible Entity's security practices.

Summary of Changes: Reformatted into table structure.

Reference to prior version: (Part 1.1) CIP-004-4, R1

Change Rationale: (Part 1.1)

Changed to remove the need to ensure or prove everyone with authorized electronic or authorized unescorted physical *access "received" ongoing reinforcement – to state that security awareness has been reinforced.*

Moved example mechanisms to guidance.

Rationale for R2:

To ensure that the Responsible Entity's training program for personnel who need authorized electronic access and/or authorized unescorted physical access to BES Cyber Systems covers the proper policies, access controls, and procedures to protect BES Cyber Systems and are trained before access is authorized.

Based on their role, some personnel may not require training on all topics.

Summary of Changes:

1. Addition of specific role training for:
    - The visitor control program
    - Electronic interconnectivity supporting the operation and control of BES Cyber Systems
    - Storage media as part of the handling of BES Cyber Systems information

2. Change references from Critical Cyber Assets to BES Cyber Systems.

Reference to prior version: (Part 2.1) CIP004-4, R2.2.1

Change Rationale: (Part 2.1)

Removed "proper use of Critical Cyber Assets" concept from previous versions to focus the requirement on cyber security issues, not the business function. The previous version was

focused more on the business or functional use of the BES Cyber System and is outside the scope of cyber security. Personnel who will administer the visitor control process or serve as escorts for visitors need training on the program. Core training on the handling of BES Cyber System (not Critical Cyber Assets) Information, with the addition of storage; FERC Order No. 706, paragraph 413 and paragraphs 632-634, 688, 732-734; DHS 2.4.16. Core training on the identification and reporting of a Cyber Security Incident; FERC Order No. 706, Paragraph 413; Related to CIP-008-5 & DHS Incident Reporting requirements for those with roles in incident reporting. Core training on the action plans and procedures to recover or re-establish BES Cyber Systems for personnel having a role in the recovery; FERC Order No. 706, Paragraph 413. Core training programs are intended to encompass networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber Systems; FERC Order No. 706, Paragraph 434.

Reference to prior version: (Part 2.2) CIP004-4, R2.1

Change Rationale: (Part 2.2)

Addition of exceptional circumstances parameters as directed in FERC Order No. 706, Paragraph 431 is detailed in CIP-003-5.

Reference to prior version: (Part 2.3) CIP004-4, R2.3

Change Rationale: (Part 2.3)

Updated to replace "annually" with "once every 15 calendar months."

Rationale for R3:

To ensure that individuals who need authorized electronic or authorized unescorted physical access to BES Cyber Systems have been assessed for risk. Whether initial access or maintaining access, those with access must have had a personnel risk assessment completed within the last 7 years.

Summary of Changes: Specify that the seven year criminal history check covers all locations where the individual has resided for six consecutive months or more, including current residence regardless of duration.

Reference to prior version: (Part 3.1) CIP004-4, R3.1

Change Rationale: (Part 3.1)

Addressed interpretation request in guidance. Specified that process for identity confirmation is required. The implementation plan clarifies that a documented identity verification conducted under an earlier version of the CIP standards is sufficient.

Reference to prior version: (Part 3.2) CIP004-4, R3.1

Change Rationale: (Part 3.2)

Specify that the seven year criminal history check covers all locations where the individual has resided for six months or more, including current residence regardless of duration. Added

additional wording based on interpretation request. Provision is made for when a full seven-year check cannot be performed.

Reference to prior version: (Part 3.3) New

Change Rationale: (Part 3.3)

There should be documented criteria or a process used to evaluate criminal history records checks for authorizing access.

Reference to prior version: (Part 3.4) CIP-004-4, R3.3

Change Rationale: (Part 3.4)

Separated into its own table item.

Reference to prior version: (Part 3.5) CIP-004-3, R3, R3.3

Change Rationale: (Part 3.5)

Whether for initial access or maintaining access, establishes that those with access must have had PRA completed within 7 years. This covers both initial and renewal. The implementation plan specifies that initial performance of this requirement is 7 years after the last personnel risk assessment that was performed pursuant to a previous version of the CIP Cyber Security Standards for a personnel risk assessment. CIP-004-3, R3, R3.3

Rationale for R4:

To ensure that individuals with access to BES Cyber Systems and the physical and electronic locations where BES Cyber System Information is stored by the Responsible Entity have been properly authorized for such access. "Authorization" should be considered to be a grant of permission by a person or persons empowered by the Responsible Entity to perform such grants and included in the delegations referenced in CIP-003-5. "Provisioning" should be considered the actions to provide access to an individual.

Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (i.e., physical access control system, remote access system, directory services).

CIP Exceptional Circumstances are defined in a Responsible Entity's policy from CIP-003-5 and allow an exception to the requirement for authorization to BES Cyber Systems and BES Cyber System Information.

Quarterly reviews in Part 4.5 are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to access the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account

databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

If the results of quarterly or annual account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that the error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

Summary of Changes: The primary change was in pulling the access management requirements from CIP-003-4, CIP-004-4, and CIP-007-4 into a single requirement. The requirements from Version 4 remain largely unchanged except to clarify some terminology. The purpose for combining these requirements is to remove the perceived redundancy in authorization and review. The requirement in CIP-004-4 R4 to maintain a list of authorized personnel has been removed because the list represents only one form of evidence to demonstrate compliance that only authorized persons have access.

Reference to prior version: (Part 4.1) CIP 003-4, R5.1 and R5.2; CIP-006-4, R1.5 and R4; CIP-007-4, R5.1 and R5.1.1

Change Rationale: (Part 4.1)

Combined requirements from CIP-003-4, CIP-007-4, and CIP-006-4 to make the authorization process clear and consistent. *CIP-003-4, CIP-004-4, CIP-006-4, and CIP-007-4 all reference authorization of access in some form, and CIP-003-4 and CIP-007-4 require authorization on a "need to know" basis or with respect to work functions performed. These were consolidated to ensure consistency in the requirement language.*

Reference to prior version: (Part 4.2) CIP 004-4, R4.1

Change Rationale: (Part 4.2)

Feedback among team members, observers, and regional CIP auditors indicates there has been confusion in implementation around what the term "review" entailed in CIP-004-4, Requirement R4.1. This requirement clarifies the review should occur between the provisioned access and authorized access.

Reference to prior version: (Part 4.3) CIP 007-4, R5.1.3

Change Rationale: (Part 4.3)

Moved requirements to ensure consistency and eliminate the cross-referencing of requirements. Clarified what was necessary in performing verification by stating the objective was to confirm that access privileges are correct and the minimum necessary.

Reference to prior version: (Part 4.4) CIP-003-4, R5.1.2

Change Rationale: (Part 4.4)

Moved requirement to ensure consistency among access reviews. Clarified precise meaning of annual. Clarified what was necessary in performing a verification by stating the objective was to

confirm access privileges are correct and the minimum necessary for performing assigned work functions.

Rationale for R5:

The timely revocation of electronic access to BES Cyber Systems is an essential element of an access management regime. When an individual no longer requires access to a BES Cyber System to perform his or her assigned functions, that access should be revoked. This is of particular importance in situations where a change of assignment or employment is involuntary, as there is a risk the individual(s) involved will react in a hostile or destructive manner.

In considering how to address directives in FERC Order No. 706 directing "immediate" revocation of access for involuntary separation, the SDT chose not to specify hourly time parameters in the requirement (e.g., revoking access within 1 hour). The point in time at which an organization terminates a person cannot generally be determined down to the hour. However, most organizations have formal termination processes, and the timeliest revocation of access occurs in concurrence with the initial processes of termination.

Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (e.g., physical access control system, remote access system, directory services).

Summary of Changes: FERC Order No. 706, Paragraphs 460 and 461, state the following: "The Commission adopts the CIP NOPR proposal to direct the ERO to develop modifications to CIP-004-1 to require immediate revocation of access privileges when an employee, contractor or vendor no longer performs a function that requires physical or electronic access to a Critical Cyber Asset for any reason (including disciplinary action, transfer, retirement, or termination).

As a general matter, the Commission believes that revoking access when an employee no longer needs it, either because of a change in job or the end of employment, must be immediate."

Reference to prior version: (Part 5.1) CIP 004-4, R4.2

Change Rationale: (Part 5.1)

The FERC Order No. 706, Paragraphs 460 and 461, directs modifications to the Standards ***to require immediate revocation*** *for any person no longer needing access. To address this directive, this requirement specifies revocation concurrent with the termination instead of within 24 hours.*

Reference to prior version: (Part 5.2) CIP-004-4, R4.2

Change Rationale: (Part 5.2)

FERC Order No. 706, Paragraph 460 and 461, direct modifications to the Standards to require immediate revocation for any person no longer needing access, including transferred employees. In reviewing how to modify this requirement, the SDT determined the date a person no longer needs access after a transfer was problematic because the need may change over time. As a result, the SDT adapted this requirement from NIST 800-53 Version 3 to review access authorizations on the date of the transfer. The SDT felt this was a more effective control in accomplishing the objective to prevent a person from accumulating unnecessary authorizations through transfers.

Reference to prior version: (Part 5.3) New

Change Rationale: (Part 5.3)

FERC Order No. 706, Paragraph 386, directs modifications to the standards to require prompt revocation of access to protected information. To address this directive, Responsible Entities are required to revoke access to areas designated for BES Cyber System Information. This could include records closets, substation control houses, records management systems, file shares or other physical and logical areas under the Responsible Entity's control.

Reference to prior version: (Part 5.4) New

Change Rationale: (Part 5.4)

FERC Order No. 706, Paragraph 460 and 461, direct modifications to the Standards to require immediate revocation for any person no longer needing access. In order to meet the immediate timeframe, Responsible Entities will likely have initial revocation procedures to prevent remote and physical access to the BES Cyber System. Some cases may take more time to coordinate access revocation on individual Cyber Assets and applications without affecting reliability. This requirement provides the additional time to review and complete the revocation process. Although the initial actions already prevent further access, this step provides additional assurance in the access revocation process.

Reference to prior version: (Part 5.5) CIP-007-4, R5.2.3

Change Rationale: (Part 5.5)

To provide clarification of expected actions in managing the passwords.

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated version number from -2 to -3 Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	12/30/10	Modified to add specific criteria for Critical Asset identification.	Update
4	1/24/11	Approved by the NERC Board of Trustees.	Update
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5.1	9/30/13	Modified two VSLs in R4.	Errata
5.1	11/22/13	FERC Order issued approving CIP-004-5.1. (Order becomes effective on 2/3/14.)	

5.1	5/7/14	Adopted by the NERC Board of Trustees to modify the VRF and VSLs for Requirement R4.	

Redline

A. Introduction

1. Title: Cyber Security — Personnel & Training

2. Number: CIP-004-5.1

3. Purpose: To minimize the risk against compromise that could lead to misoperation or instability in the BES from individuals accessing BES Cyber Systems by requiring an appropriate level of personnel risk assessment, training, and security awareness in support of protecting BES Cyber Systems.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1. Balancing Authority

4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2. Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Interchange Coordinator or Interchange Authority

4.1.6. Reliability Coordinator

4.1.7. Transmission Operator

4.1.8. Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-004-5.1:

4.2.3.1. Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5. Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5 identification and categorization processes.

5. Effective Dates:

1. **24 Months Minimum** – CIP-004-5.1 shall become effective on the later of July 1, 2015, or the first calendar day of the ninth calendar quarter after the effective date of the order providing applicable regulatory approval.
2. In those jurisdictions where no regulatory approval is required, CIP-004-5.1 shall become effective on the first day of the ninth calendar quarter following Board of Trustees' approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

6. Background:

Standard CIP-004-5.1 exists as part of a suite of CIP Standards related to cyber security. CIP-002-5 requires the initial identification and categorization of BES Cyber Systems. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1 and CIP-011-1 require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems. This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:

> Each Responsible Entity shall implement**, in a manner that identifies, assesses, and corrects deficiencies,** . . .

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in their documented processes, but they must address the applicable requirements in the table. The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of

implementation of the documented processes and could be accomplished through other controls or compliance management activities.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5 identification and categorization processes.

- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5 identification and categorization processes.

- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.

- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.

- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.

B. Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in *CIP-004-5.1 Table R1 – Security Awareness Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-004-5.1 Table R1 – Security Awareness Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-5.1 Table R1 – Security Awareness Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Security awareness that, at least once each calendar quarter, reinforces cyber security practices (which may include associated physical security practices) for the Responsible Entity's personnel who have authorized electronic or authorized unescorted physical access to BES Cyber Systems.	An example of evidence may include, but is not limited to, documentation that the quarterly reinforcement has been provided. Examples of evidence of reinforcement may include, but are not limited to, dated copies of information used to reinforce security awareness, as well as evidence of distribution, such as: • direct communications (for example, e-mails, memos, computer-based training); or • indirect communications (for example, posters, intranet, or brochures); or • management support and reinforcement (for example, presentations or meetings).

R2. Each Responsible Entity shall implement, in a manner that identifies, assesses, and corrects deficiencies, a cyber security training program(s) appropriate to individual roles, functions, or responsibilities that collectively includes each of the applicable requirement parts in *CIP-004-5.1 Table R2 – Cyber Security Training Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M2. Evidence must include the training program that includes each of the applicable requirement parts in *CIP-004-5.1 Table R2 – Cyber Security Training Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-5.1 Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Training content on: 2.1.1. Cyber security policies; 2.1.2. Physical access controls; 2.1.3. Electronic access controls; 2.1.4. The visitor control program; 2.1.5. Handling of BES Cyber System Information and its storage; 2.1.6. Identification of a Cyber Security Incident and initial notifications in accordance with the entity's incident response plan; 2.1.7. Recovery plans for BES Cyber Systems; 2.1.8. Response to Cyber Security Incidents; and 2.1.9. Cyber security risks associated with a BES Cyber System's electronic interconnectivity and interoperability with other Cyber Assets.	Examples of evidence may include, but are not limited to, training material such as power point presentations, instructor notes, student notes, handouts, or other training materials.

CIP-004-5.1 Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Require completion of the training specified in Part 2.1 prior to granting authorized electronic access and authorized unescorted physical access to applicable Cyber Assets, except during CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, training records and documentation of when CIP Exceptional Circumstances were invoked.
2.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Require completion of the training specified in Part 2.1 at least once every 15 calendar months.	Examples of evidence may include, but are not limited to, dated individual training records.

R3. Each Responsible Entity shall implement, in a manner that identifies, assesses, and corrects deficiencies, one or more documented personnel risk assessment programs to attain and retain authorized electronic or authorized unescorted physical access to BES Cyber Systems that collectively include each of the applicable requirement parts in *CIP-004-5.1 Table R3 – Personnel Risk Assessment Program*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M3. Evidence must include the documented personnel risk assessment programs that collectively include each of the applicable requirement parts in *CIP-004-5.1 Table R3 – Personnel Risk Assessment Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-5.1 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to confirm identity.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to confirm identity.

CIP-004-5.1 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to perform a seven year criminal history records check as part of each personnel risk assessment that includes: 3.2.1. current residence, regardless of duration; and 3.2.2. other locations where, during the seven years immediately prior to the date of the criminal history records check, the subject has resided for six consecutive months or more. If it is not possible to perform a full seven year criminal history records check, conduct as much of the seven year criminal history records check as possible and document the reason the full seven year criminal history records check could not be performed.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to perform a seven year criminal history records check.

CIP-004-5.1 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Criteria or process to evaluate criminal history records checks for authorizing access.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to evaluate criminal history records checks.
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Criteria or process for verifying that personnel risk assessments performed for contractors or service vendors are conducted according to Parts 3.1 through 3.3.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's criteria or process for verifying contractors or service vendors personnel risk assessments.

CIP-004-5.1 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.5	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to ensure that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed according to Parts 3.1 to 3.4 within the last seven years.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process for ensuring that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed within the last seven years.

R4. Each Responsible Entity shall implement, in a manner that identifies, assesses, and corrects deficiencies, one or more documented access management programs that collectively include each of the applicable requirement parts in *CIP-004-5.1 Table R4 – Access Management Program. [Violation Risk Factor: ~~Lower~~Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M4. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-004-5.1 Table R4 – Access Management Program* and additional evidence to demonstrate that the access management program was implemented as described in the Measures column of the table.

CIP-004-5.1 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to authorize based on need, as determined by the Responsible Entity, except for CIP Exceptional Circumstances: 4.1.1. Electronic access; 4.1.2. Unescorted physical access into a Physical Security Perimeter; and 4.1.3. Access to designated storage locations, whether physical or electronic, for BES Cyber System Information.	An example of evidence may include, but is not limited to, dated documentation of the process to authorize electronic access, unescorted physical access in a Physical Security Perimeter, and access to designated storage locations, whether physical or electronic, for BES Cyber System Information.

CIP-004-5.1 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Verify at least once each calendar quarter that individuals with active electronic access or unescorted physical access have authorization records.	Examples of evidence may include, but are not limited to: • Dated documentation of the verification between the system generated list of individuals who have been authorized for access (i.e., workflow database) and a system generated list of personnel who have access (i.e., user account listing), or • Dated documentation of the verification between a list of individuals who have been authorized for access (i.e., authorization forms) and a list of individuals provisioned for access (i.e., provisioning forms or shared account listing).

CIP-004-5.1 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For electronic access, verify at least once every 15 calendar months that all user accounts, user account groups, or user role categories, and their specific, associated privileges are correct and are those that the Responsible Entity determines are necessary.	An example of evidence may include, but is not limited to, documentation of the review that includes all of the following: 1. A dated listing of all accounts/account groups or roles within the system; 2. A summary description of privileges associated with each group or role; 3. Accounts assigned to the group or role; and 4. Dated evidence showing verification of the privileges for the group are authorized and appropriate to the work function performed by people assigned to each account.

CIP-004-5.1 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Verify at least once every 15 calendar months that access to the designated storage locations for BES Cyber System Information, whether physical or electronic, are correct and are those that the Responsible Entity determines are necessary for performing assigned work functions.	An example of evidence may include, but is not limited to, the documentation of the review that includes all of the following: 1. A dated listing of authorizations for BES Cyber System information; 2. Any privileges associated with the authorizations; and 3. Dated evidence showing a verification of the authorizations and any privileges were confirmed correct and the minimum necessary for performing assigned work functions.

R5. Each Responsible Entity shall implement, in a manner that identifies, assesses, and corrects deficiencies, one or more documented access revocation programs that collectively include each of the applicable requirement parts in *CIP-004-5.1 Table R5 – Access Revocation*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning].*

M5. Evidence must include each of the applicable documented programs that collectively include each of the applicable requirement parts in *CIP-004-5.1 Table R5 – Access Revocation* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-5.1 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	A process to initiate removal of an individual's ability for unescorted physical access and Interactive Remote Access upon a termination action, and complete the removals within 24 hours of the termination action (Removal of the ability for access may be different than deletion, disabling, revocation, or removal of all access rights).	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form verifying access removal associated with the termination action; and 2. Logs or other demonstration showing such persons no longer have access.

CIP-004-5.1 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For reassignments or transfers, revoke the individual's authorized electronic access to individual accounts and authorized unescorted physical access that the Responsible Entity determines are not necessary by the end of the next calendar day following the date that the Responsible Entity determines that the individual no longer requires retention of that access.	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form showing a review of logical and physical access; and 2. Logs or other demonstration showing such persons no longer have access that the Responsible Entity determines is not necessary.

CIP-004-5.1 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For termination actions, revoke the individual's access to the designated storage locations for BES Cyber System Information, whether physical or electronic (unless already revoked according to Requirement R5.1), by the end of the next calendar day following the effective date of the termination action.	An example of evidence may include, but is not limited to, workflow or sign-off form verifying access removal to designated physical areas or cyber systems containing BES Cyber System Information associated with the terminations and dated within the next calendar day of the termination action.

CIP-004-5.1 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.4	High Impact BES Cyber Systems and their associated: • EACMS	For termination actions, revoke the individual's non-shared user accounts (unless already revoked according to Parts 5.1 or 5.3) within 30 calendar days of the effective date of the termination action.	An example of evidence may include, but is not limited to, workflow or sign-off form showing access removal for any individual BES Cyber Assets and software applications as determined necessary to completing the revocation of access and dated within thirty calendar days of the termination actions.

CIP-004-5.1 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.5	High Impact BES Cyber Systems and their associated: • EACMS	For termination actions, change passwords for shared account(s) known to the user within 30 calendar days of the termination action. For reassignments or transfers, change passwords for shared account(s) known to the user within 30 calendar days following the date that the Responsible Entity determines that the individual no longer requires retention of that access. If the Responsible Entity determines and documents that extenuating operating circumstances require a longer time period, change the password(s) within 10 calendar days following the end of the operating circumstances.	Examples of evidence may include, but are not limited to: • Workflow or sign-off form showing password reset within 30 calendar days of the termination; • Workflow or sign-off form showing password reset within 30 calendar days of the reassignments or transfers; or • Documentation of the extenuating operating circumstance and workflow or sign-off form showing password reset within 10 calendar days following the end of the operating circumstance.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

- Compliance Audit
- Self-Certification
- Spot Checking
- Compliance Investigation
- Self-Reporting
- Complaint

1.4. Additional Compliance Information:

- None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-004-5.1)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Lower**	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so less than 10 calendar days after the start of a subsequent calendar quarter. (1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so between 10 and 30 calendar days after the start of a subsequent calendar quarter. (1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so within the subsequent quarter but beyond 30 calendar days after the start of that calendar quarter. (1.1)	The Responsible Entity did not document or implement any security awareness process(es) to reinforce cyber security practices. (R1) OR The Responsible Entity did not reinforce cyber security practices and associated physical security practices for at least two consecutive calendar quarters. (1.1)
R2	**Operations Planning**	**Lower**	The Responsible Entity implemented a cyber security training program but failed to include one of the training	The Responsible Entity implemented a cyber security training program but failed to include two of the training content topics in Requirement Parts 2.1.1 through 2.1.9, and did not identify, assess	The Responsible Entity implemented a cyber security training program but failed to include three of the training content topics in Requirement Parts 2.1.1 through 2.1.9, and did not identify, assess	The Responsible Entity did not implement a cyber security training program appropriate to individual roles, functions, or responsibilities. Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. Furthermore,

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The security awareness program is intended to be an informational program, not a formal training program. It should reinforce security practices to ensure that personnel maintain awareness of best practices for both physical and electronic security to protect its BES Cyber Systems. The Responsible Entity is not required to provide records that show that each individual received or understood the information, but they must maintain documentation of the program materials utilized in the form of posters, memos, and/or presentations.

Examples of possible mechanisms and evidence, when dated, which can be used are:

- Direct communications (e.g., emails, memos, computer based training, etc.);
- Indirect communications (e.g., posters, intranet, brochures, etc.);
- Management support and reinforcement (e.g., presentations, meetings, etc.).

Requirement R2:

Training shall cover the policies, access controls, and procedures as developed for the BES Cyber Systems and include, at a minimum, the required items appropriate to personnel roles and responsibilities from Table R2. The Responsible Entity has the flexibility to define the training program and it may consist of multiple modules and multiple delivery mechanisms, but a single training program for all individuals needing to be trained is acceptable. The training can focus on functions, roles or responsibilities at the discretion of the Responsible Entity.

One new element in the training content is intended to encompass networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber Systems as per FERC Order No. 706, Paragraph 434. This is not intended to provide technical training to individuals supporting networking hardware and software, but educating system users of the cyber security risks associated with the interconnectedness of these systems. The users, based on their function, role or responsibility, should have a basic understanding of which systems can be accessed from other systems and how the actions they take can affect cyber security.

Each Responsible Entity shall ensure all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, complete cyber security training prior to their being granted authorized access, except for CIP Exceptional Circumstances. To retain the authorized accesses, individuals must complete the training at least one every 15 months.

Requirement R3:

Each Responsible Entity shall ensure a personnel risk assessment is performed for all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, prior to their being granted authorized access, except for program specified exceptional circumstances that are approved by the single senior management official or their delegate and impact the reliability of the BES or emergency response. Identity should be confirmed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. Identity only needs to be confirmed prior to initially granting access and only requires periodic confirmation according to the entity's process during the tenure of employment, which may or may not be the same as the initial verification action.

A seven year criminal history check should be performed for those locations where the individual has resided for at least six consecutive months. This check should also be performed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. When it is not possible to perform a full seven year criminal history check, documentation must be made of what criminal history check was performed, and the reasons a full seven-year check could not be performed. Examples of this could include

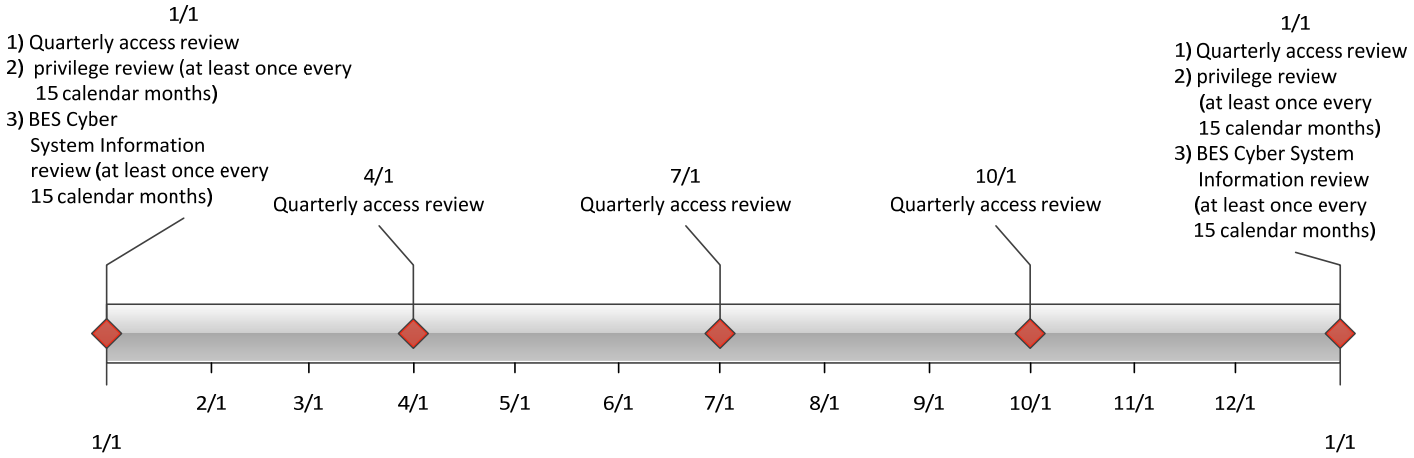
individuals under the age of 25 where a juvenile criminal history may be protected by law, individuals who may have resided in locations from where it is not possible to obtain a criminal history records check, violates the law or is not allowed under the existing collective bargaining agreement. The Responsible Entity should consider the absence of information for the full seven years when assessing the risk of granting access during the process to evaluate the criminal history check. There needs to be a personnel risk assessment that has been completed within the last seven years for each individual with access. A new criminal history records check must be performed as part of the new PRA. Individuals who have been granted access under a previous version of these standards need a new PRA within seven years of the date of their last PRA. The clarifications around the seven year criminal history check in this version do not require a new PRA be performed by the implementation date.

Requirement R4:

Authorization for electronic and unescorted physical access and access to BES Cyber System Information must be on the basis of necessity in the individual performing a work function. Documentation showing the authorization should have some justification of the business need included. To ensure proper segregation of duties, access authorization and provisioning should not be performed by the same person where possible.

This requirement specifies both quarterly reviews and reviews at least once every 15 calendar months. Quarterly reviews are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

The privilege review at least once every 15 calendar months is more detailed to ensure an individual's associated privileges are the minimum necessary to perform their work function



(i.e., least privilege). Entities can more efficiently perform this review by implementing role-based access. This involves determining the specific roles on the system (e.g., system operator, technician, report viewer, administrator, etc.) then grouping access privileges to the role and assigning users to the role. Role-based access does not assume any specific software and can be implemented by defining specific provisioning processes for each role where access group assignments cannot be performed. Role-based access permissions eliminate the need to perform the privilege review on individual accounts. An example timeline of all the reviews in Requirement R4 is included below.

Separation of duties should be considered when performing the reviews in Requirement R4. The person reviewing should be different than the person provisioning access.

If the results of quarterly or at least once every 15 calendar months account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that this error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

Requirement R5:

The requirement to revoke access at the time of the termination action includes procedures showing revocation of access concurrent with the termination action. This requirement recognizes that the timing of the termination action may vary depending on the circumstance. Some common scenarios and possible processes on when the termination action occurs are provided in the following table. These scenarios are not an exhaustive list of all scenarios, but are representative of several routine business practices.

Scenario	Possible Process
Immediate involuntary termination	Human resources or corporate security escorts the individual off site and the supervisor or human resources personnel notify the appropriate personnel to begin the revocation process.
Scheduled involuntary termination	Human resources personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Voluntary termination	Human resources personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Retirement where the last working day is several weeks prior to the termination date	Human resources personnel coordinate with manager to determine the final date access is no longer needed and schedule the revocation of access on the determined day.

Death	Human resources personnel are notified of the death and work with appropriate personnel to begin the revocation process.

Revocation of electronic access should be understood to mean a process with the end result that electronic access to BES Cyber Systems is no longer possible using credentials assigned to or known by the individual(s) whose access privileges are being revoked. Steps taken to accomplish this outcome may include deletion or deactivation of accounts used by the individual(s), but no specific actions are prescribed. Entities should consider the ramifications of deleting an account may include incomplete event log entries due to an unrecognized account or system services using the account to log on.

The initial revocation required in Requirement R5.1 includes unescorted physical access and Interactive Remote Access. These two actions should prevent any further access by the individual after termination. If an individual still has local access accounts (i.e., accounts on the Cyber Asset itself) on BES Cyber Assets, then the Responsible Entity has 30 days to complete the revocation process for those accounts. However, nothing prevents a Responsible Entity from performing all of the access revocation at the time of termination.

For transferred or reassigned individuals, a review of access privileges should be performed. This review could entail a simple listing of all authorizations for an individual and working with the respective managers to determine which access will still be needed in the new position. For instances in which the individual still needs to retain access as part of a transitory period, the entity should schedule a time to review these access privileges or include the privileges in the quarterly account review or annual privilege review.

Revocation of access to shared accounts is called out separately to prevent the situation where passwords on substation and generation devices are constantly changed due to staff turnover.

Requirement 5.5 specified that passwords for shared account are to the changed within 30 calendar days of the termination action or when the Responsible Entity determines an individual no longer requires access to the account as a result of a reassignment or transfer. The 30 days applies under normal operating conditions. However, circumstances may occur where this is not possible. Some systems may require an outage or reboot of the system in order to complete the password change. In periods of extreme heat or cold, many Responsible Entities may prohibit system outages and reboots in order to maintain reliability of the BES. When these circumstances occur, the Responsible Entity must document these circumstances and prepare to change the password within 10 calendar days following the end of the operating circumstances. Records of activities must be retained to show that the Responsible Entity followed the plan they created.

Rationale:

During the development of this standard, references to prior versions of the CIP standards and rationale for the requirements and their parts were embedded within the standard. Upon BOT approval, that information was moved to this section.

Rationale for R1:

Ensures that Responsible Entities with personnel who have authorized electronic or authorized unescorted physical access to BES Cyber Assets take action so that those personnel with such authorized electronic or authorized unescorted physical access maintain awareness of the Responsible Entity's security practices.

Summary of Changes: Reformatted into table structure.

Reference to prior version: (Part 1.1) CIP-004-4, R1

Change Rationale: (Part 1.1)

Changed to remove the need to ensure or prove everyone with authorized electronic or authorized unescorted physical *access "received" ongoing reinforcement – to state that security awareness has been reinforced.*

Moved example mechanisms to guidance.

Rationale for R2:

To ensure that the Responsible Entity's training program for personnel who need authorized electronic access and/or authorized unescorted physical access to BES Cyber Systems covers the proper policies, access controls, and procedures to protect BES Cyber Systems and are trained before access is authorized.

Based on their role, some personnel may not require training on all topics.

Summary of Changes:

1. Addition of specific role training for:
    - The visitor control program
    - Electronic interconnectivity supporting the operation and control of BES Cyber Systems
    - Storage media as part of the handling of BES Cyber Systems information

2. Change references from Critical Cyber Assets to BES Cyber Systems.

Reference to prior version: (Part 2.1) CIP004-4, R2.2.1

Change Rationale: (Part 2.1)

Removed "proper use of Critical Cyber Assets" concept from previous versions to focus the requirement on cyber security issues, not the business function. The previous version was

focused more on the business or functional use of the BES Cyber System and is outside the scope of cyber security. Personnel who will administer the visitor control process or serve as escorts for visitors need training on the program. Core training on the handling of BES Cyber System (not Critical Cyber Assets) Information, with the addition of storage; FERC Order No. 706, paragraph 413 and paragraphs 632-634, 688, 732-734; DHS 2.4.16. Core training on the identification and reporting of a Cyber Security Incident; FERC Order No. 706, Paragraph 413; Related to CIP-008-5 & DHS Incident Reporting requirements for those with roles in incident reporting. Core training on the action plans and procedures to recover or re-establish BES Cyber Systems for personnel having a role in the recovery; FERC Order No. 706, Paragraph 413. Core training programs are intended to encompass networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber Systems; FERC Order No. 706, Paragraph 434.

Reference to prior version: (Part 2.2) CIP004-4, R2.1

Change Rationale: (Part 2.2)

Addition of exceptional circumstances parameters as directed in FERC Order No. 706, Paragraph 431 is detailed in CIP-003-5.

Reference to prior version: (Part 2.3) CIP004-4, R2.3

Change Rationale: (Part 2.3)

Updated to replace "annually" with "once every 15 calendar months."

Rationale for R3:

To ensure that individuals who need authorized electronic or authorized unescorted physical access to BES Cyber Systems have been assessed for risk. Whether initial access or maintaining access, those with access must have had a personnel risk assessment completed within the last 7 years.

Summary of Changes: Specify that the seven year criminal history check covers all locations where the individual has resided for six consecutive months or more, including current residence regardless of duration.

Reference to prior version: (Part 3.1) CIP004-4, R3.1

Change Rationale: (Part 3.1)

Addressed interpretation request in guidance. Specified that process for identity confirmation is required. The implementation plan clarifies that a documented identity verification conducted under an earlier version of the CIP standards is sufficient.

Reference to prior version: (Part 3.2) CIP004-4, R3.1

Change Rationale: (Part 3.2)

Specify that the seven year criminal history check covers all locations where the individual has resided for six months or more, including current residence regardless of duration. Added

additional wording based on interpretation request. Provision is made for when a full seven-year check cannot be performed.

Reference to prior version: (Part 3.3) New

Change Rationale: (Part 3.3)

There should be documented criteria or a process used to evaluate criminal history records checks for authorizing access.

Reference to prior version: (Part 3.4) CIP-004-4, R3.3

Change Rationale: (Part 3.4)

Separated into its own table item.

Reference to prior version: (Part 3.5) CIP-004-3, R3, R3.3

Change Rationale: (Part 3.5)

Whether for initial access or maintaining access, establishes that those with access must have had PRA completed within 7 years. This covers both initial and renewal. The implementation plan specifies that initial performance of this requirement is 7 years after the last personnel risk assessment that was performed pursuant to a previous version of the CIP Cyber Security Standards for a personnel risk assessment. CIP-004-3, R3, R3.3

Rationale for R4:

To ensure that individuals with access to BES Cyber Systems and the physical and electronic locations where BES Cyber System Information is stored by the Responsible Entity have been properly authorized for such access. “Authorization” should be considered to be a grant of permission by a person or persons empowered by the Responsible Entity to perform such grants and included in the delegations referenced in CIP-003-5. “Provisioning” should be considered the actions to provide access to an individual.

Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (i.e., physical access control system, remote access system, directory services).

CIP Exceptional Circumstances are defined in a Responsible Entity’s policy from CIP-003-5 and allow an exception to the requirement for authorization to BES Cyber Systems and BES Cyber System Information.

Quarterly reviews in Part 4.5 are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to access the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account

databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

If the results of quarterly or annual account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that the error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

Summary of Changes: The primary change was in pulling the access management requirements from CIP-003-4, CIP-004-4, and CIP-007-4 into a single requirement. The requirements from Version 4 remain largely unchanged except to clarify some terminology. The purpose for combining these requirements is to remove the perceived redundancy in authorization and review. The requirement in CIP-004-4 R4 to maintain a list of authorized personnel has been removed because the list represents only one form of evidence to demonstrate compliance that only authorized persons have access.

Reference to prior version: (Part 4.1) CIP 003-4, R5.1 and R5.2; CIP-006-4, R1.5 and R4; CIP-007-4, R5.1 and R5.1.1

Change Rationale: (Part 4.1)

Combined requirements from CIP-003-4, CIP-007-4, and CIP-006-4 to make the authorization process clear and consistent. *CIP-003-4, CIP-004-4, CIP-006-4, and CIP-007-4 all reference authorization of access in some form, and CIP-003-4 and CIP-007-4 require authorization on a "need to know" basis or with respect to work functions performed. These were consolidated to ensure consistency in the requirement language.*

Reference to prior version: (Part 4.2) CIP 004-4, R4.1

Change Rationale: (Part 4.2)

Feedback among team members, observers, and regional CIP auditors indicates there has been confusion in implementation around what the term "review" entailed in CIP-004-4, Requirement R4.1. This requirement clarifies the review should occur between the provisioned access and authorized access.

Reference to prior version: (Part 4.3) CIP 007-4, R5.1.3

Change Rationale: (Part 4.3)

Moved requirements to ensure consistency and eliminate the cross-referencing of requirements. Clarified what was necessary in performing verification by stating the objective was to confirm that access privileges are correct and the minimum necessary.

Reference to prior version: (Part 4.4) CIP-003-4, R5.1.2

Change Rationale: (Part 4.4)

Moved requirement to ensure consistency among access reviews. Clarified precise meaning of annual. Clarified what was necessary in performing a verification by stating the objective was to

confirm access privileges are correct and the minimum necessary for performing assigned work functions.

Rationale for R5:

The timely revocation of electronic access to BES Cyber Systems is an essential element of an access management regime. When an individual no longer requires access to a BES Cyber System to perform his or her assigned functions, that access should be revoked. This is of particular importance in situations where a change of assignment or employment is involuntary, as there is a risk the individual(s) involved will react in a hostile or destructive manner.

In considering how to address directives in FERC Order No. 706 directing "immediate" revocation of access for involuntary separation, the SDT chose not to specify hourly time parameters in the requirement (e.g., revoking access within 1 hour). The point in time at which an organization terminates a person cannot generally be determined down to the hour. However, most organizations have formal termination processes, and the timeliest revocation of access occurs in concurrence with the initial processes of termination.

Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (e.g., physical access control system, remote access system, directory services).

Summary of Changes: FERC Order No. 706, Paragraphs 460 and 461, state the following: "The Commission adopts the CIP NOPR proposal to direct the ERO to develop modifications to CIP-004-1 to require immediate revocation of access privileges when an employee, contractor or vendor no longer performs a function that requires physical or electronic access to a Critical Cyber Asset for any reason (including disciplinary action, transfer, retirement, or termination).

As a general matter, the Commission believes that revoking access when an employee no longer needs it, either because of a change in job or the end of employment, must be immediate."

Reference to prior version: (Part 5.1) CIP 004-4, R4.2

Change Rationale: (Part 5.1)

The FERC Order No. 706, Paragraphs 460 and 461, directs modifications to the Standards ***to require immediate revocation*** *for any person no longer needing access. To address this directive, this requirement specifies revocation concurrent with the termination instead of within 24 hours.*

Reference to prior version: (Part 5.2) CIP-004-4, R4.2

Change Rationale: (Part 5.2)

FERC Order No. 706, Paragraph 460 and 461, direct modifications to the Standards to require immediate revocation for any person no longer needing access, including transferred employees. In reviewing how to modify this requirement, the SDT determined the date a person no longer needs access after a transfer was problematic because the need may change over time. As a result, the SDT adapted this requirement from NIST 800-53 Version 3 to review access authorizations on the date of the transfer. The SDT felt this was a more effective control in accomplishing the objective to prevent a person from accumulating unnecessary authorizations through transfers.

Reference to prior version: (Part 5.3) New

Change Rationale: (Part 5.3)

FERC Order No. 706, Paragraph 386, directs modifications to the standards to require prompt revocation of access to protected information. To address this directive, Responsible Entities are required to revoke access to areas designated for BES Cyber System Information. This could include records closets, substation control houses, records management systems, file shares or other physical and logical areas under the Responsible Entity's control.

Reference to prior version: (Part 5.4) New

Change Rationale: (Part 5.4)

FERC Order No. 706, Paragraph 460 and 461, direct modifications to the Standards to require immediate revocation for any person no longer needing access. In order to meet the immediate timeframe, Responsible Entities will likely have initial revocation procedures to prevent remote and physical access to the BES Cyber System. Some cases may take more time to coordinate access revocation on individual Cyber Assets and applications without affecting reliability. This requirement provides the additional time to review and complete the revocation process. Although the initial actions already prevent further access, this step provides additional assurance in the access revocation process.

Reference to prior version: (Part 5.5) CIP-007-4, R5.2.3

Change Rationale: (Part 5.5)

To provide clarification of expected actions in managing the passwords.

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated version number from -2 to -3 Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	12/30/10	Modified to add specific criteria for Critical Asset identification.	Update
4	1/24/11	Approved by the NERC Board of Trustees.	Update
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5.1	9/30/13	Modified two VSLs in R4.	Errata
5.1	11/22/13	FERC Order issued approving CIP-004-5.1. (Order becomes effective on 2/3/14.)	

CIP-006-5 Violation Risk Factor and Violation Severity Level Revisions

Clean and Redline

Clean

A. Introduction

1. Title: Cyber Security — Physical Security of BES Cyber Systems

2. Number: CIP-006-5

3. Purpose: To manage physical access to BES Cyber Systems by specifying a physical security plan in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-006-5:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5 identification and categorization processes.

5. Effective Dates:

1. **24 Months Minimum** – CIP-006-5 shall become effective on the later of July 1, 2015, or the first calendar day of the ninth calendar quarter after the effective date of the order providing applicable regulatory approval.
2. In those jurisdictions where no regulatory approval is required, CIP-006-5 shall become effective on the first day of the ninth calendar quarter following Board of Trustees' approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

6. Background:

Standard CIP-006-5 exists as part of a suite of CIP Standards related to cyber security. CIP-002-5 requires the initial identification and categorization of BES Cyber Systems. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1, and CIP-011-1 require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems. This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:

> Each Responsible Entity shall implement**, in a manner that identifies, assesses, and corrects deficiencies,** . . .

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in their documented processes, but they must address the applicable requirements in the table. The

documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management

Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5 identification and categorization processes.
- **Medium Impact BES Cyber Systems without External Routable Connectivity** – Only applies to medium impact BES Cyber Systems without External Routable Connectivity.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Locally mounted hardware or devices at the Physical Security Perimeter –** Applies to the locally mounted hardware or devices (e.g. such as motion sensors, electronic lock control mechanisms, and badge readers) at a Physical Security Perimeter associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity, and that does not contain or store access control information or independently perform access authentication. These hardware and devices are excluded in the definition of Physical Access Control Systems.

B. Requirements and Measures

R1. Each Responsible Entity shall implement, in a manner that identifies, assesses, and corrects deficiencies, one or more documented physical security plans that collectively include all of the applicable requirement parts in *CIP-006-5 Table R1 – Physical Security Plan*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning and Same Day Operations].*

M1. Evidence must include each of the documented physical security plans that collectively include all of the applicable requirement parts in *CIP-006-5 Table R1 – Physical Security Plan* and additional evidence to demonstrate implementation of the plan or plans as described in the Measures column of the table.

CIP-006-5 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	Medium Impact BES Cyber Systems without External Routable Connectivity Physical Access Control Systems (PACS) associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity	Define operational or procedural controls to restrict physical access.	An example of evidence may include, but is not limited to, documentation that operational or procedural controls exist.

CIP-006-5 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Utilize at least one physical access control to allow unescorted physical access into each applicable Physical Security Perimeter to only those individuals who have authorized unescorted physical access.	An example of evidence may include, but is not limited to, language in the physical security plan that describes each Physical Security Perimeter and how unescorted physical access is controlled by one or more different methods and proof that unescorted physical access is restricted to only authorized individuals, such as a list of authorized individuals accompanied by access logs.

CIP-006-5 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Where technically feasible, utilize two or more different physical access controls (this does not require two completely independent physical access control systems) to collectively allow unescorted physical access into Physical Security Perimeters to only those individuals who have authorized unescorted physical access.	An example of evidence may include, but is not limited to, language in the physical security plan that describes the Physical Security Perimeters and how unescorted physical access is controlled by two or more different methods and proof that unescorted physical access is restricted to only authorized individuals, such as a list of authorized individuals accompanied by access logs.

CIP-006-5 Table R1– Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Monitor for unauthorized access through a physical access point into a Physical Security Perimeter.	An example of evidence may include, but is not limited to, documentation of controls that monitor for unauthorized access through a physical access point into a Physical Security Perimeter.

CIP-006-5 Table R1– Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Issue an alarm or alert in response to detected unauthorized access through a physical access point into a Physical Security Perimeter to the personnel identified in the BES Cyber Security Incident response plan within 15 minutes of detection.	An example of evidence may include, but is not limited to, language in the physical security plan that describes the issuance of an alarm or alert in response to unauthorized access through a physical access control into a Physical Security Perimeter and additional evidence that the alarm or alert was issued and communicated as identified in the BES Cyber Security Incident Response Plan, such as manual or electronic alarm or alert logs, cell phone or pager logs, or other evidence that documents that the alarm or alert was generated and communicated.
1.6	Physical Access Control Systems (PACS) associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity	Monitor each Physical Access Control System for unauthorized physical access to a Physical Access Control System.	An example of evidence may include, but is not limited to, documentation of controls that monitor for unauthorized physical access to a PACS.

CIP-006-5 Table R1– Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.7	Physical Access Control Systems (PACS) associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity	Issue an alarm or alert in response to detected unauthorized physical access to a Physical Access Control System to the personnel identified in the BES Cyber Security Incident response plan within 15 minutes of the detection.	An example of evidence may include, but is not limited to, language in the physical security plan that describes the issuance of an alarm or alert in response to unauthorized physical access to Physical Access Control Systems and additional evidence that the alarm or alerts was issued and communicated as identified in the BES Cyber Security Incident Response Plan, such as alarm or alert logs, cell phone or pager logs, or other evidence that the alarm or alert was generated and communicated.

CIP-006-5 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.8	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Log (through automated means or by personnel who control entry) entry of each individual with authorized unescorted physical access into each Physical Security Perimeter, with information to identify the individual and date and time of entry.	An example of evidence may include, but is not limited to, language in the physical security plan that describes logging and recording of physical entry into each Physical Security Perimeter and additional evidence to demonstrate that this logging has been implemented, such as logs of physical access into Physical Security Perimeters that show the individual and the date and time of entry into Physical Security Perimeter.

CIP-006-5 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.9	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Retain physical access logs of entry of individuals with authorized unescorted physical access into each Physical Security Perimeter for at least ninety calendar days.	An example of evidence may include, but is not limited to, dated documentation such as logs of physical access into Physical Security Perimeters that show the date and time of entry into Physical Security Perimeter.

R2. Each Responsible Entity shall implement, in a manner that identifies, assesses, and corrects deficiencies, one or more documented visitor control programs that include each of the applicable requirement parts in *CIP-006-5 Table R2 – Visitor Control Program. [Violation Risk Factor: Medium] [Time Horizon: Same Day Operations.]*

M2. Evidence must include one or more documented visitor control programs that collectively include each of the applicable requirement parts in *CIP-006-5 Table R2 – Visitor Control Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-006-5 Table R2 – Visitor Control Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Require continuous escorted access of visitors (individuals who are provided access but are not authorized for unescorted physical access) within each Physical Security Perimeter, except during CIP Exceptional Circumstances.	An example of evidence may include, but is not limited to, language in a visitor control program that requires continuous escorted access of visitors within Physical Security Perimeters and additional evidence to demonstrate that the process was implemented, such as visitor logs.

CIP-006-5 Table R2 – Visitor Control Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Require manual or automated logging of visitor entry into and exit from the Physical Security Perimeter that includes date and time of the initial entry and last exit, the visitor's name, and the name of an individual point of contact responsible for the visitor, except during CIP Exceptional Circumstances.	An example of evidence may include, but is not limited to, language in a visitor control program that requires continuous escorted access of visitors within Physical Security Perimeters and additional evidence to demonstrate that the process was implemented, such as dated visitor logs that include the required information.
2.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Retain visitor logs for at least ninety calendar days.	An example of evidence may include, but is not limited to, documentation showing logs have been retained for at least ninety calendar days.

R3. Each Responsible Entity shall implement one or more documented Physical Access Control System maintenance and testing programs that collectively include each of the applicable requirement parts in *CIP-006-5 Table R3 – Maintenance and Testing Program*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning].*

M3. Evidence must include each of the documented Physical Access Control System maintenance and testing programs that collectively include each of the applicable requirement parts in *CIP-006-5 Table R3 – Maintenance and Testing Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-006-5 Table R3 – Physical Access Control System Maintenance and Testing Program			
Part	**Applicable Systems**	**Requirement**	**Measures**
3.1	Physical Access Control Systems (PACS) associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity Locally mounted hardware or devices at the Physical Security Perimeter associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity	Maintenance and testing of each Physical Access Control System and locally mounted hardware or devices at the Physical Security Perimeter at least once every 24 calendar months to ensure they function properly.	An example of evidence may include, but is not limited to, a maintenance and testing program that provides for testing each Physical Access Control System and locally mounted hardware or devices associated with each applicable Physical Security Perimeter at least once every 24 calendar months and additional evidence to demonstrate that this testing was done, such as dated maintenance records, or other documentation showing testing and maintenance has been performed on each applicable device or system at least once every 24 calendar months.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

- Compliance Audit
- Self-Certification
- Spot Checking
- Compliance Investigation
- Self-Reporting
- Complaint

1.4. Additional Compliance Information:

- None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-006-5)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Long Term Planning** **Same-Day Operations**	**Medium**	The Responsible Entity has a process to log authorized physical entry into any Physical Security Perimeter with sufficient information to identify the individual and date and time of entry and identified deficiencies but did not assess or correct the deficiencies. Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. Furthermore,

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

General:

While the focus is shifted from the definition and management of a completely enclosed "six-wall" boundary, it is expected in many instances this will remain a primary mechanism for controlling, alerting, and logging access to BES Cyber Systems. Taken together, these controls will effectively constitute the physical security plan to manage physical access to BES Cyber Systems.

Requirement R1:

Methods of physical access control include:

- Card Key: A means of electronic access where the access rights of the card holder are predefined in a computer database. Access rights may differ from one perimeter to another.
- Special Locks: These include, but are not limited to, locks with "restricted key" systems, magnetic locks that can be operated remotely, and "man-trap" systems.
- Security Personnel: Personnel responsible for controlling physical access who may reside on-site or at a monitoring station.

- Other Authentication Devices: Biometric, keypad, token, or other equivalent devices that control physical access into the Physical Security Perimeter.

Methods to monitor physical access include:

- Alarm Systems: Systems that alarm to indicate interior motion or when a door, gate, or window has been opened without authorization. These alarms must provide for notification within 15 minutes to individuals responsible for response.
- Human Observation of Access Points: Monitoring of physical access points by security personnel who are also controlling physical access.

Methods to log physical access include:

- Computerized Logging: Electronic logs produced by the Responsible Entity's selected access control and alerting method.
- Video Recording: Electronic capture of video images of sufficient quality to determine identity.
- Manual Logging: A log book or sign-in sheet, or other record of physical access maintained by security or other personnel authorized to control and monitor physical access.

The FERC Order No. 706, Paragraph 572, directive discussed utilizing two or more different and complementary physical access controls to provide defense in depth. It does not require two or more Physical Security Perimeters, nor does it exclude the use of layered perimeters. Use of two-factor authentication would be acceptable at the same entry points for a non-layered single perimeter. For example, a sole perimeter's controls could include either a combination of card key and pin code (something you know and something you have), or a card key and biometric scanner (something you have and something you are), or a physical key in combination with a guard-monitored remote camera and door release, where the "guard" has adequate information to authenticate the person they are observing or talking to prior to permitting access (something you have and something you are). The two-factor authentication could be implemented using a single Physical Access Control System but more than one authentication method must be utilized. For physically layered protection, a locked gate in combination with a locked control-building could be acceptable, provided no single authenticator (e.g., key or card key) would provide access through both.

Entities may choose for certain PACS to reside in a PSP controlling access to applicable BES Cyber Systems. For these PACS, there is no additional obligation to comply with Requirement Parts 1.1, 1.7 and 1.8 beyond what is already required for the PSP.

Requirement R2:

The logging of visitors should capture each visit of the individual and does not need to capture each entry or exit during that visit. This is meant to allow a visitor to temporarily exit the Physical Security Perimeter to obtain something they left in their vehicle or outside the area without requiring a new log entry for each and every entry during the visit.

The SDT also determined that a point of contact should be documented who can provide additional details about the visit if questions arise in the future. The point of contact could be the escort, but there is no need to document everyone that acted as an escort for the visitor.

Requirement R3:

This includes the testing of locally mounted hardware or devices used in controlling, alerting or logging access to the Physical Security Perimeter. This includes motion sensors, electronic lock control mechanisms, and badge readers which are not deemed to be part of the Physical Access Control System but are required for the protection of the BES Cyber Systems.

Rationale:

During the development of this standard, references to prior versions of the CIP standards and rationale for the requirements and their parts were embedded within the standard. Upon BOT approval, that information was moved to this section.

Rationale for R1:

Each Responsible Entity shall ensure that physical access to all BES Cyber Systems is restricted and appropriately managed. *Entities may choose for certain PACS to reside in a PSP controlling access to applicable BES Cyber Systems. For these PACS, there is no additional obligation to comply with Requirement Parts 1.1, 1.7 and 1.8 beyond what is already required for the PSP.*

Summary of Changes: The entire content of CIP-006-5 is intended to constitute a physical security program. This represents a change from previous versions, since there was no specific requirement to have a physical security program in previous versions of the standards, only requirements for physical security plans.

Added details to address FERC Order No. 706, Paragraph 572, directives for physical security defense in depth.

Additional guidance on physical security defense in depth provided to address the directive in FERC Order No. 706, Paragraph 575.

Reference to prior version: (Part 1.1) *CIP-006-4c, R2.1 for Physical Access Control Systems New Requirement for Medium Impact BES Cyber Systems not having External Routable Connectivity*

Change Rationale: (Part 1.1)

To allow for programmatic protection controls as a baseline (which also includes how the entity plans to protect Medium Impact BES Cyber Systems that do not have External Routable Connectivity not otherwise covered under Part 1.2, and it does not require a detailed list of individuals with access). Physical Access Control Systems do not themselves need to be protected at the same level as required in Parts 1.2 through 1.5.

Reference to prior version: (Part 1.2) CIP006-4c, R3 & R4
Change Rationale: (Part 1.2)

This requirement has been made more general to allow for alternate measures of restricting physical access. Specific examples of methods a Responsible Entity can take to restricting access to BES Cyber Systems has been moved to the Guidelines and Technical Basis section.

Reference to prior version: (Part 1.3) CIP006-4c, R3 & R4

Change Rationale: (Part 1.3)

The specific examples that specify methods a Responsible Entity can take to restricting access to BES Cyber Systems has been moved to the Guidelines and Technical Basis section. This requirement has been made more general to allow for alternate measures of controlling physical access.

Added to address FERC Order No. 706, Paragraph 572, related directives for physical security defense in depth.
FERC Order No. 706, Paragraph 575, directives addressed by providing the examples in the guidance document of physical security defense in depth via multi-factor authentication or layered Physical Security Perimeter(s).

Reference to prior version: (Part 1.4) CIP006-4c, R5

Change Rationale: (Part 1.4)

Examples of monitoring methods have been moved to the Guidelines and Technical Basis section.

Reference to prior version: (Part 1.5) CIP006-4c, R5

Change Rationale: (Part 1.5)

Examples of monitoring methods have been moved to the Guidelines and Technical Basis section.

Reference to prior version: (Part 1.6) CIP006-4c, R5

Change Rationale: (Part 1.6)

Addresses the prior CIP-006-4c, Requirement R5 requirement for Physical Access Control Systems.

Reference to prior version: (Part 1.7) CIP006-4c, R5

Change Rationale: (Part 1.7)

Addresses the prior CIP-006-4c, Requirement R5 requirement for Physical Access Control Systems.

Reference to prior version: (Part 1.8) CIP-006-4c, R6

Change Rationale: (Part 1.8)

CIP-006-4c, Requirement R6 was specific to the logging of access at identified access points. This requirement more generally requires logging of authorized physical access into the Physical Security Perimeter.

Examples of logging methods have been moved to the Guidelines and Technical Basis section.

Reference to prior version: (Part 1.9) CIP-006-4c, R7

Change Rationale: (Part 1.9)

No change.

Rationale for R2:

To control when personnel without authorized unescorted physical access can be in any Physical Security Perimeters protecting BES Cyber Systems or Electronic Access Control or Monitoring Systems, as applicable in Table R2.

Summary of Changes: Reformatted into table structure. Originally added in Version 3 per FERC Order issued September 30, 2009.

Reference to prior version: (Part 2.1) CIP-006-4c, R1.6.2

Change Rationale: (Part 2.1)

Added the ability to not do this during CIP Exceptional Circumstances.

Reference to prior version: (Part 2.2) CIP-006-4c R1.6.1

Change Rationale: (Part 2.2)

Added the ability to not do this during CIP Exceptional Circumstances, addressed multi-entry scenarios of the same person in a day (log first entry and last exit), and name of the person who is responsible or sponsor for the visitor. There is no requirement to document the escort or handoffs between escorts.

Reference to prior version: (Part 2.3) CIP-006-4c, R7

Change Rationale: (Part 2.3)

No change

Rationale for R3:

To ensure all Physical Access Control Systems and devices continue to function properly.

Summary of Changes: Reformatted into table structure.

Added details to address FERC Order No. 706, Paragraph 581, directives to test more frequently than every three years.

Reference to prior version: (Part 3.1) CIP-006-4c, R8.1 and R8.2

Change Rationale: (Part 3.1)

Added details to address FERC Order No. 706, Paragraph 581 directives to test more frequently than every three years. The SDT determined that annual testing was too often and agreed on two years.

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.

Version	Date	Action	Change Tracking
5	11/22/13	FERC Order issued approving CIP-006-5. (Order becomes effective on 2/3/14.)	
5	5/7/14	Adopted by the NERC Board of Trustees to modify the VRF for Requirement R3.	

Redline

A. Introduction

1. Title: Cyber Security — Physical Security of BES Cyber Systems

2. Number: CIP-006-5

3. Purpose: To manage physical access to BES Cyber Systems by specifying a physical security plan in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-006-5:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5 identification and categorization processes.

5. Effective Dates:

1. **24 Months Minimum** – CIP-006-5 shall become effective on the later of July 1, 2015, or the first calendar day of the ninth calendar quarter after the effective date of the order providing applicable regulatory approval.
2. In those jurisdictions where no regulatory approval is required, CIP-006-5 shall become effective on the first day of the ninth calendar quarter following Board of Trustees' approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

6. Background:

Standard CIP-006-5 exists as part of a suite of CIP Standards related to cyber security. CIP-002-5 requires the initial identification and categorization of BES Cyber Systems. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1, and CIP-011-1 require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems. This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:

> Each Responsible Entity shall implement**, in a manner that identifies, assesses, and corrects deficiencies,** . . .

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in their documented processes, but they must address the applicable requirements in the table. The

documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management

Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5 identification and categorization processes.
- **Medium Impact BES Cyber Systems without External Routable Connectivity** – Only applies to medium impact BES Cyber Systems without External Routable Connectivity.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Locally mounted hardware or devices at the Physical Security Perimeter –** Applies to the locally mounted hardware or devices (e.g. such as motion sensors, electronic lock control mechanisms, and badge readers) at a Physical Security Perimeter associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity, and that does not contain or store access control information or independently perform access authentication. These hardware and devices are excluded in the definition of Physical Access Control Systems.

B. Requirements and Measures

R1. Each Responsible Entity shall implement, in a manner that identifies, assesses, and corrects deficiencies, one or more documented physical security plans that collectively include all of the applicable requirement parts in *CIP-006-5 Table R1 – Physical Security Plan*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning and Same Day Operations].*

M1. Evidence must include each of the documented physical security plans that collectively include all of the applicable requirement parts in *CIP-006-5 Table R1 – Physical Security Plan* and additional evidence to demonstrate implementation of the plan or plans as described in the Measures column of the table.

CIP-006-5 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	Medium Impact BES Cyber Systems without External Routable Connectivity Physical Access Control Systems (PACS) associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity	Define operational or procedural controls to restrict physical access.	An example of evidence may include, but is not limited to, documentation that operational or procedural controls exist.

CIP-006-5 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Utilize at least one physical access control to allow unescorted physical access into each applicable Physical Security Perimeter to only those individuals who have authorized unescorted physical access.	An example of evidence may include, but is not limited to, language in the physical security plan that describes each Physical Security Perimeter and how unescorted physical access is controlled by one or more different methods and proof that unescorted physical access is restricted to only authorized individuals, such as a list of authorized individuals accompanied by access logs.

CIP-006-5 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Where technically feasible, utilize two or more different physical access controls (this does not require two completely independent physical access control systems) to collectively allow unescorted physical access into Physical Security Perimeters to only those individuals who have authorized unescorted physical access.	An example of evidence may include, but is not limited to, language in the physical security plan that describes the Physical Security Perimeters and how unescorted physical access is controlled by two or more different methods and proof that unescorted physical access is restricted to only authorized individuals, such as a list of authorized individuals accompanied by access logs.

CIP-006-5 Table R1– Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Monitor for unauthorized access through a physical access point into a Physical Security Perimeter.	An example of evidence may include, but is not limited to, documentation of controls that monitor for unauthorized access through a physical access point into a Physical Security Perimeter.

CIP-006-5 Table R1– Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Issue an alarm or alert in response to detected unauthorized access through a physical access point into a Physical Security Perimeter to the personnel identified in the BES Cyber Security Incident response plan within 15 minutes of detection.	An example of evidence may include, but is not limited to, language in the physical security plan that describes the issuance of an alarm or alert in response to unauthorized access through a physical access control into a Physical Security Perimeter and additional evidence that the alarm or alert was issued and communicated as identified in the BES Cyber Security Incident Response Plan, such as manual or electronic alarm or alert logs, cell phone or pager logs, or other evidence that documents that the alarm or alert was generated and communicated.
1.6	Physical Access Control Systems (PACS) associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity	Monitor each Physical Access Control System for unauthorized physical access to a Physical Access Control System.	An example of evidence may include, but is not limited to, documentation of controls that monitor for unauthorized physical access to a PACS.

CIP-006-5 Table R1– Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.7	Physical Access Control Systems (PACS) associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity	Issue an alarm or alert in response to detected unauthorized physical access to a Physical Access Control System to the personnel identified in the BES Cyber Security Incident response plan within 15 minutes of the detection.	An example of evidence may include, but is not limited to, language in the physical security plan that describes the issuance of an alarm or alert in response to unauthorized physical access to Physical Access Control Systems and additional evidence that the alarm or alerts was issued and communicated as identified in the BES Cyber Security Incident Response Plan, such as alarm or alert logs, cell phone or pager logs, or other evidence that the alarm or alert was generated and communicated.

CIP-006-5 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.8	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Log (through automated means or by personnel who control entry) entry of each individual with authorized unescorted physical access into each Physical Security Perimeter, with information to identify the individual and date and time of entry.	An example of evidence may include, but is not limited to, language in the physical security plan that describes logging and recording of physical entry into each Physical Security Perimeter and additional evidence to demonstrate that this logging has been implemented, such as logs of physical access into Physical Security Perimeters that show the individual and the date and time of entry into Physical Security Perimeter.

CIP-006-5 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.9	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Retain physical access logs of entry of individuals with authorized unescorted physical access into each Physical Security Perimeter for at least ninety calendar days.	An example of evidence may include, but is not limited to, dated documentation such as logs of physical access into Physical Security Perimeters that show the date and time of entry into Physical Security Perimeter.

R2. Each Responsible Entity shall implement, in a manner that identifies, assesses, and corrects deficiencies, one or more documented visitor control programs that include each of the applicable requirement parts in *CIP-006-5 Table R2 – Visitor Control Program. [Violation Risk Factor: Medium] [Time Horizon: Same Day Operations.]*

M2. Evidence must include one or more documented visitor control programs that collectively include each of the applicable requirement parts in *CIP-006-5 Table R2 – Visitor Control Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-006-5 Table R2 – Visitor Control Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Require continuous escorted access of visitors (individuals who are provided access but are not authorized for unescorted physical access) within each Physical Security Perimeter, except during CIP Exceptional Circumstances.	An example of evidence may include, but is not limited to, language in a visitor control program that requires continuous escorted access of visitors within Physical Security Perimeters and additional evidence to demonstrate that the process was implemented, such as visitor logs.

CIP-006-5 Table R2 – Visitor Control Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Require manual or automated logging of visitor entry into and exit from the Physical Security Perimeter that includes date and time of the initial entry and last exit, the visitor's name, and the name of an individual point of contact responsible for the visitor, except during CIP Exceptional Circumstances.	An example of evidence may include, but is not limited to, language in a visitor control program that requires continuous escorted access of visitors within Physical Security Perimeters and additional evidence to demonstrate that the process was implemented, such as dated visitor logs that include the required information.
2.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Retain visitor logs for at least ninety calendar days.	An example of evidence may include, but is not limited to, documentation showing logs have been retained for at least ninety calendar days.

R3. Each Responsible Entity shall implement one or more documented Physical Access Control System maintenance and testing programs that collectively include each of the applicable requirement parts in *CIP-006-5 Table R3 – Maintenance and Testing Program*. *[Violation Risk Factor: ~~Lower~~Medium] [Time Horizon: Long Term Planning].*

M3. Evidence must include each of the documented Physical Access Control System maintenance and testing programs that collectively include each of the applicable requirement parts in *CIP-006-5 Table R3 – Maintenance and Testing Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-006-5 Table R3 – Physical Access Control System Maintenance and Testing Program			
Part	**Applicable Systems**	**Requirement**	**Measures**
3.1	Physical Access Control Systems (PACS) associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity Locally mounted hardware or devices at the Physical Security Perimeter associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity	Maintenance and testing of each Physical Access Control System and locally mounted hardware or devices at the Physical Security Perimeter at least once every 24 calendar months to ensure they function properly.	An example of evidence may include, but is not limited to, a maintenance and testing program that provides for testing each Physical Access Control System and locally mounted hardware or devices associated with each applicable Physical Security Perimeter at least once every 24 calendar months and additional evidence to demonstrate that this testing was done, such as dated maintenance records, or other documentation showing testing and maintenance has been performed on each applicable device or system at least once every 24 calendar months.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

- Compliance Audit
- Self-Certification
- Spot Checking
- Compliance Investigation
- Self-Reporting
- Complaint

1.4. Additional Compliance Information:

- None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-006-5)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Long Term Planning** **Same-Day Operations**	**Medium**	The Responsible Entity has a process to log authorized physical entry into any Physical Security Perimeter with sufficient information to identify the individual and date and time of entry and identified deficiencies but did not assess or correct the deficiencies. Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. Furthermore,

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

General:

While the focus is shifted from the definition and management of a completely enclosed "six-wall" boundary, it is expected in many instances this will remain a primary mechanism for controlling, alerting, and logging access to BES Cyber Systems. Taken together, these controls will effectively constitute the physical security plan to manage physical access to BES Cyber Systems.

Requirement R1:

Methods of physical access control include:

- Card Key: A means of electronic access where the access rights of the card holder are predefined in a computer database. Access rights may differ from one perimeter to another.
- Special Locks: These include, but are not limited to, locks with "restricted key" systems, magnetic locks that can be operated remotely, and "man-trap" systems.
- Security Personnel: Personnel responsible for controlling physical access who may reside on-site or at a monitoring station.

- Other Authentication Devices: Biometric, keypad, token, or other equivalent devices that control physical access into the Physical Security Perimeter.

Methods to monitor physical access include:

- Alarm Systems: Systems that alarm to indicate interior motion or when a door, gate, or window has been opened without authorization. These alarms must provide for notification within 15 minutes to individuals responsible for response.
- Human Observation of Access Points: Monitoring of physical access points by security personnel who are also controlling physical access.

Methods to log physical access include:

- Computerized Logging: Electronic logs produced by the Responsible Entity's selected access control and alerting method.
- Video Recording: Electronic capture of video images of sufficient quality to determine identity.
- Manual Logging: A log book or sign-in sheet, or other record of physical access maintained by security or other personnel authorized to control and monitor physical access.

The FERC Order No. 706, Paragraph 572, directive discussed utilizing two or more different and complementary physical access controls to provide defense in depth. It does not require two or more Physical Security Perimeters, nor does it exclude the use of layered perimeters. Use of two-factor authentication would be acceptable at the same entry points for a non-layered single perimeter. For example, a sole perimeter's controls could include either a combination of card key and pin code (something you know and something you have), or a card key and biometric scanner (something you have and something you are), or a physical key in combination with a guard-monitored remote camera and door release, where the "guard" has adequate information to authenticate the person they are observing or talking to prior to permitting access (something you have and something you are). The two-factor authentication could be implemented using a single Physical Access Control System but more than one authentication method must be utilized. For physically layered protection, a locked gate in combination with a locked control-building could be acceptable, provided no single authenticator (e.g., key or card key) would provide access through both.

Entities may choose for certain PACS to reside in a PSP controlling access to applicable BES Cyber Systems. For these PACS, there is no additional obligation to comply with Requirement Parts 1.1, 1.7 and 1.8 beyond what is already required for the PSP.

Requirement R2:

The logging of visitors should capture each visit of the individual and does not need to capture each entry or exit during that visit. This is meant to allow a visitor to temporarily exit the Physical Security Perimeter to obtain something they left in their vehicle or outside the area without requiring a new log entry for each and every entry during the visit.

The SDT also determined that a point of contact should be documented who can provide additional details about the visit if questions arise in the future. The point of contact could be the escort, but there is no need to document everyone that acted as an escort for the visitor.

Requirement R3:

This includes the testing of locally mounted hardware or devices used in controlling, alerting or logging access to the Physical Security Perimeter. This includes motion sensors, electronic lock control mechanisms, and badge readers which are not deemed to be part of the Physical Access Control System but are required for the protection of the BES Cyber Systems.

Rationale:

During the development of this standard, references to prior versions of the CIP standards and rationale for the requirements and their parts were embedded within the standard. Upon BOT approval, that information was moved to this section.

Rationale for R1:

Each Responsible Entity shall ensure that physical access to all BES Cyber Systems is restricted and appropriately managed. *Entities may choose for certain PACS to reside in a PSP controlling access to applicable BES Cyber Systems. For these PACS, there is no additional obligation to comply with Requirement Parts 1.1, 1.7 and 1.8 beyond what is already required for the PSP.*

Summary of Changes: The entire content of CIP-006-5 is intended to constitute a physical security program. This represents a change from previous versions, since there was no specific requirement to have a physical security program in previous versions of the standards, only requirements for physical security plans.

Added details to address FERC Order No. 706, Paragraph 572, directives for physical security defense in depth.

Additional guidance on physical security defense in depth provided to address the directive in FERC Order No. 706, Paragraph 575.

Reference to prior version: (Part 1.1) *CIP-006-4c, R2.1 for Physical Access Control Systems New Requirement for Medium Impact BES Cyber Systems not having External Routable Connectivity*

Change Rationale: (Part 1.1)

To allow for programmatic protection controls as a baseline (which also includes how the entity plans to protect Medium Impact BES Cyber Systems that do not have External Routable Connectivity not otherwise covered under Part 1.2, and it does not require a detailed list of individuals with access). Physical Access Control Systems do not themselves need to be protected at the same level as required in Parts 1.2 through 1.5.

Reference to prior version: (Part 1.2) CIP006-4c, R3 & R4
Change Rationale: (Part 1.2)

This requirement has been made more general to allow for alternate measures of restricting physical access. Specific examples of methods a Responsible Entity can take to restricting access to BES Cyber Systems has been moved to the Guidelines and Technical Basis section.

Reference to prior version: (Part 1.3) CIP006-4c, R3 & R4

Change Rationale: (Part 1.3)

The specific examples that specify methods a Responsible Entity can take to restricting access to BES Cyber Systems has been moved to the Guidelines and Technical Basis section. This requirement has been made more general to allow for alternate measures of controlling physical access.

Added to address FERC Order No. 706, Paragraph 572, related directives for physical security defense in depth.
FERC Order No. 706, Paragraph 575, directives addressed by providing the examples in the guidance document of physical security defense in depth via multi-factor authentication or layered Physical Security Perimeter(s).

Reference to prior version: (Part 1.4) CIP006-4c, R5

Change Rationale: (Part 1.4)

Examples of monitoring methods have been moved to the Guidelines and Technical Basis section.

Reference to prior version: (Part 1.5) CIP006-4c, R5

Change Rationale: (Part 1.5)

Examples of monitoring methods have been moved to the Guidelines and Technical Basis section.

Reference to prior version: (Part 1.6) CIP006-4c, R5

Change Rationale: (Part 1.6)

Addresses the prior CIP-006-4c, Requirement R5 requirement for Physical Access Control Systems.

Reference to prior version: (Part 1.7) CIP006-4c, R5

Change Rationale: (Part 1.7)

Addresses the prior CIP-006-4c, Requirement R5 requirement for Physical Access Control Systems.

Reference to prior version: (Part 1.8) CIP-006-4c, R6

Change Rationale: (Part 1.8)

CIP-006-4c, Requirement R6 was specific to the logging of access at identified access points. This requirement more generally requires logging of authorized physical access into the Physical Security Perimeter.

Examples of logging methods have been moved to the Guidelines and Technical Basis section.

Reference to prior version: (Part 1.9) CIP-006-4c, R7

Change Rationale: (Part 1.9)

No change.

Rationale for R2:

To control when personnel without authorized unescorted physical access can be in any Physical Security Perimeters protecting BES Cyber Systems or Electronic Access Control or Monitoring Systems, as applicable in Table R2.

Summary of Changes: Reformatted into table structure. Originally added in Version 3 per FERC Order issued September 30, 2009.

Reference to prior version: (Part 2.1) CIP-006-4c, R1.6.2

Change Rationale: (Part 2.1)

Added the ability to not do this during CIP Exceptional Circumstances.

Reference to prior version: (Part 2.2) CIP-006-4c R1.6.1

Change Rationale: (Part 2.2)

Added the ability to not do this during CIP Exceptional Circumstances, addressed multi-entry scenarios of the same person in a day (log first entry and last exit), and name of the person who is responsible or sponsor for the visitor. There is no requirement to document the escort or handoffs between escorts.

Reference to prior version: (Part 2.3) CIP-006-4c, R7

Change Rationale: (Part 2.3)

No change

Rationale for R3:

To ensure all Physical Access Control Systems and devices continue to function properly.

Summary of Changes: Reformatted into table structure.

Added details to address FERC Order No. 706, Paragraph 581, directives to test more frequently than every three years.

Reference to prior version: (Part 3.1) CIP-006-4c, R8.1 and R8.2

Change Rationale: (Part 3.1)

Added details to address FERC Order No. 706, Paragraph 581 directives to test more frequently than every three years. The SDT determined that annual testing was too often and agreed on two years.

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.

Version	Date	Action	Change Tracking
5	11/22/13	FERC Order issued approving CIP-006-5. (Order becomes effective on 2/3/14.)	

CIP-008-5 Violation Risk Factor and Violation Severity Level Revisions

Clean and Redline

Clean

A. Introduction

1. Title: Cyber Security — Incident Reporting and Response Planning

2. Number: CIP-008-5

3. Purpose: To mitigate the risk to the reliable operation of the BES as the result of a Cyber Security Incident by specifying incident response requirements.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-008-5:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5 identification and categorization processes.

5. Effective Dates:

1. **24 Months Minimum** – CIP-008-5 shall become effective on the later of July 1, 2015, or the first calendar day of the ninth calendar quarter after the effective date of the order providing applicable regulatory approval.
2. In those jurisdictions where no regulatory approval is required, CIP-008-5 shall become effective on the first day of the ninth calendar quarter following Board of Trustees' approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

6. Background:

Standard CIP-008-5 exists as part of a suite of CIP Standards related to cyber security. CIP-002-5 requires the initial identification and categorization of BES Cyber Systems. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1, and CIP-011-1 require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems. This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in their documented processes, but they must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.
Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training

program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems –** Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5 identification and categorization processes.
- **Medium Impact BES Cyber Systems –** Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5 identification and categorization processes.

B. Requirements and Measures

R1. Each Responsible Entity shall document one or more Cyber Security Incident response plan(s) that collectively include each of the applicable requirement parts in *CIP-008-5 Table R1 – Cyber Security Incident Response Plan Specifications*. *[Violation Risk Factor: Lower] [Time Horizon: Long Term Planning].*

M1. Evidence must include each of the documented plan(s) that collectively include each of the applicable requirement parts in *CIP-008-5 Table R1 – Cyber Security Incident Response Plan Specifications*.

CIP-008-5 Table R1 – Cyber Security Incident Response Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	One or more processes to identify, classify, and respond to Cyber Security Incidents.	An example of evidence may include, but is not limited to, dated documentation of Cyber Security Incident response plan(s) that include the process to identify, classify, and respond to Cyber Security Incidents.
1.2	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	One or more processes to determine if an identified Cyber Security Incident is a Reportable Cyber Security Incident and notify the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), unless prohibited by law. Initial notification to the ES-ISAC, which may be only a preliminary notice, shall not exceed one hour from the determination of a Reportable Cyber Security Incident.	Examples of evidence may include, but are not limited to, dated documentation of Cyber Security Incident response plan(s) that provide guidance or thresholds for determining which Cyber Security Incidents are also Reportable Cyber Security Incidents and documentation of initial notices to the Electricity Sector Information Sharing and Analysis Center (ES-ISAC).

CIP-008-5 Table R1 – Cyber Security Incident Response Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	The roles and responsibilities of Cyber Security Incident response groups or individuals.	An example of evidence may include, but is not limited to, dated Cyber Security Incident response process(es) or procedure(s) that define roles and responsibilities (e.g., monitoring, reporting, initiating, documenting, etc.) of Cyber Security Incident response groups or individuals.
1.4	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Incident handling procedures for Cyber Security Incidents.	An example of evidence may include, but is not limited to, dated Cyber Security Incident response process(es) or procedure(s) that address incident handling (e.g., containment, eradication, recovery/incident resolution).

R2. Each Responsible Entity shall implement each of its documented Cyber Security Incident response plans to collectively include each of the applicable requirement parts in *CIP-008-5 Table R2 – Cyber Security Incident Response Plan Implementation and Testing. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning and Real-Time Operations].*

M2. Evidence must include, but is not limited to, documentation that collectively demonstrates implementation of each of the applicable requirement parts in *CIP-008-5 Table R2 – Cyber Security Incident Response Plan Implementation and Testing*.

CIP-008-5 Table R2 – Cyber Security Incident Response Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Test each Cyber Security Incident response plan(s) at least once every 15 calendar months: • By responding to an actual Reportable Cyber Security Incident; • With a paper drill or tabletop exercise of a Reportable Cyber Security Incident; or • With an operational exercise of a Reportable Cyber Security Incident.	Examples of evidence may include, but are not limited to, dated evidence of a lessons-learned report that includes a summary of the test or a compilation of notes, logs, and communication resulting from the test. Types of exercises may include discussion or operations based exercises.

CIP-008-5 Table R2 – Cyber Security Incident Response Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Use the Cyber Security Incident response plan(s) under Requirement R1 when responding to a Reportable Cyber Security Incident or performing an exercise of a Reportable Cyber Security Incident. Document deviations from the plan(s) taken during the response to the incident or exercise.	Examples of evidence may include, but are not limited to, incident reports, logs, and notes that were kept during the incident response process, and follow-up documentation that describes deviations taken from the plan during the incident or exercise.
2.3	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Retain records related to Reportable Cyber Security Incidents.	An example of evidence may include, but is not limited to, dated documentation, such as security logs, police reports, emails, response forms or checklists, forensic analysis results, restoration records, and post-incident review notes related to Reportable Cyber Security Incidents.

R3. Each Responsible Entity shall maintain each of its Cyber Security Incident response plans according to each of the applicable requirement parts in *CIP-008-5 Table R3 – Cyber Security Incident Response Plan Review, Update, and Communication*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Assessment].*

M3. Evidence must include, but is not limited to, documentation that collectively demonstrates maintenance of each Cyber Security Incident response plan according to the applicable requirement parts in *CIP-008-5 Table R3 – Cyber Security Incident.*

CIP-008-5 Table R3 – Cyber Security Incident Response Plan Review, Update, and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	No later than 90 calendar days after completion of a Cyber Security Incident response plan(s) test or actual Reportable Cyber Security Incident response: 3.1.1. Document any lessons learned or document the absence of any lessons learned; 3.1.2. Update the Cyber Security Incident response plan based on any documented lessons learned associated with the plan; and 3.1.3. Notify each person or group with a defined role in the Cyber Security Incident response plan of the updates to the Cyber Security Incident response plan based on any documented lessons learned.	An example of evidence may include, but is not limited to, all of the following: 1. Dated documentation of post incident(s) review meeting notes or follow-up report showing lessons learned associated with the Cyber Security Incident response plan(s) test or actual Reportable Cyber Security Incident response or dated documentation stating there were no lessons learned; 2. Dated and revised Cyber Security Incident response plan showing any changes based on the lessons learned; and 3. Evidence of plan update distribution including, but not limited to: • Emails; • USPS or other mail service; • Electronic distribution system; or • Training sign-in sheets.

CIP-008-5 Table R3 – Cyber Security Incident Response Plan Review, Update, and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	No later than 60 calendar days after a change to the roles or responsibilities, Cyber Security Incident response groups or individuals, or technology that the Responsible Entity determines would impact the ability to execute the plan: 3.2.1. Update the Cyber Security Incident response plan(s); and 3.2.2. Notify each person or group with a defined role in the Cyber Security Incident response plan of the updates.	An example of evidence may include, but is not limited to: 1. Dated and revised Cyber Security Incident response plan with changes to the roles or responsibilities, responders or technology; and 2. Evidence of plan update distribution including, but not limited to: • Emails; • USPS or other mail service; • Electronic distribution system; or • Training sign-in sheets.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

- Compliance Audit
- Self-Certification
- Spot Checking
- Compliance Investigation
- Self-Reporting
- Complaint

1.4. Additional Compliance Information:

- None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-008-5)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Long Term Planning**	**Lower**	N/A	N/A	The Responsible Entity has developed the Cyber Security Incident response plan(s), but the plan does not include the roles and responsibilities of Cyber Security Incident response groups or individuals. (1.3) OR The Responsible Entity has developed the Cyber Security Incident response plan(s), but the plan does not include incident handling procedures for Cyber Security Incidents. (1.4)	The Responsible Entity has not developed a Cyber Security Incident response plan with one or more processes to identify, classify, and respond to Cyber Security Incidents. (1.1) OR The Responsible Entity has developed a Cyber Security Incident response plan, but the plan does not include one or more processes to identify Reportable Cyber Security Incidents. (1.2) OR The Responsible Entity has developed a Cyber Security Incident response plan, but did

R #	Time Horizon	VRF	Violation Severity Levels (CIP-008-5)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						not provide at least preliminary notification to ES-ISAC within one hour from identification of a Reportable Cyber Security Incident. (1.2)
R2	**Operations Planning** **Real-time Operations**	**Lower**	The Responsible Entity has not tested the Cyber Security Incident response plan(s) within 15 calendar months, not exceeding 16 calendar months between tests of the plan. (2.1)	The Responsible Entity has not tested the Cyber Security Incident response plan(s) within 16 calendar months, not exceeding 17 calendar months between tests of the plan. (2.1)	The Responsible Entity has not tested the Cyber Security Incident response plan(s) within 17 calendar months, not exceeding 18 calendar months between tests of the plan. (2.1) OR The Responsible Entity did not document deviations, if any, from the plan during a test or when a Reportable Cyber Security Incident occurs. (2.2)	The Responsible Entity has not tested the Cyber Security Incident response plan(s) within 18 calendar months between tests of the plan. (2.1) OR The Responsible Entity did not retain relevant records related to Reportable Cyber Security Incidents. (2.3)
R3	**Operations Assessment**	**Lower**	The Responsible Entity has not notified each person or group with	The Responsible Entity has not updated the	The Responsible Entity has neither	The Responsible Entity has neither

R #	Time Horizon	VRF	Violation Severity Levels (CIP-008-5)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
			a defined role in the Cyber Security Incident response plan of updates to the Cyber Security Incident response plan within greater than 90 but less than 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (3.1.3)	Cyber Security Incident response plan based on any documented lessons learned within 90 and less than 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (3.1.2) OR The Responsible Entity has not notified each person or group with a defined role in the Cyber Security Incident response plan of updates to the Cyber Security Incident response plan within 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (3.1.3) OR	documented lessons learned nor documented the absence of any lessons learned within 90 and less than 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (3.1.1) OR The Responsible Entity has not updated the Cyber Security Incident response plan based on any documented lessons learned within 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (3.1.2) OR The Responsible Entity has not updated the	documented lessons learned nor documented the absence of any lessons learned within 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (3.1.1)

R #	Time Horizon	VRF	Violation Severity Levels (CIP-008-5)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
				The Responsible Entity has not updated the Cyber Security Incident response plan(s) or notified each person or group with a defined role within 60 and less than 90 calendar days of any of the following changes that the responsible entity determines would impact the ability to execute the plan: (3.2) • Roles or responsibilities, or • Cyber Security Incident response groups or individuals, or • Technology changes.	Cyber Security Incident response plan(s) or notified each person or group with a defined role within 90 calendar days of any of the following changes that the responsible entity determines would impact the ability to execute the plan: (3.2) • Roles or responsibilities, or • Cyber Security Incident response groups or individuals, or • Technology changes.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. Furthermore,

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The following guidelines are available to assist in addressing the required components of a Cyber Security Incident response plan:

- Department of Homeland Security, Control Systems Security Program, *Developing an Industrial Control Systems Cyber Security Incident Response Capability*, 2009, online at http://www.us-cert.gov/control_systems/practices/documents/final-RP_ics_cybersecurity_incident_response_100609.pdf
- National Institute of Standards and Technology, *Computer Security Incident Handling Guide*, Special Publication 800-61 revision 1, March 2008, online at http://csrc.nist.gov/publications/nistpubs/800-61-rev1/SP800-61rev1.pdf

For Part 1.2, a Reportable Cyber Security Incident is a Cyber Security Incident that has compromised or disrupted one or more reliability tasks of a functional entity. It is helpful to distinguish Reportable Cyber Security Incidents as one resulting in a necessary response action. A response action can fall into one of two categories: Necessary or elective. The distinguishing characteristic is whether or not action was taken in response to an event. Precautionary measures that are not in response to any persistent damage or effects may be designated as elective. All other response actions to avoid any persistent damage or adverse effects, which include the activation of redundant systems, should be designated as necessary.

The reporting obligations for Reportable Cyber Security Incidents require at least a preliminary notice to the ES-ISAC within one hour after determining that a Cyber Security Incident is reportable (not within one hour of the Cyber Security Incident, an important distinction). This addition is in response to the directive addressing this issue in FERC Order No. 706, paragraphs 673 and 676, to report within one hour (at least preliminarily). This standard does not require a complete report within an hour of determining that a Cyber Security Incident is reportable, but at least preliminary notice, which may be a phone call, an email, or sending a Web-based notice. The standard does not require a specific timeframe for completing the full report.

Requirement R2:

Requirement R2 ensures entities periodically test the Cyber Security Incident response plan. This includes the requirement in Part 2.2 to ensure the plan is actually used when testing. The testing requirements are specifically for *Reportable Cyber Security Incidents*.

Entities may use an actual response to a *Reportable Cyber Security Incident* as a substitute for exercising the plan annually. Otherwise, entities must exercise the plan with a paper drill, tabletop exercise, or full operational exercise. For more specific types of exercises, refer to the FEMA Homeland Security Exercise and Evaluation Program (HSEEP). It lists the following four types of discussion-based exercises: seminar, workshop, tabletop, and games. In particular, it defines that, "A tabletop exercise involves key personnel discussing simulated scenarios in an informal setting. Table top exercises (TTX) can be used to assess plans, policies, and procedures."

The HSEEP lists the following three types of operations-based exercises: Drill, functional exercise, and full-scale exercise. It defines that, "[A] full-scale exercise is a multi-agency, multi-jurisdictional, multi-discipline exercise involving functional (e.g., joint field office, Emergency operation centers, etc.) and 'boots on the ground' response (e.g., firefighters decontaminating mock victims)."

In addition to the requirements to implement the response plan, Part 2.3 specifies entities must retain relevant records for *Reportable Cyber Security Incidents*. There are several examples of specific types of evidence listed in the measure. Entities should refer to their handling procedures to determine the types of evidence to retain and how to transport and store the evidence. For further information in retaining incident records, refer to the NIST Guide to Integrating Forensic Techniques into Incident Response (SP800-86). The NIST guideline includes a section (Section 3.1.2) on acquiring data when performing forensics.

Requirement R3:

This requirement ensures entities maintain Cyber Security Incident response plans. There are two requirement parts that trigger plan updates: (1) lessons learned from Part 3.1 and (2) organizational or technology changes from Part 3.2.

The documentation of lessons learned from Part 3.1 is associated with each Reportable Cyber Security Incident and involves the activities as illustrated in Figure 1, below. The deadline to document lessons learned starts after the completion of the incident in recognition that complex incidents on complex systems can take a few days or weeks to complete response

activities. The process of conducting lessons learned can involve the response team discussing the incident to determine gaps or areas of improvement within the plan. Any documented deviations from the plan from Part 2.2 can serve as input to the lessons learned. It is possible to have a *Reportable Cyber Security Incident* without any documented lessons learned. In such cases, the entity must retain documentation of the absence of any lessons learned associated with the *Reportable Cyber Security Incident*.

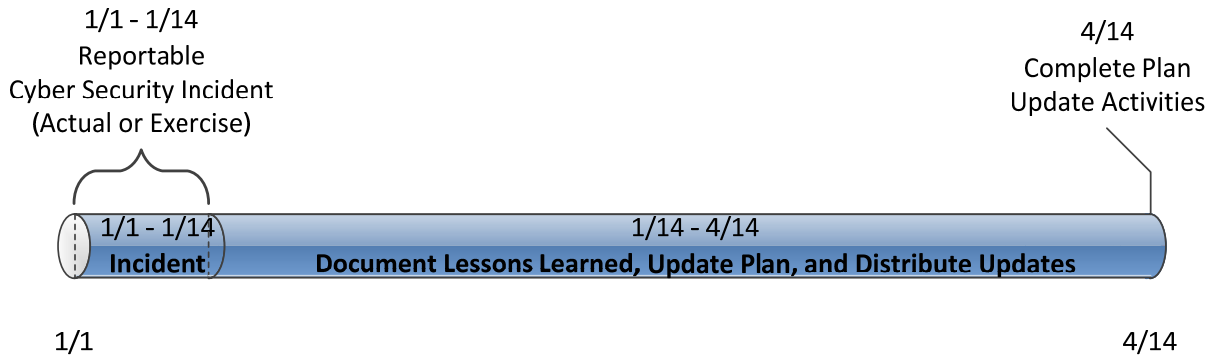

Figure 1: CIP-008-5 R3 Timeline for Reportable Cyber Security Incidents

The activities necessary to complete the lessons learned include updating the plan and distributing those updates. Entities should consider meeting with all of the individuals involved in the incident and documenting the lessons learned as soon after the incident as possible. This allows more time for making effective updates to the plan, obtaining any necessary approvals, and distributing those updates to the incident response team.

The plan change requirement in Part 3.2 is associated with organization and technology changes referenced in the plan and involves the activities illustrated in Figure 2, below. Organizational changes include changes to the roles and responsibilities people have in the plan or changes to the response groups or individuals. This may include changes to the names or contact information listed in the plan. Technology changes affecting the plan may include referenced information sources, communication systems or ticketing systems.

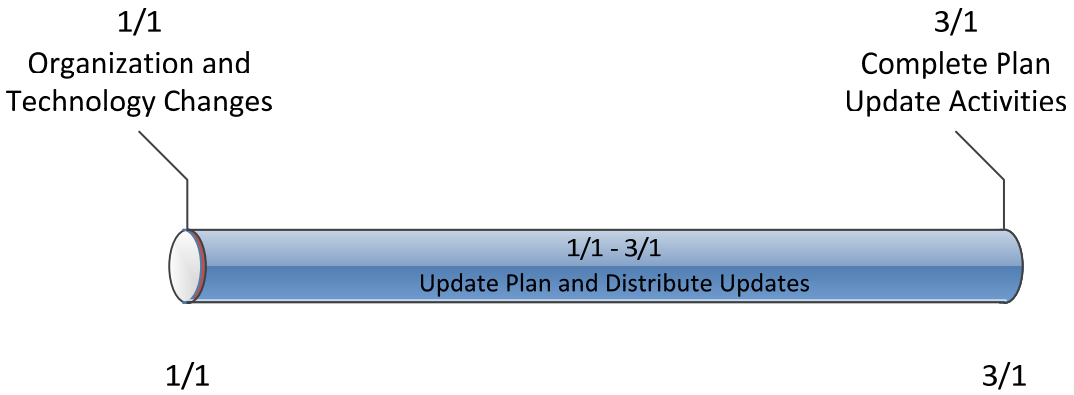

Figure 2: Timeline for Plan Changes in 3.2

Rationale:

During the development of this standard, references to prior versions of the CIP standards and rationale for the requirements and their parts were embedded within the standard. Upon BOT approval, that information was moved to this section.

Rationale for R1:

The implementation of an effective Cyber Security Incident response plan mitigates the risk to the reliable operation of the BES caused as the result of a Cyber Security Incident and provides feedback to Responsible Entities for improving the security controls applying to BES Cyber Systems. Preventative activities can lower the number of incidents, but not all incidents can be prevented. A preplanned incident response capability is therefore necessary for rapidly detecting incidents, minimizing loss and destruction, mitigating the weaknesses that were exploited, and restoring computing services. An enterprise or single incident response plan for all BES Cyber Systems may be used to meet the Requirement. An organization may have a common plan for multiple registered entities it owns.

Summary of Changes: Wording changes have been incorporated based primarily on industry feedback to more specifically describe required actions.

Reference to prior version: (Part 1.1) CIP-008, R1.1

Change Description and Justification: (Part 1.1)

"Characterize" has been changed to "identify" for clarity. "Response actions" has been changed to "respond to" for clarity.

Reference to prior version: (Part 1.2) CIP-008, R1.1

Change Description and Justification: (Part 1.2)

Addresses the reporting requirements from previous versions of CIP-008. This requirement part only obligates entities to have a process for determining Reportable Cyber Security Incidents. Also addresses the directive in FERC Order No. 706, paragraphs 673 and 676 to report within one hour (at least preliminarily).

Reference to prior version: (Part 1.3) CIP-008, R1.2

Change Description and Justification: (Part 1.3)

Replaced incident response teams with incident response "groups or individuals" to avoid the interpretation that roles and responsibilities sections must reference specific teams.

Reference to prior version: (Part 1.4) CIP-008, R1.2

Change Description and Justification: (Part 1.4)
Conforming change to reference new defined term Cyber Security Incidents.

Rationale for R2:

The implementation of an effective Cyber Security Incident response plan mitigates the risk to the reliable operation of the BES caused as the result of a Cyber Security Incident and provides feedback to Responsible Entities for improving the security controls applying to BES Cyber Systems. This requirement ensures implementation of the response plans. Requirement Part 2.3 ensures the retention of incident documentation for post event analysis.

This requirement obligates entities to follow the Cyber Security Incident response plan when an incident occurs or when testing, but does not restrict entities from taking needed deviations from the plan. It ensures the plan represents the actual response and does not exist for documentation only. If a plan is written at a high enough level, then every action during the response should not be subject to scrutiny. The plan will likely allow for the appropriate variance in tactical decisions made by incident responders. Deviations from the plan can be documented during the incident response or afterward as part of the review.

Summary of Changes: Added testing requirements to verify the Responsible Entity's response plan's effectiveness and consistent application in responding to a Cyber Security Incident(s) impacting a BES Cyber System.

Reference to prior version: (Part 2.1) CIP-008, R1.6

Change Description and Justification: (Part 2.1)

Minor wording changes; essentially unchanged.

Reference to prior version: (Part 2.2) CIP-008, R1.6

Change Description and Justification: (Part 2.2)

Allows deviation from plan(s) during actual events or testing if deviations are recorded for review.

Reference to prior version: (Part 2.3) CIP-008, R2

Change Description and Justification: (Part 2.3)
Removed references to the retention period because the Standard addresses data retention in the Compliance Section.

Rationale for R3:

Conduct sufficient reviews, updates and communications to verify the Responsible Entity's response plan's effectiveness and consistent application in responding to a Cyber Security Incident(s) impacting a BES Cyber System. A separate plan is not required for those requirement parts of the table applicable to High or Medium Impact BES Cyber Systems. If an entity has a single Cyber Security Incident response plan and High or Medium Impact BES Cyber Systems, then the additional requirements would apply to the single plan.

Summary of Changes: Changes here address the FERC Order 706, Paragraph 686, which includes a directive to perform after-action review for tests or actual incidents and update the

plan based on lessons learned. Additional changes include specification of what it means to review the plan and specification of changes that would require an update to the plan.

Reference to prior version: (Part 3.1) CIP-008, R1.5

Change Description and Justification: (Part 3.1)

Addresses FERC Order 706, Paragraph 686 to document test or actual incidents and lessons learned.

Reference to prior version: (Part 3.2) CIP-008, R1.4

Change Description and Justification: (Part 3.2)

Specifies the activities required to maintain the plan. The previous version required entities to update the plan in response to any changes. The modifications make clear the changes that would require an update.

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a Responsible Entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3		Updated version number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	Update
3	3/31/10	Approved by FERC.	

4	12/30/10	Modified to add specific criteria for Critical Asset identification.	Update
4	1/24/11	Approved by the NERC Board of Trustees.	Update
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-008-5. (Order becomes effective on 2/3/14.)	
5	5/7/14	Adopted by the NERC Board of Trustees to modify the VSL for Requirement R2.	

Redline

A. Introduction

1. Title: Cyber Security — Incident Reporting and Response Planning

2. Number: CIP-008-5

3. Purpose: To mitigate the risk to the reliable operation of the BES as the result of a Cyber Security Incident by specifying incident response requirements.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-008-5:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5 identification and categorization processes.

5. Effective Dates:

1. **24 Months Minimum** – CIP-008-5 shall become effective on the later of July 1, 2015, or the first calendar day of the ninth calendar quarter after the effective date of the order providing applicable regulatory approval.
2. In those jurisdictions where no regulatory approval is required, CIP-008-5 shall become effective on the first day of the ninth calendar quarter following Board of Trustees' approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

6. Background:

Standard CIP-008-5 exists as part of a suite of CIP Standards related to cyber security. CIP-002-5 requires the initial identification and categorization of BES Cyber Systems. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1, and CIP-011-1 require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems. This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in their documented processes, but they must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.
Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training

program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems –** Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5 identification and categorization processes.
- **Medium Impact BES Cyber Systems –** Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5 identification and categorization processes.

B. Requirements and Measures

R1. Each Responsible Entity shall document one or more Cyber Security Incident response plan(s) that collectively include each of the applicable requirement parts in *CIP-008-5 Table R1 – Cyber Security Incident Response Plan Specifications*. *[Violation Risk Factor: Lower] [Time Horizon: Long Term Planning].*

M1. Evidence must include each of the documented plan(s) that collectively include each of the applicable requirement parts in *CIP-008-5 Table R1 – Cyber Security Incident Response Plan Specifications*.

CIP-008-5 Table R1 – Cyber Security Incident Response Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	One or more processes to identify, classify, and respond to Cyber Security Incidents.	An example of evidence may include, but is not limited to, dated documentation of Cyber Security Incident response plan(s) that include the process to identify, classify, and respond to Cyber Security Incidents.
1.2	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	One or more processes to determine if an identified Cyber Security Incident is a Reportable Cyber Security Incident and notify the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), unless prohibited by law. Initial notification to the ES-ISAC, which may be only a preliminary notice, shall not exceed one hour from the determination of a Reportable Cyber Security Incident.	Examples of evidence may include, but are not limited to, dated documentation of Cyber Security Incident response plan(s) that provide guidance or thresholds for determining which Cyber Security Incidents are also Reportable Cyber Security Incidents and documentation of initial notices to the Electricity Sector Information Sharing and Analysis Center (ES-ISAC).

CIP-008-5 Table R1 – Cyber Security Incident Response Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	The roles and responsibilities of Cyber Security Incident response groups or individuals.	An example of evidence may include, but is not limited to, dated Cyber Security Incident response process(es) or procedure(s) that define roles and responsibilities (e.g., monitoring, reporting, initiating, documenting, etc.) of Cyber Security Incident response groups or individuals.
1.4	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Incident handling procedures for Cyber Security Incidents.	An example of evidence may include, but is not limited to, dated Cyber Security Incident response process(es) or procedure(s) that address incident handling (e.g., containment, eradication, recovery/incident resolution).

R2. Each Responsible Entity shall implement each of its documented Cyber Security Incident response plans to collectively include each of the applicable requirement parts in *CIP-008-5 Table R2 – Cyber Security Incident Response Plan Implementation and Testing. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning and Real-Time Operations].*

M2. Evidence must include, but is not limited to, documentation that collectively demonstrates implementation of each of the applicable requirement parts in *CIP-008-5 Table R2 – Cyber Security Incident Response Plan Implementation and Testing*.

CIP-008-5 Table R2 – Cyber Security Incident Response Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Test each Cyber Security Incident response plan(s) at least once every 15 calendar months: • By responding to an actual Reportable Cyber Security Incident; • With a paper drill or tabletop exercise of a Reportable Cyber Security Incident; or • With an operational exercise of a Reportable Cyber Security Incident.	Examples of evidence may include, but are not limited to, dated evidence of a lessons-learned report that includes a summary of the test or a compilation of notes, logs, and communication resulting from the test. Types of exercises may include discussion or operations based exercises.

CIP-008-5 Table R2 – Cyber Security Incident Response Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Use the Cyber Security Incident response plan(s) under Requirement R1 when responding to a Reportable Cyber Security Incident or performing an exercise of a Reportable Cyber Security Incident. Document deviations from the plan(s) taken during the response to the incident or exercise.	Examples of evidence may include, but are not limited to, incident reports, logs, and notes that were kept during the incident response process, and follow-up documentation that describes deviations taken from the plan during the incident or exercise.
2.3	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Retain records related to Reportable Cyber Security Incidents.	An example of evidence may include, but is not limited to, dated documentation, such as security logs, police reports, emails, response forms or checklists, forensic analysis results, restoration records, and post-incident review notes related to Reportable Cyber Security Incidents.

R3. Each Responsible Entity shall maintain each of its Cyber Security Incident response plans according to each of the applicable requirement parts in *CIP-008-5 Table R3 – Cyber Security Incident Response Plan Review, Update, and Communication*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Assessment].*

M3. Evidence must include, but is not limited to, documentation that collectively demonstrates maintenance of each Cyber Security Incident response plan according to the applicable requirement parts in *CIP-008-5 Table R3 – Cyber Security Incident.*

CIP-008-5 Table R3 – Cyber Security Incident Response Plan Review, Update, and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	No later than 90 calendar days after completion of a Cyber Security Incident response plan(s) test or actual Reportable Cyber Security Incident response: 3.1.1. Document any lessons learned or document the absence of any lessons learned; 3.1.2. Update the Cyber Security Incident response plan based on any documented lessons learned associated with the plan; and 3.1.3. Notify each person or group with a defined role in the Cyber Security Incident response plan of the updates to the Cyber Security Incident response plan based on any documented lessons learned.	An example of evidence may include, but is not limited to, all of the following: 1. Dated documentation of post incident(s) review meeting notes or follow-up report showing lessons learned associated with the Cyber Security Incident response plan(s) test or actual Reportable Cyber Security Incident response or dated documentation stating there were no lessons learned; 2. Dated and revised Cyber Security Incident response plan showing any changes based on the lessons learned; and 3. Evidence of plan update distribution including, but not limited to: • Emails; • USPS or other mail service; • Electronic distribution system; or • Training sign-in sheets.

CIP-008-5 Table R3 – Cyber Security Incident Response Plan Review, Update, and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	No later than 60 calendar days after a change to the roles or responsibilities, Cyber Security Incident response groups or individuals, or technology that the Responsible Entity determines would impact the ability to execute the plan: 3.2.1. Update the Cyber Security Incident response plan(s); and 3.2.2. Notify each person or group with a defined role in the Cyber Security Incident response plan of the updates.	An example of evidence may include, but is not limited to: 1. Dated and revised Cyber Security Incident response plan with changes to the roles or responsibilities, responders or technology; and 2. Evidence of plan update distribution including, but not limited to: • Emails; • USPS or other mail service; • Electronic distribution system; or • Training sign-in sheets.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

- Compliance Audit
- Self-Certification
- Spot Checking
- Compliance Investigation
- Self-Reporting
- Complaint

1.4. Additional Compliance Information:

- None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-008-5)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Long Term Planning**	**Lower**	N/A	N/A	The Responsible Entity has developed the Cyber Security Incident response plan(s), but the plan does not include the roles and responsibilities of Cyber Security Incident response groups or individuals. (1.3) OR The Responsible Entity has developed the Cyber Security Incident response plan(s), but the plan does not include incident handling procedures for Cyber Security Incidents. (1.4)	The Responsible Entity has not developed a Cyber Security Incident response plan with one or more processes to identify, classify, and respond to Cyber Security Incidents. (1.1) OR The Responsible Entity has developed a Cyber Security Incident response plan, but the plan does not include one or more processes to identify Reportable Cyber Security Incidents. (1.2) OR The Responsible Entity has developed a Cyber Security Incident response plan, but did

R #	Time Horizon	VRF	Violation Severity Levels (CIP-008-5)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						not provide at least preliminary notification to ES-ISAC within one hour from identification of a Reportable Cyber Security Incident. (1.2)
R2	**Operations Planning** **Real-time Operations**	**Lower**	The Responsible Entity has not tested the Cyber Security Incident response plan(s) within 15 calendar months, not exceeding 16 calendar months between tests of the plan. (2.1)	The Responsible Entity has not tested the Cyber Security Incident response plan(s) within 16 calendar months, not exceeding 17 calendar months between tests of the plan. (2.1)	The Responsible Entity has not tested the Cyber Security Incident response plan(s) within 17 calendar months, not exceeding 18 calendar months between tests of the plan. (2.1) OR The Responsible Entity did not document deviations, if any, from the plan during a test or when a Reportable Cyber Security Incident occurs. (2.2)	The Responsible Entity has not tested the Cyber Security Incident response plan(s) within ~~19~~ 18 calendar months between tests of the plan. (2.1) OR The Responsible Entity did not retain relevant records related to Reportable Cyber Security Incidents. (2.3)
R3	**Operations Assessment**	**Lower**	The Responsible Entity has not notified each person or group with	The Responsible Entity has not updated the	The Responsible Entity has neither	The Responsible Entity has neither

R #	Time Horizon	VRF	Violation Severity Levels (CIP-008-5)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
			a defined role in the Cyber Security Incident response plan of updates to the Cyber Security Incident response plan within greater than 90 but less than 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (3.1.3)	Cyber Security Incident response plan based on any documented lessons learned within 90 and less than 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (3.1.2) OR The Responsible Entity has not notified each person or group with a defined role in the Cyber Security Incident response plan of updates to the Cyber Security Incident response plan within 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (3.1.3) OR	documented lessons learned nor documented the absence of any lessons learned within 90 and less than 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (3.1.1) OR The Responsible Entity has not updated the Cyber Security Incident response plan based on any documented lessons learned within 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (3.1.2) OR The Responsible Entity has not updated the	documented lessons learned nor documented the absence of any lessons learned within 120 calendar days of a test or actual incident response to a Reportable Cyber Security Incident. (3.1.1)

R #	Time Horizon	VRF	Violation Severity Levels (CIP-008-5)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
				The Responsible Entity has not updated the Cyber Security Incident response plan(s) or notified each person or group with a defined role within 60 and less than 90 calendar days of any of the following changes that the responsible entity determines would impact the ability to execute the plan: (3.2) • Roles or responsibilities, or • Cyber Security Incident response groups or individuals, or • Technology changes.	Cyber Security Incident response plan(s) or notified each person or group with a defined role within 90 calendar days of any of the following changes that the responsible entity determines would impact the ability to execute the plan: (3.2) • Roles or responsibilities, or • Cyber Security Incident response groups or individuals, or • Technology changes.

None.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. Furthermore,

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The following guidelines are available to assist in addressing the required components of a Cyber Security Incident response plan:

- Department of Homeland Security, Control Systems Security Program, *Developing an Industrial Control Systems Cyber Security Incident Response Capability*, 2009, online at http://www.us-cert.gov/control_systems/practices/documents/final-RP_ics_cybersecurity_incident_response_100609.pdf
- National Institute of Standards and Technology, *Computer Security Incident Handling Guide*, Special Publication 800-61 revision 1, March 2008, online at http://csrc.nist.gov/publications/nistpubs/800-61-rev1/SP800-61rev1.pdf

For Part 1.2, a Reportable Cyber Security Incident is a Cyber Security Incident that has compromised or disrupted one or more reliability tasks of a functional entity. It is helpful to distinguish Reportable Cyber Security Incidents as one resulting in a necessary response action. A response action can fall into one of two categories: Necessary or elective. The distinguishing characteristic is whether or not action was taken in response to an event. Precautionary measures that are not in response to any persistent damage or effects may be designated as elective. All other response actions to avoid any persistent damage or adverse effects, which include the activation of redundant systems, should be designated as necessary.

The reporting obligations for Reportable Cyber Security Incidents require at least a preliminary notice to the ES-ISAC within one hour after determining that a Cyber Security Incident is reportable (not within one hour of the Cyber Security Incident, an important distinction). This addition is in response to the directive addressing this issue in FERC Order No. 706, paragraphs 673 and 676, to report within one hour (at least preliminarily). This standard does not require a complete report within an hour of determining that a Cyber Security Incident is reportable, but at least preliminary notice, which may be a phone call, an email, or sending a Web-based notice. The standard does not require a specific timeframe for completing the full report.

Requirement R2:

Requirement R2 ensures entities periodically test the Cyber Security Incident response plan. This includes the requirement in Part 2.2 to ensure the plan is actually used when testing. The testing requirements are specifically for *Reportable Cyber Security Incidents*.

Entities may use an actual response to a *Reportable Cyber Security Incident* as a substitute for exercising the plan annually. Otherwise, entities must exercise the plan with a paper drill, tabletop exercise, or full operational exercise. For more specific types of exercises, refer to the FEMA Homeland Security Exercise and Evaluation Program (HSEEP). It lists the following four types of discussion-based exercises: seminar, workshop, tabletop, and games. In particular, it defines that, "A tabletop exercise involves key personnel discussing simulated scenarios in an informal setting. Table top exercises (TTX) can be used to assess plans, policies, and procedures."

The HSEEP lists the following three types of operations-based exercises: Drill, functional exercise, and full-scale exercise. It defines that, "[A] full-scale exercise is a multi-agency, multi-jurisdictional, multi-discipline exercise involving functional (e.g., joint field office, Emergency operation centers, etc.) and 'boots on the ground' response (e.g., firefighters decontaminating mock victims)."

In addition to the requirements to implement the response plan, Part 2.3 specifies entities must retain relevant records for *Reportable Cyber Security Incidents*. There are several examples of specific types of evidence listed in the measure. Entities should refer to their handling procedures to determine the types of evidence to retain and how to transport and store the evidence. For further information in retaining incident records, refer to the NIST Guide to Integrating Forensic Techniques into Incident Response (SP800-86). The NIST guideline includes a section (Section 3.1.2) on acquiring data when performing forensics.

Requirement R3:

This requirement ensures entities maintain Cyber Security Incident response plans. There are two requirement parts that trigger plan updates: (1) lessons learned from Part 3.1 and (2) organizational or technology changes from Part 3.2.

The documentation of lessons learned from Part 3.1 is associated with each Reportable Cyber Security Incident and involves the activities as illustrated in Figure 1, below. The deadline to document lessons learned starts after the completion of the incident in recognition that complex incidents on complex systems can take a few days or weeks to complete response

activities. The process of conducting lessons learned can involve the response team discussing the incident to determine gaps or areas of improvement within the plan. Any documented deviations from the plan from Part 2.2 can serve as input to the lessons learned. It is possible to have a *Reportable Cyber Security Incident* without any documented lessons learned. In such cases, the entity must retain documentation of the absence of any lessons learned associated with the *Reportable Cyber Security Incident*.

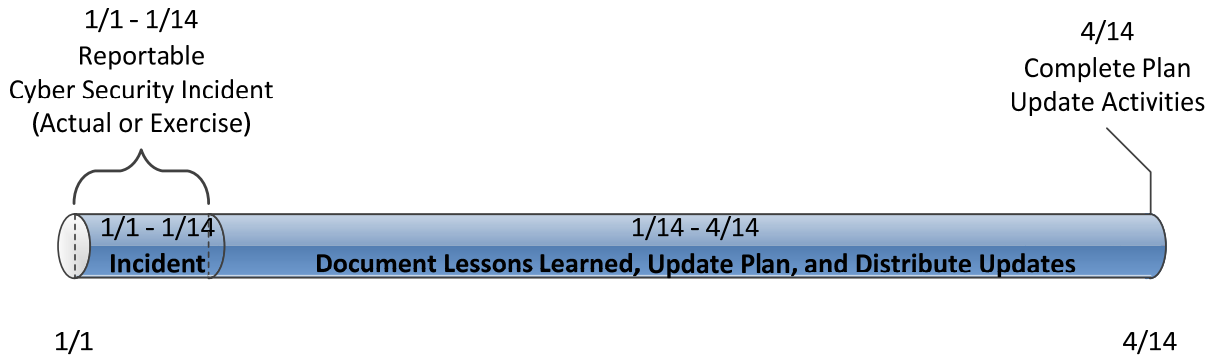

Figure 1: CIP-008-5 R3 Timeline for Reportable Cyber Security Incidents

The activities necessary to complete the lessons learned include updating the plan and distributing those updates. Entities should consider meeting with all of the individuals involved in the incident and documenting the lessons learned as soon after the incident as possible. This allows more time for making effective updates to the plan, obtaining any necessary approvals, and distributing those updates to the incident response team.

The plan change requirement in Part 3.2 is associated with organization and technology changes referenced in the plan and involves the activities illustrated in Figure 2, below. Organizational changes include changes to the roles and responsibilities people have in the plan or changes to the response groups or individuals. This may include changes to the names or contact information listed in the plan. Technology changes affecting the plan may include referenced information sources, communication systems or ticketing systems.

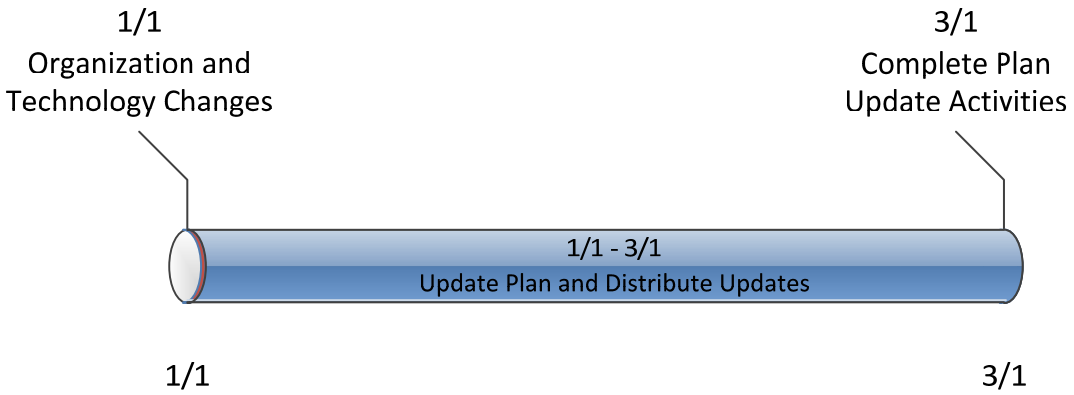

Figure 2: Timeline for Plan Changes in 3.2

Rationale:

During the development of this standard, references to prior versions of the CIP standards and rationale for the requirements and their parts were embedded within the standard. Upon BOT approval, that information was moved to this section.

Rationale for R1:

The implementation of an effective Cyber Security Incident response plan mitigates the risk to the reliable operation of the BES caused as the result of a Cyber Security Incident and provides feedback to Responsible Entities for improving the security controls applying to BES Cyber Systems. Preventative activities can lower the number of incidents, but not all incidents can be prevented. A preplanned incident response capability is therefore necessary for rapidly detecting incidents, minimizing loss and destruction, mitigating the weaknesses that were exploited, and restoring computing services. An enterprise or single incident response plan for all BES Cyber Systems may be used to meet the Requirement. An organization may have a common plan for multiple registered entities it owns.

Summary of Changes: Wording changes have been incorporated based primarily on industry feedback to more specifically describe required actions.

Reference to prior version: (Part 1.1) CIP-008, R1.1

Change Description and Justification: (Part 1.1)

"Characterize" has been changed to "identify" for clarity. "Response actions" has been changed to "respond to" for clarity.

Reference to prior version: (Part 1.2) CIP-008, R1.1

Change Description and Justification: (Part 1.2)

Addresses the reporting requirements from previous versions of CIP-008. This requirement part only obligates entities to have a process for determining Reportable Cyber Security Incidents. Also addresses the directive in FERC Order No. 706, paragraphs 673 and 676 to report within one hour (at least preliminarily).

Reference to prior version: (Part 1.3) CIP-008, R1.2

Change Description and Justification: (Part 1.3)

Replaced incident response teams with incident response "groups or individuals" to avoid the interpretation that roles and responsibilities sections must reference specific teams.

Reference to prior version: (Part 1.4) CIP-008, R1.2

Change Description and Justification: (Part 1.4)
Conforming change to reference new defined term Cyber Security Incidents.

Rationale for R2:

The implementation of an effective Cyber Security Incident response plan mitigates the risk to the reliable operation of the BES caused as the result of a Cyber Security Incident and provides feedback to Responsible Entities for improving the security controls applying to BES Cyber Systems. This requirement ensures implementation of the response plans. Requirement Part 2.3 ensures the retention of incident documentation for post event analysis.

This requirement obligates entities to follow the Cyber Security Incident response plan when an incident occurs or when testing, but does not restrict entities from taking needed deviations from the plan. It ensures the plan represents the actual response and does not exist for documentation only. If a plan is written at a high enough level, then every action during the response should not be subject to scrutiny. The plan will likely allow for the appropriate variance in tactical decisions made by incident responders. Deviations from the plan can be documented during the incident response or afterward as part of the review.

Summary of Changes: Added testing requirements to verify the Responsible Entity's response plan's effectiveness and consistent application in responding to a Cyber Security Incident(s) impacting a BES Cyber System.

Reference to prior version: (Part 2.1) CIP-008, R1.6

Change Description and Justification: (Part 2.1)

Minor wording changes; essentially unchanged.

Reference to prior version: (Part 2.2) CIP-008, R1.6

Change Description and Justification: (Part 2.2)

Allows deviation from plan(s) during actual events or testing if deviations are recorded for review.

Reference to prior version: (Part 2.3) CIP-008, R2

Change Description and Justification: (Part 2.3)
Removed references to the retention period because the Standard addresses data retention in the Compliance Section.

Rationale for R3:

Conduct sufficient reviews, updates and communications to verify the Responsible Entity's response plan's effectiveness and consistent application in responding to a Cyber Security Incident(s) impacting a BES Cyber System. A separate plan is not required for those requirement parts of the table applicable to High or Medium Impact BES Cyber Systems. If an entity has a single Cyber Security Incident response plan and High or Medium Impact BES Cyber Systems, then the additional requirements would apply to the single plan.

Summary of Changes: Changes here address the FERC Order 706, Paragraph 686, which includes a directive to perform after-action review for tests or actual incidents and update the

plan based on lessons learned. Additional changes include specification of what it means to review the plan and specification of changes that would require an update to the plan.

Reference to prior version: (Part 3.1) CIP-008, R1.5

Change Description and Justification: (Part 3.1)

Addresses FERC Order 706, Paragraph 686 to document test or actual incidents and lessons learned.

Reference to prior version: (Part 3.2) CIP-008, R1.4

Change Description and Justification: (Part 3.2)

Specifies the activities required to maintain the plan. The previous version required entities to update the plan in response to any changes. The modifications make clear the changes that would require an update.

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a Responsible Entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3		Updated version number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	Update
3	3/31/10	Approved by FERC.	

4	12/30/10	Modified to add specific criteria for Critical Asset identification.	Update
4	1/24/11	Approved by the NERC Board of Trustees.	Update
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-008-5. (Order becomes effective on 2/3/14.)	

CIP-009-5 Violation Risk Factor and Violation Severity Level Revisions

Clean and Redline

Clean

A. Introduction

1. Title: Cyber Security — Recovery Plans for BES Cyber Systems

2. Number: CIP-009-5

3. Purpose: To recover reliability functions performed by BES Cyber Systems by specifying recovery plan requirements in support of the continued stability, operability, and reliability of the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-009-5:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5 identification and categorization processes.

5. Effective Dates:

1. **24 Months Minimum** – CIP-009-5 shall become effective on the later of July 1, 2015, or the first calendar day of the ninth calendar quarter after the effective date of the order providing applicable regulatory approval.
2. In those jurisdictions where no regulatory approval is required, CIP-009-5 shall become effective on the first day of the ninth calendar quarter following Board of Trustees' approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

6. Background:

Standard CIP-009-5 exists as part of a suite of CIP Standards related to cyber security. CIP-002-5 requires the initial identification and categorization of BES Cyber Systems. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1, and CIP-011-1 require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems. This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:

> Each Responsible Entity shall implement**, in a manner that identifies, assesses, and corrects deficiencies,** . . .

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in their documented processes, but they must address the applicable requirements in the table. The

documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.
Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to BES Cyber Systems located at a Control Center and categorized as medium impact according to the CIP-002-5 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples include, but are not limited to firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.

B. Requirements and Measures

R1. Each Responsible Entity shall have one or more documented recovery plans that collectively include each of the applicable requirement parts in *CIP-009-5 Table R1 – Recovery Plan Specifications*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning].*

M1. Evidence must include the documented recovery plan(s) that collectively include the applicable requirement parts in *CIP-009-5 Table R1 – Recovery Plan Specifications*.

CIP-009-5 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Conditions for activation of the recovery plan(s).	An example of evidence may include, but is not limited to, one or more plans that include language identifying conditions for activation of the recovery plan(s).

CIP-009-5 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Roles and responsibilities of responders.	An example of evidence may include, but is not limited to, one or more recovery plans that include language identifying the roles and responsibilities of responders.
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	One or more processes for the backup and storage of information required to recover BES Cyber System functionality.	An example of evidence may include, but is not limited to, documentation of specific processes for the backup and storage of information required to recover BES Cyber System functionality.

CIP-009-5 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	One or more processes to verify the successful completion of the backup processes in Part 1.3 and to address any backup failures.	An example of evidence may include, but is not limited to, logs, workflow or other documentation confirming that the backup process completed successfully and backup failures, if any, were addressed.
1.5	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	One or more processes to preserve data, per Cyber Asset capability, for determining the cause of a Cyber Security Incident that triggers activation of the recovery plan(s). Data preservation should not impede or restrict recovery.	An example of evidence may include, but is not limited to, procedures to preserve data, such as preserving a corrupted drive or making a data mirror of the system before proceeding with recovery.

R2. Each Responsible Entity shall implement, in a manner that identifies, assesses, and corrects deficiencies, its documented recovery plan(s) to collectively include each of the applicable requirement parts in *CIP-009-5 Table R2 – Recovery Plan Implementation and Testing. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning and Real-time Operations.]*

M2. Evidence must include, but is not limited to, documentation that collectively demonstrates implementation of each of the applicable requirement parts in *CIP-009-5 Table R2 – Recovery Plan Implementation and Testing.*

CIP-009-5 Table R2 – Recovery Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	Test each of the recovery plans referenced in Requirement R1 at least once every 15 calendar months: • By recovering from an actual incident; • With a paper drill or tabletop exercise; or • With an operational exercise.	An example of evidence may include, but is not limited to, dated evidence of a test (by recovering from an actual incident, with a paper drill or tabletop exercise, or with an operational exercise) of the recovery plan at least once every 15 calendar months. For the paper drill or full operational exercise, evidence may include meeting notices, minutes, or other records of exercise findings.

CIP-009-5 Table R2 – Recovery Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	Test a representative sample of information used to recover BES Cyber System functionality at least once every 15 calendar months to ensure that the information is useable and is compatible with current configurations. An actual recovery that incorporates the information used to recover BES Cyber System functionality substitutes for this test.	An example of evidence may include, but is not limited to, operational logs or test results with criteria for testing the usability (e.g. sample tape load, browsing tape contents) and compatibility with current system configurations (e.g. manual or automated comparison checkpoints between backup media contents and current configuration).
2.3	High Impact BES Cyber Systems	Test each of the recovery plans referenced in Requirement R1 at least once every 36 calendar months through an operational exercise of the recovery plans in an environment representative of the production environment. An actual recovery response may substitute for an operational exercise.	Examples of evidence may include, but are not limited to, dated documentation of: • An operational exercise at least once every 36 calendar months between exercises, that demonstrates recovery in a representative environment; or • An actual recovery response that occurred within the 36 calendar month timeframe that exercised the recovery plans.

R3. Each Responsible Entity shall maintain each of its recovery plans in accordance with each of the applicable requirement parts in *CIP-009-5 Table R3 – Recovery Plan Review, Update and Communication*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Assessment].*

M3. Acceptable evidence includes, but is not limited to, each of the applicable requirement parts in *CIP-009-5 Table R3 – Recovery Plan Review, Update and Communication.*

CIP-009-5 Table R3 – Recovery Plan Review, Update and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	No later than 90 calendar days after completion of a recovery plan test or actual recovery: 3.1.1. Document any lessons learned associated with a recovery plan test or actual recovery or document the absence of any lessons learned; 3.1.2. Update the recovery plan based on any documented lessons learned associated with the plan; and 3.1.3. Notify each person or group with a defined role in the recovery plan of the updates to the recovery plan based on any documented lessons learned.	An example of evidence may include, but is not limited to, all of the following: 1. Dated documentation of identified deficiencies or lessons learned for each recovery plan test or actual incident recovery or dated documentation stating there were no lessons learned; 2. Dated and revised recovery plan showing any changes based on the lessons learned; and 3. Evidence of plan update distribution including, but not limited to: • Emails; • USPS or other mail service; • Electronic distribution system; or • Training sign-in sheets.

CIP-009-5 Table R3 – Recovery Plan Review, Update and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	No later than 60 calendar days after a change to the roles or responsibilities, responders, or technology that the Responsible Entity determines would impact the ability to execute the recovery plan: 3.2.1. Update the recovery plan; and 3.2.2. Notify each person or group with a defined role in the recovery plan of the updates.	An example of evidence may include, but is not limited to, all of the following: 1. Dated and revised recovery plan with changes to the roles or responsibilities, responders, or technology; and 2. Evidence of plan update distribution including, but not limited to: • Emails; • USPS or other mail service; • Electronic distribution system; or • Training sign-in sheets.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

- Compliance Audit
- Self-Certification
- Spot Checking
- Compliance Investigation
- Self-Reporting
- Complaint

1.4. Additional Compliance Information:

- None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-009-5)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Long-term Planning**	**Medium**	N/A	The Responsible Entity has developed recovery plan(s), but the plan(s) do not address one of the requirements included in Parts 1.2 through 1.5.	The Responsible Entity has developed recovery plan(s), but the plan(s) do not address two of the requirements included in Parts 1.2 through 1.5.	The Responsible Entity has not created recovery plan(s) for BES Cyber Systems. OR The Responsible Entity has created recovery plan(s) for BES Cyber Systems, but the plan(s) does not address the conditions for activation in Part 1.1. OR The Responsible Entity has created recovery plan(s) for BES Cyber Systems, but the plan(s) does not address three or more of the requirements in Parts 1.2 through 1.5.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. Furthermore,

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The following guidelines are available to assist in addressing the required components of a recovery plan:

- NERC, Security Guideline for the Electricity Sector: Continuity of Business Processes and Operations Operational Functions, September 2011, online at http://www.nerc.com/docs/cip/sgwg/Continuity%20of%20Business%20and%20Operational%20Functions%20FINAL%20102511.pdf
- National Institute of Standards and Technology, Contingency Planning Guide for Federal Information Systems, Special Publication 800-34 revision 1, May 2010, online at http://csrc.nist.gov/publications/nistpubs/800-34-rev1/sp800-34-rev1_errata-Nov11-2010.pdf

The term recovery plan is used throughout this Standard to refer to a documented set of instructions and resources needed to recover reliability functions performed by BES Cyber Systems. The recovery plan may exist as part of a larger business continuity or disaster recovery plan, but the term does not imply any additional obligations associated with those disciplines outside of the Requirements.

A documented recovery plan may not be necessary for each applicable BES Cyber System. For example, the short-term recovery plan for a BES Cyber System in a specific substation may be

managed on a daily basis by advanced power system applications such as state estimation, contingency and remedial action, and outage scheduling. One recovery plan for BES Cyber Systems should suffice for several similar facilities such as those found in substations or power plants' facilities.

For Part 1.1, the conditions for activation of the recovery plan should consider viable threats to the BES Cyber System such as natural disasters, computing equipment failures, computing environment failures, and Cyber Security Incidents. A business impact analysis for the BES Cyber System may be useful in determining these conditions.

For Part 1.2, entities should identify the individuals required for responding to a recovery operation of the applicable BES Cyber System.

For Part 1.3, entities should consider the following types of information to recover BES Cyber System functionality:

1. Installation files and media;
2. Current backup tapes and any additional documented configuration settings;
3. Documented build or restoration procedures; and
4. Cross site replication storage.

For Part 1.4, the processes to verify the successful completion of backup processes should include checking for: (1) usability of backup media, (2) logs or inspection showing that information from current, production system could be read, and (3) logs or inspection showing that information was written to the backup media. Test restorations are not required for this Requirement Part. The following backup scenarios provide examples of effective processes to verify successful completion and detect any backup failures:

- Periodic (e.g. daily or weekly) backup process – Review generated logs or job status reports and set up notifications for backup failures.
- Non-periodic backup process– If a single backup is provided during the commissioning of the system, then only the initial and periodic (every 15 months) testing must be done. Additional testing should be done as necessary and can be a part of the configuration change management program.
- Data mirroring – Configure alerts on the failure of data transfer for an amount of time specified by the entity (e.g. 15 minutes) in which the information on the mirrored disk may no longer be useful for recovery.
- Manual configuration information – Inspect the information used for recovery prior to storing initially and periodically (every 15 months). Additional inspection should be done as necessary and can be a part of the configuration change management program.

The plan must also include processes to address backup failures. These processes should specify the response to failure notifications or other forms of identification.

For Part 1.5, the recovery plan must include considerations for preservation of data to determine the cause of a Cyber Security Incident. Because it is not always possible to initially

know if a Cyber Security Incident caused the recovery activation, the data preservation procedures should be followed until such point a Cyber Security Incident can be ruled out. CIP-008 addresses the retention of data associated with a Cyber Security Incident.

Requirement R2:

A Responsible Entity must exercise each BES Cyber System recovery plan every 15 months. However, this does not necessarily mean that the entity must test each plan individually. BES Cyber Systems that are numerous and distributed, such as those found at substations, may not require an individual recovery plan and the associated redundant facilities since reengineering and reconstruction may be the generic response to a severe event. Conversely, there is typically one control center per bulk transmission service area that requires a redundant or backup facility. Because of these differences, the recovery plans associated with control centers differ a great deal from those associated with power plants and substations.

A recovery plan test does not necessarily cover all aspects of a recovery plan and failure scenarios, but the test should be sufficient to ensure the plan is up to date and at least one restoration process of the applicable cyber systems is covered.

Entities may use an actual recovery as a substitute for exercising the plan every 15 months. Otherwise, entities must exercise the plan with a paper drill, tabletop exercise, or operational exercise. For more specific types of exercises, refer to the FEMA Homeland Security Exercise and Evaluation Program (HSEEP). It lists the following four types of discussion-based exercises: seminar, workshop, tabletop, and games. In particular, it defines that, "A tabletop exercise involves key personnel discussing simulated scenarios in an informal setting. [Table top exercises (TTX)] can be used to assess plans, policies, and procedures."

The HSEEP lists the following three types of operations-based exercises: Drill, functional exercise, and full-scale exercise. It defines that, "[A] full-scale exercise is a multi-agency, multi-jurisdictional, multi-discipline exercise involving functional (e.g., joint field office, Emergency operation centers, etc.) and 'boots on the ground' response (e.g., firefighters decontaminating mock victims)."

For Part 2.2, entities should refer to the backup and storage of information required to recover BES Cyber System functionality in Requirement Part 1.3. This provides additional assurance that the information will actually recover the BES Cyber System as necessary. For most complex computing equipment, a full test of the information is not feasible. Entities should determine the representative sample of information that provides assurance in the processes for Requirement Part 1.3. The test must include steps for ensuring the information is useable and current. For backup media, this can include testing a representative sample to make sure the information can be loaded, and checking the content to make sure the information reflects the current configuration of the applicable Cyber Assets.

Requirement R3:

This requirement ensures entities maintain recovery plans. There are two requirement parts that trigger plan updates: (1) lessons learned and (2) organizational or technology changes.

The documentation of lessons learned is associated with each recovery activation, and it involves the activities as illustrated in Figure 1~~Figure 1~~, below. The deadline to document lessons learned starts after the completion of the recovery operation in recognition that complex recovery activities can take a few days or weeks to complete. The process of conducting lessons learned can involve the recovery team discussing the incident to determine gaps or areas of improvement within the plan. It is possible to have a recovery activation without any documented lessons learned. In such cases, the entity must retain documentation of the absence of any lessons learned associated with the recovery activation.

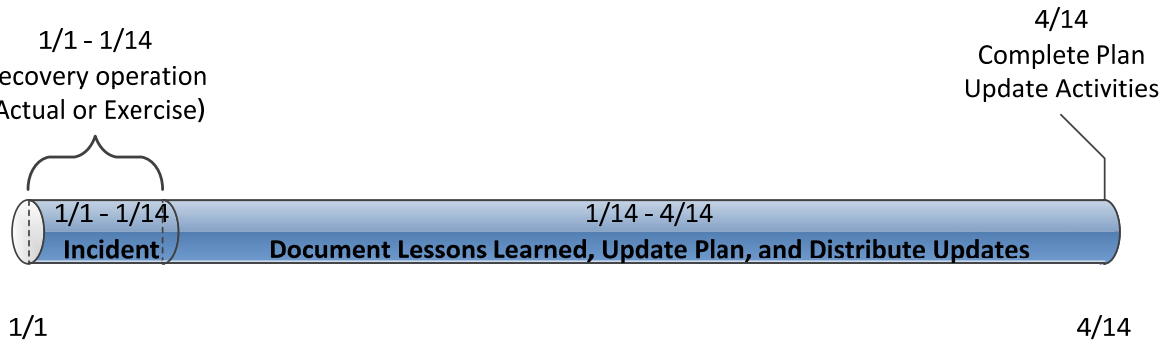

Figure 1: CIP-009-5 R3 Timeline

The activities necessary to complete the lessons learned include updating the plan and distributing those updates. Entities should consider meeting with all of the individuals involved in the recovery and documenting the lessons learned as soon after the recovery activation as possible. This allows more time for making effective updates to the plan, obtaining any necessary approvals, and distributing those updates to the recovery team.

The plan change requirement is associated with organization and technology changes referenced in the plan and involves the activities illustrated in Figure 2~~Figure 2~~, below. Organizational changes include changes to the roles and responsibilities people have in the plan or changes to the response groups or individuals. This may include changes to the names or contact information listed in the plan. Technology changes affecting the plan may include referenced information sources, communication systems, or ticketing systems.

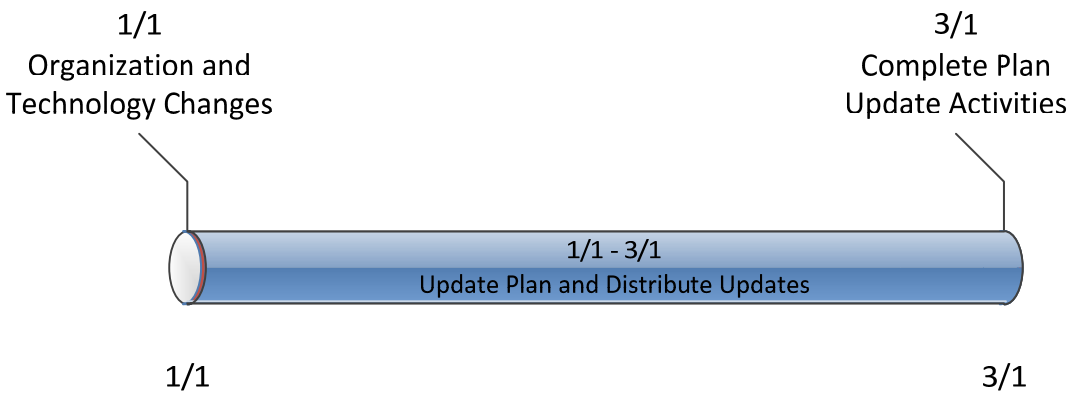

Figure 2: Timeline for Plan Changes in 3.2

When notifying individuals of response plan changes, entities should keep in mind that recovery plans may be considered BES Cyber System Information, and they should take the appropriate measures to prevent unauthorized disclosure of recovery plan information. For example, the recovery plan itself, or other sensitive information about the recovery plan, should be redacted from Email or other unencrypted transmission.

Rationale:

During the development of this standard, references to prior versions of the CIP standards and rationale for the requirements and their parts were embedded within the standard. Upon BOT approval, that information was moved to this section.

Rationale for R1:

Preventative activities can lower the number of incidents, but not all incidents can be prevented. A preplanned recovery capability is, therefore, necessary for rapidly recovering from incidents, minimizing loss and destruction, mitigating the weaknesses that were exploited, and restoring computing services so that planned and consistent recovery action to restore BES Cyber System functionality occurs.

Summary of Changes: Added provisions to protect data that would be useful in the investigation of an event that results in the need for a Cyber System recovery plan to be utilized.

Reference to prior version: (Part 1.3) CIP-009, R4

Change Description and Justification: (Part 1.3)

Addresses FERC Order Paragraph 739 and 748. The modified wording was abstracted from Paragraph 744.

Reference to prior version: (Part 1.4) New Requirement

Change Description and Justification: (Part 1.4)

Addresses FERC Order Section 739 and 748.

Reference to prior version: (Part 1.5) New Requirement

Change Description and Justification: (Part 1.5)

Added requirement to address FERC Order No. 706, Paragraph 706.

Rationale for R2:

The implementation of an effective recovery plan mitigates the risk to the reliable operation of the BES by reducing the time to recover from various hazards affecting BES Cyber Systems. This requirement ensures continued implementation of the response plans.

Requirement Part 2.2 provides further assurance in the information (e.g. backup tapes, mirrored hot-sites, etc.) necessary to recover BES Cyber Systems. A full test is not feasible in most instances due to the amount of recovery information, and the Responsible Entity must determine a sampling that provides assurance in the usability of the information.

Summary of Changes. Added operational testing for recovery of BES Cyber Systems.

Reference to prior version: (Part 2.1) CIP-009, R2

Change Description and Justification: (Part 2.1)

Minor wording change; essentially unchanged.

Reference to prior version: (Part 2.2) CIP-009, R5

Change Description and Justification: (Part 2.2)

Specifies what to test and makes clear the test can be a representative sampling. These changes, along with Requirement Part 1.4 address the FERC Order No. 706, Paragraphs 739 and 748 related to testing of backups by providing high confidence the information will actually recover the system as necessary.

Reference to prior version: (Part 2.3) CIP-009, R2

Change Description and Justification: (Part 2.3)

Addresses FERC Order No. 706, Paragraph 725 to add the requirement that the recovery plan test be a full operational test once every 3 years.

Rationale for R3:

To improve the effectiveness of BES Cyber System recovery plan(s) following a test, and to ensure the maintenance and distribution of the recovery plan(s). Responsible Entities achieve this by (i) performing a lessons learned review in 3.1 and (ii) revising the plan in 3.2 based on specific changes in the organization or technology that would impact plan execution. In both instances when the plan needs to change, the Responsible Entity updates and distributes the plan.

Summary of Changes: Makes clear when to perform lessons learned review of the plan and specifies the timeframe for updating the recovery plan.

Reference to prior version: (Part 3.1) CIP-009, R1 and R3

Change Description and Justification: (Part 3.1)

Added the timeframes for performing lessons learned and completing the plan updates. This requirement combines all three activities in one place. Where previous versions specified 30 calendar days for performing lessons learned, followed by additional time for updating recovery plans and notification, this requirement combines those activities into a single timeframe.

Reference to prior version: (Part 3.2) New Requirement

Change Description and Justification: (Part 3.2)

Specifies the activities required to maintain the plan. The previous version required entities to update the plan in response to any changes. The modifications make clear the specific changes that would require an update.

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center"	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a Responsible Entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	

3		Updated version number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	Update
3	3/31/10	Approved by FERC.	
4	12/30/10	Modified to add specific criteria for Critical Asset identification.	Update
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-009-5. (Order becomes effective on 2/3/14.)	
5	5/7/14	Adopted by the NERC Board of Trustees to modify VSLs for Requirement R3.	

Redline

A. Introduction

1. Title: Cyber Security — Recovery Plans for BES Cyber Systems

2. Number: CIP-009-5

3. Purpose: To recover reliability functions performed by BES Cyber Systems by specifying recovery plan requirements in support of the continued stability, operability, and reliability of the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-009-5:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5 identification and categorization processes.

5. Effective Dates:

1. **24 Months Minimum** – CIP-009-5 shall become effective on the later of July 1, 2015, or the first calendar day of the ninth calendar quarter after the effective date of the order providing applicable regulatory approval.
2. In those jurisdictions where no regulatory approval is required, CIP-009-5 shall become effective on the first day of the ninth calendar quarter following Board of Trustees' approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

6. Background:

Standard CIP-009-5 exists as part of a suite of CIP Standards related to cyber security. CIP-002-5 requires the initial identification and categorization of BES Cyber Systems. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1, and CIP-011-1 require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems. This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:

> Each Responsible Entity shall implement**, in a manner that identifies, assesses, and corrects deficiencies,** . . .

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in their documented processes, but they must address the applicable requirements in the table. The

documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.
Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to BES Cyber Systems located at a Control Center and categorized as medium impact according to the CIP-002-5 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples include, but are not limited to firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.

B. Requirements and Measures

R1. Each Responsible Entity shall have one or more documented recovery plans that collectively include each of the applicable requirement parts in *CIP-009-5 Table R1 – Recovery Plan Specifications*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning].*

M1. Evidence must include the documented recovery plan(s) that collectively include the applicable requirement parts in *CIP-009-5 Table R1 – Recovery Plan Specifications*.

CIP-009-5 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Conditions for activation of the recovery plan(s).	An example of evidence may include, but is not limited to, one or more plans that include language identifying conditions for activation of the recovery plan(s).

CIP-009-5 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Roles and responsibilities of responders.	An example of evidence may include, but is not limited to, one or more recovery plans that include language identifying the roles and responsibilities of responders.
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	One or more processes for the backup and storage of information required to recover BES Cyber System functionality.	An example of evidence may include, but is not limited to, documentation of specific processes for the backup and storage of information required to recover BES Cyber System functionality.

CIP-009-5 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	One or more processes to verify the successful completion of the backup processes in Part 1.3 and to address any backup failures.	An example of evidence may include, but is not limited to, logs, workflow or other documentation confirming that the backup process completed successfully and backup failures, if any, were addressed.
1.5	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	One or more processes to preserve data, per Cyber Asset capability, for determining the cause of a Cyber Security Incident that triggers activation of the recovery plan(s). Data preservation should not impede or restrict recovery.	An example of evidence may include, but is not limited to, procedures to preserve data, such as preserving a corrupted drive or making a data mirror of the system before proceeding with recovery.

R2. Each Responsible Entity shall implement, in a manner that identifies, assesses, and corrects deficiencies, its documented recovery plan(s) to collectively include each of the applicable requirement parts in *CIP-009-5 Table R2 – Recovery Plan Implementation and Testing. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning and Real-time Operations.]*

M2. Evidence must include, but is not limited to, documentation that collectively demonstrates implementation of each of the applicable requirement parts in *CIP-009-5 Table R2 – Recovery Plan Implementation and Testing.*

CIP-009-5 Table R2 – Recovery Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	Test each of the recovery plans referenced in Requirement R1 at least once every 15 calendar months: • By recovering from an actual incident; • With a paper drill or tabletop exercise; or • With an operational exercise.	An example of evidence may include, but is not limited to, dated evidence of a test (by recovering from an actual incident, with a paper drill or tabletop exercise, or with an operational exercise) of the recovery plan at least once every 15 calendar months. For the paper drill or full operational exercise, evidence may include meeting notices, minutes, or other records of exercise findings.

CIP-009-5 Table R2 – Recovery Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	Test a representative sample of information used to recover BES Cyber System functionality at least once every 15 calendar months to ensure that the information is useable and is compatible with current configurations. An actual recovery that incorporates the information used to recover BES Cyber System functionality substitutes for this test.	An example of evidence may include, but is not limited to, operational logs or test results with criteria for testing the usability (e.g. sample tape load, browsing tape contents) and compatibility with current system configurations (e.g. manual or automated comparison checkpoints between backup media contents and current configuration).
2.3	High Impact BES Cyber Systems	Test each of the recovery plans referenced in Requirement R1 at least once every 36 calendar months through an operational exercise of the recovery plans in an environment representative of the production environment. An actual recovery response may substitute for an operational exercise.	Examples of evidence may include, but are not limited to, dated documentation of: • An operational exercise at least once every 36 calendar months between exercises, that demonstrates recovery in a representative environment; or • An actual recovery response that occurred within the 36 calendar month timeframe that exercised the recovery plans.

R3. Each Responsible Entity shall maintain each of its recovery plans in accordance with each of the applicable requirement parts in *CIP-009-5 Table R3 – Recovery Plan Review, Update and Communication*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Assessment].*

M3. Acceptable evidence includes, but is not limited to, each of the applicable requirement parts in *CIP-009-5 Table R3 – Recovery Plan Review, Update and Communication.*

CIP-009-5 Table R3 – Recovery Plan Review, Update and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	No later than 90 calendar days after completion of a recovery plan test or actual recovery: 3.1.1. Document any lessons learned associated with a recovery plan test or actual recovery or document the absence of any lessons learned; 3.1.2. Update the recovery plan based on any documented lessons learned associated with the plan; and 3.1.3. Notify each person or group with a defined role in the recovery plan of the updates to the recovery plan based on any documented lessons learned.	An example of evidence may include, but is not limited to, all of the following: 1. Dated documentation of identified deficiencies or lessons learned for each recovery plan test or actual incident recovery or dated documentation stating there were no lessons learned; 2. Dated and revised recovery plan showing any changes based on the lessons learned; and 3. Evidence of plan update distribution including, but not limited to: • Emails; • USPS or other mail service; • Electronic distribution system; or • Training sign-in sheets.

CIP-009-5 Table R3 – Recovery Plan Review, Update and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	No later than 60 calendar days after a change to the roles or responsibilities, responders, or technology that the Responsible Entity determines would impact the ability to execute the recovery plan: 3.2.1. Update the recovery plan; and 3.2.2. Notify each person or group with a defined role in the recovery plan of the updates.	An example of evidence may include, but is not limited to, all of the following: 1. Dated and revised recovery plan with changes to the roles or responsibilities, responders, or technology; and 2. Evidence of plan update distribution including, but not limited to: • Emails; • USPS or other mail service; • Electronic distribution system; or • Training sign-in sheets.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

- Compliance Audit
- Self-Certification
- Spot Checking
- Compliance Investigation
- Self-Reporting
- Complaint

1.4. Additional Compliance Information:

- None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-009-5)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Long-term Planning**	**Medium**	N/A	The Responsible Entity has developed recovery plan(s), but the plan(s) do not address one of the requirements included in Parts 1.2 through 1.5.	The Responsible Entity has developed recovery plan(s), but the plan(s) do not address two of the requirements included in Parts 1.2 through 1.5.	The Responsible Entity has not created recovery plan(s) for BES Cyber Systems. OR The Responsible Entity has created recovery plan(s) for BES Cyber Systems, but the plan(s) does not address the conditions for activation in Part 1.1. OR The Responsible Entity has created recovery plan(s) for BES Cyber Systems, but the plan(s) does not address three or more of the requirements in Parts 1.2 through 1.5.

R #	Time Horizon	VRF	Violation Severity Levels (CIP-009-5)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R2	**Operations Planning** **Real-time Operations**	**Lower**	The Responsible Entity has not tested the recovery plan(s) according to R2 Part 2.1 within 15 calendar months, not exceeding 16 calendar months between tests of the plan, and when tested, any deficiencies were identified, assessed, and corrected. (2.1) OR The Responsible Entity has not tested a representative sample of the information used in the recovery of BES Cyber System functionality according to R2 Part 2.2 within 15 calendar months, not exceeding 16 calendar months between tests, and	The Responsible Entity has not tested the recovery plan(s) within 16 calendar months, not exceeding 17 calendar months between tests of the plan, and when tested, any deficiencies were identified, assessed, and corrected. (2.1) OR The Responsible Entity has not tested a representative sample of the information used in the recovery of BES Cyber System functionality according to R2 Part 2.2 within 16 calendar months, not exceeding 17 calendar months between tests, and when tested, any	The Responsible Entity has not tested the recovery plan(s) according to R2 Part 2.1 within 17 calendar months, not exceeding 18 calendar months between tests of the plan, and when tested, any deficiencies were identified, assessed, and corrected. (2.1) OR The Responsible Entity has not tested a representative sample of the information used in the recovery of BES Cyber System functionality according to R2 Part 2.2 within 17 calendar months, not exceeding 18 calendar months between tests, and	The Responsible Entity has not tested the recovery plan(s) according to R2 Part 2.1 within 18 calendar months between tests of the plan. (2.1) OR The Responsible Entity has tested the recovery plan(s) according to R2 Part 2.1 and identified deficiencies, but did not assess or correct the deficiencies. (2.1) OR The Responsible Entity has tested the recovery plan(s) according to R2 Part 2.1 but did not identify, assess, or correct the deficiencies. (2.1)

R #	Time Horizon	VRF	Violation Severity Levels (CIP-009-5)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
			when tested, any deficiencies were identified, assessed, and corrected. (2.2) OR The Responsible Entity has not tested the recovery plan according to R2 Part 2.3 within 36 calendar months, not exceeding 37 calendar months between tests, and when tested, any deficiencies were identified, assessed, and corrected. (2.3)	deficiencies were identified, assessed, and corrected. (2.2) OR The Responsible Entity has not tested the recovery plan according to R2 Part 2.3 within 37 calendar months, not exceeding 38 calendar months between tests, and when tested, any deficiencies were identified, assessed, and corrected. (2.3)	when tested, any deficiencies were identified, assessed, and corrected. (2.2) OR The Responsible Entity has not tested the recovery plan according to R2 Part 2.3 within 38 calendar months, not exceeding 39 calendar months between tests, and when tested, any deficiencies were identified, assessed, and corrected. (2.3)	OR The Responsible Entity has not tested a representative sample of the information used in the recovery of BES Cyber System functionality according to R2 Part 2.2 within 18 calendar months between tests. (2.2) OR The Responsible Entity has tested a representative sample of the information used in the recovery of BES Cyber System functionality according to R2 Part 2.2 and identified deficiencies, but did not assess or correct the deficiencies. (2.2)

R #	Time Horizon	VRF	Violation Severity Levels (CIP-009-5)

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. Furthermore,

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The following guidelines are available to assist in addressing the required components of a recovery plan:

- NERC, Security Guideline for the Electricity Sector: Continuity of Business Processes and Operations Operational Functions, September 2011, online at http://www.nerc.com/docs/cip/sgwg/Continuity%20of%20Business%20and%20Operational%20Functions%20FINAL%20102511.pdf
- National Institute of Standards and Technology, Contingency Planning Guide for Federal Information Systems, Special Publication 800-34 revision 1, May 2010, online at http://csrc.nist.gov/publications/nistpubs/800-34-rev1/sp800-34-rev1_errata-Nov11-2010.pdf

The term recovery plan is used throughout this Standard to refer to a documented set of instructions and resources needed to recover reliability functions performed by BES Cyber Systems. The recovery plan may exist as part of a larger business continuity or disaster recovery plan, but the term does not imply any additional obligations associated with those disciplines outside of the Requirements.

A documented recovery plan may not be necessary for each applicable BES Cyber System. For example, the short-term recovery plan for a BES Cyber System in a specific substation may be

managed on a daily basis by advanced power system applications such as state estimation, contingency and remedial action, and outage scheduling. One recovery plan for BES Cyber Systems should suffice for several similar facilities such as those found in substations or power plants' facilities.

For Part 1.1, the conditions for activation of the recovery plan should consider viable threats to the BES Cyber System such as natural disasters, computing equipment failures, computing environment failures, and Cyber Security Incidents. A business impact analysis for the BES Cyber System may be useful in determining these conditions.

For Part 1.2, entities should identify the individuals required for responding to a recovery operation of the applicable BES Cyber System.

For Part 1.3, entities should consider the following types of information to recover BES Cyber System functionality:

1. Installation files and media;
2. Current backup tapes and any additional documented configuration settings;
3. Documented build or restoration procedures; and
4. Cross site replication storage.

For Part 1.4, the processes to verify the successful completion of backup processes should include checking for: (1) usability of backup media, (2) logs or inspection showing that information from current, production system could be read, and (3) logs or inspection showing that information was written to the backup media. Test restorations are not required for this Requirement Part. The following backup scenarios provide examples of effective processes to verify successful completion and detect any backup failures:

- Periodic (e.g. daily or weekly) backup process – Review generated logs or job status reports and set up notifications for backup failures.
- Non-periodic backup process– If a single backup is provided during the commissioning of the system, then only the initial and periodic (every 15 months) testing must be done. Additional testing should be done as necessary and can be a part of the configuration change management program.
- Data mirroring – Configure alerts on the failure of data transfer for an amount of time specified by the entity (e.g. 15 minutes) in which the information on the mirrored disk may no longer be useful for recovery.
- Manual configuration information – Inspect the information used for recovery prior to storing initially and periodically (every 15 months). Additional inspection should be done as necessary and can be a part of the configuration change management program.

The plan must also include processes to address backup failures. These processes should specify the response to failure notifications or other forms of identification.

For Part 1.5, the recovery plan must include considerations for preservation of data to determine the cause of a Cyber Security Incident. Because it is not always possible to initially

know if a Cyber Security Incident caused the recovery activation, the data preservation procedures should be followed until such point a Cyber Security Incident can be ruled out. CIP-008 addresses the retention of data associated with a Cyber Security Incident.

Requirement R2:

A Responsible Entity must exercise each BES Cyber System recovery plan every 15 months. However, this does not necessarily mean that the entity must test each plan individually. BES Cyber Systems that are numerous and distributed, such as those found at substations, may not require an individual recovery plan and the associated redundant facilities since reengineering and reconstruction may be the generic response to a severe event. Conversely, there is typically one control center per bulk transmission service area that requires a redundant or backup facility. Because of these differences, the recovery plans associated with control centers differ a great deal from those associated with power plants and substations.

A recovery plan test does not necessarily cover all aspects of a recovery plan and failure scenarios, but the test should be sufficient to ensure the plan is up to date and at least one restoration process of the applicable cyber systems is covered.

Entities may use an actual recovery as a substitute for exercising the plan every 15 months. Otherwise, entities must exercise the plan with a paper drill, tabletop exercise, or operational exercise. For more specific types of exercises, refer to the FEMA Homeland Security Exercise and Evaluation Program (HSEEP). It lists the following four types of discussion-based exercises: seminar, workshop, tabletop, and games. In particular, it defines that, "A tabletop exercise involves key personnel discussing simulated scenarios in an informal setting. [Table top exercises (TTX)] can be used to assess plans, policies, and procedures."

The HSEEP lists the following three types of operations-based exercises: Drill, functional exercise, and full-scale exercise. It defines that, "[A] full-scale exercise is a multi-agency, multi-jurisdictional, multi-discipline exercise involving functional (e.g., joint field office, Emergency operation centers, etc.) and 'boots on the ground' response (e.g., firefighters decontaminating mock victims)."

For Part 2.2, entities should refer to the backup and storage of information required to recover BES Cyber System functionality in Requirement Part 1.3. This provides additional assurance that the information will actually recover the BES Cyber System as necessary. For most complex computing equipment, a full test of the information is not feasible. Entities should determine the representative sample of information that provides assurance in the processes for Requirement Part 1.3. The test must include steps for ensuring the information is useable and current. For backup media, this can include testing a representative sample to make sure the information can be loaded, and checking the content to make sure the information reflects the current configuration of the applicable Cyber Assets.

Requirement R3:

This requirement ensures entities maintain recovery plans. There are two requirement parts that trigger plan updates: (1) lessons learned and (2) organizational or technology changes.

The documentation of lessons learned is associated with each recovery activation, and it involves the activities as illustrated in Figure 1~~Figure 1~~, below. The deadline to document lessons learned starts after the completion of the recovery operation in recognition that complex recovery activities can take a few days or weeks to complete. The process of conducting lessons learned can involve the recovery team discussing the incident to determine gaps or areas of improvement within the plan. It is possible to have a recovery activation without any documented lessons learned. In such cases, the entity must retain documentation of the absence of any lessons learned associated with the recovery activation.

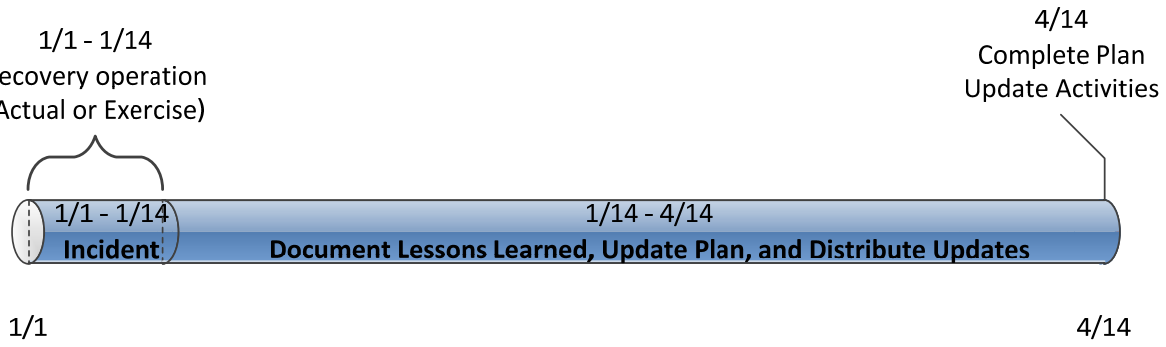

Figure 1: CIP-009-5 R3 Timeline

The activities necessary to complete the lessons learned include updating the plan and distributing those updates. Entities should consider meeting with all of the individuals involved in the recovery and documenting the lessons learned as soon after the recovery activation as possible. This allows more time for making effective updates to the plan, obtaining any necessary approvals, and distributing those updates to the recovery team.

The plan change requirement is associated with organization and technology changes referenced in the plan and involves the activities illustrated in Figure 2~~Figure 2~~, below. Organizational changes include changes to the roles and responsibilities people have in the plan or changes to the response groups or individuals. This may include changes to the names or contact information listed in the plan. Technology changes affecting the plan may include referenced information sources, communication systems, or ticketing systems.

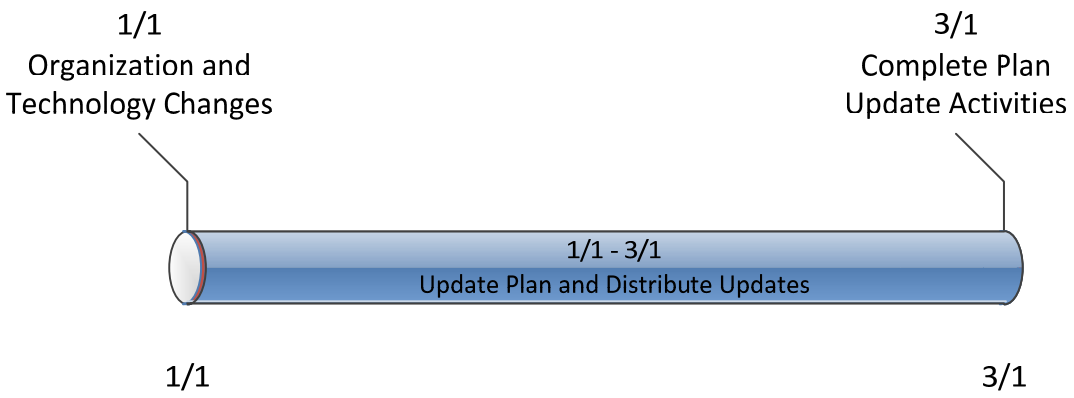

Figure 2: Timeline for Plan Changes in 3.2

When notifying individuals of response plan changes, entities should keep in mind that recovery plans may be considered BES Cyber System Information, and they should take the appropriate measures to prevent unauthorized disclosure of recovery plan information. For example, the recovery plan itself, or other sensitive information about the recovery plan, should be redacted from Email or other unencrypted transmission.

Rationale:

During the development of this standard, references to prior versions of the CIP standards and rationale for the requirements and their parts were embedded within the standard. Upon BOT approval, that information was moved to this section.

Rationale for R1:

Preventative activities can lower the number of incidents, but not all incidents can be prevented. A preplanned recovery capability is, therefore, necessary for rapidly recovering from incidents, minimizing loss and destruction, mitigating the weaknesses that were exploited, and restoring computing services so that planned and consistent recovery action to restore BES Cyber System functionality occurs.

Summary of Changes: Added provisions to protect data that would be useful in the investigation of an event that results in the need for a Cyber System recovery plan to be utilized.

Reference to prior version: (Part 1.1) CIP-009, R1.1

Change Description and Justification: (Part 1.1)

Minor wording changes; essentially unchanged.

Reference to prior version: (Part 1.2) CIP-009, R1.2

Change Description and Justification: (Part 1.2)

Minor wording changes; essentially unchanged.

Reference to prior version: (Part 1.3) CIP-009, R4

Change Description and Justification: (Part 1.3)

Addresses FERC Order Paragraph 739 and 748. The modified wording was abstracted from Paragraph 744.

Reference to prior version: (Part 1.4) New Requirement

Change Description and Justification: (Part 1.4)

Addresses FERC Order Section 739 and 748.

Reference to prior version: (Part 1.5) New Requirement

Change Description and Justification: (Part 1.5)

Added requirement to address FERC Order No. 706, Paragraph 706.

Rationale for R2:

The implementation of an effective recovery plan mitigates the risk to the reliable operation of the BES by reducing the time to recover from various hazards affecting BES Cyber Systems. This requirement ensures continued implementation of the response plans.

Requirement Part 2.2 provides further assurance in the information (e.g. backup tapes, mirrored hot-sites, etc.) necessary to recover BES Cyber Systems. A full test is not feasible in most instances due to the amount of recovery information, and the Responsible Entity must determine a sampling that provides assurance in the usability of the information.

Summary of Changes. Added operational testing for recovery of BES Cyber Systems.

Reference to prior version: (Part 2.1) CIP-009, R2

Change Description and Justification: (Part 2.1)

Minor wording change; essentially unchanged.

Reference to prior version: (Part 2.2) CIP-009, R5

Change Description and Justification: (Part 2.2)

Specifies what to test and makes clear the test can be a representative sampling. These changes, along with Requirement Part 1.4 address the FERC Order No. 706, Paragraphs 739 and 748 related to testing of backups by providing high confidence the information will actually recover the system as necessary.

Reference to prior version: (Part 2.3) CIP-009, R2

Change Description and Justification: (Part 2.3)

Addresses FERC Order No. 706, Paragraph 725 to add the requirement that the recovery plan test be a full operational test once every 3 years.

Rationale for R3:

To improve the effectiveness of BES Cyber System recovery plan(s) following a test, and to ensure the maintenance and distribution of the recovery plan(s). Responsible Entities achieve this by (i) performing a lessons learned review in 3.1 and (ii) revising the plan in 3.2 based on specific changes in the organization or technology that would impact plan execution. In both instances when the plan needs to change, the Responsible Entity updates and distributes the plan.

Summary of Changes: Makes clear when to perform lessons learned review of the plan and specifies the timeframe for updating the recovery plan.

Reference to prior version: (Part 3.1) CIP-009, R1 and R3

Change Description and Justification: (Part 3.1)

Added the timeframes for performing lessons learned and completing the plan updates. This requirement combines all three activities in one place. Where previous versions specified 30 calendar days for performing lessons learned, followed by additional time for updating recovery plans and notification, this requirement combines those activities into a single timeframe.

Reference to prior version: (Part 3.2) New Requirement

Change Description and Justification: (Part 3.2)

Specifies the activities required to maintain the plan. The previous version required entities to update the plan in response to any changes. The modifications make clear the specific changes that would require an update.

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center"	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a Responsible Entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	

3		Updated version number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	Update
3	3/31/10	Approved by FERC.	
4	12/30/10	Modified to add specific criteria for Critical Asset identification.	Update
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-009-5. (Order becomes effective on 2/3/14.)	

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

June 4, 2014

Ms. Kimberly D. Bose
Secretary
Federal Energy Regulatory Commission
888 First Street, NE
Washington, D.C. 20426

Re: Revisions to a Violation Severity Level Assigned to Protection System Maintenance Reliability Standards
Docket Nos. RM13-7-000 and RM14-8-000

Dear Secretary Bose:

In accordance with Order No. 793,[1] the North American Electric Reliability Corporation ("NERC") submits a proposed revision to a Violation Severity Level ("VSL") assigned to Requirement R1 in Protection System Maintenance ("PRC") Reliability Standard PRC-005-2 for Federal Energy Regulatory Commission ("Commission") approval. NERC has also made the same change to proposed Reliability Standard PRC-005-3, which has been adopted by the NERC Board of Trustees[2] and since filed for Commission approval.[3]

The proposed VSL revision to PRC-005-2, provided in Attachment A hereto, is consistent with the Commission's directive in Order No. 793. Attachment B includes a replacement "Exhibit A" to NERC's PRC-005-3 Petition that reflects the same VSL change in the proposed PRC-005-3 Reliability Standard (included as PRC-005-3.1 to reflect an errata change made).[4]

As background, on December 19, 2013, the Commission issued Order No. 793, approving Reliability Standard PRC-005-2 – Protection System Maintenance, stating that the "Reliability Standard contains overall improvements over the four existing Reliability Standards." However, the Commission

---

1 *Protection System Maintenance Reliability Standard*, Order No. 793, 145 FERC ¶ 61,253 (2013).

2 The agenda for the May 7, 2014 Board of Trustees meeting is available at http://www.nerc.com/gov/bot/Agenda%20highlights%20and%20Mintues%202013/board_agenda_package_May_2014.pdf

3 On February 14, 2014, NERC submitted a petition for approval of proposed Reliability Standard PRC-005-3 (Protection System Maintenance). The Commission assigned the petition to Docket No. RM14-8-000. ("PRC-005-3 Petition")

4 This replacement exhibit is the same replacement exhibit included with an errata filing to NERC's Petition for approval of proposed Reliability Standard PRC-005-3, which has been separately filed in RM14-8-000.

3353 Peachtree Road NE
Suite 600, North Tower
Atlanta, GA 30326
404-446-2560 | www.nerc.com

directed one change to the VSL assignment in Requirement R1 regarding the failure to include station batteries in a time-based maintenance program, noting that "the level of risk associated with the failure to test a given batter is not an appropriate consideration in the context of assigning violation severity levels, but rather, should be considered when assigning a violation risk factor." The Commission, therefore, directed NERC to submit a compliance filing changing the VSL for the failure to include station batteries in a time-based maintenance program to "severe."

NERC respectfully requests that the Commission approve the proposed VSL revision as just, reasonable, not unduly discriminatory or preferential, and in the public interest for PRC-005-2 and incorporate the replacement Exhibit A to the PRC-005-3 Petition in its rulemaking in RM14-8-000.

Respectfully submitted,

/s/ William H. Edwards
William H. Edwards
Counsel
North American Electric Reliability Corporation
1325 G St., NW, Suite 600

cc: Official service lists in Docket Nos. RM13-7-000 and RM14-8-000.

CERTIFICATE OF SERVICE

I hereby certify that I have served a copy of the foregoing document upon all parties listed on the official service list compiled by the Secretary in this proceeding.

Dated at Washington, D.C. this 4th day of June, 2014.

/s/ William H. Edwards

William H. Edwards
Counsel for North American
Electric Reliability Corporation

Exhibit A

PRC-005-2 Clean and Redline VSL Revisions

A. Introduction

1. Title: **Protection System Maintenance**

2. Number: PRC-005-2

3. Purpose: To document and implement programs for the maintenance of all Protection Systems affecting the reliability of the Bulk Electric System (BES) so that these Protection Systems are kept in working order.

4. Applicability:

4.1. Functional Entities:

4.1.1 Transmission Owner

4.1.2 Generator Owner

4.1.3 Distribution Provider

4.2. Facilities:

4.2.1 Protection Systems that are installed for the purpose of detecting Faults on BES Elements (lines, buses, transformers, etc.)

4.2.2 Protection Systems used for underfrequency load-shedding systems installed per ERO underfrequency load-shedding requirements.

4.2.3 Protection Systems used for undervoltage load-shedding systems installed to prevent system voltage collapse or voltage instability for BES reliability.

4.2.4 Protection Systems installed as a Special Protection System (SPS) for BES reliability.

4.2.5 Protection Systems for generator Facilities that are part of the BES, including:

4.2.5.1 Protection Systems that act to trip the generator either directly or via lockout or auxiliary tripping relays.

4.2.5.2 Protection Systems for generator step-up transformers for generators that are part of the BES.

4.2.5.3 Protection Systems for transformers connecting aggregated generation, where the aggregated generation is part of the BES (e.g., transformers connecting facilities such as wind-farms to the BES).

4.2.5.4 Protection Systems for station service or excitation transformers connected to the generator bus of generators which are part of the BES, that act to trip the generator either directly or via lockout or tripping auxiliary relays.

5. Effective Date: See Implementation Plan

6. Definitions Used in this Standard: The following terms are defined for use only within PRC-005-2, and should remain with the standard upon approval rather than being moved to the Glossary of Terms.

Unresolved Maintenance Issue – A deficiency identified during a maintenance activity that causes the component to not meet the intended performance, cannot be corrected during the maintenance interval, and requires follow-up corrective action.

Segment – Protection Systems or components of a consistent design standard, or a particular model or type from a single manufacturer that typically share other common elements. Consistent performance is expected across the entire population of a Segment. A Segment must contain at least sixty (60) individual components.

Component Type - Any one of the five specific elements of the Protection System definition.

Component – A Component is any individual discrete piece of equipment included in a Protection System, including but not limited to a protective relay or current sensing device. The designation of what constitutes a control circuit Component is dependent upon how an entity performs and tracks the testing of the control circuitry. Some entities test their control circuits on a breaker basis whereas others test their circuitry on a local zone of protection basis. Thus, entities are allowed the latitude to designate their own definitions of control circuit Components. Another example of where the entity has some discretion on determining what constitutes a single Component is the voltage and current sensing devices, where the entity may choose either to designate a full three-phase set of such devices or a single device as a single Component.

Countable Event – A failure of a Component requiring repair or replacement, any condition discovered during the maintenance activities in Tables 1-1 through 1-5 and Table 3 which requires corrective action or a Misoperation attributed to hardware failure or calibration failure. Misoperations due to product design errors, software errors, relay settings different from specified settings, Protection System Component configuration errors, or Protection System application errors are not included in Countable Events.

B. Requirements

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a Protection System Maintenance Program (PSMP) for its Protection Systems identified in Section 4.2. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

The PSMP shall:

1.1. Identify which maintenance method (time-based, performance-based per PRC-005 Attachment A, or a combination) is used to address each Protection System Component Type. All batteries associated with the station dc supply Component Type of a Protection System shall be included in a time-based program as described in Table 1-4 and Table 3.

1.2. Include the applicable monitored Component attributes applied to each Protection System Component Type consistent with the maintenance intervals specified in Tables 1-1 through 1-5, Table 2, and Table 3 where monitoring is used to extend the maintenance intervals beyond those specified for unmonitored Protection System Components.

R2. Each Transmission Owner, Generator Owner, and Distribution Provider that uses performance-based maintenance intervals in its PSMP shall follow the procedure established in PRC-005 Attachment A to establish and maintain its performance-based intervals. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

R3. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes time-based maintenance program(s) shall maintain its Protection System Components that are included within the time-based maintenance program in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3. *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

R4. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes performance-based maintenance program(s) in accordance with Requirement R2 shall implement and follow its PSMP for its Protection System Components that are included within the performance-based program(s). *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

R5. Each Transmission Owner, Generator Owner, and Distribution Provider shall demonstrate efforts to correct identified Unresolved Maintenance Issues. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

C. Measures

M1. Each Transmission Owner, Generator Owner and Distribution Provider shall have a documented Protection System Maintenance Program in accordance with Requirement R1.

For each Protection System Component Type, the documentation shall include the type of maintenance method applied (time-based, performance-based, or a combination of these maintenance methods), and shall include all batteries associated with the station dc supply Component Types in a time-based program as described in Table 1-4 and Table 3. (Part 1.1)

For Component Types that use monitoring to extend the maintenance intervals, the responsible entity(s) shall have evidence for each protection Component Type (such as manufacturer's specifications or engineering drawings) of the appropriate monitored Component attributes as specified in Tables 1-1 through 1-5, Table 2, and Table 3. (Part 1.2)

M2. Each Transmission Owner, Generator Owner, and Distribution Provider that uses performance-based maintenance intervals shall have evidence that its current performance-based maintenance program(s) is in accordance with Requirement R2, which may include but is not limited to Component lists, dated maintenance records, and dated analysis records and results.

M3. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes time-based maintenance program(s) shall have evidence that it has maintained its Protection System Components included within its time-based program in accordance with Requirement R3. The evidence may include but is not limited to dated maintenance records, dated maintenance summaries, dated check-off lists, dated inspection records, or dated work orders.

M4. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes performance-based maintenance intervals in accordance with Requirement R2 shall have evidence that it has implemented the Protection System Maintenance Program for the Protection System Components included in its performance-based program in accordance with Requirement R4. The evidence may include but is not limited to dated maintenance records, dated maintenance summaries, dated check-off lists, dated inspection records, or dated work orders.

M5. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence that it has undertaken efforts to correct identified Unresolved Maintenance Issues in accordance with Requirement R5. The evidence may include but is not limited to work orders, replacement Component orders, invoices, project schedules with completed milestones, return material authorizations (RMAs) or purchase orders.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Regional Entity

1.2. Compliance Monitoring and Enforcement Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.3. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, and Distribution Provider shall each keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

For Requirement R1, the Transmission Owner, Generator Owner, and Distribution Provider shall each keep its current dated Protection System Maintenance Program, as well as any superseded versions since the preceding compliance audit, including the documentation that specifies the type of maintenance program applied for each Protection System Component Type.

For Requirement R2, Requirement R3, Requirement R4, and Requirement R5, the Transmission Owner, Generator Owner, and Distribution Provider shall each keep documentation of the two most recent performances of each distinct maintenance activity for the Protection System Component, or all performances of each distinct maintenance activity for the Protection System Component since the previous scheduled audit date, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

2. Violation Severity Levels

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The responsible entity's PSMP failed to specify whether one Component Type is being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1)	The responsible entity's PSMP failed to specify whether two Component Types are being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1)	The responsible entity's PSMP failed to include the applicable monitoring attributes applied to each Protection System Component Type consistent with the maintenance intervals specified in Tables 1-1 through 1-5, Table 2, and Table 3 where monitoring is used to extend the maintenance intervals beyond those specified for unmonitored Protection System Components. (Part 1.2).	The responsible entity failed to establish a PSMP. OR The responsible entity failed to specify whether three or more Component Types are being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1). OR The responsible entity's PSMP failed to include applicable station batteries in a time-based program. (Part 1.1)
R2	The responsible entity uses performance-based maintenance intervals in its PSMP but failed to reduce Countable Events to no more than 4% within three years.	NA	The responsible entity uses performance-based maintenance intervals in its PSMP but failed to reduce Countable Events to no more than 4% within four years.	The responsible entity uses performance-based maintenance intervals in its PSMP but: 1) Failed to establish the technical justification described within Requirement R2 for the initial use of the performance-based PSMP OR 2) Failed to reduce Countable Events to no more than 4% within five years OR 3) Maintained a Segment with less than 60 Components OR

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
				4) Failed to: • Annually update the list of Components, OR • Annually perform maintenance on the greater of 5% of the segment population or 3 Components, OR • Annually analyze the program activities and results for each Segment.
R3	For Protection System Components included within a time-based maintenance program, the responsible entity failed to maintain 5% or less of the total Components included within a specific Protection System Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3.	For Protection System Components included within a time-based maintenance program, the responsible entity failed to maintain more than 5% but 10% or less of the total Components included within a specific Protection System Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3.	For Protection System Components included within a time-based maintenance program, the responsible entity failed to maintain more than 10% but 15% or less of the total Components included within a specific Protection System Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3.	For Protection System Components included within a time-based maintenance program, the responsible entity failed to maintain more than 15% of the total Components included within a specific Protection System Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3.
R4	For Protection System Components included within a performance-based maintenance program, the responsible entity failed to maintain 5% or less of the annual scheduled maintenance for a specific Protection System Component Type in accordance with their performance-based PSMP.	For Protection System Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 5% but 10% or less of the annual scheduled maintenance for a specific Protection System Component Type in accordance	For Protection System Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 10% but 15% or less of the annual scheduled maintenance for a specific Protection System Component Type in accordance with their performance-based PSMP.	For Protection System Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 15% of the annual scheduled maintenance for a specific Protection System Component Type in accordance

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
		with their performance-based PSMP.		with their performance-based PSMP.
R5	The responsible entity failed to undertake efforts to correct 5 or fewer identified Unresolved Maintenance Issues.	The responsible entity failed to undertake efforts to correct greater than 5, but less than or equal to 10 identified Unresolved Maintenance Issues.	The responsible entity failed to undertake efforts to correct greater than 10, but less than or equal to 15 identified Unresolved Maintenance Issues.	The responsible entity failed to undertake efforts to correct greater than 15 identified Unresolved Maintenance Issues.

E. Regional Variances

None

F. Supplemental Reference Document

The following documents present a detailed discussion about determination of maintenance intervals and other useful information regarding establishment of a maintenance program.

1. PRC-005-2 Protection System Maintenance Supplementary Reference and FAQ — July 2012.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
1	December 1, 2005	1. Changed incorrect use of certain hyphens (-) to "en dash" (–) and "em dash (—)." 2. Added "periods" to items where appropriate. 3. Changed "Timeframe" to "Time Frame" in item D, 1.2.	01/20/05
1a	February 17, 2011	Added Appendix 1 - Interpretation regarding applicability of standard to protection of radially connected transformers	Project 2009-17 interpretation
1a	February 17, 2011	Adopted by Board of Trustees	
1a	September 26, 2011	FERC Order issued approving interpretation of R1 and R2 (FERC's Order is effective as of September 26, 2011)	
1.1a	February 1, 2012	Errata change: Clarified inclusion of generator interconnection Facility in Generator Owner's responsibility	Revision under Project 2010-07
1b	February 3, 2012	FERC Order issued approving interpretation of R1, R1.1, and R1.2 (FERC's Order dated March 14, 2012). Updated version from 1a to 1b.	Project 2009-10 Interpretation
1.1b	April 23, 2012	Updated standard version to 1.1b to reflect FERC approval of PRC-005-1b.	Revision under Project 2010-07

1.1b	May 9, 2012	PRC-005-1.1b was adopted by the Board of Trustees as part of Project 2010-07 (GOTO).	
2	November 7, 2012	Adopted by Board of Trustees	Complete revision, absorbing maintenance requirements from PRC-005-1b, PRC-008-0, PRC-011-0, PRC-017-0
2	October 17, 2013	Errata Change: The Standards Committee approved an errata change to the implementation plan for PRC-005-2 to add the phrase "or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities;" to the second sentence under the "Retirement of Existing Standards" section.	
2	December 19, 2013	FERC Order issued approving PRC-005-2. (The enforcement date for PRC-005-2 will be April 1, 2015, which is the first date entities must be compliant with part of the standard. The implementation plan for PRC-005-2 includes specific compliance dates and timeframes for each of the Requirements. The regulatory approval date in the U.S. is February 24, 2014.	
2	May 7, 2014	Adopted by the NERC Board of Trustees to modify VSLs for Requirement R1.	

Table 1-1 Component Type - Protective Relay Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval[1]**	**Maintenance Activities**
Any unmonitored protective relay not having all the monitoring attributes of a category below.	6 calendar years	For all unmonitored relays: • Verify that settings are as specified For non-microprocessor relays: • Test and, if necessary calibrate For microprocessor relays: • Verify operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Verify acceptable measurement of power system input values.
Monitored microprocessor protective relay with the following: • Internal self-diagnosis and alarming (see Table 2). • Voltage and/or current waveform sampling three or more times per power cycle, and conversion of samples to numeric values for measurement calculations by microprocessor electronics. • Alarming for power supply failure (see Table 2).	12 calendar years	Verify: • Settings are as specified. • Operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Acceptable measurement of power system input values.

[1] For the tables in this standard, a calendar year starts on the first day of a new year (January 1) after a maintenance activity has been completed. For the tables in this standard, a calendar month starts on the first day of the first month after a maintenance activity has been completed.

Table 1-1 Component Type - Protective Relay Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval[1]**	**Maintenance Activities**
Monitored microprocessor protective relay with preceding row attributes and the following: • Ac measurements are continuously verified by comparison to an independent ac measurement source, with alarming for excessive error (See Table 2). • Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2). • Alarming for change of settings (See Table 2).	12 calendar years	Verify only the unmonitored relay inputs and outputs that are essential to proper functioning of the Protection System.

Table 1-2 Component Type - Communications Systems Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any unmonitored communications system necessary for correct operation of protective functions, and not having all the monitoring attributes of a category below.	4 calendar months	Verify that the communications system is functional.
	6 calendar years	Verify that the communications system meets performance criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate). Verify operation of communications system inputs and outputs that are essential to proper functioning of the Protection System.
Any communications system with continuous monitoring or periodic automated testing for the presence of the channel function, and alarming for loss of function (See Table 2).	12 calendar years	Verify that the communications system meets performance criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate). Verify operation of communications system inputs and outputs that are essential to proper functioning of the Protection System.
Any communications system with all of the following: • Continuous monitoring or periodic automated testing for the performance of the channel using criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate, and alarming for excessive performance degradation). (See Table 2) • Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2).	12 calendar years	Verify only the unmonitored communications system inputs and outputs that are essential to proper functioning of the Protection System

Table 1-3 Component Type - Voltage and Current Sensing Devices Providing Inputs to Protective Relays Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any voltage and current sensing devices not having monitoring attributes of the category below.	12 calendar years	Verify that current and voltage signal values are provided to the protective relays.
Voltage and Current Sensing devices connected to microprocessor relays with AC measurements are continuously verified by comparison of sensing input value, as measured by the microprocessor relay, to an independent ac measurement source, with alarming for unacceptable error or failure (see Table 2).	No periodic maintenance specified	None.

Table 1-4(a) Component Type – Protection System Station dc Supply Using Vented Lead-Acid (VLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Protection System Station dc supply using **Vented Lead-Acid (VLA) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • Electrolyte level • For unintentional grounds
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Cell condition of all individual battery cells where cells are visible – or measure battery cell/unit internal ohmic values where the cells are not visible • Physical condition of battery rack
	18 Calendar Months -or- 6 Calendar Years	Verify that the station battery can perform as manufactured by evaluating cell/unit measurements indicative of battery performance (e.g. internal ohmic values or float current) against the station battery baseline. -or- Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(b) Component Type – Protection System Station dc Supply Using Valve-Regulated Lead-Acid (VRLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Protection System Station dc supply **with Valve Regulated Lead-Acid (VRLA) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • For unintentional grounds
	6 Calendar Months	Inspect: • Condition of all individual units by measuring battery cell/unit internal ohmic values.
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Physical condition of battery rack
	6 Calendar Months -or- 3 Calendar Years	Verify that the station battery can perform as manufactured by evaluating cell/unit measurements indicative of battery performance (e.g. internal ohmic values or float current) against the station battery baseline. -or- Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(c) Component Type – Protection System Station dc Supply Using Nickel-Cadmium (NiCad) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS system, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Protection System Station dc supply **Nickel-Cadmium (NiCad) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • Electrolyte level • For unintentional grounds
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Cell condition of all individual battery cells. • Physical condition of battery rack
	6 Calendar Years	Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(d) Component Type – Protection System Station dc Supply Using Non Battery Based Energy Storage Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS system, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any Protection System station dc supply not using a battery and not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • For unintentional grounds
	18 Calendar Months	Inspect: Condition of non-battery based dc supply
	6 Calendar Years	Verify that the dc supply can perform as manufactured when ac power is not present.

Table 1-4(e) Component Type – Protection System Station dc Supply for non-BES Interrupting Devices for SPS, non-distributed UFLS, and non-distributed UVLS systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any Protection System dc supply used for tripping only non-BES interrupting devices as part of a SPS, non-distributed UFLS, or non-distributed UVLS system and not having monitoring attributes of Table 1-4(f).	When control circuits are verified (See Table 1-5)	Verify Station dc supply voltage.

Table 1-4(f) Exclusions for Protection System Station dc Supply Monitoring Devices and Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any station dc supply with high and low voltage monitoring and alarming of the battery charger voltage to detect charger overvoltage and charger failure (See Table 2).	No periodic maintenance specified	No periodic verification of station dc supply voltage is required.
Any battery based station dc supply with electrolyte level monitoring and alarming in every cell (See Table 2).		No periodic inspection of the electrolyte level for each cell is required.
Any station dc supply with unintentional dc ground monitoring and alarming (See Table 2).		No periodic inspection of unintentional dc grounds is required.
Any station dc supply with charger float voltage monitoring and alarming to ensure correct float voltage is being applied on the station dc supply (See Table 2).		No periodic verification of float voltage of battery charger is required.
Any battery based station dc supply with monitoring and alarming of battery string continuity (See Table 2).		No periodic verification of the battery continuity is required.
Any battery based station dc supply with monitoring and alarming of the intercell and/or terminal connection detail resistance of the entire battery (See Table 2).		No periodic verification of the intercell and terminal connection resistance is required.
Any Valve Regulated Lead-Acid (VRLA) or Vented Lead-Acid (VLA) station battery with internal ohmic value or float current monitoring and alarming, and evaluating present values relative to baseline internal ohmic values for every cell/unit (See Table 2).		No periodic evaluation relative to baseline of battery cell/unit measurements indicative of battery performance is required to verify the station battery can perform as manufactured.
Any Valve Regulated Lead-Acid (VRLA) or Vented Lead-Acid (VLA) station battery with monitoring and alarming of each cell/unit internal ohmic value (See Table 2).		No periodic inspection of the condition of all individual units by measuring battery cell/unit internal ohmic values of a station VRLA or Vented Lead-Acid (VLA) battery is required.

Table 1-5 Component Type - Control Circuitry Associated With Protective Functions Excluding distributed UFLS and distributed UVLS (see Table 3) **Note:** Table requirements apply to all Control Circuitry Components of Protection Systems, and SPSs except as noted.		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Trip coils or actuators of circuit breakers, interrupting devices, or mitigating devices (regardless of any monitoring of the control circuitry).	6 calendar years	Verify that each trip coil is able to operate the circuit breaker, interrupting device, or mitigating device.
Electromechanical lockout devices which are directly in a trip path from the protective relay to the interrupting device trip coil (regardless of any monitoring of the control circuitry).	6 calendar years	Verify electrical operation of electromechanical lockout devices.
Unmonitored control circuitry associated with SPS.	12 calendar years	Verify all paths of the control circuits essential for proper operation of the SPS.
Unmonitored control circuitry associated with protective functions inclusive of all auxiliary relays.	12 calendar years	Verify all paths of the trip circuits inclusive of all auxiliary relays through the trip coil(s) of the circuit breakers or other interrupting devices.
Control circuitry associated with protective functions and/or SPS whose integrity is monitored and alarmed (See Table 2).	No periodic maintenance specified	None.

Table 2 – Alarming Paths and Monitoring In Tables 1-1 through 1-5 and Table 3, alarm attributes used to justify extended maximum maintenance intervals and/or reduced maintenance activities are subject to the following maintenance requirements		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any alarm path through which alarms in Tables 1-1 through 1-5 and Table 3 are conveyed from the alarm origin to the location where corrective action can be initiated, and not having all the attributes of the "Alarm Path with monitoring" category below. Alarms are reported within 24 hours of detection to a location where corrective action can be initiated.	12 Calendar Years	Verify that the alarm path conveys alarm signals to a location where corrective action can be initiated.
Alarm Path with monitoring: The location where corrective action is taken receives an alarm within 24 hours for failure of any portion of the alarming path from the alarm origin to the location where corrective action can be initiated.	No periodic maintenance specified	None.

Table 3 Maintenance Activities and Intervals for distributed UFLS and distributed UVLS Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any unmonitored protective relay not having all the monitoring attributes of a category below.	6 calendar years	Verify that settings are as specified For non-microprocessor relays: • Test and, if necessary calibrate For microprocessor relays: • Verify operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Verify acceptable measurement of power system input values.
Monitored microprocessor protective relay with the following: • Internal self diagnosis and alarming (See Table 2). • Voltage and/or current waveform sampling three or more times per power cycle, and conversion of samples to numeric values for measurement calculations by microprocessor electronics. Alarming for power supply failure (See Table 2).	12 calendar years	Verify: • Settings are as specified. • Operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Acceptable measurement of power system input values
Monitored microprocessor protective relay with preceding row attributes and the following: • Ac measurements are continuously verified by comparison to an independent ac measurement source, with alarming for excessive error (See Table 2). • Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2). Alarming for change of settings (See Table 2).	12 calendar years	Verify only the unmonitored relay inputs and outputs that are essential to proper functioning of the Protection System.

Table 3 Maintenance Activities and Intervals for distributed UFLS and distributed UVLS Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Voltage and/or current sensing devices associated with UFLS or UVLS systems.	12 calendar years	Verify that current and/or voltage signal values are provided to the protective relays.
Protection System dc supply for tripping non-BES interrupting devices used only for a UFLS or UVLS system.	12 calendar years	Verify Protection System dc supply voltage.
Control circuitry between the UFLS or UVLS relays and electromechanical lockout and/or tripping auxiliary devices (excludes non-BES interrupting device trip coils).	12 calendar years	Verify the path from the relay to the lockout and/or tripping auxiliary relay (including essential supervisory logic).
Electromechanical lockout and/or tripping auxiliary devices associated only with UFLS or UVLS systems (excludes non-BES interrupting device trip coils).	12 calendar years	Verify electrical operation of electromechanical lockout and/or tripping auxiliary devices.
Control circuitry between the electromechanical lockout and/or tripping auxiliary devices and the non-BES interrupting devices in UFLS or UVLS systems, or between UFLS or UVLS relays (with no interposing electromechanical lockout or auxiliary device) and the non-BES interrupting devices (excludes non-BES interrupting device trip coils).	No periodic maintenance specified	None.
Trip coils of non-BES interrupting devices in UFLS or UVLS systems.	No periodic maintenance specified	None.

PRC-005 — Attachment A

Criteria for a Performance-Based Protection System Maintenance Program

Purpose: To establish a technical basis for initial and continued use of a performance-based Protection System Maintenance Program (PSMP).

To establish the technical justification for the initial use of a performance-based PSMP:

1. Develop a list with a description of Components included in each designated Segment of the Protection System Component population, with a minimum **Segment** population of 60 Components.
2. Maintain the Components in each Segment according to the time-based maximum allowable intervals established in Tables 1-1 through 1-5 and Table 3 until results of maintenance activities for the Segment are available for a minimum of 30 individual Components of the Segment.
3. Document the maintenance program activities and results for each Segment, including maintenance dates and Countable Events for each included Component.
4. Analyze the maintenance program activities and results for each Segment to determine the overall performance of the Segment and develop maintenance intervals.
5. Determine the maximum allowable maintenance interval for each Segment such that the Segment experiences **Countable Events** on no more than 4% of the Components within the Segment, for the greater of either the last 30 Components maintained or all Components maintained in the previous year.

To maintain the technical justification for the ongoing use of a performance-based PSMP:

1. At least annually, update the list of Protection System Components and Segments and/or description if any changes occur within the Segment.
2. Perform maintenance on the greater of 5% of the Components (addressed in the performance based PSMP) in each Segment or 3 individual Components within the Segment in each year.
3. For the prior year, analyze the maintenance program activities and results for each Segment to determine the overall performance of the Segment.
4. Using the prior year's data, determine the maximum allowable maintenance interval for each Segment such that the Segment experiences Countable Events on no more than 4% of the Components within the Segment, for the greater of either the last 30 Components maintained or all Components maintained in the previous year.
5. If the Components in a Protection System Segment maintained through a performance-based PSMP experience 4% or more Countable Events, develop, document, and implement an action plan to reduce the Countable Events to less than 4% of the Segment population within 3 years.

A. Introduction

1. Title: **Protection System Maintenance**

2. Number: PRC-005-2

3. Purpose: To document and implement programs for the maintenance of all Protection Systems affecting the reliability of the Bulk Electric System (BES) so that these Protection Systems are kept in working order.

4. Applicability:

4.1. Functional Entities:

4.1.1 Transmission Owner

4.1.2 Generator Owner

4.1.3 Distribution Provider

4.2. Facilities:

4.2.1 Protection Systems that are installed for the purpose of detecting Faults on BES Elements (lines, buses, transformers, etc.)

4.2.2 Protection Systems used for underfrequency load-shedding systems installed per ERO underfrequency load-shedding requirements.

4.2.3 Protection Systems used for undervoltage load-shedding systems installed to prevent system voltage collapse or voltage instability for BES reliability.

4.2.4 Protection Systems installed as a Special Protection System (SPS) for BES reliability.

4.2.5 Protection Systems for generator Facilities that are part of the BES, including:

4.2.5.1 Protection Systems that act to trip the generator either directly or via lockout or auxiliary tripping relays.

4.2.5.2 Protection Systems for generator step-up transformers for generators that are part of the BES.

4.2.5.3 Protection Systems for transformers connecting aggregated generation, where the aggregated generation is part of the BES (e.g., transformers connecting facilities such as wind-farms to the BES).

4.2.5.4 Protection Systems for station service or excitation transformers connected to the generator bus of generators which are part of the BES, that act to trip the generator either directly or via lockout or tripping auxiliary relays.

5. Effective Date: See Implementation Plan

6. Definitions Used in this Standard: The following terms are defined for use only within PRC-005-2, and should remain with the standard upon approval rather than being moved to the Glossary of Terms.

Unresolved Maintenance Issue – A deficiency identified during a maintenance activity that causes the component to not meet the intended performance, cannot be corrected during the maintenance interval, and requires follow-up corrective action.

Segment – Protection Systems or components of a consistent design standard, or a particular model or type from a single manufacturer that typically share other common elements. Consistent performance is expected across the entire population of a Segment. A Segment must contain at least sixty (60) individual components.

Component Type - Any one of the five specific elements of the Protection System definition.

Component – A Component is any individual discrete piece of equipment included in a Protection System, including but not limited to a protective relay or current sensing device. The designation of what constitutes a control circuit Component is dependent upon how an entity performs and tracks the testing of the control circuitry. Some entities test their control circuits on a breaker basis whereas others test their circuitry on a local zone of protection basis. Thus, entities are allowed the latitude to designate their own definitions of control circuit Components. Another example of where the entity has some discretion on determining what constitutes a single Component is the voltage and current sensing devices, where the entity may choose either to designate a full three-phase set of such devices or a single device as a single Component.

Countable Event – A failure of a Component requiring repair or replacement, any condition discovered during the maintenance activities in Tables 1-1 through 1-5 and Table 3 which requires corrective action or a Misoperation attributed to hardware failure or calibration failure. Misoperations due to product design errors, software errors, relay settings different from specified settings, Protection System Component configuration errors, or Protection System application errors are not included in Countable Events.

B. Requirements

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a Protection System Maintenance Program (PSMP) for its Protection Systems identified in Section 4.2. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

The PSMP shall:

1.1. Identify which maintenance method (time-based, performance-based per PRC-005 Attachment A, or a combination) is used to address each Protection System Component Type. All batteries associated with the station dc supply Component Type of a Protection System shall be included in a time-based program as described in Table 1-4 and Table 3.

1.2. Include the applicable monitored Component attributes applied to each Protection System Component Type consistent with the maintenance intervals specified in Tables 1-1 through 1-5, Table 2, and Table 3 where monitoring is used to extend the maintenance intervals beyond those specified for unmonitored Protection System Components.

R2. Each Transmission Owner, Generator Owner, and Distribution Provider that uses performance-based maintenance intervals in its PSMP shall follow the procedure established in PRC-005 Attachment A to establish and maintain its performance-based intervals. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

R3. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes time-based maintenance program(s) shall maintain its Protection System Components that are included within the time-based maintenance program in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3. *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

R4. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes performance-based maintenance program(s) in accordance with Requirement R2 shall implement and follow its PSMP for its Protection System Components that are included within the performance-based program(s). *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

R5. Each Transmission Owner, Generator Owner, and Distribution Provider shall demonstrate efforts to correct identified Unresolved Maintenance Issues. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

C. Measures

M1. Each Transmission Owner, Generator Owner and Distribution Provider shall have a documented Protection System Maintenance Program in accordance with Requirement R1.

For each Protection System Component Type, the documentation shall include the type of maintenance method applied (time-based, performance-based, or a combination of these maintenance methods), and shall include all batteries associated with the station dc supply Component Types in a time-based program as described in Table 1-4 and Table 3. (Part 1.1)

For Component Types that use monitoring to extend the maintenance intervals, the responsible entity(s) shall have evidence for each protection Component Type (such as manufacturer's specifications or engineering drawings) of the appropriate monitored Component attributes as specified in Tables 1-1 through 1-5, Table 2, and Table 3. (Part 1.2)

M2. Each Transmission Owner, Generator Owner, and Distribution Provider that uses performance-based maintenance intervals shall have evidence that its current performance-based maintenance program(s) is in accordance with Requirement R2, which may include but is not limited to Component lists, dated maintenance records, and dated analysis records and results.

M3. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes time-based maintenance program(s) shall have evidence that it has maintained its Protection System Components included within its time-based program in accordance with Requirement R3. The evidence may include but is not limited to dated maintenance records, dated maintenance summaries, dated check-off lists, dated inspection records, or dated work orders.

M4. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes performance-based maintenance intervals in accordance with Requirement R2 shall have evidence that it has implemented the Protection System Maintenance Program for the Protection System Components included in its performance-based program in accordance with Requirement R4. The evidence may include but is not limited to dated maintenance records, dated maintenance summaries, dated check-off lists, dated inspection records, or dated work orders.

M5. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence that it has undertaken efforts to correct identified Unresolved Maintenance Issues in accordance with Requirement R5. The evidence may include but is not limited to work orders, replacement Component orders, invoices, project schedules with completed milestones, return material authorizations (RMAs) or purchase orders.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Regional Entity

1.2. Compliance Monitoring and Enforcement Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.3. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, and Distribution Provider shall each keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

For Requirement R1, the Transmission Owner, Generator Owner, and Distribution Provider shall each keep its current dated Protection System Maintenance Program, as well as any superseded versions since the preceding compliance audit, including the documentation that specifies the type of maintenance program applied for each Protection System Component Type.

For Requirement R2, Requirement R3, Requirement R4, and Requirement R5, the Transmission Owner, Generator Owner, and Distribution Provider shall each keep documentation of the two most recent performances of each distinct maintenance activity for the Protection System Component, or all performances of each distinct maintenance activity for the Protection System Component since the previous scheduled audit date, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

2. Violation Severity Levels

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The responsible entity's PSMP failed to specify whether one Component Type is being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1) ~~OR~~ ~~The responsible entity's PSMP failed to include applicable station batteries in a time-based program. (Part 1.1)~~	The responsible entity's PSMP failed to specify whether two Component Types are being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1)	The responsible entity's PSMP failed to include the applicable monitoring attributes applied to each Protection System Component Type consistent with the maintenance intervals specified in Tables 1-1 through 1-5, Table 2, and Table 3 where monitoring is used to extend the maintenance intervals beyond those specified for unmonitored Protection System Components. (Part 1.2).	The responsible entity failed to establish a PSMP. OR The responsible entity failed to specify whether three or more Component Types are being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1). OR The responsible entity's PSMP failed to include applicable station batteries in a time-based program. (Part 1.1)
R2	The responsible entity uses performance-based maintenance intervals in its PSMP but failed to reduce Countable Events to no more than 4% within three years.	NA	The responsible entity uses performance-based maintenance intervals in its PSMP but failed to reduce Countable Events to no more than 4% within four years.	The responsible entity uses performance-based maintenance intervals in its PSMP but: 1) Failed to establish the technical justification described within Requirement R2 for the initial use of the performance-based PSMP OR 2) Failed to reduce Countable Events to no more than 4% within five years OR 3) Maintained a Segment with less than 60 Components OR

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
				4) Failed to: • Annually update the list of Components, OR • Annually perform maintenance on the greater of 5% of the segment population or 3 Components, OR • Annually analyze the program activities and results for each Segment.
R3	For Protection System Components included within a time-based maintenance program, the responsible entity failed to maintain 5% or less of the total Components included within a specific Protection System Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3.	For Protection System Components included within a time-based maintenance program, the responsible entity failed to maintain more than 5% but 10% or less of the total Components included within a specific Protection System Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3.	For Protection System Components included within a time-based maintenance program, the responsible entity failed to maintain more than 10% but 15% or less of the total Components included within a specific Protection System Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3.	For Protection System Components included within a time-based maintenance program, the responsible entity failed to maintain more than 15% of the total Components included within a specific Protection System Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3.
R4	For Protection System Components included within a performance-based maintenance program, the responsible entity failed to maintain 5% or less of the annual scheduled maintenance for a specific Protection System Component Type in accordance with their performance-based PSMP.	For Protection System Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 5% but 10% or less of the annual scheduled maintenance for a specific Protection System Component Type in accordance	For Protection System Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 10% but 15% or less of the annual scheduled maintenance for a specific Protection System Component Type in accordance with their performance-based PSMP.	For Protection System Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 15% of the annual scheduled maintenance for a specific Protection System Component Type in accordance

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
		with their performance-based PSMP.		with their performance-based PSMP.
R5	The responsible entity failed to undertake efforts to correct 5 or fewer identified Unresolved Maintenance Issues.	The responsible entity failed to undertake efforts to correct greater than 5, but less than or equal to 10 identified Unresolved Maintenance Issues.	The responsible entity failed to undertake efforts to correct greater than 10, but less than or equal to 15 identified Unresolved Maintenance Issues.	The responsible entity failed to undertake efforts to correct greater than 15 identified Unresolved Maintenance Issues.

E. Regional Variances

None

F. Supplemental Reference Document

The following documents present a detailed discussion about determination of maintenance intervals and other useful information regarding establishment of a maintenance program.

1. PRC-005-2 Protection System Maintenance Supplementary Reference and FAQ — July 2012.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
1	December 1, 2005	1. Changed incorrect use of certain hyphens (-) to "en dash" (–) and "em dash (—)." 2. Added "periods" to items where appropriate. 3. Changed "Timeframe" to "Time Frame" in item D, 1.2.	01/20/05
1a	February 17, 2011	Added Appendix 1 - Interpretation regarding applicability of standard to protection of radially connected transformers	Project 2009-17 interpretation
1a	February 17, 2011	Adopted by Board of Trustees	
1a	September 26, 2011	FERC Order issued approving interpretation of R1 and R2 (FERC's Order is effective as of September 26, 2011)	
1.1a	February 1, 2012	Errata change: Clarified inclusion of generator interconnection Facility in Generator Owner's responsibility	Revision under Project 2010-07
1b	February 3, 2012	FERC Order issued approving interpretation of R1, R1.1, and R1.2 (FERC's Order dated March 14, 2012). Updated version from 1a to 1b.	Project 2009-10 Interpretation
1.1b	April 23, 2012	Updated standard version to 1.1b to reflect FERC approval of PRC-005-1b.	Revision under Project 2010-07

1.1b	May 9, 2012	PRC-005-1.1b was adopted by the Board of Trustees as part of Project 2010-07 (GOTO).	
2	November 7, 2012	Adopted by Board of Trustees	Complete revision, absorbing maintenance requirements from PRC-005-1b, PRC-008-0, PRC-011-0, PRC-017-0
2	October 17, 2013	Errata Change: The Standards Committee approved an errata change to the implementation plan for PRC-005-2 to add the phrase "or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities;" to the second sentence under the "Retirement of Existing Standards" section.	
2	December 19, 2013	FERC Order issued approving PRC-005-2. (The enforcement date for PRC-005-2 will be April 1, 2015, which is the first date entities must be compliant with part of the standard. The implementation plan for PRC-005-2 includes specific compliance dates and timeframes for each of the Requirements. The regulatory approval date in the U.S. is February 24, 2014.	
2	May 7, 2014	Adopted by the NERC Board of Trustees to modify VSLs for Requirement R1.	

Table 1-1 Component Type - Protective Relay Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval[1]**	**Maintenance Activities**
Any unmonitored protective relay not having all the monitoring attributes of a category below.	6 calendar years	For all unmonitored relays: • Verify that settings are as specified For non-microprocessor relays: • Test and, if necessary calibrate For microprocessor relays: • Verify operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Verify acceptable measurement of power system input values.
Monitored microprocessor protective relay with the following: • Internal self-diagnosis and alarming (see Table 2). • Voltage and/or current waveform sampling three or more times per power cycle, and conversion of samples to numeric values for measurement calculations by microprocessor electronics. • Alarming for power supply failure (see Table 2).	12 calendar years	Verify: • Settings are as specified. • Operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Acceptable measurement of power system input values.

[1] For the tables in this standard, a calendar year starts on the first day of a new year (January 1) after a maintenance activity has been completed. For the tables in this standard, a calendar month starts on the first day of the first month after a maintenance activity has been completed.

Table 1-1 Component Type - Protective Relay Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval[1]**	**Maintenance Activities**
Monitored microprocessor protective relay with preceding row attributes and the following: • Ac measurements are continuously verified by comparison to an independent ac measurement source, with alarming for excessive error (See Table 2). • Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2). • Alarming for change of settings (See Table 2).	12 calendar years	Verify only the unmonitored relay inputs and outputs that are essential to proper functioning of the Protection System.

Table 1-2 Component Type - Communications Systems Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any unmonitored communications system necessary for correct operation of protective functions, and not having all the monitoring attributes of a category below.	4 calendar months	Verify that the communications system is functional.
	6 calendar years	Verify that the communications system meets performance criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate). Verify operation of communications system inputs and outputs that are essential to proper functioning of the Protection System.
Any communications system with continuous monitoring or periodic automated testing for the presence of the channel function, and alarming for loss of function (See Table 2).	12 calendar years	Verify that the communications system meets performance criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate). Verify operation of communications system inputs and outputs that are essential to proper functioning of the Protection System.
Any communications system with all of the following: • Continuous monitoring or periodic automated testing for the performance of the channel using criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate, and alarming for excessive performance degradation). (See Table 2) • Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2).	12 calendar years	Verify only the unmonitored communications system inputs and outputs that are essential to proper functioning of the Protection System

Table 1-3 Component Type - Voltage and Current Sensing Devices Providing Inputs to Protective Relays Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any voltage and current sensing devices not having monitoring attributes of the category below.	12 calendar years	Verify that current and voltage signal values are provided to the protective relays.
Voltage and Current Sensing devices connected to microprocessor relays with AC measurements are continuously verified by comparison of sensing input value, as measured by the microprocessor relay, to an independent ac measurement source, with alarming for unacceptable error or failure (see Table 2).	No periodic maintenance specified	None.

Table 1-4(a) Component Type – Protection System Station dc Supply Using Vented Lead-Acid (VLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Protection System Station dc supply using **Vented Lead-Acid (VLA) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • Electrolyte level • For unintentional grounds
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Cell condition of all individual battery cells where cells are visible – or measure battery cell/unit internal ohmic values where the cells are not visible • Physical condition of battery rack
	18 Calendar Months -or- 6 Calendar Years	Verify that the station battery can perform as manufactured by evaluating cell/unit measurements indicative of battery performance (e.g. internal ohmic values or float current) against the station battery baseline. -or- Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(b) Component Type – Protection System Station dc Supply Using Valve-Regulated Lead-Acid (VRLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Protection System Station dc supply **with Valve Regulated Lead-Acid (VRLA) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • For unintentional grounds
	6 Calendar Months	Inspect: • Condition of all individual units by measuring battery cell/unit internal ohmic values.
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Physical condition of battery rack
	6 Calendar Months -or- 3 Calendar Years	Verify that the station battery can perform as manufactured by evaluating cell/unit measurements indicative of battery performance (e.g. internal ohmic values or float current) against the station battery baseline. -or- Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(c) Component Type – Protection System Station dc Supply Using Nickel-Cadmium (NiCad) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS system, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Protection System Station dc supply **Nickel-Cadmium (NiCad) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • Electrolyte level • For unintentional grounds
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Cell condition of all individual battery cells. • Physical condition of battery rack
	6 Calendar Years	Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(d) Component Type – Protection System Station dc Supply Using Non Battery Based Energy Storage Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS system, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any Protection System station dc supply not using a battery and not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • For unintentional grounds
	18 Calendar Months	Inspect: Condition of non-battery based dc supply
	6 Calendar Years	Verify that the dc supply can perform as manufactured when ac power is not present.

Table 1-4(e) Component Type – Protection System Station dc Supply for non-BES Interrupting Devices for SPS, non-distributed UFLS, and non-distributed UVLS systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any Protection System dc supply used for tripping only non-BES interrupting devices as part of a SPS, non-distributed UFLS, or non-distributed UVLS system and not having monitoring attributes of Table 1-4(f).	When control circuits are verified (See Table 1-5)	Verify Station dc supply voltage.

Table 1-4(f) Exclusions for Protection System Station dc Supply Monitoring Devices and Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any station dc supply with high and low voltage monitoring and alarming of the battery charger voltage to detect charger overvoltage and charger failure (See Table 2).	No periodic maintenance specified	No periodic verification of station dc supply voltage is required.
Any battery based station dc supply with electrolyte level monitoring and alarming in every cell (See Table 2).		No periodic inspection of the electrolyte level for each cell is required.
Any station dc supply with unintentional dc ground monitoring and alarming (See Table 2).		No periodic inspection of unintentional dc grounds is required.
Any station dc supply with charger float voltage monitoring and alarming to ensure correct float voltage is being applied on the station dc supply (See Table 2).		No periodic verification of float voltage of battery charger is required.
Any battery based station dc supply with monitoring and alarming of battery string continuity (See Table 2).		No periodic verification of the battery continuity is required.
Any battery based station dc supply with monitoring and alarming of the intercell and/or terminal connection detail resistance of the entire battery (See Table 2).		No periodic verification of the intercell and terminal connection resistance is required.
Any Valve Regulated Lead-Acid (VRLA) or Vented Lead-Acid (VLA) station battery with internal ohmic value or float current monitoring and alarming, and evaluating present values relative to baseline internal ohmic values for every cell/unit (See Table 2).		No periodic evaluation relative to baseline of battery cell/unit measurements indicative of battery performance is required to verify the station battery can perform as manufactured.
Any Valve Regulated Lead-Acid (VRLA) or Vented Lead-Acid (VLA) station battery with monitoring and alarming of each cell/unit internal ohmic value (See Table 2).		No periodic inspection of the condition of all individual units by measuring battery cell/unit internal ohmic values of a station VRLA or Vented Lead-Acid (VLA) battery is required.

Table 1-5 Component Type - Control Circuitry Associated With Protective Functions Excluding distributed UFLS and distributed UVLS (see Table 3) **Note:** Table requirements apply to all Control Circuitry Components of Protection Systems, and SPSs except as noted.		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Trip coils or actuators of circuit breakers, interrupting devices, or mitigating devices (regardless of any monitoring of the control circuitry).	6 calendar years	Verify that each trip coil is able to operate the circuit breaker, interrupting device, or mitigating device.
Electromechanical lockout devices which are directly in a trip path from the protective relay to the interrupting device trip coil (regardless of any monitoring of the control circuitry).	6 calendar years	Verify electrical operation of electromechanical lockout devices.
Unmonitored control circuitry associated with SPS.	12 calendar years	Verify all paths of the control circuits essential for proper operation of the SPS.
Unmonitored control circuitry associated with protective functions inclusive of all auxiliary relays.	12 calendar years	Verify all paths of the trip circuits inclusive of all auxiliary relays through the trip coil(s) of the circuit breakers or other interrupting devices.
Control circuitry associated with protective functions and/or SPS whose integrity is monitored and alarmed (See Table 2).	No periodic maintenance specified	None.

Table 2 – Alarming Paths and Monitoring In Tables 1-1 through 1-5 and Table 3, alarm attributes used to justify extended maximum maintenance intervals and/or reduced maintenance activities are subject to the following maintenance requirements		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any alarm path through which alarms in Tables 1-1 through 1-5 and Table 3 are conveyed from the alarm origin to the location where corrective action can be initiated, and not having all the attributes of the "Alarm Path with monitoring" category below. Alarms are reported within 24 hours of detection to a location where corrective action can be initiated.	12 Calendar Years	Verify that the alarm path conveys alarm signals to a location where corrective action can be initiated.
Alarm Path with monitoring: The location where corrective action is taken receives an alarm within 24 hours for failure of any portion of the alarming path from the alarm origin to the location where corrective action can be initiated.	No periodic maintenance specified	None.

Table 3 Maintenance Activities and Intervals for distributed UFLS and distributed UVLS Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any unmonitored protective relay not having all the monitoring attributes of a category below.	6 calendar years	Verify that settings are as specified For non-microprocessor relays: • Test and, if necessary calibrate For microprocessor relays: • Verify operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Verify acceptable measurement of power system input values.
Monitored microprocessor protective relay with the following: • Internal self diagnosis and alarming (See Table 2). • Voltage and/or current waveform sampling three or more times per power cycle, and conversion of samples to numeric values for measurement calculations by microprocessor electronics. Alarming for power supply failure (See Table 2).	12 calendar years	Verify: • Settings are as specified. • Operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Acceptable measurement of power system input values
Monitored microprocessor protective relay with preceding row attributes and the following: • Ac measurements are continuously verified by comparison to an independent ac measurement source, with alarming for excessive error (See Table 2). • Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2). Alarming for change of settings (See Table 2).	12 calendar years	Verify only the unmonitored relay inputs and outputs that are essential to proper functioning of the Protection System.

Table 3 Maintenance Activities and Intervals for distributed UFLS and distributed UVLS Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Voltage and/or current sensing devices associated with UFLS or UVLS systems.	12 calendar years	Verify that current and/or voltage signal values are provided to the protective relays.
Protection System dc supply for tripping non-BES interrupting devices used only for a UFLS or UVLS system.	12 calendar years	Verify Protection System dc supply voltage.
Control circuitry between the UFLS or UVLS relays and electromechanical lockout and/or tripping auxiliary devices (excludes non-BES interrupting device trip coils).	12 calendar years	Verify the path from the relay to the lockout and/or tripping auxiliary relay (including essential supervisory logic).
Electromechanical lockout and/or tripping auxiliary devices associated only with UFLS or UVLS systems (excludes non-BES interrupting device trip coils).	12 calendar years	Verify electrical operation of electromechanical lockout and/or tripping auxiliary devices.
Control circuitry between the electromechanical lockout and/or tripping auxiliary devices and the non-BES interrupting devices in UFLS or UVLS systems, or between UFLS or UVLS relays (with no interposing electromechanical lockout or auxiliary device) and the non-BES interrupting devices (excludes non-BES interrupting device trip coils).	No periodic maintenance specified	None.
Trip coils of non-BES interrupting devices in UFLS or UVLS systems.	No periodic maintenance specified	None.

PRC-005 — Attachment A

Criteria for a Performance-Based Protection System Maintenance Program

Purpose: To establish a technical basis for initial and continued use of a performance-based Protection System Maintenance Program (PSMP).

To establish the technical justification for the initial use of a performance-based PSMP:

1. Develop a list with a description of Components included in each designated Segment of the Protection System Component population, with a minimum **Segment** population of 60 Components.
2. Maintain the Components in each Segment according to the time-based maximum allowable intervals established in Tables 1-1 through 1-5 and Table 3 until results of maintenance activities for the Segment are available for a minimum of 30 individual Components of the Segment.
3. Document the maintenance program activities and results for each Segment, including maintenance dates and Countable Events for each included Component.
4. Analyze the maintenance program activities and results for each Segment to determine the overall performance of the Segment and develop maintenance intervals.
5. Determine the maximum allowable maintenance interval for each Segment such that the Segment experiences **Countable Events** on no more than 4% of the Components within the Segment, for the greater of either the last 30 Components maintained or all Components maintained in the previous year.

To maintain the technical justification for the ongoing use of a performance-based PSMP:

1. At least annually, update the list of Protection System Components and Segments and/or description if any changes occur within the Segment.
2. Perform maintenance on the greater of 5% of the Components (addressed in the performance based PSMP) in each Segment or 3 individual Components within the Segment in each year.
3. For the prior year, analyze the maintenance program activities and results for each Segment to determine the overall performance of the Segment.
4. Using the prior year's data, determine the maximum allowable maintenance interval for each Segment such that the Segment experiences Countable Events on no more than 4% of the Components within the Segment, for the greater of either the last 30 Components maintained or all Components maintained in the previous year.
5. If the Components in a Protection System Segment maintained through a performance-based PSMP experience 4% or more Countable Events, develop, document, and implement an action plan to reduce the Countable Events to less than 4% of the Segment population within 3 years.

Exhibit B

PRC-005-3 Clean and Redline VSL Revisions

A. Introduction

1. Title: **Protection System and Automatic Reclosing Maintenance**

2. Number: PRC-005-3.1

3. Purpose: To document and implement programs for the maintenance of all Protection Systems and Automatic Reclosing affecting the reliability of the Bulk Electric System (BES) so that they are kept in working order.

4. Applicability:

4.1. Functional Entities:

4.1.1 Transmission Owner

4.1.2 Generator Owner

4.1.3 Distribution Provider

4.2. Facilities:

4.2.1 Protection Systems that are installed for the purpose of detecting Faults on BES Elements (lines, buses, transformers, etc.)

4.2.2 Protection Systems used for underfrequency load-shedding systems installed per ERO underfrequency load-shedding requirements.

4.2.3 Protection Systems used for undervoltage load-shedding systems installed to prevent system voltage collapse or voltage instability for BES reliability.

4.2.4 Protection Systems installed as a Special Protection System (SPS) for BES reliability.

4.2.5 Protection Systems for generator Facilities that are part of the BES, including:

4.2.5.1 Protection Systems that act to trip the generator either directly or via lockout or auxiliary tripping relays.

4.2.5.2 Protection Systems for generator step-up transformers for generators that are part of the BES.

4.2.5.3 Protection Systems for transformers connecting aggregated generation, where the aggregated generation is part of the BES (e.g., transformers connecting facilities such as wind-farms to the BES).

4.2.5.4 Protection Systems for station service or excitation transformers connected to the generator bus of generators which are part of the BES, that act to trip the generator either directly or via lockout or tripping auxiliary relays.

4.2.6 Automatic Reclosing[1], including:

4.2.6.1 Automatic Reclosing applied on the terminals of Elements connected to the BES bus located at generating plant substations where the total installed

[1] Automatic Reclosing addressed in Section 4.2.6.1 and 4.2.6.2 may be excluded if the equipment owner can demonstrate that a close-in three-phase fault present for twice the normal clearing time (capturing a minimum trip-close-trip time delay) does not result in a total loss of gross generation in the Interconnection exceeding the gross capacity of the largest BES generating unit within the Balancing Authority Area where the Automatic Reclosing is applied.

gross generating plant capacity is greater than the gross capacity of the largest BES generating unit within the Balancing Authority Area.

4.2.6.2 Automatic Reclosing applied on the terminals of all BES Elements at substations one bus away from generating plants specified in Section 4.2.6.1 when the substation is less than 10 circuit-miles from the generating plant substation.

4.2.6.3 Automatic Reclosing applied as an integral part of an SPS specified in Section 4.2.4.

5. Effective Date: See Implementation Plan

6. Definitions Used in this Standard: The following terms are defined for use only within PRC-005-3, and should remain with the standard upon approval rather than being moved to the Glossary of Terms.

Automatic Reclosing – Includes the following Components:

- Reclosing relay
- Control circuitry associated with the reclosing relay.

Unresolved Maintenance Issue – A deficiency identified during a maintenance activity that causes the Component to not meet the intended performance, cannot be corrected during the maintenance interval, and requires follow-up corrective action.

Segment – Components of a consistent design standard, or a particular model or type from a single manufacturer that typically share other common elements. Consistent performance is expected across the entire population of a Segment. A Segment must contain at least sixty (60) individual Components.

Component Type – Either any one of the five specific elements of the Protection System definition or any one of the two specific elements of the Automatic Reclosing definition.

Component – A Component is any individual discrete piece of equipment included in a Protection System or in Automatic Reclosing, including but not limited to a protective relay, reclosing relay, or current sensing device. The designation of what constitutes a control circuit Component is dependent upon how an entity performs and tracks the testing of the control circuitry. Some entities test their control circuits on a breaker basis whereas others test their circuitry on a local zone of protection basis. Thus, entities are allowed the latitude to designate their own definitions of control circuit Components. Another example of where the entity has some discretion on determining what constitutes a single Component is the voltage and current sensing devices, where the entity may choose either to designate a full three-phase set of such devices or a single device as a single Component.

Countable Event – A failure of a Component requiring repair or replacement, any condition discovered during the maintenance activities in Tables 1-1 through 1-5, Table 3, and Tables 4-1 through 4-2 which requires corrective action or a Protection System Misoperation attributed to hardware failure or calibration failure. Misoperations due to product design errors, software errors, relay settings different from specified settings, Protection System Component or Automatic Reclosing configuration or application errors are not included in Countable Events.

B. Requirements

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a Protection System Maintenance Program (PSMP) for its Protection Systems and Automatic Reclosing identified in Facilities Section 4.2. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

The PSMP shall:

1.1. Identify which maintenance method (time-based, performance-based per PRC-005 Attachment A, or a combination) is used to address each Protection System and Automatic Reclosing Component Type. All batteries associated with the station dc supply Component Type of a Protection System shall be included in a time-based program as described in Table 1-4 and Table 3.

1.2. Include the applicable monitored Component attributes applied to each Protection System and Automatic Reclosing Component Type consistent with the maintenance intervals specified in Tables 1-1 through 1-5, Table 2, Table 3, and Table 4-1 through 4-2 where monitoring is used to extend the maintenance intervals beyond those specified for unmonitored Protection System and Automatic Reclosing Components.

R2. Each Transmission Owner, Generator Owner, and Distribution Provider that uses performance-based maintenance intervals in its PSMP shall follow the procedure established in PRC-005 Attachment A to establish and maintain its performance-based intervals. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

R3. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes time-based maintenance program(s) shall maintain its Protection System and Automatic Reclosing Components that are included within the time-based maintenance program in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, and Table 4-1 through 4-2. *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

R4. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes performance-based maintenance program(s) in accordance with Requirement R2 shall implement and follow its PSMP for its Protection System and Automatic Reclosing Components that are included within the performance-based program(s). *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

R5. Each Transmission Owner, Generator Owner, and Distribution Provider shall demonstrate efforts to correct identified Unresolved Maintenance Issues. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

C. Measures

M1. Each Transmission Owner, Generator Owner and Distribution Provider shall have a documented Protection System Maintenance Program in accordance with Requirement R1.

For each Protection System and Automatic Reclosing Component Type, the documentation shall include the type of maintenance method applied (time-based, performance-based, or a combination of these maintenance methods), and shall include all batteries associated with the station dc supply Component Types in a time-based program as described in Table 1-4 and Table 3. (Part 1.1)

For Component Types that use monitoring to extend the maintenance intervals, the responsible entity(s) shall have evidence for each Protection System and Automatic Reclosing Component Type (such as manufacturer's specifications or engineering drawings) of the appropriate

monitored Component attributes as specified in Tables 1-1 through 1-5, Table 2, Table 3, and Table 4-1 through 4-2. (Part 1.2)

M2. Each Transmission Owner, Generator Owner, and Distribution Provider that uses performance-based maintenance intervals shall have evidence that its current performance-based maintenance program(s) is in accordance with Requirement R2, which may include but is not limited to Component lists, dated maintenance records, and dated analysis records and results.

M3. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes time-based maintenance program(s) shall have evidence that it has maintained its Protection System and Automatic Reclosing Components included within its time-based program in accordance with Requirement R3. The evidence may include but is not limited to dated maintenance records, dated maintenance summaries, dated check-off lists, dated inspection records, or dated work orders.

M4. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes performance-based maintenance intervals in accordance with Requirement R2 shall have evidence that it has implemented the Protection System Maintenance Program for the Protection System and Automatic Reclosing Components included in its performance-based program in accordance with Requirement R4. The evidence may include but is not limited to dated maintenance records, dated maintenance summaries, dated check-off lists, dated inspection records, or dated work orders.

M5. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence that it has undertaken efforts to correct identified Unresolved Maintenance Issues in accordance with Requirement R5. The evidence may include but is not limited to work orders, replacement Component orders, invoices, project schedules with completed milestones, return material authorizations (RMAs) or purchase orders.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and Enforcement Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.3. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, and Distribution Provider shall each keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

For Requirement R1, the Transmission Owner, Generator Owner, and Distribution Provider shall each keep its current dated Protection System Maintenance Program, as well as any superseded versions since the preceding compliance audit, including the documentation that specifies the type of maintenance program applied for each Protection System Component Type.

For Requirement R2, Requirement R3, Requirement R4, and Requirement R5, the Transmission Owner, Generator Owner, and Distribution Provider shall each keep documentation of the two most recent performances of each distinct maintenance activity for the Protection System or Automatic Reclosing Component, or all performances of each distinct maintenance activity for the Protection System or Automatic Reclosing Component since the previous scheduled audit date, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

2. Violation Severity Levels

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The responsible entity's PSMP failed to specify whether one Component Type is being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1)	The responsible entity's PSMP failed to specify whether two Component Types are being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1)	The responsible entity's PSMP failed to specify whether three Component Types are being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1). OR The responsible entity's PSMP failed to include the applicable monitoring attributes applied to each Component Type consistent with the maintenance intervals specified in Tables 1-1 through 1-5, Table 2, Table 3, and Tables 4-1 through 4-2 where monitoring is used to extend the maintenance intervals beyond those specified for unmonitored Components. (Part 1.2).	The responsible entity failed to establish a PSMP. OR The responsible entity's PSMP failed to specify whether four or more Component Types are being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1). OR The responsible entity's PSMP failed to include applicable station batteries in a time-based program. (Part 1.1)
R2	The responsible entity uses performance-based maintenance intervals in its PSMP but failed to reduce Countable Events to no more than 4% within three years.	NA	The responsible entity uses performance-based maintenance intervals in its PSMP but failed to reduce Countable Events to no more than 4% within four years.	The responsible entity uses performance-based maintenance intervals in its PSMP but: 1) Failed to establish the technical justification described within Requirement R2 for the initial use of the performance-based PSMP OR 2) Failed to reduce Countable Events to no more than 4% within five years OR

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
				3) Maintained a Segment with less than 60 Components OR 4) Failed to: • Annually update the list of Components, OR • Annually perform maintenance on the greater of 5% of the Segment population or 3 Components, OR • Annually analyze the program activities and results for each Segment.
R3	For Components included within a time-based maintenance program, the responsible entity failed to maintain 5% or less of the total Components included within a specific Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, and Tables 4-1 through 4-2.	For Components included within a time-based maintenance program, the responsible entity failed to maintain more than 5% but 10% or less of the total Components included within a specific Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, and Tables 4-1 through 4-2.	For Components included within a time-based maintenance program, the responsible entity failed to maintain more than 10% but 15% or less of the total Components included within a specific Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, and Tables 4-1 through 4-2.	For Components included within a time-based maintenance program, the responsible entity failed to maintain more than 15% of the total Components included within a specific Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, and Tables 4-1 through 4-2.
R4	For Components included within a performance-based maintenance program, the responsible entity failed to maintain 5% or less of the annual scheduled maintenance for a specific	For Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 5% but 10% or less of the annual scheduled maintenance for a specific	For Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 10% but 15% or less of the annual scheduled maintenance for a specific	For Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 15% of the annual scheduled maintenance for a specific

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
	Component Type in accordance with their performance-based PSMP.	Component Type in accordance with their performance-based PSMP.	Component Type in accordance with their performance-based PSMP.	Component Type in accordance with their performance-based PSMP.
R5	The responsible entity failed to undertake efforts to correct 5 or fewer identified Unresolved Maintenance Issues.	The responsible entity failed to undertake efforts to correct greater than 5, but less than or equal to 10 identified Unresolved Maintenance Issues.	The responsible entity failed to undertake efforts to correct greater than 10, but less than or equal to 15 identified Unresolved Maintenance Issues.	The responsible entity failed to undertake efforts to correct greater than 15 identified Unresolved Maintenance Issues.

E. Regional Variances

None

F. Supplemental Reference Document

The following documents present a detailed discussion about determination of maintenance intervals and other useful information regarding establishment of a maintenance program.

1. PRC-005-2 Protection System Maintenance Supplementary Reference and FAQ — March 2013.
2. Considerations for Maintenance and Testing of Autoreclosing Schemes — November 2012.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
1	December 1, 2005	1. Changed incorrect use of certain hyphens (-) to "en dash" (–) and "em dash (—)." 2. Added "periods" to items where appropriate. 3. Changed "Timeframe" to "Time Frame" in item D, 1.2.	01/20/05
1a	February 17, 2011	Added Appendix 1 - Interpretation regarding applicability of standard to protection of radially connected transformers	Project 2009-17 interpretation
1a	February 17, 2011	Adopted by Board of Trustees	
1a	September 26, 2011	FERC Order issued approving interpretation of R1 and R2 (FERC's Order is effective as of September 26, 2011)	
1.1a	February 1, 2012	Errata change: Clarified inclusion of generator interconnection Facility in Generator Owner's responsibility	Revision under Project 2010-07
1b	February 3, 2012	FERC Order issued approving interpretation of R1, R1.1, and R1.2 (FERC's Order dated March 14, 2012). Updated version from 1a to 1b.	Project 2009-10 Interpretation
1.1b	April 23, 2012	Updated standard version to 1.1b to reflect FERC approval of PRC-005-1b.	Revision under Project 2010-07

1.1b	May 9, 2012	PRC-005-1.1b was adopted by the Board of Trustees as part of Project 2010-07 (GOTO).	
2	November 7, 2012	Adopted by Board of Trustees	Project 2007-17 - Complete revision, absorbing maintenance requirements from PRC-005-1.1b, PRC-008-0, PRC-011-0, PRC-017-0
2	October 17, 2013	Errata Change: The Standards Committee approved an errata change to the implementation plan for PRC-005-2 to add the phrase “or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities;” to the second sentence under the “Retirement of Existing	
2	May 7, 2014	Adopted by the NERC Board of Trustees to modify VSLs for Requirement R1.	
3	November 7, 2013	Adopted by the NERC Board of Trustees	Revised to address the FERC directive in Order No.758 to include Automatic Reclosing in maintenance programs.
3.1	February 12, 2014	Errata Change: The Standards Committee approved errata changes to correct capitalization of certain defined terms within the definitions of "Unresolved Maintenance Issue" and "Protection System Maintenance Program". The changes will be reflected in the definitions section of PRC-005-3 for "Unresolved Maintenance Issue" and in the NERC Glossary of Terms for "Protection System Maintenance Program".	

Table 1-1 Component Type - Protective Relay Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval[2]**	**Maintenance Activities**
Any unmonitored protective relay not having all the monitoring attributes of a category below.	6 Calendar Years	For all unmonitored relays: • Verify that settings are as specified For non-microprocessor relays: • Test and, if necessary calibrate For microprocessor relays: • Verify operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Verify acceptable measurement of power system input values.
Monitored microprocessor protective relay with the following: • Internal self-diagnosis and alarming (see Table 2). • Voltage and/or current waveform sampling three or more times per power cycle, and conversion of samples to numeric values for measurement calculations by microprocessor electronics. • Alarming for power supply failure (see Table 2).	12 Calendar Years	Verify: • Settings are as specified. • Operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Acceptable measurement of power system input values.

[2] For the tables in this standard, a calendar year starts on the first day of a new year (January 1) after a maintenance activity has been completed. For the tables in this standard, a calendar month starts on the first day of the first month after a maintenance activity has been completed.

Table 1-1 Component Type - Protective Relay Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval[2]**	**Maintenance Activities**
Monitored microprocessor protective relay with preceding row attributes and the following: • Ac measurements are continuously verified by comparison to an independent ac measurement source, with alarming for excessive error (See Table 2). • Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2). • Alarming for change of settings (See Table 2).	12 Calendar Years	Verify only the unmonitored relay inputs and outputs that are essential to proper functioning of the Protection System.

Table 1-2 Component Type - Communications Systems Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any unmonitored communications system necessary for correct operation of protective functions, and not having all the monitoring attributes of a category below.	4 Calendar Months	Verify that the communications system is functional.
	6 Calendar Years	Verify that the communications system meets performance criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate). Verify operation of communications system inputs and outputs that are essential to proper functioning of the Protection System.
Any communications system with continuous monitoring or periodic automated testing for the presence of the channel function, and alarming for loss of function (See Table 2).	12 Calendar Years	Verify that the communications system meets performance criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate). Verify operation of communications system inputs and outputs that are essential to proper functioning of the Protection System.
Any communications system with all of the following: • Continuous monitoring or periodic automated testing for the performance of the channel using criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate, and alarming for excessive performance degradation). (See Table 2) • Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2).	12 Calendar Years	Verify only the unmonitored communications system inputs and outputs that are essential to proper functioning of the Protection System

Table 1-3 Component Type - Voltage and Current Sensing Devices Providing Inputs to Protective Relays Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any voltage and current sensing devices not having monitoring attributes of the category below.	12 Calendar Years	Verify that current and voltage signal values are provided to the protective relays.
Voltage and Current Sensing devices connected to microprocessor relays with AC measurements are continuously verified by comparison of sensing input value, as measured by the microprocessor relay, to an independent ac measurement source, with alarming for unacceptable error or failure (see Table 2).	No periodic maintenance specified	None.

Table 1-4(a) Component Type – Protection System Station dc Supply Using Vented Lead-Acid (VLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Protection System Station dc supply using **Vented Lead-Acid (VLA) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • Electrolyte level • For unintentional grounds
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Cell condition of all individual battery cells where cells are visible – or measure battery cell/unit internal ohmic values where the cells are not visible • Physical condition of battery rack

Table 1-4(a) Component Type – Protection System Station dc Supply Using Vented Lead-Acid (VLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
	18 Calendar Months -or- 6 Calendar Years	Verify that the station battery can perform as manufactured by evaluating cell/unit measurements indicative of battery performance (e.g. internal ohmic values or float current) against the station battery baseline. -or- Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(b) Component Type – Protection System Station dc Supply Using Valve-Regulated Lead-Acid (VRLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Protection System Station dc supply **with Valve Regulated Lead-Acid (VRLA) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • For unintentional grounds
	6 Calendar Months	Inspect: • Condition of all individual units by measuring battery cell/unit internal ohmic values.
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Physical condition of battery rack

Table 1-4(b) Component Type – Protection System Station dc Supply Using Valve-Regulated Lead-Acid (VRLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
	6 Calendar Months -or- 3 Calendar Years	Verify that the station battery can perform as manufactured by evaluating cell/unit measurements indicative of battery performance (e.g. internal ohmic values or float current) against the station battery baseline. -or- Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(c) Component Type – Protection System Station dc Supply Using Nickel-Cadmium (NiCad) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS system, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Protection System Station dc supply **Nickel-Cadmium (NiCad) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • Electrolyte level • For unintentional grounds
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Cell condition of all individual battery cells. • Physical condition of battery rack
	6 Calendar Years	Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(d) Component Type – Protection System Station dc Supply Using Non Battery Based Energy Storage Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS system, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any Protection System station dc supply not using a battery and not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • For unintentional grounds
	18 Calendar Months	Inspect: Condition of non-battery based dc supply
	6 Calendar Years	Verify that the dc supply can perform as manufactured when ac power is not present.

Table 1-4(e) Component Type – Protection System Station dc Supply for non-BES Interrupting Devices for SPS, non-distributed UFLS, and non-distributed UVLS systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any Protection System dc supply used for tripping only non-BES interrupting devices as part of a SPS, non-distributed UFLS, or non-distributed UVLS system and not having monitoring attributes of Table 1-4(f).	When control circuits are verified (See Table 1-5)	Verify Station dc supply voltage.

Table 1-4(f) Exclusions for Protection System Station dc Supply Monitoring Devices and Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any station dc supply with high and low voltage monitoring and alarming of the battery charger voltage to detect charger overvoltage and charger failure (See Table 2).	No periodic maintenance specified	No periodic verification of station dc supply voltage is required.
Any battery based station dc supply with electrolyte level monitoring and alarming in every cell (See Table 2).		No periodic inspection of the electrolyte level for each cell is required.
Any station dc supply with unintentional dc ground monitoring and alarming (See Table 2).		No periodic inspection of unintentional dc grounds is required.
Any station dc supply with charger float voltage monitoring and alarming to ensure correct float voltage is being applied on the station dc supply (See Table 2).		No periodic verification of float voltage of battery charger is required.
Any battery based station dc supply with monitoring and alarming of battery string continuity (See Table 2).		No periodic verification of the battery continuity is required.
Any battery based station dc supply with monitoring and alarming of the intercell and/or terminal connection detail resistance of the entire battery (See Table 2).		No periodic verification of the intercell and terminal connection resistance is required.
Any Valve Regulated Lead-Acid (VRLA) or Vented Lead-Acid (VLA) station battery with internal ohmic value or float current monitoring and alarming, and evaluating present values relative to baseline internal ohmic values for every cell/unit (See Table 2).		No periodic evaluation relative to baseline of battery cell/unit measurements indicative of battery performance is required to verify the station battery can perform as manufactured.
Any Valve Regulated Lead-Acid (VRLA) or Vented Lead-Acid (VLA) station battery with monitoring and alarming of each cell/unit internal ohmic value (See Table 2).		No periodic inspection of the condition of all individual units by measuring battery cell/unit internal ohmic values of a station VRLA or Vented Lead-Acid (VLA) battery is required.

Table 1-5 Component Type - Control Circuitry Associated With Protective Functions Excluding distributed UFLS and distributed UVLS (see Table 3) Note: Table requirements apply to all Control Circuitry Components of Protection Systems, and SPSs except as noted.		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Trip coils or actuators of circuit breakers, interrupting devices, or mitigating devices (regardless of any monitoring of the control circuitry).	6 Calendar Years	Verify that each trip coil is able to operate the circuit breaker, interrupting device, or mitigating device.
Electromechanical lockout devices which are directly in a trip path from the protective relay to the interrupting device trip coil (regardless of any monitoring of the control circuitry).	6 Calendar Years	Verify electrical operation of electromechanical lockout devices.
Unmonitored control circuitry associated with SPS. (See Table 4-2(b) for SPS which include Automatic Reclosing.)	12 Calendar Years	Verify all paths of the control circuits essential for proper operation of the SPS.
Unmonitored control circuitry associated with protective functions inclusive of all auxiliary relays.	12 Calendar Years	Verify all paths of the trip circuits inclusive of all auxiliary relays through the trip coil(s) of the circuit breakers or other interrupting devices.
Control circuitry associated with protective functions and/or SPSs whose integrity is monitored and alarmed (See Table 2).	No periodic maintenance specified	None.

Table 2 – Alarming Paths and Monitoring In Tables 1-1 through 1-5, Table 3, and Tables 4-1 through 4-2, alarm attributes used to justify extended maximum maintenance intervals and/or reduced maintenance activities are subject to the following maintenance requirements		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any alarm path through which alarms in Tables 1-1 through 1-5, Table 3, and Tables 4-1 through 4-2 are conveyed from the alarm origin to the location where corrective action can be initiated, and not having all the attributes of the "Alarm Path with monitoring" category below. Alarms are reported within 24 hours of detection to a location where corrective action can be initiated.	12 Calendar Years	Verify that the alarm path conveys alarm signals to a location where corrective action can be initiated.
Alarm Path with monitoring: The location where corrective action is taken receives an alarm within 24 hours for failure of any portion of the alarming path from the alarm origin to the location where corrective action can be initiated.	No periodic maintenance specified	None.

Table 3 Maintenance Activities and Intervals for distributed UFLS and distributed UVLS Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any unmonitored protective relay not having all the monitoring attributes of a category below.	6 Calendar Years	Verify that settings are as specified. For non-microprocessor relays: • Test and, if necessary calibrate. For microprocessor relays: • Verify operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Verify acceptable measurement of power system input values.
Monitored microprocessor protective relay with the following: • Internal self diagnosis and alarming (See Table 2). • Voltage and/or current waveform sampling three or more times per power cycle, and conversion of samples to numeric values for measurement calculations by microprocessor electronics. Alarming for power supply failure (See Table 2).	12 Calendar Years	Verify: • Settings are as specified. • Operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Acceptable measurement of power system input values
Monitored microprocessor protective relay with preceding row attributes and the following: • Ac measurements are continuously verified by comparison to an independent ac measurement source, with alarming for excessive error (See Table 2). • Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2). Alarming for change of settings (See Table 2).	12 Calendar Years	Verify only the unmonitored relay inputs and outputs that are essential to proper functioning of the Protection System.

Table 3 Maintenance Activities and Intervals for distributed UFLS and distributed UVLS Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Voltage and/or current sensing devices associated with UFLS or UVLS systems.	12 Calendar Years	Verify that current and/or voltage signal values are provided to the protective relays.
Protection System dc supply for tripping non-BES interrupting devices used only for a UFLS or UVLS system.	12 Calendar Years	Verify Protection System dc supply voltage.
Control circuitry between the UFLS or UVLS relays and electromechanical lockout and/or tripping auxiliary devices (excludes non-BES interrupting device trip coils).	12 Calendar Years	Verify the path from the relay to the lockout and/or tripping auxiliary relay (including essential supervisory logic).
Electromechanical lockout and/or tripping auxiliary devices associated only with UFLS or UVLS systems (excludes non-BES interrupting device trip coils).	12 Calendar Years	Verify electrical operation of electromechanical lockout and/or tripping auxiliary devices.
Control circuitry between the electromechanical lockout and/or tripping auxiliary devices and the non-BES interrupting devices in UFLS or UVLS systems, or between UFLS or UVLS relays (with no interposing electromechanical lockout or auxiliary device) and the non-BES interrupting devices (excludes non-BES interrupting device trip coils).	No periodic maintenance specified	None.
Trip coils of non-BES interrupting devices in UFLS or UVLS systems.	No periodic maintenance specified	None.

Table 4-1 Maintenance Activities and Intervals for Automatic Reclosing Components Component Type – Reclosing Relay		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any unmonitored reclosing relay not having all the monitoring attributes of a category below.	6 Calendar Years	Verify that settings are as specified. For non-microprocessor relays: • Test and, if necessary calibrate For microprocessor relays: • Verify operation of the relay inputs and outputs that are essential to proper functioning of the Automatic Reclosing.
Monitored microprocessor reclosing relay with the following: • Internal self diagnosis and alarming (See Table 2). • Alarming for power supply failure (See Table 2).	12 Calendar Years	Verify: • Settings are as specified. • Operation of the relay inputs and outputs that are essential to proper functioning of the Automatic Reclosing.

Table 4-2(a) Maintenance Activities and Intervals for Automatic Reclosing Components Component Type – Control Circuitry Associated with Reclosing Relays that are NOT an Integral Part of an SPS		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Unmonitored Control circuitry associated with Automatic Reclosing that is not an integral part of an SPS.	12 Calendar Years	Verify that Automatic Reclosing, upon initiation, does not issue a premature closing command to the close circuitry.
Control circuitry associated with Automatic Reclosing that is not part of an SPS and is monitored and alarmed for conditions that would result in a premature closing command. (See Table 2)	No periodic maintenance specified	None.

Table 4-2(b) Maintenance Activities and Intervals for Automatic Reclosing Components Component Type – Control Circuitry Associated with Reclosing Relays that ARE an Integral Part of an SPS		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Close coils or actuators of circuit breakers or similar devices that are used in conjunction with Automatic Reclosing as part of an SPS (regardless of any monitoring of the control circuitry).	6 Calendar Years	Verify that each close coil or actuator is able to operate the circuit breaker or mitigating device.
Unmonitored close control circuitry associated with Automatic Reclosing used as an integral part of an SPS.	12 Calendar Years	Verify all paths of the control circuits associated with Automatic Reclosing that are essential for proper operation of the SPS.
Control circuitry associated with Automatic Reclosing that is an integral part of an SPS whose integrity is monitored and alarmed. (See Table 2)	No periodic maintenance specified	None.

PRC-005 — Attachment A

Criteria for a Performance-Based Protection System Maintenance Program

Purpose: To establish a technical basis for initial and continued use of a performance-based Protection System Maintenance Program (PSMP).

To establish the technical justification for the initial use of a performance-based PSMP:

1. Develop a list with a description of Components included in each designated Segment, with a minimum **Segment** population of 60 Components.
2. Maintain the Components in each Segment according to the time-based maximum allowable intervals established in Tables 1-1 through 1-5, Table 3, and Tables 4-1 through 4-2 until results of maintenance activities for the Segment are available for a minimum of 30 individual Components of the Segment.
3. Document the maintenance program activities and results for each Segment, including maintenance dates and Countable Events for each included Component.
4. Analyze the maintenance program activities and results for each Segment to determine the overall performance of the Segment and develop maintenance intervals.
5. Determine the maximum allowable maintenance interval for each Segment such that the Segment experiences **Countable Events** on no more than 4% of the Components within the Segment, for the greater of either the last 30 Components maintained or all Components maintained in the previous year.

To maintain the technical justification for the ongoing use of a performance-based PSMP:

1. At least annually, update the list of Components and Segments and/or description if any changes occur within the Segment.
2. Perform maintenance on the greater of 5% of the Components (addressed in the performance based PSMP) in each Segment or 3 individual Components within the Segment in each year.
3. For the prior year, analyze the maintenance program activities and results for each Segment to determine the overall performance of the Segment.
4. Using the prior year's data, determine the maximum allowable maintenance interval for each Segment such that the Segment experiences Countable Events on no more than 4% of the Components within the Segment, for the greater of either the last 30 Components maintained or all Components maintained in the previous year.
5. If the Components in a Segment maintained through a performance-based PSMP experience 4% or more Countable Events, develop, document, and implement an action plan to reduce the Countable Events to less than 4% of the Segment population within 3 years.

A. Introduction

1. Title: **Protection System and Automatic Reclosing Maintenance**

2. Number: PRC-005-3.1

3. Purpose: To document and implement programs for the maintenance of all Protection Systems and Automatic Reclosing affecting the reliability of the Bulk Electric System (BES) so that they are kept in working order.

4. Applicability:

4.1. Functional Entities:

4.1.1 Transmission Owner

4.1.2 Generator Owner

4.1.3 Distribution Provider

4.2. Facilities:

4.2.1 Protection Systems that are installed for the purpose of detecting Faults on BES Elements (lines, buses, transformers, etc.)

4.2.2 Protection Systems used for underfrequency load-shedding systems installed per ERO underfrequency load-shedding requirements.

4.2.3 Protection Systems used for undervoltage load-shedding systems installed to prevent system voltage collapse or voltage instability for BES reliability.

4.2.4 Protection Systems installed as a Special Protection System (SPS) for BES reliability.

4.2.5 Protection Systems for generator Facilities that are part of the BES, including:

4.2.5.1 Protection Systems that act to trip the generator either directly or via lockout or auxiliary tripping relays.

4.2.5.2 Protection Systems for generator step-up transformers for generators that are part of the BES.

4.2.5.3 Protection Systems for transformers connecting aggregated generation, where the aggregated generation is part of the BES (e.g., transformers connecting facilities such as wind-farms to the BES).

4.2.5.4 Protection Systems for station service or excitation transformers connected to the generator bus of generators which are part of the BES, that act to trip the generator either directly or via lockout or tripping auxiliary relays.

4.2.6 Automatic Reclosing[1], including:

4.2.6.1 Automatic Reclosing applied on the terminals of Elements connected to the BES bus located at generating plant substations where the total installed

[1] Automatic Reclosing addressed in Section 4.2.6.1 and 4.2.6.2 may be excluded if the equipment owner can demonstrate that a close-in three-phase fault present for twice the normal clearing time (capturing a minimum trip-close-trip time delay) does not result in a total loss of gross generation in the Interconnection exceeding the gross capacity of the largest BES generating unit within the Balancing Authority Area where the Automatic Reclosing is applied.

gross generating plant capacity is greater than the gross capacity of the largest BES generating unit within the Balancing Authority Area.

4.2.6.2 Automatic Reclosing applied on the terminals of all BES Elements at substations one bus away from generating plants specified in Section 4.2.6.1 when the substation is less than 10 circuit-miles from the generating plant substation.

4.2.6.3 Automatic Reclosing applied as an integral part of an SPS specified in Section 4.2.4.

5. Effective Date: See Implementation Plan

6. Definitions Used in this Standard: The following terms are defined for use only within PRC-005-3, and should remain with the standard upon approval rather than being moved to the Glossary of Terms.

Automatic Reclosing – Includes the following Components:

- Reclosing relay
- Control circuitry associated with the reclosing relay.

Unresolved Maintenance Issue – A deficiency identified during a maintenance activity that causes the ~~component~~ Component to not meet the intended performance, cannot be corrected during the maintenance interval, and requires follow-up corrective action.

Segment – Components of a consistent design standard, or a particular model or type from a single manufacturer that typically share other common elements. Consistent performance is expected across the entire population of a Segment. A Segment must contain at least sixty (60) individual Components.

Component Type – Either any one of the five specific elements of the Protection System definition or any one of the two specific elements of the Automatic Reclosing definition.

Component – A Component is any individual discrete piece of equipment included in a Protection System or in Automatic Reclosing, including but not limited to a protective relay, reclosing relay, or current sensing device. The designation of what constitutes a control circuit Component is dependent upon how an entity performs and tracks the testing of the control circuitry. Some entities test their control circuits on a breaker basis whereas others test their circuitry on a local zone of protection basis. Thus, entities are allowed the latitude to designate their own definitions of control circuit Components. Another example of where the entity has some discretion on determining what constitutes a single Component is the voltage and current sensing devices, where the entity may choose either to designate a full three-phase set of such devices or a single device as a single Component.

Countable Event – A failure of a Component requiring repair or replacement, any condition discovered during the maintenance activities in Tables 1-1 through 1-5, Table 3, and Tables 4-1 through 4-2 which requires corrective action or a Protection System Misoperation attributed to hardware failure or calibration failure. Misoperations due to product design errors, software errors, relay settings different from specified settings, Protection System Component or Automatic Reclosing configuration or application errors are not included in Countable Events.

B. Requirements

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a Protection System Maintenance Program (PSMP) for its Protection Systems and Automatic Reclosing identified in Facilities Section 4.2. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

The PSMP shall:

1.1. Identify which maintenance method (time-based, performance-based per PRC-005 Attachment A, or a combination) is used to address each Protection System and Automatic Reclosing Component Type. All batteries associated with the station dc supply Component Type of a Protection System shall be included in a time-based program as described in Table 1-4 and Table 3.

1.2. Include the applicable monitored Component attributes applied to each Protection System and Automatic Reclosing Component Type consistent with the maintenance intervals specified in Tables 1-1 through 1-5, Table 2, Table 3, and Table 4-1 through 4-2 where monitoring is used to extend the maintenance intervals beyond those specified for unmonitored Protection System and Automatic Reclosing Components.

R2. Each Transmission Owner, Generator Owner, and Distribution Provider that uses performance-based maintenance intervals in its PSMP shall follow the procedure established in PRC-005 Attachment A to establish and maintain its performance-based intervals. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

R3. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes time-based maintenance program(s) shall maintain its Protection System and Automatic Reclosing Components that are included within the time-based maintenance program in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, and Table 4-1 through 4-2. *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

R4. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes performance-based maintenance program(s) in accordance with Requirement R2 shall implement and follow its PSMP for its Protection System and Automatic Reclosing Components that are included within the performance-based program(s). *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

R5. Each Transmission Owner, Generator Owner, and Distribution Provider shall demonstrate efforts to correct identified Unresolved Maintenance Issues. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

C. Measures

M1. Each Transmission Owner, Generator Owner and Distribution Provider shall have a documented Protection System Maintenance Program in accordance with Requirement R1.

For each Protection System and Automatic Reclosing Component Type, the documentation shall include the type of maintenance method applied (time-based, performance-based, or a combination of these maintenance methods), and shall include all batteries associated with the station dc supply Component Types in a time-based program as described in Table 1-4 and Table 3. (Part 1.1)

For Component Types that use monitoring to extend the maintenance intervals, the responsible entity(s) shall have evidence for each Protection System and Automatic Reclosing Component Type (such as manufacturer's specifications or engineering drawings) of the appropriate

monitored Component attributes as specified in Tables 1-1 through 1-5, Table 2, Table 3, and Table 4-1 through 4-2. (Part 1.2)

M2. Each Transmission Owner, Generator Owner, and Distribution Provider that uses performance-based maintenance intervals shall have evidence that its current performance-based maintenance program(s) is in accordance with Requirement R2, which may include but is not limited to Component lists, dated maintenance records, and dated analysis records and results.

M3. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes time-based maintenance program(s) shall have evidence that it has maintained its Protection System and Automatic Reclosing Components included within its time-based program in accordance with Requirement R3. The evidence may include but is not limited to dated maintenance records, dated maintenance summaries, dated check-off lists, dated inspection records, or dated work orders.

M4. Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes performance-based maintenance intervals in accordance with Requirement R2 shall have evidence that it has implemented the Protection System Maintenance Program for the Protection System and Automatic Reclosing Components included in its performance-based program in accordance with Requirement R4. The evidence may include but is not limited to dated maintenance records, dated maintenance summaries, dated check-off lists, dated inspection records, or dated work orders.

M5. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence that it has undertaken efforts to correct identified Unresolved Maintenance Issues in accordance with Requirement R5. The evidence may include but is not limited to work orders, replacement Component orders, invoices, project schedules with completed milestones, return material authorizations (RMAs) or purchase orders.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and Enforcement Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.3. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, and Distribution Provider shall each keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

For Requirement R1, the Transmission Owner, Generator Owner, and Distribution Provider shall each keep its current dated Protection System Maintenance Program, as well as any superseded versions since the preceding compliance audit, including the documentation that specifies the type of maintenance program applied for each Protection System Component Type.

For Requirement R2, Requirement R3, Requirement R4, and Requirement R5, the Transmission Owner, Generator Owner, and Distribution Provider shall each keep documentation of the two most recent performances of each distinct maintenance activity for the Protection System or Automatic Reclosing Component, or all performances of each distinct maintenance activity for the Protection System or Automatic Reclosing Component since the previous scheduled audit date, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

2. Violation Severity Levels

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The responsible entity's PSMP failed to specify whether one Component Type is being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1) ~~OR~~ ~~The responsible entity's PSMP failed to include applicable station batteries in a time-based program. (Part 1.1)~~	The responsible entity's PSMP failed to specify whether two Component Types are being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1)	The responsible entity's PSMP failed to specify whether three Component Types are being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1). OR The responsible entity's PSMP failed to include the applicable monitoring attributes applied to each Component Type consistent with the maintenance intervals specified in Tables 1-1 through 1-5, Table 2, Table 3, and Tables 4-1 through 4-2 where monitoring is used to extend the maintenance intervals beyond those specified for unmonitored Components. (Part 1.2).	The responsible entity failed to establish a PSMP. OR The responsible entity's PSMP failed to specify whether four or more Component Types are being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1). OR The responsible entity's PSMP failed to include applicable station batteries in a time-based program. (Part 1.1)
R2	The responsible entity uses performance-based maintenance intervals in its PSMP but failed to reduce Countable Events to no more than 4% within three years.	NA	The responsible entity uses performance-based maintenance intervals in its PSMP but failed to reduce Countable Events to no more than 4% within four years.	The responsible entity uses performance-based maintenance intervals in its PSMP but: 1) Failed to establish the technical justification described within Requirement R2 for the initial use of the performance-based PSMP OR 2) Failed to reduce Countable Events to no more than 4% within five years OR

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
				3) Maintained a Segment with less than 60 Components OR 4) Failed to: • Annually update the list of Components, OR • Annually perform maintenance on the greater of 5% of the Segment population or 3 Components, OR • Annually analyze the program activities and results for each Segment.
R3	For Components included within a time-based maintenance program, the responsible entity failed to maintain 5% or less of the total Components included within a specific Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, and Tables 4-1 through 4-2.	For Components included within a time-based maintenance program, the responsible entity failed to maintain more than 5% but 10% or less of the total Components included within a specific Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, and Tables 4-1 through 4-2.	For Components included within a time-based maintenance program, the responsible entity failed to maintain more than 10% but 15% or less of the total Components included within a specific Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, and Tables 4-1 through 4-2.	For Components included within a time-based maintenance program, the responsible entity failed to maintain more than 15% of the total Components included within a specific Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, and Tables 4-1 through 4-2.
R4	For Components included within a performance-based maintenance program, the responsible entity failed to maintain 5% or less of the annual scheduled maintenance for a specific	For Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 5% but 10% or less of the annual scheduled maintenance for a specific	For Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 10% but 15% or less of the annual scheduled maintenance for a specific	For Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 15% of the annual scheduled maintenance for a specific

Requirement Number	Lower VSL	Moderate VSL	High VSL	Severe VSL
	Component Type in accordance with their performance-based PSMP.	Component Type in accordance with their performance-based PSMP.	Component Type in accordance with their performance-based PSMP.	Component Type in accordance with their performance-based PSMP.
R5	The responsible entity failed to undertake efforts to correct 5 or fewer identified Unresolved Maintenance Issues.	The responsible entity failed to undertake efforts to correct greater than 5, but less than or equal to 10 identified Unresolved Maintenance Issues.	The responsible entity failed to undertake efforts to correct greater than 10, but less than or equal to 15 identified Unresolved Maintenance Issues.	The responsible entity failed to undertake efforts to correct greater than 15 identified Unresolved Maintenance Issues.

E. Regional Variances

None

F. Supplemental Reference Document

The following documents present a detailed discussion about determination of maintenance intervals and other useful information regarding establishment of a maintenance program.

1. PRC-005-2 Protection System Maintenance Supplementary Reference and FAQ — March 2013.
2. Considerations for Maintenance and Testing of Autoreclosing Schemes — November 2012.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
1	December 1, 2005	1. Changed incorrect use of certain hyphens (-) to "en dash" (–) and "em dash (—)." 2. Added "periods" to items where appropriate. 3. Changed "Timeframe" to "Time Frame" in item D, 1.2.	01/20/05
1a	February 17, 2011	Added Appendix 1 - Interpretation regarding applicability of standard to protection of radially connected transformers	Project 2009-17 interpretation
1a	February 17, 2011	Adopted by Board of Trustees	
1a	September 26, 2011	FERC Order issued approving interpretation of R1 and R2 (FERC's Order is effective as of September 26, 2011)	
1.1a	February 1, 2012	Errata change: Clarified inclusion of generator interconnection Facility in Generator Owner's responsibility	Revision under Project 2010-07
1b	February 3, 2012	FERC Order issued approving interpretation of R1, R1.1, and R1.2 (FERC's Order dated March 14, 2012). Updated version from 1a to 1b.	Project 2009-10 Interpretation
1.1b	April 23, 2012	Updated standard version to 1.1b to reflect FERC approval of PRC-005-1b.	Revision under Project 2010-07

1.1b	May 9, 2012	PRC-005-1.1b was adopted by the Board of Trustees as part of Project 2010-07 (GOTO).	
2	November 7, 2012	Adopted by Board of Trustees	Project 2007-17 - Complete revision, absorbing maintenance requirements from PRC-005-1.1b, PRC-008-0, PRC-011-0, PRC-017-0
2	October 17, 2013	Errata Change: The Standards Committee approved an errata change to the implementation plan for PRC-005-2 to add the phrase “or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities;” to the second sentence under the “Retirement of Existing	
2	May 7, 2014	Adopted by the NERC Board of Trustees to modify VSLs for Requirement R1.	
3	November 7, 2013	Adopted by the NERC Board of Trustees	Revised to address the FERC directive in Order No.758 to include Automatic Reclosing in maintenance programs.
3.1	February 12, 2014	Errata Change: The Standards Committee approved errata changes to correct capitalization of certain defined terms within the definitions of "Unresolved Maintenance Issue" and "Protection System Maintenance Program". The changes will be reflected in the definitions section of PRC-005-3 for "Unresolved Maintenance Issue" and in the NERC Glossary of Terms for "Protection System Maintenance Program".	

Table 1-1 Component Type - Protective Relay Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval[2]**	**Maintenance Activities**
Any unmonitored protective relay not having all the monitoring attributes of a category below.	6 Calendar Years	For all unmonitored relays: • Verify that settings are as specified For non-microprocessor relays: • Test and, if necessary calibrate For microprocessor relays: • Verify operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Verify acceptable measurement of power system input values.
Monitored microprocessor protective relay with the following: • Internal self-diagnosis and alarming (see Table 2). • Voltage and/or current waveform sampling three or more times per power cycle, and conversion of samples to numeric values for measurement calculations by microprocessor electronics. • Alarming for power supply failure (see Table 2).	12 Calendar Years	Verify: • Settings are as specified. • Operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Acceptable measurement of power system input values.

[2] For the tables in this standard, a calendar year starts on the first day of a new year (January 1) after a maintenance activity has been completed. For the tables in this standard, a calendar month starts on the first day of the first month after a maintenance activity has been completed.

Table 1-1 Component Type - Protective Relay Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval[2]**	**Maintenance Activities**
Monitored microprocessor protective relay with preceding row attributes and the following: • Ac measurements are continuously verified by comparison to an independent ac measurement source, with alarming for excessive error (See Table 2). • Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2). • Alarming for change of settings (See Table 2).	12 Calendar Years	Verify only the unmonitored relay inputs and outputs that are essential to proper functioning of the Protection System.

Table 1-2 Component Type - Communications Systems Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any unmonitored communications system necessary for correct operation of protective functions, and not having all the monitoring attributes of a category below.	4 Calendar Months	Verify that the communications system is functional.
	6 Calendar Years	Verify that the communications system meets performance criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate). Verify operation of communications system inputs and outputs that are essential to proper functioning of the Protection System.
Any communications system with continuous monitoring or periodic automated testing for the presence of the channel function, and alarming for loss of function (See Table 2).	12 Calendar Years	Verify that the communications system meets performance criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate). Verify operation of communications system inputs and outputs that are essential to proper functioning of the Protection System.
Any communications system with all of the following: • Continuous monitoring or periodic automated testing for the performance of the channel using criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate, and alarming for excessive performance degradation). (See Table 2) • Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2).	12 Calendar Years	Verify only the unmonitored communications system inputs and outputs that are essential to proper functioning of the Protection System

Table 1-3 Component Type - Voltage and Current Sensing Devices Providing Inputs to Protective Relays Excluding distributed UFLS and distributed UVLS (see Table 3)		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any voltage and current sensing devices not having monitoring attributes of the category below.	12 Calendar Years	Verify that current and voltage signal values are provided to the protective relays.
Voltage and Current Sensing devices connected to microprocessor relays with AC measurements are continuously verified by comparison of sensing input value, as measured by the microprocessor relay, to an independent ac measurement source, with alarming for unacceptable error or failure (see Table 2).	No periodic maintenance specified	None.

Table 1-4(a) Component Type – Protection System Station dc Supply Using Vented Lead-Acid (VLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Protection System Station dc supply using **Vented Lead-Acid (VLA) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • Electrolyte level • For unintentional grounds
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Cell condition of all individual battery cells where cells are visible – or measure battery cell/unit internal ohmic values where the cells are not visible • Physical condition of battery rack

Table 1-4(a) Component Type – Protection System Station dc Supply Using Vented Lead-Acid (VLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
	18 Calendar Months -or- 6 Calendar Years	Verify that the station battery can perform as manufactured by evaluating cell/unit measurements indicative of battery performance (e.g. internal ohmic values or float current) against the station battery baseline. -or- Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(b) Component Type – Protection System Station dc Supply Using Valve-Regulated Lead-Acid (VRLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Protection System Station dc supply **with Valve Regulated Lead-Acid (VRLA) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • For unintentional grounds
	6 Calendar Months	Inspect: • Condition of all individual units by measuring battery cell/unit internal ohmic values.
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Physical condition of battery rack

Table 1-4(b) Component Type – Protection System Station dc Supply Using Valve-Regulated Lead-Acid (VRLA) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
	6 Calendar Months -or- 3 Calendar Years	Verify that the station battery can perform as manufactured by evaluating cell/unit measurements indicative of battery performance (e.g. internal ohmic values or float current) against the station battery baseline. -or- Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(c) Component Type – Protection System Station dc Supply Using Nickel-Cadmium (NiCad) Batteries Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS system, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Protection System Station dc supply **Nickel-Cadmium (NiCad) batteries** not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • Electrolyte level • For unintentional grounds
	18 Calendar Months	Verify: • Float voltage of battery charger • Battery continuity • Battery terminal connection resistance • Battery intercell or unit-to-unit connection resistance Inspect: • Cell condition of all individual battery cells. • Physical condition of battery rack
	6 Calendar Years	Verify that the station battery can perform as manufactured by conducting a performance or modified performance capacity test of the entire battery bank.

Table 1-4(d) Component Type – Protection System Station dc Supply Using Non Battery Based Energy Storage Excluding distributed UFLS and distributed UVLS (see Table 3) Protection System Station dc supply used only for non-BES interrupting devices for SPS, non-distributed UFLS system, or non-distributed UVLS systems is excluded (see Table 1-4(e)).		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any Protection System station dc supply not using a battery and not having monitoring attributes of Table 1-4(f).	4 Calendar Months	Verify: • Station dc supply voltage Inspect: • For unintentional grounds
	18 Calendar Months	Inspect: Condition of non-battery based dc supply
	6 Calendar Years	Verify that the dc supply can perform as manufactured when ac power is not present.

Table 1-4(e) Component Type – Protection System Station dc Supply for non-BES Interrupting Devices for SPS, non-distributed UFLS, and non-distributed UVLS systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any Protection System dc supply used for tripping only non-BES interrupting devices as part of a SPS, non-distributed UFLS, or non-distributed UVLS system and not having monitoring attributes of Table 1-4(f).	When control circuits are verified (See Table 1-5)	Verify Station dc supply voltage.

Table 1-4(f) Exclusions for Protection System Station dc Supply Monitoring Devices and Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any station dc supply with high and low voltage monitoring and alarming of the battery charger voltage to detect charger overvoltage and charger failure (See Table 2).	No periodic maintenance specified	No periodic verification of station dc supply voltage is required.
Any battery based station dc supply with electrolyte level monitoring and alarming in every cell (See Table 2).		No periodic inspection of the electrolyte level for each cell is required.
Any station dc supply with unintentional dc ground monitoring and alarming (See Table 2).		No periodic inspection of unintentional dc grounds is required.
Any station dc supply with charger float voltage monitoring and alarming to ensure correct float voltage is being applied on the station dc supply (See Table 2).		No periodic verification of float voltage of battery charger is required.
Any battery based station dc supply with monitoring and alarming of battery string continuity (See Table 2).		No periodic verification of the battery continuity is required.
Any battery based station dc supply with monitoring and alarming of the intercell and/or terminal connection detail resistance of the entire battery (See Table 2).		No periodic verification of the intercell and terminal connection resistance is required.
Any Valve Regulated Lead-Acid (VRLA) or Vented Lead-Acid (VLA) station battery with internal ohmic value or float current monitoring and alarming, and evaluating present values relative to baseline internal ohmic values for every cell/unit (See Table 2).		No periodic evaluation relative to baseline of battery cell/unit measurements indicative of battery performance is required to verify the station battery can perform as manufactured.
Any Valve Regulated Lead-Acid (VRLA) or Vented Lead-Acid (VLA) station battery with monitoring and alarming of each cell/unit internal ohmic value (See Table 2).		No periodic inspection of the condition of all individual units by measuring battery cell/unit internal ohmic values of a station VRLA or Vented Lead-Acid (VLA) battery is required.

Table 1-5 Component Type - Control Circuitry Associated With Protective Functions Excluding distributed UFLS and distributed UVLS (see Table 3) Note: Table requirements apply to all Control Circuitry Components of Protection Systems, and SPSs except as noted.		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Trip coils or actuators of circuit breakers, interrupting devices, or mitigating devices (regardless of any monitoring of the control circuitry).	6 Calendar Years	Verify that each trip coil is able to operate the circuit breaker, interrupting device, or mitigating device.
Electromechanical lockout devices which are directly in a trip path from the protective relay to the interrupting device trip coil (regardless of any monitoring of the control circuitry).	6 Calendar Years	Verify electrical operation of electromechanical lockout devices.
Unmonitored control circuitry associated with SPS. (See Table 4-2(b) for SPS which include Automatic Reclosing.)	12 Calendar Years	Verify all paths of the control circuits essential for proper operation of the SPS.
Unmonitored control circuitry associated with protective functions inclusive of all auxiliary relays.	12 Calendar Years	Verify all paths of the trip circuits inclusive of all auxiliary relays through the trip coil(s) of the circuit breakers or other interrupting devices.
Control circuitry associated with protective functions and/or SPSs whose integrity is monitored and alarmed (See Table 2).	No periodic maintenance specified	None.

Table 2 – Alarming Paths and Monitoring In Tables 1-1 through 1-5, Table 3, and Tables 4-1 through 4-2, alarm attributes used to justify extended maximum maintenance intervals and/or reduced maintenance activities are subject to the following maintenance requirements		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any alarm path through which alarms in Tables 1-1 through 1-5, Table 3, and Tables 4-1 through 4-2 are conveyed from the alarm origin to the location where corrective action can be initiated, and not having all the attributes of the "Alarm Path with monitoring" category below. Alarms are reported within 24 hours of detection to a location where corrective action can be initiated.	12 Calendar Years	Verify that the alarm path conveys alarm signals to a location where corrective action can be initiated.
Alarm Path with monitoring: The location where corrective action is taken receives an alarm within 24 hours for failure of any portion of the alarming path from the alarm origin to the location where corrective action can be initiated.	No periodic maintenance specified	None.

Table 3 Maintenance Activities and Intervals for distributed UFLS and distributed UVLS Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any unmonitored protective relay not having all the monitoring attributes of a category below.	6 Calendar Years	Verify that settings are as specified. For non-microprocessor relays: • Test and, if necessary calibrate. For microprocessor relays: • Verify operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Verify acceptable measurement of power system input values.
Monitored microprocessor protective relay with the following: • Internal self diagnosis and alarming (See Table 2). • Voltage and/or current waveform sampling three or more times per power cycle, and conversion of samples to numeric values for measurement calculations by microprocessor electronics. Alarming for power supply failure (See Table 2).	12 Calendar Years	Verify: • Settings are as specified. • Operation of the relay inputs and outputs that are essential to proper functioning of the Protection System. • Acceptable measurement of power system input values
Monitored microprocessor protective relay with preceding row attributes and the following: • Ac measurements are continuously verified by comparison to an independent ac measurement source, with alarming for excessive error (See Table 2). • Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2). Alarming for change of settings (See Table 2).	12 Calendar Years	Verify only the unmonitored relay inputs and outputs that are essential to proper functioning of the Protection System.

Table 3 Maintenance Activities and Intervals for distributed UFLS and distributed UVLS Systems		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Voltage and/or current sensing devices associated with UFLS or UVLS systems.	12 Calendar Years	Verify that current and/or voltage signal values are provided to the protective relays.
Protection System dc supply for tripping non-BES interrupting devices used only for a UFLS or UVLS system.	12 Calendar Years	Verify Protection System dc supply voltage.
Control circuitry between the UFLS or UVLS relays and electromechanical lockout and/or tripping auxiliary devices (excludes non-BES interrupting device trip coils).	12 Calendar Years	Verify the path from the relay to the lockout and/or tripping auxiliary relay (including essential supervisory logic).
Electromechanical lockout and/or tripping auxiliary devices associated only with UFLS or UVLS systems (excludes non-BES interrupting device trip coils).	12 Calendar Years	Verify electrical operation of electromechanical lockout and/or tripping auxiliary devices.
Control circuitry between the electromechanical lockout and/or tripping auxiliary devices and the non-BES interrupting devices in UFLS or UVLS systems, or between UFLS or UVLS relays (with no interposing electromechanical lockout or auxiliary device) and the non-BES interrupting devices (excludes non-BES interrupting device trip coils).	No periodic maintenance specified	None.
Trip coils of non-BES interrupting devices in UFLS or UVLS systems.	No periodic maintenance specified	None.

Table 4-1 Maintenance Activities and Intervals for Automatic Reclosing Components Component Type – Reclosing Relay		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Any unmonitored reclosing relay not having all the monitoring attributes of a category below.	6 Calendar Years	Verify that settings are as specified. For non-microprocessor relays: • Test and, if necessary calibrate For microprocessor relays: • Verify operation of the relay inputs and outputs that are essential to proper functioning of the Automatic Reclosing.
Monitored microprocessor reclosing relay with the following: • Internal self diagnosis and alarming (See Table 2). • Alarming for power supply failure (See Table 2).	12 Calendar Years	Verify: • Settings are as specified. • Operation of the relay inputs and outputs that are essential to proper functioning of the Automatic Reclosing.

Table 4-2(a) Maintenance Activities and Intervals for Automatic Reclosing Components Component Type – Control Circuitry Associated with Reclosing Relays that are NOT an Integral Part of an SPS		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Unmonitored Control circuitry associated with Automatic Reclosing that is not an integral part of an SPS.	12 Calendar Years	Verify that Automatic Reclosing, upon initiation, does not issue a premature closing command to the close circuitry.
Control circuitry associated with Automatic Reclosing that is not part of an SPS and is monitored and alarmed for conditions that would result in a premature closing command. (See Table 2)	No periodic maintenance specified	None.

Table 4-2(b) Maintenance Activities and Intervals for Automatic Reclosing Components Component Type – Control Circuitry Associated with Reclosing Relays that ARE an Integral Part of an SPS		
Component Attributes	**Maximum Maintenance Interval**	**Maintenance Activities**
Close coils or actuators of circuit breakers or similar devices that are used in conjunction with Automatic Reclosing as part of an SPS (regardless of any monitoring of the control circuitry).	6 Calendar Years	Verify that each close coil or actuator is able to operate the circuit breaker or mitigating device.
Unmonitored close control circuitry associated with Automatic Reclosing used as an integral part of an SPS.	12 Calendar Years	Verify all paths of the control circuits associated with Automatic Reclosing that are essential for proper operation of the SPS.
Control circuitry associated with Automatic Reclosing that is an integral part of an SPS whose integrity is monitored and alarmed. (See Table 2)	No periodic maintenance specified	None.

PRC-005 — Attachment A

Criteria for a Performance-Based Protection System Maintenance Program

Purpose: To establish a technical basis for initial and continued use of a performance-based Protection System Maintenance Program (PSMP).

To establish the technical justification for the initial use of a performance-based PSMP:

1. Develop a list with a description of Components included in each designated Segment, with a minimum **Segment** population of 60 Components.
2. Maintain the Components in each Segment according to the time-based maximum allowable intervals established in Tables 1-1 through 1-5, Table 3, and Tables 4-1 through 4-2 until results of maintenance activities for the Segment are available for a minimum of 30 individual Components of the Segment.
3. Document the maintenance program activities and results for each Segment, including maintenance dates and Countable Events for each included Component.
4. Analyze the maintenance program activities and results for each Segment to determine the overall performance of the Segment and develop maintenance intervals.
5. Determine the maximum allowable maintenance interval for each Segment such that the Segment experiences **Countable Events** on no more than 4% of the Components within the Segment, for the greater of either the last 30 Components maintained or all Components maintained in the previous year.

To maintain the technical justification for the ongoing use of a performance-based PSMP:

1. At least annually, update the list of Components and Segments and/or description if any changes occur within the Segment.
2. Perform maintenance on the greater of 5% of the Components (addressed in the performance based PSMP) in each Segment or 3 individual Components within the Segment in each year.
3. For the prior year, analyze the maintenance program activities and results for each Segment to determine the overall performance of the Segment.
4. Using the prior year's data, determine the maximum allowable maintenance interval for each Segment such that the Segment experiences Countable Events on no more than 4% of the Components within the Segment, for the greater of either the last 30 Components maintained or all Components maintained in the previous year.
5. If the Components in a Segment maintained through a performance-based PSMP experience 4% or more Countable Events, develop, document, and implement an action plan to reduce the Countable Events to less than 4% of the Segment population within 3 years.

PETITION OF THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION FOR APPROVAL OF PROPOSED RELIABILITY STANDARDS VAR-001-4 AND VAR-002-3 AND THE RETIREMENT OF RELIABILITY STANDARDS VAR-001-3 AND VAR-002-2b

Pursuant to Section 215(d)(1) of the Federal Power Act ("FPA")[1] and Section 39.5 of the Commission's Regulations,[2] the North American Electric Reliability Corporation ("NERC")[3] hereby submits proposed Reliability Standards VAR-001-4 (Voltage and Reactive Control) and VAR-002-3 (Generator Operation for Maintaining Network Voltage Schedules) for Commission approval.[4] NERC requests that the Commission approve proposed Reliability Standards VAR-001-4 and VAR-002-3 as just, reasonable, not unduly discriminatory or preferential, and in the public interest.[5] NERC also requests approval of (i) the associated Implementation Plan, (ii) the associated Violation Risk Factors ("VRFs") and Violation Severity Levels ("VSLs"), and (iii) the retirement of currently effective Reliability Standards VAR-001-3 and VAR-002-2b, as detailed in this Petition.

---

1 16 U.S.C. § 824o(d)(1) (2012).

2 18 C.F.R. § 39.5 (2013).

3 The Commission certified NERC as the electric reliability organization ("ERO") in accordance with Section 215 of the FPA on July 20, 2006. *N. Am. Elec. Reliability Corp.*, 116 FERC ¶ 61,062, *order on reh'g and compliance*, 117 FERC ¶ 61,126 (2006), *aff'd sub nom. Alcoa Inc. v. FERC*, 564 F.3d 1342 (D.C. Cir. 2009) ("ERO Certification Order").

4 The NERC Board of Trustees approved proposed Reliability Standards VAR-001-4 on February 6, 2014 and VAR-002-3 on May 7, 2014.

5 Unless otherwise designated, all capitalized terms shall have the meaning set forth in the *Glossary of Terms Used in NERC Reliability Standards* ("NERC Glossary"), *available at* http://www.nerc.com/files/Glossary_of_Terms.pdf.

As required by Section 39.5(a)[6] of the Commission's Regulations, this Petition presents the technical basis and purpose of proposed Reliability Standards VAR-001-4 and VAR-002-3, a summary of the development history, and a demonstration that the proposed Reliability Standards meet the criteria identified by the Commission in Order No. 672.[7] This Petition is organized as follows: First, the Petition presents an executive summary of the proposed Reliability Standards. Next, the Petition provides background on the regulatory structure governing the Reliability Standards approval process, as well as information on the existing Reliability Standards that proposed VAR-001-4 and VAR-002-3 Reliability Standards will replace. The Petition then discusses the proposed Reliability Standards in detail, including how they satisfy the governing statutory criteria and the Commission's directives associated with these Reliability Standards. Finally, we provide the requested effective date for the proposed Reliability Standards.

The following documents are attached as exhibits to this Petition: (a) the proposed Reliability Standards (Exhibit A, with VAR-001-4 as Exhibit A-1 and VAR-002-3 as Exhibit A-2), (b) the proposed Implementation Plan for the proposed Reliability Standards (Exhibit B), (c) a discussion of how the proposed Reliability Standards satisfy the Order No. 672 criteria (Exhibit C), (d) mapping documents showing how the proposed Reliability Standards compare to the corresponding existing Reliability Standards (Exhibit D, with VAR-001-4 compared against VAR-001-3 as Exhibit D-1 and VAR-002-3 compared against VAR-002-2b as Exhibit D-2), (e) an analysis of the VRFs and VSLs for the proposed Reliability Standards (Exhibit E), (f) a

summary of the development history and record of development for the proposed Reliability Standards (Exhibit F), and (g) the standard drafting team roster (Exhibit G).

I. EXECUTIVE SUMMARY

The Voltage and Reactive ("VAR") group of Reliability Standards, which consists of two continent-wide Reliability Standards, VAR-001-3 and VAR-002-2b,[8] is designed to maintain voltage stability on the Bulk-Power System, protect transmission, generation, distribution, and customer equipment, and support the reliable operation of the Bulk-Power System. Voltage stability is the ability of a power system to maintain acceptable voltage levels throughout the system under normal operating conditions and following a disturbance. Failure to maintain acceptable voltage levels (*i.e.*, voltage levels become too high or too low) may cause violations of System Operating Limits ("SOLs") and Interconnection Reliability Operating Limits ("IROLs"), result in damage to Bulk-Power System equipment, and thereby threaten the reliable operation of the Bulk-Power System. The primary factor in maintaining voltage stability is having the appropriate amount of Reactive Power on the system.[9] Proposed Reliability Standards VAR-001-4 and VAR-002-3 are intended to replace and improve upon Reliability Standards VAR-001-3 and VAR-002-2b, respectively, to ensure that the Bulk-Power System operates at acceptable voltage levels and that sufficient Reactive Power is available to maintain voltage stability.

[8] The VAR group of Reliability Standards also includes two regional Reliability Standards, VAR-002-WECC-1 and VAR-501-WECC-1. NERC is not proposing any modifications to these regional Reliability Standards. Additionally, VAR-001-3 includes a regional variance developed by the Western Electricity Coordinating Council ("WECC") applicable to Generator Operators located in the WECC region. NERC has not substantively modified the WECC regional variance and it will be carried forward as part of VAR-001-4. Accordingly, this Petition does not discuss the two regional Reliability Standards or the regional variance.

[9] Reactive Power is the portion of electricity that establishes and sustains the electric and magnetic fields of Bulk-Power System equipment and supports voltage stability.

In general, proposed Reliability Standard VAR-001-4 sets forth the requirements applicable to Transmission Operators for scheduling, monitoring, and controlling Reactive Power resources in the Real-time Operations, Same-day Operations, and Operational Planning time horizons to regulate voltage and Reactive Power flows for the reliable operation of the Bulk-Power System. Proposed Reliability Standard VAR-002-3 sets forth the requirements applicable to Generator Operators and Generator Owners for providing the necessary reactive support and voltage control necessary to maintain reliable operations. Generators are the largest and most reliable Reactive Power resource and play an integral role in maintaining voltage stability on the Bulk-Power System. Collectively, the proposed Reliability Standards are designed to prevent voltage instability and voltage collapse on the Bulk-Power System.

As described further below, proposed Reliability Standard VAR-001-4 requires each Transmission Operator to:

- Specify a system-wide voltage schedule (which is either a range or a target value with an associated tolerance band) as part of its plan to operate within SOLs and IROLs, and to provide the voltage schedule to its Reliability Coordinator and adjacent Transmission Operators upon request (Requirement R1);
- Schedule sufficient reactive resources to regulate voltage levels (Requirement R2);
- Operate or direct the operation of devices to regulate transmission voltage and reactive flows (Requirement R3);
- Develop a set of criteria to exempt generators from certain requirements under Reliability Standard VAR-002-3 related to voltage or Reactive Power schedules, automatic voltage regulations, and notification (Requirement R4);
- Specify a voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) for generators at either the high or low voltage side of the generator step-up transformer, provide the schedule to the associated Generator Operator, direct the Generator Operator to comply with that schedule in automatic voltage control mode, provide the Generator Operator the notification requirements for deviating from the schedule, and, if requested, provide the Generator Operator the criteria used to develop the schedule (Requirement R5); and

- Communicate step-up transformer tap changes, the time frame for completion, and the justification for these changes to Generator Owners (Requirement R6).

Proposed Reliability Standard VAR-002-3 requires each Generator Operator to:

- Operate each of its generators connected to the interconnected transmission system in automatic voltage control mode or in a different control mode as instructed by the Transmission Operator, unless the Generator Operator (1) is exempted pursuant to the criteria developed under VAR-001-4, Requirement R4, or (2) makes certain notifications to the Transmission Operator specifying the reasons it cannot so operate (Requirement R1);

- Maintain the Transmission Operator's generator voltage or Reactive Power schedule, unless the Generator Operator (1) is exempted pursuant to the criteria developed under VAR-001-4, Requirement R4, or (2) complies with the notification requirements for deviations as established by the Transmission Owner pursuant to VAR-001-4, Requirement R5 (Requirement R2);[10]

- Notify the Transmission Operator of a change in status of its voltage controlling device within 30 minutes, unless the status is restored within that time period (Requirement R3); and

- Notify the Transmission Operator of a change in reactive capability due to factors other than those described in VAR-002-3, Requirement R3 within 30 minutes unless the capability has been restored during that time period (Requirement R4).

Proposed Reliability Standard VAR-002-3 also requires each Generator Owner to:

- Provide information on its step-up transformers and auxiliary transformers within 30 days of a request from the Transmission Operator or Transmission Planner (Requirement R5); and

- Comply with the Transmission Operator's step-up transformer tap change directives unless compliance would violate safety, an equipment rating, or applicable laws, rules or regulations (Requirement R6).

[10] VAR-002-3, Requirement R2 also provides that: (1) when a generator's AVR is out of service or the generator does not have AVR, the Generator Operator shall use an alternative method to control the generator's Reactive Power output to meet the schedule; (2) when instructed to modify voltage, the Generator Operator shall comply or provide an explanation of why the schedule cannot be met; and (3) if the Generator Operator does not monitor voltage at the location specified in its voltage schedule, it shall have a methodology for converting the scheduled voltage specified by the Transmission Operator to the voltage point being monitored by the Generator Operator.

The proposed Reliability Standards were developed to address outstanding Commission directives from Order Nos. 693[11] and 724[12] and build upon the previous versions of the Reliability Standards to improve their quality and content.[13] In addition to addressing certain Commission directives, the proposed Reliability Standards streamline language for increased clarity, omit requirements duplicative with or otherwise unnecessary when compared to existing Reliability Standards, and remove requirements that provide little to no reliability benefit. As discussed further below, Reliability Standard VAR-001-4 improves upon the prior version of the standard as follows:

- Requirements that are duplicative of other currently enforceable and pending Reliability Standards are removed.

- Requirement R1 improves reliability by requiring Transmission Operators to (1) define system voltage schedules, which may be a range or a target value with an associated tolerance band, to help ensure the Bulk-Power System operates within operating limits, and (2) coordinate with adjacent Transmission Operators and Reliability Coordinators regarding those system voltage schedules.

- Requirement R2 consolidates Requirements R2 and R9 of VAR-001-3 to clarify the Transmission Operator's responsibility to schedule sufficient reactive resources to regulate voltage levels under normal and Contingency conditions.[14]

- Requirement R3 consolidates Requirements R7 and R8 of VAR-001-3 to clarify the Transmission Operator's responsibility to provide the necessary voltage support (*i.e.*, "operate or direct the Real-time operation of devices"[15]) to help maintain voltage stability.

- Requirement R4 continues to provide Transmission Operators the flexibility to exempt generators from certain compliance obligations, but clarifies the obligations from which

[12] *Electric Reliability Organization Interpretations of Specific Requirements of Frequency Response and Bias and Voltage and Reactive Control Reliability Standards*, Order No. 724, 127 FERC ¶ 61,158 (2009).

[13] Exhibits D-1 and D-2 to this Petition provide mapping documents comparing the existing VAR-001-3 and VAR-002-2b Reliability Standards to the proposed VAR-001-4 and VAR-002-3 Reliability Standards.

[14] A Contingency is defined in the NERC Glossary as "the unexpected failure or outage of a system component, such as a generator, transmission line, circuit breaker, switch or other electrical element."

[15] VAR-001-4, Requirement R3.

generators may be exempt. Requirement R4 also eliminates the need for Transmission Operators to maintain a list of all generators that have been granted an exemption as such a requirement provides little to no reliability benefit.

- Requirement R5 creates a more transparent information-sharing process between Transmission Operators and Generator Operators about voltage or Reactive Power schedules and notification requirements for deviating from such schedules.

- Requirement R5 also addresses the Commission's Order No. 693 directive to consider a time frame associated with an "incident" of non-compliance with VAR-002,[16] as well as the Order No. 724 directive to develop and implement technically sound voltage schedules.

Further, in proposed Reliability Standard VAR-002-3:

- Requirements R1 and R2 carry forward the obligations that Generator Operators operate in automatic voltage control mode and follow the voltage or Reactive Power schedule provided by the Transmission Operator but provide Generator Operators increased flexibility to deviate from voltage or Reactive Power schedules and operational modes where system-specific circumstances or events may require these deviations to protect reliability and prevent equipment damage.

- Requirements R3 and R4 remove unnecessary and overly burdensome communication requirements that provide little to no reliability benefit. Eliminating these notification requirements will enable Transmission Operators to focus resources on improving system monitoring and responding to voltage issues as they may arise in Real-time.

- Requirements R5 and R6 improve clarity by removing extraneous language (Requirement R5) and adopting consistent language throughout the requirement (Requirement R6), which will help responsible entities understand and more effectively apply these requirements.

For the reasons discussed herein, NERC respectfully requests that the Commission approve proposed Reliability Standards VAR-001-4 and VAR-002-3 as just, reasonable, not unduly discriminatory or preferential, and in the public interest.

[16] As further discussed in Section IV.C, this Commission directive was issued in reference to Reliability Standard VAR-002. However, the standard drafting team determined that this directive is more appropriately addressed in VAR-001-4, Requirement R5.

III. BACKGROUND

A. Regulatory Framework

In FPA section 215,[18] Congress entrusted the Commission with the duties of approving and enforcing rules to ensure the reliability of the nation's Bulk-Power System, and certifying an ERO that would be charged with developing and enforcing mandatory Reliability Standards, subject to Commission approval.[19] All users, owners, and operators of the Bulk-Power System in the United States are subject to Commission-approved Reliability Standards.[20] The ERO must obtain Commission approval of each Reliability Standard that the ERO proposes should become mandatory and enforceable in the United States, as well as modifications to the Reliability

---

[17] Persons to be included on the Commission's service list are identified by an asterisk. NERC respectfully requests a waiver of Rule 203 of the Commission's Regulations, 18 C.F.R. § 385.203, to allow the inclusion of more than two persons on the service list in this proceeding.

[18] 16 U.S.C. § 824o.

[19] The Commission certified NERC as the ERO. *See* Order No. 672, *order on reh'g*, Order No. 672-A; ERO Certification Order, *supra* note 3.

[20] 16 U.S.C. § 824o(b)(1).

Standards,[21] and the Commission may order the ERO to submit new or modified Reliability Standards.[22]

The Commission has the regulatory responsibility to approve Reliability Standards that protect the reliability of the Bulk-Power System and to ensure that they are just, reasonable, not unduly discriminatory or preferential, and in the public interest. The Commission gives due weight to the technical expertise of the ERO with respect to the content of a Reliability Standard.[23]

B. NERC Reliability Standards Development Procedure

NERC develops Reliability Standards in accordance with Section 300 of the NERC Rules of Procedure and the NERC Standard Processes Manual.[24] The Commission has found that the NERC Rules of Procedure provide for reasonable notice and opportunity for public comment, due process, openness, and a balance of interests in developing Reliability Standards, and thus satisfy certain of the criteria for approving Reliability Standards.[25] The development process is open to any person or entity with a legitimate interest in the reliability of the Bulk-Power System. NERC considers all stakeholder comments and requires a vote by stakeholders as well as the NERC Board of Trustees to approve a Reliability Standard before NERC will submit the

25 ERO Certification Order at P 250.

Reliability Standard for Commission approval. NERC developed proposed Reliability Standards VAR-001-4 and VAR-002-3 in an open and fair manner and in accordance with this process.[26]

C. The Existing VAR Reliability Standards

1. Reliability Standard VAR-001-3

Currently enforceable Reliability Standard VAR-001-3 requires Transmission Operators to monitor, control and maintain voltage levels, reactive flows and reactive resources within certain limits in Real-time to protect equipment and the reliable operation of the Interconnection.[27] Under the existing requirements, [28] each Transmission Operator is required to:

- Individually and jointly with other Transmission Operators ensure that formal policies and procedures are developed, maintained and implemented for monitoring and controlling voltage levels and MVar flows within their individual areas and the areas of neighboring Transmission Operators (Requirement R1);
- Acquire sufficient reactive resources within its areas to protect voltage levels under normal and Contingency conditions (Requirement R2);
- Specify criteria to exempt generators from compliance with the voltage or Reactive Power schedule developed by the Transmission Operator in accordance with VAR-001-3, maintain a list of exempted generators, and notify Generator Owners of any exempted generators (Requirement R3);
- Specify a voltage or Reactive Power schedule at the interconnection between the generator facilities and Transmission Owner's facilities, provide the schedule to the associated Generator Operator, and direct it to comply with the schedule in automatic voltage control mode (Requirement R4);

[26] Order No. 672 at P 334.

[27] As noted above, VAR-001-3 also includes a regional variance applicable to Generator Operators in the Western Interconnection. Because NERC is not proposing any substantive changes to that regional variance, it is not discussed herein.

[28] The Commission approved retirement of Requirement R5 effective January 21, 2014. *See Electric Reliability Organization Proposal to Retire Requirements in Reliability Standards*, Order No. 788, 145 FERC ¶ 61,147, at P 17 (2013).

- Know the status of all transmission Reactive Power resources and, when notified of the loss of an automatic voltage regulator ("AVR") control, direct the Generator Operator to maintain or change its voltage or Reactive Power schedule (Requirement R6);

- Operate or direct operations of devices to regulate transmission voltage and reactive flow (Requirement R7);

- Operate or direct operations of capacitive and inductive reactive resources within its area to maintain system and Interconnection voltages within established limits (Requirement R8);

- Maintain reactive resources to support its voltage under first Contingency conditions and disperse and locate these resources to allow for effective and quick application when Contingencies occur (Requirement R9);

- Correct and report SOL and IROL violations resulting from reactive resource deficiencies (Requirement R10);

- Consult with and provide documentation to Generator Owners about required tap changes, timeframes for completion, and technical justification for these changes (Requirement R11); and

- Direct corrective action necessary to prevent voltage collapse when reactive resources are insufficient.

Currently enforceable Reliability Standard VAR-001-3, however, does not address the following outstanding Commission directives from Order Nos. 693 and 724:

- Include Reliability Coordinators as responsible entities;[29]

- Address the power factor range at the interface between Load Serving Entities ("LSEs") and the Bulk-Power System;[30]

- Consider acceptable ranges of net power factors where LSEs receive service from the Bulk-Power System;[31]

- Specify and define requirements on "established limits" and "sufficient reactive resources" and identify voltage and Reactive Power margins to prevent voltage instability;[32]

---

29 Order No. 693 at P 1855.

30 *Id.* at P 1861.

31 *Id.* at PP 1860, 1862.

32 *Id.* at P 1868.

- Require the performance of periodic voltage stability analysis using online and offline techniques to assist Real-time operations;[33] and

- Ensure voltage schedules reflect sound engineering and operating judgment and experience.[34]

As discussed below, proposed Reliability Standard VAR-001-4 or other existing or pending Reliability Standards address these outstanding Commission directives.

2. Reliability Standard VAR-002-2b

Currently enforceable Reliability Standard VAR-002-2b requires that generators provide reactive and voltage control necessary to maintain voltage levels, reactive flows and reactive resources within applicable facility ratings to protect equipment and the reliable operation of the Interconnection. Under the existing requirements, each Generator Operator is required to:

- Operate in automatic voltage control mode unless it is exempted or the Generator Operator notifies its Transmission Operator that it is (1) operating the generator in start-up or shutdown mode pursuant to a Real-time communication or a procedure previously provided to the Transmission Operator, or (2) not operating the generator in automatic voltage control mode for a reason other than start-up or shutdown (Requirement R1);

- Maintain the voltage or Reactive Power schedule, unless otherwise exempted by the Transmission Operator, use an alternative method for controlling the generator voltage and Reactive Power output when a generator's AVR is out of service, and, when directed to modify voltage, provide an explanation to the Transmission Operator if it cannot meet the schedule (Requirement R2); and

- Notify its Transmission Operator as soon as practical, but within 30 minutes, of a status or capability change on any Reactive Power resource (generator or other), including the status of each AVR and power system stabilizer, and the expected duration of the identified change (Requirement R3).

Reliability Standard VAR-002-2b also requires each Generator Owner to:

- Provide tap-related information on step-up transformers and auxiliary transformers with primary voltages equal to or greater than the generator terminal voltage within 30

[33] *Id.* at P 1875.

[34] Order No. 724 at P 49.

calendar days of a request from the Transmission Operator and Transmission Planner (Requirement R4); and

- Ensure that transformer tap positions are changed according to the Transmission Operator's specifications, unless this action would violate safety, an equipment rating, or a regulatory or statutory requirement, in which case the Generator Owner must notify the Transmission Operator and justify why the Generator Owner is unable to comply (Requirement R5).

Currently enforceable Reliability Standard VAR-002-2b does not address the Commission's directive to consider an additional time frame associated with an "incident" of non-compliance with VAR-002.[35] As discussed below, this directive is addressed in proposed Reliability Standard VAR-001-4.

D. Procedural History of Project 2013-04 – Voltage and Reactive Control (VAR)

In February 2013, NERC initiated an informal development process to revive efforts to modify the existing VAR Reliability Standards to address the outstanding Commission directives from Order Nos. 693 and 724 related to those standards.[36] Participants in this informal process were industry subject matter experts, NERC staff, and FERC staff from the Office of Electric Reliability. The informal development group met numerous times between February 2013 and July 2013 to discuss the outstanding Commission directives and ways to improve the existing VAR Reliability Standards. The informal group also conducted industry outreach to obtain feedback on the existing standards.

After evaluating the VAR Reliability Standards and the Commission's directives, the informal group concluded that certain of the existing requirements and outstanding directives overlapped with or were duplicative of requirements in other Reliability Standards to maintain and operate within SOLs and IROLs or were otherwise unnecessary from a reliability

[35] Order No. 693 at PP 1883, 1885.

[36] In 2008, NERC initiated Project 2008-01 to address the directives from Order No. 693 related to the VAR Reliability Standards. That project was not completed due to project reprioritization.

perspective. To that end, the informal participants developed revised drafts of the VAR Reliability Standards to address Commission directives, eliminate duplicative or unnecessary requirements, and improve the quality and content of those existing requirements that are necessary to help maintain voltage stability on the Bulk-Power System.

As discussed further in Exhibit F, Project 2013-04 formally commenced on July 19, 2013 with the posting of a Standard Authorization Request ("SAR") along with the initial drafts of the proposed Reliability Standards developed by the informal participants for a 45-day comment period and ballot. A formal standard drafting team was formed following the posting of the SAR and the initial drafts of the proposed Reliability Standards.[37]

Following the close of the initial ballot, the standard drafting team addressed industry comments and posted second drafts of the proposed Reliability Standards on October 11, 2013 for an additional 45-day comment period and ballot. Proposed Reliability Standard VAR-001-4 received the requisite approval during the second ballot and was subsequently posted for a final ballot. The final ballot concluded on December 23, 2013 and received an approval rating of 75.35%. The NERC Board of Trustees approved proposed Reliability Standard VAR-001-4 on February 6, 2014.

The standard drafting team addressed additional industry comments on the second draft of proposed Reliability Standard VAR-002-3 and, on February 27, 2014, posted a third draft of the standard for a 45-day comment period and ballot. Proposed Reliability Standard VAR-002-3 received the requisite approval in the third ballot and was subsequently posted for a final ballot. The final ballot concluded on May 5, 2014 and received an approval rating of 88.26%. The NERC Board of Trustees approved proposed Reliability Standard VAR-002-3 on May 7, 2014.

[37] Exhibit G provides the standard drafting team roster.

IV. JUSTIFICATION FOR APPROVAL

As discussed below and in Exhibit C, proposed Reliability Standards VAR-001-4 and VAR-002-3 satisfy the Commission's criteria in Order No. 672 and are just, reasonable, not unduly discriminatory or preferential, and in the public interest. The following sections provide: (1) the basis and purpose of the proposed Reliability Standards; (2) a discussion of the requirements in the proposed Reliability Standards; (3) an explanation of how the proposed Reliability Standards satisfy outstanding Commission directives from Order Nos. 693 and 724; and (4) a discussion of the enforceability of the proposed Reliability Standards.

A. Basis and Purpose of the Proposed Reliability Standards

Proposed Reliability Standards VAR-001-4 and VAR-002-3 replace and improve upon the prior versions of the standards (VAR-001-3 and VAR-002-2b) by addressing outstanding Commission directives from Order Nos. 693 and 724, improving reliability, clarifying language in certain requirements, and eliminating redundant or unnecessary requirements. As is further discussed in Section IV.C below, the outstanding Commission directives are addressed by proposed Reliability Standards VAR-001-4 and VAR-002-3, or already have been addressed in other currently enforceable or pending Reliability Standards. So as to avoid unnecessary redundancies or duplicative requirements, NERC does not propose to address in VAR-001-4 and VAR-002-3 those directives already addressed by other existing or pending Reliability Standards.

The standard drafting team sought to modify the currently enforceable Reliability Standards VAR-001-3 and VAR-002-2b to improve the clarity, quality, and content of the standards. These efforts include, but are not limited to, the following:

- VAR-001-4, Requirement R1 removes voltage level controls and monitoring obligations duplicative with other currently enforceable Reliability Standards and improves reliability by requiring Transmission Operators to (1) specify system voltage schedules,

which may be either a range or a target value with associated tolerance bands, and (2) coordinate with adjacent Transmission Operators and Reliability Coordinators regarding those system voltage schedules.

- VAR-001-4, Requirements R2 and R3 simplify and consolidate several existing requirements while ensuring sufficient reactive resources are scheduled (Requirement R2) and voltage support is provided (Requirement R3).

- VAR-001-4, Requirement R4 removes unnecessary compliance complexities and offers Transmission Operators the flexibility to tailor exemption criteria to area-specific needs.

- VAR-001-4, Requirement R5 improves transparency of Transmission Operator voltage or Reactive Power schedules for generators and provides the Transmission Operator the flexibility to develop notification requirements for deviations from those schedules based on the unique characteristics and needs of its system.

- VAR-001-4, Requirement R6 maintains and improves upon the existing tap setting requirements to avoid an adverse reliability impact caused by an improper tap setting that in turn may affect the Reactive Power output of a generator.

- VAR-002-3, Requirement R1 improves upon the prior version of the Reliability Standard by providing an option for certain Generator Operators to operate in modes other than automatic voltage control mode, as may be instructed by the Transmission Operator. Further, in addition to start-up or shutdown, Requirement R1 adds testing as a time when a generator need not operate in automatic voltage control mode or a different mode instructed by the Transmission Operator.

- VAR-002-3, Requirement R2 carries forward the requirement that Generator Operators maintain the generator voltage or Reactive Power schedule provided by the Transmission Operator pursuant to VAR-001-4, Requirement R5 but allows the Generator Operator to deviate from that schedule if it is exempted or satisfies the notification requirements established by the Transmission Operator under VAR-001-4, Requirement R5, Part 5.2. VAR-002-3, Requirement R2 also clarifies that Generator Operators that do not monitor voltage at the location specified in their voltage schedule provided by the Transmission Operator may convert the schedule to the voltage point monitored by the Generator Operator using a documented conversion methodology.

- VAR-002-3, Requirements R3 and R4 limit status change notification requirements to those changes lasting longer than 30 minutes because notification of changes resolved within a 30-minute window provides minimal, if any, reliability benefit.

- VAR-002-3, Requirements R5 and R6 include clarifying edits to remove an unnecessary sub-part (Requirement R5) and uniformly reference the applicable entity (Requirement R6).

B. Requirements in the Proposed Reliability Standards

1. Reliability Standard VAR-001-4

Proposed Reliability Standard VAR-001-4 consists of six requirements and is applicable to Transmission Operators and, for the WECC regional variance maintained and carried forward from Reliability Standard VAR-001-3, Generator Operators within the Western Interconnection. An explanation of the six requirements and the omission of certain VAR-001-3 requirements are provided below.[38]

VAR-001-4, Requirement R1

> **R1.** Each Transmission Operator shall specify a system voltage schedule (which is either a range or a target value with an associated tolerance band) as part of its plan to operate within System Operating Limits and Interconnection Reliability Operating Limits.
>
> **1.1.** Each Transmission Operator shall provide a copy of the voltage schedules (which is either a range or a target value with an associated tolerance band) to its Reliability Coordinator and adjacent Transmission Operators within 30 calendar days of a request.

Requirement R1 is intended to replace and simplify the currently-effective VAR-001-3, Requirement R1, which requires Transmission Operators, individually and jointly, to develop formal policies and procedures for controlling and monitoring voltage levels and MVar flows. In evaluating VAR-001-3, Requirement R1, the standard drafting team concluded that because controlling and monitoring voltage levels and MVar flows is already required by the Transmission Operations ("TOP") group of Reliability Standards, it should not be duplicated in proposed Reliability Standard VAR-001-4. Specifically, currently effective Reliability Standard TOP-004-2, Requirement R6 also requires "Transmission Operators, individually and jointly

[38] The WECC regional variance is not reproduced herein as it has not been substantively modified from the currently enforceable VAR-001-3 regional variance. Only non-material changes have been made to reference the replacement of VAR-001-4, Requirements R4 and R5, rather than VAR-001-3, Requirements R3 and R5.

with other Transmission Operators, [to] develop, maintain, and implement formal policies and procedures to provide for transmission reliability." That requirement specifies that the "policies and procedures shall address the execution and coordination of activities that impact inter- and intra-Regional reliability, including," among other things, "monitoring and controlling voltage levels and real and reactive power flows."

Additionally, currently effective TOP Reliability Standards require that Transmission Operators plan to meet SOLs and IROLs (TOP-002-2.1b, Requirement R10) and operate within SOLs and IROLs (TOP-004-2, Requirement R1).[39] As stated in the NERC Glossary, a SOL is defined as:

> the value (such as MW, MVar, Amperes, Frequency or Volts) that satisfies the most limiting of the prescribed operating criteria for a specified system configuration to ensure operation within acceptable reliability criteria. [SOLs] are based upon certain operating criteria. These include, but are not limited to: [1] Facility Ratings (Applicable pre- and post-Contingency equipment or facility ratings); [2] Transient Stability Ratings (Applicable pre- and post-Contingency Stability Limits); [3] Voltage Stability Ratings (Applicable pre- and post-Contingency Voltage Stability); and [4] System Voltage Limits (Applicable pre- and post-Contingency Voltage Limits).[40]

Accordingly, to meet the obligations under Reliability Standards TOP-002-2.1b, Requirement R10 and TOP-004-2, Requirement R1 to plan to meet and operate within SOLs and IROLs, a Transmission Operator is required to monitor and control voltage levels and MVar flows. Failure to do so could lead to a violation of these requirements.

Similarly, monitoring and controlling voltage and MVar flows is fundamental to complying with TOP-004-2, Requirements R2 and R3, which require a Transmission Operator to

---

[39] Reliability Standard FAC-014-2, Requirement R2 requires a Transmission Operator to establish SOLs (as directed by its Reliability Coordinator) for its portion of the Reliability Coordinator Area that are consistent with its Reliability Coordinator's SOL Methodology.

[40] An IROL is defined in the NERC Glossary as "[a] SOL that, if violated, could lead to instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Bulk Electric System" (footnote omitted).

operate to protect against instability, uncontrolled separation, or cascading outages from (1) the most severe single contingency (Requirement R2), and (2) multiple outages, as specified by its Reliability Coordinator (Requirement R3). Failure to monitor and control voltage and MVar flows could result in a violation of these requirements.

Certain of the TOP Reliability Standards are currently being modified as part of a standards development project at NERC. While certain language and obligations from the existing TOP Reliability Standards may change, the obligation to monitor and control voltage levels and reactive flows will remain. Specifically, as proposed, draft Reliability Standards TOP-001-3 and TOP-002-4 would collectively require Transmission Operators to plan to meet and operate within SOLs and IROLs.[41] In addition, those draft Reliability Standards would require each Transmission Operator to (1) monitor facilities within its area and neighboring areas to maintain reliability in its area, and (2) perform a Real-time Assessment at least once every 30 minutes. To comply with these obligations, Transmission Operators must monitor and control voltage, as discussed above.

Because controlling and monitoring voltage and MVar flows is covered elsewhere, the standard drafting team modified VAR-001-4, Requirement R1 to only require that Transmission Operators (1) specify a system voltage schedule as part of its plan to operate with SOLs and IROLs, and (2) provide such schedules to adjacent Transmission Operators and applicable Reliability Coordinators, upon request. The requirement to specify a system voltage schedule as a range or a target value with an associated tolerance band will help ensure that the system maintains an appropriate voltage level in Real-time. The reactive behavior of any particular system depends on a myriad of local conditions which change over time. The intent of

[41] As of the date of this Petition, proposed Reliability Standards TOP-001-3 and TOP-002-4 have been posted for an initial comment period and ballot, which is scheduled to close on July 2, 2014.

Requirement R1 is not to mandate that Transmission Operators set and maintain a static voltage level; rather it is to require Transmission Operators to identify the acceptable voltage limits (either by identifying a range or a target value with an associated tolerance band) that supports reliable operations in Real-time.

The requirement to share the voltage schedule with neighboring Transmission Operators and Reliability Coordinators will allow for increased and improved coordination between neighboring areas. Given the interconnected nature of the Bulk-Electric System, voltage coordination is necessary to help ensure that sufficient Reactive Power is available to support both Real-time and day-ahead operations.

VAR-001-4, Requirement R2

> **R2.** Each Transmission Operator shall schedule sufficient reactive resources to regulate voltage levels under normal and Contingency conditions. Transmission Operators can provide sufficient reactive resources through various means including, but not limited to, reactive generation scheduling, transmission line and reactive resource switching, and using controllable load.

Requirement R2 modifies and consolidates the obligations in currently-effective VAR-001-3, Requirements R2 and R9 to require the scheduling of sufficient reactive resources. As noted above, the primary factor in maintaining voltage stability is having the appropriate amount of Reactive Power on the system. Proposed Requirement R2 helps ensure that sufficient reactive resources are online and scheduled in Real-time.

VAR-001-3, Requirements R2 and R9 require each Transmission Operator to (1) "acquire sufficient reactive resources . . . within its area to protect the voltage levels under normal and Contingency conditions" and (2) "maintain reactive resources . . . to support its voltage under first Contingency conditions," respectively. The standard drafting team concluded that these requirements should be combined into a single requirement that more directly states

the desired performance for ensuring that sufficient Reactive Power is on the system in Real-time to maintain voltage stability (*i.e.*, to "schedule sufficient reactive resources to regulate voltage levels under normal and Contingency conditions").[42]

Requirement R2 also clarifies the language with respect to the manner in which Transmission Operators may schedule sufficient reactive resources (*e.g.*, through reactive generation scheduling, transmission line and reactive resource switching, and using controllable load). Consistent with the Commission's directive in Order No. 693,[43] Requirement R2 includes the use of controllable load in the non-exhaustive list of ways to provide sufficient reactive resources. As the Commission stated, "in many cases, load response and demand-side investment can reduce the need for reactive power capability in the system."[44]

VAR-001-4, Requirement R3

> **R3.** Each Transmission Operator shall operate or direct the Real-time operation of devices to regulate transmission voltage and reactive flow as necessary.

Whereas Requirement R2 obligates the Transmission Operator to ensure that there are sufficient reactive resources online and scheduled, Requirement R3 requires that a Transmission Operator actually provide sufficient voltage support in Real-time by operating its own devices or directing others to do so.

Requirement R3 carries forward the obligation from VAR-001-3, Requirement R7. However, by deleting the phrase "be able to" Requirement R3 creates an affirmative obligation to operate or direct the operation of devices to regulate transmission voltage and reactive flow

---

42 VAR-001-4, Requirement R2.

43 Order No. 693 at P 1879.

44 *Id*.

when necessary.[45] Additionally, the standard drafting team concluded that there was no need to separately carry forward VAR-001-3, Requirement R8 because it was subsumed in proposed VAR-001-4, Requirement R3.

VAR-001-4, Requirement R4

> **R4.** The Transmission Operator shall specify the criteria that will exempt generators from: 1) following a voltage or Reactive Power schedule, 2) from having its automatic voltage regulator (AVR) in service or from being in voltage control mode, or 3) from having to make any associated notifications.
>
> **4.1** If a Transmission Operator determines that a generator has satisfied the exemption criteria, it shall notify the associated Generator Operator.

As discussed below, proposed Reliability Standard VAR-002-3 imposes requirements on the Generator Operator for providing reactive support, including: (1) following the voltage or Reactive Power schedule provided by the Transmission Operator; (2) operating its generator(s) in automatic voltage control mode; and (3) notifying the Transmission Operator of any deviations from the schedule or changes to the status of its voltage control mode. In certain circumstances, however, it may not be necessary or desired for a Generator Operator to comply with such requirements. For instance, a Generator Operator may need to be exempt from performance for the following system events, among others: (1) maintenance during shoulder months; (2) scenarios where two generators are located within close proximity and cannot both operate in voltage control mode; and (3) system voltage swings where it would harm reliability if all Generator Operators provided deviation notifications to their respective Transmission Operators at one time.

[45] VAR-001-3, Requirement R7 states as follows: "The Transmission Operator shall ***be able to*** operate or direct the operation of devices necessary to regulate transmission voltage and reactive flow" (emphasis added).

Requirement R4 carries forward the authority in currently enforceable Reliability Standard VAR-001-3, Requirement R3 for a Transmission Operator to exempt a Generator Operator from having to comply with all or some of its Reactive Power obligations. Proposed Requirement R4 clarifies that a Transmission Operator may exempt a Generator Operator from the following requirements: (1) complying with a voltage or Reactive Power schedule; (2) operating in automatic voltage control mode; and (3) certain notification requirements. Requirement R4 also allows each Transmission Operator to tailor its criteria for exemptions to its area's specific needs.

Further, Requirement R4 simplifies Reliability Standard VAR-001-3, Requirement R3 by removing the need for Transmission Operators to maintain a list of generators in its area that are exempt from following a voltage or Reactive Power schedule. Removal of this list requirement alleviates unnecessary compliance burdens and complexities related to how often to update and maintain these lists. Instead, proposed Requirement R4 focuses on whether the exemption criteria are transparent and whether the Transmission Owner notified the Generator Operator that it is exempt.

VAR-001-4, Requirement R5

> **R5.** Each Transmission Operator shall specify a voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) at either the high voltage side or low voltage side of the generator step-up transformer at the Transmission Operator's discretion.
>
> **5.1.** The Transmission Operator shall provide the voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) to the associated Generator Operator and direct the Generator Operator to comply with the schedule in automatic voltage control mode (the AVR is in service and controlling voltage).
>
> **5.2.** The Transmission Operator shall provide the Generator Operator with the notification requirements for deviations from the voltage

or Reactive Power schedule (which is either a range or a target value with an associated tolerance band).

5.3. The Transmission Operator shall provide the criteria used to develop voltage schedules [or] Reactive Power schedule (which is either a range or a target value with an associated tolerance band) to the Generator Operator within 30 days of receiving a request.

Requirement R5 carries forward the obligation from currently-effective Reliability Standard VAR-001-3, Requirement R4 that Transmission Operators must provide a voltage or Reactive Power schedule for each generator and direct the associated Generator Operator to comply with that schedule in automatic voltage control mode unless otherwise instructed or exempted. Proposed Requirement R5 modifies that requirement to clarify that a Transmission Operator may provide the voltage or Reactive Power schedule at either the high or low voltage side of the generator step-up transformer.[46] Specifying the location of the voltage or Reactive Power schedule provides a mechanism for the Generator Operator to convert the scheduled voltage to the voltage point it monitors. As discussed below, VAR-002-3, Requirement R2, Part 2.2 clarifies that if the Generator Operator does not monitor voltage at the location specified in the schedule provided by the Transmission Operator, the Generator Operator may use a conversion methodology for converting the scheduled voltage to the voltage point monitored by the Generator Operator.

As with the system level voltage schedule, the voltage or Reactive Power schedule provided to Generator Operators must be a range or a target value with an associated tolerance band. Specifying the voltage schedule as a range or as a target value with an associated tolerance

[46] VAR-003-1, Requirement R4 simply states that the Transmission Operator must "specify a voltage or Reactive Power schedule at the interconnection between the generator facility and the Transmission Operator's facilities" (footnote omitted).

band provides information that Generator Operators can use to set their control devices to appropriate settings to maintain operation within the specified tolerances.

Further, Part 5.2 requires Transmission Operators to provide Generator Operators the notification requirements for deviations from the voltage or Reactive Power schedule. Part 5.2 ensures that Generator Operators are aware of the notification requirements for deviating from the required schedule while also providing Transmission Operators the flexibility to develop notification requirements that best suit their needs.

Lastly, Requirement R5 provides for increased transparency of the Transmission Operator's development of voltage and Reactive Power schedules. Part 5.3 requires Transmission Operators to provide Generator Operators the criteria for developing the voltage or Reactive Power schedule, if requested. Part 5.3 will help ensure that the Transmission Operator has a technical basis for setting the required voltage and Reactive Power schedule that takes into account system needs and any limitations of the specific generator. Providing such criteria may alleviate some operational disputes between Transmission Operators and Generator Operators regarding the technical justifications for the voltage and Reactive Power schedules.

VAR-001-4, Requirement R6

> **R6.** After consultation with the Generator Owner regarding necessary step-up transformer tap changes and the implementation schedule, the Transmission Operator shall provide documentation to the Generator Owner specifying the required tap changes, a timeframe for making the changes, and technical justification for these changes.

Requirement R6 updates currently-effective VAR-001-3, Requirement R11 to allow for scheduling consultation. Because an improper tap setting may affect the amount of VARs produced by a generator, the standard drafting team concluded that this requirement needed to be included in proposed Reliability Standard VAR-001-4.

Omitted VAR-001-3 Requirements

Several currently enforceable requirements from Reliability Standard VAR-001-3 have been omitted from proposed Reliability Standard VAR-001-4 because they have been retired (Requirement R5)[47] or are duplicative with other currently enforceable and pending Reliability Standards (existing Requirements R6, R10 and R12). On this last category of omitted requirements:

- VAR-001-3, Requirement R6 is duplicative of currently enforceable TOP-006-2, Requirement R1, which requires that Transmission Operators know the status of all generating and transmission resources, including Reactive Power resources, available for use. In addition, TOP-006-2, Requirement R2 requires, among other things, each Reliability Coordinator, Transmission Operator, and Balancing Authority to monitor applicable real and reactive power flows, voltage, and the status of rotating and static reactive resources, which requires monitoring of power system stabilizers ("PSS") in areas that rely on PSS equipment. The TOP Reliability Standards currently in development would require each Transmission Owner to monitor Facilities, sub-100 kV facilities, and the status of Special Protection Systems within its area and neighboring areas, as needed to maintain reliability within its Transmission Operator Area.[48] This monitoring activity requires Transmission Operators to know the status of Reactive Power resources.

- VAR-001-3, Requirement R10 is duplicative of currently enforceable TOP-004-2, Requirement R1, which provides that Transmission Operators shall operate within SOLs and IROLs. This would include taking action to correct SOL and IROL violations resulting from reactive resource deficiencies. Additionally, TOP-004-2, Requirement R4 requires Transmission Operators that enter an unknown operating state (*i.e.*, any state for which valid operating limits have not been determined) to restore operations to respect proven reliable power system limits within 30 minutes. The TOP Reliability Standard currently in development will continue to require Transmission Operators to operate within SOLs and IROLs and take action to correct and report such violations.[49]

---

[47] The Commission approved the retirement of Requirement R5 of VAR-001-2. *See* Order No. 788 at P 17 (accepting retirement of VAR-001-2, Requirement R5, effective January 21, 2014, because it is redundant with the *pro forma* Open Access Transmission Tariff and any resulting reliability gap is addressed by currently enforceable VAR-001-3, Requirement R2). (Currently effective VAR-001-3, Requirement R5 also notes that Requirement R5 will be retired effective January 21, 2014.) Proposed VAR-001-4, Requirement R2 will also achieve the reliability objective envisioned by retired Requirement R5.

[48] *See* draft Reliability Standard TOP-001-3, Requirement R10, *available at* http://www.nerc.com/pa/Stand/Pages/Project-2014-03-Revisions-to-TOP-and-IRO-Standards.aspx.

[49] *See* draft Reliability Standard TOP-001-3, Requirements R12–R15.

- VAR-001-3, Requirement R12 is also duplicative with requirements in TOP-004-2 to take corrective action, including load-shedding, to operate within SOLs and IROLs and prevent voltage collapse. The TOP Reliability Standard currently in development will continue to require Transmission Operators to take action to prevent voltage collapse.[50] Additionally, Reliability Standard EOP-003-2 covers plans for load shedding to prevent voltage collapse.

2. Reliability Standard VAR-002-3

Proposed Reliability Standard VAR-002-3 consists of six requirements and is applicable to Generator Operators and Generator Owners. An explanation of each of the six requirements is provided below.

VAR-002-3, Requirement R1

> **R1.** The Generator Operator shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) in service and controlling voltage) or in a different control mode as instructed by the Transmission Operator unless: 1) the generator is exempted by the Transmission Operator, or 2) the Generator Operator has notified the Transmission Operator of one of the following:
>
> - That the generator is being operated in start-up,[FN1] shutdown,[FN2] or testing mode pursuant to a Real-time communication or a procedure that was previously provided to the Transmission Operator; or
>
> - That the generator is not being operated in automatic voltage control mode or in the control mode that was instructed by the Transmission Operator for a reason other than start-up, shutdown, or testing.
>
> [FN1: Start-up is deemed to have ended when the generator is ramped up to its minimum continuously sustainable load and the generator is prepared for continuous operation.]
>
> [FN2: Shutdown is deemed to begin when the generator is ramped down to its minimum continuously sustainable load and the generator is prepared to go offline.]

Requirement R1 carries forward the obligation in currently effective VAR-002-2b, Requirement R1 for Generator Operators to operate generators in automatic voltage control

[50] *See id.*

mode, but modifies the requirement to allow a Generator Operator to operate in a different control mode if instructed by the Transmission Operator. From a reliability perspective, it is beneficial for generators to operate in automatic voltage control mode. Once set in "voltage controlling" mode, the AVR should automatically adjust to voltage swings within its pre-defined voltage band. A different control mode, however, may be appropriate in certain circumstance. For instance, where two large generators are located within close proximity, if both generators operate in voltage control mode it may result in undesirable effects, such as voltage swings due to the units competing to control voltage. In such instances, to improve voltage regulation and stability, it may be beneficial to allow one of the units to be in automatic voltage control mode while directing the other unit to operate in an alternative mode. Proposed Reliability Standard VAR-002-3 therefore provides for a default mode of operation (*i.e.*, automatic voltage control mode) while also providing flexibility for Transmission Operators and Generator Operators to coordinate if a different control mode would be more effective.

Additionally, Requirement R1 modifies currently effective VAR-002-2b, Requirement R1 to add testing as a time when a generator need not operate in automatic voltage control mode or a different mode instructed by the Transmission Operator.

VAR-002-3, Requirement R2

> **R2.** Unless exempted by the Transmission Operator, each Generator Operator shall maintain the generator voltage or Reactive Power schedule[FN3] (within each generating Facility's capabilities[FN4]) provided by the Transmission Operator, or otherwise shall meet the conditions of notification for deviations from the voltage or Reactive Power schedule provided by the Transmission Operator.
>
> > **2.1.** When a generator's AVR is out of service or the generator does not have an AVR, the Generator Operator shall use an alternative method to control the generator reactive output to meet the voltage or Reactive Power schedule provided by the Transmission Operator.

2.2. When instructed to modify voltage, the Generator Operator shall comply or provide an explanation of why the schedule cannot be met.

2.3. Generator Operators that do not monitor the voltage at the location specified in their voltage schedule shall have a methodology for converting the scheduled voltage specified by the Transmission Operator to the voltage point being monitored by the Generator Operator.

[FN3: The voltage or Reactive Power schedule is a target value with a tolerance band or a voltage or Reactive Power range communicated by the Transmission Operator to the Generator Operator.]

[FN4: Generating Facility capability may be established by test or other means, and may not be sufficient at times to pull the system voltage within the schedule tolerance band. Also, when a generator is operating in manual control, reactive power capability may change based on stability considerations.]

Requirement R2 carries forward the affirmative obligation from VAR-003-1, Requirement R2 that the Generator Operator maintain the voltage or Reactive Power schedule provided by the Transmission Operator, unless the Transmission Operator exempts the Generator Operator from doing so. Proposed Requirement R2 adds that the Generator Operator need not comply with the schedule if it satisfies the notification requirements for deviations established by the Transmission Operator under Reliability Standard VAR-001-4, Requirement R5, Part 5.2. By removing prescriptive notification requirements for the entire continent and providing additional flexibility, proposed Requirement R2, together with VAR-001-4, Requirement R5, Part 5.2, allows each Transmission Operator to determine the notification requirements for each of its respective Generator Operators based on system requirements and generator needs.

Additionally, proposed Requirement R2 includes a new Part 2.3 to allow Generator Operators that do not monitor voltage at the location specified in their voltage schedule provided by the Transmission Operator to convert the schedule to the voltage point monitored by the Generator Operator. As noted above, proposed Reliability Standard VAR-001-4, Requirement

R5 clarifies that the Transmission Operator may specify the schedule at either the high or low voltage side of the generator step-up transformer. Part 2.3 of proposed VAR-002-3 was included to allow a generator to continue monitoring voltage based on existing equipment, provided it has a methodology for conversion. There are many ways to convert the voltage schedule, including the development of voltage regulation curves for the transformers or the use of straight ratio conversion. This standard provides Generator Operators with the ability to meet a voltage schedule based on metering equipment while providing the necessary voltage support.

VAR-002-3, Requirements R3 and R4

> **R3.** Each Generator Operator shall notify its associated Transmission Operator of a status change on the AVR, power system stabilizer, or alternative voltage controlling device within 30 minutes of the change. If the status has been restored within 30 minutes of such change, then the Generator Operator is not required to notify the Transmission Operator of the status change.
>
> **R4.** Each Generator Operator shall notify its associated Transmission Operator within 30 minutes of becoming aware of a change in reactive capability due to factors other than a status change described in Requirement R3. If the capability has been restored within 30 minutes of the Generator Operator becoming aware of such change, then the Generator Operator is not required to notify the Transmission Operator of the change in reactive capability.

Proposed Requirements R3 and R4 separate the notification requirements in currently-effective VAR-002-2b, Requirement R3 into two requirements: (1) for AVR/PSS status changes (proposed Requirement R3), and (2) for reactive capability changes (proposed Requirement R4). Each of the proposed requirements provides for a 30-minute window to allow a Generator Operator time to resolve an issue before having to notify the Transmission Operator of a change. For example, proposed Requirement R3 limits the notifications required when an AVR goes out of service and quickly comes back in service (*i.e.*, within 30 minutes) because notification of this type of status change provides little to no benefit to reliability. For the same reason, proposed

Requirement R3 also removes existing Part 3.1, which requires that the Generator Operator provide an estimate for the expected duration of the status change.

Proposed Requirement R4 also limits the notifications required when a reactive capability change occurs and is quickly restored (*i.e.*, within 30 minutes) because notification of this type of status change provides little to no benefit to reliability. Proposed Requirement R4 improves VAR-002-2b, Requirement R3, which requires notification as soon as the reactive capability change occurs, to allow Generator Operators to report reactive capability changes after they become aware of the change. Proposed Requirement R4 also removes existing Part 3.2, which requires that the Generator Operator provide an estimate for the expected duration of the status change.

VAR-002-3, Requirement R5

R5. The Generator Owner shall provide the following to its associated Transmission Operator and Transmission Planner within 30 calendar days of a request.

5.1. For generator step-up transformers and auxiliary transformers with primary voltages equal to or greater than the generator terminal voltage:

5.1.1. Tap settings.

5.1.2. Available fixed tap ranges.

5.1.3. Impedance data.

Requirement R5 maintains most of currently-effective VAR-002-2b, Requirement R4 because of the importance of accurate tap settings. That is, if the tap setting is not properly set, then the VARs available from a particular generator may be affected. Proposed Requirement R5 removes existing Sub-part 4.1.4, which requires that a Generator Owner provide "[t]he +/- voltage range with step-change in % for load-tap changing transformers." This percentage

information is extraneous because tap settings, available fixed tap ranges and impedance data already are required[51] and can be used to calculate the step-change percentage, if needed.

VAR-002-3, Requirement R6

> **R6.** After consultation with the Transmission Operator regarding necessary step-up transformer tap changes, the Generator Owner shall ensure that transformer tap positions are changed according to the specifications provided by the Transmission Operator, unless such action would violate safety, an equipment rating, a regulatory requirement, or a statutory requirement.
>
> > **6.1.** If the Generator Owner cannot comply with the Transmission Operator's specifications, the Generator Owner shall notify the Transmission Operator and shall provide the technical justification.

Requirement R6 maintains most of currently-effective VAR-002-2b, Requirement R5 due to the importance of accurate tap settings, as explained above. However, Requirement R6 updates VAR-002-2b, Requirement R5 to clarify that the requirement and corresponding part apply to the same functional entity (Generator Owners).[52]

C. Proposed VAR-001-4 and VAR-002-3 Satisfy Outstanding Commission Directives

Project 2013-04 was initiated to address outstanding Commission directives from Order Nos. 693 and 724. The following is a discussion of each outstanding directive and the manner in which proposed Reliability Standards VAR-001-4 and VAR-002-3 address them.[53]

Applicability to Reliability Coordinators: In Order No. 693, the Commission directed NERC to modify Reliability Standard VAR-001 to "include reliability coordinators as applicable

---

[51] VAR-002-2b, Requirement R4, Sub-parts 4.1.1–4.1.3; VAR-002-3, Requirement R5, Sub-parts 5.1.1–5.1.3.

[52] Existing Requirement R5 references "Generator Owner" in Requirement R5 and "Generator Operator" in Part 5.1. Proposed Requirement R6 modifies the reference to "Generator Operator" in Part 5.1 to reference "Generator Owner" in what is now Part 6.1.

[53] Since the issuance of Order No. 693, the Commission withdrew its directives from paragraphs 1863 and 1869 of Order No. 693 related to the VAR Reliability Standards. *Electric Reliability Organization Proposal to Retire Requirements in Reliability Standards*, 145 FERC ¶ 61,147 at PP 25–26, Att. A (2013).

entities and include a new requirement(s) that identifies the reliability coordinator's monitoring responsibilities."[54] The Commission reasoned that because "a reliability coordinator is the highest level of authority overseeing the reliability of the Bulk-Power System it is important to include the reliability coordinator as an applicable entity to assure that adequate voltage and reactive resources are being maintained."[55] Because the Interconnection Reliability Operations and Coordination ("IRO") group of Reliability Standards address Reliability Coordinator monitoring functions, the standard drafting team concluded that any additional requirements on the Reliability Coordinator monitoring function regarding voltage should be addressed in the IRO Reliability Standards. There is currently a NERC standards development project, Project 2014-03 – Revisions to TOP and IRO Standards, which is modifying the IRO Reliability Standards. The standard drafting team for that project is considering whether any revisions are necessary to address this directive.[56] Therefore, NERC does not propose to apply VAR-001-4 to Reliability Coordinators or develop any additional VAR-001-4 requirements applicable to Reliability Coordinators at this time.

Reactive Power requirements for LSEs: As directed by the Commission,[57] NERC addressed Reactive Power requirements for LSEs on a comparable basis with purchasing-selling

---

[54] Order No. 693 at P 1855.

[55] *Id*.

[56] Specifically, the drafting team for Project 2014-03 has proposed a new IRO-002-4, Requirement R4, which provides:

> Each Reliability Coordinator shall monitor Facilities within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to determine any potential [SOL and IROL] exceedances within its Reliability Coordinator Area, including sub-100 kV facilities needed to make this determination and the status of Special Protection Systems in its Reliability Coordinator Area.

[57] Order No. 692 at P 1858.

entities in Reliability Standard VAR-001-2, Requirement R5.[58] Subsequently, the Commission approved retirement of the requirement addressing this directive because the directive is effectively addressed in Schedule 2 (Reactive Supply and Voltage Control from Generation or Other Sources Service) of the Commission's *pro forma* Open Access Transmission Tariff.[59] As such, NERC does not propose to address this directive in the proposed Reliability Standards.

Power factor range at the interface between LSEs and the Bulk-Power System: The Commission directed NERC to develop a modification to the VAR Reliability Standards "to address the power factor range at the interface between LSEs and the Bulk-Power System."[60] The Commission was concerned that during high loads, if the power factor at the interface between many LSEs and the Bulk-Power System is so low as to result in low voltages at key busses on the Bulk-Power System, then there is risk for voltage collapse. Since the issuance of this directive, however, other Reliability Standards approved by the Commission address this issue. Specifically, Reliability Standard TPL-001-4, which has been approved by the Commission and subject to future enforcement, requires that system models include Real and reactive Load forecasts.[61] These system model inputs provide the appropriate power factors to be maintained. Additionally, Reliability Standard FAC-001-1 requires that each Transmission Owner and applicable Generator Owner provide a written summary of its plan to achieve the required system performance for "Voltage, Reactive Power, and ***power factor control***."[62] Because currently enforceable Reliability Standards TPL-001-4 and FAC-001-1 address the

[58] *NERC Petition for Approval of Proposed Modifications to Reliability Standards BAL-002-1; EOP-002-3; FAC-002-1; MOD-021-2; PRC-004-2; and VAR-001-2*, 134 FERC ¶ 61,015 (2011).

[59] Order No. 788 at P 17.

[60] Order No. 693 at P 1861.

[61] TPL-001-4, Requirement R1, Part 1.1.4, *available at* http://www.nerc.com/files/TPL-001-4.pdf.

[62] *See* FAC-001-1, Requirement R3, Part 3.1.9, *available at* http://www.nerc.com/files/FAC-001-1.pdf (emphasis added).

appropriate power factors to be maintained, the VAR standard drafting team determined it would be duplicative and unnecessary for reliability purposes to add the same or similar requirements to proposed Reliability Standards VAR-001-4 and VAR-002-3.

Consideration of acceptable ranges of net power factor range: The Commission directed NERC to consider the difficulty of reaching "an agreement on acceptable ranges of net power factors at the interfaces where LSEs receive service from the Bulk-Power System because the acceptable range of power factors at any particular point on the electrical system varies based on many location-specific factors."[63] The standard drafting team considered this directive carefully and determined that it has been addressed by the interconnection process and related agreements, as well as by currently enforceable Reliability Standards TPL-001-4 and FAC-001-1, as discussed above. Therefore, the standard drafting team did not include any additional language to proposed Reliability Standards VAR-001-4 and VAR-002-3 to address this directive.

Detailed and definitive requirement on established limits and sufficient reactive resources: The Commission directed NERC to "include more detailed and definitive requirements on 'established limits' and 'sufficient reactive resources' and identify acceptable margins (*i.e.*, voltage and/or reactive power margins) above voltage instability points to prevent voltage instability and to ensure reliable operation."[64] The Commission, in part, was addressing concerns that the Transmission Operator should be required to have a technical basis for setting the required voltage schedule that takes into account system needs and any limitations of the specific generator.[65] Proposed Reliability Standard VAR-001-4 addresses this concern by requiring Transmission Operators to (1) share their system voltage schedules with their

63 Order No. 693 at PP 1860, 1862.

64 *Id*. at P 1868.

65 *See id*. at P 1864.

Reliability Coordinators and adjacent Transmission Operators (Requirement R1, Part 1.1), and (2) provide Generator Operators the criteria used to develop generator-specific voltage and Reactive Power schedules (Requirement R5, Part 5.3). This increased transparency will help ensure that Transmission Operators have a technical basis for setting system-wide and generator specific voltage and Reactive Power schedules that takes into account system needs and any limitations of the specific generator.

Additionally, the Commission stated that "the Reliability Standard would benefit from having more defined requirements that clearly define what voltage limits are used and how much reactive resources are needed to ensure voltage instability will not occur under normal and emergency conditions."[66] Currently enforceable FAC and TOP Reliability Standards approved by the Commission following the issuance of Order No. 693, however, address this directive by requiring entities to develop methodologies for establishing SOLs and IROLs that include detailed and definitive requirements for voltage limits and margins. Specifically, Reliability Standard FAC-011-2, Requirement R1 requires the Reliability Coordinator to have a documented methodology for use in developing SOLs (the "SOL Methodology") within its Reliability Coordinator Area for use in the operations horizon.[67] Among other things, the SOL Methodology must include a requirement that SOLs provide BES performance consistent with maintaining voltage stability.[68]

---

[66] *Id*. at P 1870.

[67] Reliability Standard FAC-010-2.1 requires the Reliability Coordinator to have a documented SOL Methodology for use in the planning horizon.

[68] Specifically, FAC-011-2, Requirement R2 provides that:

> [t]he Reliability Coordinator's SOL Methodology shall include a requirement that SOLs provide BES performance consistent with the following:

continued . . .

Reliability Standard FAC-014-2 then requires (1) each Reliability Coordinator to ensure that SOLs, including IROLs, for its Reliability Coordinator Area are established and consistent with its SOL Methodology, and (2) each Transmission Operator to establish SOLs (as directed by its Reliability Coordinator) for its portion of the Reliability Coordinator Area that are consistent with its Reliability Coordinator's SOL Methodology.

These FAC Reliability Standards operate in tandem with the TOP Reliability Standards, which, as discussed above, require that each Transmission Operator plan to meet and operate within SOLs and IROLs. The standard drafting team determined that these currently enforceable FAC and TOP Reliability Standards collectively provide sufficient detail on "established limits" and margins, and it was unnecessary to include any additional definitive and detailed requirements in VAR-001-4 or VAR-002-3 to address voltage instability and ensure reliable operations. The standard drafting team determined, however, that because acceptable voltage limits and the level of sufficient Reactive Power necessary to maintain voltage depends on the unique characteristics of each system, the proposed Reliability Standards cannot dictate a specific, "one-size-fits-all" approach to determining what constitutes a sufficient level of Reactive Power. Rather, the SOL Methodologies developed by Reliability Coordinators under FAC-011-2 will provide the necessary detail tailored to the needs of the system in question.

Periodic voltage stability analysis: The Commission directed NERC to include a requirement to "perform voltage stability analysis periodically, using online techniques where

---

> R2.1. In the pre-contingency state, the BES shall demonstrate transient, dynamic and ***voltage stability***; all Facilities shall be within their Facility Ratings and within their thermal, voltage and ***stability limits***. . . .
>
> R2.2. [T]he system shall demonstrate transient, dynamic and ***voltage stability***; all Facilities shall be operating within their Facility Ratings and within their thermal, ***voltage and stability limits***; and Cascading or uncontrolled separation shall not occur.

(Emphasis added.)

commercially-available, and offline simulation tools where online tools are not available, to assist real-time operations."[69] The Commission stated that "[t]he ERO should consider the available technologies and software as it develops this modification to VAR-001-1 and identify a process to assure that the Reliability Standard is not limiting the application of validated software or other tools."[70] The standard drafting team concluded that requiring periodic voltage stability analysis in proposed VAR-001-4 was duplicative of requirements in the TOP group of Reliability Standards. Specifically, period voltage stability analysis is already required to comply with Reliability Standards TOP-002-2.1b, Requirements R10[71] and R11,[72] TOP-004-2, Requirement R6,[73] and TOP-006-2, Requirement R2.[74] Each of these existing Reliability Standards requires active planning and monitoring to operate within SOLs. Because periodic voltage stability analysis is an inherent component of these monitoring requirements, particularly TOP-002-2.1b, Requirement R11, the standard drafting team did not propose to duplicate these requirements in proposed Reliability Standards VAR-001-4 and VAR-002-3. As noted above, the TOP Reliability Standards currently in development propose to carry forward the obligation

---

69 Order No. 693 at P 1875.

70 *Id*.

71 Reliability Standard TOP-002-2.1b, Requirement R10 provides that "[e]ach Balancing Authority and Transmission Operator shall plan to meet all [SOLs] and [IROLs]."

72 Reliability Standard TOP-002-2.1b, Requirement R11 provides that the "Transmission Operator shall perform seasonal, next-day, and current-day Bulk Electric System studies to determine SOLs." The requirement also specifies that the "Transmission Operator shall update these Bulk Electric System studies as necessary to reflect current system conditions; and shall make the results of Bulk Electric System studies available to the Transmission Operators, Balancing Authorities (subject to confidentiality requirements), and to its Reliability Coordinator."

73 TOP-004-2, Requirement R6 provides that "Transmission Operators, individually and jointly with other Transmission Operators, shall develop, maintain, and implement formal policies and procedures to provide for transmission reliability. These policies and procedures shall address the execution and coordination of activities that impact inter- and intra-Regional reliability, including . . . [m]onitoring and controlling voltage levels and real and reactive power flows.

74 TOP-006-2, Requirement R2 requires that "[e]ach Reliability Coordinator, Transmission Operator, and Balancing Authority shall monitor applicable transmission line status, real and reactive power flows, voltage, load-tap-changer settings, and status of rotating and static reactive resources."

to plan to meet and operate within SOLs and IROLs. Further, draft Reliability Standard TOP-002-4, Requirement R1 would require Transmission Operators to perform an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its SOLs.[75] An Operational Planning Analyses would include a voltage stability analysis to assist Real-time operations.

NERC is not proposing to modify its Reliability Standards to require that entities perform periodic voltage stability analyses using online techniques where commercially-available or offline simulation tools where online tools are not available. From a Reliability Standards perspective, the goal is to ensure that relevant entities perform periodic voltage stability analyses in a manner that helps maintain reliable operation in Real-time, not to limit or dictate the techniques or tools used to perform the analysis. An entity may perform the analysis using online techniques or offline simulation tools based on their availability and effectiveness. To comply with the TOP Reliability Standards, however, the entity must show that it performed a voltage stability analysis using techniques and/or tools designed to assess voltage stability effectively.

Controllable load: The Commission directed NERC to include controllable load as a reactive resource.[76] As noted above, proposed Reliability Standard VAR-001-4, Requirement R2 addresses this directive as controllable load is included as a "sufficient reactive resource."

---

[75] The term "Operational Planning Analysis" is proposed to be modified as follows:

> An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations.

[76] Order No. 693 at P 1879.

VAR-002 non-compliance window: The Commission directed NERC to consider modifying VAR-002 to add a time frame associated with an "incident" of non-compliance with VAR-002.[77] The standard drafting team considered modifications to VAR-002, but could not reach consensus on establishing, or developing guidelines for defining, a continent-wide time frame that would apply to all generators under VAR-002. Rather, the directive was addressed in an equally effective and efficient manner in proposed Reliability Standard VAR-001-4, Requirement R5, which requires that each Transmission Operator provide its Generator Operators with applicable voltage or Reactive Power schedules and notification requirements for deviations from those schedules. This approach provides the necessary flexibility to each Transmission Operator to define time frames based on its unique system assessments and tailor deviation notifications to the voltage constraints experienced in a particular area.

Technically sound voltage schedules: In Order No. 724, the Commission remanded to NERC an interpretation of VAR-001-1, Requirement R4 to ensure voltage schedules "reflect sound engineering, as well as operating judgment and experience."[78] To address this directive, Requirement R5, Part 5.3 requires a Transmission Operator, upon request, to provide the Generator Operator the technical support for how a voltage schedule and an associated tolerance band was established. This increased transparency will help ensure that the schedules reflect sound engineering and operating judgment.

D. Enforceability of the Proposed Reliability Standards

Proposed Reliability Standards VAR-001-4 and VAR-002-3 include VRFs and VSLs. The VRFs and VSLs guide how NERC will enforce the requirements of the proposed Reliability

---

[77] *Id*. at PP 1883, 1885.

[78] Order No. 724 at P 49.

Standards and comport with NERC and Commission guidelines related to their assignment. Exhibit E provides a detailed review of the VRFs and VSLs, as well as analysis on how the VRFs and VSLs were determined using the NERC and Commission guidelines.

The proposed Reliability Standards also include measures that support each requirement promulgated thereunder by clearly identifying what is required for compliance and how the requirement will be enforced. These measures help ensure that the requirements will be enforced in a clear, consistent and non-preferential manner and without prejudice to any party.[79]

V. EFFECTIVE DATE

As described in the Implementation Plan attached hereto as Exhibit B, NERC respectfully requests that the Commission approve proposed Reliability Standards VAR-001-4 and VAR-002-3 and the retirement of VAR-001-3 and VAR-002-2b, effective on the first day of the first calendar quarter after Commission approval. The proposed implementation period will provide sufficient time for responsible entities to develop or modify their processes to transition from compliance with existing Reliability Standards VAR-001-3 and VAR-002-2b to proposed Reliability Standards VAR-001-4 and VAR-002-3.

[79] Order No. 672 at P 327 ("There should be a clear criterion or measure of whether an entity is in compliance with a proposed Reliability Standard. It should contain or be accompanied by an objective measure of compliance so that it can be enforced and so that enforcement can be applied in a consistent and non-preferential manner.").

VI. CONCLUSION

For the reasons set forth above, NERC respectfully requests that the Commission approve:

- Proposed Reliability Standards VAR-001-4 and VAR-002-3 and the associated elements included in Exhibit A, effective as proposed herein;
- The proposed Implementation Plan included in Exhibit B; and
- The retirement of the currently effective Reliability Standards VAR-001-3 and VAR-002-2b, effective as proposed herein.

Respectfully submitted,

/s/ Shamai Elstein

Date: June 9, 2014

Exhibit A-1

Proposed Reliability Standard VAR-001-4

A. Introduction

1. **Title:** Voltage and Reactive Control

2. **Number:** VAR-001-4

3. **Purpose:** To ensure that voltage levels, reactive flows, and reactive resources are monitored, controlled, and maintained within limits in Real-time to protect equipment and the reliable operation of the Interconnection.

4. **Applicability:**

   4.1. Transmission Operators

   4.2. Generator Operators within the Western Interconnection (for the WECC Variance)

5. **Effective Date:**

   5.1. The standard shall become effective on the first day of the first calendar quarter after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

B. Requirements and Measures

R1. Each Transmission Operator shall specify a system voltage schedule (which is either a range or a target value with an associated tolerance band) as part of its plan to operate within System Operating Limits and Interconnection Reliability Operating Limits. *[Violation Risk Factor: High] [Time Horizon: Operational Planning]*

1.1. Each Transmission Operator shall provide a copy of the voltage schedules (which is either a range or a target value with an associated tolerance band) to its Reliability Coordinator and adjacent Transmission Operators within 30 calendar days of a request.

M1. The Transmission Operator shall have evidence that it specified system voltage schedules using either a range or a target value with an associated tolerance band.

For part 1.1, the Transmission Operator shall have evidence that the voltage schedules (which is either a range or a target value with an associated tolerance band) were provided to its Reliability Coordinator and adjacent Transmission Operators within 30 days of a request. Evidence may include, but is not limited to, emails, website postings, and meeting minutes.

R2. Each Transmission Operator shall schedule sufficient reactive resources to regulate voltage levels under normal and Contingency conditions. Transmission Operators can provide sufficient reactive resources through various means including, but not limited to, reactive generation scheduling, transmission line and reactive resource switching, and using controllable load. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same-day Operations, and Operational Planning]*

M2. Each Transmission Operator shall have evidence of scheduling sufficient reactive resources based on their assessments of the system. For the operational planning time horizon, Transmission Operators shall have evidence of assessments used as the basis for how resources were scheduled.

R3. Each Transmission Operator shall operate or direct the Real-time operation of devices to regulate transmission voltage and reactive flow as necessary. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same-day Operations, and Operational Planning]*

M3. Each Transmission Operator shall have evidence that actions were taken to operate capacitive and inductive resources as necessary in Real-time. This may include instructions to Generator Operators to: 1) provide additional voltage support; 2) bring resources on-line; or 3) make manual adjustments.

R4. The Transmission Operator shall specify the criteria that will exempt generators from: 1) following a voltage or Reactive Power schedule, 2) from having its automatic voltage regulator (AVR) in service or from being in voltage control mode, or 3) from having to make any associated notifications. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

4.1 If a Transmission Operator determines that a generator has satisfied the exemption criteria, it shall notify the associated Generator Operator.

M4. Each Transmission Operator shall have evidence of the documented criteria for generator exemptions.

For part 4.1, the Transmission Operator shall also have evidence to show that, for each generator in its area that is exempt from: 1) following a voltage or Reactive Power schedule, 2) from having its

automatic voltage regulator (AVR) in service or from being in voltage control mode, or 3) from having to make any notifications, the associated Generator Operator was notified of this exemption.

R5. Each Transmission Operator shall specify a voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) at either the high voltage side or low voltage side of the generator step-up transformer at the Transmission Operator's discretion. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

5.1. The Transmission Operator shall provide the voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) to the associated Generator Operator and direct the Generator Operator to comply with the schedule in automatic voltage control mode (the AVR is in service and controlling voltage).

5.2. The Transmission Operator shall provide the Generator Operator with the notification requirements for deviations from the voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band).

5.3. The Transmission Operator shall provide the criteria used to develop voltage schedules Reactive Power schedule (which is either a range or a target value with an associated tolerance band) to the Generator Operator within 30 days of receiving a request.

M5. The Transmission Operator shall have evidence of a documented voltage or Reactive Power Schedule (which is either a range or a target value with an associated tolerance band).

For part 5.1, the Transmission Operator shall have evidence it provided a voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) to the applicable Generator Operators, and that the Generator Operator was directed to comply with the schedule in automatic voltage control mode, unless exempted.

For part 5.2, the Transmission Operator shall have evidence it provided notification requirements for deviations from the voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band). For part 5.3, the Transmission Operator shall have evidence it provided the criteria used to develop voltage schedules or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) within 30 days of receiving a request by a Generator Operator.

R6. After consultation with the Generator Owner regarding necessary step-up transformer tap changes and the implementation schedule, the Transmission Operator shall provide documentation to the Generator Owner specifying the required tap changes, a timeframe for making the changes, and technical justification for these changes. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M6. The Transmission Operator shall have evidence that it provided documentation to the Generator Owner when a change was needed to a generating unit's step-up transformer tap in accordance with the requirement and that it consulted with the Generator Owner.

C. Compliance

1. **Compliance Monitoring Process:**

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" refers to NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time a registered entity is required to retain specific evidence to demonstrate compliance. For instances in which the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask the registered entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Operator shall retain evidence for Measures 1 through 6 for 12 months. The Compliance Monitor shall retain any audit data for three years.

1.3. Compliance Monitoring and Assessment Processes:

"Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.4. Additional Compliance Information:

None

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operational Planning**	**High**	N/A	N/A	N/A	The Transmission Operator does not specify a system voltage schedule (which is either a range or a target value with an associated tolerance band).
R2	**Real-time Operations, Same-day Operations, and Operational Planning**	**High**	N/A	N/A	The Transmission Operator does not schedule sufficient reactive resources as necessary to avoid violating an SOL.	The Transmission Operator does not schedule sufficient reactive resources as necessary to avoid violating an IROL.
R3	**Real-time Operations, Same-day Operations, and Operational Planning**	**High**	N/A	N/A	The Transmission Operator does not operate or direct any real-time operation of devices as necessary to avoid violating an SOL.	The Transmission Operator does not operate or direct any real-time operation of devices as necessary to avoid violating an IROL.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R4	**Operations Planning**	**Lower**	N/A	N/A	The Transmission Operator has exemption criteria and notified the Generator Operator, but the Transmission Operator does not have evidence of the notification to the Generator Operator.	The Transmission Operator does not have exemption criteria.
R5	**Operations Planning**	**Medium**	N/A	The Transmission Operator does not provide the criteria for voltage or Reactive Power schedules (which is either a range or a target value with an associated tolerance band) after 30 days of a request.	The Transmission Operator does not provide voltage or Reactive Power schedules (which is either a range or a target value with an associated tolerance band) to all Generator Operators.	The Transmission Operator does not provide voltage or Reactive Power schedules (which is either a range or a target value with an associated tolerance band) to any Generator Operators. Or The Transmission Operator does not provide the Generator Operator with the notification requirements for deviations from the

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band).
R6	**Operations Planning**	**Lower**	The Transmission Operator does not provide either the technical justification or timeframe for changing generator step-up tap settings.	N/A	N/A	The Transmission Operator does not provide the technical justification and the timeframe for changing generator step-up tap settings.

D. Regional Variances

The following Interconnection-wide variance shall be applicable in the Western Electricity Coordinating Council (WECC) and replaces, in their entirety, Requirements R4 and R5. Please note that Requirement R4 is deleted and R5 is replaced with the following requirements.

Requirements

E.A.13 Each Transmission Operator shall issue any one of the following types of voltage schedules to the Generator Operators for each of their generation resources that are on-line and part of the Bulk Electric System within the Transmission Operator Area: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same-day Operations]*

- A voltage set point with a voltage tolerance band and a specified period.
- An initial volt-ampere reactive output or initial power factor output with a voltage tolerance band for a specified period that the Generator Operator uses to establish a generator bus voltage set point.
- A voltage band for a specified period.

E.A.14 Each Transmission Operator shall provide one of the following voltage schedule reference points for each generation resource in its Area to the Generator Operator. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same-day Operations]*

- The generator terminals.
- The high side of the generator step-up transformer.
- The point of interconnection.
- A location designated by mutual agreement between the Transmission Operator and Generator Operator.

E.A.15 Each Generator Operator shall convert each voltage schedule specified in Requirement E.A.13 into the voltage set point for the generator excitation system. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same-day Operations]*

E.A.16 Each Generator Operator shall provide its voltage set point conversion methodology from the point in Requirement E.A.14 to the generator terminals within 30 calendar days of request by its Transmission Operator. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

E.A.17 Each Transmission Operator shall provide to the Generator Operator, within 30 calendar days of a request for data by the Generator Operator, its transmission equipment data and operating data that supports development of the voltage set point conversion methodology. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

E.A.18 Each Generator Operator shall meet the following control loop specifications if the Generator Operator uses control loops external to the Automatic Voltage Regulators (AVR) to manage MVar loading: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

E.A.18.1. Each control loop's design incorporates the AVR's automatic voltage controlled response to voltage deviations during System Disturbances.

E.A.18.2. Each control loop is only used by mutual agreement between the Generator Operator and the Transmission Operator affected by the control loop.

Measures[1]

M.E.A.13 Each Transmission Operator shall have and provide upon request, evidence that it provided the voltage schedules to the Generator Operator. Dated spreadsheets, reports, voice recordings, or other documentation containing the voltage schedule including set points, tolerance bands, and specified periods as required in Requirement E.A.13 are acceptable as evidence.

M.E.A.14 The Transmission Operator shall have and provide upon request, evidence that it provided one of the voltage schedule reference points in Requirement E.A.14 for each generation resource in its Area to the Generator Operator. Dated letters, e-mail, or other documentation that contains notification to the Generator Operator of the voltage schedule reference point for each generation resource are acceptable as evidence.

M.E.A.15 Each Generator Operator shall have and provide upon request, evidence that it converted a voltage schedule as described in Requirement E.A.13 into a voltage set point for the AVR. Dated spreadsheets, logs, reports, or other documentation are acceptable as evidence.

M.E.A.16 The Generator Operator shall have and provide upon request, evidence that within 30 calendar days of request by its Transmission Operator it provided its voltage set point conversion methodology from the point in Requirement E.A.14 to the generator terminals. Dated reports, spreadsheets, or other documentation are acceptable as evidence.

M.E.A.17 The Transmission Operator shall have and provide upon request, evidence that within 30 calendar days of request by its Generator Operator it provided data to support development of the voltage set point conversion methodology. Dated reports, spreadsheets, or other documentation are acceptable as evidence.

M.E.A.18 If the Generator Operator uses outside control loops to manage MVar loading, the Generator Operator shall have and provide upon request, evidence that it met the control loop specifications in sub-parts E.A.18.1 through E.A.18.2. Design specifications with identified agreed-upon control loops, system reports, or other dated documentation are acceptable as evidence.

[1] The number for each measure corresponds with the number for each requirement, i.e. M.E.A.13 means the measure for Requirement E.A.13.

Violation Severity Levels

E #	Lower VSL	Moderate VSL	High VSL	Severe VSL
E.A.13	For the specified period, the Transmission Operator did not issue one of the voltage schedules listed in E.A.13 to at least one generation resource but less than or equal to 5% of the generation resources that are on-line and part of the BES in the Transmission Operator Area.	For the specified period, the Transmission Operator did not issue one of the voltage schedules listed in E.A.13 to more than 5% but less than or equal to 10% of the generation resources that are on-line and part of the BES in the Transmission Operator Area.	For the specified period, the Transmission Operator did not issue one of the voltage schedules listed in E.A.13 to more than 10% but less than or equal to 15% of the generation resources that are on-line and part of the BES in the Transmission Operator Area.	For the specified period, the Transmission Operator did not issue one of the voltage schedules listed in E.A.13 to more than 15% of the generation resources that are on-line and part of the BES in the Transmission Operator Area.
E.A.14	The Transmission Operator did not provide a voltage schedule reference point for at least one but less than or equal to 5% of the generation resources in the Transmission Operator area.	The Transmission Operator did not provide a voltage schedule reference point for more than 5% but less than or equal to 10% of the generation resources in the Transmission Operator Area.	The Transmission Operator did not a voltage schedule reference point for more than 10% but less than or equal to 15% of the generation resources in the Transmission Operator Area.	The Transmission Operator did not provide a voltage schedule reference point for more than 15% of the generation resources in the Transmission Operator Area.

Guidelines and Technical Basis

For technical basis for each requirement, please review the rationale provided for each requirement.

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for R1:

Paragraph 1868 of Order No. 693 requires NERC to add more "detailed and definitive requirements on “established limits” and “sufficient reactive resources”, and identify acceptable margins (i.e. voltage and/or reactive power margins)." Since Order No. 693 was issued, however, several FAC and TOP standards have become enforceable to add more requirements around voltage limits. More specifically, FAC-011 and FAC-014 require that System Operating Limits (SOLs) and reliability margins are established. The NERC Glossary definition of SOLs includes both: 1) Voltage Stability Ratings (Applicable pre- and post-Contingency Voltage Stability) and 2*)* System Voltage Limits (Applicable pre- and post-Contingency Voltage Limits). Therefore, for reliability reasons Requirement R1 now requires a Transmission Operator (TOP) to set voltage or Reactive Power schedules with associated tolerance bands. Further, since neighboring areas can affect each other greatly, each TOP must also provide a copy of these schedules to its Reliability Coordinator (RC) and adjacent TOP upon request.

Rationale for R2:

Paragraph 1875 from Order No. 693 directed NERC to include requirements to run voltage stability analysis periodically, using online techniques where commercially available and offline tools when online tools are not available. This standard does not explicitly require the periodic voltage stability analysis because such analysis would be performed pursuant to the SOL methodology developed under the FAC standards. TOP standards also require the TOP to operate within SOLs and Interconnection Reliability Operating Limits (IROL). The VAR standard drafting team (SDT) and industry participants also concluded that the best models and tools are the ones that have been proven and the standard should not add a requirement for a responsible entity to purchase new online simulations tools. Thus, the VAR SDT simplified the requirements to ensuring sufficient reactive resources are online or scheduled. Controllable load is specifically included to answer FERC's directive in Order No. 693 at Paragraph 1879.

Rationale for R3:

Similar to Requirement R2, the VAR SDT determined that for reliability purposes, the TOP must ensure sufficient voltage support is provided in Real-time in order to operate within an SOL.

Rationale for R4:

The VAR SDT received significant feedback on instances when a TOP would need the flexibility for defining exemptions for generators. These exemptions can be tailored as the TOP deems necessary for the specific area's needs. The goal of this requirement is to provide a TOP the ability to exempt a Generator Operator (GOP) from: 1) a voltage or Reactive Power schedule, 2) a setting on the AVR, or 3) any VAR-002 notifications based on the TOP's criteria. Feedback from the industry detailed many system events that would require these types of exemptions which included, but are not limited to: 1) maintenance during shoulder months, 2) scenarios where two units are located within close proximity and both cannot be in voltage control mode, and 3) large system voltage swings where it would harm reliability if all GOP were to notify their respective TOP of deviations at one time. Also, in an effort to improve the requirement, the sub-requirements containing an exemption list were removed from the currently enforceable standard because this created more compliance issues with regard to how often the list would be updated and maintained.

Rationale for R5:

The new requirement provides transparency regarding the criteria used by the TOP to establish the voltage schedule. This requirement also provides a vehicle for the TOP to use appropriate granularity when setting notification requirements for deviation from the voltage or Reactive Power schedule. Additionally, this requirement provides clarity regarding a "tolerance band" as specified in the voltage schedule and the control dead-band in the generator's excitation system.

Voltage Schedule tolerances are the bandwidth that accompanies the voltage target in a voltage schedule, should reflect the anticipated fluctuation in voltage at the Generation Operator's facility during normal operations, and be based on the TOP's assessment of N-1 and credible N-2 system contingencies. The voltage schedule's bandwidth should not be confused with the control dead-band that is programmed into a Generation Operator's automatic voltage regulator's control system, which should be adjusting the AVR prior to reaching either end of the voltage schedule's bandwidth.

Rationale for R6:

Although tap settings are first established prior to interconnection, this requirement could not be deleted because no other standard addresses when a tap setting must be adjusted. If the tap setting is not properly set, then the amount of VARs produced by a unit can be affected.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
1	August 2, 2006	BOT Adoption	Revised
1	June 18, 2007	FERC approved Version 1 of the standard.	Revised
1	July 3, 2007	Added “Generator Owners” and “Generator Operators” to Applicability section.	Errata
1	August 23, 2007	Removed “Generator Owners” and “Generator Operators” to Applicability section.	Errata
2	August 5, 2010	Adopted by NERC Board of Trustees; Modified to address Order No. 693 Directives contained in paragraphs 1858 and 1879.	Revised
2	January, 10 2011	FERC issued letter order approving the addition of LSEs and Controllable Load to the standard.	Revised
3	May 9, 2012	Adopted by NERC Board of Trustees; Modified to add a WECC region variance	Revised
3	June 20, 2013	FERC issued order approving VAR-001-3	Revised
3	November 21, 2013	R5 and associated elements approved by FERC for retirement as part of the Paragraph 81 project (Project 2013-02)	Revised
4	February 6, 2014	Adopted by NERC Board of Trustees	Revised

A. Introduction

1. **Title:** Voltage and Reactive Control

2. **Number:** VAR-001-34

3. **Purpose:** To ensure that voltage levels, reactive flows, and reactive resources are monitored, controlled, and maintained within limits in real-time to protect equipment and the reliable operation of the Interconnection.

4. **Applicability:**

   4.1. Transmission Operators.

   4.2. Purchasing-Selling Entities.

   4.3. Load Serving Entities.

   4.4.2. Generator Operators within the Western Interconnection. (for the WECC Variance)

5. **(Proposed) Effective Date:**

   5.1. The standard shall become effective on the first day of the first calendar quarter six months after the date that the standard is approved by an applicable regulatory governmental authority or as otherwise provided for in a jurisdiction where approval; or in those jurisdictions where no regulatory approval by an applicable governmental authority is required, for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter six months after the date the standard is adopted by the NERC Board of Trustees' adoption Trustees or as otherwise provided for in that jurisdiction.

B. Requirements

Each Transmission Operator, individually and jointly Measures

R1. Each Transmission Operator shall specify a system voltage schedule (which is either a range or a target value with other an associated tolerance band) as part of its plan to operate within System Operating Limits and Interconnection Reliability Operating Limits. *[Violation Risk Factor: High] [Time Horizon: Operational Planning]*

1.1. Each Transmission Operator shall provide a copy of the voltage schedules (which is either a range or a target value with an associated tolerance band) to its Reliability Coordinator and adjacent Transmission Operators, shall ensure that formal policies and procedures are developed, maintained, and implemented for monitoring within 30 calendar days of a request.

M1. The Transmission Operator shall have evidence that it specified system voltage schedules using either a range or a target value with an associated tolerance band.

1.1. For part 1.1, the Transmission Operator shall have evidence that the voltage schedules (which is either a range or a target value with an associated tolerance band) were provided to its Reliability Coordinator and controlling voltage levels and Mvar flows within their individual areas and with the areas of neighboringadjacent Transmission Operators.

Each Transmission Operator shall acquire sufficient reactive resources — which within 30 days of a request. Evidence may include, but is not limited to, emails, website postings, and meeting minutes.

R2. Each Transmission Operator shall schedule sufficient reactive resources to regulate voltage levels under normal and Contingency conditions. Transmission Operators can provide sufficient reactive resources through various means including, but not limited to, reactive generation scheduling;, transmission line and reactive resource switching;,, and using controllable load — within its area to protect the voltage levels under normal. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same-day Operations, and* Contingency conditions. This includes the *Operational Planning]*

M2. Each Transmission Operator's shareOperator shall have evidence of the scheduling sufficient reactive requirementsresources based on their assessments of interconnectingthe system. For the operational planning time horizon, Transmission Operators shall have evidence of assessments used as the basis for how resources were scheduled.

R2.R3. Each Transmission Operator shall operate or direct the Real-time operation of devices to regulate transmission circuits.voltage and reactive flow as necessary. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same-day Operations, and Operational Planning]*

M3. Each Transmission Operator shall have evidence that actions were taken to operate capacitive and inductive resources as necessary in Real-time. This may include instructions to Generator Operators to: 1) provide additional voltage support; 2) bring resources on-line; or 3) make manual adjustments.

1.3. The Transmission Operator shall specify the criteria that exemptswill exempt generators from compliance with the requirements defined in Requirement 4, and Requirement 6.1.

R3.1.R4. Each Transmission Operator shall maintain a list of generators in its area that are exempt from : 1) following a voltage or Reactive Power schedule. , 2) from having its automatic voltage regulator (AVR) in service or from being in voltage control mode, or 3) from having to make any associated notifications. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

R3.2.4.1 For eachIf a Transmission Operator determines that a generator that is on thishas satisfied the exemption list, the Transmission Operatorcriteria, it shall notify the associated Generator Owner. Operator.

M4. Each Transmission Operator shall have evidence of the documented criteria for generator exemptions.

For part 4.1, the Transmission Operator shall also have evidence to show that, for each generator in its area that is exempt from: 1) following a voltage or Reactive Power schedule, 2) from having its automatic voltage regulator (AVR) in service or from being in voltage control mode, or 3) from having to make any notifications, the associated Generator Operator was notified of this exemption.

R5. Each Transmission Operator shall specify a voltage or Reactive Power schedule [1](which is either a range or a target value with an associated tolerance band) at either the interconnection betweenhigh voltage side or low voltage side of the generator facility andstep-up transformer at the Transmission Owner's facilities to be maintained by each generator. Operator's discretion. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

R4.5.1. The Transmission Operator shall provide the voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) to the associated Generator Operator and direct the Generator Operator to comply with the schedule in automatic voltage control mode (the AVR is in service and controlling voltage).

1.7. Each Purchasing-Selling Entity and Load-Serving Entity shall arrange for (self-provide or purchase) reactive resources – which may include, but is not limited to, reactive generation scheduling; transmission line and reactive resource switching;, and controllable load – to satisfy its reactive requirements identified by its Transmission Service Provider. (Retirement approved by FERC effective January 21, 2014.)

1.8. The Transmission Operator shall know the status of all transmission provide the Generator Operator with the notification requirements for deviations from the voltage or Reactive Power resources, including the status of voltage regulators and power system stabilizers.

R6.1.5.2. When notified of the loss of an automatic voltage regulator control, the Transmission Operator shall direct the Generator Operator to maintain or change either its voltage schedule or its Reactive Power schedule.(which is either a range or a target value with an associated tolerance band).

1.10. The Transmission Operator shall be able to operate or directprovide the operation of devices necessary to regulate transmissioncriteria used to develop voltage and reactive flow.

R8.5.3. Each Transmissionschedules Reactive Power schedule (which is either a range or a target value with an associated tolerance band) to the Generator Operator shall operate or

[1] The voltage schedule is a target voltage to be maintained within a tolerance band during a specified period.

~~direct the operation of capacitive and inductive reactive resources within its area – which may include, but is not limited to, reactive generation scheduling; transmission line and reactive resource switching; controllable load; and, if necessary, load shedding – to maintain system and Interconnection voltages within established limits~~within 30 days of receiving a request.

~~**1.0.** Each Transmission Operator shall maintain reactive resources – which may include, but is not limited to, reactive generation scheduling; transmission line and reactive resource switching; and controllable load – to support its voltage under first Contingency conditions.~~

~~**2.0.** Each Transmission Operator shall disperse and locate the reactive resources so that the resources can be applied effectively and quickly when Contingencies occur.~~

~~**3.0.** Each Transmission Operator shall correct IROL or SOL violations resulting from reactive resource deficiencies (IROL violations must be corrected within 30 minutes) and complete the required IROL or SOL violation reporting.~~

M5. The Transmission Operator shall have evidence of a documented voltage or Reactive Power Schedule (which is either a range or a target value with an associated tolerance band).

For part 5.1, the Transmission Operator shall have evidence it provided a voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) to the applicable Generator Operators, and that the Generator Operator was directed to comply with the schedule in automatic voltage control mode, unless exempted.

For part 5.2, the Transmission Operator shall have evidence it provided notification requirements for deviations from the voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band). For part 5.3, the Transmission Operator shall have evidence it provided the criteria used to develop voltage schedules or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) within 30 days of receiving a request by a Generator Operator.

~~**R11.**~~**R6.** After consultation with the Generator Owner regarding necessary step-up transformer tap changes and the implementation schedule, the Transmission Operator shall provide documentation to the Generator Owner specifying the required tap changes, a timeframe for making the changes, and technical justification for these changes. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

~~**1.0.** The Transmission Operator shall direct corrective action, including load reduction, necessary to prevent voltage collapse when reactive resources are insufficient.~~

~~B. Measures~~

~~**M3.** The Transmission Operator shall have evidence it provided a voltage or Reactive Power schedule as specified in Requirement 4 to each Generator Operator it requires to follow such a schedule.~~

~~**M4.** The Transmission Operator shall have evidence to show that, for each generating unit in its area that is exempt from following a voltage or Reactive Power schedule, the associated Generator Owner was notified of this exemption in accordance with Requirement 3.2.~~

~~**M5.** The Transmission Operator shall have evidence to show that it issued directives as specified in Requirement 6.1 when notified by a Generator Operator of the loss of an automatic voltage regulator control.~~

~~M4.~~M6. The Transmission Operator shall have evidence that it provided documentation to the Generator Owner when a change was needed to a generating unit's step-up transformer tap in accordance with ~~Requirement 11~~the requirement and that it consulted with the Generator Owner.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

Regional Entity.

Compliance Monitoring Period and Reset Time Frame

One calendar year.

1.2. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

DataAs defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" refers to NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.4.1.2. Evidence Retention:

The following evidence retention periods identify the period of time a registered entity is required to retain specific evidence to demonstrate compliance. For instances in which the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask the registered entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Operator shall retain evidence for Measures 1 through 46 for 12 months.

The Compliance Monitor shall retain any audit data for three years.

1.3. Compliance Monitoring and Assessment Processes:

"Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.5.1.4. Additional Compliance Information:

The Transmission Operator shall demonstrate compliance through self-certification or audit (periodic, as part of targeted monitoring or initiated by complaint or event), as determined by the Compliance Monitor.

1. Violation Severity Levels (no changes)

None

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operational Planning	High	N/A	N/A	N/A	The Transmission Operator does not specify a system voltage schedule (which is either a range or a target value with an associated tolerance band).
R2	Real-time Operations, Same-day Operations, and Operational Planning	High	N/A	N/A	The Transmission Operator does not schedule sufficient reactive resources as necessary to avoid violating an SOL.	The Transmission Operator does not schedule sufficient reactive resources as necessary to avoid violating an IROL.
R3	Real-time Operations, Same-day Operations, and Operational Planning	High	N/A	N/A	The Transmission Operator does not operate or direct any real-time operation of devices as necessary to avoid violating an SOL.	The Transmission Operator does not operate or direct any real-time operation of devices as necessary to avoid violating an IROL.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R4	Operations Planning	Lower	N/A	N/A	The Transmission Operator has exemption criteria and notified the Generator Operator, but the Transmission Operator does not have evidence of the notification to the Generator Operator.	The Transmission Operator does not have exemption criteria.
R5	Operations Planning	Medium	N/A	The Transmission Operator does not provide the criteria for voltage or Reactive Power schedules (which is either a range or a target value with an associated tolerance band) after 30 days of a request.	The Transmission Operator does not provide voltage or Reactive Power schedules (which is either a range or a target value with an associated tolerance band) to all Generator Operators.	The Transmission Operator does not provide voltage or Reactive Power schedules (which is either a range or a target value with an associated tolerance band) to any Generator Operators. Or The Transmission Operator does not provide the Generator Operator with the notification requirements for deviations from the

R #	Time Horizon	VRF	Violation Severity Levels

						voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band).
R6	**Operations Planning**	**Lower**	The Transmission Operator does not provide either the technical justification or timeframe for changing generator step-up tap settings.	N/A	N/A	The Transmission Operator does not provide the technical justification and the timeframe for changing generator step-up tap settings.

~~D.~~ D. Regional Variances

~~Regional Variance for the Western Electricity Coordinating Council~~

The following Interconnection-wide variance shall be applicable in the Western Electricity Coordinating Council (WECC) and replaces, in their entirety, Requirements ~~R3~~R4 and ~~R4.~~ R5. Please note that Requirement ~~R3~~R4 is deleted and ~~R4~~R5 is replaced with the following requirements.

Requirements

~~E.A.13.~~**E.A.13** Each Transmission Operator shall issue any one of the following types of voltage schedules to the Generator Operators for each of their generation resources that are on-line and part of the Bulk Electric System within the Transmission Operator Area: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same-day Operations]*

- A voltage set point with a voltage tolerance band and a specified period.
- An initial volt-ampere reactive output or initial power factor output with a voltage tolerance band for a specified period that the Generator Operator uses to establish a generator bus voltage set point.
- A voltage band for a specified period.

~~E.A.15.~~**E.A.14** Each Transmission Operator shall provide one of the following voltage schedule reference points for each generation resource in its Area to the Generator Operator. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same-day Operations~~]~~:]*

- The generator terminals.
- The high side of the generator step-up transformer.
- The point of interconnection.
- A location designated by mutual agreement between the Transmission Operator and Generator Operator.

~~E.A.16.~~**E.A.15** Each Generator Operator shall convert each voltage schedule specified in Requirement E.A.13 into the voltage set point for the generator excitation system. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same-day Operations]*

~~E.A.18.~~**E.A.16** Each Generator Operator shall provide its voltage set point conversion methodology from the point in Requirement E.A.14 to the generator terminals within

30 calendar days of request by its Transmission Operator. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

~~E.A.20.~~**E.A.17** Each Transmission Operator shall provide to the Generator Operator, within 30 calendar days of a request for data by the Generator Operator, its transmission equipment data and operating data that supports development of the voltage set point conversion methodology. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

~~E.A.22.~~**E.A.18** Each Generator Operator shall meet the following control loop specifications if the Generator Operator uses control loops external to the Automatic Voltage Regulators (AVR) to manage MVar loading: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

~~E.A.18.2.~~**E.A.18.1.** Each control loop's design incorporates the AVR's automatic voltage controlled response to voltage deviations during System Disturbances.

~~E.A.18.3.~~**E.A.18.2.** Each control loop is only used by mutual agreement between the Generator Operator and the Transmission Operator affected by the control loop.

Measures2

~~M.E.A.13.~~ **M.E.A.13** Each Transmission Operator shall have and provide upon request, evidence that it provided the voltage schedules to the Generator Operator. Dated spreadsheets, reports, voice recordings, or other documentation containing the voltage schedule including set points, tolerance bands, and specified periods as required in Requirement E.A.13 are acceptable as evidence.

~~M.E.A.14.~~ **M.E.A.14** The Transmission Operator shall have and provide upon request, evidence that it provided one of the voltage schedule reference points in Requirement E.A.14 for each generation resource in its Area to the Generator Operator. Dated letters, e-mail, or other documentation that contains notification to the Generator Operator of the voltage schedule reference point for each generation resource are acceptable as evidence.

~~M.E.A.15.~~ **M.E.A.15** Each Generator Operator shall have and provide upon request, evidence that it converted a voltage schedule as described in Requirement E.A.13 into a

[2] The number for each measure corresponds with the number for each requirement, i.e. M.E.A.13 means the measure for Requirement E.A.13.

voltage set point for the AVR. Dated spreadsheets, logs, reports, or other documentation are acceptable as evidence.

~~M.E.A.16.~~ **M.E.A.16** The Generator Operator shall have and provide upon request, evidence that within 30 calendar days of request by its Transmission Operator it provided its voltage set point conversion methodology from the point in Requirement E.A.14 to the generator terminals. Dated reports, spreadsheets, or other documentation are acceptable as evidence.

~~M.E.A.17.~~ **M.E.A.17** The Transmission Operator shall have and provide upon request, evidence that within 30 calendar days of request by its Generator Operator it provided data to support development of the voltage set point conversion methodology. Dated reports, spreadsheets, or other documentation are acceptable as evidence.

~~M.E.A.18.~~ **M.E.A.18** If the Generator Operator uses outside control loops to manage MVar loading, the Generator Operator shall have and provide upon request, evidence that it met the control loop specifications in sub-parts E.A.18.1 through E.A.18.2. Design specifications with identified agreed-upon control loops, system reports, or other dated documentation are acceptable as evidence.

Violation Severity Levels

E #	Lower VSL	Moderate VSL	High VSL	Severe VSL
E.A.13	For the specified period, the Transmission Operator did not issue one of the voltage schedules listed in E.A.13 to at least one generation resource but less than or equal to 5% of the generation resources that are on-line and part of the BES in the Transmission Operator Area.	For the specified period, the Transmission Operator did not issue one of the voltage schedules listed in E.A.13 to more than 5% but less than or equal to 10% of the generation resources that are on-line and part of the BES in the Transmission Operator Area.	For the specified period, the Transmission Operator did not issue one of the voltage schedules listed in E.A.13 to more than 10% but less than or equal to 15% of the generation resources that are on-line and part of the BES in the Transmission Operator Area.	For the specified period, the Transmission Operator did not issue one of the voltage schedules listed in E.A.13 to more than 15% of the generation resources that are on-line and part of the BES in the Transmission Operator Area.

Guidelines and Technical Basis

For technical basis for each requirement, please review the rationale provided for each requirement.

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for R1:

Paragraph 1868 of Order No. 693 requires NERC to add more "detailed and definitive requirements on “established limits” and “sufficient reactive resources”, and identify acceptable margins (i.e. voltage and/or reactive power margins)." Since Order No. 693 was issued, however, several FAC and TOP standards have become enforceable to add more requirements around voltage limits. More specifically, FAC-011 and FAC-014 require that System Operating Limits (SOLs) and reliability margins are established. The NERC Glossary definition of SOLs includes both: 1) Voltage Stability Ratings (Applicable pre- and post-Contingency Voltage Stability) and 2) System Voltage Limits (Applicable pre- and post-Contingency Voltage Limits). Therefore, for reliability reasons Requirement R1 now requires a Transmission Operator (TOP) to set voltage or Reactive Power schedules with associated tolerance bands. Further, since neighboring areas can affect each other greatly, each TOP must also provide a copy of these schedules to its Reliability Coordinator (RC) and adjacent TOP upon request.

Rationale for R2:

Paragraph 1875 from Order No. 693 directed NERC to include requirements to run voltage stability analysis periodically, using online techniques where commercially available and offline tools when online tools are not available. This standard does not explicitly require the periodic voltage stability analysis because such analysis would be performed pursuant to the SOL methodology developed under the FAC standards. TOP standards also require the TOP to operate within SOLs and Interconnection Reliability Operating Limits (IROL). The VAR standard drafting team (SDT) and industry participants also concluded that the best models and tools are the ones that have been proven and the standard should not add a requirement for a responsible entity to purchase new online simulations tools. Thus, the VAR SDT simplified the requirements to ensuring sufficient reactive resources are online or scheduled. Controllable load is specifically included to answer FERC's directive in Order No. 693 at Paragraph 1879.

Rationale for R3:

Similar to Requirement R2, the VAR SDT determined that for reliability purposes, the TOP must ensure sufficient voltage support is provided in Real-time in order to operate within an SOL.

Rationale for R4:

The VAR SDT received significant feedback on instances when a TOP would need the flexibility for defining exemptions for generators. These exemptions can be tailored as the TOP deems necessary for the specific area's needs. The goal of this requirement is to provide a TOP the ability to exempt a Generator Operator (GOP) from: 1) a voltage or Reactive Power schedule, 2) a setting on the AVR, or 3) any VAR-002 notifications based on the TOP's criteria. Feedback from the industry detailed many system events that would require these types of exemptions which included, but are not limited to: 1) maintenance during shoulder months, 2) scenarios where two units are located within close proximity and both cannot be in voltage control mode, and 3) large system voltage swings where it would harm reliability if all GOP were to notify their respective TOP of deviations at one time. Also, in an effort to improve the requirement, the sub-requirements containing an exemption list were removed from the currently enforceable standard because this created more compliance issues with regard to how often the list would be updated and maintained.

Rationale for R5:

The new requirement provides transparency regarding the criteria used by the TOP to establish the voltage schedule. This requirement also provides a vehicle for the TOP to use appropriate granularity when setting notification requirements for deviation from the voltage or Reactive Power schedule. Additionally, this requirement provides clarity regarding a "tolerance band" as specified in the voltage schedule and the control dead-band in the generator's excitation system.

Voltage Schedule tolerances are the bandwidth that accompanies the voltage target in a voltage schedule, should reflect the anticipated fluctuation in voltage at the Generation Operator's facility during normal operations, and be based on the TOP's assessment of N-1 and credible N-2 system contingencies. The voltage schedule's bandwidth should not be confused with the control dead-band that is programmed into a Generation Operator's automatic voltage regulator's control system, which should be adjusting the AVR prior to reaching either end of the voltage schedule's bandwidth.

Rationale for R6:

Although tap settings are first established prior to interconnection, this requirement could not be deleted because no other standard addresses when a tap setting must be adjusted. If the tap setting is not properly set, then the amount of VARs produced by a unit can be affected.

Exhibit A-2

Proposed Reliability Standard VAR-002-3

A. Introduction

1. **Title:** **Generator Operation for Maintaining Network Voltage Schedules**

2. **Number:** VAR-002-3

3. **Purpose:** To ensure generators provide reactive support and voltage control, within generating Facility capabilities, in order to protect equipment and maintain reliable operation of the Interconnection.

4. **Applicability:**

   4.1. Generator Operator

   4.2. Generator Owner

5. **Effective Dates**

   The standard shall become effective on the first day of the first calendar quarter after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, VAR-002-3 shall become effective on the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

B. Requirements and Measures

R1. The Generator Operator shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) in service and controlling voltage) or in a different control mode as instructed by the Transmission Operator unless: 1) the generator is exempted by the Transmission Operator, or 2) the Generator Operator has notified the Transmission Operator of one of the following: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

- That the generator is being operated in start-up,[1] shutdown,[2] or testing mode pursuant to a Real-time communication or a procedure that was previously provided to the Transmission Operator; or
- That the generator is not being operated in automatic voltage control mode or in the control mode that was instructed by the Transmission Operator for a reason other than start-up, shutdown, or testing.

M1. The Generator Operator shall have evidence to show that it notified its associated Transmission Operator any time it failed to operate a generator in the automatic voltage control mode or in a different control mode as specified in Requirement R1. If a generator is being started up or shut down with the automatic voltage control off, or is being tested, and no notification of the AVR status is made to the Transmission Operator, the Generator Operator will have evidence that it notified the Transmission Operator of its procedure for placing the unit into automatic voltage control mode as required in Requirement R1. Such evidence may include, but is not limited to, dated evidence of transmittal of the procedure such as an electronic message or a transmittal letter with the procedure included or attached. If a generator is exempted, the Generator Operator shall also have evidence that the generator is exempted from being in automatic voltage control mode (with its AVR in service and controlling voltage).

R2. Unless exempted by the Transmission Operator, each Generator Operator shall maintain the generator voltage or Reactive Power schedule[3] (within each generating Facility's capabilities[4]) provided by the Transmission Operator, or otherwise shall meet the conditions of notification for deviations from the voltage or Reactive Power schedule provided by the Transmission Operator. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

2.1. When a generator's AVR is out of service or the generator does not have an AVR, the Generator Operator shall use an alternative method to control the generator reactive

[1] Start-up is deemed to have ended when the generator is ramped up to its minimum continuously sustainable load and the generator is prepared for continuous operation.

[2] Shutdown is deemed to begin when the generator is ramped down to its minimum continuously sustainable load and the generator is prepared to go offline.

[3] The voltage or Reactive Power schedule is a target value with a tolerance band or a voltage or Reactive Power range communicated by the Transmission Operator to the Generator Operator.

[4] Generating Facility capability may be established by test or other means, and may not be sufficient at times to pull the system voltage within the schedule tolerance band. Also, when a generator is operating in manual control, reactive power capability may change based on stability considerations.

output to meet the voltage or Reactive Power schedule provided by the Transmission Operator.

2.2. When instructed to modify voltage, the Generator Operator shall comply or provide an explanation of why the schedule cannot be met.

2.3. Generator Operators that do not monitor the voltage at the location specified in their voltage schedule shall have a methodology for converting the scheduled voltage specified by the Transmission Operator to the voltage point being monitored by the Generator Operator.

M2. In order to identify when a generator is deviating from its schedule, the Generator Operator will monitor voltage based on existing equipment at its Facility. The Generator Operator shall have evidence to show that the generator maintained the voltage or Reactive Power schedule provided by the Transmission Operator, or shall have evidence of meeting the conditions of notification for deviations from the voltage or Reactive Power schedule provided by the Transmission Operator. Evidence may include, but is not limited to, operator logs, SCADA data, phone logs, and any other notifications that would alert the Transmission Operator or otherwise demonstrate that the Generator Operator complied with the Transmission Operator's instructions for addressing deviations from the voltage or Reactive Power schedule.

For Part 2.1, when a generator's AVR is out of service or the generator does not have an AVR, a Generator Operator shall have evidence to show an alternative method was used to control the generator reactive output to meet the voltage or Reactive Power schedule provided by the Transmission Operator.

For Part 2.2, the Generator Operator shall have evidence that it complied with the Transmission Operator's instructions to modify its voltage or provided an explanation to the Transmission Operator of why the Generator Operator was unable to comply with the instruction. Evidence may include, but is not limited to, operator logs, SCADA data, and phone logs.

For Part 2.3, for Generator Operators that do not monitor the voltage at the location specified on the voltage schedule, the Generator Operator shall demonstrate the methodology for converting the scheduled voltage specified by the Transmission Operator to the voltage point being monitored by the Generator Operator.

R3. Each Generator Operator shall notify its associated Transmission Operator of a status change on the AVR, power system stabilizer, or alternative voltage controlling device within 30 minutes of the change. If the status has been restored within 30 minutes of such change, then the Generator Operator is not required to notify the Transmission Operator of the status change *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

M3. The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of any status change identified in Requirement R3. If the status has been restored within the first 30 minutes, no notification is necessary.

R4. Each Generator Operator shall notify its associated Transmission Operator within 30 minutes of becoming aware of a change in reactive capability due to factors other than a status change described in Requirement R3. If the capability has been restored within 30 minutes of the

Generator Operator becoming aware of such change, then the Generator Operator is not required to notify the Transmission Operator of the change in reactive capability. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

M4. The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of becoming aware of a change in reactive capability in accordance with Requirement R4. If the capability has been restored within the first 30 minutes, no notification is necessary.

R5. The Generator Owner shall provide the following to its associated Transmission Operator and Transmission Planner within 30 calendar days of a request. *[Violation Risk Factor: Lower] [Time Horizon: Real-time Operations]*

5.1. For generator step-up transformers and auxiliary transformers with primary voltages equal to or greater than the generator terminal voltage:

5.1.1. Tap settings.

5.1.2. Available fixed tap ranges.

5.1.3. Impedance data.

M5. The Generator Owner shall have evidence it provided its associated Transmission Operator and Transmission Planner with information on its step-up transformers and auxiliary transformers as required in Requirement R5, Part 5.1.1 through Part 5.1.3 within 30 calendar days.

R6. After consultation with the Transmission Operator regarding necessary step-up transformer tap changes, the Generator Owner shall ensure that transformer tap positions are changed according to the specifications provided by the Transmission Operator, unless such action would violate safety, an equipment rating, a regulatory requirement, or a statutory requirement. *[Violation Risk Factor: Lower] [Time Horizon: Real-time Operations]*

6.1. If the Generator Owner cannot comply with the Transmission Operator's specifications, the Generator Owner shall notify the Transmission Operator and shall provide the technical justification.

M6. The Generator Owner shall have evidence that its step-up transformer taps were modified per the Transmission Operator's documentation in accordance with Requirement R6. The Generator Owner shall have evidence that it notified its associated Transmission Operator when it could not comply with the Transmission Operator's step-up transformer tap specifications in accordance with Requirement R6, Part 6.1.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" refers to NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner shall keep its latest version of documentation on its step-up and auxiliary transformers. The Generator Operator shall maintain all other evidence for the current and previous calendar year.

The Compliance Monitor shall retain any audit data for three years.

1.3. Compliance Monitoring and Assessment Processes:

"Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.4. Additional Compliance Information:

None.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Real-time Operations**	**Medium**	N/A	N/A	N/A	Unless exempted, the Generator Operator did not operate each generator connected to the interconnected transmission system in the automatic voltage control mode or in a different control mode as instructed by the Transmission Operator, and failed to provide the required notifications to Transmission Operator as identified in Requirement R1.
R2	**Real-time Operations**	**Medium**	N/A	N/A	The Generator Operator did not have a conversion methodology when it monitors voltage at a location different from the schedule provided by the Transmission Operator.	The Generator Operator did not maintain the voltage or Reactive Power schedule as instructed by the Transmission Operator and did not make the necessary notifications required by the Transmission Operator. OR The Generator Operator did not have an operating AVR, and the responsible entity did not use an alternative method for controlling voltage. OR The Generator Operator did not modify voltage when directed, and the responsible entity did not provide any

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						explanation.
R3	**Real-time Operations**	**Medium**	N/A	N/A	N/A	The Generator Operator did not make the required notification within 30 minutes of the status change.
R4	**Real-time Operations**	**Medium**	N/A	N/A	N/A	The Generator Operator did not make the required notification within 30 minutes of becoming aware of the capability change.
R5	**Real-time Operations**	**Lower**	N/A	N/A	The Generator Owner failed to provide its associated Transmission Operator and Transmission Planner one of the types of data specified in Requirement R5 Parts 5.1.1, 5.1.2, and 5.1.3.	The Generator Owner failed to provide to its associated Transmission Operator and Transmission Planner two or more of the types of data specified in Requirement R5 Parts 5.1.1, 5.1.2, and 5.1.3.
R6	**Real-time Operations**	**Lower**	N/A	N/A	N/A	The Generator Owner did not ensure the tap changes were made according the Transmission Operator's specifications. OR

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						The Generator Owner failed to perform the tap changes, and the Generator Owner did not provide technical justification for why it could not comply with the Transmission Operator specifications.

1.1a	10/29/2008	BOT adopted errata changes; updated version number to "1.1a"	Errata
1.1b	3/3/2009	Added Appendix 2 – Interpretation of VAR-002-1.1a approved by BOT on February 10, 2009	Revised
2b	8/16/2012	Revised R1 to address an Interpretation Request. Also added previously approved VRFs, Time Horizons and VSLs. Revised R2 to address consistency issue with VAR-001-2, R4. FERC Order issued approving VAR-002-2b. Adopted by Board of Trustees.	Revised
2b	4/16/2013	FERC Order issued approving VAR-002-2b	
3	5/7/2014	Adopted by the NERC Board of Trustees	

Guidelines and Technical Basis

For technical basis for each requirement, please review the rationale provided for each requirement.

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for R1:

This requirement has been maintained due to the importance of running a unit with its automatic voltage regulator (AVR) in service and in either voltage controlling mode or the mode instructed by the TOP. However, the requirement has been modified to allow for testing, and the measure has been updated to include some of the evidence that can be used for compliance purposes.

Rationale for R2:

Requirement R2 details how a Generator Operator (GOP) operates its generator(s) to provide voltage support and when the GOP is expected to notify the Transmission Operator (TOP). In an effort to remove prescriptive notification requirements for the entire continent, the VAR-002-3 standard drafting team (SDT) opted to allow each TOP to determine the notification requirements for each of its respective GOPs based on system requirements. Additionally, a new Part 2.3 has been added to detail that each GOP may monitor voltage by using its existing facility equipment.

Conversion Methodology: There are many ways to convert the voltage schedule from one voltage level to another. Some entities may choose to develop voltage regulation curves for their transformers; others may choose to do a straight ratio conversion; others may choose an entirely different methodology. All of these methods have technical challenges, but the studies performed by the TOP, which consider N-1 and credible N-2 contingencies, should compensate for the error introduced by these methodologies, and the TOP possesses the authority to direct the GOP to modify its output if its performance is not satisfactory. During a significant system event, such as a voltage collapse, even a generation unit in automatic voltage control that controls based on the low-side of the generator step-up transformer should see the event on the low-side of the generator step-up transformer and respond accordingly.

Voltage Schedule Tolerances: The bandwidth that accompanies the voltage target in a voltage schedule should reflect the anticipated fluctuation in voltage at the GOP's Facility during normal operations and be based on the TOP's assessment of N-1 and credible N-2 system contingencies. The voltage schedule's bandwidth should not be confused with the control dead-band that is programmed into a GOP's AVR control system, which should be adjusting the AVR prior to reaching either end of the voltage schedule's bandwidth.

Rationale for R3:

This requirement has been modified to limit the notifications required when an AVR goes out of service and quickly comes back in service. Notifications of this type of status change provide little to no benefit to reliability. Thirty (30) minutes have been built into the requirement to allow a GOP time to resolve an issue before having to notify the TOP of a status change. The requirement has also been amended to remove the sub-requirement to provide an estimate for the expected duration of the status change.

Rationale for R4:

This requirement has been bifurcated from the prior version VAR-002-2b Requirement R3. This requirement allows GOPs to report reactive capability changes after they are made aware of the change. The current standard requires notification as soon as the change occurs, but many GOPs are not aware of a reactive capability change until it has taken place.

Rationale for R5:

This requirement and corresponding measure have been maintained due to the importance of having accurate tap settings. If the tap setting is not properly set, then the VARs available from that unit can be affected. The prior version of VAR-002-2b, Requirement R4.1.4 (the +/- voltage range with step-change in % for load-tap changing transformers) has been removed. The percentage information was not needed because the tap settings, ranges and impedance are required. Those inputs can be used to calculate the step-change percentage if needed.

Rationale for R6:

This requirement and corresponding measure have been maintained due to the importance of having accurate tap settings. If the tap setting is not properly set, then the VARs available from that unit can be affected.

A. Introduction

1. **Title:** **Generator Operation for Maintaining Network Voltage Schedules**~~—~~

2. **Number:** VAR-002-~~2b~~3

3. **Purpose:** ~~—~~ To ensure generators provide reactive support and voltage control ~~necessary to ensure voltage levels, reactive flows, and reactive resources are maintained,~~ within ~~applicable~~generating Facility ~~Ratings~~capabilities, in order to protect equipment and ~~the~~maintain reliable operation of the Interconnection.

4. **Applicability:**

   4.1. Generator Operator~~.~~

   4.2. Generator Owner~~.~~

5. **Effective ~~Date:~~ ~~In those jurisdictions where regulatory approval is required, this~~Dates**

   ~~5.~~The standard shall become effective on the first day of the first calendar quarter after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable ~~regulatory~~governmental authority is required for a standard to go into effect. Where approval ~~or as otherwise made effective pursuant to the laws~~by an applicable ~~to such ERO~~ governmental ~~authorities. In those jurisdictions where no regulatory approval~~authority is not required, ~~this standard~~ VAR-002-3 shall become effective on the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees ~~approval~~or as otherwise provided for in that jurisdiction.

B. Requirements and Measures

R1. The Generator Operator shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) in service and controlling voltage) or in a different control mode as instructed by the Transmission Operator unless: 1) the generator is exempted by the Transmission Operator, or 2) the Generator Operator has notified the Transmission Operator of one of the following: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

- That the generator is being operated in start-up,[1] ~~or~~ shutdown,[2] or testing mode pursuant to a Real-time communication or a procedure that was previously provided to the Transmission Operator; or
- That the generator is not being operated in ~~the~~ automatic voltage control mode or in the control mode that was instructed by the Transmission Operator for a reason other than start-up ~~or~~, shutdown, or testing.

M1. The Generator Operator shall have evidence to show that it notified its associated Transmission Operator any time it failed to operate a generator in the automatic voltage control mode or in a different control mode as specified in Requirement R1. If a generator is being started up or shut down with the automatic voltage control off, or is being tested, and no notification of the AVR status is made to the Transmission Operator, the Generator Operator will have evidence that it notified the Transmission Operator of its procedure for placing the unit into automatic voltage control mode as required in Requirement R1. Such evidence may include, but is not limited to, dated evidence of transmittal of the procedure such as an electronic message or a transmittal letter with the procedure included or attached. If a generator is exempted, the Generator Operator shall also have evidence that the generator is exempted from being in automatic voltage control mode (with its AVR in service and controlling voltage).

R2. Unless exempted by the Transmission Operator, each Generator Operator shall maintain the generator voltage or Reactive Power schedule[3] (within ~~applicable Facility Ratings[4]) as directed by the Transmission Operator.~~each generating Facility's capabilities[5]) provided by the Transmission Operator, or otherwise shall meet the conditions of notification for deviations from the voltage or

[1] Start-up is deemed to have ended when the generator is ramped up to its minimum continuously sustainable load and the generator is prepared for continuous operation.

[2] Shutdown is deemed to begin when the generator is ramped down to its minimum continuously sustainable load and the generator is prepared to go offline.

[3] The voltage or Reactive Power schedule is a target value with a tolerance band or a voltage or Reactive Power range communicated by the Transmission Operator to the Generator Operator ~~establishing a tolerance band within which the target value is to be maintained during a specified period~~.

[4] ~~When a Generator is operating in manual control, reactive power capability may change based on stability considerations and this may lead to a change in the associated Facility Ratings.~~

[5] Generating Facility capability may be established by test or other means, and may not be sufficient at times to pull the system voltage within the schedule tolerance band. Also, when a generator is operating in manual control, reactive power capability may change based on stability considerations.

Reactive Power schedule provided by the Transmission Operator. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

~~R2.1.~~2.1. When a generator's ~~automatic voltage regulator~~AVR is out of service or the generator does not have an AVR, the Generator Operator shall use an alternative method to control the generator ~~voltage and~~ reactive output to meet the voltage or Reactive Power schedule ~~directed~~provided by the Transmission Operator.

~~R2.2.~~2.2. When ~~directed~~instructed to modify voltage, the Generator Operator shall comply or provide an explanation of why the schedule cannot be met.

2.3. Generator Operators that do not monitor the voltage at the location specified in their voltage schedule shall have a methodology for converting the scheduled voltage specified by the Transmission Operator to the voltage point being monitored by the Generator Operator.

M2. In order to identify when a generator is deviating from its schedule, the Generator Operator will monitor voltage based on existing equipment at its Facility. The Generator Operator shall have evidence to show that the generator maintained the voltage or Reactive Power schedule provided by the Transmission Operator, or shall have evidence of meeting the conditions of notification for deviations from the voltage or Reactive Power schedule provided by the Transmission Operator. Evidence may include, but is not limited to, operator logs, SCADA data, phone logs, and any other notifications that would alert the Transmission Operator or otherwise demonstrate that the Generator Operator complied with the Transmission Operator's instructions for addressing deviations from the voltage or Reactive Power schedule.

For Part 2.1, when a generator's AVR is out of service or the generator does not have an AVR, a Generator Operator shall have evidence to show an alternative method was used to control the generator reactive output to meet the voltage or Reactive Power schedule provided by the Transmission Operator.

For Part 2.2, the Generator Operator shall have evidence that it complied with the Transmission Operator's instructions to modify its voltage or provided an explanation to the Transmission Operator of why the Generator Operator was unable to comply with the instruction. Evidence may include, but is not limited to, operator logs, SCADA data, and phone logs.

For Part 2.3, for Generator Operators that do not monitor the voltage at the location specified on the voltage schedule, the Generator Operator shall demonstrate the methodology for converting the scheduled voltage specified by the Transmission Operator to the voltage point being monitored by the Generator Operator.

R3. Each Generator Operator shall notify its associated Transmission Operator ~~as soon as practical, but~~ of a status change on the AVR, power system stabilizer, or alternative voltage controlling device within 30 minutes of ~~any of the following:~~ the change. If the status has been restored within 30 minutes of such change, then the Generator Operator is not required to notify the Transmission Operator of the status change *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

~~**3.1.** A status or capability change on any generator Reactive Power resource, including the status of each automatic voltage regulator and power system stabilizer and the expected duration of the change in status or capability.~~

~~**3.2.** A status or capability change on any other Reactive Power resources under the Generator Operator's control and the expected duration of the change in status or capability.~~

M3. The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of any status change identified in Requirement R3. If the status has been restored within the first 30 minutes, no notification is necessary.

R4. Each Generator Operator shall notify its associated Transmission Operator within 30 minutes of becoming aware of a change in reactive capability due to factors other than a status change described in Requirement R3. If the capability has been restored within 30 minutes of the Generator Operator becoming aware of such change, then the Generator Operator is not required to notify the Transmission Operator of the change in reactive capability. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

M4. The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of becoming aware of a change in reactive capability in accordance with Requirement R4. If the capability has been restored within the first 30 minutes, no notification is necessary.

~~**R4.**~~**R5.** The Generator Owner shall provide the following to its associated Transmission Operator and Transmission Planner within 30 calendar days of a request. *[Violation Risk Factor: Lower] [Time Horizon: Real-time Operations]*

~~**R4.1.**~~**5.1.** For generator step-up transformers and auxiliary transformers with primary voltages equal to or greater than the generator terminal voltage:

~~**R4.1.1.**~~**5.1.1.** Tap settings.

~~**R4.1.2.**~~**5.1.2.** Available fixed tap ranges.

~~**R4.1.3.**~~**5.1.3.** Impedance data.

~~**4.1.4.** The +/- voltage range with step-change in % for load-tap changing transformers.~~

M5. The Generator Owner shall have evidence it provided its associated Transmission Operator and Transmission Planner with information on its step-up transformers and auxiliary transformers as required in Requirement R5, Part 5.1.1 through Part 5.1.3 within 30 calendar days.

~~**R5.**~~**R6.** After consultation with the Transmission Operator regarding necessary step-up transformer tap changes, the Generator Owner shall ensure that transformer tap positions are changed according to the specifications provided by the Transmission Operator, unless such action would violate safety, an equipment rating, a regulatory requirement, or a statutory requirement. *[Violation Risk Factor: ~~Medium~~Lower] [Time Horizon: Real-time Operations]*

~~**R5.1.**~~**6.1.** If the Generator ~~Operator can't~~Owner cannot comply with the Transmission Operator's specifications, the Generator ~~Operator~~Owner shall notify the Transmission Operator and shall provide the technical justification.

~~C. Measures~~

~~**M1.** The Generator Operator shall have evidence to show that it notified its associated Transmission Operator any time it failed to operate a generator in the automatic voltage control mode as specified in Requirement 1. If a generator is being started up or shut down with the automatic voltage control off and no notification of the automatic voltage regulator status is made to the Transmission Operator, the Generator Operator will have evidence that it notified the Transmission Operator of its procedure for placing the unit into automatic voltage control mode. Such evidence must include, but is not limited to, dated evidence of transmittal of the procedure such as an electronic message or a transmittal letter with the procedure included or attached.~~

~~**M2.** The Generator Operator shall have evidence to show that it controlled its generator voltage and reactive output to meet the voltage or Reactive Power schedule provided by its associated Transmission Operator as specified in Requirement 2.~~

~~**M3.** The Generator Operator shall have evidence to show that it responded to the Transmission Operator's direction as identified in Requirement 2.1 and Requirement 2.2.~~

~~**M4.** The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of any of the changes identified in Requirement 3.~~

~~**M5.** The Generator Owner shall have evidence it provided its associated Transmission Operator and Transmission Planner with information on its step-up transformers and auxiliary transformers as required in Requirements 4.1.1 through 4.1.4~~

M6. The Generator Owner shall have evidence that its step-up transformer taps were modified per the Transmission Operator's documentation ~~as identified in Requirement 5.~~in accordance with Requirement R6. The Generator Owner shall have evidence that it notified its associated Transmission Operator when it could not comply with the Transmission Operator's step-up transformer tap specifications in accordance with Requirement R6, Part 6.1.

~~**M7.** The Generator Operator shall have evidence that it notified its associated Transmission Operator when it couldn't comply with the Transmission Operator's step-up transformer tap specifications as identified in Requirement 5.1.~~

D.C. Compliance

1. **Compliance Monitoring Process:**

1.1. Compliance Monitoring Responsibility

1.1. For entities that do not work for the Regional Entity, the Regional Entity shall serve as the **Compliance Enforcement Authority.:**

For functional entities that work for their Regional Entity, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" refers to NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. DataEvidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Operator shall maintain evidence needed for Measure 1 through Measure 4 and Measure 7 for the current and previous calendar year.

The Generator Owner shall keep its latest version of documentation on its step-up and auxiliary transformers. (Measures 5 and 6) The Generator Operator shall maintain all other evidence for the current and previous calendar year.

The Compliance Monitor shall retain any audit data for three years.

1.3. Compliance Monitoring and EnforcementAssessment Processes:

The following processes may be used:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

"Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.4. Additional Compliance Information:

None.

Appendix 1

Interpretation of Requirements R1 and R2

Request:

Requirement R1 of Standard VAR-002-1 states that Generation Operators shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (***automatic voltage regulator in service and controlling voltage***) unless the Generator Operator has notified the Transmission Operator.

Requirement R2 goes on to state that each Generation Operator shall maintain the generator voltage ***or Reactive Power output*** as directed by the Transmission Operator.

The two underlined phrases are the reasons for this interpretation request.

Most generation excitation controls include a device known as the Automatic Voltage Regulator, or AVR. This is the device which is referred to by the R1 requirement above. Most AVR's have the option of being set in various operating modes, such as constant voltage, constant power factor, and constant Mvar.

In the course of helping members of the WECC insure that they are in full compliance with NERC Reliability Standards, I have discovered both Transmission Operators and Generation Operators who have interpreted this standard to mean that AVR operation in the constant power factor or constant Mvar modes complies with the R1 and R2 requirements cited above. Their rational is as follows:

- The AVR is clearly in service because it is operating in one of its operating modes
- The AVR is clearly controlling voltage because to maintain constant PF or constant Mvar, it controls the generator terminal voltage
- R2 clearly gives the Transmission Operator the option of directing the Generation Operator to maintain a constant reactive power output rather than a constant voltage.

Other parties have interpreted this standard to require operation in the constant voltage mode only. Their rational stems from the belief that the purpose of the VAR-002-1 standard is to insure the automatic delivery of additional reactive to the system whenever a voltage decline begins to occur.

The material impact of misinterpretation of these standards is twofold.

- First, misinterpretation may result in reduced reactive response during system disturbances, which in turn may contribute to voltage collapse.
- Second, misinterpretation may result in substantial financial penalties imposed on generation operators and transmission operators who believe that they are in full compliance with the standard.

In accordance with the NERC Reliability Standards Development Procedure, I am requesting that a formal interpretation of the VAR-002-1 standard be provided. Two specific questions need to be answered.

- First, does AVR operation in the constant PF or constant Mvar modes comply with R1?

- ~~Second, does R2 give the Transmission Operator the option of directing the Generation Owner to operate the AVR in the constant Pf or constant Mvar modes rather than the constant voltage mode?~~

~~Interpretation:~~

1. ~~First, does AVR operation in the constant PF or constant Mvar modes comply with R1?~~

   ~~Interpretation~~: ~~No, only operation in constant voltage mode meets this requirement. This answer is predicated on the assumption that the generator has the physical equipment that will allow such operation and that the Transmission Operator has not directed the generator to run in a mode other than constant voltage.~~

2. ~~Second, does R2 give the Transmission Operator the option of directing the Generation Owner (sic) to operate the AVR in the constant Pf or constant Mvar modes rather than the constant voltage mode?~~

   ~~Interpretation~~: ~~Yes, if the Transmission Operator specifically directs a Generator Operator to operate the AVR in a mode other than constant voltage mode, then that directed mode of AVR operation is allowed.~~

Appendix 2

Interpretation of VAR-002-1a

Request:

VAR-002 — Generator Operation for Maintaining Network Voltage Schedules, addresses the generator's provision of voltage and VAR control. Confusion exists in the industry and regions as to which requirements in this standard apply to Generator Operators that operate generators that do not have automatic voltage regulation capability.

The Standard's requirements do not identify the subset of generator operators that need to comply – forcing some generator operators that do not have any automatic voltage regulation capability to demonstrate how they complied with the requirements, even when they aren't physically able to comply with the requirements. Generator owners want clarification to verify that they are not expected to acquire AVR devices to comply with the requirements in this standard.

Many generators do not have automatic voltage regulators and do not receive voltage schedules. These entities are at a loss as to how to comply with these requirements and are expending resources attempting to demonstrate compliance with these requirements. A clarification will avoid challenges and potential litigation stemming from sanctions and penalties applied to entities that are being audited for compliance with this standard, but who do not fall within the scope or intent of the standard itself.

Please identify which requirements apply to generators that do not operate generators equipped with AVRs.

Response: All the requirements and associated subrequirements in VAR-002-1a apply to Generator Owners and Generator Operators that own or operate generators whether equipped with an automatic voltage regulator or not. The standard is predicated on the assumption that the generator has the physical equipment (automatic voltage regulator) that is capable of automatic operation. A generator that is not equipped with an automatic voltage regulator results in a functionally equivalent condition to a generator equipped with an automatic voltage regulator that is out of service due to maintenance or failure.

There are no requirements in the standard that require a generator to have an automatic voltage regulator, nor are there any requirements for a Generator Owner to modify its generator to add an automatic voltage regulator. Unless exempted by the Transmission Operator, each Generator Operator shall maintain the generator voltage or Reactive Power output (within applicable Facility Ratings) as directed by the Transmission Operator.

Guidelines and Technical Basis

For technical basis for each requirement, please review the rationale provided for each requirement.

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for R1:

This requirement has been maintained due to the importance of running a unit with its automatic voltage regulator (AVR) in service and in either voltage controlling mode or the mode instructed by the TOP. However, the requirement has been modified to allow for testing, and the measure has been updated to include some of the evidence that can be used for compliance purposes.

Rationale for R2:

Requirement R2 details how a Generator Operator (GOP) operates its generator(s) to provide voltage support and when the GOP is expected to notify the Transmission Operator (TOP). In an effort to remove prescriptive notification requirements for the entire continent, the VAR-002-3 standard drafting team (SDT) opted to allow each TOP to determine the notification requirements for each of its respective GOPs based on system requirements. Additionally, a new Part 2.3 has been added to detail that each GOP may monitor voltage by using its existing facility equipment.

Conversion Methodology: There are many ways to convert the voltage schedule from one voltage level to another. Some entities may choose to develop voltage regulation curves for their transformers; others may choose to do a straight ratio conversion; others may choose an entirely different methodology. All of these methods have technical challenges, but the studies performed by the TOP, which consider N-1 and credible N-2 contingencies, should compensate for the error introduced by these methodologies, and the TOP possesses the authority to direct the GOP to modify its output if its performance is not satisfactory. During a significant system event, such as a voltage collapse, even a generation unit in automatic voltage control that controls based on the low-side of the generator step-up transformer should see the event on the low-side of the generator step-up transformer and respond accordingly.

Voltage Schedule Tolerances: The bandwidth that accompanies the voltage target in a voltage schedule should reflect the anticipated fluctuation in voltage at the GOP's Facility during normal operations and be based on the TOP's assessment of N-1 and credible N-2 system contingencies. The voltage schedule's bandwidth should not be confused with the control dead-band that is programmed into a GOP's AVR control system, which should be adjusting the AVR prior to reaching either end of the voltage schedule's bandwidth.

Rationale for R3:

This requirement has been modified to limit the notifications required when an AVR goes out of service and quickly comes back in service. Notifications of this type of status change provide little to no benefit to reliability. Thirty (30) minutes have been built into the requirement to allow a GOP time to resolve an issue before having to notify the TOP of a status change. The requirement has also been amended to remove the sub-requirement to provide an estimate for the expected duration of the status change.

Rationale for R4:

This requirement has been bifurcated from the prior version VAR-002-2b Requirement R3. This requirement allows GOPs to report reactive capability changes after they are made aware of the change. The current standard requires notification as soon as the change occurs, but many GOPs are not aware of a reactive capability change until it has taken place.

Rationale for R5:

This requirement and corresponding measure have been maintained due to the importance of having accurate tap settings. If the tap setting is not properly set, then the VARs available from that unit can be affected. The prior version of VAR-002-2b, Requirement R4.1.4 (the +/- voltage range with step-change in % for load-tap changing transformers) has been removed. The percentage information was not needed because the tap settings, ranges and impedance are required. Those inputs can be used to calculate the step-change percentage if needed.

Rationale for R6:

This requirement and corresponding measure have been maintained due to the importance of having accurate tap settings. If the tap setting is not properly set, then the VARs available from that unit can be affected.

N/A

Conforming Changes to Other Standards

None

Effective Dates

VAR-001-4 and VAR-002-3 – All requirements shall become effective on the first day of the first calendar quarter after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, VAR-001-4 and VAR-002-3 shall become effective on the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Justification

The currently effective VAR-002 standard is one of the most violated standards; however, the industry argues these violations do not address any reliability gaps. Instead, Generator Operators and Transmission Operators are required to handle many nuisance phone calls for slight deviations from a voltage schedule. The nuisance phone calls can be a distraction during a scheduled maintenance or a system event; thus, the industry would support making the changes as soon as possible. However, since VAR-001 now requires determining voltage and reactive power schedules with associated tolerance bands in addition to any notification requirements, the Transmission Operators need a quarter to prepare documentation. The VAR-002 standards cannot go into effect without the new TOP schedules and notification requirements. Also for Transmission Operators that do not already provide tolerance bands with voltage schedules, those Transmission Operators will need some time to adjust to providing new data (more specifically, the criteria for schedules) to Generator Operators.

Retirements

VAR-001-3 and VAR-002-2b will be retired at midnight of the day immediately prior to the Effective Date of VAR-001-4 and VAR-002-3 in the particular jurisdiction in which the new standards are becoming effective.

Exhibit C

Order No. 672 Criteria

In Order No. 672,[1] the Commission identified a number of criteria it will use to analyze Reliability Standards proposed for approval to ensure they are just, reasonable, not unduly discriminatory or preferential, and in the public interest. The discussion below identifies these factors and explains how proposed Reliability Standards VAR-001-4 and VAR-002-3 have met or exceeded the criteria:

1. Proposed Reliability Standards must be designed to achieve a specified reliability goal and must contain a technically sound means to achieve that goal.[2]

The proposed Reliability Standards achieve specific reliability goals. Proposed Reliability Standard VAR-001-4 (Voltage and Reactive Control) ensures that responsible entities monitor, control, and maintain voltage levels, reactive flows, and reactive resources in Real-time to protect equipment and maintain reliable operations. Proposed Reliability Standard VAR-002-3 (Generator Operation for Maintaining Network Voltage Schedules) ensures that responsible entities provide the reactive support and voltage control necessary to protect equipment and maintain reliable operations. Collectively, these proposed Reliability Standards are designed to prevent voltage instability and voltage collapse of the Bulk-Power System.

2. Proposed Reliability Standards must be applicable only to users, owners, and operators of the Bulk-Power System, and must be clear and unambiguous as to what is required and who is required to comply.[3]

Proposed Reliability Standard VAR-001-4 applies to Transmission Operators and, within the Western Interconnection, Generator Operators and is clear and unambiguous as to what is required and who is required to comply, in accordance with Order No. 672.

---

[1] *Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval, and Enforcement of Electric Reliability Standards*, Order No. 672, FERC Stats. & Regs ¶ 31,204, *order on reh'g*, Order No. 672-A, FERC Stats. & Regs ¶ 31,212 (2006).

[2] Order No. 672 at PP 321, 324.

[3] *Id.* at PP 322, 325.

Proposed Reliability Standard VAR-001-4 contains six requirements that clearly and unambiguously state to whom each requirement applies and establishes the applicable entities' compliance obligations.

Proposed Reliability Standard VAR-002-3 applies to Generator Operators and Generator Owners and is clear and unambiguous as to what is required and who is required to comply, in accordance with Order No. 672. Proposed Reliability Standard VAR-002-3 contains six requirements that clearly and unambiguously state to whom each requirement applies and establishes the applicable entities' compliance obligations.

3. A proposed Reliability Standard must include clear and understandable consequences and a range of penalties (monetary and/or non-monetary) for a violation.[4]

Proposed Reliability Standards VAR-001-4 and VAR-002-3 include Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) that comport with NERC and Commission guidelines. As explained further in Exhibit F, the severity level assigned to each requirement (for a violation of the requirement) contains a clear explanation of the basis for the assignment, which promotes uniformity and consistency in applying each requirement. The VSLs do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

Proposed Reliability Standards VAR-001-4 and VAR-002-3 also include clear and understandable consequences and a range of penalties (monetary and/or non-monetary) for a violation. Upon approval by the Commission, the ranges of penalties for violations will be based on the applicable VRF and VSL in accordance with the sanctions table and the supporting penalty determination process described in the Commission-approved NERC Sanction Guidelines, Appendix 4B to the NERC Rules of Procedure.

[4] *Id.* at P 326.

4. A proposed Reliability Standard must identify a clear and objective criterion or measure for compliance, so that it can be enforced in a consistent and non-preferential manner.[5]

The proposed Reliability Standards identify clear and objective criteria or measures for compliance, so that each Reliability Standard can be enforced in a consistent non-preferential manner. Specifically, each proposed Reliability Standard includes a clear statement of its purpose, the rationale behind each requirement, and a statement of the measures to be used in assessing compliance with each requirement. These provisions help provide clarity on how the requirements will be enforced, and ensure that the requirements will be assessed and enforced in a clear, consistent, and non-preferential manner, without prejudice to any party.

5. Proposed Reliability Standards should achieve a reliability goal effectively and efficiently – but do not necessarily have to reflect "best practices" without regard to implementation cost or historical regional infrastructure design.[6]

The proposed Reliability Standards achieve the reliability goals effectively and efficiently in accordance with Order No. 672. Collectively, the proposed Reliability Standards improve reliability by ensuring that the Bulk-Power System operates at acceptable voltage levels and that sufficient Reactive Power on the Bulk-Power System exists to provide the voltage support necessary to maintain voltage stability. Proposed Reliability Standard VAR-001-4 improves reliability by requiring set system voltage schedules and voltage coordination among responsible entities. Proposed Reliability Standard VAR-002-3 improves reliability by requiring reactive support and voltage control from responsible entities necessary to protect equipment and maintain reliable operations. In each case, the proposed Reliability Standard provides flexibility to the responsible

[5] *Id.* at P 327.

[6] *Id.* at P 328.

entities to determine how best to achieve compliance, thereby ensuring reliability without imposing unduly burdensome costs or requiring the adoption of "best practices."

6. Proposed Reliability Standards cannot be "lowest common denominator," *i.e.*, cannot reflect a compromise that does not adequately protect Bulk-Power System reliability. Proposed Reliability Standards can consider costs to implement for smaller entities, but not at consequences of less than excellence in operating system reliability.[7]

The proposed Reliability Standards do not reflect a "lowest common denominator" approach. To the contrary, proposed Reliability Standards VAR-001-4 and VAR-002-3 represent a significant improvement over the previous versions as described herein.

7. Proposed Reliability Standards must be designed to apply throughout North America to the maximum extent achievable with a single Reliability Standard while not favoring one geographic area or regional model. It should take into account regional variations in the organization and corporate structures of transmission owners and operators, variations in generation fuel type and ownership patterns, and regional variations in market design if these affect the proposed Reliability Standard.[8]

The proposed Reliability Standards apply throughout North America and do not favor one geographic area or regional model. The existing regional variance in VAR-001-3 applicable in the Western Interconnection will continue to be enforced in proposed VAR-001-4.

8. Proposed Reliability Standards should cause no undue negative effect on competition or restriction of the grid beyond any restriction necessary for reliability.[9]

The Proposed Reliability Standards do not cause undue negative effect on competition or restriction of the grid. Specifically, neither proposed Reliability Standard

[7] *Id.* at PP 329, 330.

[8] Order No. 672 at PP 331.

[9] *Id.* at P 332.

VAR-001-4 nor VAR-002-3 restricts the available transmission capability or limit use of the Bulk-Power System in a preferential manner.

9. The implementation time for the proposed Reliability Standard is reasonable.[10]

The implementation time and proposed effective dates for the proposed Reliability Standards are just and reasonable and appropriately balance the urgency in the need to implement the Reliability Standards against the reasonableness of the time allowed for those who must comply to develop necessary procedures, software, facilities, staffing, or other relevant capability. The proposed effective dates will allow applicable entities adequate time to ensure compliance with the requirements and are explained in the proposed Implementation Plan, attached as Exhibit B.

10. The Reliability Standard was developed in an open and fair manner and in accordance with the Commission-approved Reliability Standard development process.[11]

The proposed Reliability Standards were developed in accordance with NERC's Commission-approved, ANSI-accredited processes for developing and approving Reliability Standards. Exhibit F includes a summary of the Reliability Standards development proceedings, and details the processes followed to develop the proposed Standards.

These processes included, among other things, multiple comment periods, pre-ballot review periods, and balloting periods. Additionally, all drafting team meetings were properly noticed and open to the public. Ballot initiatives achieved a quorum and exceeded the required ballot pool approval levels.

[10] *Id.* at P 333.

[11] *Id.* at P 334.

11. NERC must explain any balancing of vital public interests in the development of proposed Reliability Standards.[12]

NERC has identified no competing vital public interests regarding the request for approval of proposed Reliability Standards VAR-001-4 and VAR-002-3. No comments were received indicating that the proposed Reliability Standards conflict with other vital public interests.

12. Proposed Reliability Standards must consider any other appropriate factors.[13]

No other negative factors relevant to whether the proposed Reliability Standards satisfy the Commission's criteria for approval were identified.

Exhibit D-1

Mapping Document for Proposed Reliability Standard VAR-001-4

Project 2013-04 Voltage & Reactive Control

Mapping Document - Transition of VAR-001-3 to VAR-001-4

Standard: VAR-001-4 – Voltage and Reactive Control		
Requirement in Approved Standard	**Transitions to the below Requirement in New Standard or Other Action**	**Description and Change Justification**
VAR-001-3, Requirement R1	VAR-001-4, Requirement R1	Elements of VAR-001-3, Requirement R1 were duplicated in other Reliability Standards. Specifically, currently enforceable Reliability Standard TOP-004-2 Requirements R1, R2, and R3 duplicate monitoring and controlling voltage requirements. To comply with the obligation to operate within the IROLs and SOLs, entities must monitor and control voltage. Further, the Transmission Operations group of Reliability Standards is currently in development but will continue to include requirements that Transmission Operators ("TOPs"): (1) plan to operate within IROLs and SOLs; and (2) operate within IROLs and SOLs. Requirement R1 has been modified to remove the duplication and require the Transmission Operator ("TOPs") to specify a system voltage and Reactive Power schedules. A new part 1.1 has been added to allow for voltage coordination with adjacent TOPs and applicable Reliability Coordinators ("RCs").
VAR-001-3, Requirement R2	VAR-001-4, Requirement R2	The new Requirement R2 consolidates and modifies Requirements R2 and R9 of VAR-001-3 to require that TOPs schedule sufficient reactive resources. New Requirement R2 also clarifies the language with respect to the manner in which Transmission Operators may schedule sufficient reactive resources.

Standard: VAR-001-4 – Voltage and Reactive Control		
Requirement in Approved Standard	**Transitions to the below Requirement in New Standard or Other Action**	**Description and Change Justification**
VAR-001-3, Requirement R3	VAR-001-4, Requirement R4	Requirement R4 carries forward the authority in currently enforceable Reliability Standard VAR-001-03, Requirement R3 for a TOP to exempt a Generator Operator ("GOP") from having to comply with all or some of its Reactive Power obligations. New Requirement R4, however, does not include a requirement for the TOP to maintain an exemption list. Instead, the standard focuses on the transparency of the exemption criteria and whether the TOP notifies the GOP if granted an exemption.
VAR-001-3, Requirement R4	VAR-001-4, Requirement R5	The new requirements have been updated to allow the TOP to provide the voltage or Reactive Power schedule at either the high side or the low side of the GSU. Also a tolerance band is now required under the new requirement. New parts have also been added to direct a GOP to operate in AVR, to require the TOP to provide notification requirements, and to provide the criteria for developing schedules and tolerance bands upon request.
VAR-001-3, Requirement R5	Deleted	The Federal Energy Regulatory Commission approved the retirement requirement as part of the Paragraph 81 project. *Electric Reliability Organization Proposal to Retire Requirements in Reliability Standards*, 145 FERC ¶ 61,147 at PP 25-26, Attachment A (2013).

Standard: VAR-001-4 – Voltage and Reactive Control		
Requirement in Approved Standard	**Transitions to the below Requirement in New Standard or Other Action**	**Description and Change Justification**
VAR-001-3, Requirement R6	Deleted	VAR-001-3, Requirement R6 was deleted because it was duplicative of existing TOP Reliability standards (i.e., TOP-006-2, Requirement R1), which require knowing the status of Reactive Power resources. The TOP standards currently in development would carry forward this obligation. Although power system stabilizers are not specifically named in the TOP standards, the areas that rely on PSS equipment will require monitoring the PSS status under the data specifications of the TOP standards.
VAR-001-3, Requirement R7	VAR-001-4, Requirement R3	VAR-001-4, Requirement R3 carries forward the obligation from VAR-001-3, Requirement R7
VAR-001-3, Requirement R8	VAR-001-4, Requirement R3	The standard drafting team concluded that there was no need to separately carry forward VAR-001-3, Requirement R8 because it was subsumed in proposed VAR-001-4, Requirement R3.
VAR-001-3, Requirement R9	VAR-001-4, Requirement R2	See comments for Requirement R2.
VAR-001-3, Requirement R10	Deleted	VAR-001-3, Requirement R10 was deleted because it was duplicative of existing TOP Reliability standards (i.e., TOP-004-2, Requirements R1 and R4), which require TOPs to correct SOL/IROL violations resulting from reactive resources deficiencies. The TOP standards currently in development would carry forward this obligation.
VAR-001-3, Requirement R11	VAR-001-4, Requirement R6	The requirement has been updated to allow for scheduling consultation.

Standard: VAR-001-4 – Voltage and Reactive Control		
Requirement in Approved Standard	**Transitions to the below Requirement in New Standard or Other Action**	**Description and Change Justification**
VAR-001-3, Requirement R12	Deleted	VAR-001-3, Requirement R10 was deleted because it was duplicative of existing TOP and EOP Reliability standards (i.e., TOP-004-2; EOP-003-2), to take corrective action, including load-shedding, to prevent voltage collapse. The TOP standards currently in development would carry forward this obligation.

Exhibit D-2

Mapping Document for Proposed Reliability Standard VAR-002-3

Project 2013-04 Voltage & Reactive Control

Mapping Document - Transition of VAR-002-2b to VAR-002-3

Standard: VAR-002-3 – Capacity Benefit Margin		
Requirement in Approved Standard	**Transitions to the below Requirement in New Standard or Other Action**	**Description and Change Justification**
VAR-002-2b, Requirement R1	VAR-002-3, Requirement R1	VAR-002-3, Requirement R1 carries forward the obligation in currently effective VAR-002-2b, Requirement R1 for Generator Operators ("GOPs") to operate generators in automatic voltage control mode but modifies the requirement to allow a GOP to operate in a different control mode if instructed by the Transmission Operator ("TOP"). New Requirement R1 also adds testing as a time when a generator need not operate in automatic voltage control mode or a different mode instructed by the Transmission Operator.
VAR-002-2b, Requirement R2	VAR-002-3, Requirement R2	VAR-002-3, Requirement R2 carries forward the affirmative obligation from VAR-003-1, Requirement R2 that the GOP maintain the voltage or Reactive Power schedule provided by the TOP pursuant to VAR-001-4, Requirement R5, unless the TOP exempts the GOP from doing so pursuant to VAR-001-4, Requirement R4. New Requirement R2 also adds that the GOP need not comply with the schedule if it satisfies the notification requirements for deviations established by the TOP VAR-001-4, Requirement R5, Part 5.2. Lastly, new Requirement R2 includes a provision to allow GOPs that do not monitor voltage at the location specified in their voltage schedule provided by the TOP to convert the schedule to the voltage point monitored by the GOP.

Standard: VAR-002-3 – Capacity Benefit Margin		
Requirement in Approved Standard	**Transitions to the below Requirement in New Standard or Other Action**	**Description and Change Justification**
VAR-002-2b, Requirement R3	VAR-002-3, Requirement R3 and R4.	Proposed Requirements R3 and R4 separate the notification requirements in currently-effective VAR-002-2b, Requirement R3 into two requirements: (1) for AVR/PSS status changes (proposed Requirement R3), and (2) for reactive capability changes (proposed Requirement R4). Each of the proposed requirements provides for a 30-minute window to allow a GOPs time to resolve an issue before having to notify the TOP of a change.
VAR-002-2b, Requirement R3	VAR-002-3, Requirement R5	VAR-002-3, Requirement R5 carries forward the obligations in VAR-002-2b, Requirement R3 but modifies it to the sub-part that requires the GOP to provide "[t]he +/- voltage range with step-change in % for load-tap changing transformers." The measure was also modified to add that a GOP must provide the data "within 30 calendar days"
VAR-002-2b, Requirement R4	VAR-002-3, Requirement R6	VAR-002-3, Requirement R6 modifies VAR-002-2b, Requirement R4 only to apply to the same functional entity throughout the requirement.

Analysis of Violation Risk Factors and Violation Severity Levels

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Violation Risk Factor and Violation Severity Level Justifications

VAR-002-3 – Generator Operation for Maintaining Network Voltage Schedules

This document provides the Standard Drafting Team's (SDT) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in VAR-002-3 – Generator Operation for Maintaining Network Voltage Schedules. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project. A copy of the standard with the associated VRFs and VSLs is available here.

NERC Criteria - Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Violation Risk Factor Guidelines

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities

• Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) – Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) –Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria - Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

FERC's VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline 1 – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline 2 – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.

Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3 – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4 – Violation Severity Level Assignment Should Be Based on a Single Violation, Not on a Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the

Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF Justification – VAR-002-3 Requirement R1	
Proposed VRF	**Medium**
NERC VRF Discussion	A VRF of Medium is necessary because this requirement could affect the stability of the BES, but the requirement itself addresses instances where a GOP will not necessarily operate in with the AVR in different control modes or when the TOP will instruct a GOP to operate in other modes.
FERC VRF G1 Discussion	Guideline 1 – Consistency with Blackout Report: Although the Blackout Report list Reactive Power and voltage control are part of the list of critical areas where a violation could severely affect the reliability of the Bulk-Power System, the GOP control modes are not as critical because the TOP is monitoring the system. The companion requirement to VAR-002-3 (in VAR-001-4) are properly designated with a HIGH VRF to ensure voltage schedules are provided as part of the TOPs plan to operate within System Operating Limits and Interconnection Reliability Operating Limits.
FERC VRF G2 Discussion	Guideline 2 – Consistency within a Reliability Standard: The VRF applies to the entire requirement.
FERC VRF G3 Discussion	Guideline 3 – Consistency among Reliability Standards: Because maintaining a voltage schedule is critical to preventing a violation of a System Operating Limit, this VRF was drafted to be the same VRFs for VAR-001-4 Requirement R5. VAR-001-4 Requirement R5 requires the TOP to specify a schedule and notification requirements that the GOP must follow.
FERC VRF G4 Discussion	Guideline 4 – Consistency with NERC Definitions of VRFs: This VRF is consistent with the NERC Definition because a GOP not operating in the proper control mode can affect the BES, but a single violation is unlikely to lead to instability, separation, or cascading failure. This is especially the case since a TOP will also be monitoring for voltage deviations.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More Than One Obligation:

	This VRF does not co-mingle multiple objectives, nor does it water down the Requirement to reflect a lower risk level.

VSL Justification – VAR-002-3 Requirement R1	
NERC VSL Guidelines	Consistent with NERC's VSL Guideline, this VSL acknowledges the criticality of this requirement and whether or not a system voltage schedule was created.
FERC VSL G1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The current level of compliance is not lowered with the proposed VSL because this requirement only has a "severe" VSL.
FERC VSL G2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The single VSL assignment category for "Binary" Requirements is not consistent Guideline 2b: VSL Assignments that contain ambiguous language	The proposed VSL is written to ensure uniformity and consistency in the determination of penalties. Guideline 2a: The proposed VSL is binary, and therefore, a single severe VSL is necessary. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.

FERC VSL G3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is consistent with the corresponding requirements.
FERC VSL G4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on a cumulative number of violations.

VRF Justification – VAR-002-3 Requirement R2	
Proposed VRF	**Medium**
NERC VRF Discussion	A VRF of Medium is consistent with the NERC VRF definition. Requirement R2 focuses on GOPs maintaining a schedule, but there could be system events that will pull a GOP out of schedule. Also, late at night and early in the morning, the system may experience instances of low or high voltage. This could impact the BES, but a single instance is unlikely to lead to instability, separation, or cascading failure. The sub-requirements also require the GOP to modify the voltage schedule when directed by the TOP.
FERC VRF G1 Discussion	Guideline 1 – Consistency with Blackout Report: Although the Blackout Report lists Reactive Power and voltage control as critical areas where a violation could severely affect the reliability of the Bulk-Power System, there are general times when a GOP will be unable to maintain a voltage schedule due to system condition. These instances occur frequently during the early morning and late at night. The companion requirement to VAR-002-3 (in VAR-001-4) are properly designated

	with a HIGH VRF to ensure voltage schedules are provided as part of the TOP's plan to operate within System Operating Limits and Interconnection Reliability Operating Limits.
FERC VRF G2 Discussion	Guideline 2 – Consistency within a Reliability Standard: The VRF applies to the entire requirement, including all sub-parts.
FERC VRF G3 Discussion	Guideline 3 – Consistency among Reliability Standards: Because maintaining a voltage schedule is critical to preventing a violation of a System Operating Limit, this VRF was drafted to be the same VRFs for VAR-001-4 Requirement R5. VAR-001-4 Requirement R5 requires the TOP to specify a schedule and notification requirements that the GOP must follow.
FERC VRF G4 Discussion	Guideline 4 – Consistency with NERC Definitions of VRFs: This VRF is consistent with the NERC Definition because a GOP not maintaining a schedule can affect the BES, but a single violation is unlikely to lead to instability, separation, or cascading failures. This is especially the case since a TOP will also be monitoring for voltage deviations
FERC VRF G5 Discussion	Guideline 5 - Treatment of Requirements that Co-mingle More Than One Obligation: This VRF does not co-mingle multiple objectives, nor does it water down the requirement to reflect a lower risk level.

VSL Justification – VAR-002-3 Requirement R2	
NERC VSL Guidelines	Consistent with NERC's VSL Guidelines, the VSL describes degrees of noncompliant performance in an incremental manner.
FERC VSL G1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering	There is no prior compliance obligation related to the subject of this standard.

the Current Level of Compliance	
FERC VSL G2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The single VSL assignment category for "Binary" Requirements is not consistent Guideline 2b: VSL Assignments that contain ambiguous language	The proposed VSL is written to ensure uniformity and consistency in the determination of penalties. Guideline 2a: The proposed VSL is not binary. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.
FERC VSL G4: Violation Severity Level Assignment Should Be Based on A Single Violation,	The proposed VSL is not based on cumulative number of violations.

Not on A Cumulative Number of Violations	

VRF Justification – VAR-002-3 Requirement R3	
Proposed VRF	**Medium**
NERC VRF Discussion	This requirement warrants a Medium VRF and is consistent with the NERC definition because this requirement is whether the GOP made the required notifications to the TOP within the appropriate timeframes.
FERC VRF G1 Discussion	Guideline 1 – Consistency with Blackout Report: Although the Blackout Report list Reactive Power and voltage control are part of the list of critical areas where a violation could severely affect the reliability of the Bulk-Power System, the GOP notifications are unlikely to lead to system instability, separation, or cascading failures. This is particularly the case because the TOP is still operating the system to stay within System Operating Limits and Interconnection Reliability Operating Limits.
FERC VRF G2 Discussion	Guideline 2 – Consistency within a Reliability Standard: There is no sub-part to Requirement 3; therefore, the requirement is consistent.
FERC VRF G3 Discussion	Guideline 3 – Consistency among Reliability Standards: This VRF is drafted to be consistent with other standards (e.g., BAL) that address making appropriate notifications.
FERC VRF G4 Discussion	Guideline 4 – Consistency with NERC Definitions of VRFs: This VRF is consistent with the NERC Definition because not making the appropriate notifications can impact the grid, but the TOPs are still effectively monitoring the system; thus, instability, separation, or cascading failures are unlikely due to a single violation.
FERC VRF G5 Discussion	Guideline 5 - Treatment of Requirements that Co-mingle More Than One Obligation This VRF does not co-mingle multiple objectives, nor does it water down the Requirement to reflect a lower risk level

VSL Justification – VAR-002-3 Requirement R3	
NERC VSL Guidelines	Consistent with NERC's VSL Guidelines. The VSL describes degrees of noncompliant performance in an incremental manner.
FERC VSL G1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The current level of compliance is not lowered with the proposed VSL.
FERC VSL G2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The single VSL assignment category for "Binary" Requirements is not consistent Guideline 2b: VSL Assignments that contain ambiguous language	The proposed VSL is written to ensure uniformity and consistency in the determination of penalties. Guideline 2a: The proposed VSL is binary because the standard is violated only when a notification is not made to the TOP; therefore, a severe VSL is warranted. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3: Violation Severity Level Assignment Should Be	The proposed VSL is worded consistently with the corresponding requirement.

Consistent with the Corresponding Requirement	
FERC VSL G4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on cumulative number of violations.

VRF Justification – VAR-002-3 Requirement R4	
Proposed VRF	**Medium**
NERC VRF Discussion	This requirement warrants a Medium VRF and is consistent with the NERC definition because this requirement is whether the GOP made the required notifications to the TOP within the appropriate timeframes.
FERC VRF G1 Discussion	Guideline 1 – Consistency with Blackout Report: Although the Blackout Report list Reactive Power and voltage control are part of the list of critical areas where a violation could severely affect the reliability of the Bulk-Power System, the GOP notifications are unlikely to lead to system instability, separation, or cascading failures. This is particularly the case because the TOP is still operating the system to stay within System Operating Limits and Interconnection Reliability Operating Limits.
FERC VRF G2 Discussion	Guideline 2 – Consistency within a Reliability Standard: There is no sub-part to Requirement 3; therefore, the requirement is consistent.
FERC VRF G3 Discussion	Guideline 3 – Consistency among Reliability Standards: This VRF is drafted to be consistent with other standards (e.g., BAL) that address making appropriate notifications.

FERC VRF G4 Discussion	Guideline 4 – Consistency with NERC Definitions of VRFs: This VRF is consistent with the NERC Definition because not making the appropriate notifications can impact the grid, but the TOPs are still effectively monitoring the system; thus, instability, separation, or cascading failures are unlikely due to a single violation.
FERC VRF G5 Discussion	Guideline 5 - Treatment of Requirements that Co-mingle More Than One Obligation This VRF does not co-mingle multiple objectives, nor does it water down the Requirement to reflect a lower risk level

VSL Justification – VAR-002-3 Requirement R4	
NERC VSL Guidelines	Consistent with NERC's VSL Guidelines. The VSL describes degrees of noncompliant performance in an incremental manner.
FERC VSL G1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The current level of compliance is not lowered with the proposed VSL.
FERC VSL G2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The single VSL assignment category for	The proposed VSL is written to ensure uniformity and consistency in the determination of penalties. Guideline 2a: The proposed VSL is binary because the standard is violated only when a notification is not made to the TOP; therefore, a severe VSL is warranted.

"Binary" Requirements is not consistent Guideline 2b: VSL Assignments that contain ambiguous language	Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.
FERC VSL G4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on cumulative number of violations.

VRF Justification – VAR-002-3 Requirement R5	
Proposed VRF	**Lower**
NERC VRF Discussion	This requirement is a Lower VRF because the tap setting data does not change frequently, and a violation is not expected adversely affect the BES.
FERC VRF G1 Discussion	Guideline 1 – Consistency with Blackout Report: Although Reactive Power and voltage control are part of the list of critical areas where a violation could severely affect the reliability of the Bulk-Power System, this requirement would not adversely impact the BES

	if violated. The tap information is provided during interconnection, and it is not expected to change frequently. Therefore, a Lower VRF is warranted.
FERC VRF G2 Discussion	Guideline 2 – Consistency within a Reliability Standard: The parts within Requirement R5 are consistent with Requirement R5 and is considered a Lower VRF.
FERC VRF G3 Discussion	Guideline 3 – Consistency among Reliability Standards: There are no other standards that address Tap settings.
FERC VRF G4 Discussion	Guideline 4 – Consistency with NERC Definitions of VRFs: This VRF is consistent with the NERC Definition because a violation is similar to an administrative violation. Further, since tap settings are infrequently changed, a violation would not adversely impact the BES.
FERC VRF G5 Discussion	Guideline 5 - Treatment of Requirements that Co-mingle More Than One Obligation: This VRF does not co-mingle multiple objectives, nor does it water down the Requirement to reflect a lower risk level.

VSL Justification – VAR-002-3 Requirement R5	
NERC VSL Guidelines	Consistent with NERC's VSL Guidelines. The VSL describes degrees of noncompliant performance in an incremental manner.
FERC VSL G1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering	There is no prior compliance obligation related to the subject of this standard.

the Current Level of Compliance	
FERC VSL G2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The single VSL assignment category for "Binary" Requirements is not consistent Guideline 2b: VSL Assignments that contain ambiguous language	The proposed VSL is written to ensure uniformity and consistency in the determination of penalties. Guideline 2a: The proposed VSL is not binary. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.
FERC VSL G4: Violation Severity Level Assignment Should Be Based on A Single Violation,	The proposed VSL is not based on cumulative number of violations.

Not on A Cumulative Number of Violations	

VRF Justification – VAR-002-3 Requirement R6	
Proposed VRF	**Lower**
NERC VRF Discussion	This requirement is a Lower VRF because the tap setting data does not change frequently, and a violation is not expected adversely affect the BES.
FERC VRF G1 Discussion	Guideline 1 – Consistency with Blackout Report: Although Reactive Power and voltage control are part of the list of critical areas where a violation could severely affect the reliability of the Bulk-Power System, this requirement would not adversely impact the BES if violated. The tap information is provided during interconnection, and it is not expected to change frequently. If a violation were to occur, the system would still operate at the level prior to making any tap setting changes. Therefore, a Lower VRF is warranted.
FERC VRF G2 Discussion	Guideline 2 – Consistency within a Reliability Standard: The part within Requirement R6 is consistent with Requirement R6 and is considered a Lower VRF.
FERC VRF G3 Discussion	Guideline 3 – Consistency among Reliability Standards: There are no other standards that address Tap settings.
FERC VRF G4 Discussion	Guideline 4 – Consistency with NERC Definitions of VRFs: This VRF is consistent with the NERC Definition because a violation is similar to an administrative violation. Further, since tap settings are infrequently changed, a violation would not adversely impact the BES.
FERC VRF G5 Discussion	Guideline 5 - Treatment of Requirements that Co-mingle More Than One Obligation:

	This VRF does not co-mingle multiple objectives, nor does it water down the Requirement to reflect a lower risk level.

VSL Justification – VAR-002-3 Requirement R6	
NERC VSL Guidelines	Consistent with NERC's VSL Guidelines. The VSL describes degrees of noncompliant performance in an incremental manner.
FERC VSL G1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	There is no prior compliance obligation related to the subject of this standard.
FERC VSL G2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The single VSL assignment category for "Binary" Requirements is not consistent Guideline 2b: VSL Assignments that contain ambiguous language	The proposed VSL is written to ensure uniformity and consistency in the determination of penalties. Guideline 2a: The proposed VSL is binary because the requirement focuses on whether tap changes were made. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.

FERC VSL G3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.
FERC VSL G4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on cumulative number of violations.

Summary of Development History and Record of Development

Project 2013-04 Voltage & Reactive Control

Related Files

Status:
The NERC Board of Trustees adopted VAR-002-3 on May 7, 2014. The standard will be filed for regulatory approval.

Background:
When the first versions of the VAR standards were approved in FERC Order No. 693,[1] the Commission also issued several directives with regard to how to improve the standard. Each of the outstanding directives are explained in detail in the technical white paper (see project page).

The informal consensus building for VAR began in February 2013. Specifically, the ad hoc group engaged stakeholders on how best to address the FERC directives, remove paragraph 81 candidates, and implement results-based approaches. A discussion of the ad hoc group's consensus building and collaborative activities are also included in the technical white paper.

Based on stakeholder outreach, the VAR-001 and VAR-002 standards have been modified. The proposed VAR-001 answers most of the FERC directives from Order No. 693, and VAR-002 has been modified to address certain compliance issues today. This posting is soliciting comment on a pro forma standard and a Standard Authorization Request (SAR).

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on July 19, 2013

Description of Current Draft

This draft standard is concluding informal development and will move to formal development when authorized by the Standards Committee.

Anticipated Actions	Anticipated Date
SAR Authorized by the Standards Committee	July
45 Day SAR Comment and Initial Ballot Open	July
Nomination Period Opens	July
Standard Drafting Team Appointed	July
Initial Comment and Initial Ballot Closes	August
Final Ballot Opens	October
Final Ballot Closes	October
BOT Adoption	November
Filing to Applicable Regulatory Authorities	December

Effective Dates

In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after applicable regulatory approval or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after Board of Trustees approval.

Version History

Version	Date	Action	Change Tracking
1	6/18/2007	Initial Standard is FERC approved	
2	1/10/2011	FERC approved added LSEs and Controllable Load to the standard.	
3	6/20/2013	WECC Variance is approved by FERC	

Definitions of Terms Used in the Standard

None.

Introduction

1. **Title:** Voltage and Reactive Control
2. **Number:** VAR-001-4
3. **Purpose:** To ensure that voltage levels, reactive flows, and reactive resources are monitored, controlled, and maintained within limits in real time to protect equipment and the reliable operation of the Interconnection.
4. **Applicability:**
   - **4.1.** Transmission Operators
   - **4.2.** Reliability Coordinators
   - **4.3.** Generator Operators within the Western Interconnection

Requirements and Measures

Rationale for R1: This requirement will allow each Transmission Operator (TOP) to establish its own policies and procedures, and the criteria for periodic updates will be individualized based on the stability of each TOP's regions. The language is refined to show that coordination with neighboring TOPs is required. It also states TOP shall provide data to the Reliability Coordinator (RC) for its monitoring functions to respond to address the FERC directive in P 1855 of Order No. 693, which directed NERC to add RC monitoring to the VAR standards. P 1868 requires NERC to add more "detailed and definitive requirements to include more detailed and definitive requirements on “established limits” and “sufficient reactive resources” and identify acceptable margins (i.e. voltage and/or reactive power margins)."

R1. Each Transmission Operator shall have documented policies or procedures that are implemented to establish, monitor, and control voltage levels and Reactive Power flows (Mvar flows) within limits as defined below. *[Violation Risk Factor: High] [Time Horizon: Operations]*

1.1. These documented policies or procedures shall include criteria used in system assessments. The criteria for the assessments shall include established steady-state limits, voltage stability limits and associated operating margins, and voltage schedules along with associated tolerance bands.

1.2. Each Transmission Operator shall provide a copy of these documented policies or procedures to adjacent Transmission Operators.

1.3. Each Transmission Operator shall provide a copy of these documented policies or procedures to its Reliability Coordinator.

M1. The Transmission Operator shall have evidence of documented policies or procedures as specified in Requirement 1. As stated in R1, the policies and procedures must detail how criteria for steady-state and voltage stability limits are used in the Transmission Operator’s assessments of the system. In order to demonstrate the Transmission Operator is implementing the policies or procedures, the Transmission Operator must be able to provide evidence that proves voltage is currently being monitored. Such evidence may include, but is not limited to: 1) proof that points are telemetered, 2) alarms are functioning, and 3) during events of low or high voltage the policies and procedures are being followed to respond to control voltage levels. The Transmission Operator must also provide evidence that the policies or procedures were communicated to adjacent Transmission Operators and to its Reliability Coordinator. Evidence may include, but is not limited to, emails, website postings, and meeting minutes. Simply posting a copy of the policies or procedure on a public website is not sufficient if the Transmission Operator and Reliability Coordinator were not notified as to where to find the policies or procedures.

Rationale for R2:

P 1875 from Order No. 693 directed NERC to include requirements to run voltage stability analysis periodically. The informal ad hoc group and industry participants concluded that the best models and tools are the ones that have been proven over time, and that the requirement should not require any utility to purchase new online simulations tools. Therefore, the new requirement does not specify when to use online tools. The sub-requirements detail the real-time and day-ahead assessments necessary under R1. The existing VAR-001 also requires a list of sufficient reactive resources; this was retained in the proposed requirement as FERC determined in a letter order that this list answered the directive in P 1868 to detail the list of "sufficient reactive resources." Controllable load is specifically included to answer FERC's directive in P 1879.

R2. Each Transmission Operator and Reliability Coordinator shall perform assessments on their respective areas in order to ensure sufficient reactive resources are available for scheduling to maintain voltage stability under normal and contingency conditions in order to provide the voltage levels as defined in Requirement R1. *[Violation Risk Factor: High] [Time Horizon: Operations]*

2.1. Each Transmission Operator shall operate or direct the real-time operation of devices necessary to regulate transmission voltage and reactive flow necessary to regulate transmission voltage and reactive flow which may include, but is not limited to reactive generation scheduling; transmission line and reactive resource switching; controllable load; and, if necessary, load shedding, to maintain system voltages within established limits.

2.2. As a result of the assessments, each Transmission Operator shall ensure that sufficient reactive resources have been scheduled to meet acceptable day-ahead voltage limits identified in Requirement R1. Sufficient reactive resources may include, but is not limited to reactive generation scheduling; transmission line and reactive resource switching; and controllable load.

M2. Each Transmission Operator and Reliability Coordinator shall have evidence of current or past studies used to schedule sufficient reactive resources. Each Transmission Operator shall also provide proof that additional resources were scheduled when necessary. During a real-time event where voltage must be adjusted, a Transmission Operator shall show evidence to show directions were given to adjust the operation of capacitive and inductive resources. This may include directions to Generator Operators to operate within new tolerance bands or to make manual adjustments if necessary. Transmission Operators shall also have evidence to show proof of directing new resources to come online. Those resources can include, but is not limited to capacitor banks, switching, adjusting controllable load, and when necessary load can be shed. For the day-ahead scheduling, Transmission Operators shall provide copies of provide day-ahead studies used to schedule enough resources to meet expected voltage requirements.

Rationale for R3:

These exemptions offer TOPs the option to exempt certain generators during maintenance or system events when those units are not able to maintain voltage schedules. Sub-requirements containing an exemption list were removed from the existing standard because this created more compliance issues with regard to how often the list would be updated and maintained.

R3. The Transmission Operator shall specify the criteria that will exempt generators from compliance with the requirements defined in Requirement 4 and any associated notification requirements. *[Violation Risk Factor: Lower] [Time Horizon: Operations]*

3.1. In the event a Transmission Operator approves a generator as satisfying the criteria, it shall notify the associated Generator Operator.

M3. Each Transmission Operator shall have evidence of the documented criteria for generator exemptions. The Transmission Operator shall also have evidence to show that, for each generating unit in its area that is exempt from following a voltage or Reactive Power schedule, the associated Generator Owner was notified of this exemption in accordance with Requirement 3. Temporary exemptions maybe provided to generators during scenarios where notifications/communications are not necessary due to a system event that prevents a Generator Operator from maintaining a schedule. Similarly, when an Automatic Voltage Regulator (AVR) is malfunctioning, which prevents a Generator Operator from maintaining a voltage schedule and tolerance band, temporary exemptions may be provided. For temporary exemptions, evidence showing the exemptions were granted must be provided. If the exemptions were given verbally from the Transmission Operator, the phone recordings or emails commemorating the phone call must be provided. For temporary exemptions, the evidence of communication must also include the timeframe for how long the exemption will last.

Rationale for R4:

The new requirement adds “tolerance band” in order to provide more detailed information when establishing limits.

R4. Each Transmission Operator shall specify a voltage or Reactive Power schedule and tolerance band (at either the high side or low side of the Generator Step-Up transformer at the TOP's discretion)

at the interconnection point between the generator facility and the Transmission Owner's facilities to be maintained by each generator. *[Violation Risk Factor: Medium] [Time Horizon: Operations]*

4.1. The Transmission Operator shall provide the voltage or Reactive Power schedule and tolerance band to the associated Generator Operator and direct the Generator Operator to comply with the schedule in automatic voltage control mode (the AVR is in service and controlling voltage).

M4. The Transmission Operator shall have evidence it provided a voltage or Reactive Power schedule and tolerance band as specified in Requirement 4 to the applicable Generator Operators. For real-time directives, evidence may include recorded phone logs.

Rationale for R5:

Since power system stabilizers (PSS) equipment is not highlighted in any other standard, the VAR standard is the appropriate place to ensure the equipment is being monitored. This requirement is not duplicative of the TOP standards because the voltage regulators and power system stabilizer are highlighted.

R5. The Transmission Operator shall know the status of all transmission Reactive Power resources, automatic voltage regulators, and power system stabilizers in their system. *[Violation Risk Factor: Medium] [Time Horizon: Operations]*

M5. The Transmission Operator shall have evidence to show Reactive Power resources are being monitored. Evidence may include, but is not limited to screen shots of EMS/SCADA data, alarms, and phone logs. In the event the monitoring system does not work, each Transmission Operator should have a protocol in place to show these resources are being monitored.

Rationale for R6:

Although tap settings are first established at interconnection, this requirement could not be deleted because no other standard addresses when a tap setting must be adjusted. If the tap setting is not properly set, then the amount of VARs produced by a unit can be affected.

R6. After consultation with the Generator Owner regarding necessary step-up transformer tap changes, the Transmission Operator shall provide documentation to the Generator Owner specifying the required tap changes, a timeframe for making the changes, and technical justification for these changes. *[Violation Risk Factor: Lower] [Time Horizon: Operations]*

M6. The Transmission Operator shall have evidence that it provided documentation to the Generator Owner when a change was needed to a generating unit’s step-up transformer tap in accordance with the requirement.

Compliance

1. **Compliance Monitoring Process:**

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The Transmission Operator shall retain evidence for Measures 1 through 4 for 12 months. The Compliance Monitor shall retain any audit data for three years.

1.3. Compliance Monitoring and Assessment Processes:

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.4. Additional Compliance Information:

- None

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations**	**High**	The Transmission Operator has documented criteria for assessments, but has provided a copy to only one of the parties that should have received a copy (either a neighboring TOPs or its RC).	The Transmission Operator has documented policies and procedures, but has not provided copies to either the neighboring TOPs or its RC.	The Transmission Operator has documented policies or procedures, but none of the sub-requirements were followed.	The Transmission Operator has no documented policies or procedures.
R2	**Operations**	**High**	N/A	The Transmission Operator only performs day-ahead assessments and only schedules day-ahead resources.	N/A	The Transmission Operator does not perform assessments and therefore does not have policies and procedures implemented to have sufficient Mvars. A lack of real-time operations is also severe.
R3	**Operations Planning**	**Lower**	N/A	N/A	N/A	The Transmission Operator does not have exemption criteria.
R4	**Operations**	**Medium**	N/A	N/A	The Transmission Operator provides voltage or Reactive Power schedules to only some of the GOPs.	The Transmission Operator does not provide voltage or Reactive Power schedules and tolerance bands at all.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R5	**Operations**	**Lower**	N/A	The Transmission Operator is unaware of the status in a stable area.	The Transmission Operator does not know the status of important equipment in weaker areas that were identified in assessments as part of R1.	N/A
R6	**Operations**	**Lower**	Either the technical justification or timeframe are not provided.	Neither the technical justification nor the timeframe are provided.	N/A	N/A

Regional Variances

Regional Variance for the Western Electricity Coordinating Council from VAR-001-3 is retained.

Interpretations

None.

Associated Documents

None.

Guidelines and Technical Basis

For technical basis for each requirement, please see the VAR White Paper for further technical information.

Standard Development Timeline

In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after Board of Trustees approval.

Version History

Version	Date	Action	Change Tracking
1	5/1/2006	Added "(R2)" to the end of levels on non-compliance 2.1.2, 2.2.2, 2.3.2, and 2.4.3.	July 5, 2006
1a	12/19/2007	Added Appendix 1 – Interpretation of R1 and R2 approved by BOT on August 1, 2007	Revised
1a	1/16/2007	In Section A.2., Added "a" to end of standard number. Section F: added "1."; and added date.	**Errata**
1.1a	10/29/2008	BOT adopted errata changes; updated version number to "1.1a"	**Errata**
1.1b	3/3/2009	Added Appendix 2 – Interpretation of VAR-002-1.1a approved by BOT on February 10, 2009	**Revised**
2b	4/16/2013	Revised R1 to address an Interpretation Request. Also added previously approved VRFs, Time Horizons and VSLs. Revised R2 to address consistency issue with VAR-001-2, R4. FERC Order issued approving VAR-002-2b.	Revised

Definitions of Terms Used in the Standard

None.

Introduction

1. **Title:** **Generator Operation for Maintaining Network Voltage Schedules**
2. **Number:** VAR-002-3
3. **Purpose:** To ensure generators provide reactive and voltage control necessary to ensure voltage levels, reactive flows, and reactive resources are maintained within applicable Facility Ratings to protect equipment and the reliable operation of the Interconnection.
4. **Applicability:**
   - **4.1.** Generator Operator
   - **4.2.** Generator Owner

Requirements and Measures

Rationale for R1: This requirement has been maintained due to the importance of running a unit with its automatic voltage regulator (AVR) in service and in voltage controlling mode. The measure has been updated include some of the evidence that can be used for Compliance purposes.

R1. The Generator Operator shall operate each generator connected to the interconnected transmission system in the automatic voltage control mode (with its automatic voltage regulator (AVR) in service and controlling voltage) unless the Generator Operator has notified the Transmission Operator of one of the following: [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]

- That the generator is being operated in start-up[1] or shutdown[2] mode pursuant to a Real-time communication or a procedure that was previously provided to the Transmission Operator; or
- That the generator is not being operated in the automatic voltage control mode for a reason other than start-up or shutdown.

M1. The Generator Operator shall have evidence to show that it notified its associated Transmission Operator any time it failed to operate a generator in the automatic voltage control mode as specified in Requirement 1. If a generator is being started up or shut down with the automatic voltage control off and no notification of the automatic voltage regulator status is made to the Transmission Operator, the Generator Operator will have evidence that it notified the Transmission Operator of its procedure for placing the unit into automatic voltage control mode. Such evidence must include, but is not limited to, dated evidence of transmittal of the procedure such as an electronic message or a transmittal letter with the procedure included or attached.

[1] Start-up is deemed to have ended when the generator is ramped up to its minimum continuously sustainable load and the generator is prepared for continuous operation.
[2] Shutdown is deemed to begin when the generator is ramped down to its minimum continuously sustainable load and the generator is prepared to go offline.

Rationale for R2:

R2 details how a Generator Operator (GOP) operates the system to a maintain voltage schedule and when the GOP is expected to notify the Transmission Operator (TOP). Sub-requirement 2.1 provides guidance on a non-compliance window in the event a unit is deviating from schedule, and the GOP must notify the TOP if it is unable to return to schedule. Thus, the non-compliance window allows for notifications when a unit is unable to provide additional VAR support (e.g., when hitting an operational limit) or when the unit is too small to raise voltage. In both instances, the TOP may then provide some type of temporary exemption as outlined in VAR-001.

R2. Unless exempted by the Transmission Operator, each Generator Operator shall maintain the generator voltage or Reactive Power schedule[3] (within applicable Facility Ratings[4]) as directed by the Transmission Operator. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]

2.1. If a GOP drifts out of schedule, each Generator Operator shall notify its associated Transmission Operator within 15 minutes when both of the following conditions are met: 1) the GOP is operating outside of the prescribed voltage or Reactive Power schedule tolerance band[5] for 15 minutes; and 2) the GOP is no longer able to return to its voltage or Reactive Power schedule.

2.2. When a generator's automatic voltage regulator is out-of-service, the Generator Operator shall use an alternative method to control the generator reactive output to meet the voltage or Reactive Power schedule directed by the Transmission Operator.

2.3. When directed to modify voltage, the Generator Operator shall comply or provide an explanation of why the schedule cannot be met.

M2. Generator Operators will still make all attempts to operate within the tolerance bands provided by the TOP, but natural drifting may occur. In instances where there is an event occurring to pull a unit out of the tolerance band, the Generator Operator will not be held in non-compliance with this requirement if the sub-requirements 2.1, 2.2, and 2.3 are met. In order to identify when a unit is deviating from its schedule, GOPs will monitor voltage based on existing equipment at its facility. Therefore, GOPs have the option to operate on a voltage schedule on either the high-side or convert the high-side schedule to a low-side schedule at the GOP's discretion. For units that monitor on the low-side/terminal voltage, Generator Operators shall provide evidence of the method of conversion from the high-side schedule to low-side monitoring. For sub-requirement 2.1, most units will not be able to return to schedule due to a limiting factor. Such limiting factors may include, but are not limited to: 1) terminal voltage, 2) bus voltage, 3) equipment temperature,

[3] The voltage or Reactive Power schedule is a target value communicated by the Transmission Operator to the Generator Operator establishing a tolerance band within which the target value is to be maintained during a specified period.

[4] When a Generator is operating in manual control, reactive power capability may change based on stability considerations and this may lead to a change in the associated Facility Ratings.

[5] GOPs monitor and control voltage based on their equipment limitations. GOPs will monitor their voltage or Reactive Power schedule tolerance bands either at the high-side or low-side/terminal voltage.

4) transformer, 5) auxiliary equipment, 6) Volts/Hz limits, and 7) excitation or regulator limits. GOP shall have evidence to show compliance with requirement R2 by providing 1) Communications with the TOP when the Generator Operator was operating outside of the prescribed voltage or Reactive Power schedule tolerance band for 30 minutes or less (the 30 minutes allow for 15 minutes to call and 15 minutes to be outside of the tolerance band) AND Generator Operator is no longer able to return to its voltage or Reactive Power schedule; 2) Generator Operator implemented an alternative method to control reactive output when the AVR was out-of-service or unavailable; 3) compliance with directive to modify voltage or a notification that the directive could not be met. Evidence may include, but is not limited to Generator Operator logs, SCADA data, phone logs, and any other alarming notifications that would alert the Transmission Operator that both conditions were met. Timing for Requirement R2.1 is crucial, and Generator Operators are expected to begin timing an event as soon as the unit is operating outside of the tolerance band. Further, voltage documentation during a system event maybe requested by an auditor to show measures were taken to bring the unit back into schedule.

Rationale for R3:

This requirement has been modified to reduce the number of violations for when an AVR goes out-of-service and then comes back in-service. Fifteen (15) minutes have been built into the requirement to allow a Generator Operator time to resolve an issue before having to notify the Transmission Operator of a status or capability change. The requirement has also been amended to remove the sub-requirement to provide an estimate for the expected duration of the status change. The 15-minute window should resolve most issues, and further trouble-shooting will probably be required if the status change is unresolved within 15 minutes.

R3. Each Generator Operator shall notify its associated Transmission Operator of a status or capability change on any generator Reactive Power resource, including the status of each automatic voltage regulator and power system stabilizer and the expected duration of the change in status or capability within 30 minutes of the change. If the status has been restored within the first 15 minutes of such change, then there is no need to call the TOP. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

M3. The Generator Operator shall have evidence it notified its associated Transmission Operator within 30 minutes of any of the changes identified in Requirement 3. If the status has been restored within the first 15 minutes, no call is necessary; therefore, if a status on Reactive Power resource has changed, and that change lasts greater than 15 minutes, the GOP must notify its associated TOP within 30 minutes of when the change first occurred.

Rationale for R4:

This requirement and corresponding measure language has been maintained due to the importance of having accurate tap settings. If the tap setting is not properly set, then the amount of VARs produced by a unit can be affected.

R4. The Generator Owner shall provide the following to its associated Transmission Operator and Transmission Planner within 30 calendar days of a request. *[Violation Risk Factor: Lower] [Time Horizon: Real-time Operations]*

4.1. For generator step-up transformers and auxiliary transformers with primary voltages equal to or greater than the generator terminal voltage:

4.1.1. Tap settings.

4.1.2. Available fixed tap ranges.

4.1.3. Impedance data.

M4. The Generator Owner shall have evidence it provided its associated Transmission Operator and Transmission Planner with information on its step-up transformers and auxiliary transformers as required in Requirements 4.1.1 through 4.1.3.

Rationale for R5:

This requirement and corresponding measure language has been maintained due to the importance of having accurate tap settings. If the tap setting is not properly set, then the amount of VARs produced by a unit can be affected.

R5. After consultation with the Transmission Operator regarding necessary step-up transformer tap changes, the Generator Owner shall ensure that transformer tap positions are changed according to the specifications provided by the Transmission Operator, unless such action would violate safety, an equipment rating, a regulatory requirement, or a statutory requirement. *[Violation Risk Factor: Lower] [Time Horizon: Real-time Operations].*

5.1. If the Generator Operator can't comply with the Transmission Operator's specifications, the Generator Operator shall notify the Transmission Operator and shall provide the technical justification.

M5. The Generator Owner shall have evidence that its step-up transformer taps were modified per the Transmission Operator's documentation as identified in Requirement 5. The Generator Operator shall have evidence that it notified its associated Transmission Operator when it couldn't comply

with the Transmission Operator's step-up transformer tap specifications as identified in Requirement 5.1.

Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner shall keep its latest version of documentation on its step-up and auxiliary transformers. The Generator Operator shall maintain all other evidence for the current and previous calendar year.

The Compliance Monitor shall retain any audit data for three years.

1.3. Compliance Monitoring and Assessment Processes:

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.4. Additional Compliance Information:

None

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Real-time Operations**	**Medium**	N/A	N/A	N/A	The responsible entity did not operate each generator in the automatic voltage control mode and failed to notify the Transmission Operator as identified in R1.
R2	**Real-time Operations**	**Medium**	N/A	N/A	N/A	The responsible entity did not perform any of the sub-requirements.
R3	**Real-time Operations**	**Medium**	N/A	N/A	N/A	The responsible entity did not make the notification within 30 minutes.
R4	**Real-time Operations**	**Lower**	When directed by the Transmission Operator to maintain the generator voltage or reactive power schedule the Generator Operator failed to meet the directed values for up to and including 45 minutes.	When directed by the Transmission Operator to maintain the generator voltage or reactive power schedule the Generator Operator failed to meet the directed values for more than 45 minutes up to and including 60 minutes. Implementation Plan
VAR Directives Project

Implementation Plan for VAR-001 and VAR-002

Approvals Required
VAR-001-4 – Voltage and Reactive Control
VAR-002-3 — Generator Operation for Maintaining Network Voltage Schedules

Prerequisite Approvals
There are no other standards that must receive approval prior to the approval of this standard.

Revisions to Glossary Terms
None

Applicable Entities
Generator Operators
Generator Owners
Transmission Operators
Reliability Coordinators

Applicable Facilities
N/A

Conforming Changes to Other Standards
None

Effective Dates
VAR-001-4 and VAR-002-3 - In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after applicable regulatory approval or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after Board of Trustees approval.

Justification

The currently effective VAR-002 standard is one of the most violated standards; however, the industry argues these violations do not address any reliability gaps. Instead, Generator Operators and Transmission Operators are required to handle many nuisance phone calls for slight deviations from a voltage schedule. The nuisance phone calls can be a distraction during a scheduled maintenance or a system event; thus, the industry would support making the changes as soon as possible. However, since VAR-001 now requires a documented policy or procedure for assessments; the Transmission Operators need a quarter to prepare documentation. Also for Transmission Operators that do not provide tolerance bands with voltage schedules, those Transmission Operators will need some time to adjust to providing new data to Generator Operators.

Retirements

VAR-001-3 and VAR-002-2b will be retired at midnight of the day immediately prior to the Effective Date of VAR-001-4 and VAR-002-3 in the particular Jurisdiction in which the new standards are becoming effective.

Standards Authorization Request Form

When completed, please email this form to:
sarcomm@nerc.com

NERC welcomes suggestions to improve the reliability of the bulk power system through improved reliability standards. Please use this form to submit your request to propose a new or a revision to a NERC's Reliability Standard.

Request to propose a new or a revision to a Reliability Standard			
Title of Proposed Standard:	Voltage and Reactive Control; Generator Operation for Maintaining Network Voltage Schedules		
Date Submitted:	July 18, 2013		
SAR Requester Information			
Name:	Soo Jin Kim		
Organization:	NERC		
Telephone:	404-446-9742	E-mail:	soo.jin.kim@nerc.net
SAR Type (Check as many as applicable)			
☐ New Standard ☒ Revision to existing Standard		☐ Withdrawal of existing Standard ☐ Urgent Action	

SAR Information
Industry Need (What is the industry problem this request is trying to solve?):
Resolve FERC directives from FERC Order No. 693 and improve upon the existing VAR standards.
Purpose or Goal (How does this request propose to address the problem described above?):
The pro forma standard consolidates the reliability components of the existing VAR-001 standard, adds new requirements to address FERC's directives in Order No. 693, and provides a non-compliance window in VAR-002 notification requirements.

SAR Information
Identify the Objectives of the proposed standard's requirements (What specific reliability deliverables are required to achieve the goal?):
The objectives are to address the outstanding directives from FERC Order 693 and added a non-compliance window for when a GOP must notifiy a TOP when a unit is deviating from a voltage schedule.
Brief Description (Provide a paragraph that describes the scope of this standard action.)

• The drafting team will answer the outstanding VAR directives from FERC Order No. 693. The VAR-001 directives are summarized from P 1880 of Order No. 693 as:
  ○ Expand the applicability to include reliability coordinators and LSEs;
  ○ Include detailed and definitive requirements on "established limits" and "sufficient reactive resources" and identify acceptable margins above the voltage instability points;
  ○ Include Requirements to perform voltage stability analysis periodically, using online techniques where commercially available and offline techniques where online techniques are not available, to assist real-time operations, for areas susceptible to voltage instability;
  ○ Include controllable load among the reactive resources to satisfy reactive Requirements; and
  ○ Address the power factor range at the interface between LSEs and the transmission grid.
• The VAR-002 directive is to simply consider adding more detail around what would constitute an incident of non-compliance for a Generator.
• The drafting team will also modify the VAR-002 standard in order to address some of the numerous notifications that are required by the currently enforceable standard.

Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR. Also provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)
Detailed description of this project can be found in the Attachment (pro forma VAR standards) and White Paper of this SAR submittal package.

Reliability Functions

Reliability Functions	
The Standard will Apply to the Following Functions (Check each one that applies.)	
☐ Regional Reliability Organization	Conducts the regional activities related to planning and operations, and coordinates activities of Responsible Entities to secure the reliability of the Bulk Electric System within the region and adjacent regions.
☒ Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☐ Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☐ Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☐ Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐ Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☐ Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☐ Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☐ Transmission Owner	Owns and maintains transmission facilities.
☒ Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☐ Distribution Provider	Delivers electrical energy to the End-use customer.
☒ Generator Owner	Owns and maintains generation facilities.
☒ Generator Operator	Operates generation unit(s) to provide real and reactive power.
☐ Purchasing-Selling	Purchases or sells energy, capacity, and necessary reliability-related

Reliability Functions		
	Entity	services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.
☐	Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles	
Applicable Reliability Principles (Check all that apply).	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☒	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☒	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☒	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.
Does the proposed Standard comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to	Yes

Reliability and Market Interface Principles	
access commercially non-sensitive information that is required for compliance with reliability standards.

Unofficial Comment Form

Project 2013-04 Voltage and Reactive Control (VAR) Revisions

Please **DO NOT** use this form for submitting comments. Please use the electronic form to submit comments on the draft VAR-001-4 and VAR-002-3 standards. The electronic comment form must be completed by 8:00 p.m. ET by **Tuesday, September 3, 2013**.

If you have questions please contact Soo Jin Kim via email or by telephone at 404-446-9742.

The project page may be accessed by clicking here.

Background Information

When the first versions of the VAR standards were approved in FERC Order No. 693,[1] the Commission also issued FERC issued several directives with regard to how to improve the standard. Each of the outstanding directives are explained in detail in the technical white paper (see project page).

The informal consensus building for VAR began in February 2013. Specifically, the ad hoc group engaged stakeholders on how best to address the FERC directives, remove paragraph 81 candidates, and implement results-based approaches. A discussion of the ad hoc group's consensus building and collaborative activities are also included in the technical white paper.

Based on stakeholder outreach, the VAR-001 and VAR-002 standards have been modified. The proposed VAR-001 answers most of the FERC directives from Order No. 693, and VAR-002 has been modified to address certain compliance issues today. This posting is soliciting comment on a pro forma standard and a Standard Authorization Request (SAR).

You do not have to answer all questions. Enter comments in simple text format. Bullets, numbers, and special formatting will not be retained.

[1] *See Mandatory Reliability Standards for the Bulk-Power System,* Order No. 693, FERC Stats. & Regs. ¶ 31,242, *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

Question

1. Do you have any specific questions or comments relating to the scope of the proposed pro forma standard or SAR?

☐ Yes
☐ No

Comments:

2. Do you have any specific questions or comments relating to the requirements in the proposed pro forma standards?

☐ Yes
☐ No

Comments:

3. Do you have any issues with the proposed timeframes for the notification requirements in VAR-002 R2 and R3? If you propose different timeframes, please explain how a change in the timeframe will not create a reliability gap?

☐ Yes
☐ No

Comments:

4. During outreach, several issues pertaining to voltage coordination were discussed, as outlined in the 'minority issues' section of the technical white paper. However, those issues are not addressed because such issues are outside of the scope of this project. What suggestions do you have for improving voltage coordination between TOPs and GOPs? Is it appropriate to address this issue in a Standards project?

Executive Summary

The VAR Reliability Standards provide the minimum requirements for maintaining voltage stability on the bulk-power system. The industry considers VAR-001 to represent transmission requirements for monitoring the reactive power performance of the system, and VAR-002 represents generator obligations for voltage support. When the VAR standards were initially approved by the Federal Energy Regulatory Commission ("FERC" or the "Commission") in 2006, the Commission provided several directives on how to improve the VAR standards. NERC initiated Project 2008-01 to address these FERC directives, but that project was unable to be completed due to a project reprioritization. Project 2008-01 and its Standard Authorization Request (SAR) used a prescriptive approach to address the FERC directives, and that project also contemplated adding an additional planning standard. This project took a different approach by implementing the Paragraph 81[1] and results-based standards initiatives. This project also utilized the recommendations from a panel of Independent Experts' Review of the NERC Reliability Standards. Due to this variance in approach, the informal development group is presenting a new SAR to post for industry comment.

In summary, FERC gave the following directives to modify VAR-001:

- Expand the applicability to include Reliability Coordinators (RCs) and load-serving entities (LSEs).
- Include detailed and definitive requirements on "established limits" and "sufficient reactive resources" and identify acceptable margins above the voltage instability points.
- To assist real-time operations for areas susceptible to voltage instability, include requirements to perform voltage stability analysis periodically, using online techniques where commercially available and offline techniques where online techniques are not available.
- Include controllable load among the reactive resources to satisfy reactive requirements.
- Address the power factor range at the interface between LSEs and the transmission grid.

FERC directed NERC to consider modifying VAR-002 to require more detailed and definitive requirements when defining the time frame associated with an "incident" of noncompliance. Hence, FERC directed NERC to consider a timeframe for allowing a generator to be out of schedule before having to make a notification to its TOP.

In early 2013, NERC initiated an informal development project to address the directives, and an informal development group was formed from industry subject matter experts, NERC staff, and staff from FERC's Office of Electric Regulation. The informal development group sought to answer FERC's directives and improve some of the compliance issues that exist today for the VAR standards. The informal development group drafted several pro forma versions of the VAR standard and sought broad industry feedback through individual phone conversations, conference calls, technical conferences, and webinars.

Since 2006, many changes have occurred that impact the VAR standards. Several new standards have been drafted and approved in the last seven years. Also, FERC recently issued a Notice of Proposed Rulemaking (NOPR) addressing Paragraph 81, and that NOPR recommends retiring certain VAR requirements that are redundant with Open-Access Transmission Tariffs (OATTs). In addition, VAR-002 has consistently been identified as one of the most violated standards, so certain compliance issues surround VAR-002 had to be addressed.

In concert with the Paragraph 81 initiative, each of the above-mentioned directives does not equate to a new VAR requirement. Instead, the informal development group removed certain redundancies with other standards and created requirements that provide for documented policies and procedures to address the above directives for VAR-001.

The pro forma VAR-001 has added RC monitoring requirements, and the standard requires each Transmission Operator (TOP) to have written operating policies and procedures used to define voltage limits. Those policies and procedures must set definitive guidelines on the frequency of system assessments. Further, the pro forma standard states that controllable load is a viable reactive power resource that can be used in the day-ahead and real-time operations. The informal development project did not address power factor, because the relevant requirement that currently addresses LSEs and

[1] *See North American Electric Reliability Corp.*, 138 FERC ¶ 61,193, at P 81, *order on reh'g and clarification*, 139 FERC ¶ 61,168 (2012).

power factor is proposed for retirement by FERC in its June 2013 NOPR on Paragraph 81 because the OATT covers the arrangement for ancillary services that include VAR purchases to maintain power factor.

Additionally, VAR-002 has been amended in the pro forma standard to provide for a noncompliance timeframe when a generator is out of voltage schedule and when reactive power equipment is out-of-service and then back in-service status again. The language not only addresses FERC's directive, but it also provides resolution to several compliance issues in existence today. Certain timing elements for VAR-002 may be debated during the formal development process, but the informal development group has reached a consensus on the principles of providing these time periods.

As detailed further below, the informal development group drafted the pro forma VAR standard in a manner that would accomplish three objectives: 1) address the FERC directives; 2) mitigate compliance issues for generators in VAR-002; and 3) simplify the TOP's requirements in VAR-001 while maintaining reliability and eliminating nuisance phone calls. The pro forma standard is not overly prescriptive, and Compliance has prepared guidance that will develop into RSAWs and auditor training. This guidance will allow for more predictability when the new VAR standard is implemented, and it will hopefully alleviate some industry concerns regarding future audits.

Purpose

The purpose of this white paper is to provide a summary of the issues, rationale, and support for the proposed revisions to the currently enforceable VAR standards, VAR-001 and VAR-002. This white paper also provides an explanation of how outstanding VAR directives from the Commission contained in Order No. 693[2] are addressed going forward. This white paper is a product of the informal development process, which provides for the formation of an informal development group. The informal development group met several times and conducted numerous webinars and technical conferences from February through June 2013. The information obtained through industry outreach was discussed thoroughly by the informal development group, and several of the discussion topics are reflected throughout this paper. In addition, the contents of this paper will give a foundation to the formal development process.

The ultimate goal of the Standards team is present the new VAR standards to the Board of Trustees in their November 2013 meeting. Thus, the formal Standards Drafting Team will be seeking final industry approval of the VAR standards by October 2013.

[2] *See Mandatory Reliability Standards for the Bulk-Power System,* Order No. 693, FERC Stats. & Regs. ¶ 31,242, *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

History of the VAR Informal Development

The informal development group started with a group of individuals that were originally part of Project 2008-01. Due to a project reprioritization conducted by the Standards Committee and NERC, Project 2008-01 was halted. There is some overlap between the current VAR project and project 2008-01, but the scope is slightly different. Project 2008-01 was moving toward creating a VAR planning standard in addition to modifying VAR-001 and VAR-002. The current project is only amending VAR-001 and VAR-002, and the current project remains predominantly focused on addressing the outstanding FERC directives.

The informal development group first met on a February 15, 2013 conference call. The meeting was to introduce the various parties and a coordinate logistics for the informal development process. The informal development group is currently comprised of the following:

- Dennis Chastain – Tennessee Valley Authority
- Bill Harm – PJM Interconnection L.L.C.
- Steve Hitchens – Bonneville Power Administration
- Sharma Kolluri – Entergy Services Inc.
- Martin Kaufman – ExxonMobil Research and Engineering Company
- Joshua Pierce – Southern Company
- Hari Singh – Xcel Energy
- Hamid Zakery – Calpine Corporation
- Scott Berry – Indiana Municipal Power Agency

Members of the informal development group met in person on February 27 and 28 in Atlanta. The group then convened several times over conference calls before an April 11 webinar.

The April 11 webinar was the first time the group proposed new VAR language to address a majority of the directives from Order No. 693. The industry provided significant feedback during two subsequent technical conferences. The first technical conference was hosted by Southern Company in Atlanta, Georgia, on April 18, 2013. The second technical conference was held at Xcel Energy in Denver, Colorado, on April 29, 2013. Both conferences provided an opportunity for the informal development group to listen to industry concerns regarding the VAR standards, and the informal development group answered numerous questions on the current draft of the pro forma standards.

The informal development group reconvened for a two-day meeting at Entergy on May 15, 2013. The group also invited several individuals who participated in the webinars and technical conferences to attend the meeting. During the May meeting, the VAR pro forma standard was modified several times. The informal development group continued the discussion on how to best address industry's concerns through electronic communications and several conference calls.

The next iteration of the pro forma standard was then presented to the industry on a June 14 webinar. The webinar contained several survey questions, and the informal development group was able to gauge whether a majority of industry supported the pro forma standard. Based on the survey and webinar feedback, the informal development group was able to amend the pro forma standard further before presenting the final draft to the Standards Committee on July 18, 2013.

Technical Discussion

Background

What is Reactive Power?

Reactive power does not have the same characteristics as real power. Real power is measured in watts and able to be transmitted over long distances. Real power is an energy supply that is eventually distributed to end-use customers. Reactive power is just as important as real power because it is necessary to maintain system stability. Reactive power supports voltage. Voltage is measured in volts, and electrical current is measured in amperes. Reactive power is measured in volt-amperes reactive (VARs). When the Bulk Electric System (BES) does not have enough reactive power, there is risk of a voltage collapse, which could lead to cascading outages. In fact, a lack of reactive power supply was a contributing factor to the large blackouts in 2003 and 2011.

Nature of Reactive Power and Why it is Necessary

Generally reactive power is needed to provide voltage support and maintain system stability. Prabha Kundur, a leading subject matter expert in system stability, explains, "[p]ower system stability may be broadly defined as that property of a power system that enables it to remain in a state of operating equilibrium under normal operating conditions and to regain an acceptable state of equilibrium after being subjected to a disturbance."[3] The VAR standards ensure that there is enough reactive power on the system to provide the voltage support necessary to avoid voltage collapse. Although there are numerous reactive power resources, the best and largest source of reactive power or VAR support comes from generators. However, the amount of reactive power that a generator can create is proportional to the amount of MWs being produced. Therefore, the more VARs produced at a generating facility, the fewer MWs produced.

VAR-001

The stated purpose of the VAR-001 standard is to ensure that voltage levels, reactive flows, and reactive resources are monitored, controlled, and maintained within limits in real time to protect equipment and the reliable operation of the interconnection. The VAR standards focus on the Operations horizon (which is real-time up to one year into the future). The informal development group is cognizant of the fact that the nature of reactive power on the network varies depending on local conditions. Thus, the group focused on the process that the requirements would detail, not the proper numbers a TOP should enforce in the standard. For VAR-001, the group would not put operational limits on how a TOP should manage voltage stability for its regions; more specifically, the informal development group did not want to place numerical requirements on what the proper operational limits should be for the continent. Operating margins vary due to specific system characteristics as well as the operating conditions. Rather than detailing a continent-wide back-off margin, the informal development group designed the pro forma VAR-001 to require the Transmission Operator to document policies and procedures used to establish, monitor, and control voltage and reactive power flows (Mvars). Those policies are then used to establish voltage and reactive power schedules for the generators.

Requirement R1

R1 requires that documented policies and procedures are in place. These policies and procedures must include criteria for the assessments of the TOP's systems. The policies will consequently include studies used to establish voltage schedules and associated tolerance bands. In addition, the system assessments must include dynamic voltage limits and operating margins. By requiring a documented policy and procedure, the reliability standard removes the opportunity for auditors or other parties to scrutinize a TOP's own system studies.

R1 also requires Transmission Operators to communicate their policies and procedures with their associated RC and neighboring TOPs. This type of communication relates to R2, which details how a TOP and RC take a system study and ensure sufficient reactive power is available to support both real-time and day-ahead operations.

Requirement R2

[3] Prabha Kundur, *Power System Stability and Control,* Electric Power Research Institute, p. 17 (1994).

R2 requires both TOPs and RCs to perform system assessments in order to schedule reactive resources for both the real-time and day-ahead time frames. By scheduling sufficient reactive resources, the TOP and RC are maintaining voltage levels (and consequently system stability) under both normal and contingency situation. R2 further defines "sufficient reactive resources," and those resources include controllable load pursuant to FERC Order No. 693.

Requirement R3

R3 requires each TOP to specify what criteria will exempt a generator from 1) having to follow a provided voltage schedule; or 2) providing a notification under VAR-002. The TOP must notify the generator when an exemption is given, but there are no requirements on what the criteria should be for exemptions. This enables TOPs to have flexibility when providing exemptions during maintenance or system events. For example, if a unit is experiencing a malfunction in AVR equipment, the TOP may provide a temporary exemption to the generator until the equipment is repaired.

Requirement R4

R4 requires each TOP to specify a voltage or reactive power schedule and associated tolerance band for each generator. By requiring both a tolerance band and a documented policy or procedure for establishing voltage schedules, there is a level of transparency as to how voltage or reactive power schedules were created. The informal development group refrained from providing any language that requires GOPs to mutually agree with TOPs on specific numbers. Such language could create disputes between the parties as to what the appropriate voltage schedule should be for a unit. To preserve a TOP's ability to assess and monitor its system, and in an effort not to undermine the TOP standards, R4 provides more transparency while clearly maintaining a TOP's role in determining voltage schedules.

Requirement R5

R5 ensures that the TOP knows the status of all reactive power resources, automatic voltage regulators, and power system stabilizers in its system. This requirement mandates that the TOP actively monitor the system for voltage issues, and the new measure language now specifies that electronically metered points and EMS data will serve as a compliance mechanism for this particular requirement.

Requirement R6

The informal development group did not modify the requirement regarding step-up transformer tap changes.

WECC Variance

FERC approved the WECC variance to VAR-001 on June 20, 2013.[4] The WECC variance eliminates the TOP's ability to allow for exemptions, and it also requires a TOP to (1) issue a choice of voltage schedules for each of the generating resources that are on-line and part of the BES in its area; (2) provide to Generator Operators (GOPs) a voltage schedule reference point; and (3) provide transmission equipment data and operating data requested by GOPs to support their set point conversion methodology.[5] The informal development group did not adopt the WECC variance because it is more stringent than the existing standard, and numerous TOPs want the flexibility to allow for exemptions from notification requirements, particularly when maintenance is being performed or when a generator's AVR is malfunctioning. However, the current pro forma standard does not affect the WECC variance. Since the WECC variance is retained, the VAR-001 standard is applicable to GOPs in the WECC region.

VAR-002

The purpose behind the VAR-002 standard is for generators to provide reactive and voltage control necessary to ensure voltage levels, reactive flows, and reactive resources are maintained within applicable Facility Ratings to protect equipment and the reliable operation of the interconnection. Currently, VAR-002 is problematic due the numerous violations for GOPs 1) when a unit deviates from schedule; and 2) when an AVR turns on, then off. In both instances, a generator has an obligation under the currently enforceable standard to call a TOP within 30 minutes. The current standard does not allow for any deviations from notification requirements; thus, the GOP must determine if it is more appropriate to make a notification or address a potential issue that is affecting the voltage schedule or AVR status. The notifications themselves also create "nuisance" phone calls for TOPs. Most TOPs have the ability to monitor voltage through telemeter equipment.

[4] *See Petition for Approval of Proposed Reliability Standard VAR-001-3 (WECC Variance)*, Letter Order, Docket No. RD13-6-000 (issued June 20, 2013).
[5] *See* VAR-001-3

Thus, most TOPs already know when a unit drifts out of schedule. In order to address both the compliance issues and FERC's directive to consider a noncompliance window, the pro forma VAR-002 proposes language that gives a GOP time to respond to an issue before notifying its TOP.

Requirement R2

R2 requires GOPs to follow a TOP-provided voltage or reactive power schedule. However, there is universal agreement among TOPs and GOPs that if a unit drifts out of schedule momentarily and then drifts back into schedule, there is no risk to the reliability of the system. However, under the current VAR-002 standard in effect, when a unit drifts out of schedule there is an obligation to notify the TOP. Also, when the unit goes back into schedule there is an obligation to notify the TOP again. Thus, for a slight deviation, a GOP may face two potential violations for failure to make notifications to the TOP.

Based on industry feedback, a TOP should be notified when a unit cannot follow a voltage schedule. However, notifications for every schedule change are harmful to reliability because such calls detract focus from addressing system issues as they occur. The new language in the pro forma standard for R2 requires a GOP to notify a TOP when 1) the unit has been out of schedule for 15 minutes; AND 2) when a unit cannot return to schedule. In most cases, a unit will not be able to return to schedule when it has encountered an operating limit. There are also instances when a system event is pulling the unit out of schedule, and the unit is too small to move its voltage back in schedule. In these situations, it is important for the TOP to be notified, because those units cannot provide anymore voltage support to combat a system event.

Requirement R3

R3 requires a GOP to notify its TOP within 30 minutes of a "status" change. The status change identifies whether a reactive resource is available for voltage support. In an effort to allow GOP to first identify and address why a status change has occurred, the new pro forma standard Requirement R3 gives the GOP an initial 15 minutes to correct and restore the status of any reactive power resource. However, if the status has not been corrected after 15 minutes, the GOP has 15 minutes to notify its associated TOP of the status change.

Requirements R1, R4, and R5

The informal development group did not modify the requirement regarding AVR and tap changes.

Monitoring

Both R2 and R3 inherently have several compliance issues with regard to how voltage is monitored and controlled. Most TOPs provide GOPs with a voltage schedule as the high side of the generator step-up transformer, but a large number of GOPs only have metering equipment on the low side of the transformer. Therefore, in order to meet a voltage schedule, but these GOPs will convert the "high-side" schedule to a "low-side" schedule. The low-side schedule is then usually translated into an AVR control point or target. However, for several smaller facilities and nuclear facilities, those generators have installed metering on the high-side. Also, some facilities have made additions to their facilities to add load-drop compensation to see monitoring on the high-side. Thus, although many Generators monitor voltage on the low side of the terminal, there are a significant number of facilities that monitor voltage on the high side. Generators that use high-side voltage reference for regulation receive voltage reference signals from their associated TOP. This can create an issue during audits, because the standard does not dictate which method is acceptable for monitoring voltage.

In order to develop a continent-wide standard that allows GOPs to monitor voltage based on existing equipment limitations, the language of pro forma VAR-002's measures was greatly augmented. Specifically, the GOPs were explicitly given the discretion to monitor on either the high side or low side of the transformer. The pertinent language added to M2 is, "[i]n order to identify when a unit is deviating from its schedule, GOPs will monitor voltage based on existing equipment at its facility. Therefore, GOPs have the option to operate on a voltage schedule on the high side or convert the high-side schedule to a low-side schedule at the GOP's discretion." This language is necessary to assure GOPs that the standard will not determine where specific equipment should be installed at a facility. Further, this language clarifies to an auditor that either high-side or low-side monitoring is sufficient for VAR-002 compliance.

AVR

Once the AVR is set and in "voltage controlling" mode, the AVR should automatically adjust to voltage swings. At issue is whether a generator is required to make any adjustments to a control-point or AVR setting when the AVR response is not enough to react to a voltage deviation or system event. There is a current debate in the industry as to what actions are

required to maintain system stability. From the Generator's perspective, the AVR is the best mechanism to address voltage, and several Generators advocate that if an AVR setting should be adjusted, then the respective TOP should direct that AVR change. The TOPs argue that if an event is occurring, there is not enough time to call each generator to dictate the specifications for an adjustment; further, the TOPs assert that generators have an obligation to maintain a voltage schedule that includes making the necessary AVR adjustments. This industry divide is not addressed in the pro forma standard presented today. The informal development group did not address changing underlying principles of the VAR-002 standard, because the scope of the project with regard to VAR-002 was merely to consider a non-compliance window. However, the issue may be revisited during the formal development stage by the standard development team.

Minority Issue on Voltage Coordination

Another issue that arose during the informal outreach was the need for more voltage coordination between GOPs and TOPs. Some GOPs advocated for VAR standards to be re-written in order require more coordination, but again since the scope of this project is to focus on FERC directives, the informal development group opted to require more detail on how the TOPs study their systems. This issue will be presented for comment during the balloting of the pro forma, and the formal drafting team will make recommendations based on comments received as to how to address this issue in the future.

Outstanding FERC Directives

The VAR standards were first approved in FERC Order No. 693.[6] However, in approving the standards, the Commission also gave several directives on how to improve the VAR standards for reliability purposes. VAR-001 targets the transmission responsibilities for maintaining voltage stability while VAR-002 focuses on generator functions. Order No. 693 summarized the directives for VAR-001 as requiring NERC to do the following:

> (1) expand the applicability to include RCs and LSEs; (2) include detailed and definitive requirements on "established limits" and "sufficient reactive resources" as discussed above, and identify acceptable margins above the voltage instability points; (3) to assist real-time operations for areas susceptible to voltage instability include requirements to perform voltage stability analysis periodically, using online techniques where commercially available and offline techniques where online techniques are not available; (4) include controllable load among the reactive resources to satisfy reactive requirements; and (5) address the power factor range at the interface between LSEs and the transmission grid.[7]

For VAR-002, FERC directed NERC to consider providing more definitive requirements on what a noncompliance window should be for mandatory notifications. Each of the relevant directives is explained in further detail below.

Directive from P 1855 of Order No. 693

"Accordingly, the ERO should modify VAR-001-1 to include reliability coordinators as applicable entities and include a new requirement(s) that identifies the reliability coordinator's monitoring responsibilities."

VAR Informal Consideration

The informal development group amended VAR-001 to make RCs applicable to this standard, and requirements were added that identify RC monitoring for voltage stability. The informal development group did not expand the VAR standards to be overly prescriptive with regard to how an RC should monitor its own system; further, the group did not want to duplicate the efforts of the IRO standards pending before FERC. Instead the group focused on the most critical elements necessary for an RC to monitor its system for voltage stability. An RC performs many monitoring functions, but for voltage stability it is necessary to ensure that 1) the RC is aware of how its TOPs are monitoring voltage, and 2) the RC is performing the adequate studies to ensure reactive resources are properly scheduled for both real-time and day-ahead operations. Although some entities in Texas provided feedback that certain RCs perform functions equivalent to a TOP, the informal development group did not expand VAR-001 to give parity to TOPs and RCs. Upon further investigation, these situations are addressed through contractual obligations that clearly outline the reliability roles of both parties. The new RC functions are reflected in the new VAR pro forma standard through requirements R1 and R2. Both requirements are detailed further below.

Directive from P 1858 of Order No. 693

"The Commission directs the ERO to address the reactive power requirements for LSEs on a comparable basis with purchasing-selling entities."

VAR Informal Consideration

This FERC directive was addressed in VAR-001-2.[8] The Commission also recently issued a NOPR regarding Paragraph 81 that recommended retiring the existing VAR requirement that initially answered FERC's directive in P 1858.[9] FERC's support for Paragraph 81 and rationale for proposing the retirement is:

---

[6] *See generally,* Order No. 693 at PP 1846-1885.

[7] Order No. 693 at P 1880.

[8] *See* FERC letter order, *NERC Petition for Approval of Proposed Modifications to Reliability Standards BAL-002-1; EOP-002-3; FAC-002-1; MOD-021-2; PRC-004-2; and VAR-001-2,* 134 FERC ¶ 61,015 (2011).

[9] *See Electric Reliability Organization Proposal to Retire Requirements in Reliability Standards,* Notice of Proposed Rulemaking, 143 FERC ¶ 61,251 (2013) ("NOPR").

> We propose to approve the retirement of VAR-001-2, Requirement R5 based on NERC's assertion that Requirement R5 is redundant with provisions of the *pro forma* OATT. Specifically, Schedule 2 of the open access transmission tariff requires transmission providers to provide reactive power resources, either directly or indirectly, and requires transmission customers to either purchase or self-supply reactive power resources.[10]

In light of this NOPR, the informal development group is not adding new language to the VAR standard that would address this directive. Further, there is an ongoing NERC effort to evaluate if purchasing-selling entities (PSEs) should continue to be a registered function. The informal development group may address this directive in the future, pending a final rulemaking from FERC and a determination on the status of the future applicability of standards to PSEs.

Directive from P 1861 of Order No. 693

"In the NOPR, the Commission asked for comments on acceptable ranges of net power factor at the interface at which the LSEs receive service from the Bulk-Power System during normal and extreme load conditions... The Commission believes that Reliability Standard VAR-001-1 is an appropriate place for the ERO to take steps to address these concerns by setting out requirements for transmission owners and LSEs to maintain an appropriate power factor range at their interface. **We direct the ERO to develop appropriate modifications to this Reliability Standard to address the power factor range at the interface between LSEs and the Bulk- Power System."**

VAR Informal Consideration

Initially, the informal development group addressed the directive on power factor in two ways. First, based on P 1863,[11] the informal development group considered requiring seasonal power factor data to be provided to the TOPs on request. This would ensure the system studies were based on accurate data. Second, the informal development group considered whether entities could ensure power factor is maintained by arranging for VARs when MWs are purchased. However, the recently issued NOPR recommends retiring the requirement that currently requires VARs to be acquired due to redundancy with OATT. The NOPR also recommends withdrawing P 1863 as a directive because the Commission clarified the paragraph to be general guidance, not a FERC directive to modify the standard.[12]

In addition, the informal development group did not further amend the pro forma standard to add obligations to maintain power factors, because the FAC-001 standard requires Transmission Owners (TOs) to set interconnection requirements including "Voltage, Reactive Power, and **power factor control**."[13] Interconnection agreements also define minimum power factor requirements as a contractual obligation.[14] In an effort to keep the VAR standard consistent with interconnection requirements established by contract, and consistent with the pro forma Generator Interconnection agreements pursuant to FERC Order No. 2003 which requires a 0.95 leading to 0.95 lagging power factor,[15] the informal group did not add any additional requirements at this time to address power factor.

Directive from P 1862 of Order No. 693

"We direct the ERO to include APPA's concern in the Reliability Standards development process. We note that transmission operators currently have access to data through their energy management systems to determine a range of

[10] NOPR at P 83.

[11] Order No. 693 at P 1863 (stating "[t]he Commission expects that the appropriate power factor range developed for the interface between the bulk electric system and the LSE from VAR-001-1 would be used as an input to the transmission and operations planning Reliability Standards").

[12] *See* NOPR at Attachment A.

[13] *See* FAC-001-0, R 2.1.9. (available at: http://www.nerc.com/files/FAC-001-0.pdf) (emphasis added).

Nat'l Ass'n of Regulatory Util. Comm'rs v. FERC, 475 F.3d 1277 (D.C. Cir. 2007), cert. denied, 552 U.S. 1230 (2008) (*establishing Large Generator Interconnection Agreement requirement).

[15] Order No. 2003 at P 542 (finding "[w]e adopt the power factor requirement of 0.95 leading to 0.95 lagging because it is a common practice in some NERC regions. If a Transmission Provider wants to adopt a different power factor requirement, Final Rule LGIA Article 9.6.1 permits it to do so as long as the power factor requirement applies to all generators on a comparable basis").

power factors at which load operates during various conditions, and **we suggest that the ERO use this type of data as a starting point for developing this modification."**

VAR Informal Consideration
APPA stated, "It may be difficult to reach an agreement on acceptable ranges of net power factors at the interfaces where LSEs receive service from the Bulk-Power System because the acceptable range of power factors at any particular point on the electrical system varies based on many location-specific factors. APPA further states that system power factors will be affected by the transmission infrastructure used to supply the load."[16] APPA's concerns were discussed, and the informal development group did not want to establish a particular range on power factor, especially since power factor requirements are detailed in interconnection agreements as discussed with the P 1861 directive.

Directive from P 1868 of Order No. 693

"In the NOPR, the Commission expressed concern that the technical requirements containing terms such as "established limits" or "sufficient reactive resources" are not definitive enough to address voltage instability and ensure reliable operations. To address this concern, the NOPR proposed directing the ERO to modify VAR-001-1 to include more detailed and definitive requirements on "established limits" and "sufficient reactive resources" and identify acceptable margins (i.e. voltage and/or reactive power margins) above voltage instability points to prevent voltage instability and to ensure reliable operations. **We will keep this direction, and direct the ERO to include this modification in this Reliability Standard**."

Directive from P 1869 of Order No. 693

We recognize that our proposed modification does not identify what definitive requirements the Reliability Standard should use for "established limits" and "sufficient reactive resources." **Rather, the ERO should develop appropriate requirements that address the Commission's concerns through the ERO Reliability Standards development process.** The Commission believes that the concerns of Dynegy, EEI and MISO are best addressed by the ERO in the Reliability Standards development process.

VAR Informal Consideration for PP 1868 and 1869.
In an effort to address this directive and in order to preserve the TOs' flexibility to monitor their systems accordingly, the informal development group added requirements in the pro forma standard VAR-001 Requirement R1 that require steady-state and voltage limits to be included in the criteria used to assess transmission systems:

> R1. Each Transmission Operator shall have documented policies or procedures that are implemented to establish, monitor, and control voltage levels and Reactive Power flows (Mvar flows) within limits as defined below:
>
> > R. 1.1. These documented policies or procedures shall include criteria used in system assessments. The criteria for the assessments shall include established steady-state and voltage stability limits with associated tolerance bands and operating margins.

Also, a new Requirement R2 was updated to include existing language on reactive resources that a TOP can schedule in both the real-time and day-ahead time frame. That list of sufficient reactive resources includes reactive generation scheduling, transmission line and reactive resource switching, and controllable load.

Directive from P 1875 of Order No. 693

In response to the concerns of APPA, SDG&E and EEI on the availability of tools, the Commission recognizes that transient voltage stability analysis is often conducted as an offline study, and that steady-state voltage stability analysis can be done online. The Commission clarifies that it does not wish to require anyone to use tools that are not validated for real-time operations. Taking these comments into consideration, the Commission clarifies its proposed modification from the NOPR. For the Final Rule, **we direct the ERO, through its Reliability Standards development process, to modify Reliability Standard VAR-001-1 to include Requirements to perform voltage stability analysis periodically, using online techniques where commercially-available, and offline simulation tools where online tools are not available, to assist real-time**

[16] Order No. 693 at P 1860.

operations. The ERO should consider the available technologies and software as it develops this modification to VAR-001-1 and identify a process to assure that the Reliability Standard is not limiting the application of validated software or other tools.

VAR Informal Consideration
The informal group determined that the Commission is not requiring TOPs to purchase new online models or to implement tools that will not adequately study a TOP's reactive power requirements. Instead, the group allowed the TOPs to create their own documented procedures for performing assessments in pro forma standard Requirement R1.

Further, TOPs may under the new pro forma standard align their voltage planning with the pending TPL standards currently being reviewed by the Commission. The TPL standards require voltage studies, as outlined below:

> **R5.** Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady-state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum specify a low voltage level and a maximum length of time that transient voltages may remain below that level. [17]

Directive from P 1879 of Order No. 693

The Commission noted in the NOPR that in many cases, load response and demand-side investment can reduce the need for reactive power capability in the system. Based on this assertion, the Commission proposed to direct the ERO to include controllable load among the reactive resources to satisfy reactive requirements for incorporation into Reliability Standard VAR-001-1. **While we affirm this requirement, we expect the ERO to consider the comments of SoCal Edison with regard to reliability and SMA in its process for developing the technical capability requirements for using controllable load as a reactive resource in the applicable Reliability Standards.**

VAR Informal Consideration
NERC addressed this directive in a prior version of the VAR standard,[18] but as mentioned above, the list for sufficient reactive resources that includes controllable load has been retained in R2.

Directive from P 1885 of Order No. 693

"Dynegy has suggested an improvement to Reliability Standard VAR-002-1, and NERC should consider this in its Reliability Standards development process."

Dynegy requested that VAR-002 be modified to include "more detailed and definitive requirements when defining the time frame associated with an 'incident'of non compliance."[19]

VAR Informal Consideration
The informal development team addressed this directive in two separate requirements. The noncompliance incidences at issue occur 1) when a generator deviates from a voltage or reactive power schedule; and 2) when a generator is not operating a unit in automatic voltage control mode; more specifically, automatic voltage regulator (AVR) should be in service and controlling voltage.

The new pro forma VAR-002 R2.1 addresses when a unit must notify its TOP when a unit is out of schedule:

> R.2.1. If a GOP drifts out of schedule, each Generator Operator shall notify its associated Transmission Operator within 15 minutes when both of the following conditions are met: 1) the GOP is operating outside of the prescribed voltage or

[17] *See*TPL-001-2, R5 (available at http://www.nerc.com/files/TPL-001-2.pdf).
[18] *See NERC Petition for Approval of Proposed Modifications to Reliability Standards BAL-002-1; EOP-002-3; FAC-002-1; MOD-021-2; PRC-004-2; and VAR-001-2,* 134 FERC ¶ 61,015 (2011).
[19] Order No. 693 at P 1883.

> Reactive Power schedule tolerance band[20] for 15 minutes; and 2) the GOP is no longer able to return to its voltage or Reactive Power schedule.

The new pro forma VAR-002 R3 addresses when a unit must contact its TOP when the facility is out of AVR:

> R3. Each Generator Operator shall notify its associated Transmission Operator of a status or capability change on any generator Reactive Power resource, including the status of each automatic voltage regulator and power system stabilizer and the expected duration of the change in status or capability within 30 minutes of the change. If the status has been restored within the first 15 minutes of such change, then there is no need to call TOP.

The informal development group established the 15-minute time requirements following much discussion. Several industry stakeholders advocated for a larger window of time before a notification must be made; however, there is no consensus on when a reliability gap would be created by expanding the time requirements. Some stakeholders also argued that 15 minutes was excessive.

[20] GOPs monitor and control voltage based on their equipment limitations. GOPs will monitor their voltage or Reactive Power schedule tolerance bands either at the high-side or low-side/terminal voltage.

Conclusion

The goal of the VAR informal development project is to provide a venue for addressing many of the issues that can arise during the formal development process. By engaging with industry stakeholders through an active dialogue, the informal development group was able to efficiently address the concerns of many entities through conference calls, webinars, and informal group meetings. The informal group collaborated over the past five months to develop robust pro forma VAR standards that will serve as the basis for a new VAR standard, which should be posted for industry comment in August 2013. This white paper serves to memorialize some of the discussions surrounding contentious VAR issues, and it provides a basis for the technical discussion that occurred during the informal process. For the aforementioned discussion, the informal development group recommends approval of the accompanying SAR and the posting of the pro forma standards in order to continue the progress on the VAR standards.

Entity Participants

Appendix B: Entity Participants

The below entities represent a non-exhaustive list of entities that had personnel that participated in the VAR informal development effort in some manner, which may include one of the following: direct participation on the ad-hoc group, inclusion on the wider distribution (the "plus" list), attendance at workshops or other technical discussions, participation in a webinar or teleconference, or by providing feedback to the group through a variety of methods (e.g., email, phone calls, etc.). Additionally, though not listed here, announcements were distributed to wider NERC distribution lists to provide the opportunity for entities that were not actively participating to join the effort.

VAR Mapping Document

Transition of VAR-001-3 and VAR-002-2b (the *pro forma* standard)

Standard: VAR-001-4 – Voltage and Reactive Control		
Requirement in Approved Standard	**Transitions to the below Requirement in New Standard or Other Action**	**Description and Change Justification**
VAR-001-3 R1	Requirement R1	The *pro forma* creates adds additional sub-requirements that requires the policies and procedures to include criteria for system assessments. The assessments must now include steady-state limits, voltage stability limits and associated operating margins, and voltage schedules along with associated tolerance bands. The sub-requirements also now mandate that information is shared with neighboring TOPs and the applicable RC.
VAR-001-3 R2	Requirement R2	The new requirement has been updated to incorporate real-time and day-ahead scheduling of resources. It eliminates the need for the existing R7, R8, and R9.
VAR-001-3 R3	Requirement R3	The new requirement has been simplified by removing the need to maintain an exemption list. Instead, the standard focuses on whether the exemption criteria are known and whether a granted exemption was communicated to the applicable Generator.

Standard: VAR-001-4 – Voltage and Reactive Control		
Requirement in Approved Standard	**Transitions to the below Requirement in New Standard or Other Action**	**Description and Change Justification**
VAR-001-3 R4	Requirement R4	The new requirements have been updated to allow the TOP to provide the voltage or Reactive Power schedule at either the high side or the low side of the GSU. Also as tolerance band is now required under the new requirement.
VAR-001-3 R5	Deleted	Pending a final rulemaking on P81, this requirement has been deleted.
VAR-001-3 R6	Requirement R5	The sub-requirement R6.1 was deleted because it is duplicative of VAR-002's requirement R1 and R2.
VAR-001-3 R7	Deleted	See comments for new R2.
VAR-001-3 R8	Deleted	See comments for new R2.
VAR-001-3 R9	Deleted	See comments for new R2.
VAR-001-3 R10	Deleted	This is duplicative of TOP-001-2 and the Tv definition.
VAR-001-3 R11	Requirement R6	The only change is the numbering due to other deletions.
VAR-001-3 R12	Deleted	This requirement was deleted because the EOP standards address taking any corrective action including load-shedding. Also the new TOP-002-3 R2 and TOP-001-2 R11 address the TOP taking corrective actions.

Standard: VAR-002-3 – Capacity Benefit Margin		
Requirement in Approved Standard	**Transitions to the below Requirement in New Standard or Other Action**	**Description and Change Justification**
VAR-002-2b R1	Requirement R1	The requirement has not been modified.

Standard: VAR-002-3 – Capacity Benefit Margin		
Requirement in Approved Standard	**Transitions to the below Requirement in New Standard or Other Action**	**Description and Change Justification**
VAR-002-2b R2	Requirement R2	The new *pro forma* requirement has been updated by including a new sub-requirement to allowing GOPs to only call in certain instances when deviating from voltage schedules .
VAR-002-2b R2	Requirement R3	The new *pro forma* requirement has been updated by including a new sub-requirement to allowing GOPs to investigate why the status has changed on AVR equipment before having to notify the TOP.
VAR-002-2b R2	Requirement R4	The requirement has not been modified.
VAR-002-2b R2	Requirement R5	The requirement has not been modified.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Compliance Operations

Draft Reliability Standard Compliance Guidance for VAR-001 and VAR-002

July 8, 2013

Introduction

The NERC Compliance department (Compliance) worked with the Informal VAR Group (IVG) in a review of pro forma VAR-001 and VAR-002 standards. The purpose of the review is to discuss the requirements of the pro forma standards to obtain an understanding of its intended purpose and necessary evidence to support compliance. The purpose of this document is to address specific questions posed by the IVG in order to aid in the wording of the requirements and provide a level of understanding regarding evidentiary support necessary to demonstrate compliance. In addition, a conclusion related to whether the pro forma standards provide reasonable guidance for compliance auditors is provided. However, this document makes no assessment as to the enforceability of the standard.

While all testing requires levels of auditor judgment, participating in these reviews allows Compliance to develop training and approaches to support a high level of consistency in audits conducted by the Regional Entities. The following questions will be used to aid in such auditor training.

IVG VAR-001 and VAR-002 Questions

Question 1

To show that VAR-001 policies or procedures are "implemented," would Compliance ask for a TOP to provide data around an "event?" Otherwise, would Compliance request TOPs to prove compliance over the entire audit period? What is the best way to provide sample data to support that VAR-001 requirements are being met?

Compliance Response to Question 1 (Compliance response in context of VAR-001 R1)

Part 1 – Compliance can use a range of approaches to understand and verify implementation. With regard to this standard, those approaches may include observing, interviewing, reviewing an entity's response to instances of voltage deviation that require operator intervention, as well as reviewing documentation for notifications of voltage deviations that may include exemption requests. Registered entities may also demonstrate the implementation of policies or procedures by providing documentation in connection with an event. Also, auditors may be independently aware of events occurring within the TOP's area, and the use of such events to determine the nature of an entity's response is evidence of implementation of policies and procedures. Alternatively, a lack of response to a known event could be evidence of noncompliance with implementation of policies and procedures.

Part 2 – Yes, the Rules of Procedure provide that a registered entity is required to be compliant with Reliability Standards during the audit period. A compliance audit should be appropriately scoped and testing designed to obtain a reasonable assurance of compliance. In this regard, though possible, it is unlikely an auditor would require levels of proof of compliance for an entire audit period and would use approaches such as those noted in Part 1 to gain reasonable assurance of compliance.

Part 3 – As noted in the answer to Part 1, there are a range of approaches to help an auditor determine compliance and those range of approaches should be used to help the registered entity demonstrate compliance. As noted above, those approaches may include observing, interviewing, providing documentation relative to an event, as well as documents generated during normal operations such as notifications of voltage deviations.

Question 2
For VAR-001 R2, would Compliance focus more on real-time directives? For the day-ahead time frame, is it enough to show studies that were used to schedule resources?

Compliance Response to Question 2
Part 1 – Compliance cannot commit to the level of testing that would or would not be performed on a requirement by requirement basis or favoring the testing of one sub-requirement over another. These determinations would be made in connection with the scoping of an audit for a specific registered entity.

Part 2 – No. The entity would be expected to provide the documentation for the day ahead scheduling in addition to documentation supporting that it was scheduled, as noted in the requirement.
The auditor would first gain an understanding of the entity's process for conducting the studies and the frequency the studies are performed. Based on the entities response, the auditor most likely would select a sample of studies to verify and ascertain whether the resulting actions, or non actions, were supported by such studies. Documented evidence existing at the time of the study selected by the auditor for verification would be considered stronger evidence than verbal explanations given by entities in response to inquiries during an audit.

Question 3
For VAR-001 R3, is the standard clear enough to allow for temporary exemptions?

Compliance Response to Question 3
Yes. The TOP would need to provide the criteria and evidence supporting the delivery of the exemption notification.

Question 4
With regard to VAR-002, will generators receive a violation for instances where a system event is affecting system voltage, but the generators made the appropriate conversions and set the AVRs to meet the original schedule provided by the TOP?

Compliance Response to Question 4 (Compliance response in context of VAR-002 R2)
No, the generator operators can only be responsible for maintaining the schedule provided by the TOP; if the TOP provides a new directive or schedule, the GOP is required to follow the new directive.

Question 5
Related to VAR-002, generators monitor voltage on both the low side and high side of the GSU and the "number" being monitored by the Generator will not always equate to the number provided by the TOP. Does this need to be spelled out in the requirement?

Compliance Response to Question 5 (Compliance response in context of VAR-002 R2)
The Generator should be able to provide documentation that identifies the "number" being monitored and the calculation demonstrating how the "number" equates to the schedule provided by the TOP.

Question 6
For VAR-002 R2, the Generator demonstrates compliance by executing the three sub-tasks. Is it clear that those are the only items that a Generator will need to do to maintain voltage? There are events when a unit will be dragged out of voltage schedule, and a unit is limited by its operating capacity to prevent such instances. Those instances should not be a violation under VAR-002 R2, if the GOP is doing everything possible to bring the unit back into a voltage schedule (i.e., the three sub-requirements).

Compliance Response to Question 6
The main requirement is clearly stated, that except for an exemption, each of the three sub-requirements must be performed. In this regard, the Generator must document their performance to provide evidence to the auditor of compliance. We have provided additional notes for R2.1-.3 below:

R2.1: Based on the language modification, the Generator may operate up to 30 minutes prior to notifying the TOP that the Generator cannot return to its schedule. The sub-requirement would not require the documentation for instances where a Generator returned to their schedule in 30 minutes or less. Instances greater than 30 minutes would require documentation supporting the Generator contacting the TOP, documentation showing when the Generator first began operating outside of the schedule and when the determination was made the GOP was no longer able to return to its schedule.

R2.2: Based on conversations with the IVG, the only alternative is to manually control the reactive output. In this regard, it is suggested that, unless another method exists, the language be changed to "shall use a manual method."

R2.3 The sub-requirement is self explanatory and would require the Generator to provide documentation supporting compliance or the written explanation.

Question 7

For VAR-002 requirement R3, the requirement allows for a 15 minute grace-period to reporting a status change, if the issue with reactive resource is corrected. Is that point clear? This requirement is concerned with allowing a Generator to resolve an issue with a resource without having to call or notify the TOP every time the status of the resources goes in and out of service. Also, the IVG would like for telemetered points to count as an automatic notification to the TOP. Is such notification acceptable to Compliance?

Compliance Response to Question 7

Part 1 – The Requirement is clear, notification is only required between minutes 16 and 30, regardless of restoration.

Part 2 – If telemetered points meet the requirement of a notification, the requirement will need to explain the supporting documentation that substantiates compliance (what evidence can be provided to an auditor.)

Conclusion

In general, Compliance finds the pro forma standards provide a reasonable level of guidance for Compliance Auditors to conduct audits in a consistent manner. The standard establishes timelines, data requirements, and ownership of specific actions. In general, the standard would provide reasonable guidance to develop training for Compliance Auditors to execute their reviews. Compliance does recommend the IVG address the issues noted in the previous section of this document related to the standards.

Following final approval of the Reliability Standard, Compliance will develop the final Reliability Standards Auditor Worksheet (RSAW) and associated training.

Proposed Timeline for the VAR Standard Drafting Team (SDT)		
Anticipated Date	**Location**	**Event**
July 2013	-	SC Authorizes SAR and pro forma Standards for Posting
July 2013		Conduct Nominations for VAR Project
July 2013	-	Post SAR and pro forma Standards for 45-Day Initial Comment Period
August 2013	-	Conduct Ballot
September 2013	-	45-Day Comment Period and Ballot Closes
September 2013	TBD	VAR Standard Drafting Team Face to Face Meeting to Respond to Respond to Initial Comments and Revise as Necessary
September 2013	-	Conduct Final Ballot
November 7, 2013	-	NERC Board of Trustees Adoption
December 31, 2013	-	NERC Files Petition with the Applicable Governmental Authorities

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

Project 2013-04 Voltage and Reactive Control
VAR-001-4 & VAR-002-3

Ballot and Non-Binding Poll now open through September 3, 2013

Now Available

A ballot for **VAR-001-4 and VAR-002-3** and non-binding poll of the associated Violation Risk Factors and Violation Severity Levels is open through **8 p.m. Eastern on Tuesday, September 3, 2013.**

Background information for this project can be found on the project page.

Instructions

Members of the ballot pool associated with this project may log in and submit their vote for the standard by clicking here.

As a reminder, this ballot is being conducted under the revised Standard Processes Manual, which requires all negative votes to have an associated comment submitted (or an indication of support of another entity's comments). Please see NERC's announcement regarding the balloting software updates and the guidance document, which explains how to cast your ballot and note if you've made a comment in the online comment form or support another entity's comment.

Next Steps

The ballot results will be announced and posted on the project page. The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standard(s). If the comments do not show the need for significant revisions, the standard(s) will proceed to a final ballot.

Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Wendy Muller, Standards Development Administrator, at wendy.muller@nerc.net or at 404-446-2560.

Standards Announcement

Project 2013-04 Voltage and Reactive Control
VAR-001-4 & VAR-002-3

Comment Period: July 19, 2013 – September 3, 2013
Ballot Pools Forming Now: July 19, 2013 – August 19, 2013

Upcoming:
Ballot and Non-Binding Poll: August 23, 2013 – September 3, 2013

Now Available

A 45-day formal comment period for **VAR-001-4 and VAR-002-3** is open through **8 p.m. Eastern on Tuesday, September 3, 2013.** The standard authorization request (SAR) for this project is also posted for comment. Additional supporting documents are posted for information. A ballot pool is being formed and the ballot pool window is open through 8 a.m. Eastern on **Monday, August 19, 2013** *(please note that ballot pools close at 8 a.m. Eastern and mark your calendar accordingly).*

This project began with an informal development process to address outstanding FERC directives from Order 693 and compliance issues. The modifications to VAR-001 and VAR-002 were drafted in tandem, and several requirements in one standard reference the other standard. Accordingly, the standards are being balloted together. Further, in an effort to support Paragraph 81 and the results-based standard concepts, informal development is proposing six requirements for retirement. The goal is to present the standards to the NERC Board of Trustees in November 2013.

Background information, including other supporting documents for this project, can be found on the project page. Please contact either Soo Jin Kim, the standards developer or a participant on the informal development group if you would like additional information.

Instructions for Joining Ballot Pool(s)

Ballot pools are being formed for the standards mentioned and the associated non-binding polls in this project. Registered Ballot Body members must join the ballot pools to be eligible to vote in the balloting and submit an opinion for the non-binding polls of the associated VRFs and VSLs. Registered Ballot Body members may join the ballot pools at the following page: Join Ballot Pools

During the pre-ballot window, members of the ballot pool may communicate with one another by using their "ballot pool list server." (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list servers.) The list servers for this project are:

Ballot for VAR-001-4 & VAR-002-3: bp-2013-04_VAR_1_in@nerc.com
Non-Binding Poll for VAR-001-4 & VAR-002-3: bp-2013-04_VAR_NB_1_in@nerc.com

Instructions for Commenting

A formal comment period is open through **8 p.m. Eastern on Tuesday, September 3, 2013**. Please use the electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Wendy Muller. An off-line, unofficial copy of the comment forms are posted on the project page.

Next Steps

A ballot for the standards and non-binding poll of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) will be conducted as previously outlined.

Standards Development Process

The Standards Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Standard Drafting Team Nominations

Project 2010-03 Modeling Data: MOD-032-1, MOD-033-1
Project 2010-04 Demand Data: MOD-031-1
Project 2013-04 Voltage and Reactive Control: VAR-001-3, VAR-002-4
Project 2010-01 Training: PER-005-2

Nomination Period Open: July 24, 2013 – August 2, 2013

Link to Official Nomination Form
Link to Word Version of Nomination Form

Background
These projects have recently transitioned from informal development to formal development. Ad hoc groups developed Standard Authorization Requests, pro-forma Reliability Standards, a technical white paper and supporting documents through the stakeholder consensus building informal development process which are currently posted for comment with upcoming ballots. The NERC Standards Committee is seeking industry experts to serve on standard drafting teams for formal development.

Each standard drafting team (SDT) is proposed to consist of a maximum of 10 members. SDT members are expected to attend all (or at least the vast majority) of the face-to-face SDT meetings (projected to be 3 days a month) as well as participate in all the SDT meetings held via conference calls (projected to be 2 to 5 days a month) for the remainder of 2013. Nominees are asked to be mindful of the time commitment this project will require, and volunteer only if their schedule will allow them to actively participate.

Background information about each project including the projected schedule is available on the project pages. The stakeholders who comprised the ad hoc group participants can be found at the links below:

- Project 2010-03 Modeling Data
- Project 2010-04 Demand Data
- Project 2013-04 Voltage and Reactive Control
- Project 2010-01 Training

Notice to all ad hoc group participants: if you are interested in continuing on the SDT you must nominate yourself to be considered for possible inclusion on the team.

For all projects below, the following are beneficial, but not required: team members with experience in compliance, legal, regulatory, facilitation, technical writing, previous drafting team experience, or experience with developing standards inside or outside (e.g., IEEE, NAESB, ANSI, etc.) of the NERC process. Any person interested in being chair of a SDT must be willing to undergo one half day of facilitation training prior to the first team meeting.

Further, nominees should have technical expertise in the subject matter of the standard drafting team on which they wish to serve, as identified below:

- Project 2010-03 Modeling Data: MOD-032-1, MOD-033-1 – Nominees should have experience in one or more of the following areas: transmission planning, steady-state and dynamics modeling, and system model validation. The project is also seeking perspectives from each Interconnection and from various organizations whose functions are contemplated to be subject to the Reliability Standards.
- Project 2010-04 Demand Data: MOD-031-1 – Nominees should have experience in one or more of the following areas: transmission operations, transmission planning, operations planning, and resource planning.
- Project 2013-04 Voltage and Reactive Control: VAR-001-4, VAR-002-3 – Nominees should have experience in one or more of the following areas: transmission operations, transmission planning, reliability coordination, and generator operation.
- Project 2010-01 Training: PER-005-2 – Nominees should have experience in training or transmission and generation operations.

Instructions for Submitting a Nomination to Participate on a Standard Drafting Team

If you are interested in serving on a SDT, please complete this nomination form by **August 2, 2013**. One nomination form must be submitted for each SDT an individual wishes to volunteer for, describing the individual's experience or qualifications related to that project.

An unofficial Word version of the nomination form is posted on the Standard Drafting Team Vacancies page.

Standards Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our gratitude to all those who participate.

For more information or assistance, please contact Wendy Muller, Standards Development Administrator, at wendy.muller@nerc.net or at 404-446-2560.

North American Electric Reliability Corporation
3353 Peachtree Rd, NE
Suite 600, North Tower

Nomination Form

Standard Drafting Team Members

Project 2010-03 Modeling Data: MOD-032-1, MOD-033-1
Project 2010-04 Demand Data: MOD-031-1
Project 2013-04 Voltage and Reactive Control: VAR-001-3, VAR-002-4
Project 2010-01 Training: PER-005-2

If you are interested in serving on a standard drafting team for one of the projects above, please complete this nomination form by **August 2, 2013**. One nomination form should be submitted for each standard drafting team an individual wishes to volunteer for, describing the individual's experience or qualifications related to that project. If you have any questions, please contact Valerie Agnew at valerie.agnew@nerc.net.

By submitting the following information, you are indicating your willingness and agreement to actively participate in the Standard Drafting Team (SDT) meetings if appointed to the SDT by the Standards Committee. This means that if you are appointed to the SDT, you are expected to attend all (or at least the vast majority) of the face-to-face SDT meetings (projected to be 3 days a month) within the projected schedule as well as participate in all the SDT meetings held via conference calls (projected to be 3-5 days a month) for the durations of 2013. Nominees are asked to be mindful of the time commitment this project will require, and volunteer only if their schedule will allow them to actively participate. The projected schedules can be found on the project pages below.

- Project 2010-03 Modeling Data
- Project 2010-04 Demand Data
- Project 2013-04 Voltage and Reactive Control
- Project 2010-01 Training

Thank you for volunteering! All nominees will be contacted with the disposition of their nomination after the Standards Committee appoints a team for the project for which you have volunteered.

Name:	
Select the Project for which the nominee is volunteering:	☐ Project 2010-03 Modeling Data: MOD-032-1, MOD-033-1 ☐ Project 2010-04 Demand Data: MOD-031-1 ☐ Project 2013-04 Voltage and Reactive Control: VAR-001-3, VAR-002-4

	☐ Project 2010-01 Training: PER-005-2
Organization:	
Address:	
Telephone:	
E-mail:	

Please briefly describe your experience and qualifications to serve on the selected Standard Drafting Team:

If you are currently a member of any NERC drafting team, please list each team here:

☐ Not currently on any active SAR drafting team, standard drafting team, standard review team, or informal ad hoc group.

☐ Currently a member of the following SAR, standard drafting team(s), standard review team(s), or informal ad hoc group:

If you previously worked on any NERC drafting team please identify the team(s):

☐ No prior NERC SAR or standard drafting team experience.

☐ Prior experience on the following team(s):

Select each NERC Region in which you have experience relevant to the Project for which you are volunteering:

☐ ERCOT	☐ NPCC	☐ SPP
☐ FRCC	☐ RFC	☐ WECC
☐ MRO	☐ SERC	☐ NA – Not Applicable

Select each Function[1] in which you have current or prior expertise:	
☐ Balancing Authority	☐ Transmission Operator
☐ Compliance Enforcement Authority	☐ Transmission Owner
☐ Distribution Provider	☐ Transmission Planner
☐ Generator Operator	☐ Transmission Service Provider
☐ Generator Owner	☐ Purchasing-selling Entity
☐ Interchange Authority	☐ Reliability Coordinator
☐ Load-serving Entity	☐ Reliability Assurer
☐ Market Operator	☐ Resource Planner
☐ Planning Coordinator	

Provide the names and contact information for two references who could attest to your technical qualifications and your ability to work well in a group:			
Name:		Telephone:	
Organization:		E-mail:	
Name:		Telephone:	
Organization:		E-mail:	

Provide the name of your immediate supervisor if not provided above:			
Name:		Telephone:

Ballot and Non-Binding Poll Results

Now Available

A ballot for **VAR-001-4 and VAR-002-3** and non-binding poll of the associated Violation Risk Factors and Violation Severity Levels concluded at **8 p.m. Eastern on Tuesday, September 3, 2013.**

Voting statistics are listed below, and the Ballot Results page provides a link to the detailed results for the ballot.

Approval	Non-binding Poll Results
Quorum: 81.89%	Quorum: 79.95%
Approval: 43.79%	Supportive Opinions: 44.23%

Background information for this project can be found on the project page.

Next Steps

The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standard. The standard will then proceed to an additional comment period and ballot.

Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.
