Based on the SDT's experience, scheduled outages of voltage-regulating equipment at a dispersed power producing resource traditionally has been provided to the BA and TOP at the aggregate Facility level for dispersed power producing resources. Outages of voltage-regulating equipment at a dispersed power producing resource are coordinated typically as a reduction in Reactive Power capabilities, specifying whether it is inductive, capacitive, or both. Additionally, automatic voltage regulators that do not necessarily provide Reactive Power, but direct the actions of equipment that do supply Reactive Power, are typically coordinated at the aggregate Facility level as they usually are the master controller for all voltage-regulating equipment at the Facility. A key aspect of the SDT project is to maintain the status quo, if it is determined not to cause a reliability gap. *The SDT has not found or been made aware of a reliability gap that would prompt this team to apply R2 to any point less than the dispersed power producing resource aggregated Facility level and, as such, determined a modification to the applicability of this requirement is necessary for dispersed power producing resources.*

4.11.4.3 Requirement R3

The purpose of Requirement R3 as it relates to GOPs is to ensure scheduled outages of telemetering and control equipment and associated communication channels are planned and coordinated among BAs and TOPs. Based on the SDT's technical expertise, scheduled outages of telemetering and control equipment and associated communication channels at a dispersed power producing resource traditionally have been provided to the BA and TOP at the aggregate Facility level. In addition, only scheduled outages of telemetering and control equipment and associated communication channels that can affect the BA and TOP are coordinated with the BA and TOP. *Therefore, the applicability of this requirement does not need to be changed for dispersed power producing resources.*

4.11.5 TOP-006 — Monitoring System Conditions

The purpose of this standard as it relates to GOPs is to ensure BAs and TOPs know the status of all generation resources available for use as informed by the GOP. It should also be noted that the purpose of this standard is to ensure that critical reliability parameters are monitored in real time. It then can be extrapolated that the requirement, "GOP shall inform…," is done by sending dispersed power producing

resource telemetry in real time and through a digital communication medium, such as an ICCP link or RTU. The SDT concludes that a modification to the applicability of this requirement is necessary for dispersed power producing resources. The SDT is recommending that this requirement be applied at the aggregate Facility level for dispersed power producing resources for the following reasons:

- This is consistent with Inclusion I2 of the revised BES definition, which includes generating units greater than 20 MVA. If removing "less than 20 MVA" would cause a burden to the BPS, then the threshold for inclusion in the BES would have been less than 20 MVA.
- Routine maintenance is frequently completed on a small portion of the entire Facility (e.g. 2% of the generators are out of service on any given day) such as to not have a significant impact to the output capability of the Facility. Additionally, it is not uncommon to have individual generating units at a dispersed power producing resource to go into a failure mode due to internal factors of the equipment, such as hydraulic fluid pressure tolerances, gearbox-bearing thermal tolerances, etc. As such, coordinating each individual generating unit outage would burden the TOP without providing an increase in reliability to the interconnected BPS.
- As this standard requires real-time monitoring, this is most likely completed through a digital medium such as an ICCP link or RTU. The data that a dispersed power resource provides to the BA and TOP in real time should include the aggregate active power output of the Facility, among other telemetry points. These data specifications are usually outlined in interconnection agreements among the parties.

Based on the SDT's technical expertise, BAs and TOPs are informed by the GOP of all generation resources available at the dispersed power producing resource at the aggregate Facility level. Traditionally the dispersed power producing resources provide the BA and TOP, at minimum, the following telemetry points in real time: aggregate Real Power, aggregate Reactive Power, and main high-side circuit breaker status. A key aspect of the SDT project is to maintain the status quo, if it is determined not to cause a reliability gap. *The SDT has not found or been made aware of a reliability gap that would prompt this team to apply these requirement to any point less than where the dispersed power producing resource aggregates and, as such, recommends a modification to the applicability of this requirement for dispersed power-producing resources.*

4.12 TPL

At the time of this paper, these standards do not affect GOs or GOPs directly. Input from GO or GOP entities is provided to transmission planning entities through the MOD standards. *Therefore, the applicability of the TPL standards does not need to be changed for dispersed power producing resources.*

4.13 VAR

The VAR standards exist to ensure that voltage levels, reactive flows, and reactive resources are monitored, controlled, and maintained. Two VAR standards apply to GOs and/or GOPs. The voltage and/or reactive schedule provided by TOPs is specified to be at the point of interconnection or the point specified in the interconnection agreement.

4.13.1 VAR-001 — Voltage and Reactive Control (WECC Regional Variance)

The purpose of this standard as it relates to GOPs in WECC is to ensure a generator voltage schedule is issued that is appropriate for the type of generator(s) at a specific Facility. Additionally, it requires GOPs to have a methodology for how the voltage schedule is met, taking into account the type of equipment used to maintain the voltage schedule. Based on the SDT's technical expertise, voltage control and voltage schedule adherence for dispersed power producing resources occurs at the aggregate Facility level. There is no need to differentiate dispersed generation resources from any other GOP resources. *Therefore, the applicability of VAR-001 does not need to be changed for dispersed generation resources.*

4.13.2 VAR-002-2b — Generator Operation for Maintaining Network Voltage Schedules
VAR-002-3 — Generator Operation for Maintaining Network Voltage Schedules

The purpose of these standards as they relate to GOs and GOPs is to ensure generators operate in automatic voltage control mode as required by the TOP voltage or reactive power schedule provided to ensure voltage levels, reactive flows, and reactive resources are maintained within applicable Facility Ratings to protect equipment and reliability of the Interconnection. Based on the SDT's technical expertise, voltage control and voltage schedule adherence for dispersed power producing resources occurs at the aggregate Facility level, and such guidance should be provided.

In addition, the voltage-controlling equipment and the methodology to ensure the Facility has an automatic and dynamic response to ensure the TOP's instructions are maintained can be very different for each Facility. It is implied in VAR-001-3 that each TOP should understand capabilities of the generation Facility and the requirements of the transmission system to ensure that a mutually agreeable solution/schedule is used.

4.13.3 VAR-002-2b — Requirement R3.1
VAR-002-3 — Requirement R4

The purpose of these requirements is to ensure that a GOP notifies the TOP, within 30 minutes, of any status and capability changes of any generator Reactive Power resource, including automatic voltage regulator, power system stabilizer, or alternative voltage controlling device. Based on the experience of the SDT, status and capability changes are traditionally coordinated at the aggregate Facility level point of interconnection. *Therefore, the SDT has recommended changes to the standard to clarify the applicability of VAR-002-2b R3.1 and VAR-002-3 R4 for dispersed power-producing resources. These changes were successfully balloted in VAR-002-4 on November 6, 2014, and approved by the Board on November 13, 2014.*

4.13.4 VAR-002-2b — Requirement R4
VAR-002-3 — Requirement R5

The purpose of these requirements is to ensure that Transmission Operators and Transmission Planners have appropriate information and provide guidance to the GOP in regard to Generator Operators' transformers to ensure voltage levels, reactive flows, and reactive resources are maintained within applicable Facility Ratings to protect equipment and reliability of the Interconnection. Based on the experience of the SDT, dispersed power producing resources' individual generator transformers traditionally have been excluded from the requirements of VAR-002-2b R4 and VAR-002-3 R5, as they

are not used to improve voltage performance on the Interconnection. As such, applicability should be limited to transformers with at least one winding at a voltage of 100 kV or above. *Therefore, the SDT has recommended changes to the standard to clarify the applicability of VAR-002-2b R4 and VAR-002-3 R5 for dispersed generation resources. These changes were successfully balloted in VAR-002-4 on November 6, 2014, and approved by the Board on November 13, 2014.*

4.14 CIP

4.14.1 CIP Version 5

The CIP standards are still under revision in Project 2014-02. The DGR SDT and the CIP SDT continue to coordinate revisions to the CIP standards and will update this section to reflect the outcome of that effort at the appropriate time.

The CIP standards ensure physical and cyber security for BES Cyber Assets and BES Cyber Systems critical to the reliability and security of the BES. CIP-002 identifies critical assets or systems of a Facility, while CIP-003 to CIP-011 depend on the outcome of the CIP-002 assessment to determine applicability.

During the first comment period for the Project 2014-02 CIP Version 5 Revisions, the SDT received comments to modify CIP-003-6 in the Applicability section. The CIP SDT made significant modifications to the second posting of CIP-003-6 to take into account all of the comments received. This was posted for an additional 45-day comment and ballot period on September 3, 2014.

At its September meeting, the DGR SDT had a focused discussion with the CIP SDT surrounding the technical nature of the dispersed power producing resources and how it relates to the CIP standards. The coordinating effort resulted in discussions of the revised CIP-003-6. As for that posted revised standard, the CIP SDT took the approach of including an Attachment 1 for Responsible Entities. Attachment 1 requires elements to be developed in Responsible Entities' cybersecurity plans for assets containing low-impact BES cyber systems. The elements in CIP-003-6, Attachment 1 allow flexibility for the controls to be established for each of the main four elements below. The CIP SDT encourages observers of the DGR SDT to review Attachment 1 in detail. Below is some information regarding the attachment.

Element 1: Security Awareness

The intent of the security awareness program is for entities to reinforce good cybersecurity practices with their personnel at least once every 15 calendar months. The entity decides the topics and how it schedules them. The Responsible Entity should be able to produce the awareness material that was delivered and the delivery method(s) (posters, emails, topics at staff meetings, etc.) that were used. The SDT does not intend that the Responsible Entity must maintain lists of recipients and track the reception of the awareness material by personnel.

Element 2: Physical Security

The Responsible Entity has flexibility in the controls used to restrict physical access to low-impact BES Cyber Systems at a BES asset using one or a combination of access controls, monitoring controls, or other operational, procedural, or technical physical security controls. Entities may utilize perimeter controls (e.g., fences with locked gates, guards, site access policies, etc.) and/or more granular areas of physical

access control in areas where low-impact BES Cyber Systems are located, such as control rooms or control houses. User authorization programs and lists of authorized users are not required.

Element 3: Electronic Access Controls

Where Low Impact External Routable Connectivity (LERC) or Dial-up Connectivity exists, the Responsible Entity must document and implement controls that include the LERC and Dial-up Connectivity to the BES asset such that the low-impact BES Cyber Systems located at the BES asset are protected. Two glossary terms are included in order to help clarify and simplify the language in Attachment 1. The SDT's intent in creating these terms is to avoid confusion with the similar concepts and requirements (ESP, EAP, ERC, EACMS) needed for high- and medium-impact BES Cyber Systems by using separate terms that apply only to assets containing low-impact BES Cyber Systems.

Element 4: Cyber Security Incident Response

The entity should have one or more documented cybersecurity incident response plan that includes each of the topics listed. For assets that do not have LERC, it is not the intent to increase their risk by increasing the level of connectivity in order to have real-time monitoring. The intent is, if in the normal course of business suspicious activities are noted at an asset containing low-impact BES Cyber Systems, a cybersecurity incident response plan will guide the entity through responding to the incident and reporting the incident if it rises to the level of a Reportable Cyber Security Incident.

Therefore, the DGR SDT recommends that no changes be made to the proposed CIP-003-6. CIP-002-5.1 needs to remain as is, because entities must go through the process for identifying and categorizing their BES Cyber Systems and associated BES Cyber Assets. The controls put in place for proposed CIP-003-6, Attachment 1, are not burdensome, are realistic and achievable, and do not express undue compliance burden. In conclusion, the DGR SDT states that the reliability objective of these controls is adequate and the applicability of CIP-003-6 should not be modified.

The SDT states that the CIP Version 5 Revisions SDT should consider developing guidance documentation around the following areas:

- Low-impact BES Cyber Systems that must comply with a limited number of requirements, all located in CIP-003-5. The only technical requirement is R2, which will be modified during the current drafting activity to add clarity to the requirement. The SDT notes that the CIP Version 5 Revisions SDT should consider developing guidance around how this requirement relates to dispersed generation.
- Any programmable logic device that has the capability to shut down the plant within 15 minutes.
- Remote access from third-party entities into the SCADA systems that control the aggregate capacity of a Facility should be assessed to determine if there is a need of any additional cybersecurity policies.

The SDT intends to recommend guidance for those companies that only operate their turbines from one central location. Individual Elements lumped into a BES Cyber System should be addressed. When operations are on a turbine-by-turbine basis, the SDT believes there should not be rigid controls in place. The inability to "swim upstream" should be addressed as well. Further, the guidance intends to address when manufacturers operate or have control of the SCADA environment to conduct troubleshooting and other tasks, and ensure that proper security is in place.

NERC staff has committed to facilitate communication between the SDT and the CIP Version 5 Revisions SDT as appropriate to ensure alignment and to develop language for guidance, coordinated between the two SDTs. *Therefore, the applicability of CIP standards does not need to be changed for dispersed generation resources.*

Standards Authorization Request Form

When completed, please email this form to:
sarcomm@nerc.com

NERC welcomes suggestions to improve the reliability of the Bulk-Power System through improved reliability standards. Please use this form to submit your request to propose a new or a revision to a NERC's Reliability Standard.

Request to propose a new or a revision to a Reliability Standard			
Title of Proposed Standard:	Internal Communications Capabilities		
Date Submitted:	June 10, 2015		
SAR Requester Information			
Name:	Ryan Stewart		
Organization:	NERC		
Telephone:	404-446-9712	E-mail:	Ryan.Stewart@nerc.net
SAR Type (Check as many as applicable)			
☒ New Standard		☐ Withdrawal of existing Standard	
☒ Revision to existing Standard		☐ Urgent Action	

SAR Information
Purpose (Describe what the standard action will achieve in support of Bulk Electric System reliability.):
The purpose of the proposed project is to address the directive from FERC Order No. 808 to modify the COM-001-2 standard or develop a new standard to address "internal communications capabilities that could involve the issuance or receipt of Operating Instructions or other communications that could have an impact on reliability." Order No. 808, at P 1. See quotes below from Order No. 808, at P 41 for more specificity within FERC's directive.

SAR Information
Industry Need (What is the industry problem this request is trying to solve?):
On April 16, 2015, FERC issued Order No. 808, Communications Reliability Standards. In this order, FERC approved COM-001-2 and also directed that NERC to either develop a new standard or make the following modification to the existing COM-001-2 standard: > [FERC] direct[s] NERC to develop modifications to COM-001-2, or to develop a new standard, to address our concerns regarding ensuring the adequacy of internal communications capability whenever internal communications could directly affect the reliable operation of the Bulk-Power System. > Order No. 808, at P 41. FERC's directive thus encompasses a directive that the modified or new standard: > address the adequacy of internal telecommunications (or other internal communication systems) that may have an adverse effect on reliability, even within a single functional entity, including: (1) communications between geographically separate control centers within the same functional entity; and (2) communications between a control center and field personnel. These scenarios present a gap in reliability of the Bulk-Power System that NERC should address. > *Id.*
Brief Description (Provide a paragraph that describes the scope of this standard action.)
The proposed project will develop a new standard or modify existing requirements in COM-001-2 to address the directive from FERC Order No. 808, including its subparts. *See* Order No. 808, at PP 1, 41.
Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR. Also provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)
As stated above, the purpose of the proposed project is to respond to the directive in FERC Order No. 808. The following is a description of the responses the standard drafting team (SDT) shall consider during development of the new or modified standards: • The SDT shall address internal telecommunications or other internal communication systems "between geographically separate control centers within the same functional entitiy." Order No. 808, at P 41.

SAR Information
• The SDT shall address internal telecommunications or other internal communication systems "between a control center and field personnel." *Id.* • The SDT shall address "[t]he adequacy of internal communications capability whenever internal communications could directly affect the reliable operation of the Bulk-Power System." *Id.* • The SDT shall address "internal communications capabilities that could involve the issuance or receipt of Operating Instructions or other communications that could have an impact on reliability." Order No. 808, at P 1.

Reliability Functions	
The Standard will Apply to the Following Functions (Check each one that applies.)	
☐ Regional Reliability Organization	Conducts the regional activities related to planning and operations, and coordinates activities of Responsible Entities to secure the reliability of the Bulk Electric System within the region and adjacent regions.
☒ Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☒ Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☐ Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☐ Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐ Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☐ Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.

Reliability Functions		
☐	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☐	Transmission Owner	Owns and maintains transmission facilities.
☒	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☒	Distribution Provider	Delivers electrical energy to the End-use customer.
☐	Generator Owner	Owns and maintains generation facilities.
☒	Generator Operator	Operates generation unit(s) to provide real and reactive power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.
☐	Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles	
Applicable Reliability Principles (Check all that apply).	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☐	2. The frequency and voltage of interconnected Bulk-Power Systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected Bulk-Power Systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected Bulk-Power Systems shall be developed, coordinated, maintained and implemented.
☒	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected Bulk-Power Systems.
☒	6. Personnel responsible for planning and operating interconnected Bulk-Power Systems shall be trained, qualified, and have the responsibility and authority to implement actions.

Reliability and Market Interface Principles	
☐	7. The security of the interconnected Bulk-Power Systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	Yes

FEDERAL ENERGY REGULATORY COMMISSION

18 CFR Part 40

[Docket No. RM14-13-000; Order No. 808]

Communications Reliability Standards

(Issued April 16, 2015)

AGENCY: Federal Energy Regulatory Commission.

ACTION: Final rule.

SUMMARY: Pursuant to the Federal Power Act, the Commission approves two revised Reliability Standards, COM-001-2 (Communications) and COM-002-4 (Operating Personnel Communications Protocols), developed by the North American Electric Reliability Corporation (NERC), which the Commission has certified as the Electric Reliability Organization responsible for developing and enforcing mandatory Reliability Standards. The two revised Reliability Standards will enhance reliability by, among other things, requiring adoption of predefined communication protocols, annual assessment of those protocols and operating personnel's adherence thereto, training on the protocols, and use of three-part communications. In addition, the Commission directs NERC to develop a modification to Reliability Standard COM-001-2 that addresses internal communications capabilities that could involve the issuance or receipt of Operating Instructions or other communications that could have an impact on reliability.

DATES: This rule will become effective **[INSERT DATE 60 days after publication in the FEDERAL REGISTER]**.

Communications Reliability Standards Docket No. RM14-13-000

ORDER NO. 808

FINAL RULE

(Issued April 16, 2015)

1. Pursuant to section 215 of the Federal Power Act (FPA),[1] the Commission approves two Reliability Standards, COM-001-2 (Communications) and COM-002-4 (Operating Personnel Communications Protocols), developed by the North American Electric Reliability Corporation (NERC), which the Commission has certified as the Electric Reliability Organization responsible for developing and enforcing mandatory Reliability Standards. The Commission also approves three new defined terms for addition to the NERC Glossary of Terms Used in Reliability Standards (NERC Glossary), violation risk factors, violation severity levels, and NERC's proposed implementation plan for both revised standards. Further, pursuant to section 215(d)(5) of the FPA, the Commission directs that NERC develop one modification to Reliability

[1] 16 U.S.C. 824o (2012).

Standard COM-001-2 that addresses internal communications capabilities to the extent that such communications could involve the issuance or receipt of Operating Instructions or other communications that could have an impact on reliability.

2. Reliability Standard COM-001-2 is intended to establish a clear set of requirements for the communications capabilities that applicable functional entities must have in place and maintain. Reliability Standard COM-002-4 requires applicable entities to develop communication protocols with certain minimum requirements, including use of three-part communication when issuing Operating Instructions.[2] Reliability Standard COM-002-4 also sets out certain communications training requirements for all issuers and recipients of Operating Instructions, and establishes a flexible enforcement approach for failure to use three-part communication during non-emergencies and a "zero-tolerance," i.e., without exception, enforcement approach for failure to use three-part communication during an emergency.[3]

3. We find that Reliability Standards COM-001-2 and COM-002-4 will enhance reliability over the currently-effective versions of these Communications (COM)

[2] NERC proposes to define Operating Instruction as "[a] command by operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. (A discussion of general information and of potential options or alternatives . . . is not considered an Operating Instruction.)."

[3] *See* NERC Petition at 3 ("during Emergencies, operating personnel must use the documented communication protocols for three-part communications without exception.").

standards in several respects. For example, the Reliability Standards as modified expand applicability to include generator operators and distribution providers, eliminate certain ambiguities in the currently-effective standards, and clarify that the use of three-part communication is required for issuance and receipt of all Operating Instructions, with a zero-tolerance approach to enforcement of that requirement during an emergency. However, we are not persuaded that COM-001-2 adequately covers all situations in which Operating Instructions are issued or received and, therefore, direct NERC to develop a modification to that standard that addresses our concern, as further discussed below.

I. Background

A. Regulatory Background

4. Section 215 of the FPA requires a Commission-certified Electric Reliability Organization (ERO) to develop mandatory and enforceable Reliability Standards, subject to Commission review and approval.[4] Once approved, the Reliability Standards may be enforced by the ERO subject to Commission oversight, or by the Commission

[4] 16 U.S.C. at 824o(c) and (d).

independently.[5] In 2006, the Commission certified NERC as the ERO pursuant to FPA section 215.[6]

5. The Commission approved Reliability Standard COM-001-1 in Order No. 693.[7] In addition, the Commission directed NERC to develop modifications to COM-001-1 to: (1) expand the applicability of the standard to include generator operators and distribution providers, (2) identify specific requirements for telecommunications facilities for use in normal and emergency conditions that reflect the roles of the applicable entities, and (3) include adequate flexibility for compliance to allow for the adoption of new technologies and cost-effective solutions.[8] Similarly, the Commission approved Reliability Standard COM-002-2 in Order No. 693. In addition, the Commission directed NERC to develop modifications to (1) include distribution providers as applicable entities, and (2) establish tightened communications protocols, especially for communications during alerts and emergencies.[9]

[8] Order No. 693, FERC Stats. & Regs. ¶ 31,242 at P 508.

[9] *Id.* PP 531-535, 540.

6. NERC initiated Project 2006-06 to address the Order No. 693 directives related to Reliability Standards COM-001 and COM-002, resulting in two proposed Reliability Standards, COM-001-2 and COM-002-3. NERC also initiated Project 2007-02 to develop a new Reliability Standard (COM-003) that would require real-time system operators to use standardized communication protocols during normal and emergency operations, in order to improve situational awareness and shorten response time. The two projects ultimately merged when drafts of Reliability Standard COM-002-3 and COM-003-1 were combined into a single proposed Reliability Standard, COM-002-4.

B. NERC Petition

7. On May 14, 2014, NERC filed a petition seeking approval of two revised communication standards, COM-001-2 (Communications) and COM-002-4 (Operating Personnel Communications Protocols).[10] Proposed Reliability Standard COM-001-2 establishes a set of requirements for the communications capabilities that various functional entities must maintain to enable communications with other identified functional entities. Proposed Reliability Standard COM-002-4 requires applicable entities to develop documented communications protocols. NERC stated in its petition that the proposed standards are intended to address all relevant Commission directives

[10] The COM Reliability Standards are not attached to the Final Rule. The complete text of the two Reliability Standards is available on the Commission's eLibrary document retrieval system in Docket No. RM14-13 and is posted on the ERO's web site, *available at*: http://www.nerc.com.

from Order No. 693. In addition, NERC stated that the revisions reflected in proposed COM-002-4 are intended to address Recommendation No. 26 from the final report on the August 2003 blackout issued by the U.S.-Canada Power System Outage Task Force (Blackout Report) concerning the need to "[t]ighten communications protocols, especially for communications during alerts and emergencies."[11]

Reliability Standard COM-001-2

8. NERC stated in its petition that Reliability Standard COM-001-2 establishes requirements for Interpersonal Communication capabilities necessary to maintain reliability. NERC explained that proposed Reliability Standard COM-001-2 applies to reliability coordinators, balancing authorities, transmission operators, generator operators, and distribution providers. The proposed Reliability Standard includes eleven requirements and two new defined terms, "Interpersonal Communication" and "Alternative Interpersonal Communication," that, according to NERC, collectively provide a comprehensive approach to establishing communications capabilities necessary to maintain reliability.[12] NERC stated that the definitions provide clarity that an entity's

[11] NERC Petition at 3 (quoting *U.S.-Canada Power System Outage Task Force, Final Report on the August 14, 2003 Blackout in the United States and Canada: Causes and Recommendations* at 3 (April 2004) (Blackout Report), *available at* http://energy.gov/sites/prod/files/oeprod/DocumentsandMedia/BlackoutFinal-Web.pdf).

[12] *Id.* at 15. NERC defines Interpersonal Communication as "[a]ny medium that allows two or more individuals to interact, consult, or exchange information" and Alternative Interpersonal Communication as "[a]ny Interpersonal Communication that is able to serve as a substitute for, and does not utilize the same infrastructure (medium) as, Interpersonal Communication used for day-to-day operation." *Id.*

communication capability must be redundant and that each of the capabilities must not utilize the same medium. According to NERC, the definitions improve the language used in the current Reliability Standard by eliminating the use of the more ambiguous phrases "adequate and reliable" and "redundant and diversely routed" that relate to "telecommunications facilities for the exchange of Interconnection and operating information."[13]

9. The first six requirements of COM-001-2 address the Interpersonal Communication capability and Alternative Interpersonal Communication capability of the reliability coordinator, transmission operator, and balancing authority functions. Requirement R1 requires each reliability coordinator to have Interpersonal Communication capability with all transmission operators and balancing authorities within its reliability coordinator area, and with each adjacent reliability coordinator within the same interconnection. Requirement R2 requires each reliability coordinator to designate Alternative Interpersonal Communication capability with those same identified entities. Requirements R3 and R4 set out the communications capability requirements for a transmission operator. Under Requirement R3, Interpersonal Communication capability is required between the transmission operator's reliability coordinator, each balancing authority within its transmission operator area, each distribution provider and generator operator within its transmission operator area, and each adjacent transmission

[13] *Id.* at 15-16.

operator whether synchronously or asynchronously connected. Under Requirement R4, Alternative Interpersonal Communication capability must be designated between the transmission operator's reliability coordinator, each balancing authority within its transmission operator area, and each adjacent transmission operator. Requirements R5 and R6 set out similar requirements for each balancing authority, again identifying the specific functional entities for which the balancing authority must maintain Interpersonal Communication capability and for which it must designate Alternative Interpersonal Communication capability.

10. Requirements R7 and R8 address the communications capability that distribution providers and generator operators must maintain, with each required to have Interpersonal Communications capability with its balancing authority and its transmission operator.

11. Requirement R9 requires each reliability coordinator, transmission operator, and balancing authority to test its Alternative Interpersonal Communication capability at least once each calendar month, and to initiate action to repair or designate a replacement if the test is unsuccessful. Requirement R10 requires the same entities to notify applicable entities (as identified in R1, R3 and R5) of the detection of an Interpersonal Communication capability failure that lasts 30 minutes or longer. Finally, Requirement R11 requires distribution providers and generator operators to consult with affected balancing authorities and transmission operators when a failure is detected in their Interpersonal Communication capability, and to determine a mutually agreeable action for the restoration of that capability.

12. NERC stated in its petition that proposed Reliability Standard COM-001-2 improves the currently-effective Reliability Standard by: (1) eliminating terms that do not adequately specify the desired actions that applicable entities are expected to take in relation to their telecommunication facilities; (2) clearly identifying the need for applicable entities to be capable of Interpersonal Communication and Alternative Interpersonal Communication; (3) not requiring specific technology or systems to be utilized; and (4) including the distribution provider and generator operator as applicable entities.[14] NERC added that COM-001-2 also addresses relevant directives from Order No. 693 by (1) adding generator operators and distribution providers as applicable entities; (2) identifying specific requirements for telecommunications capabilities for use in all operating conditions that reflect the roles of the applicable entities and their impact on reliability; and (3) including adequate flexibility to permit the adoption of new technologies.

13. NERC proposed to retire currently-effective COM-001-1.1 when proposed Reliability Standard COM-001-2 becomes effective, with the exception of Requirement R4, which addresses communications protocols. NERC requested that Requirement R4 be retired when proposed Reliability Standard COM-002-4 becomes effective.[15]

[14] NERC Petition at 18.

[15] *Id.* at 22.

Reliability Standard COM-002-4

14. NERC stated in its petition that Reliability Standard COM-002-4 improves communications surrounding the issuance of Operating Instructions by requiring the use of predefined communications protocols to reduce the possibility of miscommunication that could lead to action or inaction harmful to reliability.[16] NERC noted that the proposed standard requires use of the same protocols regardless of operating condition (i.e., Emergency or non-emergency), but requires operating personnel to use the documented communication protocols for three-part communications "without exception" during an Emergency.[17] As NERC explained:

> [T]he proposed Reliability Standard employs the phrase "Operating Instruction during an Emergency" in certain requirements (R5, R6, R7) to provide a demarcation for what is subject to a zero-tolerance compliance approach and what is not.[18]

[16] *Id.* at 23. NERC stated that COM-002-3 (which was adopted by the NERC Board but not submitted to the Commission for approval) is proposed for retirement in the Implementation Plan because the proposed Reliability Standard has been combined with proposed COM-003-1 to create proposed Reliability Standard COM-002-4. NERC stated that Reliability Standard COM-002-3 has not been submitted to the Commission for approval, therefore, the currently effective version of COM-002 is COM-002-2. *Id.* at 23 n.43. Reliability Standard COM-002-4 combines proposed Reliability Standard COM-002-3 and the former draft COM-003-1 into a single standard that addresses communications protocols for operating personnel in Emergency and non-emergency conditions. *Id.* at 23-24.

[17] *Id.* at 3.

[18] *Id.* at 25.

NERC explained that, for Operating Instructions issued during non-emergency operations, "an entity will be assessed under a compliance approach that focuses on whether an entity meets the initial training Requirement (either R2 or R3) and whether an entity performed the assessment and took corrective actions according to Requirement R4."[19]

15. Finally, NERC stated that the proposed Reliability Standard includes distribution providers and generator operators as applicable entities, in accordance with the Commission's directive in Order No. 693, and in recognition of the fact that these types of entities can be recipients of Operating Instructions.

16. Proposed Reliability Standard COM-002-4 includes seven requirements. Requirement R1 requires entities that can both issue and receive Operating Instructions (balancing authorities, reliability coordinators and transmission operators) to have documented communications protocols that include a minimum set of elements, including use of the English language unless otherwise specified, and required use of three-part communications for issuance and receipt of Operating Instructions.[20] Requirement R2 requires these same entities to conduct initial training on the communications protocols for each of their operating personnel responsible for the real-time operation of the bulk electric system. Requirement R3 requires distribution

[19] *Id.* at 26.

[20] *See id*. at 29.

providers and generator operators (who generally only receive but do not issue Operating Instructions) to conduct initial training on three-part communication for each of their operating personnel who can receive an oral two-party, person-to-person Operating Instruction, prior to that individual operator receiving an oral two-party, person-to-person Operating Instruction.

17. Requirement R4 requires each balancing authority, reliability coordinator and transmission operator to assess, at least once every twelve months, its operating personnel's adherence to the documented communication protocols required in Requirement R1, and to provide feedback to its operating personnel on their performance.

18. Requirement R5 requires balancing authorities, reliability coordinators and transmission operators that issue an oral two-party, person-to-person "Operating Instruction during an Emergency" to use three-part communication, and to take an alternative action if a confirmation is not received. Requirement R6 requires all applicable entities (balancing authorities, distribution providers, generator operators, and transmission operators) that receive an oral two-party, person-to-person "Operating Instruction during an Emergency" to use three-part communication, i.e., to repeat the Operating Instruction and receive confirmation from the issuer that the response was correct, or request that the issuer reissue the Operating Instruction. Both Requirement R5 and R6 include the clarification that the requirement does not apply to single-party to multiple-party "burst" Operating Instructions. As noted above, NERC explains that Requirements R5 and R6 require use of three-part communication during an Emergency without exception, because "use of three-part communication is critically important if an

Emergency condition already exists, as further action or inaction could increase the harmful effects to the Bulk Electric System."[21] NERC further explains, however, that applicable entities are expected to use three-part communications at all times when issuing and receiving Operating Instructions.[22]

19. Finally, Requirement R7 requires that when a balancing authority, reliability coordinator, or transmission operator issues a written or oral single-party to multiple-party "burst" Operating Instruction during an Emergency, they must confirm or verify that at least one receiver received the Operating Instruction.

20. NERC requested that proposed Reliability Standard COM-002-4 become effective on the first day of the first calendar quarter that is twelve months after the date that the standard is approved.

C. Notice of Proposed Rulemaking

21. On September 19, 2014, the Commission issued a Notice of Proposed Rulemaking (NOPR) proposing to approve Reliability Standards COM-001-2 and COM-002-4 pursuant to FPA section 215(d)(2), along with the three new definitions referenced in the proposed standards (Operating Instruction, Interpersonal Communication, and

[21] *Id.* at 39.

[22] *Id.* at 25-26.

Alternative Interpersonal Communication), the assigned violation risk factors and violation severity levels, and the proposed implementation plan for each standard.[23]

22. In the NOPR, the Commission explained that the two revised standards addressed outstanding directives from Order No. 693, in that COM-001-2 has been expanded to include distribution providers and generator operators, and COM-002-4 has been expanded to include distribution providers.[24] The Commission also stated that Reliability Standard COM-002-4 would enhance reliability by providing for improved communications through the required development of communication protocols.

23. In the NOPR, the Commission also discussed the following specific matters and asked for further comment: (1) responsibility for use of three-part communication by transmission owners and generator owners that receive Operator Instructions; (2) whether COM-001-2 should be modified to address internal communication capability requirements, or to address testing requirements for distribution providers and generator operators; and (3) clarifications regarding the proposed terms Interpersonal Communication and Alternative Interpersonal Communication.

24. Timely comments on the NOPR were filed by: NERC; the Edison Electric Institute and the Electric Power Supply Association (EEI/EPSA); ISO/RTO Council; the National Rural Electric Cooperative Association (NRECA); International Transmission

[23] *Communications Reliability Standards,* Notice of Proposed Rulemaking, 79 FR 58709 (Sept. 30, 2014), 148 FERC ¶ 61,210 (2014) (NOPR).

[24] *Id.* PP 22, 23.

Company (ITC); Idaho Power Company (Idaho Power); and Tri-State G&T. In addition, on March 6, 2015, NERC filed Supplemental Comments.

II. Discussion

25. Pursuant to section 215(d)(2) of the FPA, we adopt our NOPR proposal and approve Reliability Standards COM-001-2 and COM-002-4, including the associated definitions, violation risk factors, violation severity levels, and implementation plans, as just, reasonable, not unduly discriminatory or preferential and in the public interest. We note that all of the commenters that addressed the overall value of the Reliability Standards supported, or did not oppose, approval of the two revised standards. We determine that COM-001-2 will enhance reliability by expanding the applicability of currently effective COM-001-1.1 to include generator operators and distribution providers as applicable entities under the COM-001 standard, and by expanding the applicability of COM-002-4 to include distribution providers. We further find that COM-002-4 will enhance reliability by requiring all issuers and recipients of Operating Instructions to develop communications protocols that require use of three-part communications, by requiring training on those protocols, and by adopting a zero-tolerance enforcement approach to the use of three-part communications during an Emergency. Moreover, we conclude that requiring issuers of Operating Instructions to perform an annual assessment of their personnel's adherence to the communications protocols will help ensure a high level of compliance with three-part communications at all times.

26. Pursuant to section 215(d)(5) of the FPA, the Commission directs that NERC develop one modification to COM-001-2 to address our concerns regarding applicability to certain internal communications, as discussed below.

27. Below, we discuss the following matters: (A) ensuring use of three-part communications by generator owners and transmission owners; (B) internal communication capability requirements; (C) testing requirements for distribution providers and generator operators; and (D) scope of the terms Interpersonal Communication and Alternative Interpersonal Communication.

A. Applicability to Generator Owners and Transmission Owners

NOPR

28. In the NOPR, the Commission raised the concern that generator owners and transmission owners are not "applicable entities" under either COM-001-2 or COM-002-4, although these entities could, under some circumstances, receive and act on Operating Instructions.[25] The Commission sought comment on the obligations of an applicable entity when issuing an Operating Instruction to a transmission owner or generator owner, including information regarding which entity is responsible if the transmission owner or generator owner fails to perform three-part communication properly. In addition, the Commission asked NERC to explain its auditing practices when reviewing operating agreements between transmission operators and transmission owners, and between

[25] *See id.* PP 25-27.

generator operators and generation owners, including NERC's approach to reviewing the protocols of any transmission owner or generator owner that acts on an Operating Instruction in order to ensure that three-part communication is used appropriately.

Comments

29. All commenters that address this issue maintain that the two revised COM Reliability Standards appropriately identify the entities that issue and/or receive Operating Instructions, and that the two standards should not be expanded to include transmission owners or generator owners.[26] NERC states that the two COM standards are appropriately tailored to apply to those functional entities that operate the Bulk-Power System as described in the NERC Functional Model and, therefore, apply to transmission operators and generator operators rather than transmission owners and generator owners. However, NERC acknowledges that "there are instances in which Transmission Owners or Generator Owners may receive and act on Operating Instructions within areas operated by RTOs or ISOs."[27] NERC asserts that, in these instances, the generator owner or transmission owner is "acting on behalf of a registered Transmission Operator or Generator Operator under delegation as a member of the RTO or ISO."[28] NERC asserts that, if performance of a reliability requirement is not achieved for a delegated task, "the

[26] *See* NERC Comments at 2, 8; EEI/EPSA Comments at 3-4; ISO/RTO Council Comments at 4; ITC Comments at 4-5; Tri-State G&T Comments at 1.

[27] NERC Comments at 8.

[28] *Id.*

relevant Transmission Operator or Generator Operator responsible for compliance with the Reliability Standards is and has been held accountable."[29]

30. NERC provides several examples of the various approaches to assigning compliance responsibility, including a Joint Registration Organization or Coordinated Functional Registration (as used in ERCOT), and assignment of compliance responsibility through operating agreements and manuals (as used in PJM). In both circumstances, NERC and Regional Entity auditors review the relevant documents assigning compliance responsibility "to determine whether there are gaps in performance under the Reliability Standards as a result of the delegation."[30] In addition, NERC states that "the registered entity for a particular function retains responsibility for providing supporting documentation regarding how a task is delegated," and "for providing proof of compliance under the Reliability Standards."[31]

31. EEI/EPSA maintains that generator owners do not receive and act on Operating Instructions, and therefore should not be included as applicable entities under the proposed standards. EEI/EPSA further maintains that transmission owners do not typically receive and act on Operating Instructions, except in regions where the transmission owners have arrangements to do so under specific operating contracts, and,

[29] *Id.*

[30] *Id.* at 10.

[31] *Id.* at 11.

in those cases, act "sol[ely] at the direction of a responsible regional TOP, having broad area responsibilities."[32]

32. Like NERC, ISO/RTO Council acknowledges that transmission owners and generator owners may act on Operating Instructions from an ISO/RTO, at least within some ISO/RTO regions, but states that in those cases the ISOs have market rules and operating procedures in place for communicating Operating Instructions to utilities and other market participants within their footprint. ISO/RTO Council also asserts that ISOs and RTOs do not control the registration of transmission owners and generator owners within their footprint, but that the entity and the relevant Regional Entity "make the final determination on their registration."[33] Finally, ISO/RTO Council suggests that applying the requirements of the proposed COM standards to generator owners and transmission owners "seems to address an administrative concern as opposed to a reliability concern," given that the "core reliability issue at hand is determining whether the RC, BA or TOP command was followed by the relevant recipient," and given that ISOs and RTOs have market rules or tariff provisions in place that require strict adherence by utilities and market participants.[34] ISO/RTO Council also asserts that, if an ISO or RTO issues a command to an entity that is not registered as a transmission operator or generator operator, and there is a three-part communication failure resulting in an enforcement

[32] EEI/EPSA Comments at 3.

[33] ISO/RTO Council Comments at 3.

[34] *Id.*

action, then the NERC Rules of Procedure should be used to hold that entity responsible.[35]

33. ITC asserts that Operating Instructions, as defined by NERC, cannot apply to a generator owner or transmission owner. ITC raises a related question, however, as to whether a transmission operator can issue an Operating Instruction to another transmission operator under the proposed Reliability Standards.[36] ITC seeks confirmation from the Commission that a transmission operator cannot issue such an instruction or directive to another transmission operator, or if no such confirmation is given, ITC asks that the Commission "explain the basis and process under which a Transmission Operator could issue such an Operating Instruction."[37]

34. Idaho Power asserts that COM-002-4 does not apply to generator owners or transmission owners, without further discussion of whether such entities could ever receive and act on Operating Instructions as defined by NERC. Tri-State G&T agrees that generator owners and transmission owners should not be added as applicable entities, as they rarely, if ever receive an Operating Instruction.

---

[35] *Id.* at 4 (asserting that the NERC Rules of Procedure, Appendix 4C, Section 5.11 allows for an ISO or RTO to include in an enforcement proceeding an entity that causes or contributes to an alleged violation of a Reliability Standard).

[36] ITC Comments at 5.

[37] *Id.* at 6.

Commission Determination

35. While several commenters have acknowledged that transmission owners and generator owners can receive and act on Operating Instructions in certain regions, we are persuaded that the proposed Reliability Standards need not be expanded to include those entities at this time. In doing so, we are persuaded by the explanation of NERC that "[w]hile the Transmission Operator or Generator Operator may delegate tasks under the proposed Reliability Standards to other member entities within [an RTO or ISO], the Transmission Operator and Generator Operator retain responsibility for compliance with the Requirements in the proposed Reliability Standards."[38] Moreover, we rely on NERC's explanation that NERC and Regional Entity auditors examine contractual arrangements "to ascertain how tasks are delegated and to determine whether there are gaps in performance . . . as a result of the delegation. Responsibility will always rest with the entity registered with NERC as the Transmission Operator."[39] Thus, in the PJM example, if a transmission owner with delegated operating responsibilities fails to use three-part communication as required under COM-002-4, the registered entity that has delegated the operating responsibilities will remain responsible for the violation.

[38] *See also* ISO/RTO Council Comments at 3-4; EEI/EPSA Comments at 3-4 (Commission approved Operating Agreements "contractually bind TOs to act in conformance with TOP obligations").

[39] NERC Comments at 10-11.

36. ITC requests clarification whether or not a transmission operator can issue an Operating Instruction to another transmission operator, pursuant to COM-001-2 and COM-002-4. We find that the issue is beyond the scope of this rulemaking. The two standards at issue in this proceeding relate to requirements for communications capability and communications protocols, and do not address the relative authorities as between functional entities to require another entity to modify its operations in real-time, which is more properly addressed in the TOP and IRO Reliability Standards, including currently effective Reliability Standard TOP-1-1a.[40]

B. Internal Communication Capability

NOPR

37. In the NOPR, the Commission raised the concern that Reliability Standard COM-001-2 does not appear to carry forward an explicit requirement to maintain adequate internal communications capabilities, unlike the existing COM-001 standard, which states that each reliability coordinator, transmission operator, and balancing authority "shall provide adequate and reliable telecommunication facilities for the exchange of

[40] Requirement R1 of TOP-1-1a states that "Each Transmission Operator shall have the responsibility and clear decision-making authority to take whatever actions are needed to ensure the reliability of its area and shall exercise specific authority to alleviate operating emergencies." The obligation of a functional entity to respond to an Operating Instruction is also expected to be more explicitly addressed in other TOP and IRO standards under development or awaiting Commission approval, including proposed Reliability Standard IRO-001-4, which requires transmission operators, balancing authorities, generator operators, and distribution providers to comply with their Reliability Coordinator's Operating Instructions except under certain described circumstances.

Interconnection and operating information . . . internally."[41] The Commission stated that maintaining adequate internal communications could be critical to reliability, pointing to specific recommendations in the 2003 Blackout Report. The Commission proposed to direct NERC to develop modifications to COM-001-2, or to develop a separate standard, "that ensures that entities maintain adequate internal communications capability, at least to the extent that such communications could involve the issuance or receipt of Operating Instructions or other communications that could have an impact on reliability." [42] Alternatively, the Commission suggested that a requirement for internal communication capability could be considered to be implicit in the proposed requirements for communications capability between functional entities, even if those functional entities reside within the same utility, and sought comment on this suggested interpretation as well as the proposed directive.

Comments

38. NERC and most other commenters assert that Reliability Standard COM-002-4 can and should be read to apply to internal communications between functional entities within the same organization, as the Commission suggested in the NOPR.[43] NERC and NRECA also assert that acceptance of this interpretation should eliminate the need for

[41] NOPR, 148 FERC ¶ 61,210 at P 28 (quoting COM-001-1.1, Requirement R1).

[42] *Id.* P 30.

[43] NERC Comments at 13; *see also, e.g.*, NRECA Comments at 1, Idaho Power Comments at 4, and Tri-State Comments at 1.

further modification to COM-002-4.[44] ITC comments that COM-001-2 should apply to internal communications between different functional entities within the same organization but only "when those communications are performed by means other than in direct, face-to-face situations."[45] ITC continues, stating that "[f]or entities performing multiple functions that are located in close proximity such that direct, face-to-face communication is available, ITC does not see a reliability need for a requirement for Alternative Interpersonal Communication, and believes the Standards should be interpreted as not requiring AIC in these situations."[46] ITC also advocates that, if the Commission does not find that COM-001-2 as submitted includes these kinds of internal communications, the standard ought to be modified to do so.

39. EEI/EPSA acknowledges that the approach taken in COM-001-2 is different than the currently-effective COM standard with respect to internal communications, but maintains that this change is consistent with results-based standards. EEI/EPSA maintains that "a result-based standard should not need to specifically cite facility requirements or the specific internal communication obligations," and maintains that COM-001-2 properly specifies communications capability "at the Functional Entity level."[47]

---

[44] NERC Comments at 13; NRECA Comments at 1-2.

[45] ITC Comments at 7.

[46] *Id.*

[47] *Id.* at 4-5.

Commission Determination

40. We agree with NERC and other commenters that Reliability Standard COM-001-2 applies to communications between functional entities within a single organization. For example, COM-001-2, Requirement R3, provides that "each Transmission Operator shall have Interpersonal Communication capability" with the reliability coordinator, and each balancing authority, distribution provider, and generator operator "within its Transmission Operator Area." We agree with NERC, ITC and other commenters that a reasonable understanding of Requirement R3 is that the transmission operator must have Interpersonal Communication capability with a balancing authority, distribution provider and/or generator operator within the same organization. Moreover, we agree with ITC that the COM-001-2 requirements concerning Alternative Interpersonal Communication only apply when those communications are performed by means other than direct, face-to-face situations.

41. However, the application of COM-001-2 to different functional entities within the same organization, as discussed above, does not fully address our concern set forth in the NOPR regarding internal communications.[48] In particular, the NOPR explained that Requirement R1.1 of currently-effective COM-001-1.1 provides that each reliability coordinator, transmission operator, and balancing authority "shall provide adequate and reliable telecommunication facilities for the exchange of Interconnection and operating

[48] *See* NOPR, 148 FERC ¶ 61,210 at PP 28-31.

information . . . internally." This currently-effective Requirement applies more broadly to internal communications, including internal communications *within* the same functional entity. Thus, unlike the currently-effective Reliability Standard, COM-001-2 does not address the adequacy of internal telecommunications (or other internal communication systems) that may have an adverse effect on reliability, even within a single functional entity, including: (1) communications between geographically separate control centers within the same functional entity; and (2) communications between a control center and field personnel. These scenarios present a gap in reliability of the Bulk-Power System that NERC should address. Accordingly, pursuant to section 215(d)(5) of the FPA, we direct NERC to develop modifications to COM-001-2, or to develop a new standard, to address our concerns regarding ensuring the adequacy of internal communications capability whenever internal communications could directly affect the reliable operation of the Bulk-Power System.

C. Testing Requirements for Distribution Providers and Generator Operators

NOPR

42. In the NOPR, the Commission expressed concern that Reliability Standard COM-001-2 did not include a requirement that distribution providers and generator operators test or actively monitor their telecommunications systems, but were merely required to consult with each affected entity to determine a mutually agreeable action for restoration

whenever a failure is detected.[49] The Commission asked for comment on "why generator operators and distribution providers should not have some form of requirement to test or actively monitor vital primary and emergency telecommunication facilities."[50]

Comments

43. NERC and the other commenters on this issue maintain that there is no need for a testing requirement for generator operators and distribution providers comparable to that required for reliability coordinators, balancing authorities and transmission operators, because generator operators and distribution providers are required to maintain only primary Interpersonal Communication capability, which is tested through routine use.[51] NERC further explains that its approach is consistent with the Commission's statement in Order No. 693 that "[w]e expect the telecommunication requirements for all applicable entities will vary according to their roles and that these requirements will be developed under the Reliability Standards development process."[52] NERC also explains that the standard drafting team found that the obligation to detect and address failures in a

[49] NOPR, 148 FERC ¶ 61,210 at P 31 (citing to COM-001-2, Requirement R11).

[50] *Id*, (citing *System Restoration Reliability Standards*, Order No. 749, 134 FERC ¶ 61,215, at P 28 (2011)).

[51] *See, e.g.*, NERC Comments at 14 ("routine use is sufficient to demonstrate functionality of this . . . primary capability"); EEI/EPSA Comments at 5-6 ("a system in regular use would gain little through routine testing"); and ISO/RTO Council Comments at 6-7 ("capability will be 'tested' through regular use").

[52] NERC Comments at 14-15 (quoting Order No. 693, FERC Stats. & Regs. ¶ 31,242 at P 487).

primary communication system, as set out in Requirement R11 of COM-001-2, is sufficient, given "the limited impact a failure might have on Distribution Providers and Generator Operators overall."[53]

Commission Determination

44. We are persuaded by the comments of NERC and others that additional testing requirements for distribution providers and generator operators are not necessary at this time. NERC and other commenters assert that the primary Interpersonal Communication systems used by a distribution provider or generator operator will effectively be tested through routine use, and that any potential failures in a given generator operator or distribution provider's external communication system will not have a substantial impact on the Bulk-Power System. In light of this explanation, as well as our recognition in Order No. 693 that telecommunication requirements for applicable entities will vary according to their roles, we decline to require any additional testing requirements for distribution providers and generator operators at this time.

D. Definition of Interpersonal Communication and Alternative Interpersonal Communication

NOPR

45. In the NOPR, the Commission sought clarification on the intended scope of the newly defined terms Interpersonal Communication and Alternative Interpersonal

[53] NERC Comments at 14.

Communication.[54] The Commission noted that NERC had explained the introduction of these terms as a means of eliminating the ambiguity in the terms "adequate and reliable" and "redundant and diversely routed" as currently used in Requirements R1 and R1.4 of COM-001-1.1.

46. The Commission raised two concerns about the new terms as used in proposed Reliability Standard COM-001-2. First, the Commission noted that the definitions do not state a minimum expectation of communication performance, such as speed and quality.[55] Second, the Commission asked for clarification as to whether Interpersonal Communication includes mediums used directly to exchange or transfer data, which communications appear to be covered under the currently-approved version of COM-001.[56] The Commission, thus, asked for further explanation "regarding acceptable (and

---

[54] NOPR, 148 FERC ¶ 61,210 at P 32. As previously noted, NERC is proposing to define the terms, respectively, as follows:

> Interpersonal Communication – Any medium that allows two or more individuals to interact, consult, or exchange information.
>
> Alternative Interpersonal Communication – Any Interpersonal Communication that is able to serve as a substitute for, and does not utilize the same infrastructure (medium) as, Interpersonal Communication used for day-to-day operation.

[55] NOPR, 148 FERC ¶ 61,210 at P 33.

[56] *Id.* As the Commission noted, COM-001-1.1, Requirement R1 addresses "telecommunications facilities for the exchange of Interconnection and operating information."

unacceptable) performance of communication for both Interpersonal and Alternative Interpersonal Communications."[57]

Comments

47. With respect to minimum performance standards or specifications for the required communications mediums, none of the commenters believe such specifications are necessary or advisable. NERC maintains that additional specifications are not necessary because the standard as written requires applicable entities to have the working capability needed to maintain reliability.[58] EEI/EPSA agrees that performance specifications are not necessary, and questions whether it is even possible to set such standards given the diversity of systems used.[59] ISO/RTO Council asserts that it would be inadvisable to include technical specifications on the communication mediums required, as it could result in the use of the least expensive medium that could achieve compliance.[60] Idaho Power suggests that the kinds of measurable characteristics that might be appropriate for use to establish minimum performance levels for data exchanges are not available here, because the proposed COM standards do not include data exchange. Tri-State G&T states that the most common expected mediums for communication under the standard

[57] *Id.*

[58] NERC Comments at 4, 15-16.

[59] EEI/EPSA Comments at 6-7.

[60] ISO/RTO Council at 5. ISO/RTO Council also notes that its members already have requirements in place with their stakeholders on necessary technical requirements for voice and data exchange.

will likely be e-mail and telephone, and that there is no need to include minimum expectations of speed or performance because "all entities are focused on reliability and would always use the fastest and most reliable means of communication."[61]

48. With respect to the transfer of data as opposed to communications between persons, all of the commenters to directly address the issue acknowledge that proposed Reliability Standard COM-001-2 is not intended to, and does not, cover data exchanges or transfers. NERC (through its initial and supplemental comments) and ISO/RTO Council maintain that COM-001-2 need not include requirements regarding data transfer capability because such capability is covered under other existing or proposed standards.

49. With respect to existing standards, NERC states that the standard drafting team determined that IRO-010-1a and IRO-014-1 "provided the necessary mandatory Requirements to ensure proper data exchange is occurring."[62] ISO/RTO Council provides several additional examples of existing Reliability Standards that address data exchange and transfer capability, including BAL-004-2b, R14; IRO-002-2, R1; and TOP-006-2, R1.[63]

50. With respect to standards under development, NERC asserts that four proposed IRO and TOP standards, now approved by the Board, "include specific coverage related

[61] Tri-State G&T Comments at 2.

[62] NERC Comments at 16. *See also* ISO/RTO Council Comments at 5-6 (noting that the standard drafting team explained that data communication is covered under Requirement R3 of IRO-010-1).

[63] ISO/RTO Council Comments at 6, n.10.

to data exchange," and "collectively require data exchange capability" for reliability coordinators, transmission operators, balancing authorities, generator operators, and distribution providers.[64] NERC describes the specific requirements in proposed Reliability Standards TOP-001-3, IRO-010-2, TOP-003-3, and IRO-002-4 that will address data exchange capabilities and/or data exchange specifications for applicable functional entities.

51. EEI/EPSA and Idaho Power also maintain that the term Interpersonal Communication does not cover data exchange, with EEI/EPSA asserting that the phrase requires a system "that enables effective communications between two or more individuals."[65] Moreover, EEI/EPSA understands the term Alternative Interpersonal Communication to require certain entities to have backup communications that do not utilize the same infrastructure.

52. ITC asserts that the definitions of Interpersonal Communication and Alternative Interpersonal Communication "could ostensibly be interpreted to extend the Standard beyond verbal and written communications and Operating Instructions to include the transmission of electronic data between control systems that are monitored/used by

[64] NERC Supp. Comments at 3. NERC identified these same four standards in its Initial Comments, but provides a more detailed discussion of the proposed standards and their status in its Supplemental Comments.

[65] EEI/EPSA at 7. Similarly, Idaho Power states that the term was intended to include voice and electronic messaging between people, and exclude data exchanges, such as SCADA and metering data. Idaho Power Comments at 4-5.

system operators."[66] ITC warns that "[i]f the Commission does indeed intend the scope of the Standards to extend to such electronic data transmission, the requirement for Alternative Interpersonal Communication may not be achievable" because "[i]t may simply not be possible to maintain a second pathway for the transmission of such data, whether by dint of data format, system compatibility, or the feasibility of installing a redundant system."[67] ITC accordingly recommends that if an alternative pathway for data transmission is deemed necessary, then the Commission should retain the language from COM-001-1 which requires "redundant and diversely routed systems."[68]

Commission Determination

53. First, we are satisfied that technical specifications regarding minimum levels of performance for the mediums used to satisfy the requirements of COM-001-2 are not necessary at this time. In doing so, we note NERC's explanation that the requirements in COM-001-2 are "absolute" and that entities must "have the capability in place to 'establish Interpersonal Communication capabilities necessary to maintain reliability.'"[69] Moreover, we are persuaded by the commenters that setting performance criteria for the email and telephonic communications at issue here is both impractical and unnecessary.

[66] ITC Comments at 8.

[67] *Id.*

[68] *Id.* at 9.

[69] NERC Comments at 15-16.

54. Second, the NOPR raised concerns pertaining to whether COM-001-2 addresses "facilities that directly exchange or transfer data." [70] In response, NERC states that data exchange capability is being addressed in proposed IRO and TOP standards.[71] Accordingly, we do not make any determinations regarding data exchange capability in the immediate rulemaking. Rather, based on NERC's explanation, we will address any issues regarding data exchange capability in the pending rulemaking pertaining to NERC's proposed TOP and IRO Reliability Standards.

III. Information Collection Statement

55. The collection of information contained in this Final Rule is subject to review by the Office of Management and Budget (OMB) under section 3507(d) of the Paperwork Reduction Act of 1995.[72] OMB's regulations require approval of certain information collection requirements imposed by agency rules.[73] Upon approval of a collection(s) of information, OMB will assign an OMB control number and an expiration date. Respondents subject to the filing requirements of a rule will not be penalized for failing

[70] *See* NOPR, 148 FERC ¶ 61,210 at P 33.

[71] *See* NERC Supplemental Filing at 2-3. On March 18, 2015, NERC submitted a petition for approval of proposed Transmission Operations and Interconnection Reliability Operations and Coordination Reliability Standards, Docket No. RM15-15-000, pending before the Commission.

[72] 44 U.S.C. 3507(d) (2012).

[73] 5 CFR 1320.11 (2013).

to respond to these collections of information unless the collections of information display a valid OMB control number.

56. The Commission solicited comments on the need for this information, whether the information will have practical utility, the accuracy of the burden estimates, ways to enhance the quality, utility, and clarity of the information to be collected or retained, and any suggested methods for minimizing respondents' burden, including the use of automated information techniques. Specifically, the Commission asked that any revised burden or cost estimates submitted by commenters be supported by sufficient detail to understand how the estimates were generated.

57. The Final Rule approves Reliability Standards COM-001-2 and COM-002-4, as well as NERC's proposed retirement of currently-effective Reliability Standards COM-001-1.1 and COM-002-2. Reliability Standard COM-001-2 establishes Interpersonal Communication capability necessary to maintain reliability, while Reliability Standard COM-002-4 improves communications related to Operating Instructions, requiring issuers of Operating Instructions to adopt predefined communications protocols and requiring both issuers and recipients of Operating Instructions to use three-part communications.

Public Reporting Burden: Reliability Standards COM-001-2 and COM-002-4 do not require responsible entities to file information with the Commission. However, the Reliability Standards require applicable entities to develop and maintain certain information, subject to audit. In particular, COM-001-2 requires that transmission operators, balancing authorities, reliability coordinators, distribution providers, and

generator operators must maintain documentation of Interpersonal Communication capability and designation of Alternate Interpersonal Communication, as well as evidence of testing of the Alternate Interpersonal Communication facilities. COM-002-4 requires balancing authorities, distribution providers, reliability coordinators, transmission operators, and generator operators to develop and maintain documented communication protocols, and to be able to provide evidence of training on the protocols and of their annual assessment of the protocols. Additionally, all applicable entities (balancing authorities, reliability coordinators, transmission operators, generator operators, and distribution providers) must be able to provide evidence of three-part communication when issuing or receiving an Operating Instruction during an Emergency.

Many of the record retention or information collection requirements in COM-001-2 and COM-002-4 are translated in some form from the currently-effective Reliability Standards (COM-001-1 and COM-002-2). For these requirements, the Commission estimates a zero net change in burden. Accordingly, our estimate below shows the increase in record-retention or information collection burden, based on the new requirements to:

> (1) develop communications protocols (a one-time burden under COM-002-4, Requirement R1),
>
> (2) maintain evidence of required training, assessments, and use of three-part communications, as applicable (an on-going burden under COM-002-4 Requirements R2, R3, R4, R5 and R6); and
>
> (3) maintain evidence to demonstrate Interpersonal Communication capability (a new, on-going burden for distribution providers and generator operators under COM-001-2 Requirements R7 and R8).

The Commission's estimate of the number of respondents is based on the NERC compliance registry as of August 15, 2014. According to the NERC compliance registry, NERC has registered 179 transmission operators, 107 balancing authorities, 15 reliability coordinators, 475 distribution providers, and 853 generator operators within the United States. However, under NERC's compliance registration program, entities may be registered for multiple functions, so these numbers incorporate some double counting, which has been accounted for in the table below. The Commission estimates the annual reporting burden and cost as follows:

Information Collection Requirement	Number and Type of Respondents (1)	Annual Number of Responses per Respondent (2)	Total Number of Responses (1)*(2)=(3)	Avg. Burden & Cost Per Response[74] (4)	Total Annual Burden Hours & Total Annual Cost[75] (3)*(4)=(5)

[74] The estimated hourly costs (salary plus benefits) are based on Bureau of Labor Statistics (BLS) information, as of March 19, 2015, for an electrical engineer ($65.34/hour for review and documentation) and for an Information and Record Clerk ($33.42/hour for record retention). These figures have been updated since issuance of the NOPR, and are *available at*: http://bls.gov/oes/current/naics3_221000.htm#17-0000. The first row of the table (one-time burden) is done by an engineer, and the latter three rows (ongoing burden) are done by a file clerk.

[75] This dollar burden figure in row 3 of this chart was incorrectly stated in the NOPR, which led to an incorrect estimate of the total dollar burden for the industry in row 5. Both estimates as stated in the NOPR were higher than the corrected and updated estimate reflected in this Final Rule.

(One-time) Development of Communication Protocols [COM-002-4 R1]	212 (BA, RC & TOP)	1	212	8 hrs. & $522.72	1,696 hours & $110,816.64
(On-going) Maintain evidence of Interpersonal Communication capability [COM-001-2 R7 and R8][76]	1,217 (DP & GOP)	1	1,217	4 hrs. & $133.68	4,868 hours & $162,688.56
(On-going) Maintain evidence of training and assessments [COM-002-4 R2, R4, R5 and R6]	212 (BA, RC & TOP)	1	212	8 hrs. & $267.36	1,696 hours & $56,680.32
(On-going) Maintain evidence of training [COM-002-4 R3, and R6]	1,217 (DP & GOP)	1	1,217	8 hrs. & $267.36	9,736 hours & $ 325,377.12
TOTAL			2,858		17,996 hours & $655,562.64

Title: Mandatory Reliability Standards for the Bulk-Power System: COM Reliability Standards.

[76] No change is expected in the record-keeping burden under COM-001-2 for reliability coordinators, balancing authorities, and transmission operators as compared to the currently-effective COM-001 standard.

Action: Proposed FERC-725V

OMB Control No: 1902-0277

Respondents: Businesses or other for-profit institutions; not-for-profit institutions.

Frequency of Responses: One-time and ongoing.

Necessity of the Information: The approval of Reliability Standards COM-001-2 and COM-002-4 implements the Congressional mandate of the Energy Policy Act of 2005 to develop mandatory and enforceable Reliability Standards to better ensure the reliability of the nation's Bulk-Power System. Specifically, the purpose of the Reliability Standards is to establish Interpersonal Communication capability necessary to maintain reliability, and to improve communications for the issuance of Operating Instructions with predefined communications protocols. The proposed Reliability Standards require entities to maintain records subject to review by the Commission and NERC to ensure compliance with the Reliability Standards.

Internal Review: The Commission has reviewed the requirements pertaining to the Reliability Standards for the Bulk-Power System and determined that the requirements are necessary to meet the statutory provisions of the Energy Policy Act of 2005. These requirements conform to the Commission's plan for efficient information collection, communication and management within the energy industry. The Commission has assured itself, by means of internal review, that there is specific, objective support for the burden estimates associated with the information requirements.

58. Interested persons may obtain information on the reporting requirements by contacting the following: Federal Energy Regulatory Commission, 888 First Street, NE,

Washington, DC 20426 [Attention: Ellen Brown, Office of the Executive Director, e-mail: DataClearance@ferc.gov, phone: (202) 502-8663, fax: (202) 273-0873].

59. Comments concerning the information collections approved in this Final Rule and the associated burden estimates should be sent to the Commission in these dockets and may also be sent to the Office of Management and Budget, Office of Information and Regulatory Affairs [Attention: Desk Officer for the Federal Energy Regulatory Commission]. For security reasons, comments should be sent by e-mail to OMB at the following e-mail address: oira_submission@omb.eop.gov. Please reference FERC-725V and the docket numbers of this Notice of Proposed Rulemaking (Docket No. RM14-13-000) in your submission.

IV. Regulatory Flexibility Act Certification

60. The Regulatory Flexibility Act of 1980 (RFA)[77] generally requires a description and analysis of proposed rules that will have significant economic impact on a substantial number of small entities. Reliability Standard COM-001-2 is expected to impose burdens for the first time on 1,217 entities (i.e., distribution providers and generator operators).[78]

[77] 5 U.S.C. 601-612.

[78] The number of small distribution providers required to comply with the COM standards may decrease significantly. In March 2015, the Commission approved revisions to the NERC Rules of Procedure to implement NERC's "risk based registration" program, which raised the registry threshold for distribution providers from a 25 MW to 75 MW peak load. *North American Electric Reliability Corp.*, 150 FERC ¶ 61,213 (2015).

Reliability Standard COM-002-4 may apply to as many as 1,279 entities.[79] Comparison of the applicable entities with FERC's small business data indicates that approximately 934 of the 1,279 entities are small entities.[80]

61. Reliability Standard COM-002-4 will serve to enhance reliability by, among other things, requiring adoption of predefined communication protocols, annual assessment of those protocols and operating personnel's adherence thereto, training on the protocols, and use of three-part communications. The Commission estimates that each small balancing authority, reliability coordinator, and transmission operator subject to Reliability Standard COM-002-4 will incur one-time compliance costs of about $523 (i.e. development of communication protocols), plus on-going annual costs of about $790 (i.e. performing training and maintaining evidence of training and assessments).[81] The Commission estimates that each of the small distribution provider and generator operator entities potentially subject to Reliability Standards COM-001-2 and COM-002-4 will incur on-going annual costs of about $887 (i.e. performing training and maintaining

[79] The applicable entities are balancing authorities, reliability coordinators, transmission operators, generator operators, and distribution providers. After accounting for entities registered for more than one function, the total count is 1,279 entities.

[80] The Small Business Administration sets the threshold for what constitutes a small business. Public utilities may fall under one of several different categories, each with a size threshold based on the company's number of employees, including affiliates, the parent company, and subsidiaries. The possible categories for the applicable entities have a size threshold ranging from 250 employees to 1,000 employees. We are using the 1000 employee threshold for this analysis.

[81] The ongoing annual costs for both paperwork and training are based on (8 hours * $33.42) + (8 * $65.34) = $790.16 or approximately $790.00.

evidence of interpersonal communication capability and of training).[82] The Commission does not consider the estimated costs per small entity to have a significant economic impact on a substantial number of small entities. Accordingly, the Commission certifies that this Final Rule will not have a significant economic impact on a substantial number of small entities.

V. Environmental Analysis

62. The Commission is required to prepare an Environmental Assessment or an Environmental Impact Statement for any action that may have a significant adverse effect on the human environment.[83] The Commission has categorically excluded certain actions from this requirement as not having a significant effect on the human environment. Included in the exclusion are rules that are clarifying, corrective, or procedural or that do not substantially change the effect of the regulations being amended.[84] The actions approved herein fall within this categorical exclusion in the Commission's regulations.

VI. Document Availability

63. In addition to publishing the full text of this document in the Federal Register, the Commission provides all interested persons an opportunity to view and/or print the contents of this document via the Internet through the Commission's Home Page

[82] The ongoing annual cost is based on (12 * $33.42) + (8 * $60.70) = $886.64 or approximately $887.00.

[83] *Regulations Implementing the National Environmental Policy Act of 1969*, Order No. 486, FERC Stats. & Regs. ¶ 30,783 (1987).

[84] 18 CFR 380.4(a)(2)(ii).

64. From the Commission's Home Page on the Internet, this information is available on eLibrary. The full text of this document is available on eLibrary in PDF and Microsoft Word format for viewing, printing, and/or downloading. To access this document in eLibrary, type the docket number excluding the last three digits of this document in the docket number field.

65. User assistance is available for eLibrary and the Commission's website during normal business hours from the Commission's Online Support at 202-502-6652 (toll free at 1-866-208-3676) or email at ferconlinesupport@ferc.gov, or the Public Reference Room at (202) 502-8371, TTY (202) 502-8659. E-mail the Public Reference Room at public.referenceroom@ferc.gov.

VII. Effective Date and Congressional Notification

66. This Final Rule is effective **[insert date 60 days from publication in the Federal Register].**

67. The Commission has determined, with the concurrence of the Administrator of the Office of Information and Regulatory Affairs of OMB, that this rule is not a "major rule" as defined in section 351 of the Small Business Regulatory Enforcement Fairness Act of

1996.[85] The Commission will submit the Final Rule to both houses of Congress and to the General Accountability Office.

68. In addition to publishing the full text of this document in the Federal Register, the Commission provides all interested persons an opportunity to view and/or print the contents of this document via the Internet through the Commission's Home Page (http://www.ferc.gov) and in the Commission's Public Reference Room during normal business hours (8:30 a.m. to 5:00 p.m. Eastern time) at 888 First Street, NE, Room 2A, Washington, DC 20426.

By direction of the Commission.

(S E A L)

Nathaniel J. Davis, Sr.,
Deputy Secretary.

386	Project 2007-02	Project 2007-02 Operating Personnel Protocols: COM-003-1	Successive Ballot	3/27/2013	4/5/2013	Quorum: 78.39% Approval: 57.50%	No Consensus 4/4/13		The RSC did not reach a full consensus however the majority of respondents had indicated they will support the standard - see comment form for further details. Some believe the standard is not necessary and that existing whitepapers alleviate the need for it. In recognition of the NERC BOT's expectations that COM-003 will be approved by the industry and brought before them for approval, NPCC has voted affirmatively and will supply comments for the record outlining our concerns.
387	Project 2007-02	Project 2007-02 Operating Personnel Protocols: COM-003-1	Non-binding Poll	3/27/2013	4/5/2013	Quorum: 77.97% Approval: 54.28%

388	Project 2010-14.1	Project 2010-14.1 - Phase 1 of Balancing Authority Reliability-based Controls: Reserves: BAL-001-2	Initial Ballot	4/16/2013	4/25/2013	Quorum: 88.60% Approval: 66.98%	No Consensus 4/23/13		The majority of NPCC's Balancing Authorities have indicated support for the standard, however NPCC as the Regional Entity has concerns based on results of the field trials that were conducted. These field trials have indicated the potential for an increased number of SOL violations as well as potential for increased ACE due to large inadvertent flows with the proposed BAAL limits based on frequency triggers. To be respectful of the positions of the NPCC BAs who will have to implement this new methodology and the support expressed, NPCC as the Regional Entity will cast an Abstention
389	Project 2010-14.1	Project 2010-14.1 - Phase 1 of Balancing Authority Reliability-based Controls: Reserves: BAL-002-2	Initial Ballot	4/16/2013	4/25/2013	Quorum: 88.51% Approval: 42.75%	Oppose 4/23/13		There is a lack of technical justification for the 500 MW threshold within the standard- NPCC will submit suggested improvements
390	Project 2010-14.1	Project 2010-14.1 - Phase 1 of Balancing Authority Reliability-based Controls: Reserves: BAL-013-1	Initial Ballot	4/16/2013	4/25/2013	Quorum: 88.51% Approval: 23.84%	Oppose 4/23/13		Losses of large blocks of load are typically caused by coincident transmission contingencies. Excessive and uninformed adjustments made to generation in order to bring the ACE to zero may well lead to further transmission issues. NPCC will submit suggested improvements
391	Project 2010-14.1	Project 2010-14.1 - Phase 1 of Balancing Authority Reliability-based Controls: Reserves: BAL-001-2	Non-binding Poll	4/16/2013	4/25/2013	Quorum: % Approval: %			
392	Project 2010-14.1	Project 2010-14.1 - Phase 1 of Balancing Authority Reliability-based Controls: Reserves: BAL-002-2	Non-binding Poll	4/16/2013	4/25/2013	Quorum: % Approval: %			
393	Project 2010-14.1	Project 2010-14.1 - Phase 1 of Balancing Authority Reliability-based Controls: Reserves: BAL-013-1	Non-binding Poll	4/16/2013	4/25/2013	Quorum: % Approval: %			
394	Project 2012-08.1	Project 2012-08.1 - Phase 1 of Glossary Updates: Statutory Definitions	Recirculation Ballot	4/18/2013	4/29/2013	Quorum: 80.70% Approval: 88.15%	No Consensus 3/22/13		
395	Project 2010-13.2	Project 2010-13.2 Phase 2 of Relay Loadability: Generation	Successive ballot	5/15/2013	5/24/2013	Quorum: 81.25% Approval: 69.23%	Support 5/23/13		The Regional Standard Committee has not expressed any concerns of significance that would warrant a ballot to reject, therefore the RSC recommends a yes vote, "Affirmative", to accept the standard
396	Project 2010-13.2	Project 2010-13.2 Phase 2 of Relay Loadability: Generation	Non-binding Poll	5/15/2013	5/24/2013	Quorum: 80.17% Approval: 61.11%			
397	Project 2007-06	Project 2007-06 - System Protection Coordination - PRC-001 and PRC-027	Successive Ballot	6/24/2013	7/3/2013	Quorum: 77.65% Approval: 52.71%			
398	Project 2007-06	Project 2007-06 - System Protection Coordination - PRC-001 and PRC-027	Non-binding Poll	6/24/2013	7/3/2013	Quorum: 77.12% Approval: 52.48%			

Line	Project	Link to Ballot Results https://standards.nerc.net/Ballot.aspx (clicking in the column to the right of "Ballot Periods" column links to the Ballot Results)	Ballot Type	Start Date	End Date (Sorted Oldest to Newest)	Ballot Results	Recommendation / Date	How NPCC Voted	Comments
399	Project 2010-17	Project 2010-17 - Definition of Bulk Electric System (Phase 2)	Initial Ballot	7/3/2013	7/12/2013	Quorum: 85.53% Approval: 49.73%			
400	Project 2007-02	Project 2007-02 - Operating Personnel Communications Protocols - COM-003	Successive Ballot	7/10/2013	7/19/2013	Quorum: 76.32% Approval: 58.36%	No Consensus 7/19/13 [Due to the concerns expressed over the potential actions by the NERC BOT and FERC as well as the incremental improvement of the standard over the previous versions, NPCC as the Regional Entity will support the standard and submit comments.]		organizations support the standard as written however some members expressed concern that in order to measure compliance with R1 and R2, the standard will require all Reliability Directives to be investigated to determine if RC approved and documented communication protocols have been violated. Also it was identified that TO, BA communication protocols would have to approved by the RC potentially causing some legal issues if protocols aren't approved and casts question on the enforcement of those protocols. NPCC will be submitting some helpful comments should the standard pass and some non-substantive revision be performed prior to the "final" (previously named recirculation) ballot.
401	Project 2007-02	Project 2007-02 - Operating Personnel Communications Protocols - COM-003	Non-binding Poll	7/10/2013	7/19/2013	Quorum: 76.20% Approval: 55.37%			
402	Project 2010-13.2	Project 2010-13.2 - Phase 2 of Relay Loadability: Generation - PRC-025	Successive Ballot	7/10/2013	7/19/2013	Quorum: 85.05% Approval: 72.43%	Support 7/19/13		
403	Project 2010-13.2	Project 2010-13.2 - Phase 2 of Relay Loadability: Generation - PRC-025	Non-binding Poll	7/10/2013	7/19/2013	Quorum: 82.51% Approval: 64.59%			
404	Project 2010-14.1	Project 2010-14.1 - Phase 1 of Balancing Authority Reliability-based Controls: Reserves: BAL-001-2	Final Ballot	7/16/2013	7/25/2013	Quorum: 92.31% Approval: 74.54%	No Consensus 7/22/13		The RSC has not reached a full consensus however the majority are in support. Issues outstanding for those not in support are concern over "hitting limits" more frequently and potential issues with BA's potentially "dragging" on the interconnection. NPCC will be voting affirmative on the standard.
405	Project 2010-13.2	Project 2010-13.2 - Phase 2 of Relay Loadability: Generation - PRC-023-3	Initial Ballot	7/26/2013	8/5/2013	Quorum: 80.05% Approval: 93.00%	Support 8/5/13		
408	Project 2010-13.2	Project 2010-13.2 - Phase 2 of Relay Loadability: Generation - PRC-025-1	Final Ballot	8/2/2013	8/12/2013	Quorum: 89.13% Approval: 76.52%	Support 8/12/13		
406	Project 2013-03	Project 2013-03 Geomagnetic Disturbance Mitigation - EOP-010-1	Initial Ballot	8/2/2013	8/12/2013	Quorum: 76.32% Approval: 62.74%	Support 8/9/13		
407	Project 2013-03	Project 2013-03 Geomagnetic Disturbance Mitigation - EOP-010-1	Non-binding Poll	8/2/2013	8/12/2013	Quorum: 75.89% Approval: 55.45%

413	Project 2010-01	Project 2010-01 - Training - PER-005-2	Ballot	8/23/2013	9/3/2013	Quorum: 75.25% Approval: 34.46%	No Consensus 8/31/13		NPCC to support with comments The most contentious issues raised by RSC members was surrounding the Control Center definition and the potential to vastly expand those needing training subject to the standard and compliance and that there was no need for a standard, rather, the FERC Directives should be addressed through other means.
414	Project 2010-01	Project 2010-01 - Training - PER-005-2	Non-binding Poll	8/23/2013	9/3/2013	Quorum: 80.45% Approval: 34.24%			
415	Project 2013-04	Project 2013-04 Voltage and Reactive Control - VAR-001-4, VAR-002-3	Ballot	8/23/2013	9/3/2013	Quorum: 81.89% Approval: 43.79%	Oppose 8/31/13		The standard, in the view of the group, has extensive issues including but not limited to, applicability issues, lacks clarity, missing measures, quality, and other substantive issues. NPCC will be submitting detailed comments to address these issues. The RSC does not believe it would be beneficial to support the standard at this point as the next step, if it fails the initial ballot, would still require an additional ballot prior to moving to recirculation due to the substantive changes that are needed for the next revision. NPCC will be submitting helpful comments to NERC and supporting the drafting team effort.

PRC-002-2 REQUIREMENTS	PRC-002-NPCC-01 REQUIREMENTS	A-15	DETERMINATION PRC-002-NPCC-01 NOT NEEDED	DETERMINATION PRC-002-NPCC-01 NEEDED
LOCATIONS FOR DATA CAPTURE (SER, FR) R1. Each Transmission Owner shall: 1.1. Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1. 1.2. Notify other owners of BES Elements connected to those BES buses, if any, within 90-calendar days of completion of Part 1.1, that those BES Elements require SER data and/or FR data. 1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the re-evaluated list of BES buses as per the Implementation Plan.	**LOCATIONS FOR DATA CAPTURE (SOE, FR)** R1. Each Transmission Owner and Generator Owner shall provide Sequence of Event (SOE) recording capability by installing Sequence of Event recorders or as part of another device, such as a Supervisory Control And Data Acquisition (SCADA) Remote Terminal Unit (RTU), a generator plant Digital (or Distributed) Control System (DCS) or part of Fault recording equipment. This capability shall: 1.1 Be provided at all substations and at locations where circuit breaker operation affects continuity of service to radial Loads greater than 300MW, or the operation of which drops 50MVA Nameplate Rating or greater of Generation, or the operation of which creates a Generation/Load island. Be provided at generating units above 50MVA Nameplate Rating or series of generating units utilizing a control scheme such that the loss of 1 unit results in a loss of greater than 50MVA Nameplate Capacity, and at Generating Plants above 300MVA Name Plate Capacity. 1.2 Monitor the following at each location listed in 1.1: 1.2.1 Transmission and Generator circuit breaker positions 1.2.2 Protective Relay tripping for all Protection Groups that operate to trip circuit breakers identified in 1.2.1. 1.2.3 Teleprotection keying and receive R2. Each Transmission Owner shall provide Fault recording capability for the following Elements at facilities where Fault recording equipment is required to be installed as per R3: **2.1** All transmission lines. **2.2** Autotransformers or phase-shifters connected to busses. **2.3** Shunt capacitors, shunt reactors. **2.4** Individual generator line interconnections. **2.5** Dynamic VAR Devices. **2.6** HVDC terminals. **R7.** Each Reliability Coordinator shall establish its area's requirements for Dynamic Disturbance Recording (DDR) capability that: **7.1** Provides a minimum of 1 DDR per 3,000 MW of	**LOCATIONS FOR DATA CAPTURE (SOE, FR)** 3.2. Sequence of Event recorders shall be provided at all **bulk power system** substations and at generating units above 50 MW **capacity**, and at generating plants above 300 MW **capacity** 4.3 **Fault** recording capability shall be provided by the GO for generating units above 200 MW **capacity**. 4.4 **Fault** recorders shall monitor the following **elements** at each location where **fault** recorders are installed: - All **BPS** Transmission Lines - Autotransformers or phase-shifters connected to **BPS** busses - Shunt capacitors 345 kV and above - Individual generator interconnections - Dynamic Var Devices - HVDC Terminals - A Transmission Owner may optionally include the monitoring of transformers serving load from a **BPS** bus. 5.2 On an **Area** basis, there shall be at least ten (10) DDRs per 30,000 MW of peak **load**, distributed throughout the system, and installed at various types of locations, with consideration given to the following factors: - Major **load** centers - Major **generation** clusters - Major voltage sensitive areas - Major transmission interfaces - Major transmission junctions - **Elements** associated with Interconnection Reliability Operating Limits (IROLs) - Major EHV interconnections between control areas. 5.3 An evaluation of the need for a DDR should be made upon each new major **BPS** installation and upon each bulk power system station addition or expansion where a **fault** recorder replacement project is being made. (A field for this purpose will be included in the next revision of Document C-22.) 5.4 DDRs shall monitor the following **elements** at each location where dynamic recorders are installed: - Most lines such that normal maintenance activities do not interfere with DDR requirements.	• The bus identification methodology in PRC-002-2 R1 would probably not include all the buses identified using A-10 thereby making the locations for sequence of events recording in PRC-002-NPCC-01 more stringent. However, the Implementation Plan for PRC-002-NPCC-01 calls for 100 per cent implementation by October, 2015. PRC-002-2 R2 adequately covers changes made to the system beyond that date that would require added sequence of recording data collection. PRC-002-2 stipulates that there is adequate fault recording data to **determine** electrical quantities, which allows for the determination of electrical quantities at buses in addition to the PRC-002-NPCC-01 identified buses. • PRC-002-2 is more stringent in that it requires notification of other BES Element owners (Part 1.2). • PRC-002-2 Part 1.3 is more stringent in that it requires a five calendar year re-evaluation period. • A-15 Sections 3.2 and 3.3 dictate what sequence of events recording data must be captured.	

PRC-002-2 REQUIREMENTS	PRC-002-NPCC-01 REQUIREMENTS	A-15	DETERMINATION PRC-002-NPCC-01 NOT NEEDED	DETERMINATION PRC-002-NPCC-01 NEEDED
	peak Load. **7.2** Records dynamic disturbance information with consideration of the following facilities/locations: **7.2.1** Major Load centers. **7.2.2** Major Generation clusters. **7.2.3** Major voltage sensitive areas. **7.2.4** Major transmission interfaces. **7.2.5** Major transmission junctions. **7.2.6** Elements associated with Interconnection Reliability Operating Limits (IROLs). **7.2.7** Major EHV interconnections between operating areas.	- Bus voltages

SER R2. Each Transmission Owner and Generator Owner shall have SER data for circuit breaker position (open/close) for each circuit breaker it owns connected directly to the BES buses identified in Requirement R1 and associated with the BES Elements at those BES buses.	**SER** R1. Each Transmission Owner and Generator Owner shall provide Sequence of Event (SOE) recording capability by installing Sequence of Event recorders or as part of another device, such as a Supervisory Control And Data Acquisition (SCADA) Remote Terminal Unit (RTU), a generator plant Digital (or Distributed) Control System (DCS) or part of Fault recording equipment. This capability shall: 1.1 Be provided at all substations and at locations where circuit breaker operation affects continuity of service to radial Loads greater than 300MW, or the operation of which drops 50MVA Nameplate Rating or greater of Generation, or the operation of which creates a Generation/Load island. Be provided at generating units above 50MVA Nameplate Rating or series of generating units utilizing a control scheme such that the loss of 1 unit results in a loss of greater than 50MVA Nameplate Capacity, and at Generating Plants above 300MVA Name Plate Capacity. 1.2 Monitor the following at each location listed in 1.1: 1.2.1 Transmission and Generator circuit breaker positions 1.2.2 Protective Relay tripping for all Protection Groups that operate to trip circuit breakers identified in 1.2.1. 1.2.3 Teleprotection keying and receive	**SER** 3.3. Sequence of Events recording shall monitor the following at each location: - Transmission and Generator circuit breaker positions - **Protective Relay** tripping for all **protection groups** - **Teleprotection** keying & receive	• For sequence of events recording PRC-002-NPCC-01 is more stringent. However, the Implementation Plan for PRC-002-NPCC-01 calls for 100 per cent implementation by October, 2015. PRC-002-2 would adequately cover changes made to the system beyond that date. It is preferable to have sequence of events recording equipment, but sequence of events can be determined (monitored) from fault recording data, and target data (as called for in PRC-002-NPCC-01 Part 1.2, A-15 Section 3.3).	

PRC-002-2 REQUIREMENTS	PRC-002-NPCC-01 REQUIREMENTS	A-15	DETERMINATION PRC-002-NPCC-01 NOT NEEDED	DETERMINATION PRC-002-NPCC-01 NEEDED
FAULT RECORDING R3. Each Transmission Owner and Generator Owner shall have FR data to determine the following electrical quantities for each triggered FR for the BES Elements it owns connected to the BES buses identified in Requirement R1: 3.1 Phase-to-neutral voltage for each phase of each specified BES bus. 3.2 Each phase current and the residual or neutral current for the following BES Elements: 3.2.1 Transformers that have a low-side operating voltage of 100kV or above. 3.2.2 Transmission Lines. R4. Each Transmission Owner and Generator Owner shall have FR data as specified in Requirement R3 that meets the following: 4.1 A single record or multiple records that include: • A pre-trigger record length of at least two cycles and a total record length of at least 30-cycles for the same trigger point, or • At least two cycles of the pre-trigger data, the first three cycles of the post-trigger data, and the final cycle of the fault as seen by the fault recorder. 4.2 A minimum recording rate of 16 samples per cycle. 4.3 Trigger settings for at least the following: 4.3.1 Neutral (residual) overcurrent. 4.3.2 Phase undervoltage or overcurrent.	**FAULT RECORDING** **R2.** Each Transmission Owner shall provide Fault recording capability for the following Elements at facilities where Fault recording equipment is required to be installed as per R3: **2.1** All transmission lines. **2.2** Autotransformers or phase-shifters connected to busses. **2.3** Shunt capacitors, shunt reactors. **2.4** Individual generator line interconnections. **2.5** Dynamic VAR Devices. **2.6** HVDC terminals. **R3.** Each Transmission Owner shall have Fault recording capability that determines the Current Zero Time for loss of Bulk Electric System (BES) transmission Elements. **R4.** Each Generator Owner shall provide Fault recording capability for Generating Plants at and above 200 MVA Capacity and connected through a generator step up (GSU) transformer to a Bulk Electric System Element unless Fault recording capability is already provided by the Transmission Owner. **R5.** Each Transmission Owner and Generator Owner shall record for Faults, sufficient electrical quantities for each monitored Element to determine the following: **5.1** Three phase-to-neutral voltages. (Common bus-side voltages may be used for lines.) **5.2** Three phase currents and neutral currents. **5.3** Polarizing currents and voltages, if used. **5.4** Frequency. **5.5** Real and reactive power. **R6.** Each Transmission Owner and Generator Owner shall provide Fault recording with the following capabilities: **6.1** Each Fault recorder record duration shall be a minimum of one (1) second. **6.2** Each Fault recorder shall have a minimum recording rate of 16 samples per cycle **6.3** Each Fault recorder shall be set to trigger for at least the following: **6.3.1** Monitored phase overcurrents set at 1.5 pu or less of rated CT secondary current or Protective Relay tripping for all Protection Groups. **6.3.2** Neutral (residual) overcurrent set at 0.2 pu or	**FAULT RECORDING** 4.1 **Fault** recording is the responsibility of transmission owners and **generation** owners. When adding or replacing a DFR at an existing BPS facility, the TO or GO should complete a notification in accordance with Document C-22. 4.2 **Fault** recording shall be provided by the TO to determine the current zero time for loss of **BPS** transmission **elements**. The current zero time shall be reported as the time of the final current zero on the last phase to interrupt. 4.3 **Fault** recording capability shall be provided by the GO for generating units above 200 MW **capacity**. 4.4 **Fault** recorders shall monitor the following **elements** at each location where **fault** recorders are installed: - All **BPS** Transmission Lines - Autotransformers or phase-shifters connected to **BPS** busses - Shunt capacitors 345 kV and above - Individual generator interconnections - Dynamic Var Devices - HVDC Terminals - A Transmission Owner may optionally include the monitoring of transformers serving load from a **BPS** bus. 4.5 Electrical quantities to be recorded for each monitored **element** shall be sufficient to determine the following: - Three phase-to-neutral voltages. (Common bus-side voltages may be used for lines.) - Three phase currents and neutral currents. - Polarizing currents and voltages, if used. - Frequency. - Active and reactive power. 4.6 **Fault** recorder record duration shall be a minimum of one (1) second. 4.7 **Fault** recorder minimum recording rate shall be 16 samples per cycle. 4.8 As a minimum, **fault** recorders shall be set to trigger for all the following functions: - **Protective Relay** tripping for all **protection**	Current Zero Time--The time of the final current zero on the last phase to interrupt (from the NERC Glossary--NPCC Section). • The inclusion of “to determine” in PRC-002-2 R3 covers the Elements to be covered in PRC-002-NPCC-01 R2, R3. • For PRC-002-NPCC-01 R4 the Current Zero Time can be determined from the retrieved data. • The quantities specified in PRC-002-NPCC-01 R5 can be determined from the data specified to be retrieved in PRC-002-2 R3. • PRC-002-NPCC-01 R6 is more stringent in that it specifies the record duration, and triggering specifics. However, this is addressed by A-15.	

PRC-002-2 REQUIREMENTS	PRC-002-NPCC-01 REQUIREMENTS	A-15	DETERMINATION PRC-002-NPCC-01 NOT NEEDED	DETERMINATION PRC-002-NPCC-01 NEEDED
	less of rated CT secondary current. **6.3.3** Monitored phase undervoltage set at 0.85 pu or greater. **6.4** Document additional triggers and deviations from the settings in 6.3.2 and 6.3.3 when local conditions dictate.	**groups** - Neutral (residual) overcurrent set at 0.2 pu rated CT secondary current - Phase undervoltage set at 0.85 pu 4.9 When local conditions require different settings or additional functions, such situations shall be documented.

DYNAMIC DISTURBANCE RECORDING R5. Each Responsible Entity shall: 5.1 Identify BES Elements for which dynamic Disturbance recording (DDR) data is required, including the following: 5.1.1 Generating resource(s) with: 5.1.1.1 Gross individual nameplate rating greater than or equal to 500 MVA. 5.1.1.2 Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1,000 MVA. 5.1.2 Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL). 5.1.3 Each terminal of a high voltage direct current (HVDC) circuit with a nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter. 5.1.4 One or more BES Elements that are part of an Interconnection Reliability Operating Limit (IROL). 5.1.5 Any one BES Element within a major voltage sensitive area as defined by an area with an in-service undervoltage load shedding (UVLS) program. 5.2 Identify a minimum DDR coverage, inclusive of those BES Elements identified in Part 5.1, of at least: 5.2.1 One BES Element; and 5.2.2 One BES Element per 3,000 MW of the Responsible Entity's historical simultaneous peak System Demand. 5.3 Notify all owners of identified BES Elements, within 90-calendar days of completion of Part 5.1, that their respective BES Elements require DDR data when requested. 5.4 Re-evaluate all BES Elements at least once every five calendar years in accordance with Parts 5.1 and 5.2, and notify owners in accordance with Part 5.3 to implement the	**DYNAMIC DISTURBANCE RECORDING** **R7.** Each Reliability Coordinator shall establish its area's requirements for Dynamic Disturbance Recording (DDR) capability that: **7.1** Provides a minimum of 1 DDR per 3,000 MW of peak Load. **7.2** Records dynamic disturbance information with consideration of the following facilities/locations: **7.2.1** Major Load centers. **7.2.2** Major Generation clusters. **7.2.3** Major voltage sensitive areas. **7.2.4** Major transmission interfaces. **7.2.5** Major transmission junctions. **7.2.6** Elements associated with Interconnection Reliability Operating Limits (IROLs). **7.2.7** Major EHV interconnections between operating areas. **R8.** Each Reliability Coordinator shall specify that DDRs installed, after the approval of this standard, function as continuous recorders. **R9.** Each Reliability Coordinator shall specify that DDRs are installed with the following capabilities: **9.1** A minimum recording time of sixty (60) seconds per trigger event. **9.2** A minimum data sample rate of 960 samples per second, and a minimum data storage rate for RMS quantities of six (6) data points per second. **9.3** Each DDR shall be set to trigger for at least one of the following (based on manufacturers' equipment capabilities): **9.3.1** Rate of change of Frequency. **9.3.2** Rate of change of Power. **9.3.3** Delta Frequency (recommend 20 mHz change). **9.3.4** Oscillation of Frequency. **R10.** Each Reliability Coordinator shall establish requirements such that the following quantities are monitored or derived where DDRs are installed: **10.1** Line currents for most lines such that normal line maintenance activities do not interfere with DDR functionality. **10.2** Bus voltages such that normal bus maintenance activities do not interfere with DDR functionality. **10.3** As a minimum, one phase current per	**DYNAMIC DISTURBANCE RECORDING** 5.1 Where the DDR capability is deemed necessary by the Reliability Coordinator, the Reliability Coordinator shall provide guidance in setting triggers and shall monitor the performance of the DDR devices. 5.2 On an **Area** basis, there shall be at least ten (10) DDRs per 30,000 MW of peak **load**, distributed throughout the system, and installed at various types of locations, with consideration given to the following factors: - Major **load** centers - Major **generation** clusters - Major voltage sensitive areas - Major transmission interfaces - Major transmission junctions - **Elements** associated with Interconnection Reliability Operating Limits (IROLs) - Major EHV interconnections between control areas. 5.3 An evaluation of the need for a DDR should be made upon each new major **BPS** installation and upon each bulk power system station addition or expansion where a **fault** recorder replacement project is being made. (A field for this purpose will be included in the next revision of Document C-22.) 5.4 DDRs shall monitor the following **elements** at each location where dynamic recorders are installed: - Most lines such that normal maintenance activities do not interfere with DDR requirements. - Bus voltages 5.5 As a minimum, DDRs shall monitor one phase current per monitored **element** and two phase-to-neutral voltages of different **elements**. One of the monitored voltages shall be of the same phase as the monitored current. 5.6 Electrical quantities to be recorded for each monitored **element** shall be sufficient to determine the following: - Voltage, current, and frequency - Active and reactive power 5.7 DDRs installed after January 1, 2009 shall function as continuous recorders.	• The inclusion of "to determine" in PRC-002-2 R6, R7 encompasses the data for the facilities/locations in PRC-002-NPCC-01 R7. • PRC-002-2 R8 addresses continuous recorders (PRC-002-NPCC-01 R8). • PRC-002-2 is more stringent in that for triggered DDR, the triggered record lengths must be at least three minutes (Part 8.1). PRC-002-NPCC-01 specifies "A minimum recording time of sixty (60) seconds per trigger event (Part 9.1). • Both PRC-002-2 and PRC-002-NPCC-01 require continuous recording (A-15 specifies this in its 5.7) negating the need for the additional triggering in PRC-002-NPCC-01 Part 9.3. The Implementation Plan for PRC-002-NPCC-01 calls for 100 per cent implementation by October, 2015. • PRC-002-2 is more stringent in that it requires a five calendar year re-evaluation period (Part 5.4). • PRC-002-2 addresses the quantities to be covered in R6 and R7 (PRC-002-NPCC-01 R10). • The timetable for the acquisition of DDR data is listed in PRC-002-2's Implementation Plan. This is more specific/stringent than PRC-002-NPCC-01 R13. • PRC-002-2 addresses "what" data is captured", not "how" it is captured. This covers the "products" of recording equipment. The requirements in PRC-002-2 pertaining to DDR (R5-R9) are performance-based in accordance with the 6/26/13 NERC Standard Processes Manual (page 6).	• PRC-002-NPCC-01 R11 requires documentation of settings to be reported to the RE.

PRC-002-2 REQUIREMENTS	PRC-002-NPCC-01 REQUIREMENTS	A-15	DETERMINATION PRC-002-NPCC-01 NOT NEEDED	DETERMINATION PRC-002-NPCC-01 NEEDED
re-evaluated list of BES Elements as per the Implementation Plan. R6. Each Transmission Owner shall have DDR data to determine the following electrical quantities for each BES Element it owns for which it received notification as identified in Requirement R5: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 6.1 One phase-to-neutral or positive sequence voltage. 6.2 The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R6, Part 6.1, or the positive sequence current. 6.3 Real Power and Reactive Power flows expressed on a three phase basis corresponding to all circuits where current measurements are required. 6.4 Frequency of any one of the voltage(s) in Requirement R6, Part 6.1. R7. Each Generator Owner shall have DDR data to determine the following electrical quantities for each BES Element it owns for which it received notification as identified in Requirement R5: 7.1 One phase-to-neutral, phase-to-phase, or positive sequence voltage at either the generator step-up transformer (GSU) high-side or low-side voltage level. 7.2 The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R7, Part 7.1, phase current(s) for any phase-to-phase voltages, or positive sequence current. 7.3 Real Power and Reactive Power flows expressed on a three phase basis corresponding to all circuits where current measurements are required. 7.4 Frequency of at least one of the voltages in Requirement R7, Part 7.1. R8. Each Transmission Owner and Generator Owner responsible for DDR data for the BES Elements identified in Requirement R5 shall have continuous data recording and storage. If the equipment was installed prior to the effective date of this standard and is not capable of continuous recording, triggered records must meet the following: 8.1 Triggered record lengths of at least three minutes. 8.2 At least one of the following three triggers:	monitored Element and two phase-to-neutral voltages of different Elements. One of the monitored voltages shall be of the same phase as the monitored current. **10.4** Frequency. **10.5** Real and reactive power. **R11.** Each Reliability Coordinator shall document additional settings and deviations from the required trigger settings described in R9 and the required list of monitored quantities as described in R10, and report this to the Regional Entity (RE) upon request. **R12.** Each Reliability Coordinator shall specify its DDR requirements including the DDR setting triggers established in R9 to the Transmission Owners and Generator Owners. **R13.** Each Transmission Owner and Generator Owner that receives a request from the Reliability Coordinator to install a DDR shall acquire and install the DDR in accordance with R12. Reliability Coordinators, Transmission Owners, and Generator Owners shall mutually agree on an implementation schedule.	5.8 Each device shall sample data at a rate of at least 960 samples per second (16 samples per cycle and shall store the RMS value of electrical quantities at a rate of at least 6 data points per second.) 5.9 The following DDR triggers shall be considered where available based on manufacturers capability: - Rate of change of Frequency - Rate of change of Power - Delta Frequency 20 mHz change - Oscillation of Frequency 5.10 When local conditions require different settings or additional functions, such situations shall be documented. 5.11 When DDR triggers are used, duration of triggered records shall be a minimum of sixty (60) seconds.		

PRC-002-2 REQUIREMENTS	PRC-002-NPCC-01 REQUIREMENTS	A-15	DETERMINATION PRC-002-NPCC-01 NOT NEEDED	DETERMINATION PRC-002-NPCC-01 NEEDED
• Off nominal frequency trigger set at: Low High o Eastern Interconnection <59.75Hz >61.0Hz o Western Interconnection <59.55Hz >61.0Hz o ERCOT Interconnection <59.35Hz >61.0 Hz o Hydro-Quebec Interconnection <58.55Hz >61.5Hz • Rate of change of frequency trigger set at: o Eastern Interconnection < -0.03125 Hz/sec >0.125 Hz/sec o Western Interconnection < -0.05625 Hz/sec >0.125 Hz/sec o ERCOT Interconnection < -0.08125 Hz/sec >0.125 Hz/sec o Hydro-Quebec Interconnection < -0.18125 Hz/sec >0.1875 Hz/sec • Undervoltage trigger set no lower than 85 percent of normal operating voltage for a duration of 5 seconds. R9. Each Transmission Owner and Generator Owner responsible for DDR data for the BES Elements identified in Requirement R5 shall have DDR data that meet the following: 9.1 Input sampling rate of at least 960 samples per second. 9.2 Output recording rate of electrical quantities of at least 30 times per second.				

PRC-002-2 REQUIREMENTS	PRC-002-NPCC-01 REQUIREMENTS	A-15	DETERMINATION PRC-002-NPCC-01 NOT NEEDED	DETERMINATION PRC-002-NPCC-01 NEEDED
TIME SYNCHRONIZATION R10. Each Transmission Owner and Generator Owner shall time synchronize all SER and FR data for the BES buses identified in Requirement R1 and DDR data for the BES Elements identified in Requirement R5 to meet the following: 10.1 Synchronization to Coordinated Universal Time (UTC) with or without a local time offset. 10.2 Synchronized device clock accuracy within ± 2 milliseconds of UTC.	**TIME SYNCHRONIZATION** **R14.** Each Transmission Owner and Generator Owner shall establish a maintenance and testing program for stand alone DME (equipment whose only purpose is disturbance monitoring) that includes: **14.1** Maintenance and testing intervals and their basis. **14.2** Summary of maintenance and testing procedures. **14.3** Monthly verification of communication channels used for accessing records remotely (if the entity relies on remote access and the channel is not monitored to a control center staffed around the clock, 24 hours a day, 7 days a week (24/7)). **14.4** Monthly verification of time synchronization (if the loss of time synchronization is not monitored to a 24/7 control center). **14.5** Monthly verification of active analog quantities. **14.6** Verification of DDR and DFR settings in the software every six (6) years. **14.7** A requirement to return failed units to service within 90 days. If a DME device will be out of service for greater than 90 days the owner shall keep a record of efforts aimed at restoring the DME to service.	**TIME SYNCHRONIZATION** **7.0 Time Synchronization** Internal clocks in DME devices shall be time synchronized to within 2 milliseconds or less of Coordinated Universal Time (UTC) scale. The time zone shall be clearly identified as either universal time zone or local time zone.	• PRC-002-2 R10 is more stringent than PRC-002-NPCC-01 Part 14.4 in its time synchronization specification. A-15 Section 7.0 is consistent with PRC-002-2. • PRC-002-2 addresses “what” data is captured”, not “how” it is captured. This covers the “products” of recording equipment, eliminating the need for a definition of maintenance and testing procedures. PRC-002-2 requirements are performance-based.	

PRC-002-2 REQUIREMENTS	PRC-002-NPCC-01 REQUIREMENTS	A-15	DETERMINATION PRC-002-NPCC-01 NOT NEEDED	DETERMINATION PRC-002-NPCC-01 NEEDED
DATA SPECIFICATIONS **R11.** Each Transmission Owner and Generator Owner shall provide, upon request, all SER and FR data for the BES buses identified in Requirement R1 and DDR data for the BES Elements identified in Requirement R5 to the Responsible Entity, Regional Entity, or NERC in accordance with the following: **11.1** Data will be retrievable for the period of 10-calendar days, inclusive of the day the data was recorded. **11.2** Data subject to Part 11.1 will be provided within 30-calendar days of a request unless an extension is granted by the requestor. **11.3** SER data will be provided in ASCII Comma Separated Value (CSV) format following Attachment 2. **11.4** FR and DDR data will be provided in electronic files that are formatted in conformance with C37.111, (IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), revision C37.111-1999 or later. **11.5** Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME), revision C37.232-2011 or later.	**DATA SPECIFICATIONS** **R15.** Each Reliability Coordinator, Transmission Owner and Generator Owner shall share data within 30 days upon request. Each Reliability Coordinator, Transmission Owner, and Generator Owner shall provide recorded disturbance data from DMEs within 30 days of receipt of the request in each of the following cases: **15.1** NERC, Regional Entity, Reliability Coordinator. **15.2** Request from other Transmission Owners, Generator Owners within NPCC. **R16.** Each Reliability Coordinator, Transmission Owner and Generator Owner shall submit the data files conforming to the following format requirements: **16.1** The data files shall be capable of being viewed, read, and analyzed with a generic COMTRADE analysis tool as per the latest revision of IEEE Standard C37.111. **16.2** Disturbance Data files shall be named in conformance with the latest revision of IEEE Standard C37.232. **16.3** Fault Recorder and DDR Files shall contain all monitored channels. SOE records shall contain station name, date, time resolved to milliseconds, SOE point name, status.	**DATA SPECIFICATIONS** 6.1 Recorded **disturbance** data from DMEs shall be forwarded within 30 days of receipt of the request in each of the following cases: - Request from NERC **Disturbance** Investigation Team - Request from NPCC **Disturbance** Investigation Team - Reliability Coordinator Request 6.2 Data forwarded shall be archived in its native format for a period of 3 years by the TO or GO. 6.3 **Disturbance** data files shall be provided in a format which is capable of being viewed, read, and analyzed with a generic COMTRADE analysis tool (8). 6.4 Disturbance Data files shall be named in conformance with IEEE C37.232 Recommended Practice for Naming Time Sequence Data Files. 6.5 **Fault** Recorder and DDR Files shall contain all monitored channels. SOE records shall contain station, date, time resolved to milliseconds, SOE point name, status. 6.6 Recorded data from each **disturbance** shall be retrievable for 10 calendar days. This requirement does not apply to **relays** unless those **relays** are designated as DME.	• The stipulation in PRC-002-NPCC-01 Part 15.2 for the provision of data to other Transmission Owners, and Generator Owners in NPCC upon request is addressed by PRC-002-2 in its R15 which mandates the provision of data to the Responsible Entity, RE, or NERC. • PRC-002-NPCC-01's data file requirements specified in R16 are addressed in PRC-002-2 R11. PRC-002-NPCC-01 Part 16.3 requires the provision of information in the data that is incumbent to the data record.	

PRC-002-2 REQUIREMENTS	PRC-002-NPCC-01 REQUIREMENTS	A-15	DETERMINATION PRC-002-NPCC-01 NOT NEEDED	DETERMINATION PRC-002-NPCC-01 NEEDED

PRC-002-2 REQUIREMENTS	PRC-002-NPCC-01 REQUIREMENTS	A-15	DETERMINATION PRC-002-NPCC-01 NOT NEEDED	DETERMINATION PRC-002-NPCC-01 NEEDED
STATUS OF RECORDING CAPABILITY **R12.** Each Transmission Owner and Generator Owner shall, within 90-calendar days of the discovery of a failure of the recording capability for the SER, FR or DDR data, either: • Restore the recording capability, or • Submit a Corrective Action Plan (CAP) to the Regional Entity and implement it.	**STATUS OF RECORDING CAPABILITY** **R14.** Each Transmission Owner and Generator Owner shall establish a maintenance and testing program for stand alone DME (equipment whose only purpose is disturbance monitoring) that includes: **14.1** Maintenance and testing intervals and their basis. **14.2** Summary of maintenance and testing procedures. **14.3** Monthly verification of communication channels used for accessing records remotely (if the entity relies on remote access and the channel is not monitored to a control center staffed around the clock, 24 hours a day, 7 days a week (24/7)). **14.4** Monthly verification of time synchronization (if the loss of time synchronization is not monitored to a 24/7 control center). **14.5** Monthly verification of active analog quantities. **14.6** Verification of DDR and DFR settings in the software every six (6) years. **14.7** A requirement to return failed units to service within 90 days. If a DME device will be out of service for greater than 90 days the owner shall keep a record of efforts aimed at restoring the DME to service.	**STATUS OF RECORDING CAPABILITY** **8.0 Maintenance And Testing** Each TO, and GO shall establish a maintenance and testing program for DME (guidance for maintenance and testing is provided in Document B-26) that includes: • Maintenance and testing intervals and their basis. • Summary of maintenance and testing procedures.	• PRC-002-2 addresses “what” data is captured”, not “how” it is captured. This covers the “results” of recording equipment. • PRC-002-2 R12 is more stringent in that it requires a CAP.	

PRC-002-2 REQUIREMENTS	PRC-002-NPCC-01 REQUIREMENTS	A-15	DETERMINATION PRC-002-NPCC-01 NOT NEEDED	DETERMINATION PRC-002-NPCC-01 NEEDED
DATA ON THE DISTURBANCE MONITORING EQUIPMENT Not Applicable.	**DATA ON THE DISTURBANCE MONITORING EQUIPMENT** **R17.** Each Reliability Coordinator, Transmission Owner and Generator Owner shall maintain, record and provide to the Regional Entity (RE), upon request, the following data on the DMEs installed to meet this standard: **17.1** Type of DME. **17.2** Make and model of equipment. **17.3** Installation location. **17.4** Operational Status. **17.5** Date last tested. **17.6** Monitored Elements. **17.7** All identified channels. **17.8** Monitored electrical quantities.	**DATA ON THE DISTURBANCE MONITORING EQUIPMENT** 6.7 The TO and GO shall each maintain and be ready to report to NPCC on request the following data on the DMEs installed to meet this standard: - Type of DME - Make and model of equipment - Installation location - Operational Status - Date last tested - Monitored **Elements** - Monitored Devices - Monitored Electrical Quantities	• PRC-002-2 addresses “what” data is captured”, not “how” it is captured. This covers the “results” of recording equipment. Providing data upon request is all that is required. A-15 Section 6.7 addresses the data needed for disturbance monitoring equipment.	

Information in a Regional Standard Authorization Request (RSAR)

The tables below identify information to be submitted in a Regional Standard Authorization Request to the NPCC Regional Standards Process Manager, NPCCstandard@npcc.org . The NPCC Regional Standards Process Manager shall be responsible for implementing and maintaining this form as needed to support the information requirements of the standards process.

Regional Standard Authorization Request Form

Title of Proposed Standard:	PRC-006-NPCC-2
Request Date:	03-31-2015

RSAR Requester Information

Name: Brian Robinson		**RSAR Type (Check box for one of these selections.)**	
Company:	NPCC	☐	New Standard
Telephone: 802-241-1400		☒	Revision to Existing Standard
Fax:	(866) 214-8632	☐	Withdrawal of Existing Standard
Email:	Brian.Robinson@utilitysvcs.com	☐	Urgent Action

Purpose (Describe the purpose of the proposed standard – what the standard will achieve in support of reliability.**)**

The purpose of the proposed RSAR is to review regional reliability standard PRC-006-NPCC-1 for potential revisions or retirements made necessary by NERC's PRC-006-1/PRC-006-2 Automatic Underfrequency Load Shedding and PRC-024-1/PRC-024-2 Generator Frequency and Voltage Protective Relay Settings standards.

PRC-006-NPCC-1 is to be reviewed to determine if the applicability of the standard needs to be revised in accordance with Project 2014-01 Dispersed Generation Resources.

PRC-006-NPCC-1 is to be reviewed in order to determine if the performance requirements as contained in the criteria of NPCC Directory#12 Sections 5.1.1 and 5.1.2 should be explicitly included in the requirements of the Regional Standard.

Attachment C in PRC-006-NPCC-1 is to be reviewed to address the implications of the design assessment, in accordance with Requirement R4 of PRC-006-1/PRC-006-2, of not meeting the program performance characteristics as identified in Requirement R3 of PRC-006-1/PRC-006-2.

PRC-006-NPCC-1 is to be reviewed in order to update Table 4 in Attachment C in accordance with the 2013 NPCC UFLS Adequacy Assessment. Additionally, the applicability of Requirements R4 and R5 will be reviewed to consider that Hydro Quebec is not part of the Eastern Interconnection.

Retiring PRC-006-NPCC-1 is to be considered if it is determined that it can be retired without sacrificing the ability to develop an effective underfrequency load shedding program.

Industry Need (Provide a detailed statement justifying the need for the proposed standard, along with any supporting documentation**.)**

To enhance efficiency and cost effectiveness, it must be determined if PRC-006-NPCC-1 requirements should be revised or retired considering the industry adoption of NERC standards PRC-006-1/PRC-006-2 and PRC-024-1/PRC-024-2, without sacrificing the ability to preserve the System during declining frequency and voltage excursion events.

OR

To enhance efficiencies and cost effectiveness, it must be determined if PRC-006-NPCC-1 requirements can be revised or retired to address the new NERC BES definition, Paragraph 81, and eliminate redundancy leading to double jeopardy with PRC-006-1/PRC-006-2 and PRC-024-1/PRC-024-2 requirements without sacrificing the ability to develop an effective underfrequency load shedding program.

Brief Description (Describe the proposed standard in sufficient detail to clearly define the scope in a manner that can be easily understood by others.**)**

The requirements in PRC-006-NPCC-1 will be reviewed individually for revision or deletion with respect to NERC standards PRC-006-1/PRC-006-2 and PRC-024-1/PRC-024-2. Both PRC-006-NPCC-1and PRC-006-1/PRC-006-2 mandate effective automatic underfrequency load shedding, and PRC-024-1/PRC-024-2 ensure that generator protective relays are set such that the units remain connected during frequency and voltage excursions. However, there are certain similar requirements in each of these standards that should be reviewed to determine whether there is an opportunity to revise or delete the requirements of PRC-006-NPCC-1 to eliminate redundancy and the resulting double jeopardy.

OR

The requirements in PRC-006-NPCC-1 will be reviewed individually for revision or deletion with respect to the new NERC BES definition, and Paragraph 81. In addition, PRC-006-NPCC-1 will be reviewed against NERC's PRC-006-1/PRC-006-2 and PRC-024-1/PRC-024-2 2-2. PRC-006-1/PRC-006-2 mandate the establishment of design and documentation requirements for automatic underfrequency load shedding (UFLS) programs. PRC-024-1/PRC-024-2 mandate that Generator Owners set their generator protective relays such that generating units remain connected during defined frequency and voltage excursions. These "umbrellas" encompasses the relevant requirements in PRC-006-NPCC-1. However, the relevant requirements in each of the standards are to be compared and the requirements of PRC-006-NPCC-1, if so determined, be revised or deleted to eliminate redundancy and the concomitant double jeopardy. The review will also ensure that NERC Rules of Procedure, Section 312. Regional Reliability Standards, bullet 1that reads "Regional Entities may propose Regional Reliability Standards that set more stringent reliability requirements than the NERC Reliability Standard or cover matters not covered by an existing NERC Reliability Standard." will govern.

PRC-006-1/PRC-006-2 specifies in Requirement R4 that "Each Planning Coordinator shall conduct and document a UFLS design assessment at least once every five years…". Revision to Attachment C of PRC-006-NPCC-1 needs to be considered to address the circumstance surrounding a design assessment that does not meet the performance characteristics as identified in Requirement R3 of PRC-006-1/PRC-006-2.

Revise Table 4 Attachment C to reflect the modified Quebec UFLS program parameters as recommended in the 2013 NPCC UFLS Adequacy Assessment and review the applicability of Requirements R4 and R5 as they pertain to the Quebec Interconnection.

Additionally, as identified by SS38 there are aspects of the performance requirements in NERC PRC-006-1 that are slightly more relaxed than the criteria in Directory#12 and these more stringent attributes of the NPCC criteria were not incorporated into the regional standard.

Specifically, the NPCC criteria in Directory#12 (Sections 5.1.1 and 5.1.2) state that (1) frequency decline is arrested at no less than 58.0 Hz for the portions of NPCC in the Eastern Interconnection, and 56.0 Hz for the portion of NPCC in the Quebec Interconnection (2)

frequency should not remain below 59.5Hz for more than 30 seconds and should not remain below 58.5 Hz. for more than 10 seconds. Review the need to include the performance criteria presently in Directory#12 into PRC-006-NPCC-02, or whether the performance criteria included in PRC-006-1/PRC-006-2 is sufficient.

Interpretations of PRC-006-NPCC-1 to be considered to clarify PRC-006-NPCC-2.

The review will include an assessment of the need to include language to address dispersed generation resources.

PRC-006-NPCC-2 should be made to conform to the NERC Results Based Standard format.

~~The review will be governed by bullet 1 of the NERC Rules of Procedure, Section 312, Regional Reliability Standards, which reads "Regional Entities may propose Regional Reliability Standards that set more stringent reliability requirements than the NERC Reliability Standard or cover matters not covered by an existing NERC Reliability Standard."~~

After this review is completed, it will be determined if PRC-006-NPCC-1 should be revised, or retired.

Reliability Functions

The Standard will Apply to the Following Functions (Check all applicable boxes.)		
☐	Reliability Coordinator	The entity that is the highest level of authority who is responsible for the reliable operation of the Bulk Electric System, has the Wide Area view of the Bulk Electric System, and has the operating tools, processes and procedures, including the authority to prevent or mitigate emergency operating situations in both next-day analysis and real-time operations. The Reliability Coordinator has the purview that is broad enough to enable the calculation of Interconnection Reliability Operating Limits, which may be based on the operating parameters of transmission systems beyond any Transmission Operator's vision.
☐	Balancing Authority	The responsible entity that integrates resource plans ahead of time, maintains load-interchange-generation balance within a Balancing Authority Area, and supports Interconnection frequency in real time.
☐	Interchange Authority	Authorizes valid and balanced Interchange Schedules.
☒	Planning Coordinator	The responsible entity that coordinates and integrates transmission facility and service plans, resource plans, and protection systems.

☐	Transmission Service Provider	The entity that administers the transmission tariff and provides Transmission Service to Transmission Customers under applicable transmission service agreements.
☒	Transmission Owner	The entity that owns and maintains transmission facilities.
☐	Transmission Operator	The entity responsible for the reliability of its "local" transmission system, and that operates or directs the operations of the transmission facilities.
☐	Transmission Planner	The entity that develops a long-term (generally one year and beyond) plan for the reliability (adequacy) of the interconnected bulk electric transmission systems within its portion of the Planning Authority Area.
☐	Resource Planner	The entity that develops a long-term (generally one year and beyond) plan for the resource adequacy of specific loads (customer demand and energy requirements) within a Planning Authority Area.
☐	Generator Operator	The entity that operates generating unit(s) and performs the functions of supplying energy and Interconnected Operations Services.
☒	Generator Owner	Entity that owns and maintains generating units.
☐	Purchasing-Selling Entity	The entity that purchases or sells, and takes title to, energy, capacity, and Interconnected Operations Services. Purchasing-Selling Entities may be affiliated or unaffiliated merchants and may or may not own generating facilities.
☒	Distribution Provider	Provides and operates the "wires" between the transmission system and the customer.
☐	Load-Serving Entity	Secures energy and transmission service (and related Interconnected Operations Services) to serve the electrical demand and energy requirements of its end-use customers.

Reliability and Market Interface Principles

Applicable Reliability Principles *(Check all boxes that apply.)*	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☒	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☒	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained, and implemented.

☒	5. Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☒	7. The security of the interconnected bulk power systems shall be assessed, monitored, and maintained on a wide-area basis.

Does the proposed Standard comply with all of the following Market Interface Principles? *(Select 'yes' or 'no' from the drop-down box.)*
Recognizing that reliability is an Common Attribute of a robust North American economy:
1. A reliability standard shall not give any market participant an unfair competitive advantage.Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure. Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

Detailed Description (Provide enough detail so that an independent entity familiar with the industry could draft a standard based on this description.)

Review and compare regional standard PRC-006-NPCC-1with continent-wide standards PRC-006-1/PRC-006-2 and PRC-024-1/PRC-024-2 to determine if revisions are necessary, or retirement of PRC-006-NPCC-01 possible.

Determine the necessity for including wording to address dispersed generation resources.

Consider incorporating more stringent aspects of Directory#12 in order to facilitate future retirement of Directory#12.

Submission Description: (doc-less) Motion to Intervene of North American Electric Reliability Corporation under RM15-2-000.

Submission Date: 4/27/2015 1:54:24 PM

Filed Date: 4/27/2015 1:54:24 PM

Dockets

RM15-2-000	Third- Party Provision of primary frequency Response Service.

Filing Party/Contacts:

Filing Party	Signer (Representative)	Other Contact (Principal)
North American Electric Reliability Corporation	Holly.Hawkins@nerc.net	
North American Electric Reliability Corporation		charlie.berardesco@nerc.net

Basis for Intervening:
The North American Electric Reliability Corporation (“NERC”) was formed to serve as the electric reliability organization (“ERO”) authorized by Section 215 of the Federal Power Act. NERC was certified as the ERO by the Commission’s Order issued July 20, 2006, in Docket No. RR06-1-000. As the ERO, NERC is subject to audit by the Commission and governmental authorities in Canada.

NERC has a substantial interest in this proceeding to preserve our rights to file reply comments should the need arise. .

No other party can adequately represent NERC’s interest. Therefore, it is in the public interest to permit this intervention.

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

North American Electric Reliability Corporation	**)** **)**	**Docket No. _____**

PETITION OF THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION FOR APPROVAL OF PROPOSED RELIABILITY STANDARD CIP-014-2

Pursuant to Section 215(d)(1) of the Federal Power Act ("FPA"),[1] Section 39.5 of the regulations of the Federal Energy Regulatory Commission ("FERC" or "Commission"),[2] and Order No. 802,[3] the North American Electric Reliability Corporation ("NERC")[4] hereby submits for Commission approval proposed Reliability Standard CIP-014-2.[5] Consistent with Order No. 802, proposed Reliability Standard CIP-014-2 modifies Reliability Standard CIP-014-1 by removing the term "widespread" from Requirement R1. As discussed below, removing the term "widespread" will help ensure that: (1) applicable entities identify the appropriate critical facilities under Requirement R1; and (2) the ERO enforces the Reliability Standard in a consistent manner. NERC requests that the Commission approve proposed Reliability Standard CIP-014-2 (Exhibit A) as just, reasonable, not unduly discriminatory, or preferential, and in the public interest.

---

1 16 U.S.C. § 824o (2006).

2 18 C.F.R. § 39.5 (2014).

3 *Physical Security Reliability Standard*, Order 802, 149 FERC ¶ 61,140 (2014).

4 The Commission certified NERC as the electric reliability organization ("ERO") in accordance with Section 215 of the FPA on July 20, 2006. *North American Electric Reliability Corporation*, 116 FERC ¶ 61,062 (2006).

5 Unless otherwise designated, all capitalized terms shall have the meaning set forth in the *Glossary of Terms Used in NERC Reliability Standards, available at* http://www.nerc.com/files/Glossary_of_Terms.pdf.

As required by Section 39.5(a) of the Commission's regulations,[6] this Petition presents the technical basis and purpose of the proposed Reliability Standard, a summary of its development history (Exhibit F), and a demonstration that the proposed Reliability Standard meets the criteria identified by the Commission in Order No. 672[7] (Exhibit C). The NERC Board of Trustees adopted proposed Reliability Standard CIP-014-2 and the associated Implementation Plan on May 7, 2015.

II. BACKGROUND

A. Regulatory Framework

By enacting the Energy Policy Act of 2005,[9] Congress entrusted the Commission with the duties of approving and enforcing rules to ensure the reliability of the Nation's Bulk-Power System, and with the duty of certifying an ERO that would be charged with developing and enforcing mandatory Reliability Standards, subject to Commission approval. Section 215(b)(1)[10] of the FPA states that all users, owners, and operators of the Bulk-Power System in the United States will be subject to Commission-approved Reliability Standards. Section 215(d)(5)[11] of the FPA authorizes the Commission to order the ERO to submit a new or modified Reliability Standard. Section 39.5(a)[12] of the Commission's regulations requires the ERO to file for Commission approval each Reliability Standard that the ERO proposes should become mandatory and enforceable in the United States, and each modification to a Reliability Standard that the ERO proposes to make effective.

The Commission has the regulatory responsibility to approve Reliability Standards that protect the reliability of the Bulk-Power System and to ensure that such Reliability Standards are just, reasonable, not unduly discriminatory or preferential, and in the public interest. Pursuant to Section 215(d)(2) of the FPA[13] and Section 39.5(c)[14] of the Commission's regulations, the Commission will give due weight to the technical expertise of the ERO with respect to the content of a Reliability Standard.

B. NERC Reliability Standards Development Procedure

The proposed Reliability Standard was developed in an open and fair manner and in accordance with the Commission-approved Reliability Standard development process.[15] NERC develops Reliability Standards in accordance with Section 300 (Reliability Standards Development) of its Rules of Procedure and the NERC Standard Processes Manual.[16] In certifying NERC as the ERO, the Commission found that NERC's proposed rules provide for reasonable notice and opportunity for public comment, due process, openness, and a balance of interests in developing Reliability Standards and thus satisfies certain of the criteria for approving Reliability Standards. The development process is open to any person or entity with a legitimate interest in the reliability of the Bulk-Power System. NERC considers the comments of all stakeholders, and a vote of stakeholders and the NERC Board of Trustees is required to approve a Reliability Standard before NERC submits the Reliability Standard to the Commission for approval.

C. Order No. 802

On November 20, 2014, the Commission issued Order No. 802 approving Reliability Standard CIP-014-1. NERC developed Reliability Standard CIP-014-1 in response to a Commission order issued March 7, 2014 in Docket No. RD14-6-000 directing NERC to submit for approval one or more Reliability Standards to address physical security risks and vulnerabilities of critical facilities on the Bulk-Power System.[17] The Commission found that Reliability Standard CIP-014-1 satisfied the directives in the March 7 Order.

---

[15] *Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval, and Enforcement of Electric Reliability Standards*, Order No. 672 at P 334, FERC Stats. & Regs. ¶ 31,204, *order on reh'g*, Order No. 672-A, FERC Stats. & Regs. ¶ 31,212 (2006).

[16] The NERC Rules of Procedure are available at http://www.nerc.com/AboutNERC/Pages/Rules-of-Procedure.aspx. The NERC Standard Processes Manual is available at http://www.nerc.com/comm/SC/Documents/Appendix_3A_StandardsProcessesManual.pdf.

[17] *Reliability Standards for Physical Security Measures*, 146 FERC ¶61,166 (2014) ("March 7 Order").

In addition to approving Reliability Standard CIP-014-1, the Commission directed NERC to remove the term "widespread" from Requirement R1 of CIP-014-1, or alternatively, to propose modifications to the Reliability Standard that address the Commission's concerns related to the term "widespread."[18] In the March 7 Order, the Commission stated that a critical facility is:

> one that, if rendered inoperable or damaged, could have a critical impact on the operation of the interconnection through instability, uncontrolled separation or cascading failures on the Bulk- Power System.

Requirement R1 of CIP-014-1, which addresses the directive in the March 7 Order that owners and operators of the Bulk-Power System perform a risk assessment of their systems to identify their critical facilities, includes much of the language from the March 7 Order with the addition of the term "widespread" before the term "instability." Specifically, CIP-014-1, Requirement R1 provides that Transmission Owners must perform risk assessments:

> designed to identify the Transmission station(s) or Transmission substation(s) that if rendered inoperable or damaged could result in *widespread* instability, uncontrolled separation, or Cascading within an Interconnection. (Emphasis added).

In Order No. 802, the Commission determined that inclusion of the undefined term "widespread" is unclear with respect to the obligation it imposes on applicable entities and introduces excessive uncertainty in identifying critical facilities under Requirement R1.[19] The Commission stated that the identification of critical facilities under Requirement R1 "should not be dependent on how an applicable entity interprets the term 'widespread' but instead should be modified to make clear that a facility that has a critical impact on the operation of an Interconnection is critical and therefore subject to Requirement R1."[20]

---

18 Order No. 802 at PP 18-19, 31-35.

19 *Id*. at PP 19, 35.

20 *Id*. at P 33.

The Commission directed NERC to submit a responsive modification to address the Commission's concerns within six months from the effective date of Order No. 802, which is May 20, 2015.

D. Procedural History of Proposed Reliability Standard CIP-014-2

As further described in Exhibit F hereto, following the issuance of Order No. 802, NERC posted a revised Standards Authorization Request for a 30-day information comment period to address the directives issued in Order No. 802. On February 20, 2015, NERC posted the proposed Reliability Standard for an initial 45-day comment period and 10-day ballot. The initial ballot received a quorum of 88.33% and an approval of 89.95%. After addressing industry comments on the initial draft of the proposed Reliability Standard, NERC posted the proposed Reliability Standard for a final ballot, which received a quorum of 92% and approval of 92.35%. The NERC Board of Trustees adopted proposed Reliability Standard CIP-014-2 and the associated Implementation Plan on May 7, 2015.

III. JUSTIFICATION FOR APPROVAL

As discussed below and in Exhibit C, proposed Reliability Standard CIP-014-2 satisfies the Commission's criteria in Order No. 672 and is just, reasonable, not unduly discriminatory or preferential, and in the public interest. Consistent with Order No. 802, proposed Reliability Standard CIP-014-2 modifies Reliability Standard CIP-014-1 by removing the term "widespread" from Requirement R1. As revised, Requirement R1 reads, in relevant part, as follows:

> Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria specified in Applicability Section 4.1.1. The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify the Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection.

Removing the term "widespread" will help provide for more consistent implementation and enforcement of Requirement R1. As the Commission recognized, the term "widespread" is susceptible to varying interpretations and may introduce uncertainty in identifying critical facilities under Requirement R1.[21] Under the proposed Reliability Standard, the identification of critical assets will not depend on the manner in which a particular entity understands the term "widespread"; instead, entities will focus on the critical impact of the facility on the operation of the Interconnection, consistent with the March 7 Order.

The Commission clarified in Order No. 802 that only an instability that has a critical impact on the operation of the interconnection warrants finding that the facility causing the instability is critical under Requirement R1.[22] To provide additional guidance to stakeholders on identifying critical facilities according to Requirement R1, the standard drafting team included the following in the Rationale for Requirement R1 appended to the proposed Reliability Standard:

> The requirement is not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the following:
>
> - Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6;
> - NERC EOP-004-2 reporting criteria
> - Area or magnitude of potential impact

[21] Order No. 802 at P 31-33.

[22] *Id*. at P 33.

Aside from removing the term "widespread," NERC did not change any other aspect of Requirement R1.

IV. EFFECTIVE DATE

In the March 7 Order, the Commission stated that "NERC should develop an implementation plan that requires owners or operators of the Bulk-Power System to implement the Reliability Standards in a timely fashion, balancing the importance of protecting the Bulk-Power System from harm while giving the owners or operators adequate time to meaningfully implement the requirements."[23] Consistent with the Commission's directive and as provided in the proposed Implementation Plan, attached hereto as Exhibit B, NERC respectfully requests that the Commission approve proposed Reliability Standard CIP-014-2 to become effective on the later of the first day following the effective date of CIP-014-1 or the first day after the effective date of the Commission's order approving CIP-014-2. The proposed effective date is designed to provide responsible entities regulatory certainty by limiting the time, if any, that CIP-014-1 would be effective.

[23] March 7 Order at P 12.

V. CONCLUSION

For the reasons set forth above, NERC respectfully requests that the Commission approve:

- proposed Reliability Standard CIP-014-2 and associated elements included in Exhibit A, effective as proposed herein;
- the proposed implementation plan included in Exhibit B; and
- the retirement of Reliability Standard CIP-014-1.

Respectfully submitted,

Exhibit A

Proposed Reliability Standard

CIP-014-2 Clean Version

A. Introduction

1. Title: Physical Security

2. Number: CIP-014-2

3. Purpose: To identify and protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection.

4. Applicability:

4.1. Functional Entities:

4.1.1 Transmission Owner that owns a Transmission station or Transmission substation that meets any of the following criteria:

4.1.1.1 Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

4.1.1.2 Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

Voltage Value of a Line	Weight Value per Line
less than 200 kV (not applicable)	(not applicable)
200 kV to 299 kV	700
300 kV to 499 kV	1300
500 kV and above	0

4.1.1.3 Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Coordinator, or

Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

4.1.1.4 Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements.

4.1.2 Transmission Operator.

Exemption: Facilities in a "protected area," as defined in 10 C.F.R. § 73.2, within the scope of a security plan approved or accepted by the Nuclear Regulatory Commission are not subject to this Standard; or, Facilities within the scope of a security plan approved or accepted by the Canadian Nuclear Safety Commission are not subject to this Standard.

5. Effective Dates:

See Implementation Plan for CIP-014-2.

6. Background:

This Reliability Standard addresses the directives from the FERC order issued March 7, 2014, *Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (2014), which required NERC to develop a physical security reliability standard(s) to identify and protect facilities that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection.

B. Requirements and Measures

R1. Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria specified in Applicability Section 4.1.1. The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify the Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection. *[VRF: High; Time-Horizon: Long-term Planning]*

1.1. Subsequent risk assessments shall be performed:

- At least once every 30 calendar months for a Transmission Owner that has identified in its previous risk assessment (as verified according to Requirement R2) one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection; or

- At least once every 60 calendar months for a Transmission Owner that has not identified in its previous risk assessment (as verified according to Requirement R2) any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection.

1.2. The Transmission Owner shall identify the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment.

M1. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the risk assessment of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria in Applicability Section 4.1.1 as specified in Requirement R1. Additionally, examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the identification of the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment as specified in Requirement R1, Part 1.2.

R2. Each Transmission Owner shall have an unaffiliated third party verify the risk assessment performed under Requirement R1. The verification may occur concurrent with or after the risk assessment performed under Requirement R1. *[VRF: Medium; Time-Horizon: Long-term Planning]*

2.1. Each Transmission Owner shall select an unaffiliated verifying entity that is either:

- A registered Planning Coordinator, Transmission Planner, or Reliability Coordinator; or
- An entity that has transmission planning or analysis experience.

2.2. The unaffiliated third party verification shall verify the Transmission Owner's risk assessment performed under Requirement R1, which may include recommendations for the addition or deletion of a Transmission station(s) or Transmission substation(s). The Transmission Owner shall ensure the verification is completed within 90 calendar days following the completion of the Requirement R1 risk assessment.

2.3. If the unaffiliated verifying entity recommends that the Transmission Owner add a Transmission station(s) or Transmission substation(s) to, or remove a Transmission station(s) or Transmission substation(s) from, its identification under Requirement R1, the Transmission Owner shall either, within 60 calendar days of completion of the verification, for each recommended addition or removal of a Transmission station or Transmission substation:

- Modify its identification under Requirement R1 consistent with the recommendation; or
- Document the technical basis for not modifying the identification in accordance with the recommendation.

2.4. Each Transmission Owner shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third party verifier and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M2. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner completed an unaffiliated third party verification of the Requirement R1 risk assessment and satisfied all of the applicable provisions of Requirement R2, including, if applicable, documenting the technical basis for not modifying the Requirement R1 identification as specified under Part 2.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 2.4.

R3. For a primary control center(s) identified by the Transmission Owner according to Requirement R1, Part 1.2 that a) operationally controls an identified Transmission station or Transmission substation verified according to Requirement R2, and b) is not under the operational control of the Transmission Owner: the Transmission Owner shall, within seven calendar days following completion of Requirement R2, notify the Transmission Operator that has operational control of the primary control center of

such identification and the date of completion of Requirement R2. *[VRF: Lower; Time-Horizon: Long-term Planning]*

3.1. If a Transmission station or Transmission substation previously identified under Requirement R1 and verified according to Requirement R2 is removed from the identification during a subsequent risk assessment performed according to Requirement R1 or a verification according to Requirement R2, then the Transmission Owner shall, within seven calendar days following the verification or the subsequent risk assessment, notify the Transmission Operator that has operational control of the primary control center of the removal.

M3. Examples of acceptable evidence may include, but are not limited to, dated written or electronic notifications or communications that the Transmission Owner notified each Transmission Operator, as applicable, according to Requirement R3.

R4. Each Transmission Owner that identified a Transmission station, Transmission substation, or a primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2. The evaluation shall consider the following: *[VRF: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

4.1. Unique characteristics of the identified and verified Transmission station(s), Transmission substation(s), and primary control center(s);

4.2. Prior history of attack on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and

4.3. Intelligence or threat warnings received from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), U.S. federal and/or Canadian governmental agencies, or their successors.

M4. Examples of evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner or Transmission Operator conducted an evaluation of the potential threats and vulnerabilities of a physical attack to their respective Transmission station(s), Transmission substation(s) and primary control center(s) as specified in Requirement R4.

R5. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s). The physical security plan(s) shall be

developed within 120 calendar days following the completion of Requirement R2 and executed according to the timeline specified in the physical security plan(s). The physical security plan(s) shall include the following attributes: *[VRF: High; Time-Horizon: Long-term Planning]*

5.1. Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.

5.2. Law enforcement contact and coordination information.

5.3. A timeline for executing the physical security enhancements and modifications specified in the physical security plan.

5.4. Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).

M5. Examples of evidence may include, but are not limited to, dated written or electronic documentation of its physical security plan(s) that covers their respective identified and verified Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R5, and additional evidence demonstrating execution of the physical security plan according to the timeline specified in the physical security plan.

R6. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall have an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5. The review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5. *[VRF: Medium; Time-Horizon: Long-term Planning]*

6.1. Each Transmission Owner and Transmission Operator shall select an unaffiliated third party reviewer from the following:

- An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.
- An entity or organization approved by the ERO.
- A governmental agency with physical security expertise.

- An entity or organization with demonstrated law enforcement, government, or military physical security expertise.

6.2. The Transmission Owner or Transmission Operator, respectively, shall ensure that the unaffiliated third party review is completed within 90 calendar days of completing the security plan(s) developed in Requirement R5. The unaffiliated third party review may, but is not required to, include recommended changes to the evaluation performed under Requirement R4 or the security plan(s) developed under Requirement R5.

6.3. If the unaffiliated third party reviewer recommends changes to the evaluation performed under Requirement R4 or security plan(s) developed under Requirement R5, the Transmission Owner or Transmission Operator shall, within 60 calendar days of the completion of the unaffiliated third party review, for each recommendation:

- Modify its evaluation or security plan(s) consistent with the recommendation; or

- Document the reason(s) for not modifying the evaluation or security plan(s) consistent with the recommendation.

6.4. Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third party reviewer and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M6. Examples of evidence may include, but are not limited to, written or electronic documentation that the Transmission Owner or Transmission Operator had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 as specified in Requirement R6 including, if applicable, documenting the reasons for not modifying the evaluation or security plan(s) in accordance with a recommendation under Part 6.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 6.4.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence during an on-site visit to show that it was compliant for the full time period since the last audit.

The Transmission Owner and Transmission Operator shall keep data or evidence to show compliance, as identified below, unless directed by its Compliance Enforcement Authority (CEA) to retain specific evidence for a longer period of time as part of an investigation.

The responsible entities shall retain documentation as evidence for three years.

If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records, subject to the confidentiality provisions of Section 1500 of the Rules of Procedure and the provisions of Section 1.4 below.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints Text

1.4. Additional Compliance Information

Confidentiality: To protect the confidentiality and sensitive nature of the evidence for demonstrating compliance with this standard, all evidence will be retained at the Transmission Owner's and Transmission Operator's facilities.

Guidelines and Technical Basis

Section 4 Applicability

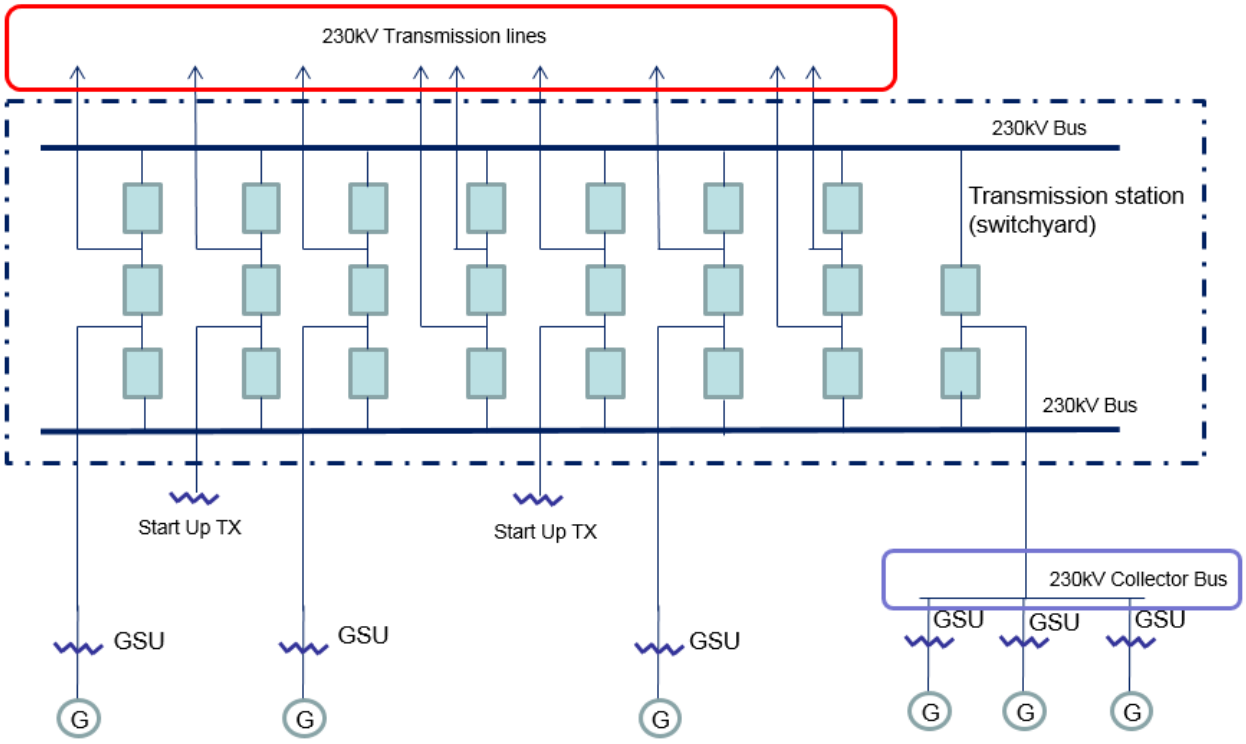
The purpose of Reliability Standard CIP-014 is to protect Transmission stations and Transmission substations, and their associated primary control centers that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. To properly include those entities that own or operate such Facilities, the Reliability Standard CIP-014 first applies to Transmission Owners that own Transmission Facilities that meet the specific criteria in Applicability Section 4.1.1.1 through 4.1.1.4. The Facilities described in Applicability Section 4.1.1.1 through 4.1.1.4 mirror those Transmission Facilities that meet the bright line criteria for "Medium Impact" Transmission Facilities under Attachment 1 of Reliability Standard CIP-002-5.1. Each Transmission Owner that owns Transmission Facilities that meet the criteria in Section 4.1.1.1 through 4.1.1.4 is required to perform a risk assessment as specified in Requirement R1 to identify its Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. The Standard Drafting Team (SDT) expects this population will be small and that many Transmission Owners that meet the applicability of this standard will not actually identify any such Facilities. Only those Transmission Owners with Transmission stations or Transmission substations identified in the risk assessment (and verified under Requirement R2) have performance obligations under Requirements R3 through R6.

This standard also applies to Transmission Operators. A Transmission Operator's obligations under the standard, however, are only triggered if the Transmission Operator is notified by an applicable Transmission Owner under Requirement R3 that the Transmission Operator operates a primary control center that operationally controls a Transmission station(s) or Transmission substation(s) identified in the Requirement R1 risk assessment. A primary control center operationally controls a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical action at the identified Transmission station or Transmission substation, such as opening a breaker, as opposed to a control center that only has information from the Transmission station or Transmission substation and must coordinate direct action through another entity. Only Transmission Operators who are notified that they have primary control centers under this standard have performance obligations under Requirements R4 through R6. In other words, primary control center for purposes of this Standard is the control center that the Transmission Owner or Transmission Operator, respectively, uses as its primary, permanently-manned site to physically operate a Transmission station or Transmission substation that is identified in Requirement R1 and verified in Requirement R2. Control centers that provide back-up capability are not applicable, as they are a form of resiliency and intentionally redundant.

The SDT considered several options for bright line criteria that could be used to determine applicability and provide an initial threshold that defines the set of Transmission stations and Transmission substations that would meet the directives of the FERC order on physical security (*i.e.*, those that could cause instability, uncontrolled separation, or Cascading within an

Interconnection). The SDT determined that using the criteria for Medium Impact Transmission Facilities in Attachment 1 of CIP-002-5.1 would provide a conservative threshold for defining which Transmission stations and Transmission substations must be included in the risk assessment in Requirement R1 of CIP-014. Additionally, the SDT concluded that using the CIP-002-5.1 Medium Impact criteria was appropriate because it has been approved by stakeholders, NERC, and FERC, and its use provides a technically sound basis to determine which Transmission Owners should conduct the risk assessment. As described in CIP-002-5.1, the failure of a Transmission station or Transmission substation that meets the Medium Impact criteria could have the capability to result in exceeding one or more Interconnection Reliability Operating Limits (IROLs). The SDT understands that using this bright line criteria to determine applicability may require some Transmission Owners to perform risk assessments under Requirement R1 that will result in a finding that none of their Transmission stations or Transmission substations would pose a risk of instability, uncontrolled separation, or Cascading within an Interconnection. However, the SDT determined that higher bright lines could not be technically justified to ensure inclusion of all Transmission stations and Transmission substations, and their associated primary control centers that, if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. Further guidance and technical basis for the bright line criteria for Medium Impact Facilities can be found in the Guidelines and Technical Basis section of CIP-002-5.1.

Additionally, the SDT determined that it was not necessary to include Generator Operators and Generator Owners in the Reliability Standard. First, Transmission stations or Transmission substations interconnecting generation facilities are considered when determining applicability. Transmission Owners will consider those Transmission stations and Transmission substations that include a Transmission station on the high side of the Generator Step-up transformer (GSU) using Applicability Section 4.1.1.1 and 4.1.1.2. As an example, a Transmission station or Transmission substation identified as a Transmission Owner facility that interconnects generation will be subject to the Requirement R1 risk assessment if it operates at 500kV or greater or if it is connected at 200 kV – 499kV to three or more other Transmission stations or Transmission substations and has an "aggregate weighted value" exceeding 3000 according to the table in Applicability Section 4.1.1.2. Second, the Transmission analysis or analyses conducted under Requirement R1 should take into account the impact of the loss of generation connected to applicable Transmission stations or Transmission substations. Additionally, the FERC order does not explicitly mention generation assets and is reasonably understood to focus on the most critical Transmission Facilities. The diagram below shows an example of a station.



Also, the SDT uses the phrase "Transmission stations or Transmission substations" to recognize the existence of both stations and substations. Many entities in industry consider a substation to be a location with physical borders (i.e. fence, wall, etc.) that contains at least an autotransformer. Locations also exist that do not contain autotransformers, and many entities in industry refer to those locations as stations (switching stations or switchyards). Therefore, the SDT chose to use both "station" and "substation" to refer to the locations where groups of Transmission Facilities exist.

On the issue of joint ownership, the SDT recognizes that this issue is not unique to CIP-014, and expects that the applicable Transmission Owners and Transmission Operators will develop memorandums of understanding, agreements, Coordinated Functional Registrations, or procedures, etc., to designate responsibilities under CIP-014 when joint ownership is at issue, which is similar to what many entities have completed for other Reliability Standards.

The language contained in the applicability section regarding the collector bus is directly copied from CIP-002-5.1, Attachment 1, and has no additional meaning within the CIP-014 standard.

Requirement R1

The initial risk assessment required under Requirement R1 must be completed on or before the effective date of the standard. Subsequent risk assessments are to be performed at least once every 30 or 60 months depending on the results of the previous risk assessment per Requirement R1, Part 1.1. In performing the risk assessment under Requirement R1, the

Transmission Owner should first identify their population of Transmission stations and Transmission substations that meet the criteria contained in Applicability Section 4.1.1. Requirement R1 then requires the Transmission Owner to perform a risk assessment, consisting of a transmission analysis, to determine which of those Transmission stations and Transmission Substations if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection. The requirement is not to require identification of, and thus, not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the following:

- Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6
- NERC EOP-004-2 reporting criteria
- Area or magnitude of potential impact

The standard does not mandate the specific analytical method for performing the risk assessment. The Transmission Owner has the discretion to choose the specific method that best suites its needs. As an example, an entity may perform a Power Flow analysis and stability analysis at a variety of load levels.

Performing Risk Assessments

The Transmission Owner has the discretion to select a transmission analysis method that fits its facts and system circumstances. To mandate a specific approach is not technically desirable and may lead to results that fail to adequately consider regional, topological, and system circumstances. The following guidance is only an example on how a Transmission Owner may perform a power flow and/or stability analysis to identify those Transmission stations and Transmission substations that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. An entity could remove all lines, without regard to the voltage level, to a single Transmission station or Transmission substation and review the simulation results to assess system behavior to determine if Cascading of Transmission Facilities, uncontrolled separation, or voltage or frequency instability is likely to occur over a significant area of the Interconnection. Using engineering judgment, the Transmission Owner (possibly in consultation with regional planning or operation committees and/or ISO/RTO committee input) should develop criteria (e.g. imposing a fault near the removed Transmission station or Transmission substation) to identify a contingency or parameters that result in potential instability, uncontrolled separation, or Cascading within an Interconnection. Regional consultation on these matters is likely to be

helpful and informative, given that the inputs for the risk assessment and the attributes of what constitutes instability, uncontrolled separation, or Cascading within an Interconnection will likely vary from region-to-region or from ISO-to-ISO based on topology, system characteristics, and system configurations. Criteria could also include post-contingency facilities loadings above a certain emergency rating or failure of a power flow case to converge. Available special protection systems (SPS), if any, could be applied to determine if the system experiences any additional instability which may result in uncontrolled separation. Example criteria may include:

(a) Thermal overloads beyond facility emergency ratings;

(b) Voltage deviation exceeding ± 10%; or

(c) Cascading outage/voltage collapse; or

(d) Frequency below under-frequency load shed points

Periodicity

A Transmission Owner who identifies one or more Transmission stations or Transmission substations (as verified under Requirement R2) that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection is required to conduct a risk assessment at least once every 30 months. This period ensures that the risk assessment remains current with projected conditions and configurations in the planned system. This risk assessment, as the initial assessment, must consider applicable planned Transmission stations and Transmission substations to be in service within 24 months. The 30 month timeframe aligns with the 24 month planned to be in service date because the Transmission Owner is provided the flexibility, depending on its planning cycle and the frequency in which it may plan to construct a new Transmission station or Transmission substation to more closely align these dates. The requirement is to conduct the risk assessment at least once every 30 months, so for a Transmission Owner that believes it is better to conduct a risk assessment once every 24 months, because of its planning cycle, it has the flexibility to do so.

Transmission Owners that have not identified any Transmission stations or Transmission substations (as verified under Requirement R2) that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection are unlikely to see changes to their risk assessment in the Near-Term Planning Horizon. Consequently, a 60 month periodicity for completing a subsequent risk assessment is specified.

Identification of Primary Control Centers

After completing the risk assessment specified in Requirement R1, it is important to additionally identify the primary control center that operationally controls each Transmission station or Transmission substation that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection. A primary control center

"operationally controls" a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker.

Requirement R2

This requirement specifies verification of the risk assessment performed under Requirement R1 by an entity other than the owner or operator of the Requirement R1 risk assessment.

A verification of the risk assessment by an unaffiliated third party, as specified in Requirement R2, could consist of:

1. Certifying that the Requirement R1 risk assessment considers the Transmission stations and Transmission substations identified in Applicability Section 4.1.1.
2. Review of the model used to conduct the risk assessment to ensure it contains sufficient system topology to identify Transmission stations and Transmission substations that if rendered inoperable or damaged could cause instability, uncontrolled separation, or Cascading within an Interconnection.
3. Review of the Requirement R1 risk assessment methodology.

This requirement provides the flexibility for a Transmission Owner to select from unaffiliated registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term unaffiliated means that the selected verifying entity cannot be a corporate affiliate (*i.e.,* the verifying or third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit.

The prohibition on registered entities using a corporate affiliate to conduct the verification, however, does not prohibit a governmental entity (e.g., a city, a municipality, a U.S. federal power marketing agency, or any other political subdivision of U.S. or Canadian federal, state, or provincial governments) from selecting as the verifying entity another governmental entity within the same political subdivision. For instance, a U.S. federal power marketing agency may select as its verifier another U.S. federal agency to conduct its verification so long as the selected entity has transmission planning or analysis experience. Similarly, a Transmission Owner owned by a Canadian province can use a separate agency of that province to perform the verification. The verifying entity, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

Requirement R2 also provides that the "verification may occur concurrent with or after the risk assessment performed under Requirement R1." This provision is designed to provide the Transmission Owner the flexibility to work with the verifying entity throughout (*i.e.,* concurrent with) the risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could collaborate with their unaffiliated verifying entity to perform the risk assessment under Requirement R1 such that both Requirement R1 and Requirement R2 are satisfied concurrently. The intent of Requirement R2

is to have an entity other than the owner or operator of the facility to be involved in the risk assessment process and have an opportunity to provide input. Accordingly, Requirement R2 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the risk assessment and subsequently has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the risk assessment.

Characteristics to consider in selecting a third party reviewer could include:

- Registered Entity with applicable planning and reliability functions.
- Experience in power system studies and planning.
- The entity's understanding of the MOD standards, TPL standards, and facility ratings as they pertain to planning studies.
- The entity's familiarity with the Interconnection within which the Transmission Owner is located.

With respect to the requirement that Transmission owners develop and implement procedures for protecting confidential and sensitive information, the Transmission Owner could have a method for identifying documents that require confidential treatment. One mechanism for protecting confidential or sensitive information is to prohibit removal of sensitive or confidential information from the Transmission Owner's site. Transmission Owners could include such a prohibition in a non-disclosure agreement with the verifying entity.

A Technical feasibility study is not required in the Requirement R2 documentation of the technical basis for not modifying the identification in accordance with the recommendation.

On the issue of the difference between a verifier in Requirement R2 and a reviewer in Requirement R6, the SDT indicates that the verifier will confirm that the risk assessment was completed in accordance with Requirement R1, including the number of Transmission stations and substations identified, while the reviewer in Requirement R6 is providing expertise on the manner in which the evaluation of threats was conducted in accordance with Requirement R4, and the physical security plan in accordance with Requirement R5. In the latter situation there is no verification of a technical analysis, rather an application of experience and expertise to provide guidance or recommendations, if needed.

Parts 2.4 and 6.4 require the entities to have procedures to protect the confidentiality of sensitive or confidential information. Those procedures may include the following elements:

1. Control and retention of information on site for third party verifiers/reviewers.
2. Only "need to know" employees, etc., get the information.
3. Marking documents as confidential
4. Securely storing and destroying information when no longer needed.
5. Not releasing information outside the entity without, for example, General Counsel sign-off.

Requirement R3

Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first completing the risk assessment specified by Requirement R1 and the verification specified by Requirement R2. Requirement R3 is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1 receive notice so that the Transmission Operator may fulfill the rest of the obligations required in Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include within the notice the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or as a result of the verification process under Requirement R2.

Requirement R4

This requirement requires owners and operators of facilities identified by the Requirement R1 risk assessment and that are verified under Requirement R2 to conduct an assessment of potential threats and vulnerabilities to those Transmission stations, Transmission substations, and primary control centers using a tailored evaluation process. Threats and vulnerabilities may vary from facility to facility based on any number of factors that include, but are not limited to, location, size, function, existing physical security protections, and attractiveness as a target.

In order to effectively conduct a threat and vulnerability assessment, the asset owner may be the best source to determine specific site vulnerabilities, but current and evolving threats may best be determined by others in the intelligence or law enforcement communities. A number of resources have been identified in the standard, but many others exist and asset owners are not limited to where they may turn for assistance. Additional resources may include state or local fusion centers, U.S. Department of Homeland Security, Federal Bureau of Investigations (FBI), Public Safety Canada, Royal Canadian Mounted Police, and InfraGard chapters coordinated by the FBI.

The Responsible Entity is required to take a number of factors into account in Parts 4.1 to 4.3 in order to make a risk-based evaluation under Requirement R4.

To assist in determining the current threat for a facility, the prior history of attacks on similarly protected facilities should be considered when assessing probability and likelihood of occurrence at the facility in question.

Resources that may be useful in conducting threat and vulnerability assessments include:

- NERC Security Guideline for the Electricity Sector: Physical Security.
- NERC Security Guideline: Physical Security Response.
- ASIS International General Risk Assessment Guidelines.
- ASIS International Facilities Physical Security Measure Guideline.

- ASIS International Security Management Standard: Physical Asset Protection.
- Whole Building Design Guide - Threat/Vulnerability Assessments.

Requirement R5

This requirement specifies development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Requirement R5 specifies the following attributes for the physical security plan:

- *Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.*

  Resiliency may include, among other things:

  a. System topology changes,

  b. Spare equipment,

  c. Construction of a new Transmission station or Transmission substation.

  While most security measures will work together to collectively harden the entire site, some may be allocated to protect specific critical components. For example, if protection from gunfire is considered necessary, the entity may only install ballistic protection for critical components, not the entire site.

- *Law enforcement contact and coordination information.*

  Examples of such information may be posting 9-1-1 for emergency calls and providing substation safety and familiarization training for local and federal law enforcement, fire department, and Emergency Medical Services.

- *A timeline for executing the physical security enhancements and modifications specified in the physical security plan.*

  Entities have the flexibility to prioritize the implementation of the various resiliency or security enhancements and modifications in their security plan according to risk, resources, or other factors. The requirement to include a timeline in the physical security plan for executing the actual physical security enhancements and modifications does not also require that the enhancements and modifications be completed within 120 days. The actual timeline may extend beyond the 120 days, depending on the amount of work to be completed.

- *Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).*

  A registered entity's physical security plan should include processes and responsibilities for obtaining and handling alerts, intelligence, and threat warnings from various

sources. Some of these sources could include the ERO, ES-ISAC, and US and/or Canadian federal agencies. This information should be used to reevaluate or consider changes in the security plan and corresponding security measures of the security plan found in R5.

Incremental changes made to the physical security plan prior to the next required third party review do not require additional third party reviews.

Requirement R6

This requirement specifies review by an entity other than the Transmission Owner or Transmission Operator with appropriate expertise for the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5. As with Requirement R2, the term unaffiliated means that the selected third party reviewer cannot be a corporate affiliate (*i.e.,* the third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Operator). A third party reviewer also cannot be a division of the Transmission Operator that operates as a functional unit.

As noted in the guidance for Requirement R2, the prohibition on registered entities using a corporate affiliate to conduct the review, however, does not prohibit a governmental entity from selecting as the third party reviewer another governmental entity within the same political subdivision. For instance, a city or municipality may use its local enforcement agency, so long as the local law enforcement agency satisfies the criteria in Requirement R6. The third party reviewer, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

The Responsible Entity can select from several possible entities to perform the review:

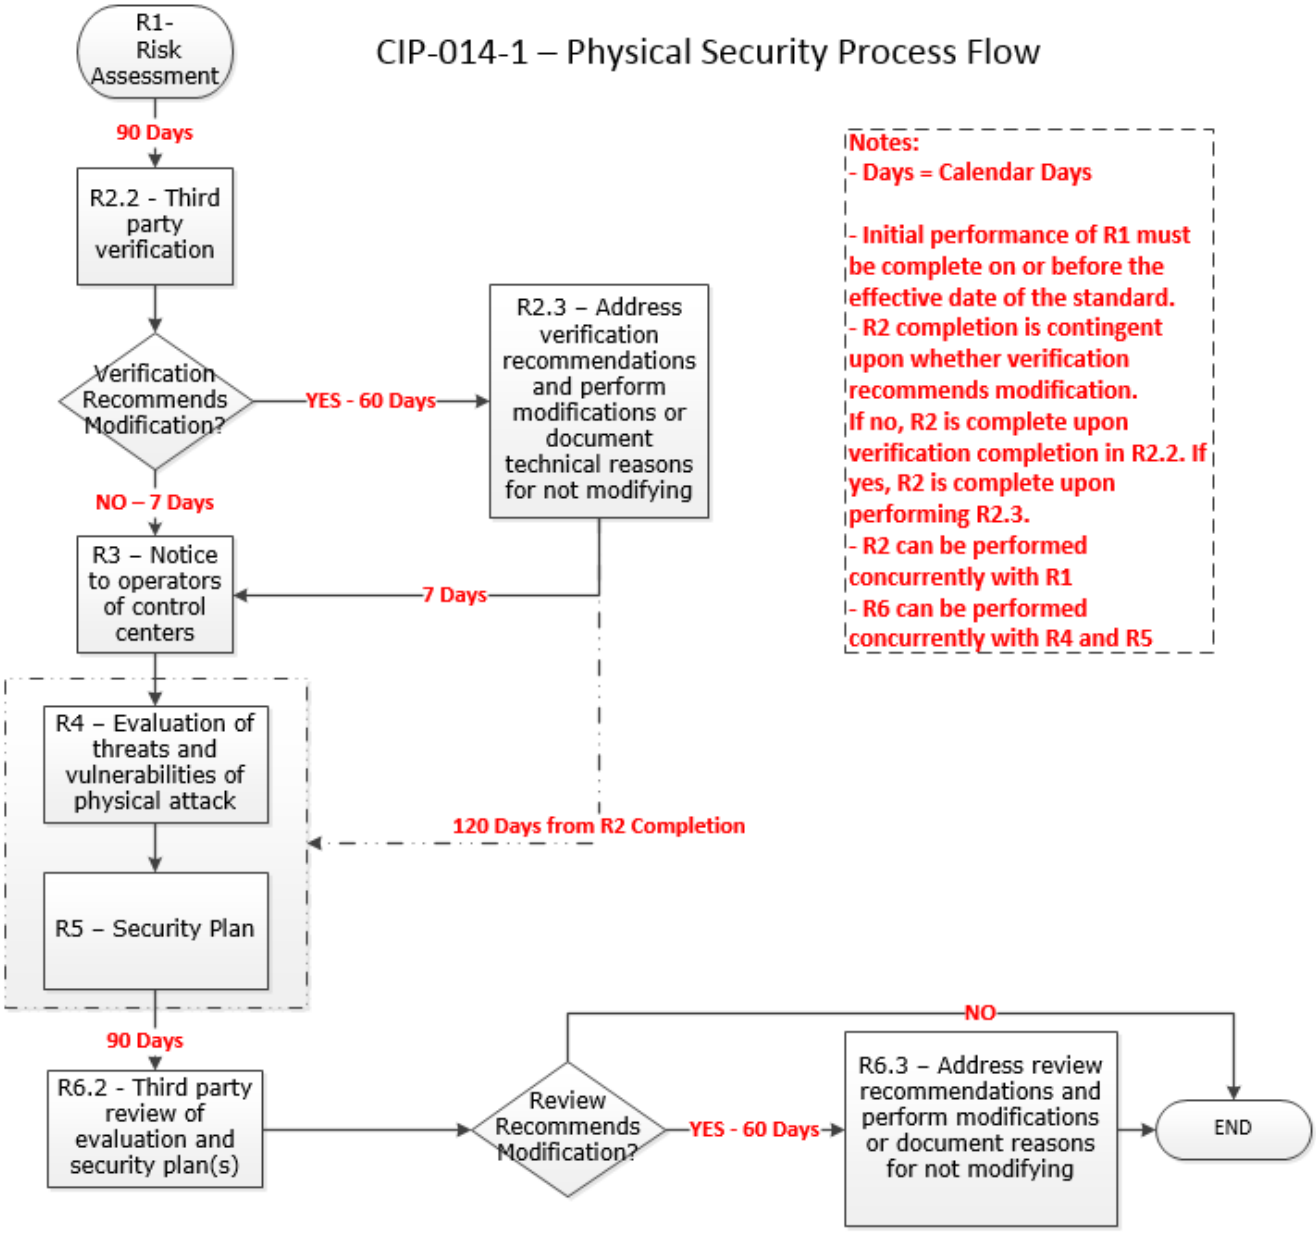
- *An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.*

  In selecting CPP and PSP for use in this standard, the SDT believed it was important that if a private entity such as a consulting or security firm was engaged to conduct the third party review, they must tangibly demonstrate competence to conduct the review. This includes electric industry physical security experience and either of the premier security industry certifications sponsored by ASIS International. The ASIS certification program was initiated in 1977, and those that hold the CPP certification are board certified in security management. Those that hold the PSP certification are board certified in physical security.

- *An entity or organization approved by the ERO.*
- *A governmental agency with physical security expertise.*
- *An entity or organization with demonstrated law enforcement, government, or military physical security expertise.*

As with the verification under Requirement R2, Requirement R6 provides that the "review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5." This provision is designed to provide applicable Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout (*i.e.,* concurrent with) the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5, which for some Responsible Entities may be more efficient and effective. In other words, a Transmission Owner or Transmission Operator could collaborate with their unaffiliated third party reviewer to perform an evaluation of potential threats and vulnerabilities (Requirement R4) and develop a security plan (Requirement R5) to satisfy Requirements R4 through R6 simultaneously. The intent of Requirement R6 is to have an entity other than the owner or operator of the facility to be involved in the Requirement R4 evaluation and the development of the Requirement R5 security plans and have an opportunity to provide input on the evaluation and the security plan. Accordingly, Requirement R6 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the evaluation and develops the security plan itself and then has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the evaluation and develop the security plan.

Timeline



CIP-014-1 – Physical Security Process Flow
R1- Risk Assessment
90 Days
R2.2 - Third party verification
Verification Recommends Modification?
YES - 60 Days
R2.3 – Address verification recommendations and perform modifications or document technical reasons for not modifying
NO – 7 Days
R3 – Notice to operators of control centers
7 Days
R4 – Evaluation of threats and vulnerabilities of physical attack
120 Days from R2 Completion
R5 – Security Plan
90 Days
R6.2 - Third party review of evaluation and security plan(s)
Review Recommends Modification?
YES - 60 Days
R6.3 – Address review recommendations and perform modifications or document reasons for not modifying
NO
END
Notes:
- Days = Calendar Days
- Initial performance of R1 must be complete on or before the effective date of the standard.
- R2 completion is contingent upon whether verification recommends modification. If no, R2 is complete upon verification completion in R2.2. If yes, R2 is complete upon performing R2.3.
- R2 can be performed concurrently with R1
- R6 can be performed concurrently with R4 and R5

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1:
This requirement meets the FERC directive from paragraph 6 of its March 7, 2014 order on physical security to perform a risk assessment to identify which facilities if rendered inoperable or damaged could impact an Interconnection through instability, uncontrolled separation, or cascading failures. The requirement is not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the following:

- Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6
- NERC EOP-004-2 reporting criteria
- Area or magnitude of potential impact

Requirement R1 also meets the FERC directive for periodic reevaluation of the risk assessment by requiring the risk assessment to be performed every 30 months (or 60 months for an entity that has not identified in a previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection).

After identifying each Transmission station and Transmission substation that meets the criteria in Requirement R1, it is important to additionally identify the primary control center that operationally controls that Transmission station or Transmission substation (*i.e.,* the control center whose electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker, compared to a control center that only has the ability to monitor the Transmission station and Transmission substation and, therefore, must coordinate direct physical action through another entity).

Rationale for Requirement R2:
This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring verification by an entity other than the owner or operator of the risk assessment performed under Requirement R1.

This requirement provides the flexibility for a Transmission Owner to select registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term "unaffiliated" means that the selected verifying entity cannot be a corporate affiliate (*i.e.*, the verifying entity cannot be an entity that controls, is controlled by, or is under common control with, the Transmission owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit. The term "unaffiliated" is not intended to prohibit a governmental entity from using another government entity to be a verifier under Requirement R2.

Requirement R2 also provides the Transmission Owner the flexibility to work with the verifying entity throughout the Requirement R1 risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could coordinate with their unaffiliated verifying entity to perform a Requirement R1 risk assessment to satisfy both Requirement R1 and Requirement R2 concurrently.

Planning Coordinator is a functional entity listed in Part 2.1. The Planning Coordinator and Planning Authority are the same entity as shown in the NERC Glossary of Terms Used in NERC Reliability Standards.

Rationale for Requirement R3:
Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first identifying which Transmission stations and Transmission substations meet the criteria specified by Requirement R1, as verified according to Requirement R2. This requirement is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1, Part 1.2 of a Transmission station or Transmission substation verified according to Requirement R2 receives notice of such identification so that the Transmission Operator may timely fulfill its resulting obligations under Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include notice of the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or the verification process under Requirement R2.

Rationale for Requirement R4:
This requirement meets the FERC directive from paragraph 8 in the order on physical security that the reliability standard must require tailored evaluation of potential threats and vulnerabilities to facilities identified in Requirement R1 and verified according to Requirement R2. Threats and vulnerabilities may vary from facility to facility based on factors such as the facility's location, size, function, existing protections, and attractiveness of the target. As such, the requirement does not mandate a one-size-fits-all approach but requires entities to account for the unique characteristics of their facilities.

Requirement R4 does not explicitly state when the evaluation of threats and vulnerabilities must occur or be completed. However, Requirement R5 requires that the entity's security

plan(s), which is dependent on the Requirement R4 evaluation, must be completed within 120 calendar days following completion of Requirement R2. Thus, an entity has the flexibility when to complete the Requirement R4 evaluation, provided that it is completed in time to comply with the requirement in Requirement R5 to develop a physical security plan 120 calendar days following completion of Requirement R2.

Rationale for Requirement R5:
This requirement meets the FERC directive from paragraph 9 in the order on physical security requiring the development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Rationale for Requirement R6:
This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring review by an entity other than the owner or operator with appropriate expertise of the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5.

As with the verification required by Requirement R2, Requirement R6 provides Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout the Requirement R4 evaluation and the development of the Requirement R5 security plan(s). This would allow entities to satisfy their obligations under Requirement R6 concurrent with the satisfaction of their obligations under Requirements R4 and R5.

CIP-014-2 Redline Version

A. Introduction

1. Title: Physical Security

2. Number: CIP-014-~~1~~2

3. Purpose: To identify and protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection.

4. Applicability:

4.1. Functional Entities:

4.1.1 Transmission Owner that owns a Transmission station or Transmission substation that meets any of the following criteria:

4.1.1.1 Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

4.1.1.2 Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

Voltage Value of a Line	Weight Value per Line
less than 200 kV (not applicable)	(not applicable)
200 kV to 299 kV	700
300 kV to 499 kV	1300
500 kV and above	0

4.1.1.3 Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Coordinator, or

Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

4.1.1.4 Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements.

4.1.2 Transmission Operator.

Exemption: Facilities in a "protected area," as defined in 10 C.F.R. § 73.2, within the scope of a security plan approved or accepted by the Nuclear Regulatory Commission are not subject to this Standard; or, Facilities within the scope of a security plan approved or accepted by the Canadian Nuclear Safety Commission are not subject to this Standard.

5. Effective Dates:

~~CIP-014-1 is effective the first day of the first calendar quarter that is six months beyond the date that this standard is approved by applicable regulatory authorities, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. In those jurisdictions where regulatory approval is not required, CIP-014-1 shall become effective on the first day of the first calendar quarter that is six months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.~~

See Implementation Plan for CIP-014-2.

6. Background:

This Reliability Standard addresses the directives from the FERC order issued March 7, 2014, *Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (2014), which required NERC to develop a physical security reliability standard(s) to identify and protect facilities that if rendered inoperable or damaged could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection.

B. Requirements and Measures

R1. Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria specified in Applicability Section 4.1.1. The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify the Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection. *[VRF: High; Time-Horizon: Long-term Planning]*

1.1. Subsequent risk assessments shall be performed:

- At least once every 30 calendar months for a Transmission Owner that has identified in its previous risk assessment (as verified according to Requirement R2) one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection; or

- At least once every 60 calendar months for a Transmission Owner that has not identified in its previous risk assessment (as verified according to Requirement R2) any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection.

1.2. The Transmission Owner shall identify the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment.

M1. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the risk assessment of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria in Applicability Section 4.1.1 as specified in Requirement R1. Additionally, examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the identification of the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment as specified in Requirement R1, Part 1.2.

R2. Each Transmission Owner shall have an unaffiliated third party verify the risk assessment performed under Requirement R1. The verification may occur concurrent with or after the risk assessment performed under Requirement R1. *[VRF: Medium; Time-Horizon: Long-term Planning]*

2.1. Each Transmission Owner shall select an unaffiliated verifying entity that is either:

- A registered Planning Coordinator, Transmission Planner, or Reliability Coordinator; or
- An entity that has transmission planning or analysis experience.

2.2. The unaffiliated third party verification shall verify the Transmission Owner's risk assessment performed under Requirement R1, which may include recommendations for the addition or deletion of a Transmission station(s) or Transmission substation(s). The Transmission Owner shall ensure the verification is completed within 90 calendar days following the completion of the Requirement R1 risk assessment.

2.3. If the unaffiliated verifying entity recommends that the Transmission Owner add a Transmission station(s) or Transmission substation(s) to, or remove a Transmission station(s) or Transmission substation(s) from, its identification under Requirement R1, the Transmission Owner shall either, within 60 calendar days of completion of the verification, for each recommended addition or removal of a Transmission station or Transmission substation:

- Modify its identification under Requirement R1 consistent with the recommendation; or
- Document the technical basis for not modifying the identification in accordance with the recommendation.

2.4. Each Transmission Owner shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third party verifier and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M2. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner completed an unaffiliated third party verification of the Requirement R1 risk assessment and satisfied all of the applicable provisions of Requirement R2, including, if applicable, documenting the technical basis for not modifying the Requirement R1 identification as specified under Part 2.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 2.4.

R3. For a primary control center(s) identified by the Transmission Owner according to Requirement R1, Part 1.2 that a) operationally controls an identified Transmission station or Transmission substation verified according to Requirement R2, and b) is not under the operational control of the Transmission Owner: the Transmission Owner

shall, within seven calendar days following completion of Requirement R2, notify the Transmission Operator that has operational control of the primary control center of such identification and the date of completion of Requirement R2. *[VRF: Lower; Time-Horizon: Long-term Planning]*

3.1. If a Transmission station or Transmission substation previously identified under Requirement R1 and verified according to Requirement R2 is removed from the identification during a subsequent risk assessment performed according to Requirement R1 or a verification according to Requirement R2, then the Transmission Owner shall, within seven calendar days following the verification or the subsequent risk assessment, notify the Transmission Operator that has operational control of the primary control center of the removal.

M3. Examples of acceptable evidence may include, but are not limited to, dated written or electronic notifications or communications that the Transmission Owner notified each Transmission Operator, as applicable, according to Requirement R3.

R4. Each Transmission Owner that identified a Transmission station, Transmission substation, or a primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2. The evaluation shall consider the following: *[VRF: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

4.1. Unique characteristics of the identified and verified Transmission station(s), Transmission substation(s), and primary control center(s);

4.2. Prior history of attack on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and

4.3. Intelligence or threat warnings received from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), U.S. federal and/or Canadian governmental agencies, or their successors.

M4. Examples of evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner or Transmission Operator conducted an evaluation of the potential threats and vulnerabilities of a physical attack to their respective Transmission station(s), Transmission substation(s) and primary control center(s) as specified in Requirement R4.

R5. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s). The physical security plan(s) shall be developed within 120 calendar days following the completion of Requirement R2 and executed according to the timeline specified in the physical security plan(s). The physical security plan(s) shall include the following attributes: *[VRF: High; Time-Horizon: Long-term Planning]*

5.1. Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.

5.2. Law enforcement contact and coordination information.

5.3. A timeline for executing the physical security enhancements and modifications specified in the physical security plan.

5.4. Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).

M5. Examples of evidence may include, but are not limited to, dated written or electronic documentation of its physical security plan(s) that covers their respective identified and verified Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R5, and additional evidence demonstrating execution of the physical security plan according to the timeline specified in the physical security plan.

R6. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall have an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5. The review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5. *[VRF: Medium; Time-Horizon: Long-term Planning]*

6.1. Each Transmission Owner and Transmission Operator shall select an unaffiliated third party reviewer from the following:

- An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified

Protection Professional (CPP) or Physical Security Professional (PSP) certification.

- An entity or organization approved by the ERO.
- A governmental agency with physical security expertise.
- An entity or organization with demonstrated law enforcement, government, or military physical security expertise.

6.2. The Transmission Owner or Transmission Operator, respectively, shall ensure that the unaffiliated third party review is completed within 90 calendar days of completing the security plan(s) developed in Requirement R5. The unaffiliated third party review may, but is not required to, include recommended changes to the evaluation performed under Requirement R4 or the security plan(s) developed under Requirement R5.

6.3. If the unaffiliated third party reviewer recommends changes to the evaluation performed under Requirement R4 or security plan(s) developed under Requirement R5, the Transmission Owner or Transmission Operator shall, within 60 calendar days of the completion of the unaffiliated third party review, for each recommendation:

- Modify its evaluation or security plan(s) consistent with the recommendation; or
- Document the reason(s) for not modifying the evaluation or security plan(s) consistent with the recommendation.

6.4. Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third party reviewer and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M6. Examples of evidence may include, but are not limited to, written or electronic documentation that the Transmission Owner or Transmission Operator had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 as specified in Requirement R6 including, if applicable, documenting the reasons for not modifying the evaluation or security plan(s) in accordance with a recommendation under Part 6.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 6.4.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence during an on-site visit to show that it was compliant for the full time period since the last audit.

The Transmission Owner and Transmission Operator shall keep data or evidence to show compliance, as identified below, unless directed by its Compliance Enforcement Authority (CEA) to retain specific evidence for a longer period of time as part of an investigation.

The responsible entities shall retain documentation as evidence for three years.

If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records, subject to the confidentiality provisions of Section 1500 of the Rules of Procedure and the provisions of Section 1.4 below.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints Text

1.4. Additional Compliance Information

Confidentiality: To protect the confidentiality and sensitive nature of the evidence for demonstrating compliance with this standard, all evidence will be retained at the Transmission Owner's and Transmission Operator's facilities.

Guidelines and Technical Basis

Section 4 Applicability

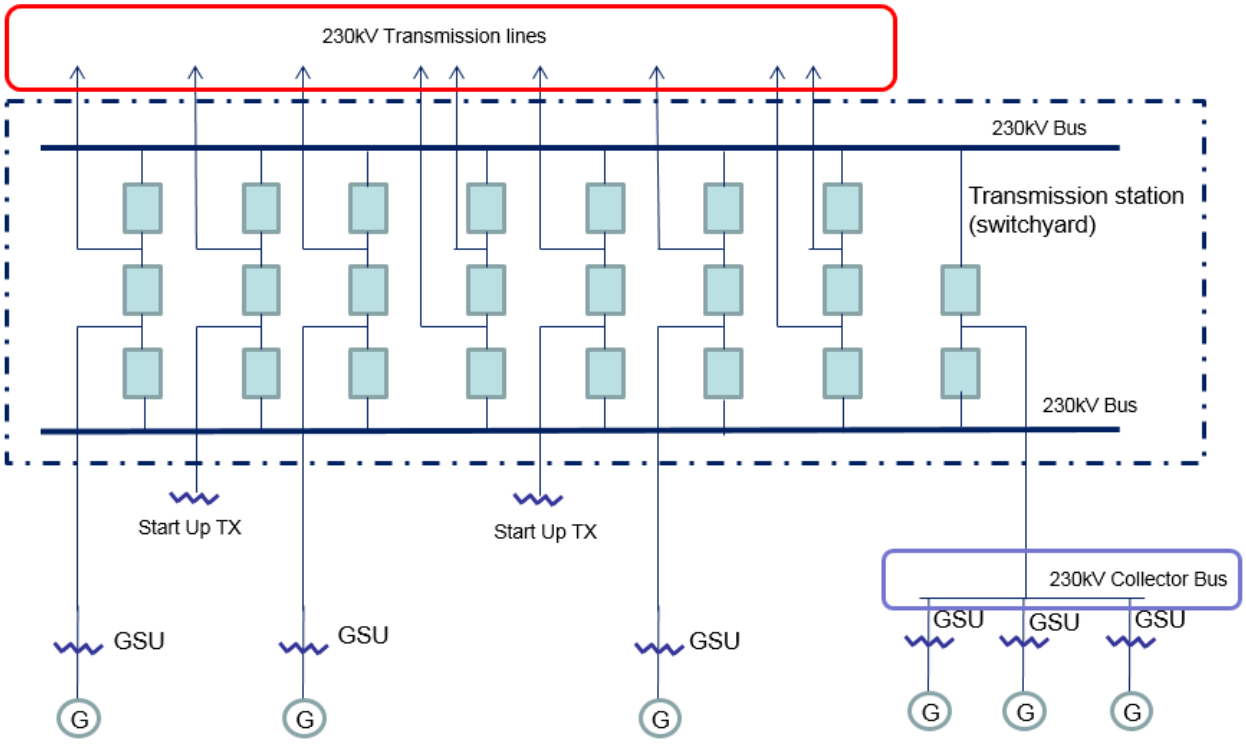
The purpose of Reliability Standard CIP-014~~-1~~ is to protect Transmission stations and Transmission substations, and their associated primary control centers that if rendered inoperable or damaged as a result of a physical attack could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection. To properly include those entities that own or operate such Facilities, the Reliability Standard CIP-014~~-1~~ first applies to Transmission Owners that own Transmission Facilities that meet the specific criteria in Applicability Section 4.1.1.1 through 4.1.1.4. The Facilities described in Applicability Section 4.1.1.1 through 4.1.1.4 mirror those Transmission Facilities that meet the bright line criteria for "Medium Impact" Transmission Facilities under Attachment 1 of Reliability Standard CIP-002-5.1. Each Transmission Owner that owns Transmission Facilities that meet the criteria in Section 4.1.1.1 through 4.1.1.4 is required to perform a risk assessment as specified in Requirement R1 to identify its Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection. The Standard Drafting Team (SDT) expects this population will be small and that many Transmission Owners that meet the applicability of this standard will not actually identify any such Facilities. Only those Transmission Owners with Transmission stations or Transmission substations identified in the risk assessment (and verified under Requirement R2) have performance obligations under Requirements R3 through R6.

This standard also applies to Transmission Operators. A Transmission Operator's obligations under the standard, however, are only triggered if the Transmission Operator is notified by an applicable Transmission Owner under Requirement R3 that the Transmission Operator operates a primary control center that operationally controls a Transmission station(s) or Transmission substation(s) identified in the Requirement R1 risk assessment. A primary control center operationally controls a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical action at the identified Transmission station or Transmission substation, such as opening a breaker, as opposed to a control center that only has information from the Transmission station or Transmission substation and must coordinate direct action through another entity. Only Transmission Operators who are notified that they have primary control centers under this standard have performance obligations under Requirements R4 through R6. In other words, primary control center for purposes of this Standard is the control center that the Transmission Owner or Transmission Operator, respectively, uses as its primary, permanently-manned site to physically operate a Transmission station or Transmission substation that is identified in Requirement R1 and verified in Requirement R2. Control centers that provide back-up capability are not applicable, as they are a form of resiliency and intentionally redundant.

The SDT considered several options for bright line criteria that could be used to determine applicability and provide an initial threshold that defines the set of Transmission stations and Transmission substations that would meet the directives of the FERC order on physical security (*i.e.*, those that could cause ~~widespread~~ instability, uncontrolled separation, or Cascading within

an Interconnection). The SDT determined that using the criteria for Medium Impact Transmission Facilities in Attachment 1 of CIP-002-5.1 would provide a conservative threshold for defining which Transmission stations and Transmission substations must be included in the risk assessment in Requirement R1 of CIP-014~~-1~~. Additionally, the SDT concluded that using the CIP-002-5.1 Medium Impact criteria was appropriate because it has been approved by stakeholders, NERC, and FERC, and its use provides a technically sound basis to determine which Transmission Owners should conduct the risk assessment. As described in CIP-002-5.1, the failure of a Transmission station or Transmission substation that meets the Medium Impact criteria could have the capability to result in exceeding one or more Interconnection Reliability Operating Limits (IROLs). The SDT understands that using this bright line criteria to determine applicability may require some Transmission Owners to perform risk assessments under Requirement R1 that will result in a finding that none of their Transmission stations or Transmission substations would pose a risk of ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection. However, the SDT determined that higher bright lines could not be technically justified to ensure inclusion of all Transmission stations and Transmission substations, and their associated primary control centers that, if rendered inoperable or damaged as a result of a physical attack could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection. Further guidance and technical basis for the bright line criteria for Medium Impact Facilities can be found in the Guidelines and Technical Basis section of CIP-002-5.1.

Additionally, the SDT determined that it was not necessary to include Generator Operators and Generator Owners in the Reliability Standard. First, Transmission stations or Transmission substations interconnecting generation facilities are considered when determining applicability. Transmission Owners will consider those Transmission stations and Transmission substations that include a Transmission station on the high side of the Generator Step-up transformer (GSU) using Applicability Section 4.1.1.1 and 4.1.1.2. As an example, a Transmission station or Transmission substation identified as a Transmission Owner facility that interconnects generation will be subject to the Requirement R1 risk assessment if it operates at 500kV or greater or if it is connected at 200 kV – 499kV to three or more other Transmission stations or Transmission substations and has an "aggregate weighted value" exceeding 3000 according to the table in Applicability Section 4.1.1.2. Second, the Transmission analysis or analyses conducted under Requirement R1 should take into account the impact of the loss of generation connected to applicable Transmission stations or Transmission substations. Additionally, the FERC order does not explicitly mention generation assets and is reasonably understood to focus on the most critical Transmission Facilities. The diagram below shows an example of a station.



Also, the SDT uses the phrase "Transmission stations or Transmission substations" to recognize the existence of both stations and substations. Many entities in industry consider a substation to be a location with physical borders (i.e. fence, wall, etc.) that contains at least an autotransformer. Locations also exist that do not contain autotransformers, and many entities in industry refer to those locations as stations (switching stations or switchyards). Therefore, the SDT chose to use both "station" and "substation" to refer to the locations where groups of Transmission Facilities exist.

On the issue of joint ownership, the SDT recognizes that this issue is not unique to CIP-014~~-1~~, and expects that the applicable Transmission Owners and Transmission Operators will develop memorandums of understanding, agreements, Coordinated Functional Registrations, or procedures, etc., to designate responsibilities under CIP-014~~-1~~ when joint ownership is at issue, which is similar to what many entities have completed for other Reliability Standards.

The language contained in the applicability section regarding the collector bus is directly copied from CIP-002-5.1, Attachment 1, and has no additional meaning within the CIP-014~~-1~~ standard.

Requirement R1

The initial risk assessment required under Requirement R1 must be completed on or before the effective date of the standard. Subsequent risk assessments are to be performed at least once every 30 or 60 months depending on the results of the previous risk assessment per Requirement R1, Part 1.1. In performing the risk assessment under Requirement R1, the

Transmission Owner should first identify their population of Transmission stations and Transmission substations that meet the criteria contained in Applicability Section 4.1.1. Requirement R1 then requires the Transmission Owner to perform a risk assessment, consisting of a transmission analysis, to determine which of those Transmission stations and Transmission Substations if rendered inoperable or damaged could result in ~~widespread instability, uncontrolled separation, or Cascading within an Interconnection.~~ instability, uncontrolled separation, or Cascading within an Interconnection. The requirement is not to require identification of, and thus, not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the following:

- Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6
- NERC EOP-004-2 reporting criteria
- Area or magnitude of potential impact

The standard does not mandate the specific analytical method for performing the risk assessment. The Transmission Owner has the discretion to choose the specific method that best suites its needs. As an example, an entity may perform a Power Flow analysis and stability analysis at a variety of load levels.

Performing Risk Assessments

The Transmission Owner has the discretion to select a transmission analysis method that fits its facts and system circumstances. To mandate a specific approach is not technically desirable and may lead to results that fail to adequately consider regional, topological, and system circumstances. The following guidance is only an example on how a Transmission Owner may perform a power flow and/or stability analysis to identify those Transmission stations and Transmission substations that if rendered inoperable or damaged as a result of a physical attack could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection. An entity could remove all lines, without regard to the voltage level, to a single Transmission station or Transmission substation and review the simulation results to assess system behavior to determine if Cascading of Transmission Facilities, uncontrolled separation, or voltage or frequency instability is likely to occur over a significant area of the Interconnection. Using engineering judgment, the Transmission Owner (possibly in consultation with regional planning or operation committees and/or ISO/RTO committee input) should develop criteria (e.g. imposing a fault near the removed Transmission station or Transmission substation) to identify a contingency or parameters that result in potential ~~widespread~~

instability, uncontrolled separation, or Cascading within an Interconnection. Regional consultation on these matters is likely to be helpful and informative, given that the inputs for the risk assessment and the attributes of what constitutes ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection will likely vary from region-to-region or from ISO-to-ISO based on topology, system characteristics, and system configurations. ~~–~~Criteria could also include post-contingency facilities loadings above a certain emergency rating or failure of a power flow case to converge. Available special protection systems (SPS), if any, could be applied to determine if the system experiences any additional instability which may result in uncontrolled separation. Example criteria may include:

(a) Thermal overloads beyond facility emergency ratings;

(b) Voltage deviation exceeding ± 10%; or

(c) Cascading outage/voltage collapse; or

(d) Frequency below under-frequency load shed points

Periodicity

A Transmission Owner who identifies one or more Transmission stations or Transmission substations (as verified under Requirement R2) that if rendered inoperable or damaged could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection is required to conduct a risk assessment at least once every 30 months. This period ensures that the risk assessment remains current with projected conditions and configurations in the planned system. This risk assessment, as the initial assessment, must consider applicable planned Transmission stations and Transmission substations to be in service within 24 months. The 30 month timeframe aligns with the 24 month planned to be in service date because the Transmission Owner is provided the flexibility, depending on its planning cycle and the frequency in which it may plan to construct a new Transmission station or Transmission substation to more closely align these dates. The requirement is to conduct the risk assessment at least once every 30 months, so for a Transmission Owner that believes it is better to conduct a risk assessment once every 24 months, because of its planning cycle, it has the flexibility to do so.

Transmission Owners that have not identified any Transmission stations or Transmission substations (as verified under Requirement R2) that if rendered inoperable or damaged could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection are unlikely to see changes to their risk assessment in the Near-Term Planning Horizon. Consequently, a 60 month periodicity for completing a subsequent risk assessment is specified.

Identification of Primary Control Centers

After completing the risk assessment specified in Requirement R1, it is important to additionally identify the primary control center that operationally controls each Transmission station or

Transmission substation that if rendered inoperable or damaged could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection. A primary control center "operationally controls" a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker.

Requirement R2

This requirement specifies verification of the risk assessment performed under Requirement R1 by an entity other than the owner or operator of the Requirement R1 risk assessment.

A verification of the risk assessment by an unaffiliated third party, as specified in Requirement R2, could consist of:

1. Certifying that the Requirement R1 risk assessment considers the Transmission stations and Transmission substations identified in Applicability Section 4.1.1.
2. Review of the model used to conduct the risk assessment to ensure it contains sufficient system topology to identify Transmission stations and Transmission substations that if rendered inoperable or damaged could cause ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection.
3. Review of the Requirement R1 risk assessment methodology.

This requirement provides the flexibility for a Transmission Owner to select from unaffiliated registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term unaffiliated means that the selected verifying entity cannot be a corporate affiliate (*i.e.,* the verifying or third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit.

The prohibition on registered entities using a corporate affiliate to conduct the verification, however, does not prohibit a governmental entity (e.g., a city, a municipality, a U.S. federal power marketing agency, or any other political subdivision of U.S. or Canadian federal, state, or provincial governments) from selecting as the verifying entity another governmental entity within the same political subdivision. For instance, a U.S. federal power marketing agency may select as its verifier another U.S. federal agency to conduct its verification so long as the selected entity has transmission planning or analysis experience. Similarly, a Transmission Owner owned by a Canadian province can use a separate agency of that province to perform the verification. The verifying entity, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

Requirement R2 also provides that the "verification may occur concurrent with or after the risk assessment performed under Requirement R1." This provision is designed to provide the Transmission Owner the flexibility to work with the verifying entity throughout (*i.e.,* concurrent with) the risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could collaborate with their unaffiliated

verifying entity to perform the risk assessment under Requirement R1 such that both Requirement R1 and Requirement R2 are satisfied concurrently. The intent of Requirement R2 is to have an entity other than the owner or operator of the facility to be involved in the risk assessment process and have an opportunity to provide input. Accordingly, Requirement R2 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the risk assessment and subsequently has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the risk assessment.

Characteristics to consider in selecting a third party reviewer could include:

- Registered Entity with applicable planning and reliability functions.
- Experience in power system studies and planning.
- The entity's understanding of the MOD standards, TPL standards, and facility ratings as they pertain to planning studies.
- The entity's familiarity with the Interconnection within which the Transmission Owner is located.

With respect to the requirement that Transmission owners develop and implement procedures for protecting confidential and sensitive information, the Transmission Owner could have a method for identifying documents that require confidential treatment. One mechanism for protecting confidential or sensitive information is to prohibit removal of sensitive or confidential information from the Transmission Owner's site. Transmission Owners could include such a prohibition in a non-disclosure agreement with the verifying entity.

A Technical feasibility study is not required in the Requirement R2 documentation of the technical basis for not modifying the identification in accordance with the recommendation.

On the issue of the difference between a verifier in Requirement R2 and a reviewer in Requirement R6, the SDT indicates that the verifier will confirm that the risk assessment was completed in accordance with Requirement R1, including the number of Transmission stations and substations identified, while the reviewer in Requirement R6 is providing expertise on the manner in which the evaluation of threats was conducted in accordance with Requirement R4, and the physical security plan in accordance with Requirement R5. In the latter situation there is no verification of a technical analysis, rather an application of experience and expertise to provide guidance or recommendations, if needed.

Parts 2.4 and 6.4 require the entities to have procedures to protect the confidentiality of sensitive or confidential information. Those procedures may include the following elements:

1. Control and retention of information on site for third party verifiers/reviewers.
2. Only "need to know" employees, etc., get the information.
3. Marking documents as confidential
4. Securely storing and destroying information when no longer needed.

5. Not releasing information outside the entity without, for example, General Counsel sign-off.

Requirement R3

Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first completing the risk assessment specified by Requirement R1 and the verification specified by Requirement R2. Requirement R3 is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1 receive notice so that the Transmission Operator may fulfill the rest of the obligations required in Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include within the notice the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or as a result of the verification process under Requirement R2.

Requirement R4

This requirement requires owners and operators of facilities identified by the Requirement R1 risk assessment and that are verified under Requirement R2 to conduct an assessment of potential threats and vulnerabilities to those Transmission stations, Transmission substations, and primary control centers using a tailored evaluation process. Threats and vulnerabilities may vary from facility to facility based on any number of factors that include, but are not limited to, location, size, function, existing physical security protections, and attractiveness as a target.

In order to effectively conduct a threat and vulnerability assessment, the asset owner may be the best source to determine specific site vulnerabilities, but current and evolving threats may best be determined by others in the intelligence or law enforcement communities. A number of resources have been identified in the standard, but many others exist and asset owners are not limited to where they may turn for assistance. Additional resources may include state or local fusion centers, U.S. Department of Homeland Security, Federal Bureau of Investigations (FBI), Public Safety Canada, Royal Canadian Mounted Police, and InfraGard chapters coordinated by the FBI.

The Responsible Entity is required to take a number of factors into account in Parts 4.1 to 4.3 in order to make a risk-based evaluation under Requirement R4.

To assist in determining the current threat for a facility, the prior history of attacks on similarly protected facilities should be considered when assessing probability and likelihood of occurrence at the facility in question.

Resources that may be useful in conducting threat and vulnerability assessments include:

- NERC Security Guideline for the Electricity Sector: Physical Security.

- NERC Security Guideline: Physical Security Response.
- ASIS International General Risk Assessment Guidelines.
- ASIS International Facilities Physical Security Measure Guideline.
- ASIS International Security Management Standard: Physical Asset Protection.
- Whole Building Design Guide - Threat/Vulnerability Assessments.

Requirement R5

This requirement specifies development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Requirement R5 specifies the following attributes for the physical security plan:

- *Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.*

  Resiliency may include, among other things:

  a. System topology changes,

  b. Spare equipment,

  c. Construction of a new Transmission station or Transmission substation.

  While most security measures will work together to collectively harden the entire site, some may be allocated to protect specific critical components. For example, if protection from gunfire is considered necessary, the entity may only install ballistic protection for critical components, not the entire site.

- *Law enforcement contact and coordination information.*

  Examples of such information may be posting 9-1-1 for emergency calls and providing substation safety and familiarization training for local and federal law enforcement, fire department, and Emergency Medical Services.

- *A timeline for executing the physical security enhancements and modifications specified in the physical security plan.*

  Entities have the flexibility to prioritize the implementation of the various resiliency or security enhancements and modifications in their security plan according to risk, resources, or other factors. The requirement to include a timeline in the physical security plan for executing the actual physical security enhancements and modifications does not also require that the enhancements and modifications be completed within 120 days. The actual timeline may extend beyond the 120 days, depending on the amount of work to be completed.

- *Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).*

  A registered entity's physical security plan should include processes and responsibilities for obtaining and handling alerts, intelligence, and threat warnings from various sources. Some of these sources could include the ERO, ES-ISAC, and US and/or Canadian federal agencies. This information should be used to reevaluate or consider changes in the security plan and corresponding security measures of the security plan found in R5.

  Incremental changes made to the physical security plan prior to the next required third party review do not require additional third party reviews.

Requirement R6

This requirement specifies review by an entity other than the Transmission Owner or Transmission Operator with appropriate expertise for the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5. As with Requirement R2, the term unaffiliated means that the selected third party reviewer cannot be a corporate affiliate (*i.e.,* the third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Operator). A third party reviewer also cannot be a division of the Transmission Operator that operates as a functional unit.

As noted in the guidance for Requirement R2, the prohibition on registered entities using a corporate affiliate to conduct the review, however, does not prohibit a governmental entity from selecting as the third party reviewer another governmental entity within the same political subdivision. For instance, a city or municipality may use its local enforcement agency, so long as the local law enforcement agency satisfies the criteria in Requirement R6. The third party reviewer, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

The Responsible Entity can select from several possible entities to perform the review:

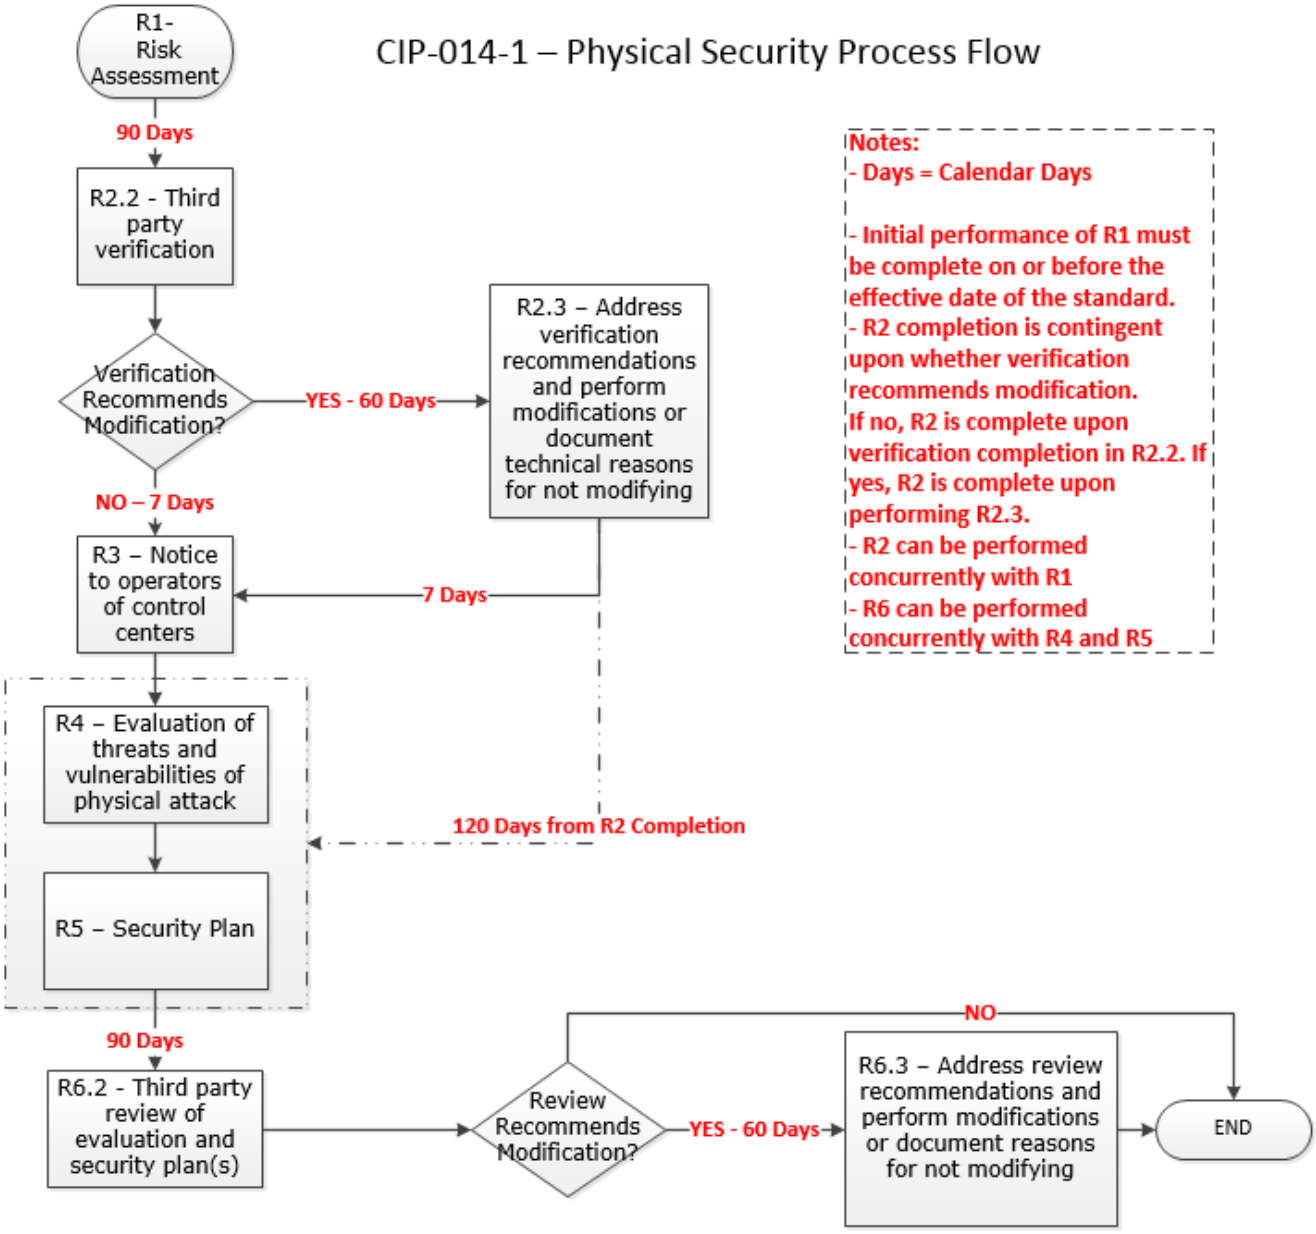
- *An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.*

  In selecting CPP and PSP for use in this standard, the SDT believed it was important that if a private entity such as a consulting or security firm was engaged to conduct the third party review, they must tangibly demonstrate competence to conduct the review. This includes electric industry physical security experience and either of the premier security industry certifications sponsored by ASIS International. The ASIS certification program was initiated in 1977, and those that hold the CPP certification are board certified in security management. Those that hold the PSP certification are board certified in physical security.

- *An entity or organization approved by the ERO.*
- *A governmental agency with physical security expertise.*
- *An entity or organization with demonstrated law enforcement, government, or military physical security expertise.*

As with the verification under Requirement R2, Requirement R6 provides that the "review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5." This provision is designed to provide applicable Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout (*i.e.,* concurrent with) the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5, which for some Responsible Entities may be more efficient and effective. In other words, a Transmission Owner or Transmission Operator could collaborate with their unaffiliated third party reviewer to perform an evaluation of potential threats and vulnerabilities (Requirement R4) and develop a security plan (Requirement R5) to satisfy Requirements R4 through R6 simultaneously. The intent of Requirement R6 is to have an entity other than the owner or operator of the facility to be involved in the Requirement R4 evaluation and the development of the Requirement R5 security plans and have an opportunity to provide input on the evaluation and the security plan. Accordingly, Requirement R6 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the evaluation and develops the security plan itself and then has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the evaluation and develop the security plan.

Timeline



CIP-014-1 – Physical Security Process Flow
R1- Risk Assessment
90 Days
R2.2 - Third party verification
Verification Recommends Modification?
YES - 60 Days
R2.3 – Address verification recommendations and perform modifications or document technical reasons for not modifying
NO – 7 Days
R3 – Notice to operators of control centers
7 Days
R4 – Evaluation of threats and vulnerabilities of physical attack
120 Days from R2 Completion
R5 – Security Plan
90 Days
R6.2 - Third party review of evaluation and security plan(s)
Review Recommends Modification?
YES - 60 Days
R6.3 – Address review recommendations and perform modifications or document reasons for not modifying
NO
END
Notes:
- Days = Calendar Days
- Initial performance of R1 must be complete on or before the effective date of the standard.
- R2 completion is contingent upon whether verification recommends modification. If no, R2 is complete upon verification completion in R2.2. If yes, R2 is complete upon performing R2.3.
- R2 can be performed concurrently with R1
- R6 can be performed concurrently with R4 and R5

Rationale~~:~~

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1:

This requirement meets the FERC directive from paragraph 6 ~~in the~~of its March 7, 2014 order on physical security to perform a risk assessment to identify which facilities if rendered inoperable or damaged could impact an Interconnection through ~~widespread instability, uncontrolled separation, or cascading failures. It also meets the portion of the directive from paragraph 11 for periodic reevaluation~~instability, uncontrolled separation, or cascading failures. The requirement is not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the following:

- Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6
- NERC EOP-004-2 reporting criteria
- Area or magnitude of potential impact

Requirement R1 also meets the FERC directive for periodic reevaluation of the risk assessment by requiring the risk assessment to be performed every 30 months (or 60 months for an entity that has not identified in a previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection).

After identifying each Transmission station and Transmission substation that meets the criteria in Requirement R1, it is important to additionally identify the primary control center that operationally controls that Transmission station or Transmission substation (*i.e.,* the control center whose electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker, compared to a control center that only has the ability to monitor the Transmission station and Transmission substation and, therefore, must coordinate direct physical action through another entity).

Rationale for Requirement R2:

This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring verification by an entity other than the owner or operator of the risk assessment performed under Requirement R1.

This requirement provides the flexibility for a Transmission Owner to select registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term "unaffiliated" means that the selected verifying entity cannot be a corporate affiliate (*i.e.*, the verifying entity cannot be an entity that controls, is controlled by, or is under common control with, the Transmission owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit. The term "unaffiliated" is not intended to prohibit a governmental entity from using another government entity to be a verifier under Requirement R2.

Requirement R2 also provides the Transmission Owner the flexibility to work with the verifying entity throughout the Requirement R1 risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could coordinate with their unaffiliated verifying entity to perform a Requirement R1 risk assessment to satisfy both Requirement R1 and Requirement R2 concurrently.

Planning Coordinator is a functional entity listed in Part 2.1. The Planning Coordinator and Planning Authority are the same entity as shown in the NERC Glossary of Terms Used in NERC Reliability Standards.

Rationale for Requirement R3:

Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first identifying which Transmission stations and Transmission substations meet the criteria specified by Requirement R1, as verified according to Requirement R2. This requirement is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1, Part 1.2 of a Transmission station or Transmission substation verified according to Requirement R2 receives notice of such identification so that the Transmission Operator may timely fulfill its resulting obligations under Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include notice of the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or the verification process under Requirement R2.

Rationale for Requirement R4:

This requirement meets the FERC directive from paragraph 8 in the order on physical security

that the reliability standard must require tailored evaluation of potential threats and vulnerabilities to facilities identified in Requirement R1 and verified according to Requirement R2. Threats and vulnerabilities may vary from facility to facility based on factors such as the facility's location, size, function, existing protections, and attractiveness of the target. As such, the requirement does not mandate a one-size-fits-all approach but requires entities to account for the unique characteristics of their facilities.

Requirement R4 does not explicitly state when the evaluation of threats and vulnerabilities must occur or be completed. However, Requirement R5 requires that the entity's security plan(s), which is dependent on the Requirement R4 evaluation, must be completed within 120 calendar days following completion of Requirement R2. Thus, an entity has the flexibility when to complete the Requirement R4 evaluation, provided that it is completed in time to comply with the requirement in Requirement R5 to develop a physical security plan 120 calendar days following completion of Requirement R2.

Rationale for Requirement R5:

This requirement meets the FERC directive from paragraph 9 in the order on physical security requiring the development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Rationale for Requirement R6:

This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring review by an entity other than the owner or operator with appropriate expertise of the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5.

As with the verification required by Requirement R2, Requirement R6 provides Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout the Requirement R4 evaluation and the development of the Requirement R5 security plan(s). This would allow entities to satisfy their obligations under Requirement R6 concurrent with the satisfaction of their obligations under Requirements R4 and R5.

Physical Security Directives
CIP-014-2

Standards Involved

Approval:

- CIP-014-2 – Physical Security

Retirement:

- CIP-014-1 – Physical Security

Prerequisite Approvals:

N/A

Background

In Order No. 802 (final order on CIP-014-1 – Physical Security), issued on November 20, 2014, FERC directed NERC to remove the term "widespread" from Reliability Standard CIP-014-1 or, alternatively, to propose modifications to the Reliability Standard that address the Commission's concerns. FERC directed that NERC submit a responsive modification within six months from the effective date of this final rule.

Effective Date

CIP-014-2 shall become effective on the later of the first day following the Effective Date of CIP-014-1 or the first day after CIP-014-2 is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, CIP-014-2 shall become effective on the later of the first day following the Effective Date of CIP-014-1 or the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction

Retirement of Existing Standards:

The existing standard, CIP-014-1, shall be retired at midnight of the day immediately prior to the effective date of CIP-014-2 in the particular jurisdiction in which the revised standard is becoming effective.

Applicability:

This standard applies to the following functional entities:

- Transmission Owner
- Transmission Operator

Implementation of CIP-014-1

All aspects of the Implementation Plan for CIP-014-1 will remain applicable to CIP-014-2 and are incorporated here by reference.

Cross References

The Implementation Plan for CIP-014-1 is available here.

Exhibit C

Order No. 672 Criteria

EXHIBIT C

Order No. 672 Criteria

In Order No. 672,[1] the Commission identified a number of criteria it will use to analyze Reliability Standards proposed for approval to ensure they are just, reasonable, not unduly discriminatory or preferential, and in the public interest. The discussion below identifies these factors and explains how the proposed Reliability Standard has met or exceeded the criteria.

1. **Proposed Reliability Standards must be designed to achieve a specified reliability goal and must contain a technically sound means to achieve that goal.[2]**

Proposed Reliability Standard CIP-014-1 achieves the specific reliability goal of enhancing physical security measures for the most critical Bulk-Power System facilities and thereby lessening the overall vulnerability of the Bulk-Power System to physical attacks. The proposed Reliability Standard requires Transmission Owners and Transmission Operators to protect those critical Transmission stations and Transmission substations, and their associated primary control centers that if rendered inoperable or damaged as a result of a physical attack could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection.

Proposed Reliability Standard CIP-014-2 modifies Reliability Standard CIP-014-1 by removing the term "widespread" from Requirement R1 of the standard. As discussed below, removing the term "widespread" will help ensure that: (1) applicable entities identify the appropriate critical facilities under Requirement R1; and (2) the ERO enforces the Reliability Standard in a consistent manner.

---

[1] *Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval, and Enforcement of Electric Reliability Standards*, Order No. 672, FERC Stats. & Regs. ¶ 31,204, *order on reh'g*, Order No. 672-A, FERC Stats. & Regs. ¶ 31,212 (2006).

[2] Order No. 672 at PP 321, 324.

2. Proposed Reliability Standards must be applicable only to users, owners and operators of the bulk power system, and must be clear and unambiguous as to what is required and who is required to comply.[3]

The proposed Reliability Standard is clear and unambiguous as to what is required and who is required to comply, in accordance with Order No. 672. The proposed Reliability Standard applies to Transmission Owners and Transmission Operators. The proposed Reliability Standard clearly articulates the actions that such entities must take to comply with the standard.

3. A proposed Reliability Standard must include clear and understandable consequences and a range of penalties (monetary and/or non-monetary) for a violation.[4]

The Violation Risk Factors ("VRFs") and Violation Severity Levels ("VSLs") for the proposed Reliability Standard comport with NERC and Commission guidelines related to their assignment, as discussed further in Exhibit E. The assignment of the severity level for each VSL is consistent with the corresponding requirement and the VSLs should ensure uniformity and consistency in the determination of penalties. The VSLs do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations. For these reasons, the proposed Reliability Standard includes clear and understandable consequences in accordance with Order No. 672.

---

[3] Order No. 672 at PP 322, 325.

[4] Order No. 672 at P 326.

4. **A proposed Reliability Standard must identify clear and objective criterion or measure for compliance, so that it can be enforced in a consistent and non-preferential manner.** [5]

The proposed Reliability Standard contains measures that support each requirement by clearly identifying what is required to demonstrate compliance. These measures help provide clarity regarding the manner in which the requirements will be enforced, and help ensure that the requirements will be enforced in a clear, consistent, and non-preferential manner and without prejudice to any party.

5. **Proposed Reliability Standards should achieve a reliability goal effectively and efficiently — but do not necessarily have to reflect "best practices" without regard to implementation cost or historical regional infrastructure design.** [6]

The proposed Reliability Standard achieves the reliability goal effectively and efficiently in accordance with Order No. 672. The proposed Reliability Standard clearly enumerates the responsibilities of applicable entities with respect to the identification and protection of critical Bulk-Power System facilities and provides entities the flexibility to tailor their processes and plans required under the standard to best suit the needs of their organization.

6. **Proposed Reliability Standards cannot be "lowest common denominator," *i.e.*, cannot reflect a compromise that does not adequately protect Bulk-Power System reliability. Proposed Reliability Standards can consider costs to implement for smaller entities, but not at consequences of less than excellence in operating system reliability.** [7]

The proposed Reliability Standard does not reflect a "lowest common denominator" approach. To the contrary, the proposed Reliability Standard contains significant benefits for the

---

5 Order No. 672 at P 327.

6 Order No. 672 at P 328.

7 Order No. 672 at P 329-30.

Bulk-Power System. The requirements of the proposed Reliability Standard help ensure that entities provide an adequate level of protection against physical attacks to critical facilities.

7. **Proposed Reliability Standards must be designed to apply throughout North America to the maximum extent achievable with a single Reliability Standard while not favoring one geographic area or regional model. It should take into account regional variations in the organization and corporate structures of transmission owners and operators, variations in generation fuel type and ownership patterns, and regional variations in market design if these affect the proposed Reliability Standard.[8]**

The proposed Reliability Standard applies throughout North America and does not favor one geographic area or regional model.

8. **Proposed Reliability Standards should cause no undue negative effect on competition or restriction of the grid beyond any restriction necessary for reliability.[9]**

The proposed Reliability Standard has no undue negative impact on competition. The proposed Reliability Standard requires the same performance by each applicable entity. The standard does not unreasonably restrict the available transmission capability or limit use of the Bulk-Power System in a preferential manner.

9. **The implementation time for the proposed Reliability Standard is reasonable.[10]**

The proposed effective date for the standard is just and reasonable and appropriately balances the urgency in the need to implement the standard against the reasonableness of the time allowed for those who must comply to develop and implement the necessary procedures and policies. The proposed implementation period will allow applicable entities adequate time to

---

[8] Order No. 672 at P 331.

[9] Order No. 672 at P 332.

[10] Order No. 672 at P 333.

meaningfully implement the requirements. The proposed effective date is explained in the proposed Implementation Plan, attached as Exhibit B.

10. The Reliability Standard was developed in an open and fair manner and in accordance with the Commission-approved Reliability Standard development process.[11]

The proposed Reliability Standard was developed in accordance with NERC's Commission-approved, ANSI- accredited processes for developing and approving Reliability Standards. Exhibit F includes a summary of the Reliability Standard development proceedings, and details the processes followed to develop the Reliability Standards. These processes included, among other things, comment and balloting periods. Additionally, all meetings of the drafting team were properly noticed and open to the public. The initial and additional ballots achieved a quorum and exceeded the required ballot pool approval levels.

11. NERC must explain any balancing of vital public interests in the development of proposed Reliability Standards.[12]

NERC has identified no competing public interests regarding the request for approval of the proposed Reliability Standard. No comments were received that indicated the proposed Reliability Standard conflicts with other vital public interests.

12. Proposed Reliability Standards must consider any other appropriate factors.[13]

No other negative factors relevant to whether the proposed Reliability Standard is just and reasonable were identified.

Considerations of Directives

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Consideration of Directives

Project 2014-04 - Physical Security Directives

April 16, 2015

Project 2014-04 - Physical Security Directives		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Paragraph 19. In addition to approving Reliability Standard CIP-014-1, the Commission adopts in part the NOPR proposal directing NERC to develop and submit modifications to the Reliability Standard concerning the use of the term "widespread" in Requirement R1. The Commission determines that the term "widespread" is unclear with respect to the obligations it imposes on applicable entities; how it would be implemented by applicable entities; and how it would be enforced. Accordingly, the Commission directs NERC, pursuant to FPA section 215(d)(5), to remove the term "widespread" from Reliability Standard CIP-014-1 or, alternatively, to propose modifications to the Reliability Standard that address the Commission's concerns. We direct that NERC submit a responsive	FERC Order 802 approving Reliability Standard CIO-014-1, Physical Security	The Physical Security Standard Drafting Team (PSSDT) revised CIP-014-1, Physical Security, by removing the term "widespread" from the standard. This was done in the Purpose Statement, Background Section, Requirement R1, the Rationale for Requirement R1 as well as the Guidance and Technical Basis Section of the standard. Additionally, the PSSDT has added the following to the Rationale and guideline and Technical Basis for Requirement R1: "The requirement is not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In

Project 2014-04 - Physical Security Directives		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
modification within six months from the effective date of this final rule. Paragraph 35: Accordingly, pursuant to FPA section 215(d)(5), the Commission directs NERC to develop a modification to Reliability Standard CIP-014-1 that either removes the term "widespread" from Requirement R1 or, in the alternative, proposes changes that address the Commission's concerns. Further, we direct that NERC submit a responsive modification within six months from the effective date of this final rule. We recognize that certain entities commented on how NERC could modify Reliability Standard CIP-014-1 to address the Commission's stated concerns. However, we conclude that it is appropriate to allow NERC to develop and propose a modification in the first instance.		the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the following: • Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6 • NERC EOP-004-2 reporting criteria • Area or magnitude of potential impact" Additionally, the PSSDT revised the Rationale for Requirement R1 as follows: "Requirement R1 also meets the directive for periodic reevaluation of the risk assessment by requiring the risk assessment to be performed every 30 months (or 60 months for an entity that has not identified in a previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an interconnection)."

Project 2014-04 - Physical Security Directives		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Paragraph 21. With respect to the informational filings proposed in the NOPR, the Commission adopts the proposal to direct NERC to make an informational filing addressing whether Reliability Standard CIP-014-1 provides physical security for all "High Impact" control centers, as that term is defined in Reliability Standard CIP-002-5.1, necessary for the reliable operation of the Bulk-Power System. However, the Commission extends the deadline for that informational filing until two years following the effective date of Reliability Standard CIP-014-1. Paragraph 57. The Commission adopts the NOPR proposal and directs NERC to submit an informational filing that addresses whether there is a need for consistent treatment of "High Impact" control centers for cybersecurity and physical security purposes through the development of Reliability Standards that afford physical protection to all "High Impact" control centers. The Commission, however, modifies the NOPR proposal and extends the due date for the informational filing to two years following the effective date of Reliability Standard CIP-014-1.	FERC Order 802 approving Reliability Standard CIO-014-1, Physical Security	NERC Staff will monitor implementation of Requirements R1 and R2 with respect to "High Impact" control centers as that term is defined in Reliability Standard CIP-002-5.1 as that term is defined in Reliability Standard CIP-002-5.1. NERC will submit an informational filing that addresses whether there is a need for consistent treatment of "High Impact" control centers for cybersecurity and physical security purposes through the development of Reliability Standards that afford physical protection to all "High Impact" control centers within two years following the effective date of Reliability Standard CIP-014-1.

Project 2014-04 - Physical Security Directives		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Paragraph 44. The Commission, instead, will focus its resources on carrying out compliance and enforcement activities to ensure that critical facilities are identified under Requirement R1. In its comments, NERC indicated that NERC staff will submit to the NERC Board of Trustees a report three months following implementation of Requirements R1, R2 and R3 concerning the scope of facilities identified as critical, including the number of facilities identified as critical and their defining characteristics. NERC also committed to sending this report to Commission staff.	FERC Order 802 approving Reliability Standard CIO-014-1, Physical Security	NERC Staff will monitor implementation of Requirements R1, R2 and R3 and will submit to the NERC Board of Trustees, a report three months following implementation of these Requirements concerning the scope of facilities identified as critical, including the number of facilities identified as critical and their defining characteristics. NERC will also submit this report to Commission staff.

VRF and VSL Justifications for CIP-014-2

VRF and VSL Justifications – CIP-014-1, R1	
Proposed VRF	High
NERC VRF Discussion	Initial and subsequent risk assessments identify Transmission stations or Transmission substations that need to be assessed for threats and vulnerabilities and potential physical security measures. Since this is a Requirement in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition. This justifies a High VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the risk assessment periodicity and the identification of the primary control center that has operational control of Transmission stations and/or Transmission substations.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable CIP-002-5.1 R1, which deals with categorizing cyber systems, is assigned a High VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Transmission Owner performed an initial risk assessment but did so after the date specified in the implementation plan for performing the initial risk assessment but less than or equal to two calendar months after that date;

VRF and VSL Justifications – CIP-014-1, R1	
	OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 30 calendar months but less than or equal to 32 calendar months; OR The Transmission Owner that has not identified in its previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 60 calendar months but less than or equal to 62 calendar months.
Proposed Moderate VSL	The Transmission Owner performed an initial risk assessment but did so more than two calendar months after the date specified in the implementation plan for performing the initial risk assessment but less than or equal to four calendar months after that date; OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 32 calendar months but less than or equal to 34 calendar months; OR The Transmission Owner that has not identified in its previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 62 calendar months but less than or equal to 64 calendar months.
Proposed High VSL	The Transmission Owner performed an initial risk assessment but did so more than four calendar months after the date specified in the implementation plan for performing the initial risk assessment but less than or equal to six calendar months after that date;

VRF and VSL Justifications – CIP-014-1, R1	
	OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 34 calendar months but less than or equal to 36 calendar months; OR The Transmission Owner that has not identified in its previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 64 calendar months but less than or equal to 66 calendar months; OR The Transmission Owner performed a risk assessment but failed to include Part 1.2.
Proposed Severe VSL	The Transmission Owner performed an initial risk assessment but did so more than six calendar months after the date specified in the implementation plan for performing the initial risk assessment; OR The Transmission Owner failed to perform an initial risk assessment; OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after more than 36 calendar months; OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection failed to perform a risk assessment; OR

VRF and VSL Justifications – CIP-014-1, R1	
	The Transmission Owner that has not identified in its previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after more than 66 calendar months; OR The Transmission Owner that has not identified in its previous risk assessment any Transmission station and Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection failed to perform a subsequent risk assessment.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if the risk assessment is not performed or if the risk assessment is not performed within required intervals.
FERC VSL G3 Violation Severity Level Assignment Should Be	The language of the VSL directly mirrors the language in the corresponding requirement.

VRF and VSL Justifications – CIP-014-1, R1	
Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is assigned for a single instance of failing to submit perform a risk assessment.

VRF and VSL Justifications – CIP-014-1, R2	
Proposed VRF	Medium
NERC VRF Discussion	Unaffiliated third party verification of initial and subsequent risk assessments provides reinforcement that the risk assessment was performed with due consideration to risk to the bulk power system. Since this Requirement is in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. This justifies a Medium VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the unaffiliated third party verification including entities that may perform the verification, provisions for adding or removing Transmission stations and/or Transmission substations, and provisions for confidentiality of sensitive information.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable EOP-005-2 R6, which deals with verifying that its restoration plan accomplishes its intended function is assigned a medium VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but did so in more than 90 calendar days but less than or equal to 100 calendar days following completion of Requirement R1;

VRF and VSL Justifications – CIP-014-1, R2	
	OR The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 and modified or documented the technical basis for not modifying its identification under Requirement R1 as required by part 2.3 but did so more than 60 calendar days and less than or equal to 70 calendar days from completion of the third party verification.
Proposed Moderate VSL	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but did so more than 100 calendar days but less than or equal to 110 calendar days following completion of Requirement R1; Or The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 and modified or documented the technical basis for not modifying its identification under Requirement R1 as required by part 2.3 but did so more than 70 calendar days and less than or equal to 80 calendar days from completion of the third party verification.
Proposed High VSL	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but did so more than 110 calendar days but less than or equal to 120 calendar days following completion of Requirement R1; OR The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 and modified or documented the technical basis for not modifying its identification under Requirement R1 as required by part 2.3 but did so more than 80 calendar days from completion of the third party verification; OR The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but failed to modify or document the technical basis for not modifying its identification under R1 as required by part 2.3.
Proposed Severe VSL	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but did so more than 120 calendar days following completion of Requirement R1; OR

VRF and VSL Justifications – CIP-014-1, R2	
	The Transmission Owner failed to have an unaffiliated third party verify the risk assessment performed under Requirement R1; OR The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but failed to implement procedures for protecting information per Part 2.4.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if an unaffiliated third party verification is not performed or if the verification is not performed within prescribe timelines. The VSLs are also written indicating violation of the Requirement Part regarding protection of information.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The language of the VSL directly mirrors the language in the corresponding requirement.
FERC VSL G4	The VSL is assigned for a single instance of failing to have an unaffiliated third party verification performed; or failing to perform

VRF and VSL Justifications – CIP-014-1, R2	
Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	the verification within prescribe timelines; or failing to implement procedures to protect information.

VRF and VSL Justifications – CIP-014-1, R3	
Proposed VRF	Lower
NERC VRF Discussion	Notifying the Transmission Operator that it has operational control of a Transmission station or Transmission substation identified in Requirement R1 and verified in Requirement R2 is necessary so that the Transmission Operator may begin performance of subsequent physical security requirements for the primary control center. This is a requirement that is administrative in nature and in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. This justifies a Lower VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the notification of the Transmission Operator regarding the removal of a Transmission station or Transmission substation.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable INT-006-4 R6, which deals with notifying other entities so that Confirmed Interchange may be implemented, is assigned a Lower VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Transmission Owner notified the Transmission Operator that operates the primary control center as specified in Requirement R3 but did so more than seven calendar days and less than or equal to nine calendar days following the completion of Requirement R2; OR The Transmission Owner notified the Transmission Operator that operates the primary control center of the removal from the

VRF and VSL Justifications – CIP-014-1, R3	
	identification in Requirement R1 but did so more than seven calendar days and less than or equal to nine calendar days following the verification or the subsequent risk assessment.
Proposed Moderate VSL	The Transmission Owner notified the Transmission Operator that operates the primary control center as specified in Requirement R3 but did so more than nine calendar days and less than or equal to 11 calendar days following the completion of Requirement R2; OR The Transmission Owner notified the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R1 but did so more than nine calendar days and less than or equal to 11 calendar days following the verification or the subsequent risk assessment.
Proposed High VSL	The Transmission Owner notified the Transmission Operator that operates the primary control center as specified in Requirement R3 but did so more than 11 calendar days and less than or equal to 13 calendar days following the completion of Requirement R2; OR The Transmission Owner notified the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R1 but did so more than 11 calendar days and less than or equal to 13 calendar days following the verification or the subsequent risk assessment.
Proposed Severe VSL	The Transmission Owner notified the Transmission Operator that operates the primary control center as specified in Requirement R3 but did so more than 13 calendar days following the completion of Requirement R2; OR The Transmission Owner failed to notify the Transmission Operator that it operates a control center identified in Requirement R1; OR The Transmission Owner notified the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R1 but did so more than 13 calendar days following the verification or the subsequent risk assessment. OR

VRF and VSL Justifications – CIP-014-1, R3	
	The Transmission Owner failed to notify the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R1.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if notification is not made subject to the conditions of the requirement.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The language of the VSL directly mirrors the language in the corresponding requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on	The VSL is assigned for a single instance of failing to make the appropriate notification.

VRF and VSL Justifications – CIP-014-1, R3	
A Cumulative Number of Violations	

VRF and VSL Justifications – CIP-014-1, R4	
Proposed VRF	Medium
NERC VRF Discussion	Performing an evaluation of potential threats and vulnerabilities of a physical attack to each of respective Transmission station(s), Transmission substation(s), and primary control center(s) is necessary to ensure the physical security of those assets as well as the reliability of the bulk power system. Since this Requirement is in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. This justifies a Medium VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the evaluation of potential threats and vulnerabilities of a physical attack to Transmission stations and/or Transmission substations.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable CIP-007-5 R2, which deals with a patch management process for tracking, evaluating, and installing cyber security patches for applicable Cyber Assets, is assigned a Medium VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See “NERC VRF Discussion” above.

VRF and VSL Justifications – CIP-014-1, R4	
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	N/A
Proposed Moderate VSL	The Responsible Entity conducted an evaluation of the potential physical threats and vulnerabilities to each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but failed to consider one of Parts 4.1 through 4.3 in the evaluation.
Proposed High VSL	The Responsible Entity conducted an evaluation of the potential physical threats and vulnerabilities to each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but failed to consider two of Parts 4.1 through 4.3 in the evaluation.
Proposed Severe VSL	The Responsible Entity failed to conduct an evaluation of the potential physical threats and vulnerabilities to each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1; OR The Responsible Entity conducted an evaluation of the potential physical threats and vulnerabilities to each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but failed to consider Parts 4.1 through 4.3.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if a responsible entity fails to conduct an

Proposed VRF	High
NERC VRF Discussion	Development, implementation and execution of a documented physical security plan(s) that covers applicable Transmission station(s), Transmission substation(s), and primary control center(s) is necessary to ensure the physical security of those assets as well as the reliability of the bulk power system. Since this Requirement is in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition. This justifies a High VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the physical security plan for applicable Transmission stations, Transmission substations, or primary control centers.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable CIP-003-3 R4, which deals with implementing and documenting a program to identify, classify, and protect information associated with Critical Cyber Assets, is assigned a High VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Responsible Entity developed and implemented a documented physical security plan(s) that covers each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but did so more than 120 calendar

VRF and VSL Justifications – CIP-014-1, R5	
	days but less than or equal to 130 calendar days after completing Requirement R2; OR The Responsible Entity developed and implemented a documented physical security plan(s) that covers its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2 but failed to include one of Parts 5.1 through 5.4 in the plan.
Proposed Moderate VSL	The Responsible Entity developed and implemented a documented physical security plan(s) that covers each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but did so more than 130 calendar days but less than or equal to 140 calendar days after completing Requirement R2; OR The Responsible Entity developed and implemented a documented physical security plan(s) that covers its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2 but failed to include two of Parts 5.1 through 5.4 in the plan.
Proposed High VSL	The Responsible Entity developed and implemented a documented physical security plan(s) that covers each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but did so more than 140 calendar days but less than or equal to 150 calendar days after completing Requirement R2; OR The Responsible Entity developed and implemented a documented physical security plan(s) that covers its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2 but failed to include three of Parts 5.1 through 5.4 in the plan.
Proposed Severe VSL	The Responsible Entity developed and implemented a documented physical security plan(s) that covers each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but did so more than 150 calendar days after completing the verification in Requirement R2; OR

VRF and VSL Justifications – CIP-014-1, R5	
	The Responsible Entity failed to develop and implement a documented physical security plan(s) that covers its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1. OR The Responsible Entity developed and implemented a documented physical security plan(s) that covers its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2 but failed to include Parts 5.1 through 5.4 in the plan.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if a responsible entity fails to develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s) or if the responsible entity failed to include any of the Requirement Parts 5.1-5.4.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The language of the VSL directly mirrors the language in the corresponding requirement.

VRF and VSL Justifications – CIP-014-1, R5	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is assigned for a single instance of failing to develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s) or failing to include any of the Requirement Parts 5.1-5.4.

VRF and VSL Justifications – CIP-014-1, R6	
Proposed VRF	Medium
NERC VRF Discussion	Unaffiliated third party review of the threat evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 provides reinforcement that these requirements were performed with due consideration to risk to the bulk power system. Since this Requirement is in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. This justifies a Medium VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the unaffiliated third party review including entities that may perform the review, timelines for completing the review and provisions for confidentiality of sensitive information.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable EOP-005-2 R6, which deals with verifying that its restoration plan accomplishes its intended function is assigned a medium VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but did so in more than 90 calendar days but less than or equal to 100 calendar days;

VRF and VSL Justifications – CIP-014-1, R6	
	OR The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 and modified or documented the reason for not modifying the security plan(s) as specified in Part 6.3 but did so more than 60 calendar days and less than or equal to 70 calendar days following completion of the third party review.
Proposed Moderate VSL	The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but did so in more than 100 calendar days but less than or equal to 110 calendar days; OR The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 and modified or documented the reason for not modifying the security plan(s) as specified in Part 6.3 but did so more than 70 calendar days and less than or equal to 80 calendar days following completion of the third party review.
Proposed High VSL	The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but did so more than 110 calendar days but less than or equal to 120 calendar days; OR The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 and modified or documented the reason for not modifying the security plan(s) as specified in Part 6.3 but did so more than 80 calendar days following completion of the third party review; OR The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but did not and modify or document the reason for not modifying the security plan(s) as specified in Part 6.3.

VRF and VSL Justifications – CIP-014-1, R6	
Proposed Severe VSL	The Responsible Entity failed to have an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 in more than 120 calendar days; OR The Responsible Entity failed to have an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5; OR The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but failed to implement procedures for protecting information per Part 6.4.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if an unaffiliated third party review is not performed or if the review is not performed within prescribe timelines. The VSLs are also written indicating violation of the Requirement Part regarding protection of information.
FERC VSL G3 Violation Severity Level Assignment Should Be	The language of the VSL directly mirrors the language in the corresponding requirement.

VRF and VSL Justifications – CIP-014-1, R6	
Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is assigned for a single instance of failing to have an unaffiliated third party review performed; or failing to perform the review within prescribe timelines; or failing to implement procedures to protect information.

Exhibit F

Summary of Development and Complete Record of Development

Summary of Development

Summary of Development History

The development record for proposed Reliability Standard CIP-014-2 is summarized below.

I. Overview of the Standard Drafting Team

When evaluating a proposed Reliability Standard, the Commission is expected to give "due weight" to the technical expertise of the ERO.[1] The technical expertise of the ERO is derived, in part, from the standard drafting team. For this project, the standard drafting team consisted of industry experts, all with a diverse set of experiences and all of whom served on the drafting team for Reliability Standard CIP-014-1. A roster of the standard drafting team members is included in Exhibit H.

II. Standard Development History

A. Standard Authorization Request Development

To address the Commission's directives in Order No. 802,[2] NERC revised the Standard Authorization Request ("SAR") approved by the Standards Committee ("SC") for the development of Reliability Standard CIP-014-1. The revised SAR was posted for a 30-day informal comment period from December 15, 2014 through January 13, 2015.

B. First Posting-Formal Comment Period, Ballot and Non-Binding Poll

Proposed Reliability CIP-014-2 was posted for a 45-day formal comment period from February 20, 2015 through April 9, 2015, with an initial ballot held from March 31, 2015 through April 9, 2015. Several documents were posted for guidance with the first draft, including the Unofficial Comment Form, Consideration of Issues and Directives, Mapping Document, and the

2 *Physical Security Reliability Standard*, Order 802, 149 FERC ¶ 61,140 (2014).

Violation Risk Factors ("VRFs") and Violation Severity Levels ("VSLs") Justification Document. The initial ballot received 88.33% quorum, and 89.95% approval. The Non-Binding Poll received 86.33% quorum and 91.20% of supportive opinions. There were 28 sets of responses to the posting, including comments from approximately 80 different individuals from approximately 58 companies representing 9 of the 10 of the industry segments. The comments are available at: http://www.nerc.com/pa/Stand/Prjct201404PhsclScrty/Project_2014-04_Physical_Security_CIP-014-2_Consideration_of_Comments_04202015.pdf.

C. Final Ballot

Proposed Reliability Standard CIP-014-2 was posted for a 10-day final ballot period from April 20, 2015 through April 29, 2015. The proposed Reliability Standard received a quorum of 92.00% and 92.35% approval.

D. Board of Trustees Approval

Proposed Reliability Standard CIP-014-2 was approved by NERC Board of Trustees on May 7, 2015.

Status
A final ballot for **CIP-014-2 – Physical Security** concluded at **8 p.m. Eastern on Wednesday, April 29, 2015**. Voting results can be accessed via the links below. The standard will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

Board Adopted: CIP-014-1 - May 13, 2014

Filed with FERC: CIP-014-1 - May 23, 2014

US Enforcement Date

Filings and Orders

Background
CIP-014-2: In Order No. 802 (final order on CIP-014-1 – Physical Security), issued on November 20, 2014, the Federal Energy Regulatory Commission (FERC) directed NERC to remove the term “widespread” from Reliability Standard CIP-014-1 or, alternatively, to propose modifications to the Reliability Standard that address FERC’s concerns. FERC directed that NERC submit a responsive modification on July 27, 2015.

CIP-014-1: This project will address the directives issued in the FERC Order on Reliability Standards for Physical Security Measures under Docket No. RD14-6-000 issued March 7, 2014. The Commission directed "The North American Electric Reliability Corporation (NERC), as the Commission-certified Electric Reliability Organization (ERO), to submit for approval one or more Reliability Standards that will require certain registered entities to take steps or demonstrate that they have taken steps to address physical security risks and vulnerabilities related to the reliable operation of the Bulk-Power System. The proposed Reliability Standards should require owners or operators of the Bulk-Power System, as appropriate, to identify facilities on the Bulk-Power System that are critical to the reliable operation of the Bulk-Power System. Then, owners or operators of those identified critical facilities should develop, validate and implement plans to protect against physical attacks that may compromise the operability or recovery of such facilities. The Commission directs NERC to submit the proposed Reliability Standards to the Commission within 90 days of the date of this order."

Standard(s) Affected - CIP-014-1, CIP-014-2

Purpose / Industry Need
CIP-014-2: FERC noted that incorporating the undefined term “widespread” in Reliability Standard CIP-014-1 introduces excessive uncertainty in identifying critical facilities under Requirement R1. As FERC stated in its earlier March 7, 2014 Order, only an instability that has a “critical impact on the operation of the interconnection” warrants finding that the facility causing the instability is critical under Requirement R1. The March 7 Order did not intend to suggest that the physical security Reliability Standards should address facilities that do not have a “critical impact on the operation of the interconnection.” FERC stated that this understanding is unintentionally absent in Requirement R1 because the requirement only deems a facility critical when, if rendered inoperable or damaged, it could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. The definition in Requirement R1 should not be dependent on how an applicable entity interprets the term “widespread” but instead should be modified to make clear that a facility that has a critical impact on the operation of an Interconnection is critical and therefore subject to Requirement R1.

CIP-014-1: From the Order: "Physical attacks to the Bulk-Power System can adversely impact the reliable operation of the Bulk-Power System, resulting in instability, uncontrolled separation, or cascading failures. However, the current Reliability Standards do not specifically require entities to take steps to reasonably protect against physical security attacks on the Bulk-Power System. Therefore, to carry out section 215 of the FPA and to provide for the reliable operation of the Bulk-Power System, the Commission directs the ERO to develop and file for approval proposed Reliability Standards that address threats and vulnerabilities to the physical security of critical facilities on the Bulk-Power System. Such Reliability Standards will enhance the Commission's ability to assure the public that critical facilities are reasonably protected against physical attacks."

NERC welcomes suggestions for improving the reliability of the Bulk-Power System through improved Reliability Standards. Please use this form to submit your proposal for a new NERC Reliability Standard or a revision to an existing standard.

Request to propose a new or a revision to a Reliability Standard			
Proposed Standard:	Project 2014-04 Physical Security Reliability Standard(s)		
Date Submitted:	March 12, 2014 (revised November 20, 2014)		
SAR Requester Information			
Name:	Stephen Crutchfield		
Organization:	NERC Staff		
Telephone:	609-651-9455	E-mail:	Stephen.crutchfield@nerc.net
SAR Type (Check as many as applicable)			
☐ New Standard		☐ Withdrawal of existing Standard	
☒ Revision to existing Standard		☐ Urgent Action	

SAR Information
Industry Need (What is the industry problem this request is trying to solve?):
On March 7, 2014, FERC issued an order directing the ERO to develop a standard to address the physical security of critical facilities on the Bulk-Power System. In the order, FERC stated: "The Commission directs the North American Electric Reliability Corporation (NERC), as the Commission-certified Electric Reliability Organization (ERO), to submit for approval one or more Reliability Standards that will require certain registered entities to take steps or demonstrate that they have taken steps to address physical security risks and vulnerabilities related to the reliable operation of the Bulk-Power System. The proposed Reliability Standards should require owners or operators of the Bulk-Power System, as appropriate, to identify facilities on the Bulk-Power System that are critical to the reliable operation of the Bulk-Power System. Then, owners or operators of those identified critical facilities should develop, validate and implement plans to protect against physical attacks that may compromise the operability or recovery of such facilities. The Commission directs NERC to submit the proposed Reliability Standards to the Commission within 90 days of the date of this order." *Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 at P 1 (2014) ("FERC Order"). In Order No. 802 (final order on CIP-014-1), issued on November 20, 2014, FERC directed NERC to remove the term "widespread" from Reliability Standard CIP-014-1 or, alternatively, to propose modifications to the Reliability Standard that address the Commission's concerns. FERC directed that NERC submit a responsive modification within six months from the effective date of this final rule.

SAR Information
Purpose or Goal (How does this request propose to address the problem described above?):
The primary goal of this SAR is to allow the Standard Drafting Team (SDT) for Project 2014-04, Physical Security to develop a standard(s) to address the directives of the March 7, 2014 FERC Order, and to address the one directive in Order 802 on the removal of the term widespread or alternatively propose modifications that address the Commission concerns in Order 802, and to ensure consistency within the NERC body of Reliability Standards.
Identify the Objectives of the proposed standard's requirements (What specific reliability deliverables are required to achieve the goal?):
Provide clear, unambiguous requirements and standard(s) to address the directives in the March 7, 2014 FERC Order regarding the physical security of critical facilities on the Bulk-Power System, and to address the one directive in Order 802 on the removal of the term widespread or alternatively propose modifications that address the Commission concerns in Order 802.

SAR Information
Brief Description (Provide a paragraph that describes the scope of this standard action.)
The SDT shall develop standard requirements, Violation Risk Factors, Violation Severity Levels, and implementation plan and shall work with compliance on an accompanying RSAW to address each of the directives in the March 7, 2014 FERC Order and to address the one directive in Order 802 on the removal of the term widespread or alternatively propose modifications that address the Commission concerns in Order 802.
Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR. Also provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)
The SDTs execution of this SAR requires the SDT to address each of the FERC directives in the deadline required by the Order and to address the one directive in Order 802 on the removal of the term widespread or alternatively propose modifications that address the Commission concerns in Order 802. The reliability assessment and justification is also set forth in the March 7, 2014 FERC Order. The March 7, 2014 FERC Order is incorporated in its entirety into this SAR, so as not to unnecessarily repeat or paraphrase the substance of the Order. There are no market interface impacts resulting from the standard action on physical security.

Reliability Functions	
The Standard will Apply to the Following Functions (Check each one that applies.)	
☐ Regional Reliability Organization	Conducts the regional activities related to planning and operations, and coordinates activities of Responsible Entities to secure the reliability of the Bulk Electric System within the region and adjacent regions.
☐ Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.

Reliability Functions	
☐ Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☐ Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☐ Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐ Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☐ Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☐ Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☒ Transmission Owner	Owns and maintains transmission facilities.
☒ Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☐ Distribution Provider	Delivers electrical energy to the End-use customer.
☐ Generator Owner	Owns and maintains generation facilities.
☐ Generator Operator	Operates generation unit(s) to provide real and reactive power.
☐ Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐ Market Operator	Interface point for reliability functions with commercial functions.
☐ Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles	
Applicable Reliability Principles (Check all that apply).	
☐	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☐	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☐	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☒	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☒	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	Yes

Background Information

In Order No. 802 (final order on CIP-014-1 – Physical Security), issued on November 20, 2014, FERC directed NERC to remove the term "widespread" from Reliability Standard CIP-014-1 or, alternatively, to propose modifications to the Reliability Standard that address the Commission's concerns. FERC directed that NERC submit a responsive modification within six months from the effective date of this final rule.

FERC noted that incorporating the undefined term "widespread" in Reliability Standard CIP-014-1 introduces excessive uncertainty in identifying critical facilities under Requirement R1. As the Commission stated in the March 7 Order, only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1. The March 7 Order did not intend to suggest that the physical security Reliability Standards should address facilities that do not have a "critical impact on the operation of the interconnection." This understanding is, we believe, unintentionally absent in Requirement R1 because the requirement only deems a facility critical when, if rendered inoperable or damaged, it could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. The definition in Requirement R1 should not be dependent on how an applicable entity interprets the term "widespread" but instead should be modified to make clear that a facility that has a critical impact on the operation of an Interconnection is critical and therefore subject to Requirement R1.

You do not have to answer all questions below. Enter comments in simple text format. Bullets, numbers, and special formatting will not be retained. Due to the expected volume of comments, the SDT asks that commenters consider consolidating responses and endorsing comments provided by another.

Questions

1. The SAR for Project 2014-04 (the original project for the CIP-014-1, Physical Security standard) was revised to adderss the directive from FERC to to remove the term “widespread” from Reliability Standard CIP-014-1 or, alternatively, to propose modifications to the Reliability Standard that address the Commission’s concerns. Do you agree with the proposed revisions to the SAR? If not, please provide specific comments regarding the SAR.

   ☐ Yes
   ☐ No

Individual
Chris Scanlon
Exelon
Yes
The Exelon Companies, PECO, ComEd and BGE, agree that removing “Widespread” from the text of the standard satisfies the concerns raised by FERC. We believe this is an efficient and effective approach to clarify the standard language and complete the Project so that implementation can begin in earnest.

Yes
BPA has no issues with the removal of the term “widespread” since it is not used elsewhere and is not a Continent-wide Term referenced in the NERC Glossary of Terms Used in Reliability Standards. However, NERC needs to be very clear and concise as to how they define a facility as “critical” and what constitutes “critical impact” to the interconnection to ensure there is no room for interpretation among entities. BPA believes that the definition in Requirement R1 should not be dependent on how an applicable entity interprets the term “widespread” but instead should be modified to make clear that a facility that has a critical impact on the operation of an Interconnection is critical and therefore subject to Requirement R1.

The SAR Information Section states that "The primary goal of this SAR is to allow the Standard Drafting Team (SDT) for Project 2014-04, Physical Security to develop a standard(s) to address the directives of the March 7, 2014 FERC Order ….." This Section should be modified to reflect the fact that the purpose of the SAR is to allow the SDT to modify the requirements of the existing Standard CIP-014-1 (Physical Security) to address the directives of FERC.

Duke Energy agrees with the proposed revisions to the SAR, including the removal of the term “widespread” from the standard. In FERC Order 802, the Commission directed NERC to remove the term “widespread”, or in the alternative, propose specific modifications to the Reliability Standard that address the Commission’s concerns. Duke Energy recommends that if the drafting team considers making modifications to the Standard to address the FERC’s concerns, that the team consider inserting the language “critical impact on the operation of the interconnection” into the Standard. We feel that this language helps clarify and narrow down possible interpretations of what constitutes instability within an interconnection.

Yes
We agree the proposed changes to the SAR address the Commission directive. However, we caution the drafting team to consider carefully how simply removing “widespread” could alter the original intent of the requirement. Widespread was added to reflect that there can be local stability issues that will not jeopardize the reliability of the overall bulk electric system. If the loss of Transmission substation or station will only cause a local stability issue, we do not believe it should be identified as requiring physical security measures. We believe this view is consistent with the intent of original FERC order directing the creation of the standard.

Joe Tarantino
Yes
The members of the Large Public Power Council agree with either the removal or modification of the word “widespread” in the Physical Security Standard to address the Commission’s concern. However, we urge the Standard Drafting Team to address the following: Any clarification made to the CIP-014 Standard should be consistent with current applicable standards, for example in the TPL-001-4 standard Requirement R6 requires the Transmission Planner and Planning Coordinator to define their criteria or methodology used in the analysis for the identification of System instability. This approach should not subject certain Facilities to the CIP-014 standard where acceptable conditions are met through acceptable performance criteria identified by the TP/PC and thereby would not deem a particular Facility as having a critical impact on the operation of the interconnection. Additionally, some degree of flexibility may be necessary across regions. Performance characteristics are potentially different between the Eastern Interconnect and the Western Interconnect; one region may be more sensitive to frequency stability while the other may be more sensitive to voltage

stability. Those Regional differences would be considered/accounted for through the TP/PC's documentation of System instability (TPL-001-4 R6).

While we may agree with the removal of the term 'widespread' we at the same time have concerns that the intent that widespread gives the standard be captured in additional language to include specificity and structure in the standard. We don't need the standard to be about capturing small, insignificant events but at the same time we need to be sure we are capturing the events that need to be captured. We also need to be sure that anything that is added does not conflict and is consistent with existing standards such as TPL-001-4, R6. The phrase '…on the removal of the term widespread or alternatively propose modifications that address the Commission concerns in Order 802.' should be rewritten as '…on the removal of the term "widespread" or alternatively propose modifications that address the Commission's comcerns in Order 802.' for consistency with its use in the 3rd paragraph in the Industry Need section. Should the Load-Serving Entity be deleted from the list of Reliability Functions in the SAR?

Consideration of Comments

Project 2014-04 Physical Security

The Physical Security Drafting Team thanks all commenters who submitted comments on the Standard Authorization Request (SAR). The SAR was posted for a 30-day public comment period from December 15, 2014 through January 13, 2015. Stakeholders were asked to provide feedback on the SAR through a special electronic comment form. There were 17 sets of comments, including comments from approximately 59 different people from approximately 58 companies representing 9 of the 10 Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact the Director of Standards, Valerie Agnew via email, or by telephone at (404) 446-2566. In addition, there is a NERC Reliability Standards Appeals Process.[1]

Summary Consideration: All those submitting comments agreed with the proposed revisions to the SAR. Several comments suggested that the drafting team consider making revisions to the standard in addition to simply removing the term "widespread" from the standard. These comments suggest modifying CIP-014-1 to make clear that a facility that has a critical impact on the operation of an Interconnection is critical and therefore subject to Requirement R1. Another comment suggested that any clarification made to the CIP-014 Standard should be consistent with current applicable standards; for example in the TPL-001-4 standard Requirement R6 requires the Transmission Planner and Planning Coordinator to define their criteria or methodology used in the analysis for the identification of System instability. These comments will be forwarded to the PSSDT for their consideration. Another comment suggested revising the SAR Information Section which states that "The primary goal of this SAR is to allow the Standard Drafting Team (SDT) for Project 2014-04, Physical Security to develop a standard(s) to address the directives of the March 7, 2014 FERC Order ....." The comment suggested modifying this to reflect the fact that the purpose of the SAR is to allow the SDT to modify the requirements of the existing Standard CIP-014-1 (Physical Security) to address the directives of FERC. The PSSDT believes that the existing language is sufficient and has elected to not revise the SAR.

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/comm/SC/Documents/Appendix_3A_StandardsProcessesManual.pdf

1. The SAR for Project 2014-04 (the original project for the CIP-014-1, Physical Security standard) was revised to address the directive from FERC to to remove the term “widespread” from Reliability Standard CIP-014-1 or, alternatively, to propose modificatons to the Reliability Standard that address the Commission’s concerns. Do you agree with the proposed revisions to the SAR? If not, please provide specific comments regarding the SAR. 8

END OF REPORT

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. A revised SAR was approved by the Standards Committee on December 9, 2014 to address the directives issued in FERC Order No. 802 issued on November 20, 2014, in Docket No. RD14-15-000, *Physical Security Reliability Standard*, 146 FERC ¶ 61,140 (2014). The appointed Physical Security Standard Drafting Team made the revisions to the standard.

Description of Current Draft

This is the first draft of the proposed Reliability Standard, and it is being posted for a 45-day comment and concurrent initial ballot period. This draft includes proposed revisions to address the directives issued in FERC Order No. 802.

Anticipated Actions	Anticipated Date
45-day Comment and Initial Ballot.	February-March, 2015
10-day Final Ballot.	April, 2015
BOT Adoption.	May, 2015
File with applicable Regulatory Authorities.	June, 2015

Version History

Version	Date	Action	Change Tracking
1.0	TBD	Effective Date	New

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the NERC Glossary of Terms used in Reliability Standards (Glossary) are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

A. Introduction

1. Title: Physical Security

2. Number: CIP-014-1

3. Purpose: To identify and protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection.

4. Applicability:

4.1. Functional Entities:

4.1.1 Transmission Owner that owns a Transmission station or Transmission substation that meets any of the following criteria:

4.1.1.1 Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

4.1.1.2 Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

Voltage Value of a Line	Weight Value per Line
less than 200 kV (not applicable)	(not applicable)
200 kV to 299 kV	700
300 kV to 499 kV	1300
500 kV and above	0

4.1.1.3 Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Coordinator, or

Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

4.1.1.4 Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements.

4.1.2 Transmission Operator.

Exemption: Facilities in a "protected area," as defined in 10 C.F.R. § 73.2, within the scope of a security plan approved or accepted by the Nuclear Regulatory Commission are not subject to this Standard; or, Facilities within the scope of a security plan approved or accepted by the Canadian Nuclear Safety Commission are not subject to this Standard.

5. Effective Dates:

See Implementation Plan for CIP-014-2.

6. Background:

This Reliability Standard addresses the directives from the FERC order issued March 7, 2014, *Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (2014), which required NERC to develop a physical security reliability standard(s) to identify and protect facilities that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection.

B. Requirements and Measures

R1. Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria specified in Applicability Section 4.1.1. The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify the Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection. *[VRF: High; Time-Horizon: Long-term Planning]*

1.1. Subsequent risk assessments shall be performed:

- At least once every 30 calendar months for a Transmission Owner that has identified in its previous risk assessment (as verified according to Requirement R2) one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection; or

- At least once every 60 calendar months for a Transmission Owner that has not identified in its previous risk assessment (as verified according to Requirement R2) any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection.

1.2. The Transmission Owner shall identify the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment.

M1. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the risk assessment of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria in Applicability Section 4.1.1 as specified in Requirement R1. Additionally, examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the identification of the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment as specified in Requirement R1, Part 1.2.

Rationale for Requirement R1:

This requirement meets the FERC directive from paragraph 6 of its March 7, 2014 order on physical security to perform a risk assessment to identify which facilities if rendered inoperable or damaged could impact an Interconnection through instability, uncontrolled separation, or cascading failures. The requirement is not to require identification of, and thus, not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the following:

- Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6
- NERC EOP-004-2 reporting criteria
- Area or magnitude of potential impact

Requirement R1 also meets the FERC directive for periodic reevaluation of the risk assessment by requiring the risk assessment to be performed every 30 months (or 60 months for an entity that has not identified in a previous risk assessment).

After identifying each Transmission station and Transmission substation that meets the criteria in Requirement R1, it is important to additionally identify the primary control center that operationally controls that Transmission station or Transmission substation (*i.e.,* the control center whose electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker, compared to a control center that only has the ability to monitor the Transmission station and Transmission substation and, therefore, must coordinate direct physical action through another entity).

R2. Each Transmission Owner shall have an unaffiliated third party verify the risk assessment performed under Requirement R1. The verification may occur concurrent with or after the risk assessment performed under Requirement R1. *[VRF: Medium; Time-Horizon: Long-term Planning]*

2.1. Each Transmission Owner shall select an unaffiliated verifying entity that is either:

- A registered Planning Coordinator, Transmission Planner, or Reliability Coordinator; or

- An entity that has transmission planning or analysis experience.

2.2. The unaffiliated third party verification shall verify the Transmission Owner's risk assessment performed under Requirement R1, which may include recommendations for the addition or deletion of a Transmission station(s) or Transmission substation(s). The Transmission Owner shall ensure the verification is completed within 90 calendar days following the completion of the Requirement R1 risk assessment.

2.3. If the unaffiliated verifying entity recommends that the Transmission Owner add a Transmission station(s) or Transmission substation(s) to, or remove a Transmission station(s) or Transmission substation(s) from, its identification under Requirement R1, the Transmission Owner shall either, within 60 calendar days of completion of the verification, for each recommended addition or removal of a Transmission station or Transmission substation:

- Modify its identification under Requirement R1 consistent with the recommendation; or

- Document the technical basis for not modifying the identification in accordance with the recommendation.

2.4. Each Transmission Owner shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third party verifier and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M2. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner completed an unaffiliated third party verification of the Requirement R1 risk assessment and satisfied all of the applicable provisions of Requirement R2, including, if applicable, documenting the technical basis for not modifying the Requirement R1 identification as specified under Part 2.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 2.4.

Rationale for Requirement R2:

This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring verification by an entity other than the owner or operator of the risk assessment performed under Requirement R1.

This requirement provides the flexibility for a Transmission Owner to select registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The

term “unaffiliated” means that the selected verifying entity cannot be a corporate affiliate (*i.e.*, the verifying entity cannot be an entity that controls, is controlled by, or is under common control with, the Transmission owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit. The term “unaffiliated” is not intended to prohibit a governmental entity from using another government entity to be a verifier under Requirement R2.

Requirement R2 also provides the Transmission Owner the flexibility to work with the verifying entity throughout the Requirement R1 risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could coordinate with their unaffiliated verifying entity to perform a Requirement R1 risk assessment to satisfy both Requirement R1 and Requirement R2 concurrently.

Planning Coordinator is a functional entity listed in Part 2.1. The Planning Coordinator and Planning Authority are the same entity as shown in the NERC Glossary of Terms Used in NERC Reliability Standards.

R3. For a primary control center(s) identified by the Transmission Owner according to Requirement R1, Part 1.2 that a) operationally controls an identified Transmission station or Transmission substation verified according to Requirement R2, and b) is not under the operational control of the Transmission Owner: the Transmission Owner shall, within seven calendar days following completion of Requirement R2, notify the Transmission Operator that has operational control of the primary control center of such identification and the date of completion of Requirement R2. *[VRF: Lower; Time-Horizon: Long-term Planning]*

3.1. If a Transmission station or Transmission substation previously identified under Requirement R1 and verified according to Requirement R2 is removed from the identification during a subsequent risk assessment performed according to Requirement R1 or a verification according to Requirement R2, then the Transmission Owner shall, within seven calendar days following the verification or the subsequent risk assessment, notify the Transmission Operator that has operational control of the primary control center of the removal.

M3. Examples of acceptable evidence may include, but are not limited to, dated written or electronic notifications or communications that the Transmission Owner notified each Transmission Operator, as applicable, according to Requirement R3.

Rationale for Requirement R3:

Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first identifying which Transmission stations and Transmission substations meet the criteria specified by Requirement R1, as verified according to Requirement R2. This requirement is intended to ensure that a Transmission

Operator that has operational control of a primary control center identified in Requirement R1, Part 1.2 of a Transmission station or Transmission substation verified according to Requirement R2 receives notice of such identification so that the Transmission Operator may timely fulfill its resulting obligations under Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include notice of the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or the verification process under Requirement R2.

R4. Each Transmission Owner that identified a Transmission station, Transmission substation, or a primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2. The evaluation shall consider the following: *[VRF: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

4.1. Unique characteristics of the identified and verified Transmission station(s), Transmission substation(s), and primary control center(s);

4.2. Prior history of attack on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and

4.3. Intelligence or threat warnings received from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), U.S. federal and/or Canadian governmental agencies, or their successors.

M4. Examples of evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner or Transmission Operator conducted an evaluation of the potential threats and vulnerabilities of a physical attack to their respective Transmission station(s), Transmission substation(s) and primary control center(s) as specified in Requirement R4.

Rationale for Requirement R4:

This requirement meets the FERC directive from paragraph 8 in the order on physical security that the reliability standard must require tailored evaluation of potential threats and vulnerabilities to facilities identified in Requirement R1 and verified according to Requirement R2. Threats and vulnerabilities may vary from facility to facility based on factors such as the facility's location, size, function,

existing protections, and attractiveness of the target. As such, the requirement does not mandate a one-size-fits-all approach but requires entities to account for the unique characteristics of their facilities.

Requirement R4 does not explicitly state when the evaluation of threats and vulnerabilities must occur or be completed. However, Requirement R5 requires that the entity's security plan(s), which is dependent on the Requirement R4 evaluation, must be completed within 120 calendar days following completion of Requirement R2. Thus, an entity has the flexibility when to complete the Requirement R4 evaluation, provided that it is completed in time to comply with the requirement in Requirement R5 to develop a physical security plan 120 calendar days following completion of Requirement R2.

R5. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s). The physical security plan(s) shall be developed within 120 calendar days following the completion of Requirement R2 and executed according to the timeline specified in the physical security plan(s). The physical security plan(s) shall include the following attributes: *[VRF: High; Time-Horizon: Long-term Planning]*

5.1. Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.

5.2. Law enforcement contact and coordination information.

5.3. A timeline for executing the physical security enhancements and modifications specified in the physical security plan.

5.4. Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).

M5. Examples of evidence may include, but are not limited to, dated written or electronic documentation of its physical security plan(s) that covers their respective identified and verified Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R5, and additional evidence demonstrating execution of the physical security plan according to the timeline specified in the physical security plan.

Rationale for Requirement R5:

This requirement meets the FERC directive from paragraph 9 in the order on physical security requiring the development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

R6. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall have an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5. The review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5. *[VRF: Medium; Time-Horizon: Long-term Planning]*

6.1. Each Transmission Owner and Transmission Operator shall select an unaffiliated third party reviewer from the following:

- An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.
- An entity or organization approved by the ERO.
- A governmental agency with physical security expertise.
- An entity or organization with demonstrated law enforcement, government, or military physical security expertise.

6.2. The Transmission Owner or Transmission Operator, respectively, shall ensure that the unaffiliated third party review is completed within 90 calendar days of completing the security plan(s) developed in Requirement R5. The unaffiliated third party review may, but is not required to, include recommended changes to the evaluation performed under Requirement R4 or the security plan(s) developed under Requirement R5.

6.3. If the unaffiliated third party reviewer recommends changes to the evaluation performed under Requirement R4 or security plan(s) developed under Requirement R5, the Transmission Owner or Transmission Operator shall, within 60 calendar days of the completion of the unaffiliated third party review, for each recommendation:

- Modify its evaluation or security plan(s) consistent with the recommendation; or
- Document the reason(s) for not modifying the evaluation or security plan(s) consistent with the recommendation.

6.4. Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third party reviewer and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M6. Examples of evidence may include, but are not limited to, written or electronic documentation that the Transmission Owner or Transmission Operator had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 as specified in Requirement R6 including, if applicable, documenting the reasons for not modifying the evaluation or security plan(s) in accordance with a recommendation under Part 6.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 6.4.

Rationale for Requirement R6:

This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring review by an entity other than the owner or operator with appropriate expertise of the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5.

As with the verification required by Requirement R2, Requirement R6 provides Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout the Requirement R4 evaluation and the development of the Requirement R5 security plan(s). This would allow entities to satisfy their obligations under Requirement R6 concurrent with the satisfaction of their obligations under Requirements R4 and R5.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence during an on-site visit to show that it was compliant for the full time period since the last audit.

The Transmission Owner and Transmission Operator shall keep data or evidence to show compliance, as identified below, unless directed by its Compliance Enforcement Authority (CEA) to retain specific evidence for a longer period of time as part of an investigation.

The responsible entities shall retain documentation as evidence for three years.

If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records, subject to the confidentiality provisions of Section 1500 of the Rules of Procedure and the provisions of Section 1.4 below.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints Text

1.4. Additional Compliance Information

Confidentiality: To protect the confidentiality and sensitive nature of the evidence for demonstrating compliance with this standard, all evidence will be retained at the Transmission Owner's and Transmission Operator's facilities.

Guidelines and Technical Basis

Section 4 Applicability

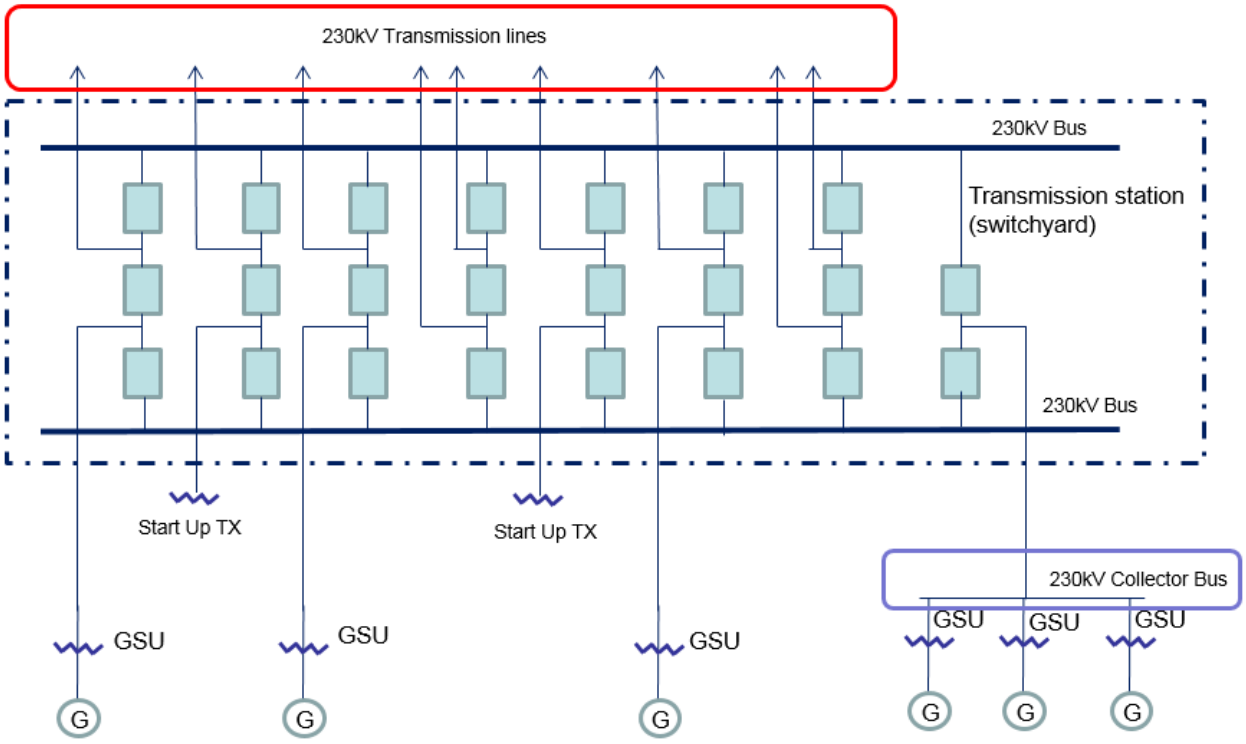
The purpose of Reliability Standard CIP-014 is to protect Transmission stations and Transmission substations, and their associated primary control centers that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. To properly include those entities that own or operate such Facilities, the Reliability Standard CIP-014 first applies to Transmission Owners that own Transmission Facilities that meet the specific criteria in Applicability Section 4.1.1.1 through 4.1.1.4. The Facilities described in Applicability Section 4.1.1.1 through 4.1.1.4 mirror those Transmission Facilities that meet the bright line criteria for "Medium Impact" Transmission Facilities under Attachment 1 of Reliability Standard CIP-002-5.1. Each Transmission Owner that owns Transmission Facilities that meet the criteria in Section 4.1.1.1 through 4.1.1.4 is required to perform a risk assessment as specified in Requirement R1 to identify its Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. The Standard Drafting Team (SDT) expects this population will be small and that many Transmission Owners that meet the applicability of this standard will not actually identify any such Facilities. Only those Transmission Owners with Transmission stations or Transmission substations identified in the risk assessment (and verified under Requirement R2) have performance obligations under Requirements R3 through R6.

This standard also applies to Transmission Operators. A Transmission Operator's obligations under the standard, however, are only triggered if the Transmission Operator is notified by an applicable Transmission Owner under Requirement R3 that the Transmission Operator operates a primary control center that operationally controls a Transmission station(s) or Transmission substation(s) identified in the Requirement R1 risk assessment. A primary control center operationally controls a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical action at the identified Transmission station or Transmission substation, such as opening a breaker, as opposed to a control center that only has information from the Transmission station or Transmission substation and must coordinate direct action through another entity. Only Transmission Operators who are notified that they have primary control centers under this standard have performance obligations under Requirements R4 through R6. In other words, primary control center for purposes of this Standard is the control center that the Transmission Owner or Transmission Operator, respectively, uses as its primary, permanently-manned site to physically operate a Transmission station or Transmission substation that is identified in Requirement R1 and verified in Requirement R2. Control centers that provide back-up capability are not applicable, as they are a form of resiliency and intentionally redundant.

The SDT considered several options for bright line criteria that could be used to determine applicability and provide an initial threshold that defines the set of Transmission stations and Transmission substations that would meet the directives of the FERC order on physical security (*i.e.*, those that could cause instability, uncontrolled separation, or Cascading within an

Interconnection). The SDT determined that using the criteria for Medium Impact Transmission Facilities in Attachment 1 of CIP-002-5.1 would provide a conservative threshold for defining which Transmission stations and Transmission substations must be included in the risk assessment in Requirement R1 of CIP-014. Additionally, the SDT concluded that using the CIP-002-5.1 Medium Impact criteria was appropriate because it has been approved by stakeholders, NERC, and FERC, and its use provides a technically sound basis to determine which Transmission Owners should conduct the risk assessment. As described in CIP-002-5.1, the failure of a Transmission station or Transmission substation that meets the Medium Impact criteria could have the capability to result in exceeding one or more Interconnection Reliability Operating Limits (IROLs). The SDT understands that using this bright line criteria to determine applicability may require some Transmission Owners to perform risk assessments under Requirement R1 that will result in a finding that none of their Transmission stations or Transmission substations would pose a risk of instability, uncontrolled separation, or Cascading within an Interconnection. However, the SDT determined that higher bright lines could not be technically justified to ensure inclusion of all Transmission stations and Transmission substations, and their associated primary control centers that, if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. Further guidance and technical basis for the bright line criteria for Medium Impact Facilities can be found in the Guidelines and Technical Basis section of CIP-002-5.1.

Additionally, the SDT determined that it was not necessary to include Generator Operators and Generator Owners in the Reliability Standard. First, Transmission stations or Transmission substations interconnecting generation facilities are considered when determining applicability. Transmission Owners will consider those Transmission stations and Transmission substations that include a Transmission station on the high side of the Generator Step-up transformer (GSU) using Applicability Section 4.1.1.1 and 4.1.1.2. As an example, a Transmission station or Transmission substation identified as a Transmission Owner facility that interconnects generation will be subject to the Requirement R1 risk assessment if it operates at 500kV or greater or if it is connected at 200 kV – 499kV to three or more other Transmission stations or Transmission substations and has an "aggregate weighted value" exceeding 3000 according to the table in Applicability Section 4.1.1.2. Second, the Transmission analysis or analyses conducted under Requirement R1 should take into account the impact of the loss of generation connected to applicable Transmission stations or Transmission substations. Additionally, the FERC order does not explicitly mention generation assets and is reasonably understood to focus on the most critical Transmission Facilities. The diagram below shows an example of a station.



Also, the SDT uses the phrase "Transmission stations or Transmission substations" to recognize the existence of both stations and substations. Many entities in industry consider a substation to be a location with physical borders (i.e. fence, wall, etc.) that contains at least an autotransformer. Locations also exist that do not contain autotransformers, and many entities in industry refer to those locations as stations (switching stations or switchyards). Therefore, the SDT chose to use both "station" and "substation" to refer to the locations where groups of Transmission Facilities exist.

On the issue of joint ownership, the SDT recognizes that this issue is not unique to CIP-014, and expects that the applicable Transmission Owners and Transmission Operators will develop memorandums of understanding, agreements, Coordinated Functional Registrations, or procedures, etc., to designate responsibilities under CIP-014 when joint ownership is at issue, which is similar to what many entities have completed for other Reliability Standards.

The language contained in the applicability section regarding the collector bus is directly copied from CIP-002-5.1, Attachment 1, and has no additional meaning within the CIP-014 standard.

Requirement R1

The initial risk assessment required under Requirement R1 must be completed on or before the effective date of the standard. Subsequent risk assessments are to be performed at least once every 30 or 60 months depending on the results of the previous risk assessment per Requirement R1, Part 1.1. In performing the risk assessment under Requirement R1, the

Transmission Owner should first identify their population of Transmission stations and Transmission substations that meet the criteria contained in Applicability Section 4.1.1. Requirement R1 then requires the Transmission Owner to perform a risk assessment, consisting of a transmission analysis, to determine which of those Transmission stations and Transmission Substations if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection. The requirement is not to require identification of, and thus, not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the following:

- Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6
- NERC EOP-004-2 reporting criteria
- Area or magnitude of potential impact

The standard does not mandate the specific analytical method for performing the risk assessment. The Transmission Owner has the discretion to choose the specific method that best suites its needs. As an example, an entity may perform a Power Flow analysis and stability analysis at a variety of load levels.

Performing Risk Assessments

The Transmission Owner has the discretion to select a transmission analysis method that fits its facts and system circumstances. To mandate a specific approach is not technically desirable and may lead to results that fail to adequately consider regional, topological, and system circumstances. The following guidance is only an example on how a Transmission Owner may perform a power flow and/or stability analysis to identify those Transmission stations and Transmission substations that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. An entity could remove all lines, without regard to the voltage level, to a single Transmission station or Transmission substation and review the simulation results to assess system behavior to determine if Cascading of Transmission Facilities, uncontrolled separation, or voltage or frequency instability is likely to occur over a significant area of the Interconnection. Using engineering judgment, the Transmission Owner (possibly in consultation with regional planning or operation committees and/or ISO/RTO committee input) should develop criteria (e.g. imposing a fault near the removed Transmission station or Transmission substation) to identify a contingency or parameters that result in potential instability, uncontrolled separation, or Cascading within an Interconnection. Regional consultation on these matters is likely to be

helpful and informative, given that the inputs for the risk assessment and the attributes of what constitutes instability, uncontrolled separation, or Cascading within an Interconnection will likely vary from region-to-region or from ISO-to-ISO based on topology, system characteristics, and system configurations. Criteria could also include post-contingency facilities loadings above a certain emergency rating or failure of a power flow case to converge. Available special protection systems (SPS), if any, could be applied to determine if the system experiences any additional instability which may result in uncontrolled separation. Example criteria may include:

(a) Thermal overloads beyond facility emergency ratings;

(b) Voltage deviation exceeding ± 10%; or

(c) Cascading outage/voltage collapse; or

(d) Frequency below under-frequency load shed points

Periodicity

A Transmission Owner who identifies one or more Transmission stations or Transmission substations (as verified under Requirement R2) that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection is required to conduct a risk assessment at least once every 30 months. This period ensures that the risk assessment remains current with projected conditions and configurations in the planned system. This risk assessment, as the initial assessment, must consider applicable planned Transmission stations and Transmission substations to be in service within 24 months. The 30 month timeframe aligns with the 24 month planned to be in service date because the Transmission Owner is provided the flexibility, depending on its planning cycle and the frequency in which it may plan to construct a new Transmission station or Transmission substation to more closely align these dates. The requirement is to conduct the risk assessment at least once every 30 months, so for a Transmission Owner that believes it is better to conduct a risk assessment once every 24 months, because of its planning cycle, it has the flexibility to do so.

Transmission Owners that have not identified any Transmission stations or Transmission substations (as verified under Requirement R2) that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection are unlikely to see changes to their risk assessment in the Near-Term Planning Horizon. Consequently, a 60 month periodicity for completing a subsequent risk assessment is specified.

Identification of Primary Control Centers

After completing the risk assessment specified in Requirement R1, it is important to additionally identify the primary control center that operationally controls each Transmission station or Transmission substation that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection. A primary control center

"operationally controls" a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker.

Requirement R2

This requirement specifies verification of the risk assessment performed under Requirement R1 by an entity other than the owner or operator of the Requirement R1 risk assessment.

A verification of the risk assessment by an unaffiliated third party, as specified in Requirement R2, could consist of:

1. Certifying that the Requirement R1 risk assessment considers the Transmission stations and Transmission substations identified in Applicability Section 4.1.1.
2. Review of the model used to conduct the risk assessment to ensure it contains sufficient system topology to identify Transmission stations and Transmission substations that if rendered inoperable or damaged could cause instability, uncontrolled separation, or Cascading within an Interconnection.
3. Review of the Requirement R1 risk assessment methodology.

This requirement provides the flexibility for a Transmission Owner to select from unaffiliated registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term unaffiliated means that the selected verifying entity cannot be a corporate affiliate (*i.e.,* the verifying or third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit.

The prohibition on registered entities using a corporate affiliate to conduct the verification, however, does not prohibit a governmental entity (e.g., a city, a municipality, a U.S. federal power marketing agency, or any other political subdivision of U.S. or Canadian federal, state, or provincial governments) from selecting as the verifying entity another governmental entity within the same political subdivision. For instance, a U.S. federal power marketing agency may select as its verifier another U.S. federal agency to conduct its verification so long as the selected entity has transmission planning or analysis experience. Similarly, a Transmission Owner owned by a Canadian province can use a separate agency of that province to perform the verification. The verifying entity, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

Requirement R2 also provides that the "verification may occur concurrent with or after the risk assessment performed under Requirement R1." This provision is designed to provide the Transmission Owner the flexibility to work with the verifying entity throughout (*i.e.,* concurrent with) the risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could collaborate with their unaffiliated verifying entity to perform the risk assessment under Requirement R1 such that both Requirement R1 and Requirement R2 are satisfied concurrently. The intent of Requirement R2

is to have an entity other than the owner or operator of the facility to be involved in the risk assessment process and have an opportunity to provide input. Accordingly, Requirement R2 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the risk assessment and subsequently has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the risk assessment.

Characteristics to consider in selecting a third party reviewer could include:

- Registered Entity with applicable planning and reliability functions.
- Experience in power system studies and planning.
- The entity's understanding of the MOD standards, TPL standards, and facility ratings as they pertain to planning studies.
- The entity's familiarity with the Interconnection within which the Transmission Owner is located.

With respect to the requirement that Transmission owners develop and implement procedures for protecting confidential and sensitive information, the Transmission Owner could have a method for identifying documents that require confidential treatment. One mechanism for protecting confidential or sensitive information is to prohibit removal of sensitive or confidential information from the Transmission Owner's site. Transmission Owners could include such a prohibition in a non-disclosure agreement with the verifying entity.

A Technical feasibility study is not required in the Requirement R2 documentation of the technical basis for not modifying the identification in accordance with the recommendation.

On the issue of the difference between a verifier in Requirement R2 and a reviewer in Requirement R6, the SDT indicates that the verifier will confirm that the risk assessment was completed in accordance with Requirement R1, including the number of Transmission stations and substations identified, while the reviewer in Requirement R6 is providing expertise on the manner in which the evaluation of threats was conducted in accordance with Requirement R4, and the physical security plan in accordance with Requirement R5. In the latter situation there is no verification of a technical analysis, rather an application of experience and expertise to provide guidance or recommendations, if needed.

Parts 2.4 and 6.4 require the entities to have procedures to protect the confidentiality of sensitive or confidential information. Those procedures may include the following elements:

1. Control and retention of information on site for third party verifiers/reviewers.
2. Only "need to know" employees, etc., get the information.
3. Marking documents as confidential
4. Securely storing and destroying information when no longer needed.
5. Not releasing information outside the entity without, for example, General Counsel sign-off.

Requirement R3

Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first completing the risk assessment specified by Requirement R1 and the verification specified by Requirement R2. Requirement R3 is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1 receive notice so that the Transmission Operator may fulfill the rest of the obligations required in Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include within the notice the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or as a result of the verification process under Requirement R2.

Requirement R4

This requirement requires owners and operators of facilities identified by the Requirement R1 risk assessment and that are verified under Requirement R2 to conduct an assessment of potential threats and vulnerabilities to those Transmission stations, Transmission substations, and primary control centers using a tailored evaluation process. Threats and vulnerabilities may vary from facility to facility based on any number of factors that include, but are not limited to, location, size, function, existing physical security protections, and attractiveness as a target.

In order to effectively conduct a threat and vulnerability assessment, the asset owner may be the best source to determine specific site vulnerabilities, but current and evolving threats may best be determined by others in the intelligence or law enforcement communities. A number of resources have been identified in the standard, but many others exist and asset owners are not limited to where they may turn for assistance. Additional resources may include state or local fusion centers, U.S. Department of Homeland Security, Federal Bureau of Investigations (FBI), Public Safety Canada, Royal Canadian Mounted Police, and InfraGard chapters coordinated by the FBI.

The Responsible Entity is required to take a number of factors into account in Parts 4.1 to 4.3 in order to make a risk-based evaluation under Requirement R4.

To assist in determining the current threat for a facility, the prior history of attacks on similarly protected facilities should be considered when assessing probability and likelihood of occurrence at the facility in question.

Resources that may be useful in conducting threat and vulnerability assessments include:

- NERC Security Guideline for the Electricity Sector: Physical Security.
- NERC Security Guideline: Physical Security Response.
- ASIS International General Risk Assessment Guidelines.
- ASIS International Facilities Physical Security Measure Guideline.

- ASIS International Security Management Standard: Physical Asset Protection.
- Whole Building Design Guide - Threat/Vulnerability Assessments.

Requirement R5

This requirement specifies development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Requirement R5 specifies the following attributes for the physical security plan:

- *Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.*

  Resiliency may include, among other things:

  a. System topology changes,

  b. Spare equipment,

  c. Construction of a new Transmission station or Transmission substation.

  While most security measures will work together to collectively harden the entire site, some may be allocated to protect specific critical components. For example, if protection from gunfire is considered necessary, the entity may only install ballistic protection for critical components, not the entire site.

- *Law enforcement contact and coordination information.*

  Examples of such information may be posting 9-1-1 for emergency calls and providing substation safety and familiarization training for local and federal law enforcement, fire department, and Emergency Medical Services.

- *A timeline for executing the physical security enhancements and modifications specified in the physical security plan.*

  Entities have the flexibility to prioritize the implementation of the various resiliency or security enhancements and modifications in their security plan according to risk, resources, or other factors. The requirement to include a timeline in the physical security plan for executing the actual physical security enhancements and modifications does not also require that the enhancements and modifications be completed within 120 days. The actual timeline may extend beyond the 120 days, depending on the amount of work to be completed.

- *Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).*

  A registered entity's physical security plan should include processes and responsibilities for obtaining and handling alerts, intelligence, and threat warnings from various

sources. Some of these sources could include the ERO, ES-ISAC, and US and/or Canadian federal agencies. This information should be used to reevaluate or consider changes in the security plan and corresponding security measures of the security plan found in R5.

Incremental changes made to the physical security plan prior to the next required third party review do not require additional third party reviews.

Requirement R6

This requirement specifies review by an entity other than the Transmission Owner or Transmission Operator with appropriate expertise for the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5. As with Requirement R2, the term unaffiliated means that the selected third party reviewer cannot be a corporate affiliate (*i.e.,* the third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Operator). A third party reviewer also cannot be a division of the Transmission Operator that operates as a functional unit.

As noted in the guidance for Requirement R2, the prohibition on registered entities using a corporate affiliate to conduct the review, however, does not prohibit a governmental entity from selecting as the third party reviewer another governmental entity within the same political subdivision. For instance, a city or municipality may use its local enforcement agency, so long as the local law enforcement agency satisfies the criteria in Requirement R6. The third party reviewer, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

The Responsible Entity can select from several possible entities to perform the review:

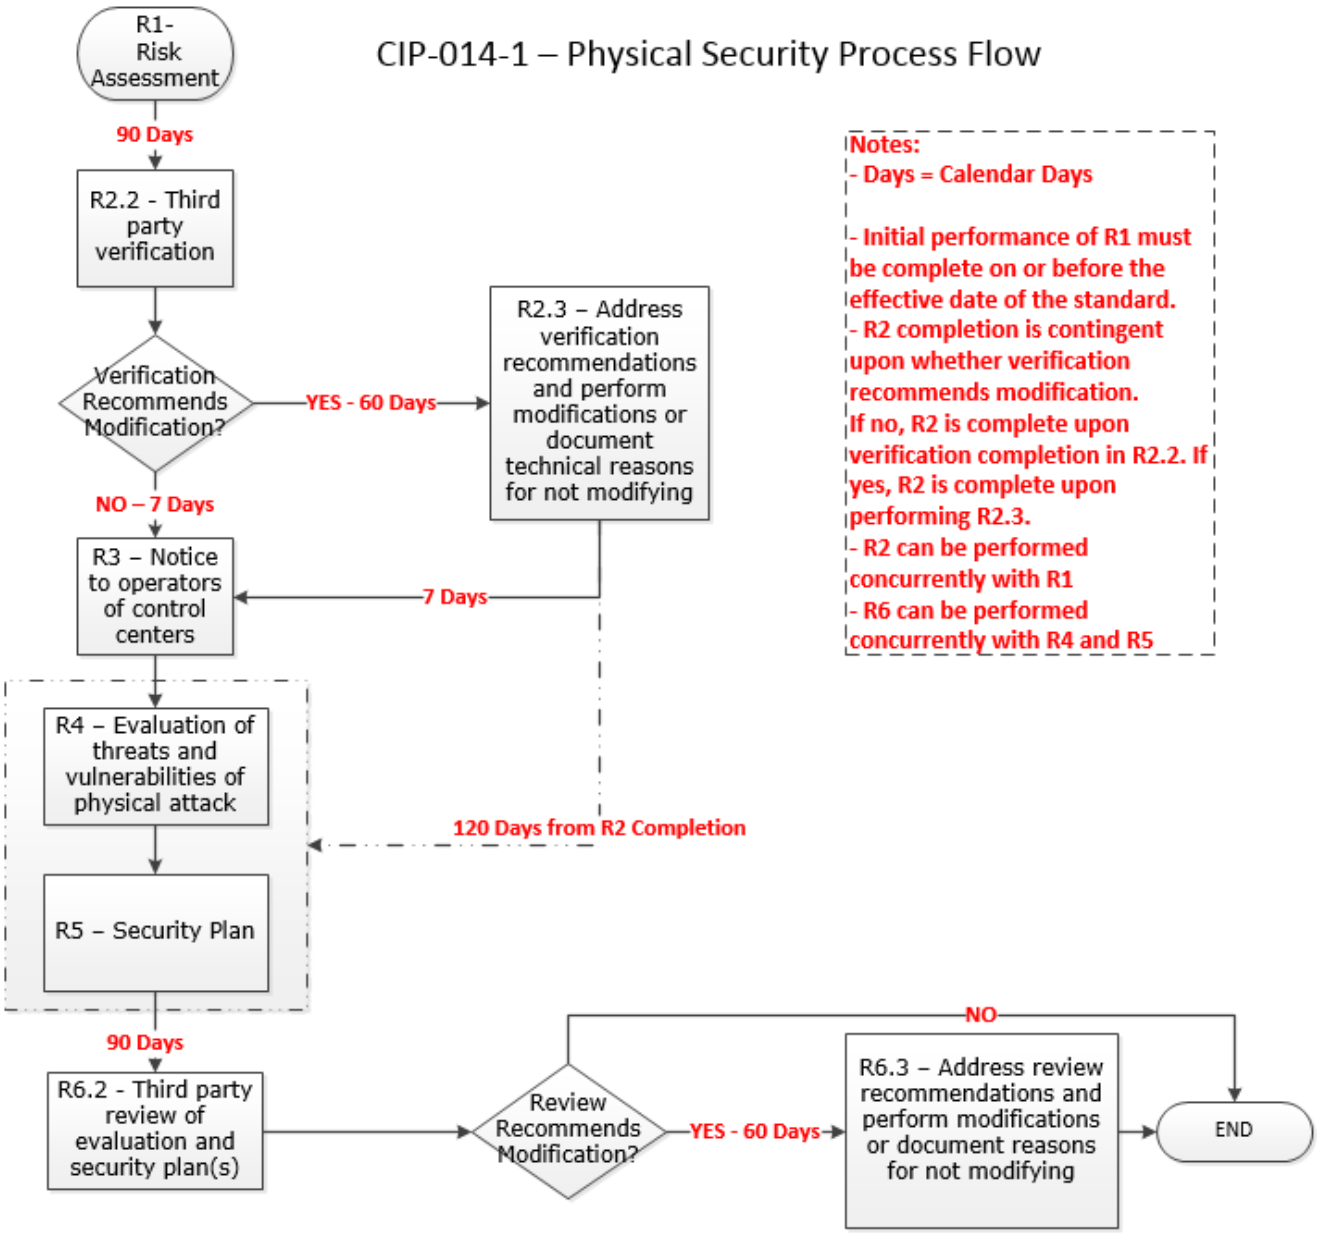
- *An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.*

  In selecting CPP and PSP for use in this standard, the SDT believed it was important that if a private entity such as a consulting or security firm was engaged to conduct the third party review, they must tangibly demonstrate competence to conduct the review. This includes electric industry physical security experience and either of the premier security industry certifications sponsored by ASIS International. The ASIS certification program was initiated in 1977, and those that hold the CPP certification are board certified in security management. Those that hold the PSP certification are board certified in physical security.

- *An entity or organization approved by the ERO.*
- *A governmental agency with physical security expertise.*
- *An entity or organization with demonstrated law enforcement, government, or military physical security expertise.*

As with the verification under Requirement R2, Requirement R6 provides that the "review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5." This provision is designed to provide applicable Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout (*i.e.,* concurrent with) the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5, which for some Responsible Entities may be more efficient and effective. In other words, a Transmission Owner or Transmission Operator could collaborate with their unaffiliated third party reviewer to perform an evaluation of potential threats and vulnerabilities (Requirement R4) and develop a security plan (Requirement R5) to satisfy Requirements R4 through R6 simultaneously. The intent of Requirement R6 is to have an entity other than the owner or operator of the facility to be involved in the Requirement R4 evaluation and the development of the Requirement R5 security plans and have an opportunity to provide input on the evaluation and the security plan. Accordingly, Requirement R6 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the evaluation and develops the security plan itself and then has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the evaluation and develop the security plan.

Timeline



CIP-014-1 – Physical Security Process Flow
R1- Risk Assessment
90 Days
R2.2 - Third party verification
Verification Recommends Modification?
YES - 60 Days
R2.3 – Address verification recommendations and perform modifications or document technical reasons for not modifying
NO – 7 Days
R3 – Notice to operators of control centers
7 Days
R4 – Evaluation of threats and vulnerabilities of physical attack
120 Days from R2 Completion
R5 – Security Plan
90 Days
R6.2 - Third party review of evaluation and security plan(s)
Review Recommends Modification?
YES - 60 Days
NO
R6.3 – Address review recommendations and perform modifications or document reasons for not modifying
END
Notes:
- Days = Calendar Days
- Initial performance of R1 must be complete on or before the effective date of the standard.
- R2 completion is contingent upon whether verification recommends modification. If no, R2 is complete upon verification completion in R2.2. If yes, R2 is complete upon performing R2.3.
- R2 can be performed concurrently with R1
- R6 can be performed concurrently with R4 and R5

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. A revised SAR was approved by the Standards Committee on December 9, 2014 to address the directives issued in FERC Order No. 802 issued on November 20, 2014, in Docket No. RD14-15-000, *Physical Security Reliability Standard*, 146 FERC ¶ 61,140 (2014). The appointed Physical Security Standard Drafting Team made the revisions to the standard.

Description of Current Draft

This is the first draft of the proposed Reliability Standard, and it is being posted for a 45-day comment and concurrent initial ballot period. This draft includes proposed revisions to address the directives issued in FERC Order No. 802.

Anticipated Actions	Anticipated Date
45-day Comment and Initial Ballot.	February-March, 2015
10-day Final Ballot.	April, 2015
BOT Adoption.	May, 2015
File with applicable Regulatory Authorities.	June, 2015

Version History

Version	Date	Action	Change Tracking
1.0	TBD	Effective Date	New

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the NERC Glossary of Terms used in Reliability Standards (Glossary) are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

A. Introduction

1. Title: Physical Security

2. Number: CIP-014-1

3. Purpose: To identify and protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection.

4. Applicability:

4.1. Functional Entities:

4.1.1 Transmission Owner that owns a Transmission station or Transmission substation that meets any of the following criteria:

4.1.1.1 Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

4.1.1.2 Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

Voltage Value of a Line	Weight Value per Line
less than 200 kV (not applicable)	(not applicable)
200 kV to 299 kV	700
300 kV to 499 kV	1300
500 kV and above	0

4.1.1.3 Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Coordinator, or

Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

4.1.1.4 Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements.

4.1.2 Transmission Operator.

Exemption: Facilities in a "protected area," as defined in 10 C.F.R. § 73.2, within the scope of a security plan approved or accepted by the Nuclear Regulatory Commission are not subject to this Standard; or, Facilities within the scope of a security plan approved or accepted by the Canadian Nuclear Safety Commission are not subject to this Standard.

5. Effective Dates:

See Implementation Plan for CIP-014-2.~~CIP-014-1 is effective the first day of the first calendar quarter that is six months beyond the date that this standard is approved by applicable regulatory authorities, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. In those jurisdictions where regulatory approval is not required, CIP-014-1 shall become effective on the first day of the first calendar quarter that is six months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.~~

6. Background:

This Reliability Standard addresses the directives from the FERC order issued March 7, 2014, *Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (2014), which required NERC to develop a physical security reliability standard(s) to identify and protect facilities that if rendered inoperable or damaged could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection.

B. Requirements and Measures

R1. Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria specified in Applicability Section 4.1.1. The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify the Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection. *[VRF: High; Time-Horizon: Long-term Planning]*

1.1. Subsequent risk assessments shall be performed:

- At least once every 30 calendar months for a Transmission Owner that has identified in its previous risk assessment (as verified according to Requirement R2) one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection; or

- At least once every 60 calendar months for a Transmission Owner that has not identified in its previous risk assessment (as verified according to Requirement R2) any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection.

1.2. The Transmission Owner shall identify the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment.

M1. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the risk assessment of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria in Applicability Section 4.1.1 as specified in Requirement R1. Additionally, examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the identification of the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment as specified in Requirement R1, Part 1.2.

Rationale for Requirement R1:

This requirement meets the FERC directive from paragraph 6 of its~~in the~~ March 7, 2014 order on physical security to perform a risk assessment to identify which facilities if rendered inoperable or damaged could impact an Interconnection through ~~widespread~~ instability, uncontrolled separation, or cascading failures. The requirement is not to require identification of, and thus, not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the following:

- Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6
- NERC EOP-004-2 reporting criteria
- Area or magnitude of potential impact

~~It~~ Requirement R1 also meets the ~~portion of the~~FERC directive ~~from paragraph 11~~ for periodic reevaluation of the risk assessment by requiring the risk assessment to be performed every 30 months (or 60 months for an entity that has not identified in a previous risk assessment ~~any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection~~).

After identifying each Transmission station and Transmission substation that meets the criteria in Requirement R1, it is important to additionally identify the primary control center that operationally controls that Transmission station or Transmission substation (*i.e.,* the control center whose electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker, compared to a control center that only has the ability to monitor the Transmission station and Transmission substation and, therefore, must coordinate direct physical action through another entity).

R2. Each Transmission Owner shall have an unaffiliated third party verify the risk assessment performed under Requirement R1. The verification may occur concurrent with or after the risk assessment performed under Requirement R1. *[VRF: Medium; Time-Horizon: Long-term Planning]*

2.1. Each Transmission Owner shall select an unaffiliated verifying entity that is either:

- A registered Planning Coordinator, Transmission Planner, or Reliability Coordinator; or
- An entity that has transmission planning or analysis experience.

2.2. The unaffiliated third party verification shall verify the Transmission Owner's risk assessment performed under Requirement R1, which may include recommendations for the addition or deletion of a Transmission station(s) or Transmission substation(s). The Transmission Owner shall ensure the verification is completed within 90 calendar days following the completion of the Requirement R1 risk assessment.

2.3. If the unaffiliated verifying entity recommends that the Transmission Owner add a Transmission station(s) or Transmission substation(s) to, or remove a Transmission station(s) or Transmission substation(s) from, its identification under Requirement R1, the Transmission Owner shall either, within 60 calendar days of completion of the verification, for each recommended addition or removal of a Transmission station or Transmission substation:

- Modify its identification under Requirement R1 consistent with the recommendation; or
- Document the technical basis for not modifying the identification in accordance with the recommendation.

2.4. Each Transmission Owner shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third party verifier and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M2. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner completed an unaffiliated third party verification of the Requirement R1 risk assessment and satisfied all of the applicable provisions of Requirement R2, including, if applicable, documenting the technical basis for not modifying the Requirement R1 identification as specified under Part 2.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 2.4.

Rationale for Requirement R2:

This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring verification by an entity other than the owner or operator of the risk assessment performed under Requirement R1.

This requirement provides the flexibility for a Transmission Owner to select registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term "unaffiliated" means that the selected verifying entity cannot be a corporate affiliate (*i.e.*, the verifying entity cannot be an entity that controls, is controlled by, or is under common control with, the Transmission owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit. The term "unaffiliated" is not intended to prohibit a governmental entity from using another government entity to be a verifier under Requirement R2.

Requirement R2 also provides the Transmission Owner the flexibility to work with the verifying entity throughout the Requirement R1 risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could coordinate with their unaffiliated verifying entity to perform a Requirement R1 risk assessment to satisfy both Requirement R1 and Requirement R2 concurrently.

Planning Coordinator is a functional entity listed in Part 2.1. The Planning Coordinator and Planning Authority are the same entity as shown in the NERC Glossary of Terms Used in NERC Reliability Standards.

R3. For a primary control center(s) identified by the Transmission Owner according to Requirement R1, Part 1.2 that a) operationally controls an identified Transmission station or Transmission substation verified according to Requirement R2, and b) is not under the operational control of the Transmission Owner: the Transmission Owner shall, within seven calendar days following completion of Requirement R2, notify the Transmission Operator that has operational control of the primary control center of such identification and the date of completion of Requirement R2. *[VRF: Lower; Time-Horizon: Long-term Planning]*

3.1. If a Transmission station or Transmission substation previously identified under Requirement R1 and verified according to Requirement R2 is removed from the identification during a subsequent risk assessment performed according to Requirement R1 or a verification according to Requirement R2, then the Transmission Owner shall, within seven calendar days following the verification or the subsequent risk assessment, notify the Transmission Operator that has operational control of the primary control center of the removal.

M3. Examples of acceptable evidence may include, but are not limited to, dated written or electronic notifications or communications that the Transmission Owner notified each Transmission Operator, as applicable, according to Requirement R3.

Rationale for Requirement R3:

Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first identifying which Transmission stations and Transmission substations meet the criteria specified by Requirement R1, as verified according to Requirement R2. This requirement is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1, Part 1.2 of a Transmission station or Transmission substation verified according to Requirement R2 receives notice of such identification so that the Transmission Operator may timely fulfill its resulting obligations under Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include notice of the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or the verification process under Requirement R2.

R4. Each Transmission Owner that identified a Transmission station, Transmission substation, or a primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2. The evaluation shall consider the following: *[VRF: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

4.1. Unique characteristics of the identified and verified Transmission station(s), Transmission substation(s), and primary control center(s);

4.2. Prior history of attack on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and

4.3. Intelligence or threat warnings received from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), U.S. federal and/or Canadian governmental agencies, or their successors.

M4. Examples of evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner or Transmission Operator conducted an evaluation of the potential threats and vulnerabilities of a physical attack to their respective Transmission station(s), Transmission substation(s) and primary control center(s) as specified in Requirement R4.

Rationale for Requirement R4:

This requirement meets the FERC directive from paragraph 8 in the order on physical security that the reliability standard must require tailored evaluation of potential threats and vulnerabilities to facilities identified in Requirement R1 and verified according to Requirement R2. Threats and vulnerabilities may vary from facility to facility based on factors such as the facility's location, size, function, existing protections, and attractiveness of the target. As such, the requirement does not mandate a one-size-fits-all approach but requires entities to account for the unique characteristics of their facilities.

Requirement R4 does not explicitly state when the evaluation of threats and vulnerabilities must occur or be completed. However, Requirement R5 requires that the entity's security plan(s), which is dependent on the Requirement R4 evaluation, must be completed within 120 calendar days following completion of Requirement R2. Thus, an entity has the flexibility when to complete the Requirement R4 evaluation, provided that it is completed in time to comply with the requirement in Requirement R5 to develop a physical security plan 120 calendar days following completion of Requirement R2.

R5. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s). The physical security plan(s) shall be developed within 120 calendar days following the completion of Requirement R2 and executed according to the timeline specified in the physical security plan(s). The physical security plan(s) shall include the following attributes: *[VRF: High; Time-Horizon: Long-term Planning]*

5.1. Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.

5.2. Law enforcement contact and coordination information.

5.3. A timeline for executing the physical security enhancements and modifications specified in the physical security plan.

5.4. Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).

M5. Examples of evidence may include, but are not limited to, dated written or electronic documentation of its physical security plan(s) that covers their respective identified

and verified Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R5, and additional evidence demonstrating execution of the physical security plan according to the timeline specified in the physical security plan.

Rationale for Requirement R5:

This requirement meets the FERC directive from paragraph 9 in the order on physical security requiring the development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

R6. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall have an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5. The review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5. *[VRF: Medium; Time-Horizon: Long-term Planning]*

6.1. Each Transmission Owner and Transmission Operator shall select an unaffiliated third party reviewer from the following:

- An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.
- An entity or organization approved by the ERO.
- A governmental agency with physical security expertise.
- An entity or organization with demonstrated law enforcement, government, or military physical security expertise.

6.2. The Transmission Owner or Transmission Operator, respectively, shall ensure that the unaffiliated third party review is completed within 90 calendar days of completing the security plan(s) developed in Requirement R5. The unaffiliated third party review may, but is not required to, include recommended changes to the evaluation performed under Requirement R4 or the security plan(s) developed under Requirement R5.

6.3. If the unaffiliated third party reviewer recommends changes to the evaluation performed under Requirement R4 or security plan(s) developed under Requirement R5, the Transmission Owner or Transmission Operator shall, within 60 calendar days of the completion of the unaffiliated third party review, for each recommendation:

- Modify its evaluation or security plan(s) consistent with the recommendation; or
- Document the reason(s) for not modifying the evaluation or security plan(s) consistent with the recommendation.

6.4. Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third party reviewer and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M6. Examples of evidence may include, but are not limited to, written or electronic documentation that the Transmission Owner or Transmission Operator had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 as specified in Requirement R6 including, if applicable, documenting the reasons for not modifying the evaluation or security plan(s) in accordance with a recommendation under Part 6.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 6.4.

Rationale for Requirement R6:

This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring review by an entity other than the owner or operator with appropriate expertise of the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5.

As with the verification required by Requirement R2, Requirement R6 provides Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout the Requirement R4 evaluation and the development of the Requirement R5 security plan(s). This would allow entities to satisfy their obligations under Requirement R6 concurrent with the satisfaction of their obligations under Requirements R4 and R5.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence during an on-site visit to show that it was compliant for the full time period since the last audit.

The Transmission Owner and Transmission Operator shall keep data or evidence to show compliance, as identified below, unless directed by its Compliance Enforcement Authority (CEA) to retain specific evidence for a longer period of time as part of an investigation.

The responsible entities shall retain documentation as evidence for three years.

If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records, subject to the confidentiality provisions of Section 1500 of the Rules of Procedure and the provisions of Section 1.4 below.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints Text

1.4. Additional Compliance Information

Confidentiality: To protect the confidentiality and sensitive nature of the evidence for demonstrating compliance with this standard, all evidence will be retained at the Transmission Owner's and Transmission Operator's facilities.

2. Table of Compliance Elements

Guidelines and Technical Basis

Section 4 Applicability

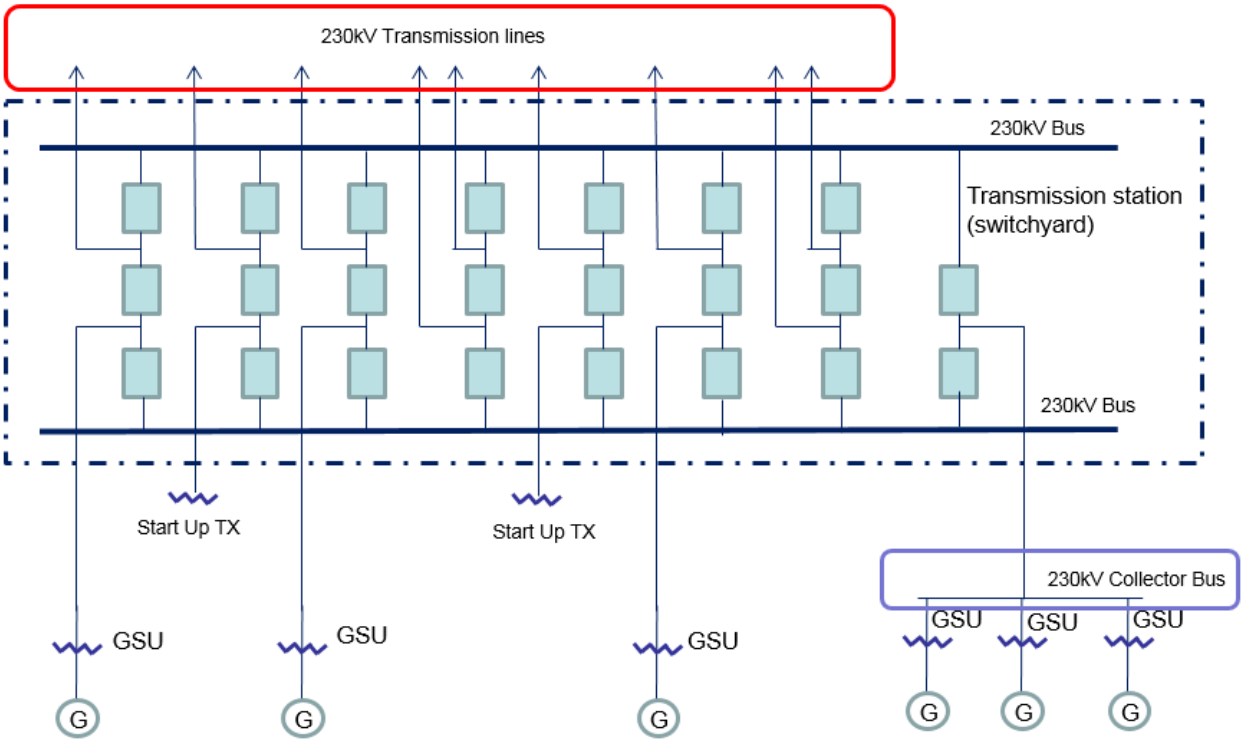
The purpose of Reliability Standard CIP-014~~-1~~ is to protect Transmission stations and Transmission substations, and their associated primary control centers that if rendered inoperable or damaged as a result of a physical attack could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection. To properly include those entities that own or operate such Facilities, the Reliability Standard CIP-014~~-1~~ first applies to Transmission Owners that own Transmission Facilities that meet the specific criteria in Applicability Section 4.1.1.1 through 4.1.1.4. The Facilities described in Applicability Section 4.1.1.1 through 4.1.1.4 mirror those Transmission Facilities that meet the bright line criteria for "Medium Impact" Transmission Facilities under Attachment 1 of Reliability Standard CIP-002-5.1. Each Transmission Owner that owns Transmission Facilities that meet the criteria in Section 4.1.1.1 through 4.1.1.4 is required to perform a risk assessment as specified in Requirement R1 to identify its Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection. The Standard Drafting Team (SDT) expects this population will be small and that many Transmission Owners that meet the applicability of this standard will not actually identify any such Facilities. Only those Transmission Owners with Transmission stations or Transmission substations identified in the risk assessment (and verified under Requirement R2) have performance obligations under Requirements R3 through R6.

This standard also applies to Transmission Operators. A Transmission Operator's obligations under the standard, however, are only triggered if the Transmission Operator is notified by an applicable Transmission Owner under Requirement R3 that the Transmission Operator operates a primary control center that operationally controls a Transmission station(s) or Transmission substation(s) identified in the Requirement R1 risk assessment. A primary control center operationally controls a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical action at the identified Transmission station or Transmission substation, such as opening a breaker, as opposed to a control center that only has information from the Transmission station or Transmission substation and must coordinate direct action through another entity. Only Transmission Operators who are notified that they have primary control centers under this standard have performance obligations under Requirements R4 through R6. In other words, primary control center for purposes of this Standard is the control center that the Transmission Owner or Transmission Operator, respectively, uses as its primary, permanently-manned site to physically operate a Transmission station or Transmission substation that is identified in Requirement R1 and verified in Requirement R2. Control centers that provide back-up capability are not applicable, as they are a form of resiliency and intentionally redundant.

The SDT considered several options for bright line criteria that could be used to determine applicability and provide an initial threshold that defines the set of Transmission stations and Transmission substations that would meet the directives of the FERC order on physical security (*i.e.*, those that could cause ~~widespread~~ instability, uncontrolled separation, or Cascading within

an Interconnection). The SDT determined that using the criteria for Medium Impact Transmission Facilities in Attachment 1 of CIP-002-5.1 would provide a conservative threshold for defining which Transmission stations and Transmission substations must be included in the risk assessment in Requirement R1 of CIP-014~~-1~~. Additionally, the SDT concluded that using the CIP-002-5.1 Medium Impact criteria was appropriate because it has been approved by stakeholders, NERC, and FERC, and its use provides a technically sound basis to determine which Transmission Owners should conduct the risk assessment. As described in CIP-002-5.1, the failure of a Transmission station or Transmission substation that meets the Medium Impact criteria could have the capability to result in exceeding one or more Interconnection Reliability Operating Limits (IROLs). The SDT understands that using this bright line criteria to determine applicability may require some Transmission Owners to perform risk assessments under Requirement R1 that will result in a finding that none of their Transmission stations or Transmission substations would pose a risk of ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection. However, the SDT determined that higher bright lines could not be technically justified to ensure inclusion of all Transmission stations and Transmission substations, and their associated primary control centers that, if rendered inoperable or damaged as a result of a physical attack could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection. Further guidance and technical basis for the bright line criteria for Medium Impact Facilities can be found in the Guidelines and Technical Basis section of CIP-002-5.1.

Additionally, the SDT determined that it was not necessary to include Generator Operators and Generator Owners in the Reliability Standard. First, Transmission stations or Transmission substations interconnecting generation facilities are considered when determining applicability. Transmission Owners will consider those Transmission stations and Transmission substations that include a Transmission station on the high side of the Generator Step-up transformer (GSU) using Applicability Section 4.1.1.1 and 4.1.1.2. As an example, a Transmission station or Transmission substation identified as a Transmission Owner facility that interconnects generation will be subject to the Requirement R1 risk assessment if it operates at 500kV or greater or if it is connected at 200 kV – 499kV to three or more other Transmission stations or Transmission substations and has an "aggregate weighted value" exceeding 3000 according to the table in Applicability Section 4.1.1.2. Second, the Transmission analysis or analyses conducted under Requirement R1 should take into account the impact of the loss of generation connected to applicable Transmission stations or Transmission substations. Additionally, the FERC order does not explicitly mention generation assets and is reasonably understood to focus on the most critical Transmission Facilities. The diagram below shows an example of a station.



Also, the SDT uses the phrase "Transmission stations or Transmission substations" to recognize the existence of both stations and substations. Many entities in industry consider a substation to be a location with physical borders (i.e. fence, wall, etc.) that contains at least an autotransformer. Locations also exist that do not contain autotransformers, and many entities in industry refer to those locations as stations (switching stations or switchyards). Therefore, the SDT chose to use both "station" and "substation" to refer to the locations where groups of Transmission Facilities exist.

On the issue of joint ownership, the SDT recognizes that this issue is not unique to CIP-014~~-1~~, and expects that the applicable Transmission Owners and Transmission Operators will develop memorandums of understanding, agreements, Coordinated Functional Registrations, or procedures, etc., to designate responsibilities under CIP-014~~-1~~ when joint ownership is at issue, which is similar to what many entities have completed for other Reliability Standards.

The language contained in the applicability section regarding the collector bus is directly copied from CIP-002-5.1, Attachment 1, and has no additional meaning within the CIP-014~~-1~~ standard.

Requirement R1

The initial risk assessment required under Requirement R1 must be completed on or before the effective date of the standard. Subsequent risk assessments are to be performed at least once every 30 or 60 months depending on the results of the previous risk assessment per Requirement R1, Part 1.1. In performing the risk assessment under Requirement R1, the

Transmission Owner should first identify their population of Transmission stations and Transmission substations that meet the criteria contained in Applicability Section 4.1.1. Requirement R1 then requires the Transmission Owner to perform a risk assessment, consisting of a transmission analysis, to determine which of those Transmission stations and Transmission Substations if rendered inoperable or damaged could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection. The requirement is not to require identification of, and thus, not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the following:

- Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6
- NERC EOP-004-2 reporting criteria
- Area or magnitude of potential impact

The standard does not mandate the specific analytical method for performing the risk assessment. The Transmission Owner has the discretion to choose the specific method that best suites its needs. As an example, an entity may perform a Power Flow analysis and stability analysis at a variety of load levels.

Performing Risk Assessments

The Transmission Owner has the discretion to select a transmission analysis method that fits its facts and system circumstances. To mandate a specific approach is not technically desirable and may lead to results that fail to adequately consider regional, topological, and system circumstances. The following guidance is only an example on how a Transmission Owner may perform a power flow and/or stability analysis to identify those Transmission stations and Transmission substations that if rendered inoperable or damaged as a result of a physical attack could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection. An entity could remove all lines, without regard to the voltage level, to a single Transmission station or Transmission substation and review the simulation results to assess system behavior to determine if Cascading of Transmission Facilities, uncontrolled separation, or voltage or frequency instability is likely to occur over a significant area of the Interconnection. Using engineering judgment, the Transmission Owner (possibly in consultation with regional planning or operation committees and/or ISO/RTO committee input) should develop criteria (e.g. imposing a fault near the removed Transmission station or Transmission substation) to identify a contingency or parameters that result in potential ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection. Regional

consultation on these matters is likely to be helpful and informative, given that the inputs for the risk assessment and the attributes of what constitutes ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection will likely vary from region-to-region or from ISO-to-ISO based on topology, system characteristics, and system configurations. ~~–~~Criteria could also include post-contingency facilities loadings above a certain emergency rating or failure of a power flow case to converge. Available special protection systems (SPS), if any, could be applied to determine if the system experiences any additional instability which may result in uncontrolled separation. Example criteria may include:

(a) Thermal overloads beyond facility emergency ratings;

(b) Voltage deviation exceeding ± 10%; or

(c) Cascading outage/voltage collapse; or

(d) Frequency below under-frequency load shed points

Periodicity

A Transmission Owner who identifies one or more Transmission stations or Transmission substations (as verified under Requirement R2) that if rendered inoperable or damaged could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection is required to conduct a risk assessment at least once every 30 months. This period ensures that the risk assessment remains current with projected conditions and configurations in the planned system. This risk assessment, as the initial assessment, must consider applicable planned Transmission stations and Transmission substations to be in service within 24 months. The 30 month timeframe aligns with the 24 month planned to be in service date because the Transmission Owner is provided the flexibility, depending on its planning cycle and the frequency in which it may plan to construct a new Transmission station or Transmission substation to more closely align these dates. The requirement is to conduct the risk assessment at least once every 30 months, so for a Transmission Owner that believes it is better to conduct a risk assessment once every 24 months, because of its planning cycle, it has the flexibility to do so.

Transmission Owners that have not identified any Transmission stations or Transmission substations (as verified under Requirement R2) that if rendered inoperable or damaged could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection are unlikely to see changes to their risk assessment in the Near-Term Planning Horizon. Consequently, a 60 month periodicity for completing a subsequent risk assessment is specified.

Identification of Primary Control Centers

After completing the risk assessment specified in Requirement R1, it is important to additionally identify the primary control center that operationally controls each Transmission station or Transmission substation that if rendered inoperable or damaged could result in ~~widespread~~

instability, uncontrolled separation, or Cascading within an Interconnection. A primary control center "operationally controls" a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker.

Requirement R2

This requirement specifies verification of the risk assessment performed under Requirement R1 by an entity other than the owner or operator of the Requirement R1 risk assessment.

A verification of the risk assessment by an unaffiliated third party, as specified in Requirement R2, could consist of:

1. Certifying that the Requirement R1 risk assessment considers the Transmission stations and Transmission substations identified in Applicability Section 4.1.1.
2. Review of the model used to conduct the risk assessment to ensure it contains sufficient system topology to identify Transmission stations and Transmission substations that if rendered inoperable or damaged could cause ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection.
3. Review of the Requirement R1 risk assessment methodology.

This requirement provides the flexibility for a Transmission Owner to select from unaffiliated registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term unaffiliated means that the selected verifying entity cannot be a corporate affiliate (*i.e.,* the verifying or third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit.

The prohibition on registered entities using a corporate affiliate to conduct the verification, however, does not prohibit a governmental entity (e.g., a city, a municipality, a U.S. federal power marketing agency, or any other political subdivision of U.S. or Canadian federal, state, or provincial governments) from selecting as the verifying entity another governmental entity within the same political subdivision. For instance, a U.S. federal power marketing agency may select as its verifier another U.S. federal agency to conduct its verification so long as the selected entity has transmission planning or analysis experience. Similarly, a Transmission Owner owned by a Canadian province can use a separate agency of that province to perform the verification. The verifying entity, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

Requirement R2 also provides that the "verification may occur concurrent with or after the risk assessment performed under Requirement R1." This provision is designed to provide the Transmission Owner the flexibility to work with the verifying entity throughout (*i.e.,* concurrent with) the risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could collaborate with their unaffiliated verifying entity to perform the risk assessment under Requirement R1 such that both

Requirement R1 and Requirement R2 are satisfied concurrently. The intent of Requirement R2 is to have an entity other than the owner or operator of the facility to be involved in the risk assessment process and have an opportunity to provide input. Accordingly, Requirement R2 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the risk assessment and subsequently has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the risk assessment.

Characteristics to consider in selecting a third party reviewer could include:

- Registered Entity with applicable planning and reliability functions.
- Experience in power system studies and planning.
- The entity's understanding of the MOD standards, TPL standards, and facility ratings as they pertain to planning studies.
- The entity's familiarity with the Interconnection within which the Transmission Owner is located.

With respect to the requirement that Transmission owners develop and implement procedures for protecting confidential and sensitive information, the Transmission Owner could have a method for identifying documents that require confidential treatment. One mechanism for protecting confidential or sensitive information is to prohibit removal of sensitive or confidential information from the Transmission Owner's site. Transmission Owners could include such a prohibition in a non-disclosure agreement with the verifying entity.

A Technical feasibility study is not required in the Requirement R2 documentation of the technical basis for not modifying the identification in accordance with the recommendation.

On the issue of the difference between a verifier in Requirement R2 and a reviewer in Requirement R6, the SDT indicates that the verifier will confirm that the risk assessment was completed in accordance with Requirement R1, including the number of Transmission stations and substations identified, while the reviewer in Requirement R6 is providing expertise on the manner in which the evaluation of threats was conducted in accordance with Requirement R4, and the physical security plan in accordance with Requirement R5. In the latter situation there is no verification of a technical analysis, rather an application of experience and expertise to provide guidance or recommendations, if needed.

Parts 2.4 and 6.4 require the entities to have procedures to protect the confidentiality of sensitive or confidential information. Those procedures may include the following elements:

1. Control and retention of information on site for third party verifiers/reviewers.
2. Only "need to know" employees, etc., get the information.
3. Marking documents as confidential
4. Securely storing and destroying information when no longer needed.
5. Not releasing information outside the entity without, for example, General Counsel sign-off.

Requirement R3

Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first completing the risk assessment specified by Requirement R1 and the verification specified by Requirement R2. Requirement R3 is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1 receive notice so that the Transmission Operator may fulfill the rest of the obligations required in Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include within the notice the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or as a result of the verification process under Requirement R2.

Requirement R4

This requirement requires owners and operators of facilities identified by the Requirement R1 risk assessment and that are verified under Requirement R2 to conduct an assessment of potential threats and vulnerabilities to those Transmission stations, Transmission substations, and primary control centers using a tailored evaluation process. Threats and vulnerabilities may vary from facility to facility based on any number of factors that include, but are not limited to, location, size, function, existing physical security protections, and attractiveness as a target.

In order to effectively conduct a threat and vulnerability assessment, the asset owner may be the best source to determine specific site vulnerabilities, but current and evolving threats may best be determined by others in the intelligence or law enforcement communities. A number of resources have been identified in the standard, but many others exist and asset owners are not limited to where they may turn for assistance. Additional resources may include state or local fusion centers, U.S. Department of Homeland Security, Federal Bureau of Investigations (FBI), Public Safety Canada, Royal Canadian Mounted Police, and InfraGard chapters coordinated by the FBI.

The Responsible Entity is required to take a number of factors into account in Parts 4.1 to 4.3 in order to make a risk-based evaluation under Requirement R4.

To assist in determining the current threat for a facility, the prior history of attacks on similarly protected facilities should be considered when assessing probability and likelihood of occurrence at the facility in question.

Resources that may be useful in conducting threat and vulnerability assessments include:

- NERC Security Guideline for the Electricity Sector: Physical Security.
- NERC Security Guideline: Physical Security Response.
- ASIS International General Risk Assessment Guidelines.

- ASIS International Facilities Physical Security Measure Guideline.
- ASIS International Security Management Standard: Physical Asset Protection.
- Whole Building Design Guide - Threat/Vulnerability Assessments.

Requirement R5

This requirement specifies development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Requirement R5 specifies the following attributes for the physical security plan:

- *Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.*

  Resiliency may include, among other things:

  a. System topology changes,

  b. Spare equipment,

  c. Construction of a new Transmission station or Transmission substation.

  While most security measures will work together to collectively harden the entire site, some may be allocated to protect specific critical components. For example, if protection from gunfire is considered necessary, the entity may only install ballistic protection for critical components, not the entire site.

- *Law enforcement contact and coordination information.*

  Examples of such information may be posting 9-1-1 for emergency calls and providing substation safety and familiarization training for local and federal law enforcement, fire department, and Emergency Medical Services.

- *A timeline for executing the physical security enhancements and modifications specified in the physical security plan.*

  Entities have the flexibility to prioritize the implementation of the various resiliency or security enhancements and modifications in their security plan according to risk, resources, or other factors. The requirement to include a timeline in the physical security plan for executing the actual physical security enhancements and modifications does not also require that the enhancements and modifications be completed within 120 days. The actual timeline may extend beyond the 120 days, depending on the amount of work to be completed.

- *Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).*

A registered entity's physical security plan should include processes and responsibilities for obtaining and handling alerts, intelligence, and threat warnings from various sources. Some of these sources could include the ERO, ES-ISAC, and US and/or Canadian federal agencies. This information should be used to reevaluate or consider changes in the security plan and corresponding security measures of the security plan found in R5.

Incremental changes made to the physical security plan prior to the next required third party review do not require additional third party reviews.

Requirement R6

This requirement specifies review by an entity other than the Transmission Owner or Transmission Operator with appropriate expertise for the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5. As with Requirement R2, the term unaffiliated means that the selected third party reviewer cannot be a corporate affiliate (*i.e.,* the third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Operator). A third party reviewer also cannot be a division of the Transmission Operator that operates as a functional unit.

As noted in the guidance for Requirement R2, the prohibition on registered entities using a corporate affiliate to conduct the review, however, does not prohibit a governmental entity from selecting as the third party reviewer another governmental entity within the same political subdivision. For instance, a city or municipality may use its local enforcement agency, so long as the local law enforcement agency satisfies the criteria in Requirement R6. The third party reviewer, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

The Responsible Entity can select from several possible entities to perform the review:

- *An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.*

  In selecting CPP and PSP for use in this standard, the SDT believed it was important that if a private entity such as a consulting or security firm was engaged to conduct the third party review, they must tangibly demonstrate competence to conduct the review. This includes electric industry physical security experience and either of the premier security industry certifications sponsored by ASIS International. The ASIS certification program was initiated in 1977, and those that hold the CPP certification are board certified in security management. Those that hold the PSP certification are board certified in physical security.

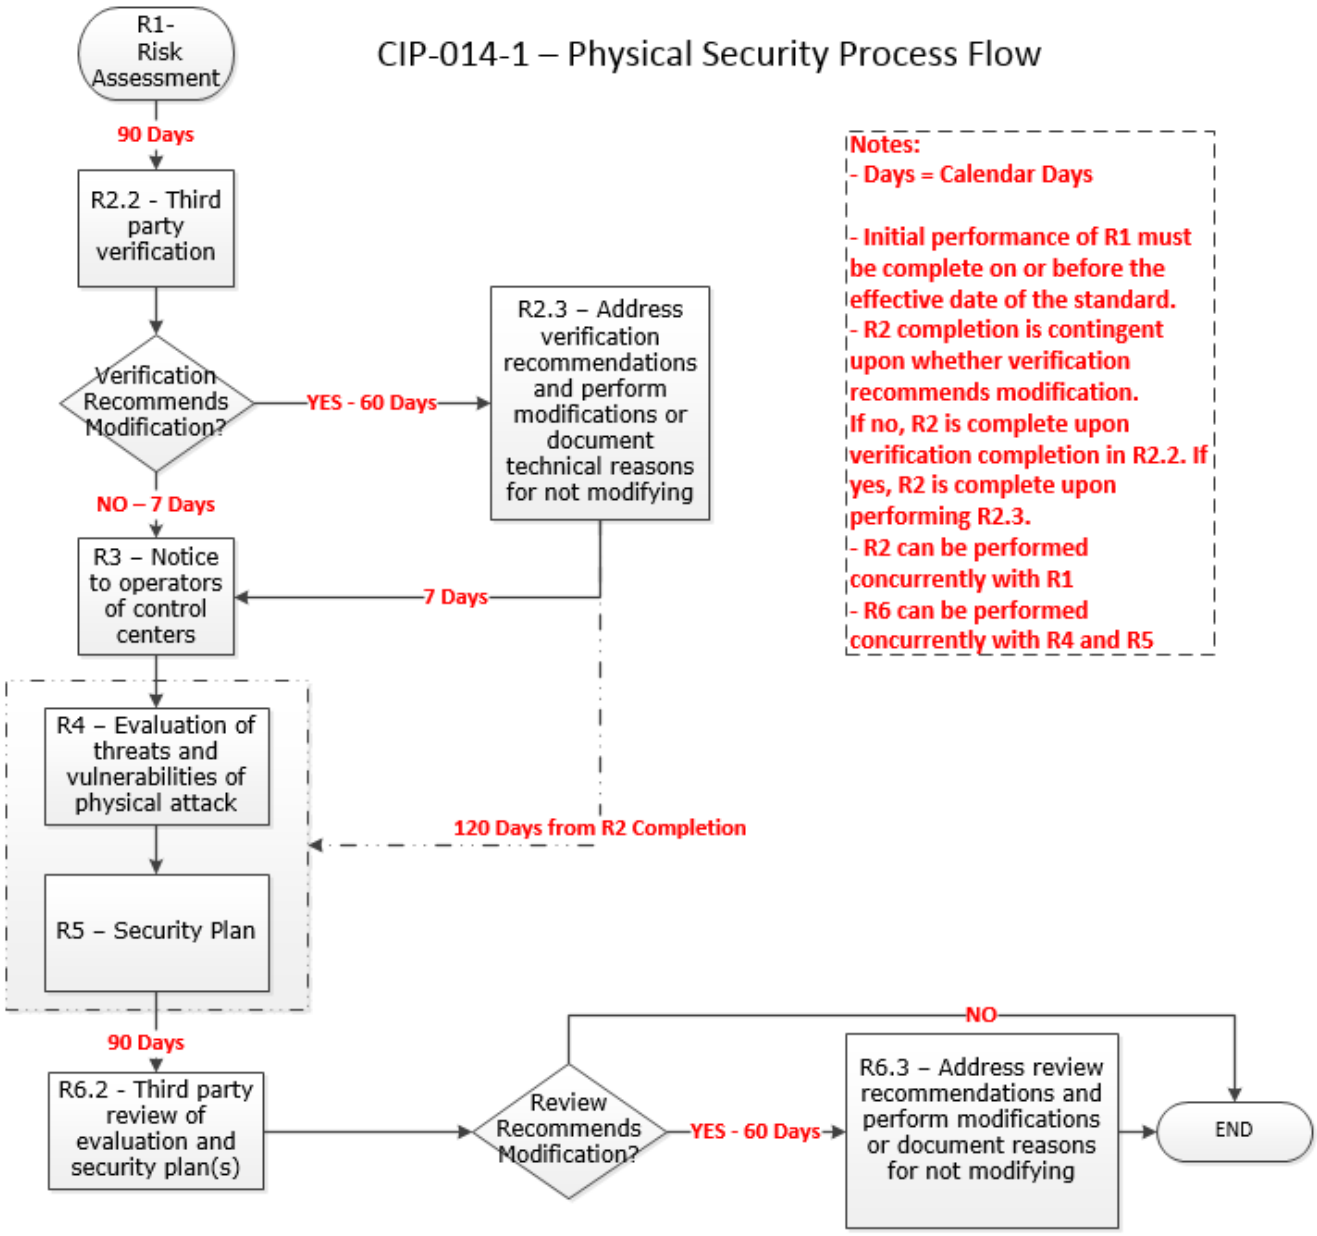
- *An entity or organization approved by the ERO.*

- *A governmental agency with physical security expertise.*

- *An entity or organization with demonstrated law enforcement, government, or military physical security expertise.*

As with the verification under Requirement R2, Requirement R6 provides that the "review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5." This provision is designed to provide applicable Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout (*i.e.,* concurrent with) the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5, which for some Responsible Entities may be more efficient and effective. In other words, a Transmission Owner or Transmission Operator could collaborate with their unaffiliated third party reviewer to perform an evaluation of potential threats and vulnerabilities (Requirement R4) and develop a security plan (Requirement R5) to satisfy Requirements R4 through R6 simultaneously. The intent of Requirement R6 is to have an entity other than the owner or operator of the facility to be involved in the Requirement R4 evaluation and the development of the Requirement R5 security plans and have an opportunity to provide input on the evaluation and the security plan. Accordingly, Requirement R6 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the evaluation and develops the security plan itself and then has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the evaluation and develop the security plan.

Timeline



CIP-014-1 – Physical Security Process Flow
R1- Risk Assessment
90 Days
R2.2 - Third party verification
Verification Recommends Modification?
YES - 60 Days
R2.3 – Address verification recommendations and perform modifications or document technical reasons for not modifying
NO – 7 Days
R3 – Notice to operators of control centers
7 Days
R4 – Evaluation of threats and vulnerabilities of physical attack
120 Days from R2 Completion
R5 – Security Plan
90 Days
R6.2 - Third party review of evaluation and security plan(s)
Review Recommends Modification?
YES - 60 Days
R6.3 – Address review recommendations and perform modifications or document reasons for not modifying
NO
END
Notes:
- Days = Calendar Days
- Initial performance of R1 must be complete on or before the effective date of the standard.
- R2 completion is contingent upon whether verification recommends modification. If no, R2 is complete upon verification completion in R2.2. If yes, R2 is complete upon performing R2.3.
- R2 can be performed concurrently with R1
- R6 can be performed concurrently with R4 and R5

Implementation Plan

Physical Security Directives
CIP-014-2

Standards Involved

Approval:

- CIP-014-2 – Physical Security

Retirement:

- CIP-014-1 – Physical Security

Prerequisite Approvals:

N/A

Background

In Order No. 802 (final order on CIP-014-1 – Physical Security), issued on November 20, 2014, FERC directed NERC to remove the term "widespread" from Reliability Standard CIP-014-1 or, alternatively, to propose modifications to the Reliability Standard that address the Commission's concerns. FERC directed that NERC submit a responsive modification within six months from the effective date of this final rule.

Effective Date

CIP-014-2 shall become effective on the later of the first day following the Effective Date of CIP-014-1 or the first day after CIP-014-2 is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, CIP-014-2 shall become effective on the later of the first day following the Effective Date of CIP-014-1 or the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction

Retirement of Existing Standards:

The existing standard, CIP-014-1, shall be retired at midnight of the day immediately prior to the effective date of CIP-014-2 in the particular jurisdiction in which the revised standard is becoming effective.

Applicability:

This standard applies to the following functional entities:

- Transmission Owner
- Transmission Operator

Implementation of CIP-014-1

All aspects of the Implementation Plan for CIP-014-1 will remain applicable to CIP-014-2 and are incorporated here by reference.

Background Information

In Order No. 802 (final order on CIP-014-1 – Physical Security), issued on November 20, 2014, FERC directed NERC to remove the term "widespread" from Reliability Standard CIP-014-1 or, alternatively, to propose modifications to the Reliability Standard that address the Commission's concerns. FERC directed that NERC submit a responsive modification within six months from the effective date of this final rule.

FERC noted that incorporating the undefined term "widespread" in Reliability Standard CIP-014-1 introduces excessive uncertainty in identifying critical facilities under Requirement R1. As the Commission stated in the March 7 Order, only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1. The March 7 Order did not intend to suggest that the physical security Reliability Standards should address facilities that do not have a "critical impact on the operation of the interconnection." This understanding is, we believe, unintentionally absent in Requirement R1 because the requirement only deems a facility critical when, if rendered inoperable or damaged, it could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection. The definition in Requirement R1 should not be dependent on how an applicable entity interprets the term "widespread" but instead should be modified to make clear that a facility that has a critical impact on the operation of an Interconnection is critical and therefore subject to Requirement R1.

The Physical Security Standard Drafting Team (PSSDT) revised CIP-014-1, Physical Security, by removing the term "widespread" from the standard. This was done in the Purpose Statement, Background Section, Requirement R1, the Rationale for Requirement R1 as well as the Guidance and Technical Basis Section of the standard. Additionally, the PSSDT has added the following to the Rationale and guideline and Technical Basis for Requirement R1:

"The requirement is not to require identification of, and thus, not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the following:

- Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6
- NERC EOP-004-2 reporting criteria
- Area or magnitude of potential impact"

Additionally, the PSSDT revised the Rationale for Requirement R1 as follows:

> Requirement R1 also meets the FERC directive for periodic reevaluation of the risk assessment by requiring the risk assessment to be performed every 30 months (or 60 months for an entity that has not identified in a previous risk).

You do not have to answer all questions below. Enter comments in simple text format. Bullets, numbers, and special formatting will not be retained. Due to the expected volume of comments, the SDT asks that commenters consider consolidating responses and endorsing comments provided by another.

Questions

1. The PSSDT has revised CIP-014-1, Physical Security, to address the directive from FERC to to remove the term "widespread" from Reliability Standard CIP-014-1. Do you agree with the proposed revisions to the standard contained in CIP-014-2 as summarized above? If not, please provide specific comments regarding the revisions and any suggestions for appropriate revisions.

   ☐ Yes
   ☐ No

Consideration of Issues and Directives

Project 2014-04 - Physical Security Directives

January 27, 2015

Project 2014-04 - Physical Security Directives		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Paragraph 19. In addition to approving Reliability Standard CIP-014-1, the Commission adopts in part the NOPR proposal directing NERC to develop and submit modifications to the Reliability Standard concerning the use of the term "widespread" in Requirement R1. The Commission determines that the term "widespread" is unclear with respect to the obligations it imposes on applicable entities; how it would be implemented by applicable entities; and how it would be enforced. Accordingly, the Commission directs NERC, pursuant to FPA section 215(d)(5), to remove the term "widespread" from Reliability Standard CIP-014-1 or, alternatively, to propose modifications to the Reliability Standard that address the Commission's concerns. We direct that NERC submit a responsive	FERC Order 802 approving Reliability Standard CIO-014-1, Physical Security	The Physical Security Standard Drafting Team (PSSDT) revised CIP-014-1, Physical Security, by removing the term "widespread" from the standard. This was done in the Purpose Statement, Background Section, Requirement R1, the Rationale for Requirement R1 as well as the Guidance and Technical Basis Section of the standard. Additionally, the PSSDT has added the following to the Rationale and guideline and Technical Basis for Requirement R1: "The requirement is not to require identification of, and thus, not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event

modification within six months from the effective date of this final rule. Paragraph 35: Accordingly, pursuant to FPA section 215(d)(5), the Commission directs NERC to develop a modification to Reliability Standard CIP-014-1 that either removes the term "widespread" from Requirement R1 or, in the alternative, proposes changes that address the Commission's concerns. Further, we direct that NERC submit a responsive modification within six months from the effective date of this final rule. We recognize that certain entities commented on how NERC could modify Reliability Standard CIP-014-1 to address the Commission's stated concerns. However, we conclude that it is appropriate to allow NERC to develop and propose a modification in the first instance.		the asset is rendered inoperable or damaged. In the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the following: • Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6 • NERC EOP-004-2 reporting criteria • Area or magnitude of potential impact" Additionally, the PSSDT revised the Rationale for Requirement R1 as follows: "Requirement R1~~It~~ also meets the ~~portion of the~~ FERC directive ~~from paragraph 11~~ for periodic reevaluation of the risk assessment by requiring the risk assessment to be performed every 30 months (or 60 months for an entity that has not identified in a previous risk assessment) ~~any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an interconnection)~~."

Project 2014-04 - Physical Security Directives		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Paragraph 21. With respect to the informational filings proposed in the NOPR, the Commission adopts the proposal to direct NERC to make an informational filing addressing whether Reliability Standard CIP-014-1 provides physical security for all "High Impact" control centers, as that term is defined in Reliability Standard CIP-002-5.1, necessary for the reliable operation of the Bulk-Power System. However, the Commission extends the deadline for that informational filing until two years following the effective date of Reliability Standard CIP-014-1. Paragraph 57. The Commission adopts the NOPR proposal and directs NERC to submit an informational filing that addresses whether there is a need for consistent treatment of "High Impact" control centers for cybersecurity and physical security purposes through the development of Reliability Standards that afford physical protection to all "High Impact" control centers. The Commission, however, modifies the NOPR proposal and extends the due date for the informational filing to two years following the effective date of Reliability Standard CIP-014-1.	FERC Order 802 approving Reliability Standard CIO-014-1, Physical Security	NERC Staff will monitor implementation of Requirements R1 and R2 with respect to "High Impact" control centers as that term is defined in Reliability Standard CIP-002-5.1 as that term is defined in Reliability Standard CIP-002-5.1. NERC will submit an informational filing that addresses whether there is a need for consistent treatment of "High Impact" control centers for cybersecurity and physical security purposes through the development of Reliability Standards that afford physical protection to all "High Impact" control centers within two years following the effective date of Reliability Standard CIP-014-1.

Project 2014-04 - Physical Security Directives		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Paragraph 44. The Commission, instead, will focus its resources on carrying out compliance and enforcement activities to ensure that critical facilities are identified under Requirement R1. In its comments, NERC indicated that NERC staff will submit to the NERC Board of Trustees a report three months following implementation of Requirements R1, R2 and R3 concerning the scope of facilities identified as critical, including the number of facilities identified as critical and their defining characteristics. NERC also committed to sending this report to Commission staff.	FERC Order 802 approving Reliability Standard CIO-014-1, Physical Security	NERC Staff will monitor implementation of Requirements R1, R2 and R3 and will submit to the NERC Board of Trustees, a report three months following implementation of these Requirements concerning the scope of facilities identified as critical, including the number of facilities identified as critical and their defining characteristics. NERC will also submit this report to Commission staff.

• Modify its evaluation or security plan(s) consistent with the recommendation; or • Document the reason(s) for not modifying the evaluation or security plan(s) consistent with the recommendation. **6.4.** Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third party reviewer and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.		• Modify its evaluation or security plan(s) consistent with the recommendation; or • Document the reason(s) for not modifying the evaluation or security plan(s) consistent with the recommendation. **6.4.** Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third party reviewer and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Project 2014-04: Physical Security

VRF and VSL Justifications for CIP-014-2

VRF and VSL Justifications – CIP-014-1, R1	
Proposed VRF	High
NERC VRF Discussion	Initial and subsequent risk assessments identify Transmission stations or Transmission substations that need to be assessed for threats and vulnerabilities and potential physical security measures. Since this is a Requirement in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition. This justifies a High VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the risk assessment periodicity and the identification of the primary control center that has operational control of Transmission stations and/or Transmission substations.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable CIP-002-5.1 R1, which deals with categorizing cyber systems, is assigned a High VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Transmission Owner performed an initial risk assessment but did so after the date specified in the implementation plan for performing the initial risk assessment but less than or equal to two calendar months after that date;

VRF and VSL Justifications – CIP-014-1, R1	
	OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 30 calendar months but less than or equal to 32 calendar months; OR The Transmission Owner that has not identified in its previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 60 calendar months but less than or equal to 62 calendar months.
Proposed Moderate VSL	The Transmission Owner performed an initial risk assessment but did so more than two calendar months after the date specified in the implementation plan for performing the initial risk assessment but less than or equal to four calendar months after that date; OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 32 calendar months but less than or equal to 34 calendar months; OR The Transmission Owner that has not identified in its previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 62 calendar months but less than or equal to 64 calendar months.
Proposed High VSL	The Transmission Owner performed an initial risk assessment but did so more than four calendar months after the date specified in the implementation plan for performing the initial risk assessment but less than or equal to six calendar months after that date;

VRF and VSL Justifications – CIP-014-1, R1	
	OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 34 calendar months but less than or equal to 36 calendar months; OR The Transmission Owner that has not identified in its previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 64 calendar months but less than or equal to 66 calendar months; OR The Transmission Owner performed a risk assessment but failed to include Part 1.2.
Proposed Severe VSL	The Transmission Owner performed an initial risk assessment but did so more than six calendar months after the date specified in the implementation plan for performing the initial risk assessment; OR The Transmission Owner failed to perform an initial risk assessment; OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after more than 36 calendar months; OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection failed to perform a risk assessment; OR The Transmission Owner that has not identified in its previous risk

VRF and VSL Justifications – CIP-014-1, R1	
	assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after more than 66 calendar months; OR The Transmission Owner that has not identified in its previous risk assessment any Transmission station and Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection failed to perform a subsequent risk assessment.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if the risk assessment is not performed or if the risk assessment is not performed within required intervals.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The language of the VSL directly mirrors the language in the corresponding requirement.

VRF and VSL Justifications – CIP-014-1, R1	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is assigned for a single instance of failing to submit perform a risk assessment.

VRF and VSL Justifications – CIP-014-1, R2	
Proposed VRF	Medium
NERC VRF Discussion	Unaffiliated third party verification of initial and subsequent risk assessments provides reinforcement that the risk assessment was performed with due consideration to risk to the bulk power system. Since this Requirement is in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. This justifies a Medium VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the unaffiliated third party verification including entities that may perform the verification, provisions for adding or removing Transmission stations and/or Transmission substations, and provisions for confidentiality of sensitive information.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable EOP-005-2 R6, which deals with verifying that its restoration plan accomplishes its intended function is assigned a medium VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but did so in more than 90 calendar days but less than or equal to 100 calendar days following completion of Requirement R1;

VRF and VSL Justifications – CIP-014-1, R2	
	OR The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 and modified or documented the technical basis for not modifying its identification under Requirement R1 as required by part 2.3 but did so more than 60 calendar days and less than or equal to 70 calendar days from completion of the third party verification.
Proposed Moderate VSL	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but did so more than 100 calendar days but less than or equal to 110 calendar days following completion of Requirement R1; Or The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 and modified or documented the technical basis for not modifying its identification under Requirement R1 as required by part 2.3 but did so more than 70 calendar days and less than or equal to 80 calendar days from completion of the third party verification.
Proposed High VSL	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but did so more than 110 calendar days but less than or equal to 120 calendar days following completion of Requirement R1; OR The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 and modified or documented the technical basis for not modifying its identification under Requirement R1 as required by part 2.3 but did so more than 80 calendar days from completion of the third party verification; OR The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but failed to modify or document the technical basis for not modifying its identification under R1 as required by part 2.3.
Proposed Severe VSL	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but did so more than 120 calendar days following completion of Requirement R1; OR The Transmission Owner failed to have an unaffiliated third party

VRF and VSL Justifications – CIP-014-1, R2	
	verify the risk assessment performed under Requirement R1; OR The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but failed to implement procedures for protecting information per Part 2.4.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if an unaffiliated third party verification is not performed or if the verification is not performed within prescribe timelines. The VSLs are also written indicating violation of the Requirement Part regarding protection of information.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The language of the VSL directly mirrors the language in the corresponding requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based	The VSL is assigned for a single instance of failing to have an unaffiliated third party verification performed; or failing to perform the verification within prescribe timelines; or failing to implement procedures to protect information.

VRF and VSL Justifications – CIP-014-1, R2	
on A Single Violation, Not on A Cumulative Number of Violations	

VRF and VSL Justifications – CIP-014-1, R3	
Proposed VRF	Lower
NERC VRF Discussion	Notifying the Transmission Operator that it has operational control of a Transmission station or Transmission substation identified in Requirement R1 and verified in Requirement R2 is necessary so that the Transmission Operator may begin performance of subsequent physical security requirements for the primary control center. This is a requirement that is administrative in nature and in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. This justifies a Lower VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the notification of the Transmission Operator regarding the removal of a Transmission station or Transmission substation.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable INT-006-4 R6, which deals with notifying other entities so that Confirmed Interchange may be implemented, is assigned a Lower VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Transmission Owner notified the Transmission Operator that operates the primary control center as specified in Requirement R3 but did so more than seven calendar days and less than or equal to nine calendar days following the completion of Requirement R2; OR The Transmission Owner notified the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R1 but did so more than seven calendar

VRF and VSL Justifications – CIP-014-1, R3	
	days and less than or equal to nine calendar days following the verification or the subsequent risk assessment.
Proposed Moderate VSL	The Transmission Owner notified the Transmission Operator that operates the primary control center as specified in Requirement R3 but did so more than nine calendar days and less than or equal to 11 calendar days following the completion of Requirement R2; OR The Transmission Owner notified the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R1 but did so more than nine calendar days and less than or equal to 11 calendar days following the verification or the subsequent risk assessment.
Proposed High VSL	The Transmission Owner notified the Transmission Operator that operates the primary control center as specified in Requirement R3 but did so more than 11 calendar days and less than or equal to 13 calendar days following the completion of Requirement R2; OR The Transmission Owner notified the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R1 but did so more than 11 calendar days and less than or equal to 13 calendar days following the verification or the subsequent risk assessment.
Proposed Severe VSL	The Transmission Owner notified the Transmission Operator that operates the primary control center as specified in Requirement R3 but did so more than 13 calendar days following the completion of Requirement R2; OR The Transmission Owner failed to notify the Transmission Operator that it operates a control center identified in Requirement R1; OR The Transmission Owner notified the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R1 but did so more than 13 calendar days following the verification or the subsequent risk assessment. OR The Transmission Owner failed to notify the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R1.

VRF and VSL Justifications – CIP-014-1, R3	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if notification is not made subject to the conditions of the requirement.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The language of the VSL directly mirrors the language in the corresponding requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is assigned for a single instance of failing to make the appropriate notification.

VRF and VSL Justifications – CIP-014-1, R4	
Proposed VRF	Medium
NERC VRF Discussion	Performing an evaluation of potential threats and vulnerabilities of a physical attack to each of respective Transmission station(s), Transmission substation(s), and primary control center(s) is necessary to ensure the physical security of those assets as well as the reliability of the bulk power system. Since this Requirement is in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. This justifies a Medium VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the evaluation of potential threats and vulnerabilities of a physical attack to Transmission stations and/or Transmission substations.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable CIP-007-5 R2, which deals with a patch management process for tracking, evaluating, and installing cyber security patches for applicable Cyber Assets, is assigned a Medium VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	N/A

VRF and VSL Justifications – CIP-014-1, R4	
Proposed Moderate VSL	The Responsible Entity conducted an evaluation of the potential physical threats and vulnerabilities to each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but failed to consider one of Parts 4.1 through 4.3 in the evaluation.
Proposed High VSL	The Responsible Entity conducted an evaluation of the potential physical threats and vulnerabilities to each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but failed to consider two of Parts 4.1 through 4.3 in the evaluation.
Proposed Severe VSL	The Responsible Entity failed to conduct an evaluation of the potential physical threats and vulnerabilities to each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1; OR The Responsible Entity conducted an evaluation of the potential physical threats and vulnerabilities to each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but failed to consider Parts 4.1 through 4.3.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if a responsible entity fails to conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) or failed to consider any of the Requirement Parts 4.1-4.3.

VRF and VSL Justifications – CIP-014-1, R4	
Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The language of the VSL directly mirrors the language in the corresponding requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is assigned for a single instance of failing to conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) or failing to consider any of the Requirement Parts 4.1-4.3.

VRF and VSL Justifications – CIP-014-1, R5	
Proposed VRF	High
NERC VRF Discussion	Development, implementation and execution of a documented physical security plan(s) that covers applicable Transmission station(s), Transmission substation(s), and primary control center(s) is necessary to ensure the physical security of those assets as well as the reliability of the bulk power system. Since this Requirement is in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition. This justifies a High VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the physical security plan for applicable Transmission stations, Transmission substations, or primary control centers.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable CIP-003-3 R4, which deals with implementing and documenting a program to identify, classify, and protect information associated with Critical Cyber Assets, is assigned a High VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Responsible Entity developed and implemented a documented physical security plan(s) that covers each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but did so more than 120 calendar days but less than or equal to 130 calendar days after completing Requirement R2;

VRF and VSL Justifications – CIP-014-1, R5	
	OR The Responsible Entity developed and implemented a documented physical security plan(s) that covers its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2 but failed to include one of Parts 5.1 through 5.4 in the plan.
Proposed Moderate VSL	The Responsible Entity developed and implemented a documented physical security plan(s) that covers each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but did so more than 130 calendar days but less than or equal to 140 calendar days after completing Requirement R2; OR The Responsible Entity developed and implemented a documented physical security plan(s) that covers its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2 but failed to include two of Parts 5.1 through 5.4 in the plan.
Proposed High VSL	The Responsible Entity developed and implemented a documented physical security plan(s) that covers each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but did so more than 140 calendar days but less than or equal to 150 calendar days after completing Requirement R2; OR The Responsible Entity developed and implemented a documented physical security plan(s) that covers its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2 but failed to include three of Parts 5.1 through 5.4 in the plan.
Proposed Severe VSL	The Responsible Entity developed and implemented a documented physical security plan(s) that covers each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but did so more than 150 calendar days after completing the verification in Requirement R2; OR The Responsible Entity failed to develop and implement a documented physical security plan(s) that covers its Transmission

VRF and VSL Justifications – CIP-014-1, R5	
	station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1. OR The Responsible Entity developed and implemented a documented physical security plan(s) that covers its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2 but failed to include Parts 5.1 through 5.4 in the plan.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if a responsible entity fails to develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s) or if the responsible entity failed to include any of the Requirement Parts 5.1-5.4.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The language of the VSL directly mirrors the language in the corresponding requirement.
FERC VSL G4 Violation Severity Level	The VSL is assigned for a single instance of failing to develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and

VRF and VSL Justifications – CIP-014-1, R5	
Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	primary control center(s) or failing to include any of the Requirement Parts 5.1-5.4.

VRF and VSL Justifications – CIP-014-1, R6	
Proposed VRF	Medium
NERC VRF Discussion	Unaffiliated third party review of the threat evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 provides reinforcement that these requirements were performed with due consideration to risk to the bulk power system. Since this Requirement is in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. This justifies a Medium VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the unaffiliated third party review including entities that may perform the review, timelines for completing the review and provisions for confidentiality of sensitive information.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable EOP-005-2 R6, which deals with verifying that its restoration plan accomplishes its intended function is assigned a medium VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but did so in more than 90 calendar days but less than or equal to 100 calendar days;

VRF and VSL Justifications – CIP-014-1, R6	
	OR The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 and modified or documented the reason for not modifying the security plan(s) as specified in Part 6.3 but did so more than 60 calendar days and less than or equal to 70 calendar days following completion of the third party review.
Proposed Moderate VSL	The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but did so in more than 100 calendar days but less than or equal to 110 calendar days; OR The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 and modified or documented the reason for not modifying the security plan(s) as specified in Part 6.3 but did so more than 70 calendar days and less than or equal to 80 calendar days following completion of the third party review.
Proposed High VSL	The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but did so more than 110 calendar days but less than or equal to 120 calendar days; OR The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 and modified or documented the reason for not modifying the security plan(s) as specified in Part 6.3 but did so more than 80 calendar days following completion of the third party review; OR The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but did not and modify or document the reason for not modifying the security plan(s) as specified in Part 6.3.
Proposed Severe VSL	The Responsible Entity failed to have an unaffiliated third party

VRF and VSL Justifications – CIP-014-1, R6	
	review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 in more than 120 calendar days; OR The Responsible Entity failed to have an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5; OR The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but failed to implement procedures for protecting information per Part 6.3.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if an unaffiliated third party review is not performed or if the review is not performed within prescribe timelines. The VSLs are also written indicating violation of the Requirement Part regarding protection of information.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the	The language of the VSL directly mirrors the language in the corresponding requirement.

VRF and VSL Justifications – CIP-014-1, R6	
Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is assigned for a single instance of failing to have an unaffiliated third party review performed; or failing to perform the review within prescribe timelines; or failing to implement procedures to protect information.

Standards Announcement

Reminder

Project 2014-04 Physical Security
CIP-014-2

Initial Ballot and Non-binding Poll Open through April 9, 2015

Balloting and commenting for this project are in the Standards Balloting & Commenting System (SBS)

Now Available

An initial ballot for **CIP-014-2 – Physical Security** and a non-binding poll of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) are open through **8 p.m. Eastern, Thursday, April 9, 2015.**

Balloting

Members of the ballot pools associated with this project may log in and submit their votes for the standard and associated VRFs and VSLs by clicking here.

Next Steps

The ballot results will be announced and posted on the project page. The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standard and post it for an additional ballot. If the comments do not show the need for significant revisions, the standard will proceed to a final ballot.

For more information on the **Standards Development Process**, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Stephen Crutchfield (via email), or at (609) 651-9455.

Standards Announcement

Project 2014-04 Physical Security
CIP-014-2

Formal Comment Period Now Open through April 9, 2015
Ballot Pools Forming Now through March 23, 2015

Balloting and commenting for this project are in the Standards Balloting & Commenting System (SBS)

Now Available

A 45-day formal comment period for the **CIP-014-2 - Physical Security** standard is open through **8 p.m. Eastern, Thursday, April 9, 2015.**

SBS Login, Registration, Validation and Permissions

To **comment** in the SBS, you must have a contributor, voter, or proxy role.
To **join a ballot pool and vote** in the SBS, you must have a voter role.
To be a **proxy** and vote in the SBS, you must have a proxy role.

To register to become a proxy or voter in the SBS:

- Go to 'My User Profile'
- Select 'Click Here' to request additional permissions
- Select 'Voter' or 'Proxy Voter'

Instructions for Commenting

Use the electronic form to submit comments on the standard. If you experience any difficulties in using the electronic form, please contact Wendy Muller. An off-line, unofficial copy of the comment form is posted on the project page.

Join the Ballot Pools

Note: If you had previously joined the ballot pools for CIP-014-1, you **must** join these ballot pools to cast a vote. Previous CIP-014-1 ballot pool members **have not** been carried over to these ballot pools.

Registered Ballot Body members may join the ballot pools here.

RSAW

The draft RSAW for the standard **CIP-014-2 - Physical Security** is posted on the project page. Submit comments regarding the draft RSAW to RSAWfeedback@nerc.net**.**

Next Steps

An initial ballot for the standard and a non-binding poll of the associated Violation Risk Factors and Violation Severity Levels will be conducted **March 31 through April 9, 2015.**

For more information on the **Standards Development Process**, refer to the Standard Processes Manual.

For more information or assistance, contact Standards Developer, Stephen Crutchfield (via email), or by telephone at 609-651-9455.

Survey Details

Name 2014-04 Physical Security

Description

Start Date 2/20/2015

End Date 4/10/2015

Associated Ballots

2014-04 Physical Security CIP-014-2 IN 1 ST

The Industry Segments are:

1 — Transmission Owners

2 — RTOs, ISOs

3 — Load-serving Entities

4 — Transmission-dependent Utilities

5 — Electric Generators

6 — Electricity Brokers, Aggregators, and Marketers

7 — Large Electricity End Users

8 — Small Electricity End Users

9 — Federal, State, Provincial Regulatory or other Government Entities

10 — Regional Reliability Organizations, Regional Entities

Survey Questions

See the Unofficial Comment Form on the Project Page for additional background information.

If you would like to bypass taking the survey, click the radio button and scroll down to submit the survey.

This will allow you to view Social Survey and agree / disagree with an already posted comment using the "thumbs up / thumbs down" feature.

Submitting a "thumbs up / thumbs down" on another entity's comment enables a negative vote to count in the calculation of consensus.

I want to bypass taking the survey

1. The PSSDT has revised CIP-014-1, Physical Security, to address the directive from FERC to to remove the term "widespread" from Reliability Standard CIP-014-1.

Do you agree with the proposed revisions to the standard contained in CIP-014-2 as summarized above? If not, please provide specific comments regarding the revisions and any suggestions for appropriate revisions.

Yes

No

Responses By Question

1. The PSSDT has revised CIP-014-1, Physical Security, to address the directive from FERC to to remove the term "widespread" from Reliability Standard CIP-014-1.

Do you agree with the proposed revisions to the standard contained in CIP-014-2 as summarized above? If not, please provide specific comments regarding the revisions and any suggestions for appropriate revisions.

Answer Comment:

The removal of widespread is ok, but there is a larger problem.

The CIP-014-2 Standard is missing some fundamental elements in R1 and R2 to assure reliability if the contemplated contingency were to actually occur, and to be consistent with other standards. To approve the standard as currently written creates inconsistencies among the entire family of reliability standards.

Station or substation damage would likely include equipment that could currently take as long as 16 months to replace. With such a lengthy period of time in which a damaged station could be out-of-service, the standard needs to explicitly require determination of limits under the system's new normal condition, and to accommodate more probable N-1 contingencies.

CIP-014 should also be consistent with other NERC standards, such as TOP-004, which requires operation within known operating limits, and preparing for the next contingency within 30 minutes. It is unrealistic to expect these limits to be determined in real-time after a substation-out event as contemplated in CIP-014.

The level of study performed in preparation for a loss of a substation (or station) can vary from one organization to another and not every system limit needs to be determined in advance. However, minimally, CIP-014 should require that generating units are confirmed to remain stable for the next N-1 contingency, that current IROLs are not degraded in the new normal condition, and that generation contingency reserves remain adequate.

My comment addresses the proposed Implementation Plan. While accepting that the change in the proposed standard is minor with respect to the currently approved version, it would be advisable to have an effective date that gives a more reasonable time, e.g. 30 days after the applicable date instead of the proposed day immediately after approval or day after the effective date of Version 1. This in order to permit relevant entities to do any necessary administrative work required for implementation.

Chris Scanlon - Exelon - 1 -

Selected Answer: Yes

Answer Comment:

Exelon agrees with the SDT proposal to remove the term "widespread" from Reliability Standard CIP-014-1. With that change we believe the standard is responsive to the directive and supportive of reliability.

We do not agree that an alternative modification is necessary to meet the concern raised in the Directive. Alternative modifications are likely to delay implementation and lead to new revisions requiring further clarification with no appreciable gain in reliability.

Allen Wallace - Fayetteville Public Works Commission - 3 -

Selected Answer: No

Answer Comment:

The concern with removing the term "widespread" is that it potentially imposes the requirements of the standard upon smaller

substations and entities that could have minimal impact on the BES. While I would prefer a more quantifiable determinant of applicability (customers affected, miles of transmission, load or generation lost, etc.) I believe that widespread is better than no discriminant at all.

Answer Comment:

With the word “widespread” removed, R1 is stating that if rendering a station inoperable results in any instability (large or small), the station should be declared critical. Depending on the severity of an instability, there may or may not be an impact on the operation of the interconnection. We are proposing the following modification to R1 to make it clearer in terms of reliability impact on the “Interconnection” in which the assessed facilities lie.

“Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria specified in Applicability Section 4.1.1. The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify the Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could result in a critical impact on the operation of the interconnected (or neighboring) power system by causing instability, uncontrolled separation, or Cascading within an Interconnection.”

Paul Haase - Seattle City Light - 1,3,4,5,6 - WECC

Error: Subreport could not be shown.

Selected Answer: Yes

Answer Comment:

Seattle City Light supports the proposed revisions expressed in draft CIP-014-2 to remove the undefined term "widespread" and votes affirmative. In particular Seattle supports the new guidance language added to the Standard and supporting documents to explain what is meant by the term "widespread" that would no longer be included in the Standard.

Seattle, however, would support the proposed draft further if the term "widespread" was not simply removed from CIP-014-2 but replaced everywhere by "critical." Although "critical" is no more defined than "widespread," the term is the exact word used by FERC in its Order requesting removal of "widespread" and relates directly to FERC and NERC guidance on the matter.

Answer Comment:

All though we agree the with the removal of the word “widespread” from the standard, we feel leaving the word “instability” in the standard still makes it vague and inconsistent. We suggest that both word “widespread” and “instability” be taken out to read R1 as follows:

“… The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify the Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could result in uncontrolled separation, or Cascading within an Interconnection.

The criticality of a facility to an interconnection is determined by its impact and not by instability. Instability is a symptom and not the final consequence. There are various types of instabilities and with consequence varying from a small 10 W generation tripping to an interconnection braking up and many things in between. There are many other symptoms which are also indicators of cascading such as excessive overload, very low voltages etc. but none of them are called out. So why leave instability in there?

The above proposed wording preserves all of the impact without dwelling on symptoms.

Darnez Gresham - Berkshire Hathaway Energy - MidAmerican Energy Co. - 1,3 - MRO

Selected Answer: No

Answer Comment:

FERC Order No. 802 states on page 18: "The definition in Requirement R1 should not be dependent on how an applicable entity interprets the term "widespread" but instead should be modified to make clear that a facility that has a critical impact on the operation of an Interconnection is critical and therefore subject to Requirement R1."

Rather than merely remove the word "widespread," NERC could better comply with the FERC order to provide clarity with a simple rearrangement of terms.

By reordering R1 from:

…if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection.

To:

…if rendered inoperable or damaged could result in uncontrolled separation or Cascading within, or the instability of, an Interconnection.

This reorganization maintains all the wording of R1 without introducing any undefined or subjective terms, but more clearly ties the term "instability" to "Interconnection." This better reflects the FERC intention of affecting an interconnection, and by changing the intervening modifier between the terms "instability" and "Interconnection" from "within" to "of" addresses the industry concern that R1, as left without the term "widespread," could be interpreted as applying to localized areas of instability

NSRF's concerns with the proposed changes to CIP-014-2 standard.

1. Removal of the term , "widespread", from R1 without replacement text in R1 - The qualifying concept of "widespread" was removed from R1 without replacing it with alternate text to address the Commission's concerns. This approach makes the text in R1 even less defined than the original CIP-014-1 text. For example, the modified text offers no criteria to define the degree of reliability impacts due to instability or uncontrolled separation that would qualify a substation. This approach would allow applicable entites and regulators to interpret even minor or the R1 text to expect a substation to be qualified by local or minor reliability impacts as qualifying a substation. Addressing the Commission's concerns by relegating criteria text to the Rationale for R1, rather than including criteria text in R1, allows the text to be disregarded because the rationale will be removed when the standard is finalized. Addressing the Commission's concerns by relegating text to to the Guidance and Technical Basis section, rather than including text in R1, allows the text to be disregarded because, not being part of R1, the the application of guidance text may be a judgement call. Our concern stems from FERC Order 693, section 253, which states that ". . . compliance will in all cases be measured by determining whether a party met or failed to meet the Requirement given the specific facts . . .". Each requirement must be clearly written for entities to follow. Any wording contained in a Guidance and Technical document is just that, wording. The words of "the Requirements within a standard define what an entity must do to be compliant".

Alternate text for R1 to replace2. Limiting the applicability of the term, “widespread””, to just instability – We interpret the qualification that the widespread reliability impact duerefers to “all three qualifying conditions – instability”, “, uncontrolled separation” and “Cascading, not to just instability alone.

3. Insufficient Use of NERC-Defined Terms - Alternate text for “widespread” should incorporatebe added to Requirement R1 and should make as much use of NERC defined-terms and concepts as much as possible. The NERC-defined term of “Adverse Reliability Impact” is used in Criterion 2.3 from Attachment 1 of the CIP-002-5.1 standard andFor example, the NERC-defined concept of “Interconnection Reliability Operating Limit” (IROL) is used in Criterion 2.9 from Attachment 1 of the CIP-002-5.1 standard. The FAC-010-2 standard already allows Planning Coordinators (PCs) to establishdefine criteria and methodology for establishing planning horizon IROLs that are appropriate for the PC’s area and the Interconnection where the limit will be applied.

Based on the preceding comments, 4. Clarification of the term, Interconnection – We interpret that the use of capitalized word “Interconnection” within the Purpose, R1, R1.1 bullet 1 and 2, and associated VSLs refers to any of the Eastern, Western, ERCOT or Quebec Interconnections, not a regional Balancing Authority interconnection or regional Independent System Operator interconnection.

NSRF suggests **recommends the following wording changes to address the above concerns:**

For Requirement R1, we suggest that the term, “widespread” in R1 be replaced with text like, “. . . if rendered inoperable or damaged could result an Adverse Reliability Impact on the BES within an Interconnection due to instability, uncontrolled separation, or Cascading” or “. .. . if rendered inoperable or damaged could result in the violation of one or more Interconnection Reliability Operation Limits (IROLs) within an Interconnection due to

instability, uncontrolled separation or Cascading within, or instability of, an Interconnection".

Also based on the preceding comments, ATC suggests revising the wording of the draft text in **For the R1 Rationale and** in the **Guidance and Technical Basis** section. ATC proposes that the wording near the end**Section**, we suggest the following modifications:

- {C}· Replace the wording of "The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the clarification text be simplified to focusfollowing: Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6; NERC EOP-004-2 reporting criteria; Area or magnitude of potential impact" with text that focuses on the concept on Adverse Reliability Impact or IROLs with language like, "The Transmission Owner should derive the criteria for the R1 risk assessment from the criteria used in the Adverse Reliability Impact definition or the criteria used to establish planning horizon IROLs as inper Requirement R3 of the NERC FAC-010-2 reliability standardReliability Standard."
- Add clarification regarding the four kinds of instability that should be considered with wording like, "The consideration of instability should include all four kinds of instability - steady state voltage instability, steady state angular instability, dynamic voltage instability, and dynamic angular instability."

Answer Comment:

Although we agree with removal of the term “widespread” from the standard, we do not find the supporting justification provided in the Rationale for R1 and/or the Guidelines and Technical Basis for R1 to be adequate and/or convincing. Specifically, we do not find the three proposed criteria for critical impact as particularly instructive to help identify which instability – out of the potentially several instabilities seen in the transmission analyses performed for R1 – would qualify as having a critical impact on the operation of the interconnection. Without a clear technical guidance on what are the attributes (quantitative and qualitative) of a “critical impact” instability” – that is, only an instability that has a critical impact on the operation of the interconnection, as stated in the March 7, 2014 Order – we do not see how the “excessive uncertainty in identifying critical facilities under R1” due to the undefined term “widespread” has been effectively addressed. Deletion of “widespread” without replacing it with adequately clear technical guidance on what constitutes a “critical impact instability” for an interconnection has only displaced the excessive uncertainty concern of FERC from “stability” to “critical impact” – it has not resolved it.

Since at least two of the three proposed criteria for critical impact puts the onus on the Transmission Owner (or its Transmission Planner) to determine (quantify) the “area or magnitude of potential impact” or determine how to identify “System instability” per R6 in TPL-001-4, this approach is prone to result in “critical impact” criteria that differ widely among the numerous Transmission Owners within each of the three Interconnections. This outcome would be incompatible and inconsistent with FERC’s stated guidance in the March 7, 2014 Order – and reiterated in the November 20, 2014 Order – that “***only*** an instability” that has a “critical impact on the operation ***of the interconnection***” (emphasis added) warrants finding that the facility resulting in the [critical interconnection impact] instability is deemed critical under Requirement R1.

We suggest the following two alternatives to address the above concerns:

1) Option 1: Enhance the technical guidance to provide a common Interconnection-wide criterion for what constitutes "critical impact" instability in the Interconnection. This would conceivably be different for each of the three Interconnections, resulting in three "critical impact" instability criteria. We note that this approach would be similar to what was adopted for the Order 754 stability studies/analyses. As such, we recommend using "Table C – Performance Measures" in the NERC Order 754 Data Request document as a good paradigm for developing an Interconnection-wide "critical impact" instability criteria.

2) Option 2: Modify Requirement R1 to recognize that only an instability that results in Cascading or uncontrolled separation within an Interconnection qualifies as one that has a "critical impact on the operation of the Interconnection". This approach implicitly acknowledges that all other instabilities have a limited (local) impact and therefore do not result in widespread instability, and widespread instability is synonymous with Cascading or uncontrolled separation. The following change in R1 and part 1.1 is suggested: "….could result in Cascading or uncontrolled separation within an Interconnection caused by (voltage or angular) instability and/or successive failures of overloaded Facilties."

Aside from the above, we suggest that the following compound sentence in the Rationale as well as Technical Basis be simplified and restructured to remove the existing contextual ambiguities that make comprehending its intent very difficult.

"The requirement is not to require identification of, and thus, not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or

damaged."

Further, we question if this sentence even belongs in the Rationale – it is hard to see how this provides a justification for Requirement R1. In fact, saying that "The requirement is not to require identification of…" appears to contradict the intent of the following verbiage in R1 "… transmission analyses designed to identify the…".

Lastly, it appears that the changes made in the following paragraph in the Rationale for R1 have inadvertently resulted in an incomplete/incoherent sentence within the parenthesis.

[It] **Requirement R1** also meets the [portion of the] **FERC** directive [from paragraph 11] for periodic reevaluation **of the risk assessment** by requiring the risk assessment to be performed every 30 months (or 60 months for an entity that has not identified in a previous risk assessment [any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled separation, or Cascading within an Interconnection]).

Answer Comment:

With the word “widespread” removed, Requirement R1 implies that if and when a station becomes inoperable and a potential threat for instability (large or small), uncontrolled separation or cascading, the station should be declared critical. Depending on the severity of an instability, there may or may not be any adverse impact on the operation of the interconnection. For example, if a station in a pocket or remote area should become inoperable and a potential threat for instability, it may not create any adverse impact on interconnected operations. Hence, to capture the intent of the requirement such that it addresses facilities that can impact interconnected operations, suggest modifying R1 as follows (see words underlined and in bold):

R1. Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria specified in Applicability Section 4.1.1. The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify the Transmission station(s) and Transmission substation(s) that if rendered

inoperable or damaged could result in **a critical impact on the operation of the interconnected power system by causing** instability, uncontrolled separation, or Cascading within an Interconnection.

For the Rationale Box for R1, we suggest replacing “among other criteria” with “for example.” This wording clarifies that the examples given are merely examples and not the only options for determining critical impact.

“[…] the Transmission Owner may determine the criteria for critical impact by considering, **for example**, any of the following:

- Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6
- NERC EOP-004-2 reporting criteria
- Area or magnitude of potential impact”

In paragraph 6 of the FERC Docket No. RD14-6-000, “interconnection” is lower case. Should “interconnection” as used in the standard’s Rationale for Requirement R1 and in the Guidelines and Technical Basis on page 31 be upper or lower case?

To make the wording of the Rationale for Requirement R1 consistent with the wording in RD14-6-000, suggest rewording the second sentence to read”…applicable Transmission Owner determines through objective analysis, technical expertise, and experienced judgment…”R6 Severe VSL: “The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under

	Requirement R5 but failed to implement procedures for protecting information per Part 6.3" should read "per Part 6.4".

Answer Comment:

Removing "widespread" from criteria will leave the Reliability Standard open to "local" impact assessments by the audit teams, which could have exponential implications even for small municipal utilities. Removing the term "widespread" opens the scope of the standard to unlimited interpretation. The term "widespread" has been commonly and generally used since the mandatory and effective date of the NERC Reliability Standards to exclude such common occurrences as a storm moving through the area (daily during the summer in Florida), causing damage up to and including

some transmission outages. Would a lightning strike on a bulk power substation causing it to operate be termed instability under the Reliability Standard or would the lightning strike also have to cause the connecting transmission lines to operate? Therefore, does removal of the word "widespread" for consideration of instability mean that every bulk power facility outage, for whatever reason is now in violation of instability? There has to be some degree of limiting language to prevent the unintended spiral that removal of the word "widespread" will cause. Entities are familiar with and understand the use of the term "widespread". Removing this modifier from the scope of assessment will require extensive instruction and scenario analysis to make the scope of the assessment clear.

Answer Comment:

1. The removal of the undefined term of “widespread” from R1 should have alternate text to address the Commission’s concern(s) and to provide industry with clarity to the applicability of transmission facilities. While we understand the drafting team’s response to FERC’s directive to remove “widespread,” this language should be modified to make clear that a facility that has a

critical impact on the operation of an Interconnection is critical and therefore subject to Requirement R1. This blanket removal of 'widespread' from the requirements makes the text in R1 even more vague and subjective than the original CIP-014-1 language that is subject to interpretation and may result in a standard that is not auditable. By removing the word widespread, there is no clear delineation of reliability impact(s) due to instability or uncontrolled separation that would qualify a substation. This language change will cause inconsistent implementation across the regions and Transmission Planners or Planning Coordinators. Furthermore, given the cost implications on a possible Transmission Owner, more clarity and certainty of scope is needed.

2. Adding to the Rationale and Guideline and Technical Basis for Requirement R1 does not address the FERC Directive. The Rationale section while assisting industry to better understand the intention of the PSSDT is not enforceable and will result in an inconsistent R1 implementation across the regions.

3. The PSSDT should refer to NERC defined-terms and concepts, where appropriate. To add clarity to 'widespread,' the PSSDT should consider the NERC defined terms of "Adverse Reliability Impact" (Criterion 2.3 from Attachment 1 of the CIP-002-5.1), "Interconnection Reliability Operating Limit" (Criterion 2.9 from Attachment 1 of the CIP-002-5.1), and the FAC-010-2 standard that is in place to assist Planning Coordinators (PC) to establish planning horizon IROLs that are appropriate for the PC's area and the Interconnections.

4. Thank you for time, attention and consideration regarding these CIP-014-2 comments.

Selected Answer: Yes

Answer Comment:

Agree that removing the term widespread removes some subjectivity, however additional clarity on what is meant by the term "instability" would be beneficial in helping entities determine the appropriate critiera to be applied, as part of their risk assessment, in the identification of facilities in-scope to this standard.

Maryclaire Yatsko - Seminole Electric Cooperative, Inc. - 1,3,4,5,6 - FRCC

Selected Answer: Yes

Answer Comment:

With the deletion of the term "widespread" from CIP-014, the TO

must *determine* whether instability, uncontrolled separation, or Cascading within an Interconnection could occur if the station was damaged or rendered inoperable. For jointly-owned facilities, i.e., two or more TOs at a Transmission station or Transmission substation, the Standard states the following on page 30 of 39:

"On the issue of joint ownership, the SDT recognizes that this issue is not unique to CIP-014, and expects that the applicable Transmission Owners and Transmission Operators will develop memorandums of understanding, agreements, Coordinated Functional Registrations, or procedures, etc., to designate responsibilities under CIP-014 when joint ownership is at issue, which is similar to what many entities have completed for other Reliability Standards."

In order to delegate responsibility to a single TO at a jointly-owned facility to make the above cited determination and the remaining Requirements in the Standard, Seminole Electric has the following questions:

(1) Can a Coordinated Functional Registration agreement (CFR), Joint Registration Organization agreement (JRO), or Memo of Understanding (MOU) be drafted on a station-by-station basis between parties? Seminole Electric is unaware whether CFRs and JROs can be developed and approved by NERC on a station-by-station basis and requests more information on this issue.

(2) In delegating responsibility for the Requirements in jointly-owned facilities under CIP-014-2, can an MOU be a sufficient mechanism to delegate authority if drafted sufficiently, or does the drafting team reason that ultimately a CFR or JRO must be executed between the co-owners (multiple TOs) at a station? Seminole Electric has been told that MOUs may be ineffective in delegating responsibility for the Requirements for jointly-owned facilities and that CFRs and JROs should be executed instead.

Answer Comment:

The group has a concern in reference to the removal of the term 'widespread' in that removing it doesn't provide any boundries to the scope of the instability or cascading outages. With that being said, this can lead to continued inconsistency throughout the industry. We understand that the Commission has a large concern about the term 'widespread' being in the doucmenation and the group would like to propose alternative language stated as followed: "instability uncontrolled separation or cascasding that would cause or affect an Operational IROL within the Interrconnection".

The group also has a concern pertaining to CIP-014 in reference to a Transmission Owner completing their assessment (which is due on or before October 15, 2015) more than 90 days before October 1. There is some confusion on when the verification would be completed (if the assessment was finished June 1). Does the Transmission Owner have 90 days from October 1 or 90 days from June 1? This would be with the assumption that the effective date is October 1. We would like the drafting team to provide more clarity in reference to Requirement R2.2 addressing this issue.

We have a concern about Requirement R4 and its timeline requirement. In the standard's Rationale Box for R4 (second paragraph), it states "Requirement R4 doesn't explicitly states when the evaluation has to be completed" however, Requirement R5 development of a security plan(s) depend on this information. We would like for the SDT to provide more detailed information on when the evaluation needs to be completed.

First line of the first paragraph of Requirement R3…. Page 9. The term ‘control center’ should be capitalized as its shown the Glossary of Terms. Additionally, this applicable for the last sentence of the paragraph.

First line of the first paragraph of Requirement R5…. Page 11. The term ‘control center’ should be capitalized as its shown the Glossary of Terms.

Erika Doot - U.S. Bureau of Reclamation - 5 -

Selected Answer: No

Answer Comment:

The Bureau of Reclamation (Reclamation) does not agree with removing the term “widespread” from R1 without adding clarifying language in the text of the standard. This approach makes the text in R1 even less defined than the original CIP-014-1 text because it offers no criteria of what degree of reliability impacts due to instability or uncontrolled separation is appropriate to determine facilities identified under R1. This approach could cause a much broader range of facilities to come within the scope of the standard by allow interpretations that even minor or local reliability impacts result in some degree of “instability… within an interconnection.” Reclamation is concerned that the removal of the term "widespread" could expand the standard to include remote facilities that if lost could impact relatively small and isolated load pockets. Reclamation suggests that the drafting team include a

footnote referencing TPL-001-4 R6 criteria, reference other specific criteria like facilities affecting IROLs, or at least incorporate FERC's language "has a critical impact on the operation of the interconnection" into the language of R1. In the alternative, the drafting team could reference a specific area or magnitude of potential impact. Unlike the rationale statement, clarifying requirement language or a footnote would be an enforceable component the standard if approved by FERC. The clarifying language would ensure that the scope of facilities identified under R1 would not be dramatically broadened with the removal of the term "widespread."

Spencer Tacke - Modesto Irrigation District - 4 -

Selected Answer: No

Answer Comment:

I am voting NO because I believe the Standard should be very specific as to what constitutes "damaged", if it is not equal to being "inoperable", as used in the Standard. Also, the Standard needs to be very specific about the method of "transmission analysis" for rendering the station "inoperable", such as complete loss of the station resulting in a three phase fault on the station bus, etc.. The Standard is very specific and clear as how to determine which facilities need to be analyzed (i.e., those exceeding an aggregate weighted value of 3000 as specified in Section 4.1.1.2), and it needs to be just as specific in defining "damaged" and the method of "transmission analysis".

Thank you.

Sincerely,

Spencer Tacke, MID

Selected Answer:	No
Answer Comment:	With the removal of the term “widespread,” Requirement R1 implies that, if and when a station becomes inoperable and a potential threat for instability (large or small), uncontrolled separation or Cascading, the station should be declared critical. However, whether there is an adverse impact on the “operation of the interconnection” depends on the severity of an instability. In particular, a station or substation may create local instability, but there may or may not have an adverse or critical impact on the “operation of the Interconnection.” For example, if a station in a pocket or remote area should become inoperable and a potential threat for instability, it may create local instability, but such local instability may not impact the operation of the interconnected system in any way. Hence, to declare such a station as “critical” would defeat the purpose of focusing security operations on those stations and substations that have a “critical impact on the operation of the Interconnection.” The SRC appreciates that the Standard Drafting Team attempted to provide additional criteria to determine the criticality of impact by provding some guidance in the rationale section for Requirement R1. However, the SRC respectfully suggests that there is a potential that such guidance may result in diverse criteria regarding criticality, which would, in turn, result in substantially different determinations of criticality across and within the Interconnections. It may also create unintended complications regarding compliance with and activities performed under other reliability standards. Hence, given the interconnected nature of the grid and the reliability standards with which Transmission Operators and Owners must comply and to ensure that the requirement effectively conveys the intent to address facilities with a “critical impact of the operations of the interconnection” and is able to be applied consistently, the SRC recommends that Requirement R1 be modified as follows (see words in red): R1. Each Transmission Owner shall perform an initial risk

assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria specified in Applicability Section 4.1.1. The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify the Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could cause instability, uncontrolled separation, or Cascading that could result in critical, adverse impacts to the operation of the interconnected power system.

Selected Answer: No

Answer Comment:

The proposed method of addressing the FERC directive to remove the term 'widespread' meets the specific language in the Order, however, it leaves the responsible entity and the Regional Compliance Organizations with regulatory uncertainty as to the scope of what constitutes 'instability' in regards to Requirement R1. The revised Rationale does little to clarify the issue for the responsible entity and the Regional Compliance Organizations. The Rationale box provides some insight, but does not provide the clarity needed in the standard. FERC stated that only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1. The SDT should build off of this concept to provide the needed clarity in the standard. One option would be too revise the requirement and then qualify what constitutes 'critical impact' from an operational perspective (for example: the loss would result in exceeding an operating limit). The proposed language for R1 is below.

"…The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify the Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could result in instability that has a critical impact on the operation of the Interconnection, uncontrolled separation, or Cascading within an Interconnection."

The guidance provided in the text box only provides examples of criteria that "may" be considered. Again this provides no regulatory certainty for the responsible entity and the Regional Compliance Organization. Additionally, the guidance reintroduces the concept of an 'area or magnitude of potential impact' which was eliminated

from the Requirement with the deletion of the term ‘widespread’. This concept should be removed from the guidance. Further, this guidance may introduce unintended consequences and could influence a weakening of the criteria established by the Planning Coordinators in response to R6 of TPL-004-1.

Additional Comments

Andrea Basinski – Puget Sound Energy

There are a couple of things which seem confusing:

- There seems to be conflict with timelines, comparing the Standard itself to the Implementation Plan.
  R2.2 places a timeline for completion of 90 calendar days after the completion of the R1 assessment, and word has filtered down that WECC said that if the R1 assessment is completed prior to the effective date, the clock starts ticking on the R2.2 90 days.

  However, the implementation plan says that R2.2 has to be completed with 90 calendar days of the effective date of the Standard. That could be a very different end date for R2.2.

- CIP-014-2 is positioned to become effective the day after CIP-014-1 becomes effective, with -1 being retired at midnight of the same day it becomes effective. This might not be an issue of -1 is superseded by -2, and never becomes effective, but you never know.

Project Name: 2014-04 Physical Security

Comment Period Start Date: 2/20/2015

Comment Period End Date: 4/10/2015

Associated Ballot: 2014-04 Physical Security CIP-014-2 IN 1 ST

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact the Senior Director of Standards, Valerie Agnew (via email) or at (404) 446-2566.

Summary Consideration:
Most commenters agreed with the proposed revisions to address the directive from FERC Order 802 to remove the term widespread from the standard. The SDT made the decision to add guidance and rationale rather than to expand on the requirement to address the FERC directive to remove "widespread". The SDT considered additional descriptive language in the requirement to replace "widespread" but decided against doing so because the additional descriptors did not provide clarity and resulted in similar ambiguity to the use of "widespread". The language of the requirement mirrors the language of the FERC order and has been widely accepted by industry.

Summary of non-substantive revisions:

- Rationale for R1: Edited the second sentence for clarity.
- Rationale for R1 (second paragraph): Added back language that was inadvertently deleted previously.
- Severe VSL for R6: Corrected a reference to Part 6.3 to Part 6.4
- Updated the date in the footer.

1. The PSSDT has revised CIP-014-1, Physical Security, to address the directive from FERC to to remove the term "widespread" from Reliability Standard CIP-014-1.

Do you agree with the proposed revisions to the standard contained in CIP-014-2 as summarized above? If not, please provide specific comments regarding the revisions and any suggestions for appropriate revisions.

Answer Comment:	The removal of widespread is ok, but there is a larger problem. The CIP-014-2 Standard is missing some fundamental elements in R1 and R2 to assure reliability if the contemplated contingency were to actually occur, and to be consistent with other standards. To approve the standard as currently written creates inconsistencies among the entire family of reliability standards. Station or substation damage would likely include equipment that could currently take as long as 16 months to replace. With such a lengthy period of time in which a damaged station could be out-of-service, the standard needs to explicitly require determination of limits under the system's new normal

condition, and to accommodate more probable N-1 contingencies.

CIP-014 should also be consistent with other NERC standards, such as TOP-004, which requires operation within known operating limits, and preparing for the next contingency within 30 minutes. It is unrealistic to expect these limits to be determined in real-time after a substation-out event as contemplated in CIP-014.

The level of study performed in preparation for a loss of a substation (or station) can vary from one organization to another and not every system limit needs to be determined in advance. However, minimally, CIP-014 should require that generating units are confirmed to remain stable for the next N-1 contingency, that current IROLs are not degraded in the new normal condition, and that generation contingency reserves remain adequate.

Response: The SDT made the decision to add guidance and rationale rather than to expand on the requirement to address the FERC directive to remove "widespread". The SDT considered additional descriptive language in the requirement to replace "widespread" but decided against doing so because the additional descriptors did not provide clarity and resulted in similar ambiguity to the use of "widespread". The standard is written to allow flexibility in how the risk assessments are

performed rather than create a prescriptive "one size fits all" requirement.

Answer Comment:	My comment addresses the proposed Implementation Plan. While accepting that the change in the proposed standard is minor with respect to the currently approved version, it would be advisable to have an effective date that gives a more reasonable time, e.g. 30 days after the applicable date instead of the proposed day immediately after approval or day after the effective date of Version 1. This in order to permit relevant entities to do any necessary administrative work required for implementation.

Response: The SDT does not believe that the Implementation Plan creates a burden for applicable entities. The SDT does not believe that an entity will need to repeat the initial risk assessment for CIP-014-2.

Chris Scanlon - Exelon - 1 -

Selected Answer: Yes

Answer Comment:

Exelon agrees with the SDT proposal to remove the term “widespread” from Reliability Standard CIP-014-1. With that change we believe the standard is responsive to the directive and supportive of reliability.

We do not agree that an alternative modification is necessary to meet the concern raised in the Directive. Alternative modifications are likely to delay implementation and lead to new revisions requiring further clarification with no appreciable gain in reliability.

Response: Thank you for your support.

Allen Wallace - Fayetteville Public Works Commission - 3 -

Selected Answer: No

Answer Comment:

The concern with removing the term "widespread" is that it potentially imposes the requirements of the standard upon smaller substations and entities that could have minimal impact on the BES. While I would prefer a more quantifiable determinant of applicability (customers affected, miles of transmission, load or generation lost, etc.) I believe that widespread is better than no discriminant at all.

Response: The language of the requirement was revised to meet the FERC directive to remove the term 'widespread" and has been widely accepted by industry. The SDT made the decision to add guidance and rationale rather than to expand on the requirement to address the FERC directive to remove "widespread". The SDT considered additional descriptive language in the requirement to replace "widespread" but decided against doing so because the additional descriptors did not

provide clarity and resulted in similar ambiguity to the use of "widespread".

Leonard Kula - Independent Electricity System Operator - 2 -

Selected Answer: Yes

Answer Comment:

With the word "widespread" removed, R1 is stating that if rendering a station inoperable results in any instability (large or small), the station should be declared critical. Depending on the severity of an instability, there may or may not be an impact on the operation of the interconnection. We are proposing the following modification to R1 to make it clearer in terms of reliability impact on the "Interconnection" in which the assessed facilities lie.

"Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months)

that meet the criteria specified in Applicability Section 4.1.1. The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify the Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could result in a critical impact on the operation of the interconnected (or neighboring) power system by causing instability, uncontrolled separation, or Cascading within an Interconnection."

Response: Use of the term "critical impact" does not provide any more clarity or guidance than using the term "widespread". The SDT decided to provide language in the guidance rather than try to revise the requirement to address the directive to remove "widespread".

Paul Haase - Seattle City Light - 1,3,4,5,6 - WECC

Selected Answer:	Yes
Answer Comment:	Seattle City Light supports the proposed revisions expressed in draft CIP-014-2 to remove the undefined term "widespread" and votes affirmative. In particular Seattle supports the new guidance language added to the Standard and supporting documents to explain what is meant by the term "widespread" that would no longer be included in the Standard.

		Seattle, however, would support the proposed draft further if the term "widespread" was not simply removed from CIP-014-2 but replaced everywhere by "critical." Although "critical" is no more defined than "widespread," the term is the exact word used by FERC in its Order requesting removal of "widespread" and relates directly to FERC and NERC guidance on the matter.
Response: Use of the term “critical impact” does not provide any more clarity or guidance than using the term “widespread”. The SDT made the decision to add guidance and rationale rather than to expand on the requirement to address the FERC directive to remove “widespread”. The SDT considered additional descriptive language in the requirement to replace “widespread” but decided against doing so because the additional descriptors did not provide clarity and resulted in similar ambiguity to the use of “widespread”.

Donna Turner - APS - Arizona Public Service Co. - 1,3,5,6 - WECC

Selected Answer:	No
Answer Comment:	All though we agree the with the removal of the word “widespread” from the standard, we feel leaving the word “instability” in the standard still makes it vague and inconsistent. We suggest that both word “widespread” and “instability” be taken out to read R1 as follows:

"… The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify the Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could result in uncontrolled separation, or Cascading within an Interconnection.

The criticality of a facility to an interconnection is determined by its impact and not by instability. Instability is a symptom and not the final consequence. There are various types of instabilities and with consequence varying from a small 10 W generation tripping to an interconnection braking up and many things in between. There are many other symptoms which are also indicators of cascading such as excessive overload, very low voltages etc. but none of them are called out. So why leave instability in there?

The above proposed wording preserves all of the impact without dwelling on symptoms.

Response: The language of the requirement mirrors the language of the FERC order and has been widely accepted by industry. The SDT made the decision to add guidance and rationale rather than to expand on the requirement to address the FERC directive to remove "widespread". The SDT considered additional descriptive language in the requirement to replace "widespread" but

decided against doing so because the additional descriptors did not provide clarity and resulted in similar ambiguity to the use of "widespread".

Darnez Gresham - Berkshire Hathaway Energy - MidAmerican Energy Co. - 1,3 - MRO

Selected Answer:	No
Answer Comment:	**FERC Order No. 802 states on page 18:** "The definition in Requirement R1 should not be dependent on how an applicable entity interprets the term "widespread" but instead should be modified to make clear that a facility that has a critical impact on the operation of an Interconnection is critical and

therefore subject to Requirement R1."

Rather than merely remove the word "widespread," NERC could better comply with the FERC order to provide clarity with a simple rearrangement of terms.

By reordering R1 from:

…if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection.

To:

…if rendered inoperable or damaged could result in uncontrolled separation or Cascading within, or the instability of, an Interconnection.

This reorganization maintains all the wording of R1 without introducing any undefined or subjective terms, but more clearly ties the term "instability" to "Interconnection." This better reflects the FERC intention of affecting an interconnection, and by changing the intervening modifier between the terms "instability" and "Interconnection" from "within" to "of" addresses the industry concern that R1, as left without the term "widespread," could be interpreted as applying to localized areas of instability

Response: The SDT made the decision to add guidance and rationale rather than to expand

on the requirement to address the FERC directive to remove "widespread". The SDT considered additional descriptive language in the requirement to replace "widespread" but decided against doing so because the additional descriptors did not provide clarity and resulted in similar ambiguity to the use of "widespread". The language of the requirement mirrors the language of the FERC order and has been widely accepted by industry.

Emily Rousseau - MRO - 1,2,3,4,5,6 - MRO

Selected Answer: Yes

Answer Comment:

NSRF's concerns with the proposed changes to CIP-014-2 standard.

1. Removal of the term , "widespread", from R1 without replacement text in R1 - The qualifying concept of "widespread" was removed from R1 without replacing it with alternate text to address the Commission's concerns. This approach makes the text in R1 even less defined than the original CIP-

014-1 text. For example, the modified text offers no criteria to define the degree of reliability impacts due to instability or uncontrolled separation that would qualify a substation. This approach would allow applicable entites and regulators to interpret even minor or the R1 text to expect a substation to be qualified by local or minor reliability impacts as qualifying a substation. Addressing the Commission's concerns by relegating criteria text to the Rationale for R1, rather than including criteria text in R1, allows the text to be disregarded because the rationale will be removed when the standard is finalized. Addressing the Commission's concerns by relegating text to to the Guidance and Technical Basis section, rather than including text in R1, allows the text to be disregarded because, not being part of R1, the the application of guidance text may be a judgement call. Our concern stems from FERC Order 693, section 253, which states that ". . . compliance will in all cases be measured by determining whether a party met or failed to meet the Requirement given the specific facts . . .". Each requirement must be clearly written for entities to follow. Any wording contained in a Guidance and Technical document is just that, wording. The words of "the Requirements within a standard define what an entity must do to be compliant".

Alternate text for R1 to replace2. Limiting the applicability of the term, "widespread"", to just instability – We interpret the qualification that the widespread reliability impact duerefers to "all three qualifying conditions – instability", ",

uncontrolled separation" and "Cascading, not to just instability alone.

3. Insufficient Use of NERC-Defined Terms - Alternate text for "widespread" should incorporatebe added to Requirement R1 and should make as much use of NERC defined-terms and concepts as much as possible. The NERC-defined term of "Adverse Reliability Impact" is used in Criterion 2.3 from Attachment 1 of the CIP-002-5.1 standard andFor example, the NERC-defined concept of "Interconnection Reliability Operating Limit" (IROL) is used in Criterion 2.9 from Attachment 1 of the CIP-002-5.1 standard. The FAC-010-2 standard already allows Planning Coordinators (PCs) to establishdefine criteria and methodology for establishing planning horizon IROLs that are appropriate for the PC's area and the Interconnection where the limit will be applied.

Based on the preceding comments, 4. Clarification of the term, Interconnection – We interpret that the use of capitalized word "Interconnection" within the Purpose, R1, R1.1 bullet 1 and 2, and associated VSLs refers to any of the Eastern, Western, ERCOT or Quebec Interconnections, not a regional Balancing Authority interconnection or regional Independent System Operator interconnection.

NSRF suggests **recommends the following wording changes to address the above**

concerns:

For Requirement R1, we suggest that the term, “widespread” in R1 be replaced with text like, “. . . if rendered inoperable or damaged could result an Adverse Reliability Impact on the BES within an Interconnection due to instability, uncontrolled separation, or Cascading” or “. .. . if rendered inoperable or damaged could result in the violation of one or more Interconnection Reliability Operation Limits (IROLs) within an Interconnection due to instability, uncontrolled separation or Cascading within, or instability of, an Interconnection”.

Also based on the preceding comments, ATC suggests revising the wording of the draft text in **For the R1 Rationale and** in the **Guidance and Technical Basis** section. ATC proposes that the wording near the end **Section**, we suggest the following modifications:

- {C}· Replace the wording of “The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the clarification text be simplified to focus following: Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6; NERC EOP-004-2 reporting criteria; Area or magnitude of potential impact” with text that focuses on the concept on Adverse Reliability Impact or IROLs with language like, “The Transmission Owner should derive the criteria for the R1 risk assessment from the criteria used in the

Adverse Reliability Impact definition or the criteria used to establish planning horizon IROLs as inper Requirement R3 of the NERC FAC-010-2 reliability standardReliability Standard."

- Add clarification regarding the four kinds of instability that should be considered with wording like, "The consideration of instability should include all four kinds of instability - steady state voltage instability, steady state angular instability, dynamic voltage instability, and dynamic angular instability."

Response: 1-3: The SDT made the decision to add guidance and rationale rather than to expand on the requirement to address the FERC directive to remove "widespread". The SDT considered additional descriptive language in the requirement to replace "widespread" but decided against doing so because the additional descriptors did not provide clarity and resulted in similar ambiguity to the use of "widespread". The language of the requirement mirrors the language of the FERC order and has been widely accepted by industry. The language of the requirement mirrors the language of the FERC order and has been widely accepted by industry.
4: You are correct.

Amy Casuscelli - Xcel Energy, Inc. - 1,3,5,6 - MRO,WECC,SPP

Selected Answer: No

Answer Comment:

Although we agree with removal of the term "widespread" from the standard, we do not find the supporting justification provided in the Rationale for R1 and/or the Guidelines and Technical Basis for R1 to be adequate and/or convincing. Specifically, we do not find the three proposed criteria for critical impact as particularly instructive to help identify which instability – out of the potentially several instabilities seen in the transmission analyses performed for R1 – would qualify as having a critical impact on the operation of the interconnection. Without a clear technical guidance on what are the attributes (quantitative and qualitative) of a "critical impact" instability" – that is, only an instability that has a critical impact on the operation of the interconnection, as stated in the March 7, 2014 Order – we do not see how the "excessive uncertainty in identifying critical facilities under R1" due to the undefined term

"widespread" has been effectively addressed. Deletion of "widespread" without replacing it with adequately clear technical guidance on what constitutes a "critical impact instability" for an interconnection has only displaced the excessive uncertainty concern of FERC from "stability" to "critical impact" – it has not resolved it.

Since at least two of the three proposed criteria for critical impact puts the onus on the Transmission Owner (or its Transmission Planner) to determine (quantify) the "area or magnitude of potential impact" or determine how to identify "System instability" per R6 in TPL-001-4, this approach is prone to result in "critical impact" criteria that differ widely among the numerous Transmission Owners within each of the three Interconnections. This outcome would be incompatible and inconsistent with FERC's stated guidance in the March 7, 2014 Order – and reiterated in the November 20, 2014 Order – that "***only*** an instability" that has a "critical impact on the operation ***of the interconnection***" (emphasis added) warrants finding that the facility resulting in the [critical interconnection impact] instability is deemed critical under Requirement R1.

We suggest the following two alternatives to address the above concerns:

1) Option 1: Enhance the technical guidance to provide a common Interconnection-wide criterion for what constitutes "critical impact" instability in the Interconnection. This would conceivably be

different for each of the three Interconnections, resulting in three “critical impact” instability criteria. We note that this approach would be similar to what was adopted for the Order 754 stability studies/analyses. As such, we recommend using “Table C – Performance Measures” in the NERC Order 754 Data Request document as a good paradigm for developing an Interconnection-wide “critical impact” instability criteria.

2) Option 2: Modify Requirement R1 to recognize that only an instability that results in Cascading or uncontrolled separation within an Interconnection qualifies as one that has a “critical impact on the operation of the Interconnection”. This approach implicitly acknowledges that all other instabilities have a limited (local) impact and therefore do not result in widespread instability, and widespread instability is synonymous with Cascading or uncontrolled separation. The following change in R1 and part 1.1 is suggested: “….could result in Cascading or uncontrolled separation within an Interconnection caused by (voltage or angular) instability and/or successive failures of overloaded Facilties.”

Aside from the above, we suggest that the following compound sentence in the Rationale as well as Technical Basis be simplified and restructured to remove the existing contextual ambiguities that make comprehending its intent very difficult.

“The requirement is not to require

identification of, and thus, not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged."

Further, we question if this sentence even belongs in the Rationale – it is hard to see how this provides a justification for Requirement R1. In fact, saying that "The requirement is not to require identification of…" appears to contradict the intent of the following verbiage in R1 "… transmission analyses designed to identify the…".

Lastly, it appears that the changes made in the following paragraph in the Rationale for R1 have inadvertently resulted in an incomplete/incoherent sentence within the parenthesis.

[It] **Requirement R1** also meets the [portion of the] **FERC** directive [from paragraph 11] for periodic reevaluation **of the risk assessment** by requiring the risk assessment to be performed every 30 months (or 60 months for an entity that has not identified in a previous risk assessment [any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in widespread instability, uncontrolled

separation, or Cascading within an Interconnection]).

Response: The SDT made the decision to add guidance and rationale rather than to expand on the requirement to address the FERC directive to remove "widespread". The SDT considered additional descriptive language in the requirement to replace "widespread" but decided against doing so because the additional descriptors did not provide clarity and resulted in similar ambiguity to the use of "widespread". The language of the requirement mirrors the language of the FERC order and has been widely accepted by industry. The language of the requirement mirrors the language of the FERC order and has been widely accepted by industry.

Regarding your proposed edits to the Rationale for R1, the SDT concurs and has revised the language for clarity and to add the language previously deleted.

John Merrell - Tacoma Public Utilities (Tacoma, WA) - 1 -

Selected Answer:	Yes
Answer Comment:	
Response:	
Likes:	0
Dislikes:	0

Lee Pedowicz - Northeast Power Coordinating Council - 10 - NPCC

Selected Answer:	No
Answer Comment:	With the word “widespread” removed, Requirement R1 implies that if and when a station becomes inoperable and a potential threat for instability (large or small), uncontrolled separation or cascading, the station should be declared critical. Depending on the severity of an instability, there may or may not be any adverse impact on the operation of the

		interconnection. For example, if a station in a pocket or remote area should become inoperable and a potential threat for instability, it may not create any adverse impact on interconnected operations. Hence, to capture the intent of the requirement such that it addresses facilities that can impact interconnected operations, suggest modifying R1 as follows (see words underlined and in bold): R1. Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria specified in Applicability Section 4.1.1. The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify the Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could result in **a critical impact on the operation of the interconnected power system by causing** instability, uncontrolled separation, or Cascading within an Interconnection. For the Rationale Box for R1, we suggest replacing “among other criteria” with “for example.” This wording clarifies that the examples given are merely examples and not the only options for determining critical impact.

"[…] the Transmission Owner may determine the criteria for critical impact by considering, **for example**, any of the following:

- Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6
- NERC EOP-004-2 reporting criteria
- Area or magnitude of potential impact"

In paragraph 6 of the FERC Docket No. RD14-6-000, "interconnection" is lower case. Should "interconnection" as used in the standard's Rationale for Requirement R1 and in the Guidelines and Technical Basis on page 31 be upper or lower case?

To make the wording of the Rationale for Requirement R1 consistent with the wording in RD14-6-000, suggest rewording the second sentence to read"…applicable Transmission Owner determines through objective analysis, technical expertise, and experienced judgment…"

R6 Severe VSL: "The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but failed to implement procedures for protecting information per Part

6.3” should read “per Part 6.4”.

Response: Use of the term “critical impact” does not provide any more clarity or guidance than using the term “widespread”. The SDT made the decision to add guidance and rationale rather than to expand on the requirement to address the FERC directive to remove “widespread”. The SDT considered additional descriptive language in the requirement to replace “widespread” but decided against doing so because the additional descriptors did not provide clarity and resulted in similar ambiguity to the use of “widespread”. The language of the requirement mirrors the language of the FERC order and has been widely accepted by industry.

The use of Interconnection is intended to be one of the four Interconnections and the word should be capitalized.

The SDT considered revising the rationale based on your comment but decided to retain the original language. The SDT revised the R6 Severe VSL per your comment.

Answer Comment:

Removing "widespread" from criteria will leave the Reliability Standard open to "local" impact assessments by the audit teams, which could have exponential implications even for small municipal utilities. Removing the term "widespread" opens the scope of the standard to unlimited interpretation. The term "widespread" has been commonly and generally used since the mandatory and effective date of the NERC Reliability Standards to exclude such common occurrences as a storm moving through the area (daily during the summer in Florida), causing damage up to and including some

transmission outages. Would a lightning strike on a bulk power substation causing it to operate be termed instability under the Reliability Standard or would the lightning strike also have to cause the connecting transmission lines to operate? Therefore, does removal of the word "widespread" for consideration of instability mean that every bulk power facility outage, for whatever reason is now in violation of instability? There has to be some degree of limiting language to prevent the unintended spiral that removal of the word "widespread" will cause. Entities are familiar with and understand the use of the term "widespread". Removing this modifier from the scope of assessment will require extensive instruction and scenario analysis to make the scope of the assessment clear.

Response: The additional guidance contained in the standard was developed to avoid inclusion of local impacts that would be adverse to reliability.

Selected Answer:	No
Answer Comment:	1. The removal of the undefined term of "widespread" from R1 should have alternate text to address the Commission's concern(s) and to provide industry with clarity to the applicability of transmission facilities. While we understand the drafting team's response to FERC's directive to remove "widespread," this language should be modified to make clear that a facility that has a critical impact on the operation of an Interconnection is critical and therefore subject to Requirement R1. This blanket removal of 'widespread' from the requirements makes the text in R1 even more vague and subjective than the original CIP-014-1 language that is subject to interpretation and may result in a standard that is not auditable. By removing the word widespread, there is no clear delineation of reliability impact(s) due to instability or uncontrolled separation that would qualify a substation. This language change will cause inconsistent implementation across the regions and Transmission Planners or Planning Coordinators. Furthermore, given the cost implications on a possible Transmission Owner, more clarity and certainty of scope is needed. 2. Adding to the Rationale and Guideline and Technical Basis for Requirement R1 does not address the FERC Directive. The

		Rationale section while assisting industry to better understand the intention of the PSSDT is not enforceable and will result in an inconsistent R1 implementation across the regions. 3. The PSSDT should refer to NERC defined-terms and concepts, where appropriate. To add clarity to 'widespread,' the PSSDT should consider the NERC defined terms of "Adverse Reliability Impact" (Criterion 2.3 from Attachment 1 of the CIP-002-5.1), "Interconnection Reliability Operating Limit" (Criterion 2.9 from Attachment 1 of the CIP-002-5.1), and the FAC-010-2 standard that is in place to assist Planning Coordinators (PC) to establish planning horizon IROLs that are appropriate for the PC's area and the Interconnections. 4. Thank you for time, attention and consideration regarding these CIP-014-2 comments.
Response: Rationales and guidance also inform auditors of the intentions of the drafting team to help ensure consistent auditing of the requirements.

Selected Answer:	Yes
Answer Comment:	Agree that removing the term widespread removes some subjectivity, however additional clarity on what is meant by the term “instability” would be beneficial in helping entities determine the appropriate critiera to be applied, as part of their risk assessment, in the identification of facilities in-scope to this standard.
Response: Instability refers to voltage or frequency instability and is widely accepted by industry.

Maryclaire Yatsko - Seminole Electric Cooperative, Inc. - 1,3,4,5,6 - FRCC

Selected Answer:	Yes
Answer Comment:	With the deletion of the term "widespread" from CIP-014, the TO must *determine* whether instability, uncontrolled separation, or Cascading within an Interconnection could occur if the station was damaged or rendered inoperable. For jointly-owned facilities, i.e., two or more TOs at a Transmission station or Transmission substation, the Standard states the following on page 30 of 39: "On the issue of joint ownership, the SDT recognizes that this issue is not unique to CIP-014, and expects that the applicable Transmission Owners and Transmission Operators will develop memorandums of understanding, agreements, Coordinated Functional Registrations, or procedures, etc., to designate responsibilities under CIP-014 when joint ownership is at issue, which is similar to what many entities have completed for other Reliability Standards." In order to delegate responsibility to a single TO at a jointly-owned facility to make the above cited determination and the remaining Requirements in the Standard, Seminole Electric has the following questions:

		(1) Can a Coordinated Functional Registration agreement (CFR), Joint Registration Organization agreement (JRO), or Memo of Understanding (MOU) be drafted on a station-by-station basis between parties? Seminole Electric is unaware whether CFRs and JROs can be developed and approved by NERC on a station-by-station basis and requests more information on this issue. (2) In delegating responsibility for the Requirements in jointly-owned facilities under CIP-014-2, can an MOU be a sufficient mechanism to delegate authority if drafted sufficiently, or does the drafting team reason that ultimately a CFR or JRO must be executed between the co-owners (multiple TOs) at a station? Seminole Electric has been told that MOUs may be ineffective in delegating responsibility for the Requirements for jointly-owned facilities and that CFRs and JROs should be executed instead.
Response: As long as a particular station or substation has been assessed, the drafting team does not have a preference as to how this is achieved. The joint-owners have to address the performance of this standard just like any other NERC standard that is applicable.

Selected Answer: No

Answer Comment:

Western Area Power Administration supports the Bureau of Reclamation comments regarding the removal of "widespread". Specifically, we request the adoption of language referring to TPL-001-4 R6 for consistency.

Response: The SDT made the decision to add guidance and rationale rather than to expand on the requirement to address the FERC

directive to remove “widespread”. The SDT considered additional descriptive language in the requirement to replace “widespread” but decided against doing so because the additional descriptors did not provide clarity and resulted in similar ambiguity to the use of “widespread”. The language of the requirement mirrors the language of the FERC order and has been widely accepted by industry. The SDT has added a reference to TPL-001-4, R6 in the rationale for R1 as well as in the guidance for R1.

Answer Comment:	The group has a concern in reference to the removal of the term 'widespread' in that removing it doesn't provide any boundries to the scope of the instability or cascading outages. With that being said, this can lead to continued inconsistency throughout the industry. We understand that the Commission has a large concern about the term 'widespread' being in the doucmenation and the group would like to propose alternative language stated as followed: "instability uncontrolled separation or cascasding that would cause or affect an Operational IROL within the Interrconnection". The group also has a concern pertaining to CIP-014 in reference to a Transmission Owner completing their assessment (which is due on or before October 15, 2015) more than 90 days before October 1. There is some confusion on when the verification would be completed (if the assessment was finished June 1). Does the Transmission

		Owner have 90 days from October 1 or 90 days from June 1? This would be with the assumption that the effective date is October 1. We would like the drafting team to provide more clarity in reference to Requirement R2.2 addressing this issue. We have a concern about Requirement R4 and its timeline requirement. In the standard's Rationale Box for R4 (second paragraph), it states "Requirement R4 doesn't explicitly states when the evaluation has to be completed" however, Requirement R5 development of a security plan(s) depend on this information. We would like for the SDT to provide more detailed information on when the evaluation needs to be completed. First line of the first paragraph of Requirement R3…. Page 9. The term 'control center' should be capitalized as its shown the Glossary of Terms. Additionally, this applicable for the last sentence of the paragraph. First line of the first paragraph of Requirement R5…. Page 11. The term 'control center' should be capitalized as its shown the Glossary of Terms.
	Response: The SDT made the decision to add guidance and rationale rather than to expand on the requirement to address the FERC directive to remove "widespread". The SDT considered additional descriptive language in the requirement to replace "widespread" but	

decided against doing so because the additional descriptors did not provide clarity and resulted in similar ambiguity to the use of "widespread". The language of the requirement mirrors the language of the FERC order and has been widely accepted by industry. The SDT made the decision to add guidance and rationale rather than to expand on the requirement.

R1 must be completed on or before October 1. Entities have 90 days from October 1 to complete R2.

R4 and R5 are linked and must be completed 120 days after completion of R2. The SDT didn't develop a specific timeline to allow for flexibility in how an entity performed the two requirements. Rather than say, for example, that R4 must be completed in 60 days and R5 must be completed in an additional 60 days, the SDT allowed flexibility in when these two requirements are performed.

The SDT has used the undefined term "control center" throughout the standard. This was used because the definition of "Control Center" contains the Reliability Coordinator and Balancing Authority, which are not applicable under CIP-014-2.

Erika Doot - U.S. Bureau of Reclamation - 5 -

Selected Answer:	No
Answer Comment:	The Bureau of Reclamation (Reclamation) does not agree with removing the term "widespread" from R1 without adding clarifying language in the text of the standard. This approach makes the text in R1 even less defined than the original CIP-014-1 text because it offers no criteria of what degree of reliability impacts due to instability or uncontrolled separation is appropriate to determine facilities identified under R1. This approach could cause a much broader range of facilities to come within the scope of the standard by allow interpretations that even minor or local reliability impacts result in some degree of "instability… within an interconnection." Reclamation is concerned that the removal of the term "widespread" could expand the standard to include remote facilities that if lost could impact relatively small and isolated load pockets. Reclamation suggests that the drafting team include a footnote referencing TPL-001-4 R6 criteria, reference other specific criteria like facilities affecting IROLs, or at least incorporate FERC's language "has a critical impact on the operation of the interconnection" into the

		language of R1. In the alternative, the drafting team could reference a specific area or magnitude of potential impact. Unlike the rationale statement, clarifying requirement language or a footnote would be an enforceable component the standard if approved by FERC. The clarifying language would ensure that the scope of facilities identified under R1 would not be dramatically broadened with the removal of the term "widespread."
Response: The SDT made the decision to add guidance and rationale rather than to expand on the requirement to address the FERC directive to remove "widespread". The SDT considered additional descriptive language in the requirement to replace "widespread" but decided against doing so because the additional descriptors did not provide clarity and resulted in similar ambiguity to the use of "widespread". The language of the requirement mirrors the language of the FERC order and has been widely accepted by industry. The SDT included a reference to TPL-001-4, R6 in the rational and guidance for R1.

Spencer Tacke - Modesto Irrigation District - 4 -

Selected Answer: No

Answer Comment:

I am voting NO because I believe the Standard should be very specific as to what constitutes "damaged", if it is not equal to being "inoperable", as used in the Standard. Also, the Standard needs to be very specific about the method of "transmission analysis" for rendering the station "inoperable", such as complete loss of the station resulting in a three phase fault on the station bus, etc.. The Standard is very specific and clear as how to determine which facilities need to be analyzed (i.e., those exceeding an aggregate weighted value of 3000 as specified in Section 4.1.1.2), and it needs to be just as specific in defining "damaged" and the method of "transmission analysis".

Thank you.

Sincerely,

Spencer Tacke, MID

Response: The SDT made the decision to add guidance and rationale rather than to expand

on the requirement to address the FERC directive to remove "widespread". This guidance includes a reference to TPL-001-4, R6. The SDT considered additional descriptive language in the requirement to replace "widespread" but decided against doing so because the additional descriptors did not provide clarity and resulted in similar ambiguity to the use of "widespread". The language of the requirement mirrors the language of the FERC order and has been widely accepted by industry.

Answer Comment:

With the removal of the term “widespread,” Requirement R1 implies that, if and when a station becomes inoperable and a potential threat for instability (large or small), uncontrolled separation or Cascading, the station should be declared critical. However, whether there is an adverse impact on the “operation of the interconnection” depends on the severity of an instability. In particular, a station or substation may create local instability, but there may or may not have an adverse or critical impact on the “operation of the Interconnection.” For example, if a station in a pocket or remote area should become inoperable and a potential threat for instability, it may create local instability, but such local instability may not impact the operation of the interconnected system in any way. Hence, to declare such a station as “critical” would defeat the purpose of focusing security operations on those stations and substations that have a “critical impact on the operation of the Interconnection.”

The SRC appreciates that the Standard Drafting Team attempted to provide additional criteria to determine the criticality of impact by providing some guidance in the rationale section for Requirement R1. However, the SRC respectfully suggests that there is a potential that such guidance may result in diverse criteria regarding criticality, which would, in turn, result in substantially different determinations of criticality across and within the Interconnections. It may also create unintended complications regarding compliance with and activities performed under other reliability standards. Hence, given the interconnected nature of the grid and the reliability standards with which Transmission Operators and Owners must comply and to ensure that the requirement effectively conveys the intent to address facilities with a "critical impact of the operations of the interconnection" and is able to be applied consistently, the SRC recommends that Requirement R1 be modified as follows (see words in red):

R1. Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria specified in Applicability Section 4.1.1. The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify the Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could cause

instability, uncontrolled separation, or Cascading that could result in critical, adverse impacts to the operation of the interconnected power system.

Response:
The SDT made the decision to add guidance and rationale rather than to expand on the requirement to address the FERC directive to remove "widespread". The SDT considered additional descriptive language in the requirement to replace "widespread" but decided against doing so because the additional descriptors did not provide clarity and resulted in similar ambiguity to the use of "widespread".

Selected Answer: No

Answer Comment:

The proposed method of addressing the FERC directive to remove the term 'widespread' meets the specific language in the Order, however, it leaves the responsible entity and the Regional Compliance Organizations with regulatory uncertainty as to the scope of what constitutes 'instability' in regards to Requirement R1. The revised Rationale does little to clarify the issue for the responsible entity and the Regional Compliance Organizations. The Rationale box provides some insight, but does not provide the clarity needed in the standard.

			FERC stated that only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1. The SDT should build off of this concept to provide the needed clarity in the standard. One option would be too revise the requirement and then qualify what constitutes 'critical impact' from an operational perspective (for example: the loss would result in exceeding an operating limit). The proposed language for R1 is below. "…The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify the Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could result in instability that has a critical impact on the operation of the Interconnection, uncontrolled separation, or Cascading within an Interconnection." The guidance provided in the text box only provides examples of criteria that "may" be considered. Again this provides no regulatory certainty for the responsible entity and the Regional Compliance Organization. Additionally, the guidance reintroduces the concept of an 'area or magnitude of potential impact' which was eliminated from the Requirement with the deletion of the term 'widespread'. This concept should be removed from the guidance. Further, this guidance may introduce unintended

consequences and could influence a weakening of the criteria established by the Planning Coordinators in response to R6 of TPL-004-1.

Response: The SDT made the decision to add guidance and rationale rather than to expand on the requirement to address the FERC directive to remove "widespread". The SDT considered additional descriptive language in the requirement to replace "widespread" but decided against doing so because the additional descriptors did not provide clarity and resulted in similar ambiguity to the use of "widespread".

Additional Comments

Andrea Basinski – Puget Sound Energy

There are a couple of things which seem confusing:

- There seems to be conflict with timelines, comparing the Standard itself to the Implementation Plan.
  R2.2 places a timeline for completion of 90 calendar days after the completion of the R1 assessment, and word has filtered down that WECC said that if the R1 assessment is completed prior to the effective date, the clock starts ticking on the R2.2 90 days.

  However, the implementation plan says that R2.2 has to be completed with 90 calendar days of the effective date of the Standard. That could be a very different end date for R2.2.

  Response: The Implementation Plan is correct. The third party verification is to be completed within 90 days of the effective date of the standard, October 1, 2015.

- CIP-014-2 is positioned to become effective the day after CIP-014-1 becomes effective, with -1 being retired at midnight of the same day it becomes effective. This might not be an issue of -1 is superseded by -2, and never becomes effective, but you never know.

  Response: The Implementation Plan calls for the retirement of -1 immediately prior to the effective date of -2 so that there is no overlap of compliance.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. A revised SAR was approved by the Standards Committee on December 9, 2014 to address the directives issued in FERC Order No. 802 issued on November 20, 2014, in Docket No. RD14-15-000, *Physical Security Reliability Standard*, 146 FERC ¶ 61,140 (2014). The appointed Physical Security Standard Drafting Team made the revisions to the standard.

Description of Current Draft

This is the first draft of the proposed Reliability Standard, and it is being posted for a 45-day comment and concurrent initial ballot period. This draft includes proposed revisions to address the directives issued in FERC Order No. 802.

Anticipated Actions	Anticipated Date
45-day Comment and Initial Ballot.	February-March, 2015
10-day Final Ballot.	April, 2015
BOT Adoption.	May, 2015
File with applicable Regulatory Authorities.	June, 2015

Version History

Version	Date	Action	Change Tracking
1.0	TBD	Effective Date	New

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the NERC Glossary of Terms used in Reliability Standards (Glossary) are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

A. Introduction

1. Title: Physical Security

2. Number: CIP-014-2

3. Purpose: To identify and protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection.

4. Applicability:

4.1. Functional Entities:

4.1.1 Transmission Owner that owns a Transmission station or Transmission substation that meets any of the following criteria:

4.1.1.1 Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

4.1.1.2 Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

Voltage Value of a Line	Weight Value per Line
less than 200 kV (not applicable)	(not applicable)
200 kV to 299 kV	700
300 kV to 499 kV	1300
500 kV and above	0

4.1.1.3 Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Coordinator, or

Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

4.1.1.4 Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements.

4.1.2 Transmission Operator.

Exemption: Facilities in a "protected area," as defined in 10 C.F.R. § 73.2, within the scope of a security plan approved or accepted by the Nuclear Regulatory Commission are not subject to this Standard; or, Facilities within the scope of a security plan approved or accepted by the Canadian Nuclear Safety Commission are not subject to this Standard.

5. Effective Dates:

See Implementation Plan for CIP-014-2.

6. Background:

This Reliability Standard addresses the directives from the FERC order issued March 7, 2014, *Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (2014), which required NERC to develop a physical security reliability standard(s) to identify and protect facilities that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection.

B. Requirements and Measures

R1. Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria specified in Applicability Section 4.1.1. The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify the Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection. *[VRF: High; Time-Horizon: Long-term Planning]*

1.1. Subsequent risk assessments shall be performed:

- At least once every 30 calendar months for a Transmission Owner that has identified in its previous risk assessment (as verified according to Requirement R2) one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection; or

- At least once every 60 calendar months for a Transmission Owner that has not identified in its previous risk assessment (as verified according to Requirement R2) any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection.

1.2. The Transmission Owner shall identify the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment.

M1. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the risk assessment of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria in Applicability Section 4.1.1 as specified in Requirement R1. Additionally, examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the identification of the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment as specified in Requirement R1, Part 1.2.

Rationale for Requirement R1:

This requirement meets the FERC directive from paragraph 6 of its March 7, 2014 order on physical security to perform a risk assessment to identify which facilities if rendered inoperable or damaged could impact an Interconnection through instability, uncontrolled separation, or cascading failures. The requirement is not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the following:

- Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6
- NERC EOP-004-2 reporting criteria
- Area or magnitude of potential impact

Requirement R1 also meets the FERC directive for periodic reevaluation of the risk assessment by requiring the risk assessment to be performed every 30 months (or 60 months for an entity that has not identified in a previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection).

After identifying each Transmission station and Transmission substation that meets the criteria in Requirement R1, it is important to additionally identify the primary control center that operationally controls that Transmission station or Transmission substation (*i.e.,* the control center whose electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker, compared to a control center that only has the ability to monitor the Transmission station and Transmission substation and, therefore, must coordinate direct physical action through another entity).

R2. Each Transmission Owner shall have an unaffiliated third party verify the risk assessment performed under Requirement R1. The verification may occur concurrent with or after the risk assessment performed under Requirement R1. *[VRF: Medium; Time-Horizon: Long-term Planning]*

2.1. Each Transmission Owner shall select an unaffiliated verifying entity that is either:

- A registered Planning Coordinator, Transmission Planner, or Reliability Coordinator; or
- An entity that has transmission planning or analysis experience.

2.2. The unaffiliated third party verification shall verify the Transmission Owner's risk assessment performed under Requirement R1, which may include recommendations for the addition or deletion of a Transmission station(s) or Transmission substation(s). The Transmission Owner shall ensure the verification is completed within 90 calendar days following the completion of the Requirement R1 risk assessment.

2.3. If the unaffiliated verifying entity recommends that the Transmission Owner add a Transmission station(s) or Transmission substation(s) to, or remove a Transmission station(s) or Transmission substation(s) from, its identification under Requirement R1, the Transmission Owner shall either, within 60 calendar days of completion of the verification, for each recommended addition or removal of a Transmission station or Transmission substation:

- Modify its identification under Requirement R1 consistent with the recommendation; or
- Document the technical basis for not modifying the identification in accordance with the recommendation.

2.4. Each Transmission Owner shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third party verifier and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M2. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner completed an unaffiliated third party verification of the Requirement R1 risk assessment and satisfied all of the applicable provisions of Requirement R2, including, if applicable, documenting the technical basis for not modifying the Requirement R1 identification as specified under Part 2.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 2.4.

Rationale for Requirement R2:

This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring verification by an entity other than the owner or operator of the risk assessment performed under Requirement R1.

This requirement provides the flexibility for a Transmission Owner to select registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term "unaffiliated" means that the selected verifying entity cannot be a corporate affiliate (*i.e.*, the verifying entity cannot be an entity that controls, is controlled by, or is under common control with, the Transmission owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit. The term "unaffiliated" is not intended to prohibit a governmental entity from using another government entity to be a verifier under Requirement R2.

Requirement R2 also provides the Transmission Owner the flexibility to work with the verifying entity throughout the Requirement R1 risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could coordinate with their unaffiliated verifying entity to perform a Requirement R1 risk assessment to satisfy both Requirement R1 and Requirement R2 concurrently.

Planning Coordinator is a functional entity listed in Part 2.1. The Planning Coordinator and Planning Authority are the same entity as shown in the NERC Glossary of Terms Used in NERC Reliability Standards.

R3. For a primary control center(s) identified by the Transmission Owner according to Requirement R1, Part 1.2 that a) operationally controls an identified Transmission station or Transmission substation verified according to Requirement R2, and b) is not under the operational control of the Transmission Owner: the Transmission Owner shall, within seven calendar days following completion of Requirement R2, notify the Transmission Operator that has operational control of the primary control center of such identification and the date of completion of Requirement R2. *[VRF: Lower; Time-Horizon: Long-term Planning]*

3.1. If a Transmission station or Transmission substation previously identified under Requirement R1 and verified according to Requirement R2 is removed from the identification during a subsequent risk assessment performed according to Requirement R1 or a verification according to Requirement R2, then the Transmission Owner shall, within seven calendar days following the verification or the subsequent risk assessment, notify the Transmission Operator that has operational control of the primary control center of the removal.

M3. Examples of acceptable evidence may include, but are not limited to, dated written or electronic notifications or communications that the Transmission Owner notified each Transmission Operator, as applicable, according to Requirement R3.

Rationale for Requirement R3:

Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first identifying which Transmission stations and Transmission substations meet the criteria specified by Requirement R1, as verified according to Requirement R2. This requirement is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1, Part 1.2 of a Transmission station or Transmission substation verified according to Requirement R2 receives notice of such identification so that the Transmission Operator may timely fulfill its resulting obligations under Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include notice of the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or the verification process under Requirement R2.

R4. Each Transmission Owner that identified a Transmission station, Transmission substation, or a primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2. The evaluation shall consider the following: *[VRF: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

4.1. Unique characteristics of the identified and verified Transmission station(s), Transmission substation(s), and primary control center(s);

4.2. Prior history of attack on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and

4.3. Intelligence or threat warnings received from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), U.S. federal and/or Canadian governmental agencies, or their successors.

M4. Examples of evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner or Transmission Operator conducted an evaluation of the potential threats and vulnerabilities of a physical attack to their respective Transmission station(s), Transmission substation(s) and primary control center(s) as specified in Requirement R4.

Rationale for Requirement R4:

This requirement meets the FERC directive from paragraph 8 in the order on physical security that the reliability standard must require tailored evaluation of potential threats and vulnerabilities to facilities identified in Requirement R1 and verified according to Requirement R2. Threats and vulnerabilities may vary from facility to facility based on factors such as the facility's location, size, function, existing protections, and attractiveness of the target. As such, the requirement does not mandate a one-size-fits-all approach but requires entities to account for the unique characteristics of their facilities.

Requirement R4 does not explicitly state when the evaluation of threats and vulnerabilities must occur or be completed. However, Requirement R5 requires that the entity's security plan(s), which is dependent on the Requirement R4 evaluation, must be completed within 120 calendar days following completion of Requirement R2. Thus, an entity has the flexibility when to complete the Requirement R4 evaluation, provided that it is completed in time to comply with the requirement in Requirement R5 to develop a physical security plan 120 calendar days following completion of Requirement R2.

R5. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s). The physical security plan(s) shall be developed within 120 calendar days following the completion of Requirement R2 and executed according to the timeline specified in the physical security plan(s). The physical security plan(s) shall include the following attributes: *[VRF: High; Time-Horizon: Long-term Planning]*

5.1. Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.

5.2. Law enforcement contact and coordination information.

5.3. A timeline for executing the physical security enhancements and modifications specified in the physical security plan.

5.4. Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).

M5. Examples of evidence may include, but are not limited to, dated written or electronic documentation of its physical security plan(s) that covers their respective identified

and verified Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R5, and additional evidence demonstrating execution of the physical security plan according to the timeline specified in the physical security plan.

Rationale for Requirement R5:

This requirement meets the FERC directive from paragraph 9 in the order on physical security requiring the development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

R6. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall have an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5. The review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5. *[VRF: Medium; Time-Horizon: Long-term Planning]*

6.1. Each Transmission Owner and Transmission Operator shall select an unaffiliated third party reviewer from the following:

- An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.
- An entity or organization approved by the ERO.
- A governmental agency with physical security expertise.
- An entity or organization with demonstrated law enforcement, government, or military physical security expertise.

6.2. The Transmission Owner or Transmission Operator, respectively, shall ensure that the unaffiliated third party review is completed within 90 calendar days of completing the security plan(s) developed in Requirement R5. The unaffiliated third party review may, but is not required to, include recommended changes to the evaluation performed under Requirement R4 or the security plan(s) developed under Requirement R5.

6.3. If the unaffiliated third party reviewer recommends changes to the evaluation performed under Requirement R4 or security plan(s) developed under Requirement R5, the Transmission Owner or Transmission Operator shall, within 60 calendar days of the completion of the unaffiliated third party review, for each recommendation:

- Modify its evaluation or security plan(s) consistent with the recommendation; or
- Document the reason(s) for not modifying the evaluation or security plan(s) consistent with the recommendation.

6.4. Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third party reviewer and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M6. Examples of evidence may include, but are not limited to, written or electronic documentation that the Transmission Owner or Transmission Operator had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 as specified in Requirement R6 including, if applicable, documenting the reasons for not modifying the evaluation or security plan(s) in accordance with a recommendation under Part 6.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 6.4.

Rationale for Requirement R6:

This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring review by an entity other than the owner or operator with appropriate expertise of the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5.

As with the verification required by Requirement R2, Requirement R6 provides Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout the Requirement R4 evaluation and the development of the Requirement R5 security plan(s). This would allow entities to satisfy their obligations under Requirement R6 concurrent with the satisfaction of their obligations under Requirements R4 and R5.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence during an on-site visit to show that it was compliant for the full time period since the last audit.

The Transmission Owner and Transmission Operator shall keep data or evidence to show compliance, as identified below, unless directed by its Compliance Enforcement Authority (CEA) to retain specific evidence for a longer period of time as part of an investigation.

The responsible entities shall retain documentation as evidence for three years.

If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records, subject to the confidentiality provisions of Section 1500 of the Rules of Procedure and the provisions of Section 1.4 below.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints Text

1.4. Additional Compliance Information

Confidentiality: To protect the confidentiality and sensitive nature of the evidence for demonstrating compliance with this standard, all evidence will be retained at the Transmission Owner's and Transmission Operator's facilities.

Guidelines and Technical Basis

Section 4 Applicability

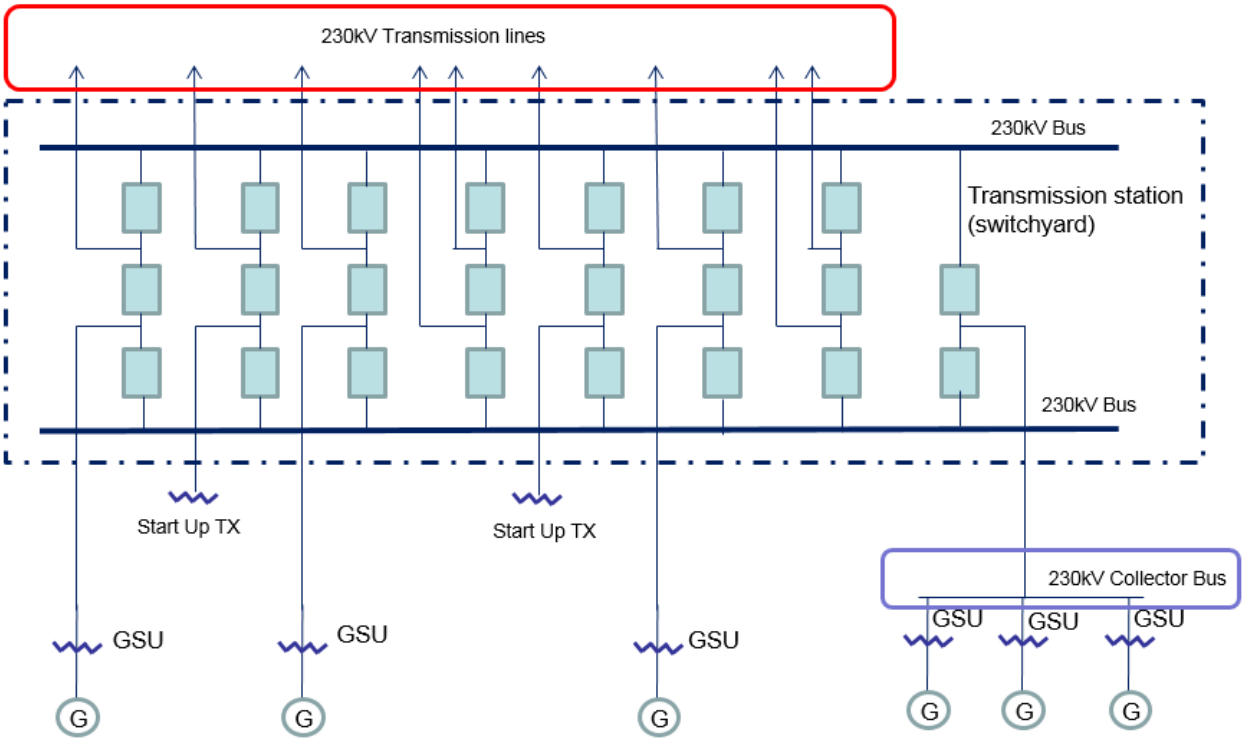
The purpose of Reliability Standard CIP-014 is to protect Transmission stations and Transmission substations, and their associated primary control centers that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. To properly include those entities that own or operate such Facilities, the Reliability Standard CIP-014 first applies to Transmission Owners that own Transmission Facilities that meet the specific criteria in Applicability Section 4.1.1.1 through 4.1.1.4. The Facilities described in Applicability Section 4.1.1.1 through 4.1.1.4 mirror those Transmission Facilities that meet the bright line criteria for "Medium Impact" Transmission Facilities under Attachment 1 of Reliability Standard CIP-002-5.1. Each Transmission Owner that owns Transmission Facilities that meet the criteria in Section 4.1.1.1 through 4.1.1.4 is required to perform a risk assessment as specified in Requirement R1 to identify its Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. The Standard Drafting Team (SDT) expects this population will be small and that many Transmission Owners that meet the applicability of this standard will not actually identify any such Facilities. Only those Transmission Owners with Transmission stations or Transmission substations identified in the risk assessment (and verified under Requirement R2) have performance obligations under Requirements R3 through R6.

This standard also applies to Transmission Operators. A Transmission Operator's obligations under the standard, however, are only triggered if the Transmission Operator is notified by an applicable Transmission Owner under Requirement R3 that the Transmission Operator operates a primary control center that operationally controls a Transmission station(s) or Transmission substation(s) identified in the Requirement R1 risk assessment. A primary control center operationally controls a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical action at the identified Transmission station or Transmission substation, such as opening a breaker, as opposed to a control center that only has information from the Transmission station or Transmission substation and must coordinate direct action through another entity. Only Transmission Operators who are notified that they have primary control centers under this standard have performance obligations under Requirements R4 through R6. In other words, primary control center for purposes of this Standard is the control center that the Transmission Owner or Transmission Operator, respectively, uses as its primary, permanently-manned site to physically operate a Transmission station or Transmission substation that is identified in Requirement R1 and verified in Requirement R2. Control centers that provide back-up capability are not applicable, as they are a form of resiliency and intentionally redundant.

The SDT considered several options for bright line criteria that could be used to determine applicability and provide an initial threshold that defines the set of Transmission stations and Transmission substations that would meet the directives of the FERC order on physical security (*i.e.*, those that could cause instability, uncontrolled separation, or Cascading within an

Interconnection). The SDT determined that using the criteria for Medium Impact Transmission Facilities in Attachment 1 of CIP-002-5.1 would provide a conservative threshold for defining which Transmission stations and Transmission substations must be included in the risk assessment in Requirement R1 of CIP-014. Additionally, the SDT concluded that using the CIP-002-5.1 Medium Impact criteria was appropriate because it has been approved by stakeholders, NERC, and FERC, and its use provides a technically sound basis to determine which Transmission Owners should conduct the risk assessment. As described in CIP-002-5.1, the failure of a Transmission station or Transmission substation that meets the Medium Impact criteria could have the capability to result in exceeding one or more Interconnection Reliability Operating Limits (IROLs). The SDT understands that using this bright line criteria to determine applicability may require some Transmission Owners to perform risk assessments under Requirement R1 that will result in a finding that none of their Transmission stations or Transmission substations would pose a risk of instability, uncontrolled separation, or Cascading within an Interconnection. However, the SDT determined that higher bright lines could not be technically justified to ensure inclusion of all Transmission stations and Transmission substations, and their associated primary control centers that, if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. Further guidance and technical basis for the bright line criteria for Medium Impact Facilities can be found in the Guidelines and Technical Basis section of CIP-002-5.1.

Additionally, the SDT determined that it was not necessary to include Generator Operators and Generator Owners in the Reliability Standard. First, Transmission stations or Transmission substations interconnecting generation facilities are considered when determining applicability. Transmission Owners will consider those Transmission stations and Transmission substations that include a Transmission station on the high side of the Generator Step-up transformer (GSU) using Applicability Section 4.1.1.1 and 4.1.1.2. As an example, a Transmission station or Transmission substation identified as a Transmission Owner facility that interconnects generation will be subject to the Requirement R1 risk assessment if it operates at 500kV or greater or if it is connected at 200 kV – 499kV to three or more other Transmission stations or Transmission substations and has an "aggregate weighted value" exceeding 3000 according to the table in Applicability Section 4.1.1.2. Second, the Transmission analysis or analyses conducted under Requirement R1 should take into account the impact of the loss of generation connected to applicable Transmission stations or Transmission substations. Additionally, the FERC order does not explicitly mention generation assets and is reasonably understood to focus on the most critical Transmission Facilities. The diagram below shows an example of a station.



Also, the SDT uses the phrase "Transmission stations or Transmission substations" to recognize the existence of both stations and substations. Many entities in industry consider a substation to be a location with physical borders (i.e. fence, wall, etc.) that contains at least an autotransformer. Locations also exist that do not contain autotransformers, and many entities in industry refer to those locations as stations (switching stations or switchyards). Therefore, the SDT chose to use both "station" and "substation" to refer to the locations where groups of Transmission Facilities exist.

On the issue of joint ownership, the SDT recognizes that this issue is not unique to CIP-014, and expects that the applicable Transmission Owners and Transmission Operators will develop memorandums of understanding, agreements, Coordinated Functional Registrations, or procedures, etc., to designate responsibilities under CIP-014 when joint ownership is at issue, which is similar to what many entities have completed for other Reliability Standards.

The language contained in the applicability section regarding the collector bus is directly copied from CIP-002-5.1, Attachment 1, and has no additional meaning within the CIP-014 standard.

Requirement R1

The initial risk assessment required under Requirement R1 must be completed on or before the effective date of the standard. Subsequent risk assessments are to be performed at least once every 30 or 60 months depending on the results of the previous risk assessment per Requirement R1, Part 1.1. In performing the risk assessment under Requirement R1, the

Transmission Owner should first identify their population of Transmission stations and Transmission substations that meet the criteria contained in Applicability Section 4.1.1. Requirement R1 then requires the Transmission Owner to perform a risk assessment, consisting of a transmission analysis, to determine which of those Transmission stations and Transmission Substations if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection. The requirement is not to require identification of, and thus, not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the following:

- Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6
- NERC EOP-004-2 reporting criteria
- Area or magnitude of potential impact

The standard does not mandate the specific analytical method for performing the risk assessment. The Transmission Owner has the discretion to choose the specific method that best suites its needs. As an example, an entity may perform a Power Flow analysis and stability analysis at a variety of load levels.

Performing Risk Assessments

The Transmission Owner has the discretion to select a transmission analysis method that fits its facts and system circumstances. To mandate a specific approach is not technically desirable and may lead to results that fail to adequately consider regional, topological, and system circumstances. The following guidance is only an example on how a Transmission Owner may perform a power flow and/or stability analysis to identify those Transmission stations and Transmission substations that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. An entity could remove all lines, without regard to the voltage level, to a single Transmission station or Transmission substation and review the simulation results to assess system behavior to determine if Cascading of Transmission Facilities, uncontrolled separation, or voltage or frequency instability is likely to occur over a significant area of the Interconnection. Using engineering judgment, the Transmission Owner (possibly in consultation with regional planning or operation committees and/or ISO/RTO committee input) should develop criteria (e.g. imposing a fault near the removed Transmission station or Transmission substation) to identify a contingency or parameters that result in potential instability, uncontrolled separation, or Cascading within an Interconnection. Regional consultation on these matters is likely to be

helpful and informative, given that the inputs for the risk assessment and the attributes of what constitutes instability, uncontrolled separation, or Cascading within an Interconnection will likely vary from region-to-region or from ISO-to-ISO based on topology, system characteristics, and system configurations. Criteria could also include post-contingency facilities loadings above a certain emergency rating or failure of a power flow case to converge. Available special protection systems (SPS), if any, could be applied to determine if the system experiences any additional instability which may result in uncontrolled separation. Example criteria may include:

(a) Thermal overloads beyond facility emergency ratings;

(b) Voltage deviation exceeding ± 10%; or

(c) Cascading outage/voltage collapse; or

(d) Frequency below under-frequency load shed points

Periodicity

A Transmission Owner who identifies one or more Transmission stations or Transmission substations (as verified under Requirement R2) that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection is required to conduct a risk assessment at least once every 30 months. This period ensures that the risk assessment remains current with projected conditions and configurations in the planned system. This risk assessment, as the initial assessment, must consider applicable planned Transmission stations and Transmission substations to be in service within 24 months. The 30 month timeframe aligns with the 24 month planned to be in service date because the Transmission Owner is provided the flexibility, depending on its planning cycle and the frequency in which it may plan to construct a new Transmission station or Transmission substation to more closely align these dates. The requirement is to conduct the risk assessment at least once every 30 months, so for a Transmission Owner that believes it is better to conduct a risk assessment once every 24 months, because of its planning cycle, it has the flexibility to do so.

Transmission Owners that have not identified any Transmission stations or Transmission substations (as verified under Requirement R2) that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection are unlikely to see changes to their risk assessment in the Near-Term Planning Horizon. Consequently, a 60 month periodicity for completing a subsequent risk assessment is specified.

Identification of Primary Control Centers

After completing the risk assessment specified in Requirement R1, it is important to additionally identify the primary control center that operationally controls each Transmission station or Transmission substation that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection. A primary control center

"operationally controls" a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker.

Requirement R2

This requirement specifies verification of the risk assessment performed under Requirement R1 by an entity other than the owner or operator of the Requirement R1 risk assessment.

A verification of the risk assessment by an unaffiliated third party, as specified in Requirement R2, could consist of:

1. Certifying that the Requirement R1 risk assessment considers the Transmission stations and Transmission substations identified in Applicability Section 4.1.1.
2. Review of the model used to conduct the risk assessment to ensure it contains sufficient system topology to identify Transmission stations and Transmission substations that if rendered inoperable or damaged could cause instability, uncontrolled separation, or Cascading within an Interconnection.
3. Review of the Requirement R1 risk assessment methodology.

This requirement provides the flexibility for a Transmission Owner to select from unaffiliated registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term unaffiliated means that the selected verifying entity cannot be a corporate affiliate (*i.e.,* the verifying or third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit.

The prohibition on registered entities using a corporate affiliate to conduct the verification, however, does not prohibit a governmental entity (e.g., a city, a municipality, a U.S. federal power marketing agency, or any other political subdivision of U.S. or Canadian federal, state, or provincial governments) from selecting as the verifying entity another governmental entity within the same political subdivision. For instance, a U.S. federal power marketing agency may select as its verifier another U.S. federal agency to conduct its verification so long as the selected entity has transmission planning or analysis experience. Similarly, a Transmission Owner owned by a Canadian province can use a separate agency of that province to perform the verification. The verifying entity, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

Requirement R2 also provides that the "verification may occur concurrent with or after the risk assessment performed under Requirement R1." This provision is designed to provide the Transmission Owner the flexibility to work with the verifying entity throughout (*i.e.,* concurrent with) the risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could collaborate with their unaffiliated verifying entity to perform the risk assessment under Requirement R1 such that both Requirement R1 and Requirement R2 are satisfied concurrently. The intent of Requirement R2

is to have an entity other than the owner or operator of the facility to be involved in the risk assessment process and have an opportunity to provide input. Accordingly, Requirement R2 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the risk assessment and subsequently has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the risk assessment.

Characteristics to consider in selecting a third party reviewer could include:

- Registered Entity with applicable planning and reliability functions.
- Experience in power system studies and planning.
- The entity's understanding of the MOD standards, TPL standards, and facility ratings as they pertain to planning studies.
- The entity's familiarity with the Interconnection within which the Transmission Owner is located.

With respect to the requirement that Transmission owners develop and implement procedures for protecting confidential and sensitive information, the Transmission Owner could have a method for identifying documents that require confidential treatment. One mechanism for protecting confidential or sensitive information is to prohibit removal of sensitive or confidential information from the Transmission Owner's site. Transmission Owners could include such a prohibition in a non-disclosure agreement with the verifying entity.

A Technical feasibility study is not required in the Requirement R2 documentation of the technical basis for not modifying the identification in accordance with the recommendation.

On the issue of the difference between a verifier in Requirement R2 and a reviewer in Requirement R6, the SDT indicates that the verifier will confirm that the risk assessment was completed in accordance with Requirement R1, including the number of Transmission stations and substations identified, while the reviewer in Requirement R6 is providing expertise on the manner in which the evaluation of threats was conducted in accordance with Requirement R4, and the physical security plan in accordance with Requirement R5. In the latter situation there is no verification of a technical analysis, rather an application of experience and expertise to provide guidance or recommendations, if needed.

Parts 2.4 and 6.4 require the entities to have procedures to protect the confidentiality of sensitive or confidential information. Those procedures may include the following elements:

1. Control and retention of information on site for third party verifiers/reviewers.
2. Only "need to know" employees, etc., get the information.
3. Marking documents as confidential
4. Securely storing and destroying information when no longer needed.
5. Not releasing information outside the entity without, for example, General Counsel sign-off.

Requirement R3

Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first completing the risk assessment specified by Requirement R1 and the verification specified by Requirement R2. Requirement R3 is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1 receive notice so that the Transmission Operator may fulfill the rest of the obligations required in Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include within the notice the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or as a result of the verification process under Requirement R2.

Requirement R4

This requirement requires owners and operators of facilities identified by the Requirement R1 risk assessment and that are verified under Requirement R2 to conduct an assessment of potential threats and vulnerabilities to those Transmission stations, Transmission substations, and primary control centers using a tailored evaluation process. Threats and vulnerabilities may vary from facility to facility based on any number of factors that include, but are not limited to, location, size, function, existing physical security protections, and attractiveness as a target.

In order to effectively conduct a threat and vulnerability assessment, the asset owner may be the best source to determine specific site vulnerabilities, but current and evolving threats may best be determined by others in the intelligence or law enforcement communities. A number of resources have been identified in the standard, but many others exist and asset owners are not limited to where they may turn for assistance. Additional resources may include state or local fusion centers, U.S. Department of Homeland Security, Federal Bureau of Investigations (FBI), Public Safety Canada, Royal Canadian Mounted Police, and InfraGard chapters coordinated by the FBI.

The Responsible Entity is required to take a number of factors into account in Parts 4.1 to 4.3 in order to make a risk-based evaluation under Requirement R4.

To assist in determining the current threat for a facility, the prior history of attacks on similarly protected facilities should be considered when assessing probability and likelihood of occurrence at the facility in question.

Resources that may be useful in conducting threat and vulnerability assessments include:

- NERC Security Guideline for the Electricity Sector: Physical Security.
- NERC Security Guideline: Physical Security Response.
- ASIS International General Risk Assessment Guidelines.
- ASIS International Facilities Physical Security Measure Guideline.

- ASIS International Security Management Standard: Physical Asset Protection.
- Whole Building Design Guide - Threat/Vulnerability Assessments.

Requirement R5

This requirement specifies development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Requirement R5 specifies the following attributes for the physical security plan:

- *Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.*

  Resiliency may include, among other things:

  a. System topology changes,

  b. Spare equipment,

  c. Construction of a new Transmission station or Transmission substation.

  While most security measures will work together to collectively harden the entire site, some may be allocated to protect specific critical components. For example, if protection from gunfire is considered necessary, the entity may only install ballistic protection for critical components, not the entire site.

- *Law enforcement contact and coordination information.*

  Examples of such information may be posting 9-1-1 for emergency calls and providing substation safety and familiarization training for local and federal law enforcement, fire department, and Emergency Medical Services.

- *A timeline for executing the physical security enhancements and modifications specified in the physical security plan.*

  Entities have the flexibility to prioritize the implementation of the various resiliency or security enhancements and modifications in their security plan according to risk, resources, or other factors. The requirement to include a timeline in the physical security plan for executing the actual physical security enhancements and modifications does not also require that the enhancements and modifications be completed within 120 days. The actual timeline may extend beyond the 120 days, depending on the amount of work to be completed.

- *Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).*

  A registered entity's physical security plan should include processes and responsibilities for obtaining and handling alerts, intelligence, and threat warnings from various

sources. Some of these sources could include the ERO, ES-ISAC, and US and/or Canadian federal agencies. This information should be used to reevaluate or consider changes in the security plan and corresponding security measures of the security plan found in R5.

Incremental changes made to the physical security plan prior to the next required third party review do not require additional third party reviews.

Requirement R6

This requirement specifies review by an entity other than the Transmission Owner or Transmission Operator with appropriate expertise for the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5. As with Requirement R2, the term unaffiliated means that the selected third party reviewer cannot be a corporate affiliate (*i.e.,* the third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Operator). A third party reviewer also cannot be a division of the Transmission Operator that operates as a functional unit.

As noted in the guidance for Requirement R2, the prohibition on registered entities using a corporate affiliate to conduct the review, however, does not prohibit a governmental entity from selecting as the third party reviewer another governmental entity within the same political subdivision. For instance, a city or municipality may use its local enforcement agency, so long as the local law enforcement agency satisfies the criteria in Requirement R6. The third party reviewer, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

The Responsible Entity can select from several possible entities to perform the review:

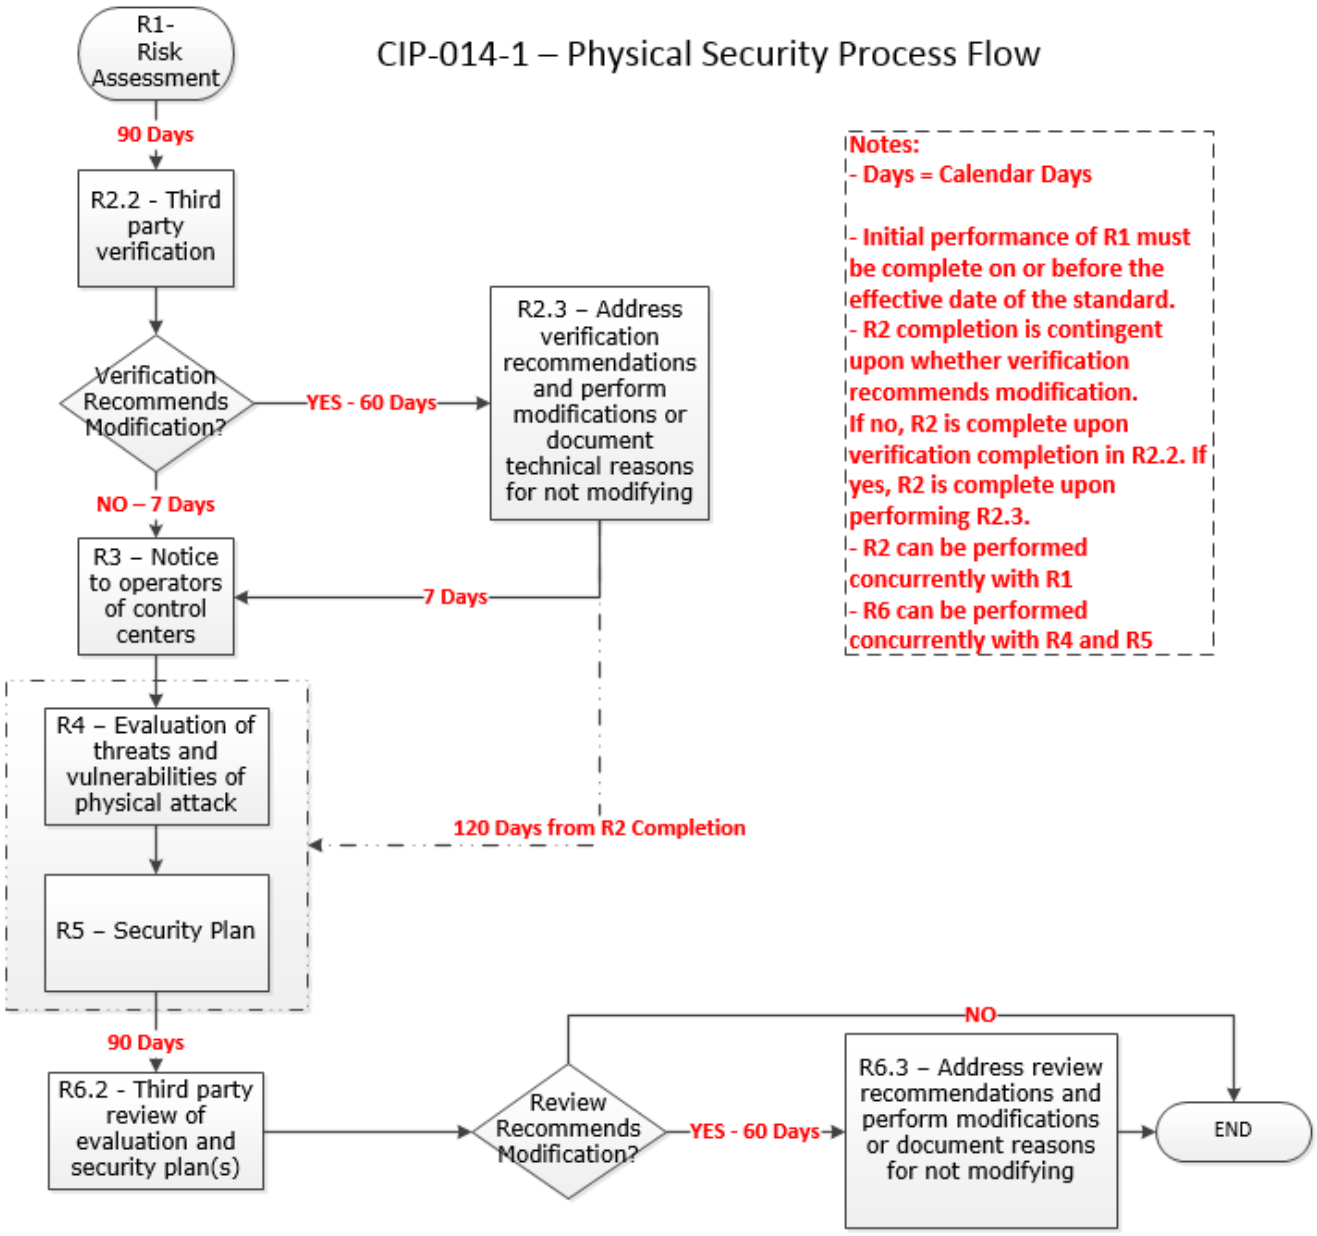
- *An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.*

  In selecting CPP and PSP for use in this standard, the SDT believed it was important that if a private entity such as a consulting or security firm was engaged to conduct the third party review, they must tangibly demonstrate competence to conduct the review. This includes electric industry physical security experience and either of the premier security industry certifications sponsored by ASIS International. The ASIS certification program was initiated in 1977, and those that hold the CPP certification are board certified in security management. Those that hold the PSP certification are board certified in physical security.

- *An entity or organization approved by the ERO.*
- *A governmental agency with physical security expertise.*
- *An entity or organization with demonstrated law enforcement, government, or military physical security expertise.*

As with the verification under Requirement R2, Requirement R6 provides that the "review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5." This provision is designed to provide applicable Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout (*i.e.,* concurrent with) the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5, which for some Responsible Entities may be more efficient and effective. In other words, a Transmission Owner or Transmission Operator could collaborate with their unaffiliated third party reviewer to perform an evaluation of potential threats and vulnerabilities (Requirement R4) and develop a security plan (Requirement R5) to satisfy Requirements R4 through R6 simultaneously. The intent of Requirement R6 is to have an entity other than the owner or operator of the facility to be involved in the Requirement R4 evaluation and the development of the Requirement R5 security plans and have an opportunity to provide input on the evaluation and the security plan. Accordingly, Requirement R6 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the evaluation and develops the security plan itself and then has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the evaluation and develop the security plan.

Timeline



CIP-014-1 – Physical Security Process Flow
R1- Risk Assessment
90 Days
R2.2 - Third party verification
Verification Recommends Modification?
YES - 60 Days
R2.3 – Address verification recommendations and perform modifications or document technical reasons for not modifying
NO – 7 Days
R3 – Notice to operators of control centers
7 Days
R4 – Evaluation of threats and vulnerabilities of physical attack
120 Days from R2 Completion
R5 – Security Plan
90 Days
R6.2 - Third party review of evaluation and security plan(s)
Review Recommends Modification?
YES - 60 Days
R6.3 – Address review recommendations and perform modifications or document reasons for not modifying
NO
END
Notes:
- Days = Calendar Days
- Initial performance of R1 must be complete on or before the effective date of the standard.
- R2 completion is contingent upon whether verification recommends modification. If no, R2 is complete upon verification completion in R2.2. If yes, R2 is complete upon performing R2.3.
- R2 can be performed concurrently with R1
- R6 can be performed concurrently with R4 and R5

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. A revised SAR was approved by the Standards Committee on December 9, 2014 to address the directives issued in FERC Order No. 802 issued on November 20, 2014, in Docket No. RD14-15-000, *Physical Security Reliability Standard*, 146 FERC ¶ 61,140 (2014). The appointed Physical Security Standard Drafting Team made the revisions to the standard.

Description of Current Draft

This is the first draft of the proposed Reliability Standard, and it is being posted for a 45-day comment and concurrent initial ballot period. This draft includes proposed revisions to address the directives issued in FERC Order No. 802.

Anticipated Actions	Anticipated Date
45-day Comment and Initial Ballot.	February-March, 2015
10-day Final Ballot.	April, 2015
BOT Adoption.	May, 2015
File with applicable Regulatory Authorities.	June, 2015

Version History

Version	Date	Action	Change Tracking
1.0	TBD	Effective Date	New

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the NERC Glossary of Terms used in Reliability Standards (Glossary) are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

A. Introduction

1. Title: Physical Security

2. Number: CIP-014-2~~1~~

3. Purpose: To identify and protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection.

4. Applicability:

4.1. Functional Entities:

4.1.1 Transmission Owner that owns a Transmission station or Transmission substation that meets any of the following criteria:

4.1.1.1 Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

4.1.1.2 Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

Voltage Value of a Line	Weight Value per Line
less than 200 kV (not applicable)	(not applicable)
200 kV to 299 kV	700
300 kV to 499 kV	1300
500 kV and above	0

4.1.1.3 Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Coordinator, or

Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

4.1.1.4 Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements.

4.1.2 Transmission Operator.

Exemption: Facilities in a "protected area," as defined in 10 C.F.R. § 73.2, within the scope of a security plan approved or accepted by the Nuclear Regulatory Commission are not subject to this Standard; or, Facilities within the scope of a security plan approved or accepted by the Canadian Nuclear Safety Commission are not subject to this Standard.

5. Effective Dates:

See Implementation Plan for CIP-014-2.

6. Background:

This Reliability Standard addresses the directives from the FERC order issued March 7, 2014, *Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (2014), which required NERC to develop a physical security reliability standard(s) to identify and protect facilities that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection.

B. Requirements and Measures

R1. Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria specified in Applicability Section 4.1.1. The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify the Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection. *[VRF: High; Time-Horizon: Long-term Planning]*

1.1. Subsequent risk assessments shall be performed:

- At least once every 30 calendar months for a Transmission Owner that has identified in its previous risk assessment (as verified according to Requirement R2) one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection; or

- At least once every 60 calendar months for a Transmission Owner that has not identified in its previous risk assessment (as verified according to Requirement R2) any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection.

1.2. The Transmission Owner shall identify the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment.

M1. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the risk assessment of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria in Applicability Section 4.1.1 as specified in Requirement R1. Additionally, examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the identification of the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment as specified in Requirement R1, Part 1.2.

Rationale for Requirement R1:

This requirement meets the FERC directive from paragraph 6 of its March 7, 2014 order on physical security to perform a risk assessment to identify which facilities if rendered inoperable or damaged could impact an Interconnection through instability, uncontrolled separation, or cascading failures. The requirement is ~~not to require identification of, and thus,~~ not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the following:

- Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6
- NERC EOP-004-2 reporting criteria
- Area or magnitude of potential impact

Requirement R1 also meets the FERC directive for periodic reevaluation of the risk assessment by requiring the risk assessment to be performed every 30 months (or 60 months for an entity that has not identified in a previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection).[A1]

After identifying each Transmission station and Transmission substation that meets the criteria in Requirement R1, it is important to additionally identify the primary control center that operationally controls that Transmission station or Transmission substation (*i.e.,* the control center whose electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker, compared to a control center that only has the ability to monitor the Transmission station and Transmission substation and, therefore, must coordinate direct physical action through another entity).

R2. Each Transmission Owner shall have an unaffiliated third party verify the risk assessment performed under Requirement R1. The verification may occur concurrent with or after the risk assessment performed under Requirement R1. *[VRF: Medium; Time-Horizon: Long-term Planning]*

2.1. Each Transmission Owner shall select an unaffiliated verifying entity that is either:

- A registered Planning Coordinator, Transmission Planner, or Reliability Coordinator; or
- An entity that has transmission planning or analysis experience.

2.2. The unaffiliated third party verification shall verify the Transmission Owner's risk assessment performed under Requirement R1, which may include recommendations for the addition or deletion of a Transmission station(s) or Transmission substation(s). The Transmission Owner shall ensure the verification is completed within 90 calendar days following the completion of the Requirement R1 risk assessment.

2.3. If the unaffiliated verifying entity recommends that the Transmission Owner add a Transmission station(s) or Transmission substation(s) to, or remove a Transmission station(s) or Transmission substation(s) from, its identification under Requirement R1, the Transmission Owner shall either, within 60 calendar days of completion of the verification, for each recommended addition or removal of a Transmission station or Transmission substation:

- Modify its identification under Requirement R1 consistent with the recommendation; or
- Document the technical basis for not modifying the identification in accordance with the recommendation.

2.4. Each Transmission Owner shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third party verifier and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M2. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner completed an unaffiliated third party verification of the Requirement R1 risk assessment and satisfied all of the applicable provisions of Requirement R2, including, if applicable, documenting the technical basis for not modifying the Requirement R1 identification as specified under Part 2.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 2.4.

Rationale for Requirement R2:

This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring verification by an entity other than the owner or operator of the risk assessment performed under Requirement R1.

This requirement provides the flexibility for a Transmission Owner to select registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term "unaffiliated" means that the selected verifying entity cannot be a corporate affiliate (*i.e.*, the verifying entity cannot be an entity that controls, is controlled by, or is under common control with, the Transmission owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit. The term "unaffiliated" is not intended to prohibit a governmental entity from using another government entity to be a verifier under Requirement R2.

Requirement R2 also provides the Transmission Owner the flexibility to work with the verifying entity throughout the Requirement R1 risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could coordinate with their unaffiliated verifying entity to perform a Requirement R1 risk assessment to satisfy both Requirement R1 and Requirement R2 concurrently.

Planning Coordinator is a functional entity listed in Part 2.1. The Planning Coordinator and Planning Authority are the same entity as shown in the NERC Glossary of Terms Used in NERC Reliability Standards.

R3. For a primary control center(s) identified by the Transmission Owner according to Requirement R1, Part 1.2 that a) operationally controls an identified Transmission station or Transmission substation verified according to Requirement R2, and b) is not under the operational control of the Transmission Owner: the Transmission Owner shall, within seven calendar days following completion of Requirement R2, notify the Transmission Operator that has operational control of the primary control center of such identification and the date of completion of Requirement R2. *[VRF: Lower; Time-Horizon: Long-term Planning]*

3.1. If a Transmission station or Transmission substation previously identified under Requirement R1 and verified according to Requirement R2 is removed from the identification during a subsequent risk assessment performed according to Requirement R1 or a verification according to Requirement R2, then the Transmission Owner shall, within seven calendar days following the verification or the subsequent risk assessment, notify the Transmission Operator that has operational control of the primary control center of the removal.

M3. Examples of acceptable evidence may include, but are not limited to, dated written or electronic notifications or communications that the Transmission Owner notified each Transmission Operator, as applicable, according to Requirement R3.

Rationale for Requirement R3:

Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first identifying which Transmission stations and Transmission substations meet the criteria specified by Requirement R1, as verified according to Requirement R2. This requirement is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1, Part 1.2 of a Transmission station or Transmission substation verified according to Requirement R2 receives notice of such identification so that the Transmission Operator may timely fulfill its resulting obligations under Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include notice of the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or the verification process under Requirement R2.

R4. Each Transmission Owner that identified a Transmission station, Transmission substation, or a primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2. The evaluation shall consider the following: *[VRF: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

4.1. Unique characteristics of the identified and verified Transmission station(s), Transmission substation(s), and primary control center(s);

4.2. Prior history of attack on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and

4.3. Intelligence or threat warnings received from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), U.S. federal and/or Canadian governmental agencies, or their successors.

M4. Examples of evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner or Transmission Operator conducted an evaluation of the potential threats and vulnerabilities of a physical attack to their respective Transmission station(s), Transmission substation(s) and primary control center(s) as specified in Requirement R4.

Rationale for Requirement R4:

This requirement meets the FERC directive from paragraph 8 in the order on physical security that the reliability standard must require tailored evaluation of potential threats and vulnerabilities to facilities identified in Requirement R1 and verified according to Requirement R2. Threats and vulnerabilities may vary from facility to facility based on factors such as the facility's location, size, function, existing protections, and attractiveness of the target. As such, the requirement does not mandate a one-size-fits-all approach but requires entities to account for the unique characteristics of their facilities.

Requirement R4 does not explicitly state when the evaluation of threats and vulnerabilities must occur or be completed. However, Requirement R5 requires that the entity's security plan(s), which is dependent on the Requirement R4 evaluation, must be completed within 120 calendar days following completion of Requirement R2. Thus, an entity has the flexibility when to complete the Requirement R4 evaluation, provided that it is completed in time to comply with the requirement in Requirement R5 to develop a physical security plan 120 calendar days following completion of Requirement R2.

R5. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s). The physical security plan(s) shall be developed within 120 calendar days following the completion of Requirement R2 and executed according to the timeline specified in the physical security plan(s). The physical security plan(s) shall include the following attributes: *[VRF: High; Time-Horizon: Long-term Planning]*

5.1. Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.

5.2. Law enforcement contact and coordination information.

5.3. A timeline for executing the physical security enhancements and modifications specified in the physical security plan.

5.4. Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).

M5. Examples of evidence may include, but are not limited to, dated written or electronic documentation of its physical security plan(s) that covers their respective identified

and verified Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R5, and additional evidence demonstrating execution of the physical security plan according to the timeline specified in the physical security plan.

Rationale for Requirement R5:

This requirement meets the FERC directive from paragraph 9 in the order on physical security requiring the development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

R6. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall have an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5. The review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5. *[VRF: Medium; Time-Horizon: Long-term Planning]*

6.1. Each Transmission Owner and Transmission Operator shall select an unaffiliated third party reviewer from the following:

- An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.
- An entity or organization approved by the ERO.
- A governmental agency with physical security expertise.
- An entity or organization with demonstrated law enforcement, government, or military physical security expertise.

6.2. The Transmission Owner or Transmission Operator, respectively, shall ensure that the unaffiliated third party review is completed within 90 calendar days of completing the security plan(s) developed in Requirement R5. The unaffiliated third party review may, but is not required to, include recommended changes to the evaluation performed under Requirement R4 or the security plan(s) developed under Requirement R5.

6.3. If the unaffiliated third party reviewer recommends changes to the evaluation performed under Requirement R4 or security plan(s) developed under Requirement R5, the Transmission Owner or Transmission Operator shall, within 60 calendar days of the completion of the unaffiliated third party review, for each recommendation:

- Modify its evaluation or security plan(s) consistent with the recommendation; or
- Document the reason(s) for not modifying the evaluation or security plan(s) consistent with the recommendation.

6.4. Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third party reviewer and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M6. Examples of evidence may include, but are not limited to, written or electronic documentation that the Transmission Owner or Transmission Operator had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 as specified in Requirement R6 including, if applicable, documenting the reasons for not modifying the evaluation or security plan(s) in accordance with a recommendation under Part 6.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 6.4.

Rationale for Requirement R6:

This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring review by an entity other than the owner or operator with appropriate expertise of the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5.

As with the verification required by Requirement R2, Requirement R6 provides Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout the Requirement R4 evaluation and the development of the Requirement R5 security plan(s). This would allow entities to satisfy their obligations under Requirement R6 concurrent with the satisfaction of their obligations under Requirements R4 and R5.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence during an on-site visit to show that it was compliant for the full time period since the last audit.

The Transmission Owner and Transmission Operator shall keep data or evidence to show compliance, as identified below, unless directed by its Compliance Enforcement Authority (CEA) to retain specific evidence for a longer period of time as part of an investigation.

The responsible entities shall retain documentation as evidence for three years.

If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records, subject to the confidentiality provisions of Section 1500 of the Rules of Procedure and the provisions of Section 1.4 below.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints Text

1.4. Additional Compliance Information

Confidentiality: To protect the confidentiality and sensitive nature of the evidence for demonstrating compliance with this standard, all evidence will be retained at the Transmission Owner's and Transmission Operator's facilities.

2. Table of Compliance Elements

Guidelines and Technical Basis

Section 4 Applicability

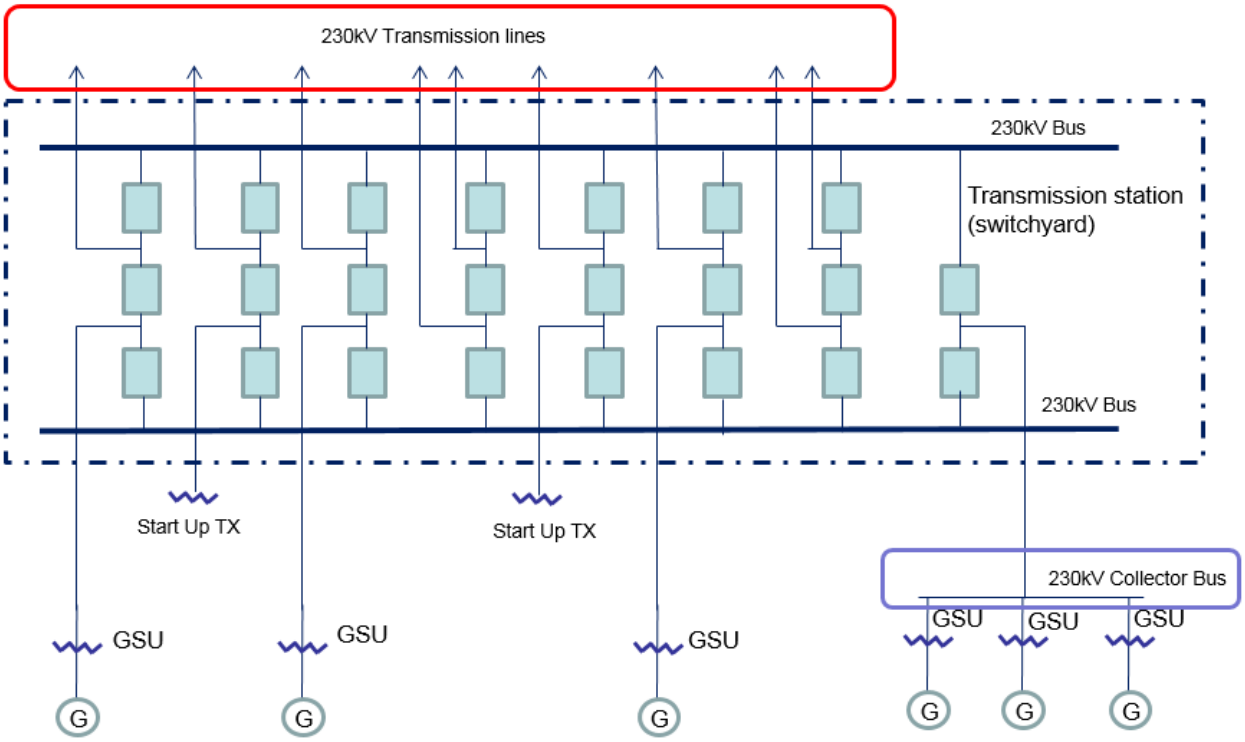
The purpose of Reliability Standard CIP-014 is to protect Transmission stations and Transmission substations, and their associated primary control centers that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. To properly include those entities that own or operate such Facilities, the Reliability Standard CIP-014 first applies to Transmission Owners that own Transmission Facilities that meet the specific criteria in Applicability Section 4.1.1.1 through 4.1.1.4. The Facilities described in Applicability Section 4.1.1.1 through 4.1.1.4 mirror those Transmission Facilities that meet the bright line criteria for "Medium Impact" Transmission Facilities under Attachment 1 of Reliability Standard CIP-002-5.1. Each Transmission Owner that owns Transmission Facilities that meet the criteria in Section 4.1.1.1 through 4.1.1.4 is required to perform a risk assessment as specified in Requirement R1 to identify its Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. The Standard Drafting Team (SDT) expects this population will be small and that many Transmission Owners that meet the applicability of this standard will not actually identify any such Facilities. Only those Transmission Owners with Transmission stations or Transmission substations identified in the risk assessment (and verified under Requirement R2) have performance obligations under Requirements R3 through R6.

This standard also applies to Transmission Operators. A Transmission Operator's obligations under the standard, however, are only triggered if the Transmission Operator is notified by an applicable Transmission Owner under Requirement R3 that the Transmission Operator operates a primary control center that operationally controls a Transmission station(s) or Transmission substation(s) identified in the Requirement R1 risk assessment. A primary control center operationally controls a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical action at the identified Transmission station or Transmission substation, such as opening a breaker, as opposed to a control center that only has information from the Transmission station or Transmission substation and must coordinate direct action through another entity. Only Transmission Operators who are notified that they have primary control centers under this standard have performance obligations under Requirements R4 through R6. In other words, primary control center for purposes of this Standard is the control center that the Transmission Owner or Transmission Operator, respectively, uses as its primary, permanently-manned site to physically operate a Transmission station or Transmission substation that is identified in Requirement R1 and verified in Requirement R2. Control centers that provide back-up capability are not applicable, as they are a form of resiliency and intentionally redundant.

The SDT considered several options for bright line criteria that could be used to determine applicability and provide an initial threshold that defines the set of Transmission stations and Transmission substations that would meet the directives of the FERC order on physical security (*i.e.*, those that could cause instability, uncontrolled separation, or Cascading within an

Interconnection). The SDT determined that using the criteria for Medium Impact Transmission Facilities in Attachment 1 of CIP-002-5.1 would provide a conservative threshold for defining which Transmission stations and Transmission substations must be included in the risk assessment in Requirement R1 of CIP-014. Additionally, the SDT concluded that using the CIP-002-5.1 Medium Impact criteria was appropriate because it has been approved by stakeholders, NERC, and FERC, and its use provides a technically sound basis to determine which Transmission Owners should conduct the risk assessment. As described in CIP-002-5.1, the failure of a Transmission station or Transmission substation that meets the Medium Impact criteria could have the capability to result in exceeding one or more Interconnection Reliability Operating Limits (IROLs). The SDT understands that using this bright line criteria to determine applicability may require some Transmission Owners to perform risk assessments under Requirement R1 that will result in a finding that none of their Transmission stations or Transmission substations would pose a risk of instability, uncontrolled separation, or Cascading within an Interconnection. However, the SDT determined that higher bright lines could not be technically justified to ensure inclusion of all Transmission stations and Transmission substations, and their associated primary control centers that, if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. Further guidance and technical basis for the bright line criteria for Medium Impact Facilities can be found in the Guidelines and Technical Basis section of CIP-002-5.1.

Additionally, the SDT determined that it was not necessary to include Generator Operators and Generator Owners in the Reliability Standard. First, Transmission stations or Transmission substations interconnecting generation facilities are considered when determining applicability. Transmission Owners will consider those Transmission stations and Transmission substations that include a Transmission station on the high side of the Generator Step-up transformer (GSU) using Applicability Section 4.1.1.1 and 4.1.1.2. As an example, a Transmission station or Transmission substation identified as a Transmission Owner facility that interconnects generation will be subject to the Requirement R1 risk assessment if it operates at 500kV or greater or if it is connected at 200 kV – 499kV to three or more other Transmission stations or Transmission substations and has an "aggregate weighted value" exceeding 3000 according to the table in Applicability Section 4.1.1.2. Second, the Transmission analysis or analyses conducted under Requirement R1 should take into account the impact of the loss of generation connected to applicable Transmission stations or Transmission substations. Additionally, the FERC order does not explicitly mention generation assets and is reasonably understood to focus on the most critical Transmission Facilities. The diagram below shows an example of a station.



Also, the SDT uses the phrase "Transmission stations or Transmission substations" to recognize the existence of both stations and substations. Many entities in industry consider a substation to be a location with physical borders (i.e. fence, wall, etc.) that contains at least an autotransformer. Locations also exist that do not contain autotransformers, and many entities in industry refer to those locations as stations (switching stations or switchyards). Therefore, the SDT chose to use both "station" and "substation" to refer to the locations where groups of Transmission Facilities exist.

On the issue of joint ownership, the SDT recognizes that this issue is not unique to CIP-014, and expects that the applicable Transmission Owners and Transmission Operators will develop memorandums of understanding, agreements, Coordinated Functional Registrations, or procedures, etc., to designate responsibilities under CIP-014 when joint ownership is at issue, which is similar to what many entities have completed for other Reliability Standards.

The language contained in the applicability section regarding the collector bus is directly copied from CIP-002-5.1, Attachment 1, and has no additional meaning within the CIP-014 standard.

Requirement R1

The initial risk assessment required under Requirement R1 must be completed on or before the effective date of the standard. Subsequent risk assessments are to be performed at least once every 30 or 60 months depending on the results of the previous risk assessment per Requirement R1, Part 1.1. In performing the risk assessment under Requirement R1, the

Transmission Owner should first identify their population of Transmission stations and Transmission substations that meet the criteria contained in Applicability Section 4.1.1. Requirement R1 then requires the Transmission Owner to perform a risk assessment, consisting of a transmission analysis, to determine which of those Transmission stations and Transmission Substations if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection. The requirement is not ~~to require identification of, and thus, not~~ intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the following:

- Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6
- NERC EOP-004-2 reporting criteria
- Area or magnitude of potential impact

The standard does not mandate the specific analytical method for performing the risk assessment. The Transmission Owner has the discretion to choose the specific method that best suites its needs. As an example, an entity may perform a Power Flow analysis and stability analysis at a variety of load levels.

Performing Risk Assessments

The Transmission Owner has the discretion to select a transmission analysis method that fits its facts and system circumstances. To mandate a specific approach is not technically desirable and may lead to results that fail to adequately consider regional, topological, and system circumstances. The following guidance is only an example on how a Transmission Owner may perform a power flow and/or stability analysis to identify those Transmission stations and Transmission substations that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. An entity could remove all lines, without regard to the voltage level, to a single Transmission station or Transmission substation and review the simulation results to assess system behavior to determine if Cascading of Transmission Facilities, uncontrolled separation, or voltage or frequency instability is likely to occur over a significant area of the Interconnection. Using engineering judgment, the Transmission Owner (possibly in consultation with regional planning or operation committees and/or ISO/RTO committee input) should develop criteria (e.g. imposing a fault near the removed Transmission station or Transmission substation) to identify a contingency or parameters that result in potential instability, uncontrolled separation, or Cascading within an Interconnection. Regional consultation on these matters is likely to be

helpful and informative, given that the inputs for the risk assessment and the attributes of what constitutes instability, uncontrolled separation, or Cascading within an Interconnection will likely vary from region-to-region or from ISO-to-ISO based on topology, system characteristics, and system configurations. Criteria could also include post-contingency facilities loadings above a certain emergency rating or failure of a power flow case to converge. Available special protection systems (SPS), if any, could be applied to determine if the system experiences any additional instability which may result in uncontrolled separation. Example criteria may include:

(a) Thermal overloads beyond facility emergency ratings;

(b) Voltage deviation exceeding ± 10%; or

(c) Cascading outage/voltage collapse; or

(d) Frequency below under-frequency load shed points

Periodicity

A Transmission Owner who identifies one or more Transmission stations or Transmission substations (as verified under Requirement R2) that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection is required to conduct a risk assessment at least once every 30 months. This period ensures that the risk assessment remains current with projected conditions and configurations in the planned system. This risk assessment, as the initial assessment, must consider applicable planned Transmission stations and Transmission substations to be in service within 24 months. The 30 month timeframe aligns with the 24 month planned to be in service date because the Transmission Owner is provided the flexibility, depending on its planning cycle and the frequency in which it may plan to construct a new Transmission station or Transmission substation to more closely align these dates. The requirement is to conduct the risk assessment at least once every 30 months, so for a Transmission Owner that believes it is better to conduct a risk assessment once every 24 months, because of its planning cycle, it has the flexibility to do so.

Transmission Owners that have not identified any Transmission stations or Transmission substations (as verified under Requirement R2) that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection are unlikely to see changes to their risk assessment in the Near-Term Planning Horizon. Consequently, a 60 month periodicity for completing a subsequent risk assessment is specified.

Identification of Primary Control Centers

After completing the risk assessment specified in Requirement R1, it is important to additionally identify the primary control center that operationally controls each Transmission station or Transmission substation that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection. A primary control center

"operationally controls" a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker.

Requirement R2

This requirement specifies verification of the risk assessment performed under Requirement R1 by an entity other than the owner or operator of the Requirement R1 risk assessment.

A verification of the risk assessment by an unaffiliated third party, as specified in Requirement R2, could consist of:

1. Certifying that the Requirement R1 risk assessment considers the Transmission stations and Transmission substations identified in Applicability Section 4.1.1.
2. Review of the model used to conduct the risk assessment to ensure it contains sufficient system topology to identify Transmission stations and Transmission substations that if rendered inoperable or damaged could cause instability, uncontrolled separation, or Cascading within an Interconnection.
3. Review of the Requirement R1 risk assessment methodology.

This requirement provides the flexibility for a Transmission Owner to select from unaffiliated registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term unaffiliated means that the selected verifying entity cannot be a corporate affiliate (*i.e.,* the verifying or third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit.

The prohibition on registered entities using a corporate affiliate to conduct the verification, however, does not prohibit a governmental entity (e.g., a city, a municipality, a U.S. federal power marketing agency, or any other political subdivision of U.S. or Canadian federal, state, or provincial governments) from selecting as the verifying entity another governmental entity within the same political subdivision. For instance, a U.S. federal power marketing agency may select as its verifier another U.S. federal agency to conduct its verification so long as the selected entity has transmission planning or analysis experience. Similarly, a Transmission Owner owned by a Canadian province can use a separate agency of that province to perform the verification. The verifying entity, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

Requirement R2 also provides that the "verification may occur concurrent with or after the risk assessment performed under Requirement R1." This provision is designed to provide the Transmission Owner the flexibility to work with the verifying entity throughout (*i.e.,* concurrent with) the risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could collaborate with their unaffiliated verifying entity to perform the risk assessment under Requirement R1 such that both Requirement R1 and Requirement R2 are satisfied concurrently. The intent of Requirement R2

is to have an entity other than the owner or operator of the facility to be involved in the risk assessment process and have an opportunity to provide input. Accordingly, Requirement R2 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the risk assessment and subsequently has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the risk assessment.

Characteristics to consider in selecting a third party reviewer could include:

- Registered Entity with applicable planning and reliability functions.
- Experience in power system studies and planning.
- The entity's understanding of the MOD standards, TPL standards, and facility ratings as they pertain to planning studies.
- The entity's familiarity with the Interconnection within which the Transmission Owner is located.

With respect to the requirement that Transmission owners develop and implement procedures for protecting confidential and sensitive information, the Transmission Owner could have a method for identifying documents that require confidential treatment. One mechanism for protecting confidential or sensitive information is to prohibit removal of sensitive or confidential information from the Transmission Owner's site. Transmission Owners could include such a prohibition in a non-disclosure agreement with the verifying entity.

A Technical feasibility study is not required in the Requirement R2 documentation of the technical basis for not modifying the identification in accordance with the recommendation.

On the issue of the difference between a verifier in Requirement R2 and a reviewer in Requirement R6, the SDT indicates that the verifier will confirm that the risk assessment was completed in accordance with Requirement R1, including the number of Transmission stations and substations identified, while the reviewer in Requirement R6 is providing expertise on the manner in which the evaluation of threats was conducted in accordance with Requirement R4, and the physical security plan in accordance with Requirement R5. In the latter situation there is no verification of a technical analysis, rather an application of experience and expertise to provide guidance or recommendations, if needed.

Parts 2.4 and 6.4 require the entities to have procedures to protect the confidentiality of sensitive or confidential information. Those procedures may include the following elements:

1. Control and retention of information on site for third party verifiers/reviewers.
2. Only "need to know" employees, etc., get the information.
3. Marking documents as confidential
4. Securely storing and destroying information when no longer needed.
5. Not releasing information outside the entity without, for example, General Counsel sign-off.

Requirement R3

Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first completing the risk assessment specified by Requirement R1 and the verification specified by Requirement R2. Requirement R3 is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1 receive notice so that the Transmission Operator may fulfill the rest of the obligations required in Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include within the notice the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or as a result of the verification process under Requirement R2.

Requirement R4

This requirement requires owners and operators of facilities identified by the Requirement R1 risk assessment and that are verified under Requirement R2 to conduct an assessment of potential threats and vulnerabilities to those Transmission stations, Transmission substations, and primary control centers using a tailored evaluation process. Threats and vulnerabilities may vary from facility to facility based on any number of factors that include, but are not limited to, location, size, function, existing physical security protections, and attractiveness as a target.

In order to effectively conduct a threat and vulnerability assessment, the asset owner may be the best source to determine specific site vulnerabilities, but current and evolving threats may best be determined by others in the intelligence or law enforcement communities. A number of resources have been identified in the standard, but many others exist and asset owners are not limited to where they may turn for assistance. Additional resources may include state or local fusion centers, U.S. Department of Homeland Security, Federal Bureau of Investigations (FBI), Public Safety Canada, Royal Canadian Mounted Police, and InfraGard chapters coordinated by the FBI.

The Responsible Entity is required to take a number of factors into account in Parts 4.1 to 4.3 in order to make a risk-based evaluation under Requirement R4.

To assist in determining the current threat for a facility, the prior history of attacks on similarly protected facilities should be considered when assessing probability and likelihood of occurrence at the facility in question.

Resources that may be useful in conducting threat and vulnerability assessments include:

- NERC Security Guideline for the Electricity Sector: Physical Security.
- NERC Security Guideline: Physical Security Response.
- ASIS International General Risk Assessment Guidelines.
- ASIS International Facilities Physical Security Measure Guideline.

- ASIS International Security Management Standard: Physical Asset Protection.
- Whole Building Design Guide - Threat/Vulnerability Assessments.

Requirement R5

This requirement specifies development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Requirement R5 specifies the following attributes for the physical security plan:

- *Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.*

  Resiliency may include, among other things:

  a. System topology changes,

  b. Spare equipment,

  c. Construction of a new Transmission station or Transmission substation.

  While most security measures will work together to collectively harden the entire site, some may be allocated to protect specific critical components. For example, if protection from gunfire is considered necessary, the entity may only install ballistic protection for critical components, not the entire site.

- *Law enforcement contact and coordination information.*

  Examples of such information may be posting 9-1-1 for emergency calls and providing substation safety and familiarization training for local and federal law enforcement, fire department, and Emergency Medical Services.

- *A timeline for executing the physical security enhancements and modifications specified in the physical security plan.*

  Entities have the flexibility to prioritize the implementation of the various resiliency or security enhancements and modifications in their security plan according to risk, resources, or other factors. The requirement to include a timeline in the physical security plan for executing the actual physical security enhancements and modifications does not also require that the enhancements and modifications be completed within 120 days. The actual timeline may extend beyond the 120 days, depending on the amount of work to be completed.

- *Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).*

  A registered entity's physical security plan should include processes and responsibilities for obtaining and handling alerts, intelligence, and threat warnings from various

sources. Some of these sources could include the ERO, ES-ISAC, and US and/or Canadian federal agencies. This information should be used to reevaluate or consider changes in the security plan and corresponding security measures of the security plan found in R5.

Incremental changes made to the physical security plan prior to the next required third party review do not require additional third party reviews.

Requirement R6

This requirement specifies review by an entity other than the Transmission Owner or Transmission Operator with appropriate expertise for the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5. As with Requirement R2, the term unaffiliated means that the selected third party reviewer cannot be a corporate affiliate (*i.e.,* the third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Operator). A third party reviewer also cannot be a division of the Transmission Operator that operates as a functional unit.

As noted in the guidance for Requirement R2, the prohibition on registered entities using a corporate affiliate to conduct the review, however, does not prohibit a governmental entity from selecting as the third party reviewer another governmental entity within the same political subdivision. For instance, a city or municipality may use its local enforcement agency, so long as the local law enforcement agency satisfies the criteria in Requirement R6. The third party reviewer, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

The Responsible Entity can select from several possible entities to perform the review:

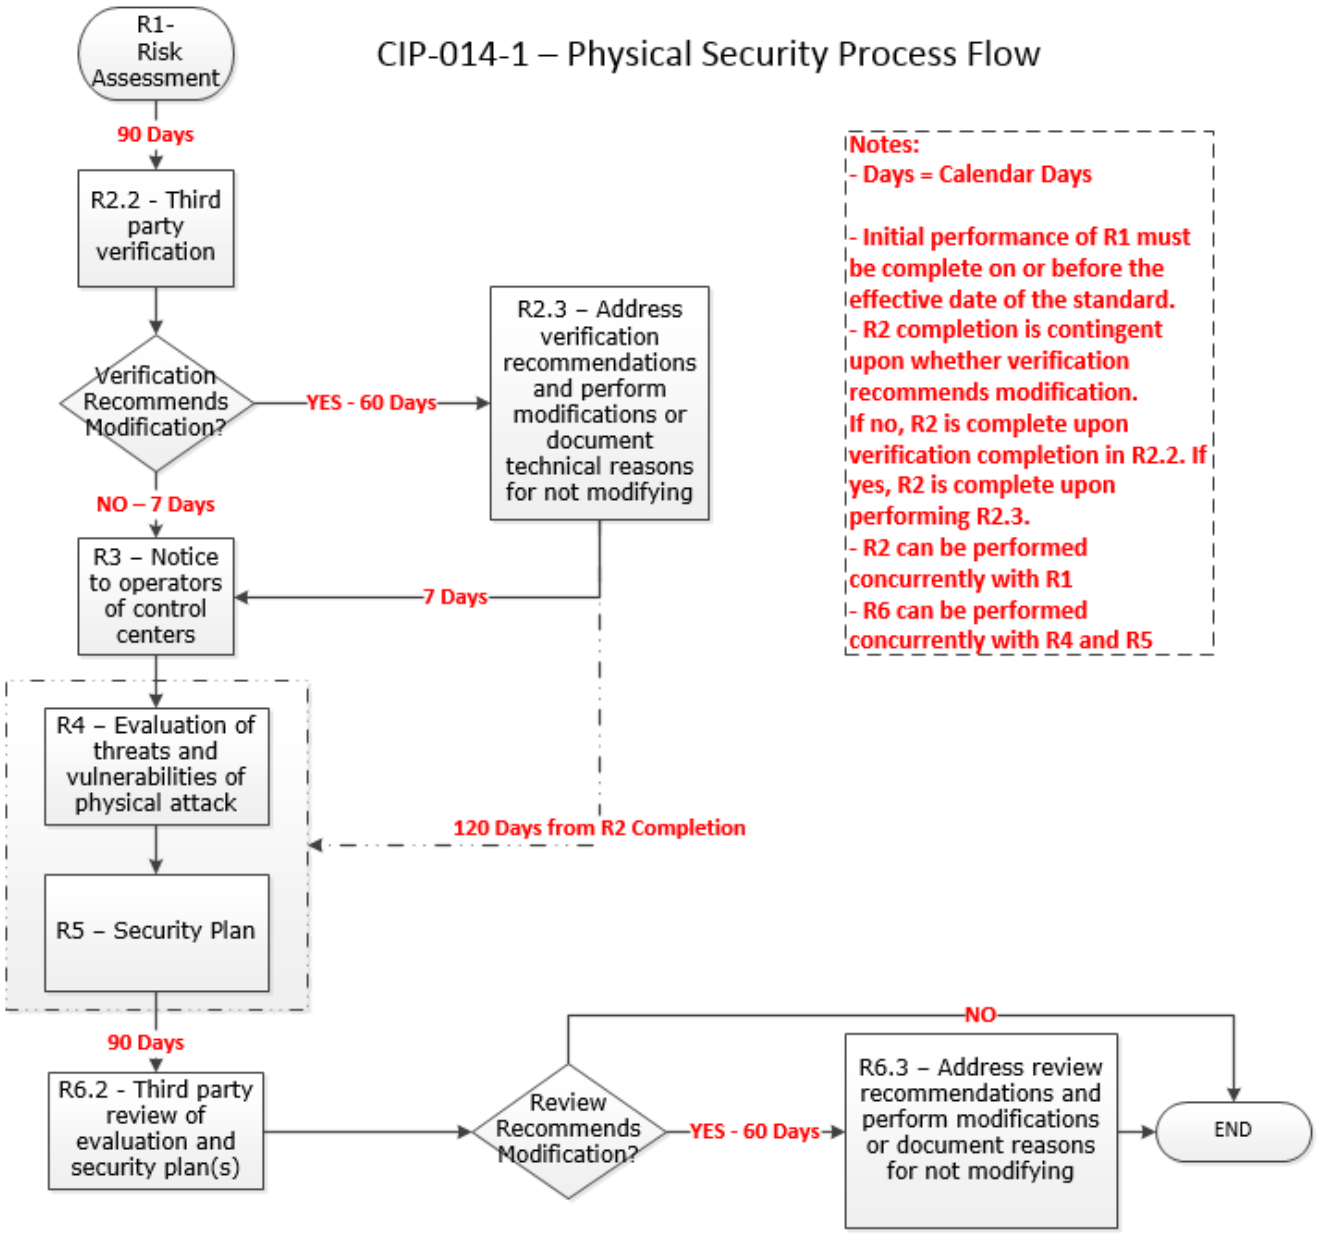
- *An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.*

  In selecting CPP and PSP for use in this standard, the SDT believed it was important that if a private entity such as a consulting or security firm was engaged to conduct the third party review, they must tangibly demonstrate competence to conduct the review. This includes electric industry physical security experience and either of the premier security industry certifications sponsored by ASIS International. The ASIS certification program was initiated in 1977, and those that hold the CPP certification are board certified in security management. Those that hold the PSP certification are board certified in physical security.

- *An entity or organization approved by the ERO.*
- *A governmental agency with physical security expertise.*
- *An entity or organization with demonstrated law enforcement, government, or military physical security expertise.*

As with the verification under Requirement R2, Requirement R6 provides that the "review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5." This provision is designed to provide applicable Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout (*i.e.,* concurrent with) the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5, which for some Responsible Entities may be more efficient and effective. In other words, a Transmission Owner or Transmission Operator could collaborate with their unaffiliated third party reviewer to perform an evaluation of potential threats and vulnerabilities (Requirement R4) and develop a security plan (Requirement R5) to satisfy Requirements R4 through R6 simultaneously. The intent of Requirement R6 is to have an entity other than the owner or operator of the facility to be involved in the Requirement R4 evaluation and the development of the Requirement R5 security plans and have an opportunity to provide input on the evaluation and the security plan. Accordingly, Requirement R6 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the evaluation and develops the security plan itself and then has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the evaluation and develop the security plan.

Timeline



CIP-014-1 – Physical Security Process Flow
R1- Risk Assessment
90 Days
R2.2 - Third party verification
Verification Recommends Modification?
YES - 60 Days
R2.3 – Address verification recommendations and perform modifications or document technical reasons for not modifying
NO – 7 Days
R3 – Notice to operators of control centers
7 Days
R4 – Evaluation of threats and vulnerabilities of physical attack
120 Days from R2 Completion
R5 – Security Plan
90 Days
R6.2 - Third party review of evaluation and security plan(s)
Review Recommends Modification?
YES - 60 Days
NO
R6.3 – Address review recommendations and perform modifications or document reasons for not modifying
END
Notes:
- Days = Calendar Days
- Initial performance of R1 must be complete on or before the effective date of the standard.
- R2 completion is contingent upon whether verification recommends modification. If no, R2 is complete upon verification completion in R2.2. If yes, R2 is complete upon performing R2.3.
- R2 can be performed concurrently with R1
- R6 can be performed concurrently with R4 and R5

A. Introduction

1. Title: Physical Security

2. Number: CIP-014-21

3. Purpose: To identify and protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection.

4. Applicability:

4.1. Functional Entities:

4.1.1 Transmission Owner that owns a Transmission station or Transmission substation that meets any of the following criteria:

4.1.1.1 Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

4.1.1.2 Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

Voltage Value of a Line	Weight Value per Line
less than 200 kV (not applicable)	(not applicable)
200 kV to 299 kV	700
300 kV to 499 kV	1300
500 kV and above	0

4.1.1.3 Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Coordinator, or

Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

4.1.1.4 Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements.

4.1.2 Transmission Operator.

Exemption: Facilities in a "protected area," as defined in 10 C.F.R. § 73.2, within the scope of a security plan approved or accepted by the Nuclear Regulatory Commission are not subject to this Standard; or, Facilities within the scope of a security plan approved or accepted by the Canadian Nuclear Safety Commission are not subject to this Standard.

5. Effective Dates:

See Implementation Plan.~~CIP-014-1 is effective the first day of the first calendar quarter that is six months beyond the date that this standard is approved by applicable regulatory authorities, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. In those jurisdictions where regulatory approval is not required, CIP-014-1 shall become effective on the first day of the first calendar quarter that is six months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.~~

6. Background:

This Reliability Standard addresses the directives from the FERC order issued March 7, 2014, *Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (2014), which required NERC to develop a physical security reliability standard(s) to identify and protect facilities that if rendered inoperable or damaged could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection.

B. Requirements and Measures

R1. Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria specified in Applicability Section 4.1.1. The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify the Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection. *[VRF: High; Time-Horizon: Long-term Planning]*

1.1. Subsequent risk assessments shall be performed:

- At least once every 30 calendar months for a Transmission Owner that has identified in its previous risk assessment (as verified according to Requirement R2) one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection; or

- At least once every 60 calendar months for a Transmission Owner that has not identified in its previous risk assessment (as verified according to Requirement R2) any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection.

1.2. The Transmission Owner shall identify the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment.

M1. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the risk assessment of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria in Applicability Section 4.1.1 as specified in Requirement R1. Additionally, examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the identification of the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment as specified in Requirement R1, Part 1.2.

R2. Each Transmission Owner shall have an unaffiliated third party verify the risk assessment performed under Requirement R1. The verification may occur concurrent with or after the risk assessment performed under Requirement R1. *[VRF: Medium; Time-Horizon: Long-term Planning]*

2.1. Each Transmission Owner shall select an unaffiliated verifying entity that is either:

- A registered Planning Coordinator, Transmission Planner, or Reliability Coordinator; or
- An entity that has transmission planning or analysis experience.

2.2. The unaffiliated third party verification shall verify the Transmission Owner's risk assessment performed under Requirement R1, which may include recommendations for the addition or deletion of a Transmission station(s) or Transmission substation(s). The Transmission Owner shall ensure the verification is completed within 90 calendar days following the completion of the Requirement R1 risk assessment.

2.3. If the unaffiliated verifying entity recommends that the Transmission Owner add a Transmission station(s) or Transmission substation(s) to, or remove a Transmission station(s) or Transmission substation(s) from, its identification under Requirement R1, the Transmission Owner shall either, within 60 calendar days of completion of the verification, for each recommended addition or removal of a Transmission station or Transmission substation:

- Modify its identification under Requirement R1 consistent with the recommendation; or
- Document the technical basis for not modifying the identification in accordance with the recommendation.

2.4. Each Transmission Owner shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third party verifier and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M2. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner completed an unaffiliated third party verification of the Requirement R1 risk assessment and satisfied all of the applicable provisions of Requirement R2, including, if applicable, documenting the technical basis for not modifying the Requirement R1 identification as specified under Part 2.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 2.4.

R3. For a primary control center(s) identified by the Transmission Owner according to Requirement R1, Part 1.2 that a) operationally controls an identified Transmission station or Transmission substation verified according to Requirement R2, and b) is not under the operational control of the Transmission Owner: the Transmission Owner

shall, within seven calendar days following completion of Requirement R2, notify the Transmission Operator that has operational control of the primary control center of such identification and the date of completion of Requirement R2. *[VRF: Lower; Time-Horizon: Long-term Planning]*

3.1. If a Transmission station or Transmission substation previously identified under Requirement R1 and verified according to Requirement R2 is removed from the identification during a subsequent risk assessment performed according to Requirement R1 or a verification according to Requirement R2, then the Transmission Owner shall, within seven calendar days following the verification or the subsequent risk assessment, notify the Transmission Operator that has operational control of the primary control center of the removal.

M3. Examples of acceptable evidence may include, but are not limited to, dated written or electronic notifications or communications that the Transmission Owner notified each Transmission Operator, as applicable, according to Requirement R3.

R4. Each Transmission Owner that identified a Transmission station, Transmission substation, or a primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2. The evaluation shall consider the following: *[VRF: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

4.1. Unique characteristics of the identified and verified Transmission station(s), Transmission substation(s), and primary control center(s);

4.2. Prior history of attack on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and

4.3. Intelligence or threat warnings received from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), U.S. federal and/or Canadian governmental agencies, or their successors.

M4. Examples of evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner or Transmission Operator conducted an evaluation of the potential threats and vulnerabilities of a physical attack to their respective Transmission station(s), Transmission substation(s) and primary control center(s) as specified in Requirement R4.

R5. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s). The physical security plan(s) shall be developed within 120 calendar days following the completion of Requirement R2 and executed according to the timeline specified in the physical security plan(s). The physical security plan(s) shall include the following attributes: *[VRF: High; Time-Horizon: Long-term Planning]*

5.1. Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.

5.2. Law enforcement contact and coordination information.

5.3. A timeline for executing the physical security enhancements and modifications specified in the physical security plan.

5.4. Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).

M5. Examples of evidence may include, but are not limited to, dated written or electronic documentation of its physical security plan(s) that covers their respective identified and verified Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R5, and additional evidence demonstrating execution of the physical security plan according to the timeline specified in the physical security plan.

R6. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R1 and verified according to Requirement R2, and each Transmission Operator notified by a Transmission Owner according to Requirement R3, shall have an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5. The review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5. *[VRF: Medium; Time-Horizon: Long-term Planning]*

6.1. Each Transmission Owner and Transmission Operator shall select an unaffiliated third party reviewer from the following:

- An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified

Protection Professional (CPP) or Physical Security Professional (PSP) certification.

- An entity or organization approved by the ERO.
- A governmental agency with physical security expertise.
- An entity or organization with demonstrated law enforcement, government, or military physical security expertise.

6.2. The Transmission Owner or Transmission Operator, respectively, shall ensure that the unaffiliated third party review is completed within 90 calendar days of completing the security plan(s) developed in Requirement R5. The unaffiliated third party review may, but is not required to, include recommended changes to the evaluation performed under Requirement R4 or the security plan(s) developed under Requirement R5.

6.3. If the unaffiliated third party reviewer recommends changes to the evaluation performed under Requirement R4 or security plan(s) developed under Requirement R5, the Transmission Owner or Transmission Operator shall, within 60 calendar days of the completion of the unaffiliated third party review, for each recommendation:

- Modify its evaluation or security plan(s) consistent with the recommendation; or
- Document the reason(s) for not modifying the evaluation or security plan(s) consistent with the recommendation.

6.4. Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third party reviewer and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M6. Examples of evidence may include, but are not limited to, written or electronic documentation that the Transmission Owner or Transmission Operator had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 as specified in Requirement R6 including, if applicable, documenting the reasons for not modifying the evaluation or security plan(s) in accordance with a recommendation under Part 6.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 6.4.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence during an on-site visit to show that it was compliant for the full time period since the last audit.

The Transmission Owner and Transmission Operator shall keep data or evidence to show compliance, as identified below, unless directed by its Compliance Enforcement Authority (CEA) to retain specific evidence for a longer period of time as part of an investigation.

The responsible entities shall retain documentation as evidence for three years.

If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records, subject to the confidentiality provisions of Section 1500 of the Rules of Procedure and the provisions of Section 1.4 below.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints Text

1.4. Additional Compliance Information

Confidentiality: To protect the confidentiality and sensitive nature of the evidence for demonstrating compliance with this standard, all evidence will be retained at the Transmission Owner's and Transmission Operator's facilities.

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-014-1)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Long-term Planning**	**High**	The Transmission Owner performed an initial risk assessment but did so after the date specified in the implementation plan for performing the initial risk assessment but less than or equal to two calendar months after that date; OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in ~~widespread~~	The Transmission Owner performed an initial risk assessment but did so more than two calendar months after the date specified in the implementation plan for performing the initial risk assessment but less than or equal to four calendar months after that date; OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could	The Transmission Owner performed an initial risk assessment but did so more than four calendar months after the date specified in the implementation plan for performing the initial risk assessment but less than or equal to six calendar months after that date; OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in ~~widespread~~	The Transmission Owner performed an initial risk assessment but did so more than six calendar months after the date specified in the implementation plan for performing the initial risk assessment; OR The Transmission Owner failed to perform an initial risk assessment; OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or

R #	Time Horizon	VRF	Violation Severity Levels (CIP-014-1)

1	November 20, 2014	FERC Order approving CIP-014-1	

Guidelines and Technical Basis

Section 4 Applicability

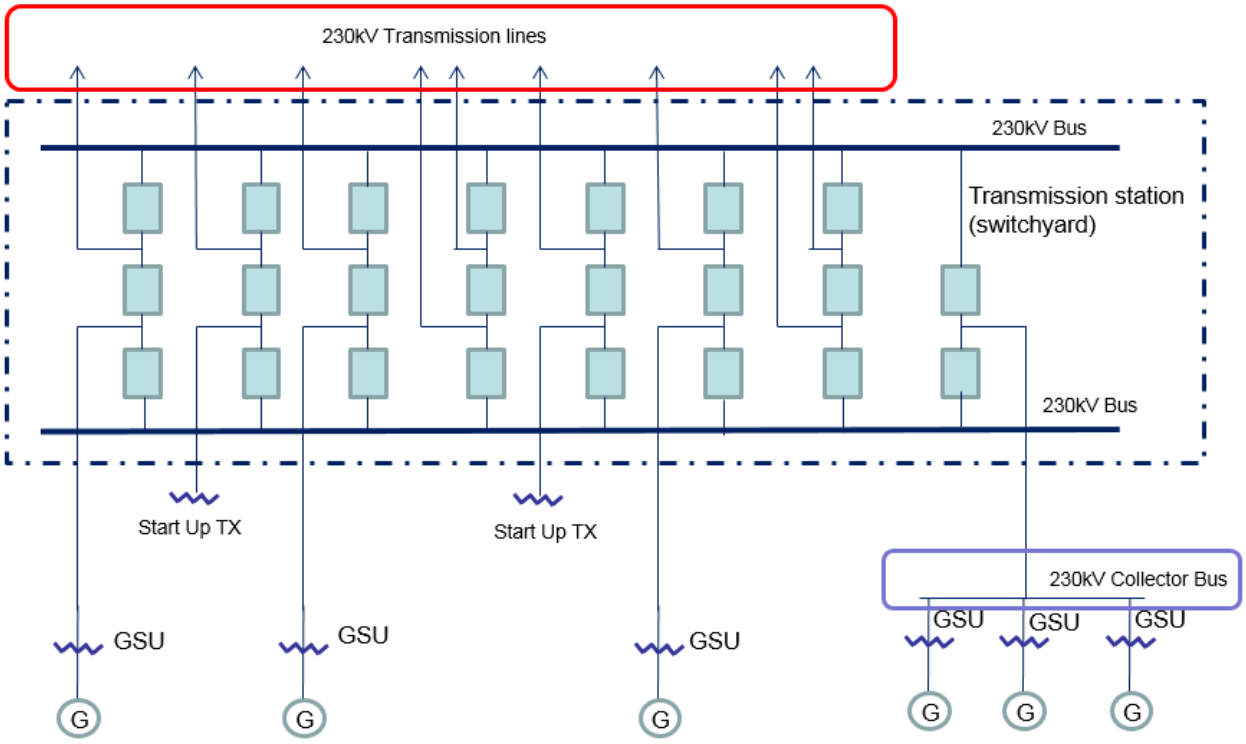
The purpose of Reliability Standard CIP-014~~-1~~ is to protect Transmission stations and Transmission substations, and their associated primary control centers that if rendered inoperable or damaged as a result of a physical attack could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection. To properly include those entities that own or operate such Facilities, the Reliability Standard CIP-014~~-1~~ first applies to Transmission Owners that own Transmission Facilities that meet the specific criteria in Applicability Section 4.1.1.1 through 4.1.1.4. The Facilities described in Applicability Section 4.1.1.1 through 4.1.1.4 mirror those Transmission Facilities that meet the bright line criteria for "Medium Impact" Transmission Facilities under Attachment 1 of Reliability Standard CIP-002-5.1. Each Transmission Owner that owns Transmission Facilities that meet the criteria in Section 4.1.1.1 through 4.1.1.4 is required to perform a risk assessment as specified in Requirement R1 to identify its Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection. The Standard Drafting Team (SDT) expects this population will be small and that many Transmission Owners that meet the applicability of this standard will not actually identify any such Facilities. Only those Transmission Owners with Transmission stations or Transmission substations identified in the risk assessment (and verified under Requirement R2) have performance obligations under Requirements R3 through R6.

This standard also applies to Transmission Operators. A Transmission Operator's obligations under the standard, however, are only triggered if the Transmission Operator is notified by an applicable Transmission Owner under Requirement R3 that the Transmission Operator operates a primary control center that operationally controls a Transmission station(s) or Transmission substation(s) identified in the Requirement R1 risk assessment. A primary control center operationally controls a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical action at the identified Transmission station or Transmission substation, such as opening a breaker, as opposed to a control center that only has information from the Transmission station or Transmission substation and must coordinate direct action through another entity. Only Transmission Operators who are notified that they have primary control centers under this standard have performance obligations under Requirements R4 through R6. In other words, primary control center for purposes of this Standard is the control center that the Transmission Owner or Transmission Operator, respectively, uses as its primary, permanently-manned site to physically operate a Transmission station or Transmission substation that is identified in Requirement R1 and verified in Requirement R2. Control centers that provide back-up capability are not applicable, as they are a form of resiliency and intentionally redundant.

The SDT considered several options for bright line criteria that could be used to determine applicability and provide an initial threshold that defines the set of Transmission stations and Transmission substations that would meet the directives of the FERC order on physical security (*i.e.*, those that could cause ~~widespread~~ instability, uncontrolled separation, or Cascading within

an Interconnection). The SDT determined that using the criteria for Medium Impact Transmission Facilities in Attachment 1 of CIP-002-5.1 would provide a conservative threshold for defining which Transmission stations and Transmission substations must be included in the risk assessment in Requirement R1 of CIP-014~~-1~~. Additionally, the SDT concluded that using the CIP-002-5.1 Medium Impact criteria was appropriate because it has been approved by stakeholders, NERC, and FERC, and its use provides a technically sound basis to determine which Transmission Owners should conduct the risk assessment. As described in CIP-002-5.1, the failure of a Transmission station or Transmission substation that meets the Medium Impact criteria could have the capability to result in exceeding one or more Interconnection Reliability Operating Limits (IROLs). The SDT understands that using this bright line criteria to determine applicability may require some Transmission Owners to perform risk assessments under Requirement R1 that will result in a finding that none of their Transmission stations or Transmission substations would pose a risk of ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection. However, the SDT determined that higher bright lines could not be technically justified to ensure inclusion of all Transmission stations and Transmission substations, and their associated primary control centers that, if rendered inoperable or damaged as a result of a physical attack could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection. Further guidance and technical basis for the bright line criteria for Medium Impact Facilities can be found in the Guidelines and Technical Basis section of CIP-002-5.1.

Additionally, the SDT determined that it was not necessary to include Generator Operators and Generator Owners in the Reliability Standard. First, Transmission stations or Transmission substations interconnecting generation facilities are considered when determining applicability. Transmission Owners will consider those Transmission stations and Transmission substations that include a Transmission station on the high side of the Generator Step-up transformer (GSU) using Applicability Section 4.1.1.1 and 4.1.1.2. As an example, a Transmission station or Transmission substation identified as a Transmission Owner facility that interconnects generation will be subject to the Requirement R1 risk assessment if it operates at 500kV or greater or if it is connected at 200 kV – 499kV to three or more other Transmission stations or Transmission substations and has an "aggregate weighted value" exceeding 3000 according to the table in Applicability Section 4.1.1.2. Second, the Transmission analysis or analyses conducted under Requirement R1 should take into account the impact of the loss of generation connected to applicable Transmission stations or Transmission substations. Additionally, the FERC order does not explicitly mention generation assets and is reasonably understood to focus on the most critical Transmission Facilities. The diagram below shows an example of a station.



Also, the SDT uses the phrase "Transmission stations or Transmission substations" to recognize the existence of both stations and substations. Many entities in industry consider a substation to be a location with physical borders (i.e. fence, wall, etc.) that contains at least an autotransformer. Locations also exist that do not contain autotransformers, and many entities in industry refer to those locations as stations (switching stations or switchyards). Therefore, the SDT chose to use both "station" and "substation" to refer to the locations where groups of Transmission Facilities exist.

On the issue of joint ownership, the SDT recognizes that this issue is not unique to CIP-014~~-1~~, and expects that the applicable Transmission Owners and Transmission Operators will develop memorandums of understanding, agreements, Coordinated Functional Registrations, or procedures, etc., to designate responsibilities under CIP-014~~-1~~ when joint ownership is at issue, which is similar to what many entities have completed for other Reliability Standards.

The language contained in the applicability section regarding the collector bus is directly copied from CIP-002-5.1, Attachment 1, and has no additional meaning within the CIP-014~~-1~~ standard.

Requirement R1

The initial risk assessment required under Requirement R1 must be completed on or before the effective date of the standard. Subsequent risk assessments are to be performed at least once every 30 or 60 months depending on the results of the previous risk assessment per Requirement R1, Part 1.1. In performing the risk assessment under Requirement R1, the

Transmission Owner should first identify their population of Transmission stations and Transmission substations that meet the criteria contained in Applicability Section 4.1.1. Requirement R1 then requires the Transmission Owner to perform a risk assessment, consisting of a transmission analysis, to determine which of those Transmission stations and Transmission Substations if rendered inoperable or damaged could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection. The requirement is not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the following:

- Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6
- NERC EOP-004-2 reporting criteria
- Area or magnitude of potential impact

The standard does not mandate the specific analytical method for performing the risk assessment. The Transmission Owner has the discretion to choose the specific method that best suites its needs. As an example, an entity may perform a Power Flow analysis and stability analysis at a variety of load levels.

Performing Risk Assessments

The Transmission Owner has the discretion to select a transmission analysis method that fits its facts and system circumstances. To mandate a specific approach is not technically desirable and may lead to results that fail to adequately consider regional, topological, and system circumstances. The following guidance is only an example on how a Transmission Owner may perform a power flow and/or stability analysis to identify those Transmission stations and Transmission substations that if rendered inoperable or damaged as a result of a physical attack could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection. An entity could remove all lines, without regard to the voltage level, to a single Transmission station or Transmission substation and review the simulation results to assess system behavior to determine if Cascading of Transmission Facilities, uncontrolled separation, or voltage or frequency instability is likely to occur over a significant area of the Interconnection. Using engineering judgment, the Transmission Owner (possibly in consultation with regional planning or operation committees and/or ISO/RTO committee input) should develop criteria (e.g. imposing a fault near the removed Transmission station or Transmission substation) to identify a contingency or parameters that result in potential ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection. Regional consultation on these matters is likely to be helpful and informative, given that the inputs for

the risk assessment and the attributes of what constitutes ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection will likely vary from region-to-region or from ISO-to-ISO based on topology, system characteristics, and system configurations.~~-~~ Criteria could also include post-contingency facilities loadings above a certain emergency rating or failure of a power flow case to converge. Available special protection systems (SPS), if any, could be applied to determine if the system experiences any additional instability which may result in uncontrolled separation. Example criteria may include:

(a) Thermal overloads beyond facility emergency ratings;

(b) Voltage deviation exceeding ± 10%; or

(c) Cascading outage/voltage collapse; or

(d) Frequency below under-frequency load shed points

Periodicity

A Transmission Owner who identifies one or more Transmission stations or Transmission substations (as verified under Requirement R2) that if rendered inoperable or damaged could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection is required to conduct a risk assessment at least once every 30 months. This period ensures that the risk assessment remains current with projected conditions and configurations in the planned system. This risk assessment, as the initial assessment, must consider applicable planned Transmission stations and Transmission substations to be in service within 24 months. The 30 month timeframe aligns with the 24 month planned to be in service date because the Transmission Owner is provided the flexibility, depending on its planning cycle and the frequency in which it may plan to construct a new Transmission station or Transmission substation to more closely align these dates. The requirement is to conduct the risk assessment at least once every 30 months, so for a Transmission Owner that believes it is better to conduct a risk assessment once every 24 months, because of its planning cycle, it has the flexibility to do so.

Transmission Owners that have not identified any Transmission stations or Transmission substations (as verified under Requirement R2) that if rendered inoperable or damaged could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection are unlikely to see changes to their risk assessment in the Near-Term Planning Horizon. Consequently, a 60 month periodicity for completing a subsequent risk assessment is specified.

Identification of Primary Control Centers

After completing the risk assessment specified in Requirement R1, it is important to additionally identify the primary control center that operationally controls each Transmission station or Transmission substation that if rendered inoperable or damaged could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection. A primary control

center “operationally controls” a Transmission station or Transmission substation when the control center’s electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker.

Requirement R2

This requirement specifies verification of the risk assessment performed under Requirement R1 by an entity other than the owner or operator of the Requirement R1 risk assessment.

A verification of the risk assessment by an unaffiliated third party, as specified in Requirement R2, could consist of:

1. Certifying that the Requirement R1 risk assessment considers the Transmission stations and Transmission substations identified in Applicability Section 4.1.1.
2. Review of the model used to conduct the risk assessment to ensure it contains sufficient system topology to identify Transmission stations and Transmission substations that if rendered inoperable or damaged could cause ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection.
3. Review of the Requirement R1 risk assessment methodology.

This requirement provides the flexibility for a Transmission Owner to select from unaffiliated registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term unaffiliated means that the selected verifying entity cannot be a corporate affiliate (*i.e.,* the verifying or third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit.

The prohibition on registered entities using a corporate affiliate to conduct the verification, however, does not prohibit a governmental entity (e.g., a city, a municipality, a U.S. federal power marketing agency, or any other political subdivision of U.S. or Canadian federal, state, or provincial governments) from selecting as the verifying entity another governmental entity within the same political subdivision. For instance, a U.S. federal power marketing agency may select as its verifier another U.S. federal agency to conduct its verification so long as the selected entity has transmission planning or analysis experience. Similarly, a Transmission Owner owned by a Canadian province can use a separate agency of that province to perform the verification. The verifying entity, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

Requirement R2 also provides that the “verification may occur concurrent with or after the risk assessment performed under Requirement R1.” This provision is designed to provide the Transmission Owner the flexibility to work with the verifying entity throughout (*i.e.,* concurrent with) the risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could collaborate with their unaffiliated verifying entity to perform the risk assessment under Requirement R1 such that both Requirement R1 and Requirement R2 are satisfied concurrently. The intent of Requirement R2

is to have an entity other than the owner or operator of the facility to be involved in the risk assessment process and have an opportunity to provide input. Accordingly, Requirement R2 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the risk assessment and subsequently has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the risk assessment.

Characteristics to consider in selecting a third party reviewer could include:

- Registered Entity with applicable planning and reliability functions.
- Experience in power system studies and planning.
- The entity's understanding of the MOD standards, TPL standards, and facility ratings as they pertain to planning studies.
- The entity's familiarity with the Interconnection within which the Transmission Owner is located.

With respect to the requirement that Transmission owners develop and implement procedures for protecting confidential and sensitive information, the Transmission Owner could have a method for identifying documents that require confidential treatment. One mechanism for protecting confidential or sensitive information is to prohibit removal of sensitive or confidential information from the Transmission Owner's site. Transmission Owners could include such a prohibition in a non-disclosure agreement with the verifying entity.

A Technical feasibility study is not required in the Requirement R2 documentation of the technical basis for not modifying the identification in accordance with the recommendation.

On the issue of the difference between a verifier in Requirement R2 and a reviewer in Requirement R6, the SDT indicates that the verifier will confirm that the risk assessment was completed in accordance with Requirement R1, including the number of Transmission stations and substations identified, while the reviewer in Requirement R6 is providing expertise on the manner in which the evaluation of threats was conducted in accordance with Requirement R4, and the physical security plan in accordance with Requirement R5. In the latter situation there is no verification of a technical analysis, rather an application of experience and expertise to provide guidance or recommendations, if needed.

Parts 2.4 and 6.4 require the entities to have procedures to protect the confidentiality of sensitive or confidential information. Those procedures may include the following elements:

1. Control and retention of information on site for third party verifiers/reviewers.
2. Only "need to know" employees, etc., get the information.
3. Marking documents as confidential
4. Securely storing and destroying information when no longer needed.
5. Not releasing information outside the entity without, for example, General Counsel sign-off.

Requirement R3

Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first completing the risk assessment specified by Requirement R1 and the verification specified by Requirement R2. Requirement R3 is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1 receive notice so that the Transmission Operator may fulfill the rest of the obligations required in Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include within the notice the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or as a result of the verification process under Requirement R2.

Requirement R4

This requirement requires owners and operators of facilities identified by the Requirement R1 risk assessment and that are verified under Requirement R2 to conduct an assessment of potential threats and vulnerabilities to those Transmission stations, Transmission substations, and primary control centers using a tailored evaluation process. Threats and vulnerabilities may vary from facility to facility based on any number of factors that include, but are not limited to, location, size, function, existing physical security protections, and attractiveness as a target.

In order to effectively conduct a threat and vulnerability assessment, the asset owner may be the best source to determine specific site vulnerabilities, but current and evolving threats may best be determined by others in the intelligence or law enforcement communities. A number of resources have been identified in the standard, but many others exist and asset owners are not limited to where they may turn for assistance. Additional resources may include state or local fusion centers, U.S. Department of Homeland Security, Federal Bureau of Investigations (FBI), Public Safety Canada, Royal Canadian Mounted Police, and InfraGard chapters coordinated by the FBI.

The Responsible Entity is required to take a number of factors into account in Parts 4.1 to 4.3 in order to make a risk-based evaluation under Requirement R4.

To assist in determining the current threat for a facility, the prior history of attacks on similarly protected facilities should be considered when assessing probability and likelihood of occurrence at the facility in question.

Resources that may be useful in conducting threat and vulnerability assessments include:

- NERC Security Guideline for the Electricity Sector: Physical Security.
- NERC Security Guideline: Physical Security Response.
- ASIS International General Risk Assessment Guidelines.
- ASIS International Facilities Physical Security Measure Guideline.

- ASIS International Security Management Standard: Physical Asset Protection.
- Whole Building Design Guide - Threat/Vulnerability Assessments.

Requirement R5

This requirement specifies development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Requirement R5 specifies the following attributes for the physical security plan:

- *Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.*

  Resiliency may include, among other things:

  a. System topology changes,

  b. Spare equipment,

  c. Construction of a new Transmission station or Transmission substation.

  While most security measures will work together to collectively harden the entire site, some may be allocated to protect specific critical components. For example, if protection from gunfire is considered necessary, the entity may only install ballistic protection for critical components, not the entire site.

- *Law enforcement contact and coordination information.*

  Examples of such information may be posting 9-1-1 for emergency calls and providing substation safety and familiarization training for local and federal law enforcement, fire department, and Emergency Medical Services.

- *A timeline for executing the physical security enhancements and modifications specified in the physical security plan.*

  Entities have the flexibility to prioritize the implementation of the various resiliency or security enhancements and modifications in their security plan according to risk, resources, or other factors. The requirement to include a timeline in the physical security plan for executing the actual physical security enhancements and modifications does not also require that the enhancements and modifications be completed within 120 days. The actual timeline may extend beyond the 120 days, depending on the amount of work to be completed.

- *Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).*

  A registered entity's physical security plan should include processes and responsibilities for obtaining and handling alerts, intelligence, and threat warnings from various

sources. Some of these sources could include the ERO, ES-ISAC, and US and/or Canadian federal agencies. This information should be used to reevaluate or consider changes in the security plan and corresponding security measures of the security plan found in R5.

Incremental changes made to the physical security plan prior to the next required third party review do not require additional third party reviews.

Requirement R6

This requirement specifies review by an entity other than the Transmission Owner or Transmission Operator with appropriate expertise for the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5. As with Requirement R2, the term unaffiliated means that the selected third party reviewer cannot be a corporate affiliate (*i.e.,* the third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Operator). A third party reviewer also cannot be a division of the Transmission Operator that operates as a functional unit.

As noted in the guidance for Requirement R2, the prohibition on registered entities using a corporate affiliate to conduct the review, however, does not prohibit a governmental entity from selecting as the third party reviewer another governmental entity within the same political subdivision. For instance, a city or municipality may use its local enforcement agency, so long as the local law enforcement agency satisfies the criteria in Requirement R6. The third party reviewer, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

The Responsible Entity can select from several possible entities to perform the review:

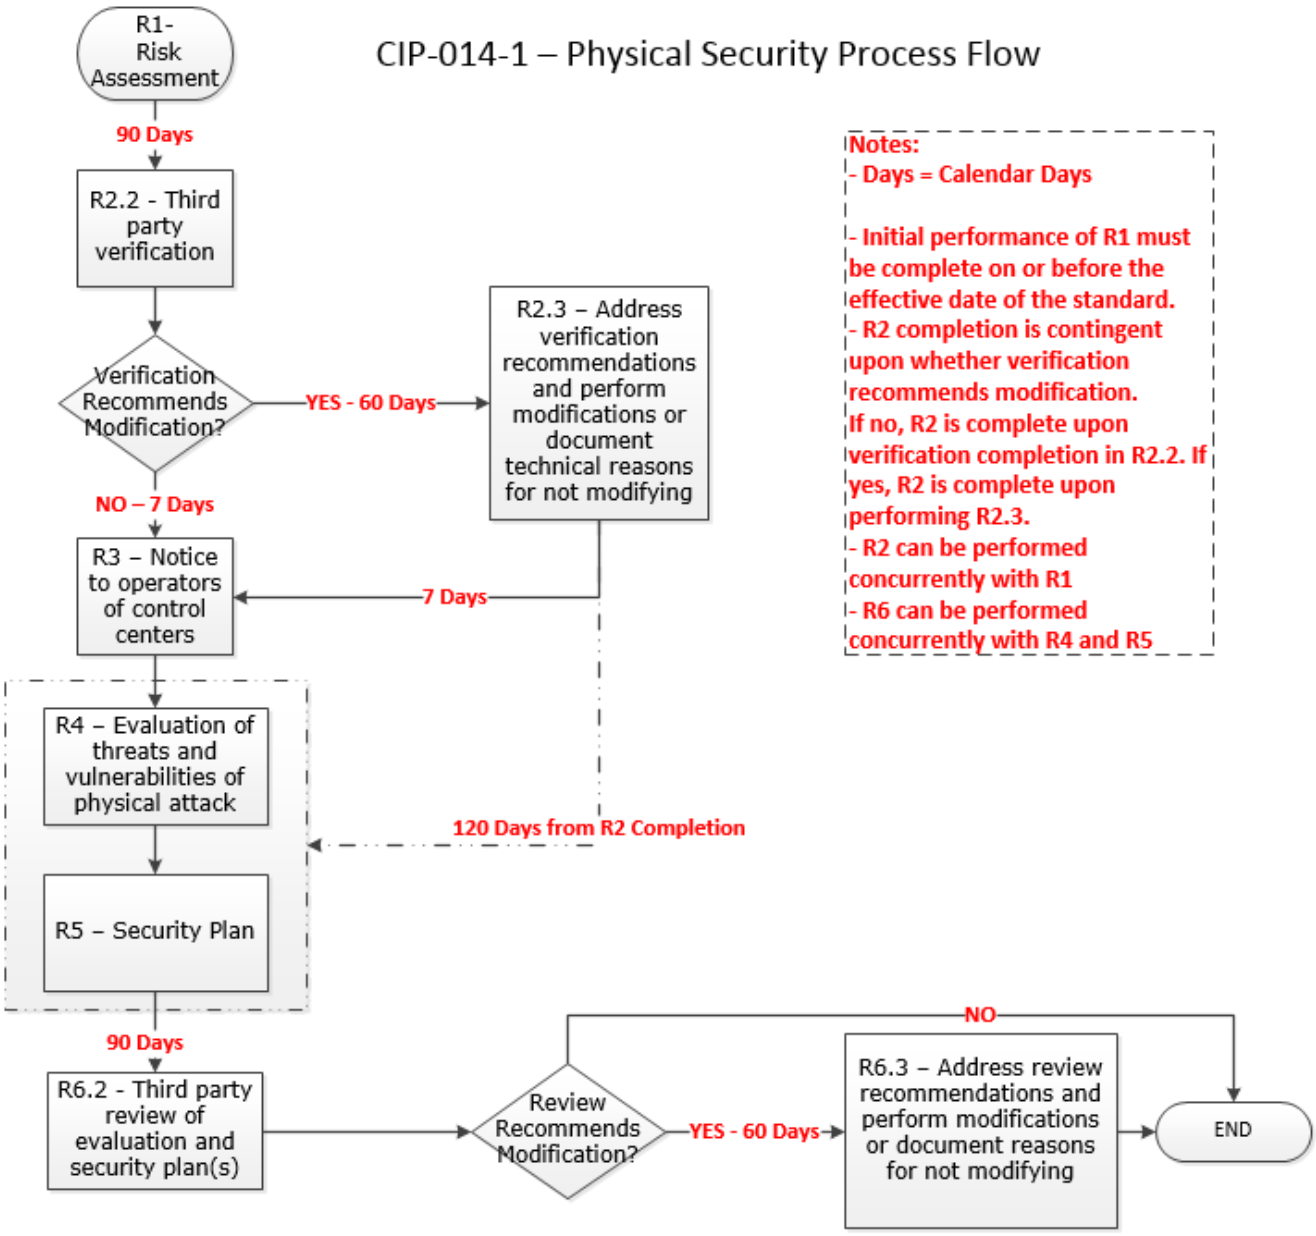
- *An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.*

  In selecting CPP and PSP for use in this standard, the SDT believed it was important that if a private entity such as a consulting or security firm was engaged to conduct the third party review, they must tangibly demonstrate competence to conduct the review. This includes electric industry physical security experience and either of the premier security industry certifications sponsored by ASIS International. The ASIS certification program was initiated in 1977, and those that hold the CPP certification are board certified in security management. Those that hold the PSP certification are board certified in physical security.

- *An entity or organization approved by the ERO.*
- *A governmental agency with physical security expertise.*
- *An entity or organization with demonstrated law enforcement, government, or military physical security expertise.*

As with the verification under Requirement R2, Requirement R6 provides that the "review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5." This provision is designed to provide applicable Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout (*i.e.,* concurrent with) the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5, which for some Responsible Entities may be more efficient and effective. In other words, a Transmission Owner or Transmission Operator could collaborate with their unaffiliated third party reviewer to perform an evaluation of potential threats and vulnerabilities (Requirement R4) and develop a security plan (Requirement R5) to satisfy Requirements R4 through R6 simultaneously. The intent of Requirement R6 is to have an entity other than the owner or operator of the facility to be involved in the Requirement R4 evaluation and the development of the Requirement R5 security plans and have an opportunity to provide input on the evaluation and the security plan. Accordingly, Requirement R6 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the evaluation and develops the security plan itself and then has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the evaluation and develop the security plan.

Timeline



CIP-014-1 – Physical Security Process Flow
R1- Risk Assessment
90 Days
R2.2 - Third party verification
Verification Recommends Modification?
YES - 60 Days
R2.3 – Address verification recommendations and perform modifications or document technical reasons for not modifying
NO – 7 Days
R3 – Notice to operators of control centers
7 Days
R4 – Evaluation of threats and vulnerabilities of physical attack
120 Days from R2 Completion
R5 – Security Plan
90 Days
R6.2 - Third party review of evaluation and security plan(s)
Review Recommends Modification?
YES - 60 Days
R6.3 – Address review recommendations and perform modifications or document reasons for not modifying
NO
END
Notes:
- Days = Calendar Days
- Initial performance of R1 must be complete on or before the effective date of the standard.
- R2 completion is contingent upon whether verification recommends modification. If no, R2 is complete upon verification completion in R2.2. If yes, R2 is complete upon performing R2.3.
- R2 can be performed concurrently with R1
- R6 can be performed concurrently with R4 and R5

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1:

This requirement meets the FERC directive from paragraph 6 in the order on physical security to perform a risk assessment to identify which facilities if rendered inoperable or damaged could impact an Interconnection through ~~widespread~~ instability, uncontrolled separation, or cascading failures. The requirement is not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the following:

- Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6
- NERC EOP-004-2 reporting criteria
- Area or magnitude of potential impact

Requirement R1~~It~~ also meets the portion of the directive ~~from paragraph 11~~ for periodic reevaluation of~~by requiring~~ the risk assessment to be performed every 30 months (or 60 months for an entity that has not identified in a previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in ~~widespread~~ instability, uncontrolled separation, or Cascading within an Interconnection).

After identifying each Transmission station and Transmission substation that meets the criteria in Requirement R1, it is important to additionally identify the primary control center that operationally controls that Transmission station or Transmission substation (*i.e.,* the control center whose electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker, compared to a control center that only has the ability to monitor the Transmission station and Transmission substation and, therefore, must coordinate direct physical action through another entity).

Rationale for Requirement R2:

This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring verification by an entity other than the owner or operator of the risk assessment performed under Requirement R1.

This requirement provides the flexibility for a Transmission Owner to select registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term "unaffiliated" means that the selected verifying entity cannot be a corporate affiliate (*i.e.*, the verifying entity cannot be an entity that controls, is controlled by, or is under common control with, the Transmission owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit. The term "unaffiliated" is not intended to prohibit a governmental entity from using another government entity to be a verifier under Requirement R2.

Requirement R2 also provides the Transmission Owner the flexibility to work with the verifying entity throughout the Requirement R1 risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could coordinate with their unaffiliated verifying entity to perform a Requirement R1 risk assessment to satisfy both Requirement R1 and Requirement R2 concurrently.

Planning Coordinator is a functional entity listed in Part 2.1. The Planning Coordinator and Planning Authority are the same entity as shown in the NERC Glossary of Terms Used in NERC Reliability Standards.

Rationale for Requirement R3:

Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first identifying which Transmission stations and Transmission substations meet the criteria specified by Requirement R1, as verified according to Requirement R2. This requirement is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1, Part 1.2 of a Transmission station or Transmission substation verified according to Requirement R2 receives notice of such identification so that the Transmission Operator may timely fulfill its resulting obligations under Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include notice of the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or the verification process under Requirement R2.

Rationale for Requirement R4:

This requirement meets the FERC directive from paragraph 8 in the order on physical security that the reliability standard must require tailored evaluation of potential threats and vulnerabilities to facilities identified in Requirement R1 and verified according to Requirement R2. Threats and vulnerabilities may vary from facility to facility based on factors such as the

facility's location, size, function, existing protections, and attractiveness of the target. As such, the requirement does not mandate a one-size-fits-all approach but requires entities to account for the unique characteristics of their facilities.

Requirement R4 does not explicitly state when the evaluation of threats and vulnerabilities must occur or be completed. However, Requirement R5 requires that the entity's security plan(s), which is dependent on the Requirement R4 evaluation, must be completed within 120 calendar days following completion of Requirement R2. Thus, an entity has the flexibility when to complete the Requirement R4 evaluation, provided that it is completed in time to comply with the requirement in Requirement R5 to develop a physical security plan 120 calendar days following completion of Requirement R2.

Rationale for Requirement R5:

This requirement meets the FERC directive from paragraph 9 in the order on physical security requiring the development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Rationale for Requirement R6:

This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring review by an entity other than the owner or operator with appropriate expertise of the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5.

As with the verification required by Requirement R2, Requirement R6 provides Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout the Requirement R4 evaluation and the development of the Requirement R5 security plan(s). This would allow entities to satisfy their obligations under Requirement R6 concurrent with the satisfaction of their obligations under Requirements R4 and R5.

Physical Security Directives
CIP-014-2

Standards Involved

Approval:

- CIP-014-2 – Physical Security

Retirement:

- CIP-014-1 – Physical Security

Prerequisite Approvals:

N/A

Background

In Order No. 802 (final order on CIP-014-1 – Physical Security), issued on November 20, 2014, FERC directed NERC to remove the term "widespread" from Reliability Standard CIP-014-1 or, alternatively, to propose modifications to the Reliability Standard that address the Commission's concerns. FERC directed that NERC submit a responsive modification within six months from the effective date of this final rule.

Effective Date

CIP-014-2 shall become effective on the later of the first day following the Effective Date of CIP-014-1 or the first day after CIP-014-2 is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, CIP-014-2 shall become effective on the later of the first day following the Effective Date of CIP-014-1 or the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction

Retirement of Existing Standards:

The existing standard, CIP-014-1, shall be retired at midnight of the day immediately prior to the effective date of CIP-014-2 in the particular jurisdiction in which the revised standard is becoming effective.

Applicability:

This standard applies to the following functional entities:

- Transmission Owner
- Transmission Operator

Implementation of CIP-014-1

All aspects of the Implementation Plan for CIP-014-1 will remain applicable to CIP-014-2 and are incorporated here by reference.

Consideration of Directives

Project 2014-04 - Physical Security Directives

April 16, 2015

Project 2014-04 - Physical Security Directives		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Paragraph 19. In addition to approving Reliability Standard CIP-014-1, the Commission adopts in part the NOPR proposal directing NERC to develop and submit modifications to the Reliability Standard concerning the use of the term "widespread" in Requirement R1. The Commission determines that the term "widespread" is unclear with respect to the obligations it imposes on applicable entities; how it would be implemented by applicable entities; and how it would be enforced. Accordingly, the Commission directs NERC, pursuant to FPA section 215(d)(5), to remove the term "widespread" from Reliability Standard CIP-014-1 or, alternatively, to propose modifications to the Reliability Standard that address the Commission's concerns. We direct that NERC submit a responsive	FERC Order 802 approving Reliability Standard CIO-014-1, Physical Security	The Physical Security Standard Drafting Team (PSSDT) revised CIP-014-1, Physical Security, by removing the term "widespread" from the standard. This was done in the Purpose Statement, Background Section, Requirement R1, the Rationale for Requirement R1 as well as the Guidance and Technical Basis Section of the standard. Additionally, the PSSDT has added the following to the Rationale and guideline and Technical Basis for Requirement R1: "The requirement is not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In

modification within six months from the effective date of this final rule. Paragraph 35: Accordingly, pursuant to FPA section 215(d)(5), the Commission directs NERC to develop a modification to Reliability Standard CIP-014-1 that either removes the term "widespread" from Requirement R1 or, in the alternative, proposes changes that address the Commission's concerns. Further, we direct that NERC submit a responsive modification within six months from the effective date of this final rule. We recognize that certain entities commented on how NERC could modify Reliability Standard CIP-014-1 to address the Commission's stated concerns. However, we conclude that it is appropriate to allow NERC to develop and propose a modification in the first instance.		the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the following: • Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6 • NERC EOP-004-2 reporting criteria • Area or magnitude of potential impact" Additionally, the PSSDT revised the Rationale for Requirement R1 as follows: "Requirement R1 also meets the directive for periodic reevaluation of the risk assessment by requiring the risk assessment to be performed every 30 months (or 60 months for an entity that has not identified in a previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an interconnection)."

Project 2014-04 - Physical Security Directives		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Paragraph 21. With respect to the informational filings proposed in the NOPR, the Commission adopts the proposal to direct NERC to make an informational filing addressing whether Reliability Standard CIP-014-1 provides physical security for all "High Impact" control centers, as that term is defined in Reliability Standard CIP-002-5.1, necessary for the reliable operation of the Bulk-Power System. However, the Commission extends the deadline for that informational filing until two years following the effective date of Reliability Standard CIP-014-1. Paragraph 57. The Commission adopts the NOPR proposal and directs NERC to submit an informational filing that addresses whether there is a need for consistent treatment of "High Impact" control centers for cybersecurity and physical security purposes through the development of Reliability Standards that afford physical protection to all "High Impact" control centers. The Commission, however, modifies the NOPR proposal and extends the due date for the informational filing to two years following the effective date of Reliability Standard CIP-014-1.	FERC Order 802 approving Reliability Standard CIO-014-1, Physical Security	NERC Staff will monitor implementation of Requirements R1 and R2 with respect to "High Impact" control centers as that term is defined in Reliability Standard CIP-002-5.1 as that term is defined in Reliability Standard CIP-002-5.1. NERC will submit an informational filing that addresses whether there is a need for consistent treatment of "High Impact" control centers for cybersecurity and physical security purposes through the development of Reliability Standards that afford physical protection to all "High Impact" control centers within two years following the effective date of Reliability Standard CIP-014-1.

Project 2014-04 - Physical Security Directives		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Paragraph 44. The Commission, instead, will focus its resources on carrying out compliance and enforcement activities to ensure that critical facilities are identified under Requirement R1. In its comments, NERC indicated that NERC staff will submit to the NERC Board of Trustees a report three months following implementation of Requirements R1, R2 and R3 concerning the scope of facilities identified as critical, including the number of facilities identified as critical and their defining characteristics. NERC also committed to sending this report to Commission staff.	FERC Order 802 approving Reliability Standard CIO-014-1, Physical Security	NERC Staff will monitor implementation of Requirements R1, R2 and R3 and will submit to the NERC Board of Trustees, a report three months following implementation of these Requirements concerning the scope of facilities identified as critical, including the number of facilities identified as critical and their defining characteristics. NERC will also submit this report to Commission staff.

Project 2014-04 - Physical Security Directives

Mapping Document

Background

In Order No. 802 (final order on CIP-014-1 – Physical Security), issued on November 20, 2014, FERC directed NERC to remove the term "widespread" from Reliability Standard CIP-014-1 or, alternatively, to propose modifications to the Reliability Standard that address the Commission's concerns. FERC directed that NERC submit a responsive modification within six months from the effective date of this final rule.

• Modify its evaluation or security plan(s) consistent with the recommendation; or • Document the reason(s) for not modifying the evaluation or security plan(s) consistent with the recommendation. **6.4.** Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third party reviewer and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.		• Modify its evaluation or security plan(s) consistent with the recommendation; or • Document the reason(s) for not modifying the evaluation or security plan(s) consistent with the recommendation. **6.4.** Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third party reviewer and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

Project 2014-04 Physical Security

VRF and VSL Justifications for CIP-014-2

VRF and VSL Justifications – CIP-014-1, R1	
Proposed VRF	High
NERC VRF Discussion	Initial and subsequent risk assessments identify Transmission stations or Transmission substations that need to be assessed for threats and vulnerabilities and potential physical security measures. Since this is a Requirement in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition. This justifies a High VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the risk assessment periodicity and the identification of the primary control center that has operational control of Transmission stations and/or Transmission substations.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable CIP-002-5.1 R1, which deals with categorizing cyber systems, is assigned a High VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Transmission Owner performed an initial risk assessment but did so after the date specified in the implementation plan for performing the initial risk assessment but less than or equal to two calendar months after that date; OR

VRF and VSL Justifications – CIP-014-1, R1	
	The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 30 calendar months but less than or equal to 32 calendar months; OR The Transmission Owner that has not identified in its previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 60 calendar months but less than or equal to 62 calendar months.
Proposed Moderate VSL	The Transmission Owner performed an initial risk assessment but did so more than two calendar months after the date specified in the implementation plan for performing the initial risk assessment but less than or equal to four calendar months after that date; OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 32 calendar months but less than or equal to 34 calendar months; OR The Transmission Owner that has not identified in its previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 62 calendar months but less than or equal to 64 calendar months.
Proposed High VSL	The Transmission Owner performed an initial risk assessment but did so more than four calendar months after the date specified in the implementation plan for performing the initial risk assessment but less than or equal to six calendar months after that date; OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission

VRF and VSL Justifications – CIP-014-1, R1	
	substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 34 calendar months but less than or equal to 36 calendar months; OR The Transmission Owner that has not identified in its previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 64 calendar months but less than or equal to 66 calendar months; OR The Transmission Owner performed a risk assessment but failed to include Part 1.2.
Proposed Severe VSL	The Transmission Owner performed an initial risk assessment but did so more than six calendar months after the date specified in the implementation plan for performing the initial risk assessment; OR The Transmission Owner failed to perform an initial risk assessment; OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after more than 36 calendar months; OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection failed to perform a risk assessment; OR The Transmission Owner that has not identified in its previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection

VRF and VSL Justifications – CIP-014-1, R1	
	performed a subsequent risk assessment but did so after more than 66 calendar months; OR The Transmission Owner that has not identified in its previous risk assessment any Transmission station and Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection failed to perform a subsequent risk assessment.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if the risk assessment is not performed or if the risk assessment is not performed within required intervals.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The language of the VSL directly mirrors the language in the corresponding requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A	The VSL is assigned for a single instance of failing to submit perform a risk assessment.

VRF and VSL Justifications – CIP-014-1, R1	
Cumulative Number of Violations	

VRF and VSL Justifications – CIP-014-1, R2	
Proposed VRF	Medium
NERC VRF Discussion	Unaffiliated third party verification of initial and subsequent risk assessments provides reinforcement that the risk assessment was performed with due consideration to risk to the bulk power system. Since this Requirement is in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. This justifies a Medium VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the unaffiliated third party verification including entities that may perform the verification, provisions for adding or removing Transmission stations and/or Transmission substations, and provisions for confidentiality of sensitive information.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable EOP-005-2 R6, which deals with verifying that its restoration plan accomplishes its intended function is assigned a medium VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but did so in more than 90 calendar days but less than or equal to 100 calendar days following completion of Requirement R1; OR

VRF and VSL Justifications – CIP-014-1, R2	
	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 and modified or documented the technical basis for not modifying its identification under Requirement R1 as required by part 2.3 but did so more than 60 calendar days and less than or equal to 70 calendar days from completion of the third party verification.
Proposed Moderate VSL	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but did so more than 100 calendar days but less than or equal to 110 calendar days following completion of Requirement R1; Or The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 and modified or documented the technical basis for not modifying its identification under Requirement R1 as required by part 2.3 but did so more than 70 calendar days and less than or equal to 80 calendar days from completion of the third party verification.
Proposed High VSL	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but did so more than 110 calendar days but less than or equal to 120 calendar days following completion of Requirement R1; OR The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 and modified or documented the technical basis for not modifying its identification under Requirement R1 as required by part 2.3 but did so more than 80 calendar days from completion of the third party verification; OR The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but failed to modify or document the technical basis for not modifying its identification under R1 as required by part 2.3.
Proposed Severe VSL	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but did so more than 120 calendar days following completion of Requirement R1; OR The Transmission Owner failed to have an unaffiliated third party verify the risk assessment performed under Requirement R1; OR

VRF and VSL Justifications – CIP-014-1, R2	
	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but failed to implement procedures for protecting information per Part 2.4.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if an unaffiliated third party verification is not performed or if the verification is not performed within prescribe timelines. The VSLs are also written indicating violation of the Requirement Part regarding protection of information.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The language of the VSL directly mirrors the language in the corresponding requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is assigned for a single instance of failing to have an unaffiliated third party verification performed; or failing to perform the verification within prescribe timelines; or failing to implement procedures to protect information.

VRF and VSL Justifications – CIP-014-1, R3	
Proposed VRF	Lower
NERC VRF Discussion	Notifying the Transmission Operator that it has operational control of a Transmission station or Transmission substation identified in Requirement R1 and verified in Requirement R2 is necessary so that the Transmission Operator may begin performance of subsequent physical security requirements for the primary control center. This is a requirement that is administrative in nature and in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. This justifies a Lower VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the notification of the Transmission Operator regarding the removal of a Transmission station or Transmission substation.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable INT-006-4 R6, which deals with notifying other entities so that Confirmed Interchange may be implemented, is assigned a Lower VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Transmission Owner notified the Transmission Operator that operates the primary control center as specified in Requirement R3 but did so more than seven calendar days and less than or equal to nine calendar days following the completion of Requirement R2; OR

VRF and VSL Justifications – CIP-014-1, R3	
	The Transmission Owner notified the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R1 but did so more than seven calendar days and less than or equal to nine calendar days following the verification or the subsequent risk assessment.
Proposed Moderate VSL	The Transmission Owner notified the Transmission Operator that operates the primary control center as specified in Requirement R3 but did so more than nine calendar days and less than or equal to 11 calendar days following the completion of Requirement R2; OR The Transmission Owner notified the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R1 but did so more than nine calendar days and less than or equal to 11 calendar days following the verification or the subsequent risk assessment.
Proposed High VSL	The Transmission Owner notified the Transmission Operator that operates the primary control center as specified in Requirement R3 but did so more than 11 calendar days and less than or equal to 13 calendar days following the completion of Requirement R2; OR The Transmission Owner notified the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R1 but did so more than 11 calendar days and less than or equal to 13 calendar days following the verification or the subsequent risk assessment.
Proposed Severe VSL	The Transmission Owner notified the Transmission Operator that operates the primary control center as specified in Requirement R3 but did so more than 13 calendar days following the completion of Requirement R2; OR The Transmission Owner failed to notify the Transmission Operator that it operates a control center identified in Requirement R1; OR The Transmission Owner notified the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R1 but did so more than 13 calendar days following the verification or the subsequent risk assessment. OR

VRF and VSL Justifications – CIP-014-1, R3	
	The Transmission Owner failed to notify the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R1.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if notification is not made subject to the conditions of the requirement.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The language of the VSL directly mirrors the language in the corresponding requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is assigned for a single instance of failing to make the appropriate notification.

VRF and VSL Justifications – CIP-014-1, R4	
Proposed VRF	Medium
NERC VRF Discussion	Performing an evaluation of potential threats and vulnerabilities of a physical attack to each of respective Transmission station(s), Transmission substation(s), and primary control center(s) is necessary to ensure the physical security of those assets as well as the reliability of the bulk power system. Since this Requirement is in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. This justifies a Medium VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the evaluation of potential threats and vulnerabilities of a physical attack to Transmission stations and/or Transmission substations.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable CIP-007-5 R2, which deals with a patch management process for tracking, evaluating, and installing cyber security patches for applicable Cyber Assets, is assigned a Medium VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	N/A
Proposed Moderate VSL	The Responsible Entity conducted an evaluation of the potential physical threats and vulnerabilities to each of its Transmission

VRF and VSL Justifications – CIP-014-1, R4	
	station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but failed to consider one of Parts 4.1 through 4.3 in the evaluation.
Proposed High VSL	The Responsible Entity conducted an evaluation of the potential physical threats and vulnerabilities to each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but failed to consider two of Parts 4.1 through 4.3 in the evaluation.
Proposed Severe VSL	The Responsible Entity failed to conduct an evaluation of the potential physical threats and vulnerabilities to each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1; OR The Responsible Entity conducted an evaluation of the potential physical threats and vulnerabilities to each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but failed to consider Parts 4.1 through 4.3.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if a responsible entity fails to conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) or failed to consider any of the Requirement Parts 4.1-4.3.

VRF and VSL Justifications – CIP-014-1, R4	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The language of the VSL directly mirrors the language in the corresponding requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is assigned for a single instance of failing to conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) or failing to consider any of the Requirement Parts 4.1-4.3.

VRF and VSL Justifications – CIP-014-1, R5	
Proposed VRF	High
NERC VRF Discussion	Development, implementation and execution of a documented physical security plan(s) that covers applicable Transmission station(s), Transmission substation(s), and primary control center(s) is necessary to ensure the physical security of those assets as well as the reliability of the bulk power system. Since this Requirement is in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition. This justifies a High VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the physical security plan for applicable Transmission stations, Transmission substations, or primary control centers.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable CIP-003-3 R4, which deals with implementing and documenting a program to identify, classify, and protect information associated with Critical Cyber Assets, is assigned a High VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Responsible Entity developed and implemented a documented physical security plan(s) that covers each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but did so more than 120 calendar days but less than or equal to 130 calendar days after completing Requirement R2; OR

VRF and VSL Justifications – CIP-014-1, R5	
	The Responsible Entity developed and implemented a documented physical security plan(s) that covers its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2 but failed to include one of Parts 5.1 through 5.4 in the plan.
Proposed Moderate VSL	The Responsible Entity developed and implemented a documented physical security plan(s) that covers each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but did so more than 130 calendar days but less than or equal to 140 calendar days after completing Requirement R2; OR The Responsible Entity developed and implemented a documented physical security plan(s) that covers its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2 but failed to include two of Parts 5.1 through 5.4 in the plan.
Proposed High VSL	The Responsible Entity developed and implemented a documented physical security plan(s) that covers each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but did so more than 140 calendar days but less than or equal to 150 calendar days after completing Requirement R2; OR The Responsible Entity developed and implemented a documented physical security plan(s) that covers its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2 but failed to include three of Parts 5.1 through 5.4 in the plan.
Proposed Severe VSL	The Responsible Entity developed and implemented a documented physical security plan(s) that covers each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but did so more than 150 calendar days after completing the verification in Requirement R2; OR The Responsible Entity failed to develop and implement a documented physical security plan(s) that covers its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1. OR

VRF and VSL Justifications – CIP-014-1, R5	
	The Responsible Entity developed and implemented a documented physical security plan(s) that covers its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2 but failed to include Parts 5.1 through 5.4 in the plan.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if a responsible entity fails to develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s) or if the responsible entity failed to include any of the Requirement Parts 5.1-5.4.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The language of the VSL directly mirrors the language in the corresponding requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is assigned for a single instance of failing to develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s) or failing to include any of the Requirement Parts 5.1-5.4.

VRF and VSL Justifications – CIP-014-1, R6	
Proposed VRF	Medium
NERC VRF Discussion	Unaffiliated third party review of the threat evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 provides reinforcement that these requirements were performed with due consideration to risk to the bulk power system. Since this Requirement is in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. This justifies a Medium VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the unaffiliated third party review including entities that may perform the review, timelines for completing the review and provisions for confidentiality of sensitive information.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable EOP-005-2 R6, which deals with verifying that its restoration plan accomplishes its intended function is assigned a medium VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but did so in more than 90 calendar days but less than or equal to 100 calendar days; OR

VRF and VSL Justifications – CIP-014-1, R6	
	The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 and modified or documented the reason for not modifying the security plan(s) as specified in Part 6.3 but did so more than 60 calendar days and less than or equal to 70 calendar days following completion of the third party review.
Proposed Moderate VSL	The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but did so in more than 100 calendar days but less than or equal to 110 calendar days; OR The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 and modified or documented the reason for not modifying the security plan(s) as specified in Part 6.3 but did so more than 70 calendar days and less than or equal to 80 calendar days following completion of the third party review.
Proposed High VSL	The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but did so more than 110 calendar days but less than or equal to 120 calendar days; OR The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 and modified or documented the reason for not modifying the security plan(s) as specified in Part 6.3 but did so more than 80 calendar days following completion of the third party review; OR The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but did not and modify or document the reason for not modifying the security plan(s) as specified in Part 6.3.
Proposed Severe VSL	The Responsible Entity failed to have an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 in more than 120 calendar days;

VRF and VSL Justifications – CIP-014-1, R6	
	OR The Responsible Entity failed to have an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5; OR The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but failed to implement procedures for protecting information per Part 6.4.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if an unaffiliated third party review is not performed or if the review is not performed within prescribe timelines. The VSLs are also written indicating violation of the Requirement Part regarding protection of information.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The language of the VSL directly mirrors the language in the corresponding requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based	The VSL is assigned for a single instance of failing to have an unaffiliated third party review performed; or failing to perform the review within prescribe timelines; or failing to implement procedures to protect information.

VRF and VSL Justifications for CIP-014-2

VRF and VSL Justifications – CIP-014-1, R1	
Proposed VRF	High
NERC VRF Discussion	Initial and subsequent risk assessments identify Transmission stations or Transmission substations that need to be assessed for threats and vulnerabilities and potential physical security measures. Since this is a Requirement in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition. This justifies a High VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the risk assessment periodicity and the identification of the primary control center that has operational control of Transmission stations and/or Transmission substations.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable CIP-002-5.1 R1, which deals with categorizing cyber systems, is assigned a High VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Transmission Owner performed an initial risk assessment but did so after the date specified in the implementation plan for performing the initial risk assessment but less than or equal to two calendar months after that date;

VRF and VSL Justifications – CIP-014-1, R1	
	OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 30 calendar months but less than or equal to 32 calendar months; OR The Transmission Owner that has not identified in its previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 60 calendar months but less than or equal to 62 calendar months.
Proposed Moderate VSL	The Transmission Owner performed an initial risk assessment but did so more than two calendar months after the date specified in the implementation plan for performing the initial risk assessment but less than or equal to four calendar months after that date; OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 32 calendar months but less than or equal to 34 calendar months; OR The Transmission Owner that has not identified in its previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 62 calendar months but less than or equal to 64 calendar months.
Proposed High VSL	The Transmission Owner performed an initial risk assessment but did so more than four calendar months after the date specified in the implementation plan for performing the initial risk assessment but less than or equal to six calendar months after that date;

VRF and VSL Justifications – CIP-014-1, R1	
	OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 34 calendar months but less than or equal to 36 calendar months; OR The Transmission Owner that has not identified in its previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after 64 calendar months but less than or equal to 66 calendar months; OR The Transmission Owner performed a risk assessment but failed to include Part 1.2.
Proposed Severe VSL	The Transmission Owner performed an initial risk assessment but did so more than six calendar months after the date specified in the implementation plan for performing the initial risk assessment; OR The Transmission Owner failed to perform an initial risk assessment; OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after more than 36 calendar months; OR The Transmission Owner that has identified in its previous risk assessment one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection failed to perform a risk assessment; OR The Transmission Owner that has not identified in its previous risk

VRF and VSL Justifications – CIP-014-1, R1	
	assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection performed a subsequent risk assessment but did so after more than 66 calendar months; OR The Transmission Owner that has not identified in its previous risk assessment any Transmission station and Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection failed to perform a subsequent risk assessment.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if the risk assessment is not performed or if the risk assessment is not performed within required intervals.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The language of the VSL directly mirrors the language in the corresponding requirement.

VRF and VSL Justifications – CIP-014-1, R1	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is assigned for a single instance of failing to submit perform a risk assessment.

VRF and VSL Justifications – CIP-014-1, R2	
Proposed VRF	Medium
NERC VRF Discussion	Unaffiliated third party verification of initial and subsequent risk assessments provides reinforcement that the risk assessment was performed with due consideration to risk to the bulk power system. Since this Requirement is in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. This justifies a Medium VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the unaffiliated third party verification including entities that may perform the verification, provisions for adding or removing Transmission stations and/or Transmission substations, and provisions for confidentiality of sensitive information.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable EOP-005-2 R6, which deals with verifying that its restoration plan accomplishes its intended function is assigned a medium VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but did so in more than 90 calendar days but less than or equal to 100 calendar days following completion of Requirement R1;

VRF and VSL Justifications – CIP-014-1, R2	
	OR The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 and modified or documented the technical basis for not modifying its identification under Requirement R1 as required by part 2.3 but did so more than 60 calendar days and less than or equal to 70 calendar days from completion of the third party verification.
Proposed Moderate VSL	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but did so more than 100 calendar days but less than or equal to 110 calendar days following completion of Requirement R1; Or The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 and modified or documented the technical basis for not modifying its identification under Requirement R1 as required by part 2.3 but did so more than 70 calendar days and less than or equal to 80 calendar days from completion of the third party verification.
Proposed High VSL	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but did so more than 110 calendar days but less than or equal to 120 calendar days following completion of Requirement R1; OR The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 and modified or documented the technical basis for not modifying its identification under Requirement R1 as required by part 2.3 but did so more than 80 calendar days from completion of the third party verification; OR The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but failed to modify or document the technical basis for not modifying its identification under R1 as required by part 2.3.
Proposed Severe VSL	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but did so more than 120 calendar days following completion of Requirement R1; OR The Transmission Owner failed to have an unaffiliated third party

VRF and VSL Justifications – CIP-014-1, R2	
	verify the risk assessment performed under Requirement R1; OR The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R1 but failed to implement procedures for protecting information per Part 2.4.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if an unaffiliated third party verification is not performed or if the verification is not performed within prescribe timelines. The VSLs are also written indicating violation of the Requirement Part regarding protection of information.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The language of the VSL directly mirrors the language in the corresponding requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based	The VSL is assigned for a single instance of failing to have an unaffiliated third party verification performed; or failing to perform the verification within prescribe timelines; or failing to implement procedures to protect information.

VRF and VSL Justifications – CIP-014-1, R2	
on A Single Violation, Not on A Cumulative Number of Violations	

VRF and VSL Justifications – CIP-014-1, R3	
Proposed VRF	Lower
NERC VRF Discussion	Notifying the Transmission Operator that it has operational control of a Transmission station or Transmission substation identified in Requirement R1 and verified in Requirement R2 is necessary so that the Transmission Operator may begin performance of subsequent physical security requirements for the primary control center. This is a requirement that is administrative in nature and in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. This justifies a Lower VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the notification of the Transmission Operator regarding the removal of a Transmission station or Transmission substation.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable INT-006-4 R6, which deals with notifying other entities so that Confirmed Interchange may be implemented, is assigned a Lower VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Transmission Owner notified the Transmission Operator that operates the primary control center as specified in Requirement R3 but did so more than seven calendar days and less than or equal to nine calendar days following the completion of Requirement R2; OR The Transmission Owner notified the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R1 but did so more than seven calendar

VRF and VSL Justifications – CIP-014-1, R3	
	days and less than or equal to nine calendar days following the verification or the subsequent risk assessment.
Proposed Moderate VSL	The Transmission Owner notified the Transmission Operator that operates the primary control center as specified in Requirement R3 but did so more than nine calendar days and less than or equal to 11 calendar days following the completion of Requirement R2; OR The Transmission Owner notified the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R1 but did so more than nine calendar days and less than or equal to 11 calendar days following the verification or the subsequent risk assessment.
Proposed High VSL	The Transmission Owner notified the Transmission Operator that operates the primary control center as specified in Requirement R3 but did so more than 11 calendar days and less than or equal to 13 calendar days following the completion of Requirement R2; OR The Transmission Owner notified the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R1 but did so more than 11 calendar days and less than or equal to 13 calendar days following the verification or the subsequent risk assessment.
Proposed Severe VSL	The Transmission Owner notified the Transmission Operator that operates the primary control center as specified in Requirement R3 but did so more than 13 calendar days following the completion of Requirement R2; OR The Transmission Owner failed to notify the Transmission Operator that it operates a control center identified in Requirement R1; OR The Transmission Owner notified the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R1 but did so more than 13 calendar days following the verification or the subsequent risk assessment. OR The Transmission Owner failed to notify the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R1.

VRF and VSL Justifications – CIP-014-1, R3	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if notification is not made subject to the conditions of the requirement.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The language of the VSL directly mirrors the language in the corresponding requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is assigned for a single instance of failing to make the appropriate notification.

VRF and VSL Justifications – CIP-014-1, R4	
Proposed VRF	Medium
NERC VRF Discussion	Performing an evaluation of potential threats and vulnerabilities of a physical attack to each of respective Transmission station(s), Transmission substation(s), and primary control center(s) is necessary to ensure the physical security of those assets as well as the reliability of the bulk power system. Since this Requirement is in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. This justifies a Medium VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the evaluation of potential threats and vulnerabilities of a physical attack to Transmission stations and/or Transmission substations.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable CIP-007-5 R2, which deals with a patch management process for tracking, evaluating, and installing cyber security patches for applicable Cyber Assets, is assigned a Medium VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	N/A

VRF and VSL Justifications – CIP-014-1, R4	
Proposed Moderate VSL	The Responsible Entity conducted an evaluation of the potential physical threats and vulnerabilities to each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but failed to consider one of Parts 4.1 through 4.3 in the evaluation.
Proposed High VSL	The Responsible Entity conducted an evaluation of the potential physical threats and vulnerabilities to each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but failed to consider two of Parts 4.1 through 4.3 in the evaluation.
Proposed Severe VSL	The Responsible Entity failed to conduct an evaluation of the potential physical threats and vulnerabilities to each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1; OR The Responsible Entity conducted an evaluation of the potential physical threats and vulnerabilities to each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but failed to consider Parts 4.1 through 4.3.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if a responsible entity fails to conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) or failed to consider any of the Requirement Parts 4.1-4.3.

VRF and VSL Justifications – CIP-014-1, R4	
Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The language of the VSL directly mirrors the language in the corresponding requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is assigned for a single instance of failing to conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) or failing to consider any of the Requirement Parts 4.1-4.3.

VRF and VSL Justifications – CIP-014-1, R5	
Proposed VRF	High
NERC VRF Discussion	Development, implementation and execution of a documented physical security plan(s) that covers applicable Transmission station(s), Transmission substation(s), and primary control center(s) is necessary to ensure the physical security of those assets as well as the reliability of the bulk power system. Since this Requirement is in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition. This justifies a High VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the physical security plan for applicable Transmission stations, Transmission substations, or primary control centers.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable CIP-003-3 R4, which deals with implementing and documenting a program to identify, classify, and protect information associated with Critical Cyber Assets, is assigned a High VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Responsible Entity developed and implemented a documented physical security plan(s) that covers each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but did so more than 120 calendar days but less than or equal to 130 calendar days after completing Requirement R2;

VRF and VSL Justifications – CIP-014-1, R5	
	OR The Responsible Entity developed and implemented a documented physical security plan(s) that covers its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2 but failed to include one of Parts 5.1 through 5.4 in the plan.
Proposed Moderate VSL	The Responsible Entity developed and implemented a documented physical security plan(s) that covers each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but did so more than 130 calendar days but less than or equal to 140 calendar days after completing Requirement R2; OR The Responsible Entity developed and implemented a documented physical security plan(s) that covers its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2 but failed to include two of Parts 5.1 through 5.4 in the plan.
Proposed High VSL	The Responsible Entity developed and implemented a documented physical security plan(s) that covers each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but did so more than 140 calendar days but less than or equal to 150 calendar days after completing Requirement R2; OR The Responsible Entity developed and implemented a documented physical security plan(s) that covers its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2 but failed to include three of Parts 5.1 through 5.4 in the plan.
Proposed Severe VSL	The Responsible Entity developed and implemented a documented physical security plan(s) that covers each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 but did so more than 150 calendar days after completing the verification in Requirement R2; OR The Responsible Entity failed to develop and implement a documented physical security plan(s) that covers its Transmission

VRF and VSL Justifications – CIP-014-1, R5	
	station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1. OR The Responsible Entity developed and implemented a documented physical security plan(s) that covers its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R1 and verified according to Requirement R2 but failed to include Parts 5.1 through 5.4 in the plan.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if a responsible entity fails to develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s) or if the responsible entity failed to include any of the Requirement Parts 5.1-5.4.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The language of the VSL directly mirrors the language in the corresponding requirement.
FERC VSL G4 Violation Severity Level	The VSL is assigned for a single instance of failing to develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and

VRF and VSL Justifications – CIP-014-1, R5	
Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	primary control center(s) or failing to include any of the Requirement Parts 5.1-5.4.

VRF and VSL Justifications – CIP-014-1, R6	
Proposed VRF	Medium
NERC VRF Discussion	Unaffiliated third party review of the threat evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 provides reinforcement that these requirements were performed with due consideration to risk to the bulk power system. Since this Requirement is in a planning time frame, a violation could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. This justifies a Medium VRF for this requirement.
FERC VRF G1 Discussion	*Guideline 1- Consistency w/ Blackout Report* This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	*Guideline 2- Consistency within a Reliability Standard* The Requirement Parts for this Requirement provide additional detail regarding the unaffiliated third party review including entities that may perform the review, timelines for completing the review and provisions for confidentiality of sensitive information.
FERC VRF G3 Discussion	*Guideline 3- Consistency among Reliability Standards* The comparable EOP-005-2 R6, which deals with verifying that its restoration plan accomplishes its intended function is assigned a medium VRF.
FERC VRF G4 Discussion	*Guideline 4- Consistency with NERC Definitions of VRFs* See "NERC VRF Discussion" above.
FERC VRF G5 Discussion	*Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation* This guideline is not applicable, as the requirement does not co-mingle more than one obligation.
Proposed Lower VSL	The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but did so in more than 90 calendar days but less than or equal to 100 calendar days;

VRF and VSL Justifications – CIP-014-1, R6	
	OR The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 and modified or documented the reason for not modifying the security plan(s) as specified in Part 6.3 but did so more than 60 calendar days and less than or equal to 70 calendar days following completion of the third party review.
Proposed Moderate VSL	The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but did so in more than 100 calendar days but less than or equal to 110 calendar days; OR The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 and modified or documented the reason for not modifying the security plan(s) as specified in Part 6.3 but did so more than 70 calendar days and less than or equal to 80 calendar days following completion of the third party review.
Proposed High VSL	The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but did so more than 110 calendar days but less than or equal to 120 calendar days; OR The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 and modified or documented the reason for not modifying the security plan(s) as specified in Part 6.3 but did so more than 80 calendar days following completion of the third party review; OR The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but did not and modify or document the reason for not modifying the security plan(s) as specified in Part 6.3.
Proposed Severe VSL	The Responsible Entity failed to have an unaffiliated third party

VRF and VSL Justifications – CIP-014-1, R6	
	review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 in more than 120 calendar days; OR The Responsible Entity failed to have an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5; OR The Responsible Entity had an unaffiliated third party review the evaluation performed under Requirement R4 and the security plan(s) developed under Requirement R5 but failed to implement procedures for protecting information per Part 6.4~~3~~.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This guideline is not applicable because this is a new requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is not binary. Guideline 2b: The VSL assignment contains clear and unambiguous language that makes clear that the requirement is wholly or partially violated if an unaffiliated third party review is not performed or if the review is not performed within prescribe timelines. The VSLs are also written indicating violation of the Requirement Part regarding protection of information.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the	The language of the VSL directly mirrors the language in the corresponding requirement.

VRF and VSL Justifications – CIP-014-1, R6	
Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is assigned for a single instance of failing to have an unaffiliated third party review performed; or failing to perform the review within prescribe timelines; or failing to implement procedures to protect information.

Standards Announcement

Project 2014-04 Physical Security
CIP-014-2

Final Ballot Open through April 29, 2015

Now Available

A final ballot for **CIP-014-2 – Physical Security** is open through **8 p.m. Eastern, Wednesday, April 29, 2015.**

The standard drafting team's considerations of the responses received from the last comment period are reflected in this draft of the standard.

Balloting

In the final ballot, votes are counted by exception. Only members of the ballot pool may cast a vote. All ballot pool members may change their previously cast votes. A ballot pool member who failed to vote during the previous ballot period may vote in the final ballot period. If a ballot pool member does not participate in the final ballot, the member's vote from the previous ballot will be carried over as their vote in the final ballot.

Members of the ballot pool associated with this project may log in and submit their vote for the standard here. If you experience any difficulties in using the Standards Commenting & Balloting System, contact Wendy Muller.

Next Steps

Voting results for the standard will be posted and announced after the ballot closes. If approved, the standard will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities**.**

For more information on the **Standards Development Process**, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Stephen Crutchfield (via email), or at (609) 651-9455.

CIP-014-2

Final Ballot Results

Now Available

A final ballot for **CIP-014-2 – Physical Security** concluded at **8 p.m. Eastern, Wednesday, April 29, 2015**.

The standard achieved a quorum and received sufficient affirmative votes for approval. Voting statistics are listed below and the Ballot Results page provides a link to the detailed results for the ballot.

Quorum / Approval
92.00% / 92.35%

Next Steps
The standard will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Stephen Crutchfield (via email), or at (609) 651-9455.

Project 2014-04 - Physical Security Directives

Mapping Document

Background

In Order No. 802 (final order on CIP-014-1 – Physical Security), issued on November 20, 2014, FERC directed NERC to remove the term "widespread" from Reliability Standard CIP-014-1 or, alternatively, to propose modifications to the Reliability Standard that address the Commission's concerns. FERC directed that NERC submit a responsive modification within six months from the effective date of this final rule.

Standard: CIP-014-2, Physical Security		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Comments**
R1. Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria specified in Applicability Section 4.1.1. The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify the Transmission station(s) and Transmission substation(s) that if rendered	Removed the term "widespread" from Requirement R1	**R1.** Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria specified in Applicability Section 4.1.1. The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify the Transmission station(s) and Transmission substation(s) that if rendered

Standards Drafting Team Roster

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Project 2014-04 Physical Security Standards Drafting Team Roster

Name and Title	Company and Address	Contact Info	Bio
Susan Ivey Chair	2301 Market St. Philadelphia, PA 19103	215-841-4706 SusanO'Brien.Ivey@exeloncorp.com	Susan Ivey is Vice President of Transmission Strategy & Compliance at Exelon and is responsible for oversight of the electric transmission systems of the Exelon Utilities of BGE, ComEd and PECO located in Baltimore, Chicago and Philadelphia, respectively. She coordinates the efforts for electric transmission operations and long-term planning for all three companies, and manages the interface with regulatory authorities and all transmission interconnected third parties. Ms. Ivey oversees and administers the NERC Compliance Program for Exelon. Ms. Ivey also leads the coordination of physical security practices across the Exelon Utilities to ensure alignment of strategies and programs for addressing security risks associated with the electric and gas businesses.
Lou Oberski Vice-Chair	Dominion Resources Services, Inc.	804-819-2837 Lou.Oberski@dom.com	Lou Oberski is Managing Director of Regulation and NERC Compliance Policy for Dominion Resources Services, Inc. He is responsible for administration of all aspects of Dominion's corporate NERC compliance assurance programs and oversees Dominion's

	120 Tredegar St Richmond, VA 23219		involvement at NERC and its sub-regions as well as FERC and RTO policy coordination for Dominion at PJM, ISO-New England and the MidContinent ISO. Prior to his current position, his career at Dominion covered increasing management responsibilities in transmission engineering, operations, planning and maintenance. The most recent 10 years have focused on developing, establishing and coordinating NERC and RTO policy at Dominion with a particular emphasis on generation supplier policy at NERC and RTOs. Mr. Oberski is a member of the North American Energy Standards Board, Board of Directors and past chair of its Executive Committee. He is also a member of EEI's Reliability Executive Advisory Committee, the SERC Board of Directors and SERC Board Executive Committee. Mr. Oberski has been employed by Dominion for 30 years and holds a bachelor's degree in electrical engineering from Western Michigan University.
John Breckenridge	KCP&L 1200 Main Street 18th Floor KCMO 64106	816-654-1725 john.breckenridge @kcpl.com	John Breckenridge is the Senior Manager of Corporate Security for Kansas City Power & Light based in Kansas City, MO. In his current capacity, he directs the overall Corporate Security function to ensure security operations are in compliance with

			legal, regulatory, and company requirements. Corporate Security responsibilities include physical security, investigations, guard force management, protection operations, law enforcement liaison, enterprise-wide crisis management and business continuity planning. To be effective, Mr. Breckenridge uses his 25 plus years of military, criminal justice and industrial security experience to work with each functional department and business unit. Mr. Breckenridge began his career while in the US Army, where he was instrumental in supporting many special security operations throughout the US and in many countries, especially during his assignment in Europe. In addition to his eight-year career in the military, Mr. Breckenridge worked for six years in the Jackson County, MO. criminal justice system. During this time, he specialized in security systems, close protection operations and special event security functions first with the Department of Corrections and then in conjunction with the Jackson County Courts. From 1993 until 2008, Mr. Breckenridge was the Director of Security and Chief Security Officer for

			Aquila Energy until Aquila was purchased by Kansas City Power & Light. Mr. Breckenridge is Board Certified in Security Management as a Certified Protection Professional, holds a BLA degree and a degree with an emphasis in Criminal Justice, is a Licensed Private Investigator and an active member of several security related professional organizations. Mr. Breckenridge has been featured as a Guest Lecturer for successful business approaches to security issues and has also been featured in several trade and regional publications.
Ross Johnson	Capital Power	780-405-5542 rjohnson@capitalpower.com	Ross Johnson, CPP is the Senior Manager of Security and Contingency Planning for Capital Power. He served in the Canadian Forces as an infantry and intelligence officer for 24 years. Since leaving the service in 2001, Mr. Johnson has been employed in several security-related leadership positions in aviation security, the offshore oil industry, and the electricity sector. Prior to joining Capital Power in 2009, he was the Director of Security and Contingency Planning with EPCOR Utilities. Mr. Johnson is the author of Antiterrorism Planning and Threat Response, a book on the prevention of

			terrorist attacks. (Click here for a recent review in the ASIS publication 'Security Dynamics.) Mr. Johnson is a member of the NERC Critical Infrastructure Protection Committee, where he sits on the Executive Committee. He is also Chair of the Committee's Physical Security Working Group, and the leader of the Physical Security Roundtable Group. He is Chair of the Canadian Electricity Association's Security and Infrastructure Protection Committee, and Chair of ASIS International's Petrochemical, Chemical, and Extractive Industries Security Council. Mr. Johnson has a Baccalaureate in Military Arts and Sciences with Distinction, and is board-certified in security management by ASIS International.
Kathleen Judge	National Grid 939 Southbridge Street, Worcester, MA 01610	508-860-6040 Kathleen.judge@nationalgrid.com	Kathy Judge is Director of Risk and Compliance for Security at National Grid, where she has worked for 25+ years. Ms. Judge is responsible for managing National Grid's strategies and best practices required to protect energy delivery facilities in accordance with governing security regulations in the US. As part of this she is actively engaged with state and federal regulatory authorities to shape policies and procedures. For example, at the federal level she works with the Infrastructure Security Compliance Division of DHS, the United States Coast Guard and

			the Pipeline Security Division of the Transportation Security Administration. Ms. Judge was also the chair of the American Gas Association Security Committee and currently serves as an AGA representative on the Oil & Natural Gas Sector Coordinating Council. She is also actively involved in the EEI Security Committee and serves on the Executive Steering Committee for the Long Island Sound Area Maritime Security Committee. In prior roles, Ms. Judge was responsible for, and a key member on, delivering Company's business plan for a deregulated energy market, serving as the strategic and operational expert on electricity restructuring for Massachusetts, Rhode Island, New Hampshire and New York. She was also an active member of the North American Energy Standards Board Retail Electric Quadrant, developing model business practices for deregulated marketplaces. Leading up to this, she was a key developer and implementer of an award winning renewable energy program in Massachusetts and Rhode Island. Ms. Judge holds a Master of Business Administration degree from Nichols College.

Mike O'Neil	Florida Power & Light 700 Universe Blvd., Juno Beach, Fl. 33408	561-904-3503 mco0hwz@fpl.com	Mike O'Neil is Director of Power Delivery Compliance & Regulatory. He is responsible for business unit execution compliance to transmission based FERC requirements for FPL and NERC transmission reliability standards for FPL and NEER facilities throughout the country.
Stephen Pelcher	Santee Cooper One Riverwood Drive Moncks Corner, SC 29461	843-761-4016 srpelche@santeecooper.com	Stephen Pelcher is Deputy General Counsel Nuclear and Regulatory Compliance at Santee Cooper. Mr. Pelcher joined Santee Cooper in 1996. Prior to working for Santee Cooper, he was Senior Attorney for Duquesne Light Company in Pittsburgh (1990 to 1996). Mr. Pelcher has been a practicing attorney for more than 31 years and has worked in the electric utility industry for 24 years. Among other duties, Mr. Pelcher is the lead Santee Cooper company attorney in all matters within the jurisdiction of the FERC under Part II of the Federal Power Act; the lead company attorney relating to interpretation of requirements embedded within standards established by NERC under Section 215 of the Federal Power Act and current Chair of Santee Cooper's internal Reliability Standards Compliance Coordination Committee. Mr. Pelcher has a Bachelor of Arts degree in Philosophy from the University of Pittsburgh, College of Arts and Sciences; a Juris Doctor from the

			University of Pittsburgh, School of Law; and an LL.M (Taxation) from the Dickinson School of Law, Pennsylvania State University.
John Pespisa	Southern California Edison 2244 Walnut Grove Ave. Rosemead, Ca 91770	626-688-6291 John.pespisa@sce.com	John Pespisa is Director of SCE's NERC Compliance program and Acting Director of SCE's Security Technology & Compliance group. Mr. Pespisa started his career with Southern California Edison in 1987, starting in transmission operations and electrical substations. Since then he has worked in positions of increasing responsibility including operation of SCE's bulk electric and distribution systems, and supervisory positions at SCE's Energy Control Center, including Manager of short term power marketing, and Manager of Real-Time Power Operations. In 2011, he moved to his current position as the Director of SCE's NERC Compliance Program In his current role he oversees SCE's compliance with federal Reliability Standards, which have been promulgated to ensure the safe, reliable operation of the power grid, and to protect the grid's critical infrastructure against cyber threats. Mr. Pespisa is a graduate of Cal State Los Angeles and hold degrees in Electrical Engineering and Business Management.
Robert Rhodes	Southwest Power Pool	501-614-3241 rrhodes@spp.org	Robert Rhodes is the Manager, Reliability Standards at Southwest Power Pool (SPP) where he has been

	201 Worthen Drive Little Rock, AR 72223		employed since 2000. In his previous role at SPP he was Manager, Reliability Coordination for over 10 years. Prior to joining SPP, Mr. Rhodes worked at Progress Energy (Carolina Power & Light Company) in Raleigh, NC for over 26 years in various positions in transmission maintenance, operations and planning. In his current capacity, Mr. Rhodes works with SPP members, SPP staff and other industry experts to ensure that reliability standards necessary to maintain a reliable bulk electric system are in place. He coordinates SPP members and registered entities in the development, refinement, maintenance, communication, training and implementation of national and regional reliability standards and policies. Mr. Rhodes is active at NERC currently serving on the Operating Reliability Subcommittee (ORS), the ORS Executive Committee, the Resources Subcommittee, the Standards Committee Process Subcommittee, the Reliability Coordination Standard Drafting Team, the Operating Personnel Communications Protocols Standard Drafting Team and the TOP/IRO Revisions Standard Drafting Team. He has previously served on the Reliability Coordinator Working Group, the Interchange Distribution Calculator Working Group and was Vice Chair of the Distribution Factor Working Group. Additionally, he has served on committees,

			working groups and task forces in SPP, SERC and VACAR. Mr. Rhodes received an Associate in Science degree from Rockingham Community College in 1970, a Bachelor of Science degree in Electrical Engineering from North Carolina State University in 1972 and a Master of Engineering degree from Rensselaer Polytechnic Institute in 1974. He is a member of Tau Beta Pi, Eta Kappa Nu, Order of the Engineer, the Institute of Electrical and Electronics Engineers and its Power Engineering Society and the National Society of Professional Engineers. He is a NERC Certified System Operator (Reliability) and is a registered professional engineer in the State of North Carolina.

Allan Wick	Tri-State Generation & Transmission Association, Inc. 1100 W. 116th Ave., Westminster, CO 80234	303-254-3341 awick@tristategt.org	Allan Wick is a 30 year security executive, 13 in the energy sector with a comprehensive industry perspective after working for an investor owned utility, independent system operator and now at a cooperative generation and transmission company - where he serves as their Enterprise Security Manager & Chief Security Officer. He is a member of the ASIS International Utilities Security Council and the WECC Physical Security Working Group since 2005. He also served for six years on the ASIS International Certification Board of Directors. Mr. Wick has designed and implemented enterprise-wide physical security programs for three different organizations, served as a drafting team member for five ANSI standards, and has authored a number of security related magazine articles and white papers. Mr. Wick received his MBA from Webster University and holds multiple security and business continuity certifications, including CPP, PSP, CBCP, CFE, and PCI.
Manho Yeung	Pacific Gas and Electric Company Mail Code N9G, P.O. Box 770000	415-973-7649 MxY6@pge.com	Manho Yeung is Senior Director, System Planning and Reliability, for Pacific Gas and Electric Company and is responsible for electric transmission and distribution planning, asset and risk management and reliability

	San Francisco, California, 94177		improvements. Manho oversees PG&E's capital investment plan in expanding, upgrading and modernizing its 18,500 miles of electric transmission lines, 850 substations, and 140,000 miles of distribution lines. Mr. Yeung has been with Pacific Gas and Electric Company since 1980 and has over 30 years of energy policy, electric generation planning, electric T&D planning, asset and risk management, project management, engineering, and operations experience. Mr. Yeung received his Bachelor of Science degree in electric engineering from the Georgia Institute of Technology, and a Master of Science degree in electric engineering from the Santa Clara University. He is a registered professional electric engineer in the State of California.
Stephen Crutchfield Senior Standards Developer	North American Electric Reliability Corporation 3353 Peachtree Road, NE, Suite 600 - North Tower Atlanta, GA 30326	609-651-9455 Stephen.crutchfield@nerc.net	Stephen Crutchfield is the lead NERC Staff Senior Standards Developer for Project 2014-04, Physical Security. Stephen began his career with NERC in May 2007. Prior to joining NERC, he was a Project Manager with Shaw Energy Delivery Services, managing engineering and construction projects in the substation and transmission line fields. Mr. Crutchfield's background also includes experience

			with PJM as Manager of RTO Integration, working on the operations and markets integration of new members (AEP, ComEd, Dayton, Dominion and Duquesne) into PJM and southern seams operations issues with Progress Energy, Duke and TVA. He also helped lead the team that was developing GridSouth in the dual roles of Organization Architect and Manager of Customer Support. Prior to GridSouth, Stephen was the Manager of Power System Operations Training at Progress Energy where he spent over 10 years training System Operators and Engineers. Overall, Stephen was with Progress Energy for 16 years. Mr. Crutchfield received his Bachelor of Arts in Physics from the University of Virginia and Masters of Science in Electrical Engineering from North Carolina State University. He holds a Master of Science in Management degree, also from North Carolina State University. He is also a member of the Institute of Electrical and Electronic Engineers and the Power and Energy Society.
Steven Noess Director of Compliance Assurance	North American Electric Reliability Corporation	404-217-9691 steven.noess@nerc.net	Steven Noess is Director of Compliance Assurance at the North American Electric Reliability Corporation (NERC) in Atlanta, GA, and has been employed by NERC since 2011.

	3353 Peachtree Road, NE, Suite 600 - North Tower Atlanta, GA 30326		Prior to joining NERC, Mr. Noess was an attorney at the Minnesota Legislature. Before becoming an attorney, Steven was an officer in the United States Army. Mr. Noess has a bachelor's of science degree from the U.S. Military Academy, West Point, NY, and a law degree from the University of Minnesota Law School.
Mark Olson Senior Standards Developer	North American Electric Reliability Corporation 3353 Peachtree Road, NE, Suite 600 - North Tower Atlanta, GA 30326	404-446-9760 Mark.olson@nerc.net	Mark Olson is a Senior Standards Developer at the North American Electric Reliability Corporation (NERC), and has been employed by NERC since 2012. Previously he was a career officer in the U.S. Navy where he served in various positions related to the operations and management of surface ships and naval personnel. Mr. Olsen has a master's degree in electrical engineering from the Naval Postgraduate School and a bachelor's degree from the U.S. Naval Academy.
Brian Harrell Director, ES-ISAC Operations and Deputy Director of the ES-ISAC	Electricity Sector Information Sharing and Analysis Center North American Electric Reliability Corporation	202-400-3003 office | 609-651-0671 (c) Brian.Harrell@nerc.net	Brian Harrell is the Director, ES-ISAC Operations for the Electricity Sector Information Sharing and Analysis Center (ES-ISAC) and Deputy Director of the ES-ISAC at the North American Electric Reliability Corporation (NERC), joining NERC in August 2010. In this capacity he is responsible for managing situational awareness, incident management, and

	1325 G Street NW, Suite 600 Washington, DC 20005		security coordination for the electricity sector through timely, reliable and secure information exchange. Mr. Harrell has 18 years of experience in the security industry serving in organizations such as law enforcement, military, and corporate security, among others. Mr. Harrell is formerly the NERC Director of Critical Infrastructure Protection Programs, as well as the CIP Manager for the SERC Reliability Corporation, where he oversaw electricity security related matters. Prior to joining SERC, Brian was the Sector Security Specialist for the Infrastructure Security Compliance Division at the U.S. Department of Homeland Security (DHS). Mr. Harrell specialized in securing high risk facilities and Continuity of Operations (COOP) for DHS. Brian also served in the US Marine Corps as an Anti-Terrorism and Force Protection Instructor.
Bob Canada Manager, Physical Security	North American Electric Reliability Corporation 3353 Peachtree Road, NE, Suite 600 - North Tower Atlanta, GA 30326	404-446-9709 bob.canada@nerc.net	Bob Canada currently serves as Manager, Physical Security. In this role, he will participates in the Physical Security Standard implementation effort with the Standards-led team at NERC and continues to support the Critical Infrastructure Protection Committee (CIPC) as staff support to the Physical Security Subcommittee and its working groups.

			Mr. Canada was previously employed in the electric industry for 32 years with Southern Company in various roles with corporate security and was Manager of Corporate Security at Georgia Power Company from March 1995 - December 2002. His responsibilities included corporate and internal investigations, physical security of employees and corporate assets. He also directed alarm systems design and installation as well and was responsible for the overall corporate response for security at Georgia Power Co. M. Canada directed the Georgia Power and Southern Company Security Planning for the Atlanta Olympic Games. He was responsible for the development of the corporate security plan along with the implementation and daily operations included physical security of the transmission and distribution facilities supporting the Olympic venues, monitoring the protective countermeasures in place, consulting with Federal, State and Local Law Enforcement Agencies to protect the State, Metropolitan and Atlanta Electrical Infrastructure. Mr. Canada served two terms for the Southeastern Reliability Council (SERC) as the first Chairman of the Critical Infrastructure Protection Committee and represented SERC on the North American Electric

			Reliability Corporation's (NERC) Critical Infrastructure Committee (CIPC) as the Physical Security voting member. Subsequently, he was elected by the CIPC as a Vice Chair for four terms. Mr. Canada received his Bachelor's from West Georgia State University and his Juris Doctorate from Woodrow Wilson College of Law.

VIA ELECTRONIC FILING

Ms. Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, N.E.
Washington, D.C. 20426

Re: ***North American Electric Reliability Corporation***
Request for Approval of Amended Compliance and Certification Committee Charter
Docket No. RR15-___-000

Dear Ms. Bose:

The North American Electric Reliability Corporation ("NERC")[1] hereby submits for Federal Energy Regulatory Commission ("FERC" or "Commission") approval the proposed amended Compliance and Certification Committee ("CCC") Charter. This filing consists of this transmittal letter; Attachment 1, which contains a clean version of the proposed amendments to the CCC Charter; and Attachment 2, which contains a redlined version of the proposed amendments.

Proposed Amendments

The proposed amendments to the CCC Charter were made to improve the clarity and accuracy of the document. Specifically, the proposed amendments correct references to the NERC Rules of Procedure and change references to NERC titles to reflect organizational changes at NERC.

[1] NERC is the Commission-certified electric reliability organization responsible for the development and enforcement of mandatory Reliability Standards. *See North American Electric Reliability Corp.*, 116 FERC ¶ 61,062, *order on reh'g and compliance*, 117 FERC ¶ 61,126 (2006), *aff'd sub nom. Alcoa Inc. v. FERC*, 564 F.3d 342 (D.C. Cir. 2009).

3353 Peachtree Road NE
Suite 600, North Tower
Atlanta, GA 30326
404-446-2560 | www.nerc.com

FERC originally approved the CCC Charter in June 2007 in an Order on Compliance Filing,[2] and approved a revised CCC Charter in June 2010.[3] In accordance with this prior practice, NERC is submitting these revisions to the charter for FERC approval. The NERC Board of Trustees approved the revised CCC Charter on May 7, 2015. NERC notes that the CCC Charter is not part of NERC's Bylaws or Rules of Procedure and therefore may not require Commission approval. NERC respectfully requests Commission guidance on the need to file amendments to the CCC Charter with the Commission for approval.

Communications

Please address any communications concerning this filing to the persons listed below and place their names on the Commission's official service list:

Mission

In the capacity of a North American Electric Reliability Corporation (NERC) Board of Trustees (Board)-appointed stakeholder committee serving and reporting directly to the NERC Board, the Compliance and Certification Committee (CCC) will engage with, support, and advise the NERC Board and NERC regarding all facets of the NERC Compliance Monitoring and Enforcement Program (Compliance and Enforcement program), Organization Registration program (Registration program), and Organization Certification program (Certification program). As a committee providing support and advice but otherwise independent of the execution of these programs, the CCC will monitor NERC's adherence to the Rules of Procedure (ROP) for these programs. Also and in a similar manner, as a committee independent of the Reliability Standards development process, the CCC will be the body responsible for monitoring NERC's adherence to the (ROP) regarding the Reliability Standards development process with the exception of appeals of substantive or procedural action or inaction associated with a Reliability Standard or the Standards process as defined in the appeals section of the Standard Processes Manual. The CCC is also responsible for establishing and implementing a program to monitor NERC's compliance with the Reliability Standards that apply to NERC.

Compliance and Certification Committee Functions

To fulfill its mission, the CCC performs the following functions:

1. Organizes and conducts committee meetings directly with NERC staff regarding all facets of the Compliance and Enforcement, Registration, and Certification programs;[1]
2. Provides comments and recommendations to the NERC Board and NERC staff;
3. Provides comments to NERC with respect to stakeholders' perception of the policies, practices, and effectiveness of the Compliance and Enforcement program, Registration program, and Certification program;
4. Recommends revisions of the electric reliability organization (ERO) ROP related to the Compliance and Enforcement program, Registration program, and Certification program to the NERC Board;
5. Establishes and implements programs to monitor:[2]
    a. NERC's adherence to Section 405 for Compliance Monitoring and Enforcement, including but not limited to the uniform CMEP (Appendix 4C) and the Sanction Guidelines (Appendix 4B).
    b. NERC's adherence to Section 506 for Organization Registration and Certification, including but not limited to the Organization Registration and Certification Manual (Appendix 5A).
    c. NERC's adherence to Section 300 of the ROP regarding the Reliability Standards development process with the exception of appeals of substantive or procedural action or inaction associated with a Reliability Standard or the Reliability Standards process as defined in the appeals section of the Reliability Standards Development Procedure. Committee members who have participated in the development process for a particular Reliability Standard shall not participate in the committee's monitoring of that process.
    d. NERC's compliance with the Reliability Standards that apply to NERC.
6. Serves as the hearing body for any contest regarding findings of or penalties or sanctions for violation(s) of Reliability Standard(s) where NERC is directly monitoring the entity for compliance with those standards (registered entity by agreement with a Regional Entity or absent a delegation agreement; the Region itself where approved standards are applicable to the Region) as described in Section 408 of the NERC ROP;
7. As directed by the NERC Board, serves as the mediator for any disagreements between NERC and the Regional Entities concerning NERC performance audits of Regional Entities' compliance programs. When directed by the Board to serve as mediator, the committee chair will appoint three disinterested members of the committee to meet with representatives of NERC and the Regional Entity to attempt to resolve the matter.
8. Actively supports the Standards Committee in the development of new and revised standards by providing a pool of qualified compliance oriented personnel for participation in the compliance administration element phase of the standards development process;
9. Provides assistance to NERC and the Regional Entities to implement the Compliance and Enforcement, Registration, and Certification programs; and

[1] Meetings are conducted under Section 4 of this Charter.

[2] Monitoring by the CCC is ongoing and does not preclude, interfere with or replace, in whole or in part, the NERC Board's responsibility to conduct and provide such reviews of these programs as required by Federal Energy Regulatory Commission (the Commission) regulations, 18 C.F.R. § 39.3.c: "The Electric Reliability Organization shall submit an assessment of its performance three years from the date of certification by the Commission, and every five years thereafter."

10. Undertakes assignments from the Board or the Board's Compliance Committee related to compliance and enforcement, organization registration, organization certification, and standards development.

Membership

Goals

The CCC provides for balanced discussion, commentary, and recommendations on compliance issues by bringing together a wide diversity of opinions and perspectives from NERC member sector experts who have particular familiarity, knowledge, and experience in the area of compliance and NERC Standards and Regional Standards.

Appointment and Terms of Service

Members are appointed to the committee by the NERC Board and serve on the committee at the pleasure of the Board. Member terms are the lesser of three years from appointment or interim approval (Section 5.b), replacement, or removal by the Board. Members may be reappointed at the conclusion of a term. There is no limitation on the number of times a member may be reappointed. A member may be recommended to the Board for reappointment by the Nominating Subcommittee by self- nomination. To the extent practicable, member terms will be staggered such that approximately one-third of the committee is subject to reappointment or replacement each year.

Qualifications

Individuals deemed qualified to serve on the committee will generally include senior-level industry experts who have particular familiarity, knowledge, and experience in the area of compliance, compliance enforcement, compliance administration and management, organization responsibilities and registration, organization certification, and NERC Standards and Regional Standards. These individuals should be involved with internal compliance programs within their respective organizations.

Expectations

Committee members are expected to represent the interests of the sector they represent to the best of their ability and judgment. In addition to the duties, rights, and privileges described elsewhere in this charter, committee members will:

1. Act consistently during meetings with the procedures in this manual and Robert's Rules of Order;
2. Demonstrate and provide knowledge and expertise in support of committee activities;
3. Adjudicate in a fair and unbiased manner that meets applicable legal and due process requirements when participating in hearing procedures conducted under the NERC ROP Section 408;
4. Solicit comments and opinions from constituents and groups of constituents or trade organizations represented by the member and convey them to the committee;
5. Respond promptly to all committee requests, including requests for reviews, comments, and votes on issues before the committee;
6. Arrange for a proxy to attend and vote at committee meetings in the member's absence; and
7. Respond promptly to all requests to register for committee meetings.

Representation

The membership structure of the CCC will be modeled upon the membership structure of the NERC Member Representatives Committee (MRC) as described in NERC's Bylaws (the Bylaws) Article VIII Section 2 [see Attachment A]. This should produce a committee that has an appropriate balance of entities subject to compliance with the NERC Reliability Standards and NERC's Compliance and Enforcement program, and others affected by the Standards and the Compliance and Enforcement program.

Regional Entities

Each Regional Entity, or the applicable regional organization if no Regional Entity exists for the geographic area, may nominate one member to the committee. In aggregate, the sector will have voting strength equivalent to two members. The voting weight of each Regional member's vote will be set such that the sum of the weight of all available Regional members' votes is two votes.

Canadian Representation

The committee structure will include representation by Canadians as laid out in Article VIII Section 4 of the Bylaws.

NERC Membership

Users, owners, and operators of the bulk power system are subject to the Compliance, Registration, and Certification programs regardless of whether they are NERC members. It is expected that committee members will generally be from organizations who are NERC members; however, committee members may be non-members of NERC who are subject to the qualifications identified herein and meeting requirements laid out in the Bylaws for non-NERC-member participation in the MRC.

Selection

The CCC will conduct open nominations processes to receive nominations to fill any membership vacancies. Prospective members of the committee may be identified to the CCC via any means the committee finds acceptable, including solicited or unsolicited nomination by a recognized industry group or association, general open solicitation by the committee for nomination(s), individuals' self-nomination, directed solicitation by the committee to an individual or individuals, or referral by the Board or other NERC body or committee.

Nominating Subcommittee

The CCC will annually appoint a Nominating Subcommittee to identify, qualify, and recommend individuals to fill sector representative vacancies on the committee or, when required, to serve as the chair or vice chair of the committee. The subcommittee will identify the individuals they are recommending to the full CCC for review. Individuals recommended by the subcommittee for appointment to the committee must be approved by the Board.

Interim Approval

Upon approval of the committee, individuals identified and selected by the Nominating Subcommittee for membership on the committee may serve as members on an interim basis pending their appointment by the Board.

Expertise

When selecting individuals to recommend for committee membership, the Nominating Subcommittee will seek to engage individuals who, in aggregate, provide the committee with a level and breadth of expertise sufficient to achieve its goals and fulfill its scope and responsibilities while respecting other important factors such as industry sector, Region, interconnection, and country.

Regional Entity Members

Each Regional Entity, or the applicable regional organization if no Regional Entity exists for the geographic area, may nominate an individual to serve as a member representing their organization. The Nominating Subcommittee will defer to these nominations. The nomination is non-binding upon the Board. Vacancies on the committee will exist where the Regional Reliability Organization or Regional Entity has not provided a nomination.

Canadian Members

The Nominating Subcommittee will endeavor to attract and engage Canadians with suitable qualifications and expertise in adequate numbers to satisfy Article VIII Section 4 of the Bylaws. Recognized Canadian organizations

such as the Canadian Electricity Association and Canada's Energy and Utility Regulators will be consulted and solicited for assistance in recruiting Canadians to serve on the committee. All members considered to be serving as Canadians on the committee will be expected to have an endorsement, as appropriate, of such an organization. Canadian representatives should be capable of representing Canadian viewpoints in committee activities, in addition to the sector that they otherwise represent. Consistent with practice regarding the MRC, the Board may appoint additional Canadian individuals to the committee towards satisfying Article VIII Section 4 of the Bylaws.

Industry Sector Members

The Nominating Subcommittee will assess the qualifications of nominees and select individuals to recommend to the NERC Board for appointment to the committee. The subcommittee may give preference to candidates nominated by organizations generally considered by the industry as representative of a broad cross-section of the industry sector in question, such as an industry trade association. A NERC Member sector may elect to identify sector representatives for nomination to the Nominating Subcommittee through a process approved by the NERC Board.

General Nominations and Appointment Process

The committee's secretary administers the general nominations process.

Requesting Nominations

The NERC staff will request nominations and will forward all nominations received to the Nominating Subcommittee. The Nominating Subcommittee will then prepare its recommended slate of members. The recommended slate will be reviewed by the whole committee for information purposes before it is submitted to the Board. The committee may approve the slate to serve as members on an interim basis, pending appointment by the Board at the Board's earliest convenience, but will not otherwise act on the slate.

Board Approval

The Nominating Subcommittee will present the recommended committee membership slate to the Board for approval. If the Board approves the recommended committee slate, each member on the slate is appointed. The Board may also appoint members individually as needed to meet membership balance and fill vacancies.

Vacancies and Non-participation

The committee's secretary will administer the nominations process for vacancies on the committee.

Addressed on an Ongoing Basis

Vacancies on the committee can be addressed on an ongoing basis through receipt and consideration of both solicited and unsolicited nominations for the vacant positions.

Role of the Nominating Subcommittee

Nominations received for vacancies will be vetted by the Nominating Subcommittee in the same manner as general nominations. The subcommittee may subsequently and individually recommend nominees they deem qualified to the NERC Board for consideration for appointment to the committee. Existing committee members may also approve such individuals to serve as members on an interim basis pending full appointment by the Board.

Resignations

By the Member

In the event a member can no longer serve on the committee, that member will submit a written resignation to the committee chair or the secretary.

Requested by the Chair

The chair may request any committee member who ceases to participate in the committee, as indicated by not attending or sending a proxy for two consecutive meetings, to submit a resignation or to request continuation of membership with an explanation of extenuating circumstances. If a written response is not received within 30 days of the chair's request, the lack of response will be considered a resignation.

Referral to the Nominating Subcommittee

The committee chair will refer the vacancy resulting from a resignation to the Nominating Subcommittee of the committee. If a recent list of nominations is available to the Nominating Subcommittee that it deems to be valid, the subcommittee will recommend a replacement nominee; otherwise, the subcommittee will request NERC staff prepare a new solicitation for nominations to fill that position. The Nominating Subcommittee will follow the previously stated criteria in recommending a replacement.

By the Board

Committee members serve at the pleasure of the Board who may request resignation from, remove, or replace a member from the committee, as the Board deems appropriate.

Interim Approval

The committee chair may seek a vote of the committee to allow the proposed replacement member to be seated, pending appointment of the replacement at the Board's next scheduled meeting.

Proxies

A substitute representative, or proxy, may attend and vote during all or a portion of a committee meeting in lieu of a voting member provided the absent member notifies the committee chair, vice chair, or secretary of the proxy.

Notification

Such notification will be in writing (electronic medium is acceptable). The proxy representatives and their affiliation will be named in the correspondence.

Serving as Proxy

A voting member of a committee may not serve as a proxy for another voting member on the same committee (i.e. a member may not cast more than their own vote).

Exclusions

Regional Entity Staff

Regional Entity staff members who administer any portion of the Compliance and Enforcement program, Registration program, or Certification program for that Regional Entity, or for any other Regional Entity, may not serve as a member of the CCC.

Organizations

No two individuals from the same organization, or affiliated organizations, may serve concurrently on the committee. Any committee member who has a membership conflict of this nature is obligated to notify the committee secretary, who shall inform the committee chair. Members impacted by such a conflict, such as through a merger of organizations, may confer between themselves to determine which member should resign from the committee and notify the committee secretary and chair; however, if both members are within the same industry sector and cannot reach an amicable solution by determining the member to remain, the Nominating Subcommittee will review the qualifications of each member and propose the member to remain to the full committee who will determine which member shall continue to serve, subject to Board approval. If the conflict is not resolved in a timely manner by the impacted members, the committee chair shall notify all members of the

affected industry sectors recommending actions to resolve the conflict. If the membership conflict is still unresolved, the committee chair shall take the conflict to the NERC Board for resolution.

NERC Staff

The Director of Compliance Assurance shall not be a member of the committee or vote on committee business. The Director of Compliance Assurance and the secretary shall be recused from participating in any committee activity that involves monitoring of NERC's adherence to ROP or activity that the Director of Compliance Assurance oversees. If the NERC staff coordinator has been recused from participating in a Committee activity, the chair shall appoint another member of the committee as acting secretary for any meetings or other activities from which the NERC staff coordinator is recused.

Changes in Member Affiliation

A committee member whose affiliation has changed may retain the membership position under these circumstances:

1. The new organization is in the same industry sector, and
2. The member meets all other membership requirements.

Conflict of Interest

No committee member may have a conflict of interest that would impair his or her ability to fulfill obligations under this charter. Any committee member who knows of any form of membership conflict, such as working for an entity affiliated with that of another committee member, will notify the committee chair within 10 business days of obtaining that knowledge.

Meetings

In the absence of specific provisions in this manual, all committee meetings will follow Roberts Rules of Order.

Quorum

Two-thirds Requirement

The quorum necessary for transacting business at meetings of the committee is two-thirds of the voting members currently on the committee's roster.

Interim Basis

Voting members approved by the committee on an interim basis, pending appointment by the Board, will be counted in the determination of a quorum.

Lack of Quorum

If a quorum is not present at the beginning of the meeting, the committee may not take any actions requiring a vote by the committee; however, the chair may, with the consent of the members present, elect to allow discussion of the agenda items.

Voting

Actions by members of the committee will be approved upon receipt of the affirmative vote of two-thirds of the votes present (including proportional votes by Regional Representatives) at any meeting at which a quorum is present.

Antitrust Guidelines

All persons attending or otherwise participating in a NERC committee meeting will act in accordance with NERC's Antitrust Compliance Guidelines at all times during the meeting.

Open Meetings

NERC committee meetings will be open to the public, except as noted below under Confidential Information.

Confidential Sessions

At the discretion of the CCC chair, a meeting or portion of a meeting may have attendance limited based on confidentiality of the information to be disclosed at the meeting. Such limitations should be applied sparingly and on a non-discriminatory basis as needed to protect information that is sensitive information or confidential information to one or more parties. All hearings of compliance matters will be confidential sessions. Confidential information will only be disclosed as provided by NERC ROP 1500. Confidentiality agreements may also be applied, as necessary, to protect sensitive information or confidential information.

Types of Meetings

Meetings may be conducted in person, by conference call, or by other means. The procedures contained in this manual will apply to all meetings regardless of how they are conducted.

Majority and Minority Views

All members of a committee will be given the opportunity to provide alternative views on an issue. The results of committee actions, including recorded minutes, will reflect the majority as well as any minority views of the committee members. The chair will communicate both the majority and any minority views in presenting results to the Board.

Action Without a Meeting

Two-thirds Majority

Any action required or permitted at a meeting of the committee may be taken without a meeting if two-thirds of the total votes available to the members of the CCC (including the proportional votes available to Regional Representatives) approve taking the action outside of a meeting.

Procedure

Such action without a meeting will be performed by mail or electronic ballot (e.g., telephone, fax, email, or Internet) and will be recorded in the minutes as a roll call ballot. The secretary will announce the action required at least 10 days before the date on which the action is to be voted. As time permits, members should be allowed a window of 10 business days to vote. The secretary will provide the results of such an action within 10 business days of the close of the voting period.

Officers and Staff

General

Number of Positions

The committee will have two officers and one secretary.

Officers

The committee officers will be one chair and one vice chair.

Executive

The committee shall retain an Executive Committee consisting of the committee officers, subcommittee chairs, secretary, and the Director of Compliance Assurance.

Secretary

The NERC staff coordinator will serve as the committee's secretary.

Voting of Officers

The committee chair and vice chair are voting members of the committee.

Officers Nominated by the Nominating Subcommittee

The CCC Nominating Subcommittee will recommend a chair and a vice chair who are then appointed by the NERC Board for a two-year term. The term of the chair and the vice chair, except for the first year, will begin on July 1 and end on June 30.

Officers as Sector Representatives

The chair and vice chair are selected from the membership of the committee and, in addition to their chair or vice chair responsibilities, will continue to serve as a member for the sector for which they were appointed to the committee.

Chair

The chair will direct and provide general supervision of committee activities, including the following:

1. Coordinate the schedule of all committee meetings, including approval of meeting duration and location;
2. Develop committee agendas and rule on any deviation, addition, or deletion from a published agenda;
3. Preside at and manage committee meetings, including the nature and length of discussion, recognition of speakers and proxies, motions, and voting;
4. Will lead or direct the conduct of any hearings and the preparation of any adjudicatory documents by the committee under Section 408 of the NERC ROP;
5. Will ensure actions and undertakings by the committee under the NERC ROP Section 408 meet all applicable legal and due process requirements;
6. Will act as spokesperson for the committee at forums inside and outside of NERC; and
7. May attend meetings of the NERC Board when necessary to report to the Board on committee activities.

Vice Chair

The vice chair will assume the responsibilities of the chair under the following conditions:

1. At the discretion of the chair (for brief periods of time);

2. When the chair is absent or temporarily unable to perform the chair's duties; or
3. When the chair is permanently unavailable or unable to perform the chair's duties. In the case of a permanent change, the vice chair will continue to serve until a new chair is nominated and selected by the Board.

Staff Coordinator

A member of the NERC staff will be selected by NERC's Director of Compliance Assurance to serve as the staff coordinator and secretary of the committee. The staff coordinator is not a committee member and does not have a vote. Under the direction of the committee executive and applicable NERC bylaws, guidelines, and ROP, the staff coordinator will do the following:

1. Manage the day-to-day operation and business of the committee;
2. Prepare and distribute the notices of the committee meetings, prepare the meeting agenda, and prepare and distribute the minutes of the committee meetings; and
3. Act as the committee's parliamentarian.

Nominating Subcommittee

Appointment

The CCC will annually appoint a Nominating Subcommittee.

Five Members

The subcommittee will consist of five members nominated by the committee chair and approved by the committee. The chair of the subcommittee will be selected by the CCC chair from among the five subcommittee members.

Appointed Annually

The chair will appoint the subcommittee members at the first regular meeting of the committee of the calendar year.

Length of term

The subcommittee members will serve for up to 14 months or until a new Nominating Subcommittee is authorized, whichever is earlier.

Duties

In addition to the duties, rights, and privileges described elsewhere in this manual, members of the Nominating Subcommittee will:

1. Prepare a slate of committee officer candidates for submission to the NERC Board for approval, and
2. Prepare a slate of recommended individuals to fill designated committee vacancies as required.

Subordinate Groups

Committee Organization

The CCC organizational structure will be arranged as allowed in the NERC Bylaws to support a superior-subordinate hierarchy that is ordered as follows: a committee, a subcommittee, a working group, and a task force, with a committee being primary and a task force being quaternary.

Subgroups

The committee may establish subcommittees, working groups, and task forces as necessary. The committee chair may also form any of these subordinate groups on behalf of the committee. The committee will be the responsible sponsor of all subordinate subcommittees, working groups, or task forces it may create, or that its subordinate subcommittees and working groups may create. The committee will keep the Board informed of all groups subordinate to the committee.

Subcommittees

The committee may establish subcommittees to which the committee may delegate some of the committee's broadly defined continuing functions. The committee will approve the scope of each subcommittee it forms. The committee chair will appoint the subcommittee officers (typically a chair and a vice chair) for a specific term (generally two years). The subcommittee officers may be reappointed for up to two additional terms. The subcommittee will work within its assigned scope and be accountable for the responsibilities assigned to it by the committee. The formation of a subcommittee, due to the permanency of the subcommittee, will be approved by the Board.

Working Groups

The committee or any of its subcommittees may delegate specific continuing functions to a working group. The sponsoring committee or subcommittee will approve the scope of each working group it forms. The chair of the sponsoring committee or subcommittee will appoint the working group officers (typically a chair and a vice chair) for a specific term (generally two years). The working group officers may be reappointed for up to two additional terms. The sponsoring committee or subcommittee will conduct a "sunset" review of each working group every two years. The working group will be accountable for the responsibilities assigned to it by the committee or subcommittee and will, at all times, work within its assigned scope.

Task Forces

The committee, subcommittee, or working group may assign specific work of a finite duration to a task force. The sponsoring committee, subcommittee, or working group will approve the scope of each task force it forms. The chair of the sponsoring committee, subcommittee, or working group will appoint the task force officers (typically a chair and a vice chair). Each task force will have a finite duration, normally less than one year. The sponsoring group will review the task force scope at the end of the expected duration and at each subsequent meeting of the sponsoring group after that until the task force is retired. Action of the task force sponsoring group is required to continue the task force past its defined duration. The sponsoring group should consider promoting to a working group any task force that is required to work longer than one year.

Membership and Representation

The membership of each subcommittee, working group, and task force should be established to address the need for expertise and balance of interests. Each group's membership requirements will be defined within the group's approved scope.

As a general guide, the broader the group's scope, the more emphasis there should be on balancing of interests. Therefore, subcommittees would be expected to have the broadest representation of appropriate industry

sectors, while a task force may be more focused on simply having the necessary expertise, and a working group may be somewhere between.

Each member of a subordinate group, and its officers, will be appointed by the chair of the sponsoring committee or group.

To the extent subgroup membership is of a representative nature, recommendations for staffing of the group should be provided in a manner consistent with the principles outlined in the staffing of a committee, including the use of an open nominations process. Regional Entity representatives should be recommended by the Regional Entity and Canadian representatives by the Canadian Electricity Association.

Preference may also be given to representatives recommended by broadly-based industry associations.

To the extent that subgroup membership is based on providing requisite expertise, the chair of the sponsoring committee or group may appoint members based on the relevant technical qualifications.

Procedures

Subcommittees, working groups, and taskforces will conduct business in a manner consistent with all applicable sections of this manual and Robert's Rules of Order.

Hearings

General

The CCC will conduct hearings, as necessary, to fulfill its function of serving as the hearing body for any contest between NERC and a Regional Entity regarding NERC findings, penalties, or sanctions for violation(s) of Reliability Standard(s) by the Regional Entity as described in Section 408 of the NERC ROP.

Hearing Procedure

Unless specifically identified otherwise elsewhere in this charter, the CCC's hearing procedure shall follow the hearing procedure mandated and approved by jurisdictional authorities for use by NERC and the Regional Entities in the Compliance and Enforcement program.

Hearing Panel

The committee shall not have a standing hearing panel. When a hearing is to be conducted, the CCC shall select five members to serve as the adjudicatory panel for that hearing. Members to serve on the panel shall be selected by vote of a valid quorum of the committee. Voting members of the committee with little or no affiliation with parties to the hearing may be nominated or volunteer to stand for selection to the hearing panel. One or more alternates may also be selected, as the committee deems appropriate for the circumstances. A member may serve on more than one panel concurrently. A panel is disbanded upon conclusion of the hearing proceedings for which it was formed.

Mission

In the capacity of a ~~NERC~~ North American Electric Reliability Corporation (NERC) Board of Trustees (Board)-appointed stakeholder committee serving and reporting directly to the NERC Board, the Compliance and Certification Committee (CCC) will engage with, support, and advise the NERC Board and NERC ~~Compliance~~ regarding all facets of the NERC Compliance Monitoring and Enforcement Program (Compliance and Enforcement program), Organization Registration program (Registration program), and Organization Certification program (Certification program). As a committee providing support and advice but otherwise independent of the execution of these programs, the CCC will monitor NERC's ~~compliance~~adherence ~~with~~ to the Rules of Procedure (ROP) for these programs ~~on an periodic ongoing basis~~. Also and in a similar manner, as a committee independent of the Reliability Standards development process, the CCC will be the body responsible for monitoring NERC's ~~compliance~~adherence ~~with~~ to the ~~Rules of Procedure~~(ROP) regarding the Reliability Standards development process~~,~~ with the exception of appeals of substantive or procedural action or inaction associated with a ~~r~~Reliability ~~s~~Standard or the ~~s~~Standards process as defined in the appeals section of the ~~Reliability Standards Development Procedure~~Standard Processes Manual. The CCC is also responsible for establishing and implementing a program to monitor NERC's compliance with the Reliability Standards that apply to NERC.

Compliance and Certification Committee Functions

To fulfill its mission, the ~~Compliance and Certification Committee~~CCC performs the following ~~–~~functions:

1. Organizes and conducts committee meetings directly with NERC ~~Compliance program~~ staff regarding all facets of the Compliance and Enforcement, Registration, and Certification programs~~;~~.[1]

~~1.~~2. ~~1~~Provides comments and recommendations to the NERC Board and NERC ~~compliance~~ staff~~;~~.

~~2.~~3. Provides comments to NERC with respect to stakeholders' perception of the policies, ~~practices~~practices, and effectiveness of the Compliance and Enforcement program, Registration program, and Certification program~~;~~.

~~3.~~4. Recommends revisions of the ~~ERO~~ ~~E~~electric ~~R~~reliability o~~O~~rganization (ERO) ~~Rules of Procedure~~ROP related to the Compliance and Enforcement program, Registration program, and Certification program to the NERC Board~~;~~.

~~4.~~5. Establishes and implements programs to monitor~~2~~:[2]

a. ~~NERC's compliance with the reliability standards that apply to~~ NERC's adherence to Section 405 for Compliance Monitoring and Enforcement, including but not limited to the uniform CMEP (Appendix 4C) and the Sanction Guidelines (Appendix 4B).~~The Compliance program's adherence to NERC's Rules of Procedure as specified in Section 405 of NERC's Rules of Procedure~~;~~.~~

~~a.~~b. NERC's adherence to Section 506 for Organization Registration and Certification, including but not limited to the Organization Registration and Certification Manual (Appendix 5A).

c. NERC's adherence ~~with the~~to Section 300 of the ~~Rules of Procedure~~ROP regarding the Reliability Standards development process with the exception of appeals of substantive or procedural action or inaction associated with a Reliability Standard or the Reliability Standards process as defined in the appeals section of the Reliability Standards Development Procedure. Committee members who have participated in the development process for a particular Reliability Standard shall not participate in the c~~C~~committee's monitoring of that process.

~~b.~~d. NERC's compliance with the Reliability Standards that apply to NERC.

~~5.~~6. ~~Hearing body.~~ Serves as the hearing body for any contest regarding findings of or penalties or sanctions for violation(s) of ~~r~~Reliability ~~s~~Standard(s) where NERC is directly monitoring the entity for compliance with those ~~s~~Standards (~~R~~registered ~~E~~entity by agreement with a~~n~~ Regional Entity or absent a delegation agreement; the Region itself where approved ~~s~~Standards are applicable to the ~~R~~region) as described in ~~the NERC Rules of Procedure (ROP)~~ Section 409 of the NERC ~~Rules of Procedure~~ROP~~;~~.

~~6.~~7. ~~Mediator.~~ As directed by the NERC Board, serves as the mediator for any disagreements between NERC and the Regional Entities concerning NERC performance audits of Regional Entities' compliance programs. When directed by the Board to serve as mediator, the committee chair will appoint three disinterested members of the committee to meet with representatives of NERC and the Regional Entity to attempt to resolve the matter.

[1] Meetings are conducted ~~pursuant to~~under Section 4 of this Charter.

[2] Monitoring by the CCC is ongoing and does not preclude, interfere with or replace, in whole or in part, the NERC Board's responsibility to conduct and provide such reviews of these programs as required by Federal Energy Regulatory Commission (the Commission) ~~Order 672~~regulations, 18 C.F.R. ~~at~~ § 39.3.c: "The Electric Reliability Organization shall submit an assessment of its performance three years from the date of certification by the Commission, and every five years thereafter."

7.8. Compliance administration. Actively supports the Standards Committee in the development of new and revised ssStandards by providing a pool of qualified compliance oriented personnel for participation in the compliance administration element phase of the ssStandards development process;.

8.9. Organization registration and certification. Provides assistance to NERC and the Regional Entities to implement the Compliance and Enforcement, and Organization Registration, and Certification programs; and.

9.10. Board assignments. Undertakes assignments from the Board or the Board's Compliance Committee related to compliance and enforcement, organization registration, and organization certification, and ssStandards development.

Membership

Goals

The ~~Compliance and Certification Committee~~ CCC provides for balanced discussion, ~~commentary~~commentary, and recommendations on compliance issues by bringing together a wide diversity of opinions and perspectives from NERC member sector experts who have particular familiarity, ~~knowledge~~knowledge, and experience in the area of compliance and NERC Standards and Regional S~~s~~tandards.

Appointment and Terms of Service

Members are appointed to the committee by the NERC Board and serve on the committee at the pleasure of the Board. Member terms are the lesser ~~of:~~of three years from appointment or interim approval (Section 5.b)~~,~~, replacement, or removal by the Board. Members may be reappointed at the conclusion of a term. There is no limitation on the number of times a member may be reappointed. A member may be recommended to the Board for reappointment by the Nominating Subcommittee by self- nomination. To the extent practicable, member terms will be staggered such that approximately one-~~-~~third of the committee is subject to reappointment or replacement each year.

Qualifications

Individuals deemed qualified to serve on the committee will generally include senior-~~-~~level industry experts who have particular familiarity, knowledge, and experience in the area of compliance, compliance enforcement, compliance administration and management, organization responsibilities and registration, organization certification, and NERC Standards and Regional S~~s~~tandards. These individuals should be involved with internal compliance programs within their respective organizations.

Expectations

Committee members are expected to represent the interests of the sector they represent~~,~~ to the best of their ability and judgment. In addition to the duties, rights, and privileges described elsewhere in this charter, committee members will ~~do the following:~~:

1. Act consistently during meetings with the procedures in this manual and Robert's Rules of Order;~~,~~
2. Demonstrate and provide knowledge and expertise in support of committee activities;~~,~~
3. Adjudicate in a fair and unbiased manner that meets applicable legal and due process requirements when participating in hearing procedures conducted under ~~pursuant to~~ the NERC ~~Rules of Procedure~~ROP ~~(ROP)~~ Section 409;~~,~~
4. Solicit comments and opinions from constituents and groups of constituents or trade organizations represented by the member and convey them to the committee;~~,~~
5. Respond promptly to all committee requests, including requests for reviews, comments, and votes on issues before the committee;~~,~~
6. Arrange for a proxy to attend and vote at committee meetings in the member's absence; and~~,~~
7. Respond promptly to all requests to register for committee meetings.

Representation

The membership structure of the ~~Compliance and Certification Committee (~~CCC~~)~~ will be modeled upon the membership structure of the NERC Member Representatives Committee (MRC) as described in NERC's Bylaws (the Bylaws) Article VIII Section 2 [see Attachment A]. This ~~will~~ should produce a committee that has an

appropriate balance of entities subject to compliance with the NERC Reliability Standards and NERC's Compliance and Enforcement program, and others affected by the ~~s~~Standards and the Compliance and Enforcement program.

Regional Entities

Each Regional Entity, or the applicable regional organization if no Regional Entity exists for the geographic area, may nominate one member to the committee. In ~~aggregate~~aggregate, the sector will have voting strength equivalent to two members. The voting weight of each ~~r~~Regional member's vote will be set such that the sum of the weight of all available ~~r~~Regional members' votes is two votes.

Canadian Representation

The committee structure will include representation by Canadians as laid out in Article VIII Section 4 of the Bylaws.

NERC Membership

Users, ~~owners~~owners, and operators of the bulk power system are subject to the Compliance, ~~Registration~~Registration, and Certification programs ~~irrespective~~ regardless of whether they are NERC members. It is expected that committee members will generally be from organizations who are NERC members; h~~. H~~owever, committee members may be non-members of NERC who are subject to the qualifications identified herein and meeting requirements laid out in the Bylaws for non-NERC-member participation in the MRC.

Selection

The CCC will conduct open nominations processes to receive nominations to fill any membership vacancies. Prospective members of the committee may be identified to the CCC via any means the committee finds acceptable, including~~:~~ solicited or unsolicited nomination by a recognized industry group or association,~~;~~ general open solicitation by the committee for nomination(s),~~;~~ individuals' self-nomination,~~;~~ directed solicitation by the committee to an individual or individuals, or~~;~~ referral by the Board or other NERC body or committee.

Nominating Subcommittee

The CCC will annually appoint ~~create~~ a Nominating Subcommittee ~~yearly~~ to identify, qualify, and recommend individuals to fill sector representative vacancies on the committee or, when required, to serve as the chair or vice chair of the committee. The subcommittee will identify the individuals they are recommending to the full CCC for review. Individuals recommended by the subcommittee for appointment to the committee must be approved by the Board.

Interim Approval

Upon approval of the ~~committee~~committee, individuals identified and selected by the Nominating Subcommittee for membership on the committee may serve as members on an interim basis~~,~~ pending their appointment by the Board.

Expertise

When selecting individuals to recommend for committee membership, the Nominating Subcommittee will seek to engage individuals who, in aggregate, provide the committee with a level and breadth of expertise sufficient to achieve its goals and fulfill its scope and responsibilities~~,~~ while respecting other important factors such as industry sector, R~~r~~egion, i~~I~~nterconnection, and country.

Regional Entity Members

Each Regional Entity, or the applicable regional organization if no Regional Entity exists for the geographic area, may nominate an individual to serve as a member representing their organization. The Nominating Subcommittee will defer to these nominations. The nomination is non-binding upon the Board. Vacancies on the committee will exist where the R~~r~~egional R~~r~~eliability O~~o~~rganization or R~~r~~egional E~~e~~ntity has not provided a nomination.

Canadian Members

The Nominating Subcommittee will endeavor to attract and engage Canadians with suitable qualifications and expertise in adequate numbers to satisfy Article VIII Section 4 of the Bylaws. Recognized Canadian organizations such as the Canadian Electricity Association and Canada's Energy and Utility Regulators ~~(CAMPUT)~~~~CAMPUT~~ will be consulted and solicited for assistance in recruiting Canadians to serve on the committee. A ~~and a~~ll members considered to be serving as Canadians on the committee will be expected to have an endorsement, as appropriate, of such an organization. Canadian representatives should be capable of representing Canadian viewpoints in committee activities, in addition to the ~~sector which~~sector that they otherwise represent. Consistent with practice regarding the MRC, the Board may appoint additional Canadian individuals to the committee towards satisfying Article VIII Section 4 of the Bylaws.

Industry Sector Members

The Nominating Subcommittee will assess the qualifications of nominees and select individuals to recommend to the NERC Board for appointment to the committee. The subcommittee may give preference to candidates nominated by organizations generally considered by the industry as representative of a broad cross-section of the industry sector in question, such as an industry trade association. A NERC Member sector may elect to identify sector representatives for nomination to the Nominating Subcommittee through a process approved by the NERC Board.

General Nominations and Appointment Process

The committee's secretary administers the general nominations process.

Requesting Nominations

The NERC staff will request nominations ~~NERC staff will~~and will forward ~~received~~all nominations received ~~received~~ to the Nominating~~ions~~ Subcommittee. The Nominating Subcommittee will then prepare its recommended slate of members. The recommended slate will be reviewed by the whole committee for information purposes before it is submitted to the Board. The committee may approve the slate to serve as members on an interim basis, pending appointment by the Board at the Board's earliest convenience, but will not otherwise act on the slate.

Board Approval

The Nominating Subcommittee will present the recommended committee membership slate to the Board for approval. If the Board approves the recommended committee ~~slate~~slate, each member on the slate is appointed. The Board may also appoint members individually as needed to meet membership balance and fill vacancies.

Vacancies and Non-participation

The committee's secretary will administer the nominations process for vacancies on the committee.

Addressed on an Ongoing Basis

Vacancies on the committee can be addressed on an ongoing basis through receipt and consideration of both solicited and unsolicited nominations for the vacant positions.

Role of the Nominating Subcommittee

Nominations received for vacancies will be vetted by the Nominating Subcommittee in the same manner ~~as nominations received~~ as general nominations. The subcommittee may subsequently and individually recommend nominees they deem qualified to the NERC Board for consideration for appointment to the committee. E~~;e~~xisting committee members may also approve such individuals to serve as members on an interim basis pending full appointment by the Board.

Resignations

By the Member

In the event a member can no longer serve on the committee, that member will submit a written resignation to the committee chair or the secretary.

Requested by the Chair

The chair may request any committee member who ceases to participate in the committee, as indicated by not attending or sending a proxy for two consecutive meetings, to submit a resignation or to request continuation of membership with an explanation of extenuating circumstances. If a written response is not received within 30 days of the chair's request, the lack of response will be considered a resignation.

Referral to the Nominating Subcommittee

The committee chair will refer the vacancy resulting from a resignation to the Nominating Subcommittee of the committee. If a recent list of nominations is available to the Nominating Subcommittee that it deems to be valid, the subcommittee will recommend a replacement nominee; otherwise, the subcommittee will request NERC staff prepare a new solicitation for nominations to fill that position. The Nominating Subcommittee will follow the previously stated criteria in recommending a replacement.

By the Board

Committee members serve at the pleasure of the Board who may request resignation from, ~~remove~~remove, or replace a member from the ~~committee~~committee, as the Board deems appropriate.

Interim Approval

The committee chair may seek a vote of the committee to allow the proposed replacement member to be seated, pending appointment of the replacement~~,~~ at the Board's next scheduled meeting.

Proxies

A substitute representative, or proxy, may attend and vote during all or a portion of~~,~~ a committee meeting in lieu of a voting member~~,~~ provided the absent member notifies the committee chair, vice chair, or secretary of the proxy.

Notification

Such notification will be in writing (electronic medium is acceptable). The proxy representatives and their affiliation will be named in the correspondence.

~~May not serve as a proxy for another member~~Serving as Proxy

A voting member of a committee may not serve as a proxy for another voting member on the same committee (i.e. a member may not cast more than their own vote).

Exclusions

Regional Entity S~~s~~taff

Regional Entity staff members who administer any portion of the Compliance and Enforcement program, Registration program, or Certification program~~, or Readiness Evaluation program~~ for that Regional Entity, or for any other Regional Entity, may not serve as a member of the CCC.

Organizations

No two individuals from the same organization, or affiliated organizations, may serve concurrently on the committee. Any committee member who has a membership conflict of this nature is obligated to notify the committee secretary, who shall inform the committee chair. Members impacted by such a conflict, such as

through a merger of organizations, may confer between themselves to determine which member should resign from the committee and notify the committee secretary and chair; h. However, if both members are within the same industry sector and cannot reach an amicable solution by determining the member to remain, the Nominating Subcommittee will review the qualifications of each member and propose the member to remain to the full committee who will determine which member shall continue to serve, subject to Board approval. If the conflict is not resolved in a timely manner by the impacted members, the committee chair shall notify all members of the affected industry sectors recommending actions to resolve the conflict. If the membership conflict is still unresolved, the committee chair shall take the conflict to the NERC Board for resolution.

NERC Staff

The Director of Compliance Operations Assurance shall not be a member of the committee or vote on committee business. The Director of Compliance Operations Assurance and the Ssecretary shall be recused from participating in any committee activity that involves monitoring of NERC's compliance withadherence to Rules of ProcedureROP or activity that the Director of Compliance Operations Assurance oversees. If the NERC staff coordinator has been recused from participating in a Committee activity, the chair shall appoint another member of the committee as acting secretary for any meetings or other activities from which the NERC staff coordinator is recused.

Changes in Member Affiliation

A committee member whose affiliation has changed may retain the membership position under these circumstancesif:

1. The new organization is in the same industry sector, and
2. The member meets all other membership requirements.

Conflict of Interest

No committee member may have a conflict of interest that would impair his or her ability to fulfill obligations under this charter. Any committee member who knows of any form of membership conflict, such as working for an entity affiliated with that of another committee member, will notify the committee chair within ten 10 business days of obtaining that knowledge.

Meetings

In the absence of specific provisions in this manual, all committee meetings will follow Roberts Rules of Order, ~~Newly Revised.~~

Quorum

~~Two-thirds of the voting members~~Two-thirds Requirement

The quorum necessary for transacting business at meetings of the committee is two-thirds of the voting members currently on the committee's roster.

~~Includes members approved on interim basis~~Interim Basis

Voting members approved by the committee on an interim basis, pending appointment by the Board, will be counted in the determination of a quorum.

Lack of Q~~a q~~uorum

If a quorum is not present at the beginning of the meeting, the committee may not take any actions requiring a vote by the committee; h~~. H~~owever, the chair may, with the consent of the members present, elect to allow discussion of the agenda items.

Voting ~~— actions require two-thirds majority~~

Actions by members of the c~~C~~ommittee will be approved upon receipt of the affirmative vote of two-thirds of the votes present (including proportional votes by Regional Representatives) at any meeting at which a quorum is present~~. .~~ ~~The chairmanchair and vice chair may vote.~~

Antitrust Guidelines

All persons attending or otherwise participating in a NERC committee meeting will act in accordance with NERC's Antitrust Compliance Guidelines at all times during the meeting.

Open Meetings

NERC committee meetings will be open to the public, except as noted below under Confidential Information.

Confidential Sessions

At the discretion of the CCC c~~C~~hair, a meeting or portion of a meeting ~~of a committee~~ may have attendance limited based on confidentiality of the information to be disclosed at the meeting. Such limitations should be applied sparingly and on a non-discriminatory basis as needed to protect information that is sensitive information or confidential information to one or more parties. All hearings of compliance matters will be confidential sessions. Confidential information will only be disclosed as provided by NERC ~~Rule of Procedure~~ROP 1500. Confidentiality agreements may also be applied, as necessary, to protect sensitive information or confidential information.

Types of Meetings

Meetings may be conducted in person, by conference call, or by other means. The procedures contained in this manual will apply to all meetings regardless of how they are conducted.

Majority and M~~m~~inority V~~v~~iews

All members of a committee will be givenafforded the opportunity to provide alternative views on an issue. The results of committee actions, including recorded minutes, will reflect the majority as well as any minority views of the committee members. The chair will communicate both the majority and any minority views in presenting results to the Board.

Action W~~w~~ithout a Meeting

~~Requires~~ T~~t~~wo-thirds M~~m~~ajority

Any action required or permitted at a meeting of the committee may be taken without a meeting if two-thirds of the total votes available to the members of the CCC (including the proportional votes available to Regional Representatives) approve taking the action outside of a meeting.

Procedure

Such action without a meeting will be performed by mail or electronic ballot (e.g., telephone, fax~~csimile~~, e~~-~~mail, or Internet)~~,~~ and will be recorded in the minutes as a roll call ballot. The secretary will announce the action required at least 10 days before~~prior to~~ the date on which the action is to be voted. As time permits, members should be allowed a window of 10~~ten~~ business days to vote. The secretary will provide the results of such an action within 10~~ten~~ business days of the close of the voting period.

Officers and Staff

General

Number of Positions

The committee will have two officers and onea secretary.

Officers

The committee officers will be one chair and one vice chair.

Executive

The committee shall retain an Executive Committee consisting of the committee officers, subcommittee chairs, secretary, and the Director of Compliance Assurance.

Secretary

The NERC staff coordinator will serve as the committee's secretary.

Officers may voteVoting of Officers

The committee chair and vice chair are voting members of the committee.

Officers nominated Nominated by the Nominating Subcommittee

The CCC Nominating Subcommittee will recommend a chair and a vice chair who are then appointed by the NERC Board for a two-year term. The term of the chair and the vice chair, except for the first year, will begin on July 1 and end on June 30.

Officers remain as Ssector Rrepresentatives

The chair and vice chair are selected from the membership of the committee and, in addition to their chair or vice chair responsibilities, will continue to serve as a member for the sector for which they were appointed to the committee.

Chair

The chair will direct and provide general supervision of committee activities, including the following:

1. Coordinate the schedule of all committee meetings, including approval of meeting duration and location;
2. Develop committee agendas and rule on any deviation, addition, or deletion from a published agenda;
3. Preside at and manage committee meetings, including the nature and length of discussion, recognition of speakers and proxies, motions, and voting;
4. Will lead or direct the conduct of any hearings and the preparation of any adjudicatory documents by the committee underpursuant to Section 409 of the NERC Rules of ProcedureROP (ROP) Section 409;
5. Will iensure actions and undertakings by the committee pursuant tounder the NERC Rules of ProcedureROP (ROP) Section 409 meet all applicable legal and due process requirements;
6. Will act as spokesperson for the committee at forums insidewithin and outside of NERC; and.
7. May attend meetings of the NERC Board when necessary to report to the Board on committee activities.

Vice Cehair

The vice chair will assume the responsibilities of the chair under the following conditions:

1. At the discretion of the chair (for brief periods of time);

2. When the chair is absent or temporarily unable to perform the chair's duties; or
3. When the chair is permanently unavailable or unable to perform the chair's duties. In the case of a permanent change, the vice chair will continue to serve until a new chair is nominated and selected by the Board.

Staff Coordinator

A member of the NERC staff will be selected by NERC's Director of Compliance ~~Operations~~ Assurance to serve as the staff coordinator and secretary of the committee. The staff coordinator is not a committee member and does not have a vote. Under the direction of the committee executive and applicable NERC bylaws, guidelines, and ~~r~~Rules of p~~P~~rocedureROP, the staff coordinator will do the following:

1. Manage the day-to-day operation and business of the committee;
2. Prepare and distribute the notices of the committee meetings, prepare the meeting agenda, and prepare and distribute the minutes of the committee meetings; and~~.~~
3. Act as the committee's parliamentarian.

Nominating Subcommittee

Appointment

The ~~Compliance and Certification Committee (~~CCC~~)~~ will annually appoint a Nominating Subcommittee.

Five M~~m~~embers

The subcommittee will consist of five members nominated by the committee chair and approved by the committee. The chair of the subcommittee will be selected by the CCC chair from among the five subcommittee members.

Appointed A~~a~~nnually

The ~~chairman~~chair will appoint the subcommittee members at the first regular meeting of the committee of the calendar year.

~~Serve for 14 months~~Length of term

The subcommittee members will serve for up to 14 months or until ~~such time~~ ~~as~~ a new Nominating Subcommittee is authorized, whichever is earlier.

Duties

In addition to the duties, rights, and privileges described elsewhere in this manual, members of the Nominating Subcommittee will ~~do the following~~:

1. Prepare a slate of committee officer candidates for submission to the NERC Board for approval, and~~.~~
2. Prepare a slate of recommended individuals to fill designated committee vacancies as required.

Subordinate Groups

Committee Oorganization ~~hierarchy~~

The ~~Compliance and Certification Committee~~ CCC organizational structure will be arranged as allowed in the NERC Bylaws to support a superior-subordinate hierarchy that is ordered as follows: a

~~1.~~ cCommittee, a ~~e~~

~~2.~~ sSubcommittee, a

~~3.~~ wWorking gGroup, and a ~~p~~

~~4.~~ tTask fForce, with a committee being primary and a task force being quaternary.

Subgroups

The committee may establish subcommittees, working groups, and task forces as necessary. The committee chair may also form any of these subordinate groups on behalf of the committee. The committee will be the responsible sponsor of all subordinate subcommittees, working groups, or task forces it may create, or that its subordinate subcommittees and working groups may create. The committee will keep the Board informed of all groups subordinate to the committee.

Subcommittees

The committee may establish subcommittees to which the committee may delegate somecertain of the committee's broadly defined continuing functions. The committee will approve the scope of each subcommittee it forms. The committee chair will appoint the subcommittee officers (typically a chair and a vice chair) for a specific term (generally two years). The subcommittee officers may be reappointed for up to two additional terms. The subcommittee will work within its assigned scope and be accountable for the responsibilities assigned to it by the committee. The formation of a subcommittee, due to the permanency of the subcommittee, will be approved by the Board.

Working Groups

The committee or any of its subcommittees may delegate specific continuing functions to a working group. The sponsoring committee or subcommittee will approve the scope of each working group it forms. The chair of the sponsoring committee or subcommittee will appoint the working group officers (typically a chair and a vice chair) for a specific term (generally two years). The working group officers may be reappointed for up to two additional terms. The sponsoring committee or subcommittee will conduct a "sunset" review of each working group every two years. The working group will be accountable for the responsibilities assigned to it by the committee or subcommittee and will, at all times, work within its assigned scope.

Task Forces

The committee, subcommittee, or working group may assign specific work of a finite duration to a task force. The sponsoring committee, subcommittee, or working group will approve the scope of each task force it forms. The chair of the sponsoring committee, subcommittee, or working group will appoint the task force officers (typically a chair and a vice chair). Each task force will have a finite duration, normally less than one year. The sponsoring group will review the task force scope at the end of the expected duration and at each subsequent meeting of the sponsoring group after that until the task force is retired. Action of the task force sponsoring group is required to continue the task force past its defined duration. The sponsoring group should consider promoting to a working group any task force that is required to work longer than one year.

~~Subgroup~~ Membership and Representation

The membership of each subcommittee, working group, and task force should be established to address the need for expertise and balance of interests. Each group's membership requirements will be defined within the group's approved scope.

As a general guide, the broader the group's scope, the more emphasis there should be on balancing of interests. Therefore, subcommittees would be expected to have the broadest representation of appropriate industry sectors, while a task force may be more focused on simply having the necessary expertise, and a working group may be somewhere between.

Each member of a subordinate group, and its officers, will be appointed by the chair of the sponsoring committee or group.

To the extent subgroup membership is of a representative nature, recommendations for staffing of the group should be provided in a manner consistent with the principles outlined in the staffing of a committee, including the use of an open nominations process. Regional Entity representatives should be recommended by the Regional Entity and Canadian representatives by the Canadian Electricity Association.

Preference may also be given to representatives recommended by broadly-based industry associations.

To the extent that subgroup membership is based on providing requisite expertise, the chair of the sponsoring committee or group may appoint members based on the relevant technical qualifications.

~~Subgroup~~ Procedures

Subcommittees, working groups, and taskforces will conduct business in a manner consistent with all applicable sections of this manual and Robert's Rules of Order.

Hearings

General

The ~~Compliance and Certification Committee~~ CCC will conduct hearings, as necessary, to fulfill its function of serving as the hearing body for any contest between NERC and a Regional Entity ~~(RE)~~ regarding NERC findings, ~~of or~~ penalties, or sanctions for violation(s) of ~~r~~Reliability ~~s~~Standard(s) by the Regional Entity as described in ~~the NERC Rules of Procedure (ROP)~~ Section 409 of the NERC ~~Rules of Procedure~~ROP.

Hearing Procedure

Unless specifically identified otherwise elsewhere in this charter, the CCC's hearing procedure shall follow the hearing procedure mandated and approved by jurisdictional authorities for use by NERC and the Regional Entities in the Compliance and Enforcement program.

Hearing Panel

The committee shall not have a standing hearing panel. When a hearing is to be ~~conducted~~conducted, the CCC shall select five members to serve as the adjudicatory panel for that hearing. Members to serve on the panel shall be selected by vote of a valid quorum of the committee. Voting members of the committee ~~at arm's length from~~with little or no affiliation with ~~-~~parties to the hearing may be nominated or volunteer to stand for selection to the hearing panel. One or more alternates may also be selected ~~if/as~~, as the committee deems appropriate for the circumstances. A member may serve on more than one panel concurrently. A panel is disbanded upon conclusion of the hearing proceedings for which it was formed.

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

North American Electric Reliability	**)**	
Corporation	**)**	**Docket No. FA11-21-000**

COMPLIANCE FILING OF THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

The North American Electric Reliability Corporation ("NERC")[1] submits this compliance filing in accordance with the Commission's January 16, 2013 Order in Docket No. FA11-21-000.[2] In the January 16 Order, the Commission approved a Settlement Agreement between the Office of Enforcement ("Enforcement") and NERC related to Enforcement's findings and recommendations arising out of its 2012 performance audit of NERC. Specifically, Section II.7(b)(i) of the Settlement Agreement requires that:

> Within forty-five days of the end of each quarter, beginning with the quarter ending March 31, 2013, NERC will file with the Commission the unaudited report of the NERC budget-to-actual spending variances during the preceding quarter. This report will include information regarding sources and uses of operating and working capital reserves and will match or exceed the level of detail of the quarterly budget-to-actual variance report of NERC expenditures attached to the agenda of NERC Board of Trustees Finance and Audit Committee's October 2012 meeting.[3]

Attached hereto is the unaudited report of NERC's budget-to-actual variance information for the first quarter of 2015, in accordance with the January 16 Order. This variance information was

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

North American Electric Reliability Corporation Summary of Results as of March 31, 2015

Through March 31, 2015, NERC was $1.6M, 9.3%, under its expense and fixed asset budget, including costs related to the Cyber Risk Information Sharing Program (CRISP). As reflected in the following table, NERC is projecting to be approximately $358.0k, 0.5%, under budget at year end, due to a variety of reasons, but primarily due to lower than budgeted costs for CRISP.

YTD Actual versus YTD Budget and 2015 Projection versus 2015 Total Budget by Category

	2015 Actual	2015 Budget	2015 Variance Over(Under)	%	2015 Projection	2015 Annual Budget	2015 Projected Variance from Budget Over(Under)	%
TOTAL FUNDING	**20,395,475**	**17,700,754**	**2,694,721**	**15.2%**	**65,656,973**	**67,371,264**	**(1,714,291)**	**-2.5%**
BUDGET - EXPENSES and FIXED ASSETS								
PERSONNEL EXPENSES	9,274,547	9,316,593	(42,046)	-0.5%	35,380,411	35,803,311	(422,900)	-1.2%
MEETINGS, TRAVEL and CONFERENCE CALLS	871,033	905,559	(34,526)	-3.8%	3,758,931	3,566,146	192,785	5.4%
CONSULTANTS and CONTRACTS	2,519,192	3,995,150	(1,475,958)	-36.9%	13,509,173	14,311,466	(802,293)	-5.6%
RENT	701,577	746,939	(45,362)	-6.1%	2,987,777	2,987,777	-	0.0%
OFFICE COSTS, PROFESSIONAL SERVICES and MISCELLANEOUS	1,421,594	1,557,744	(136,150)	-8.7%	6,264,196	6,231,108	33,088	0.5%
Other Non-Operating Expenses	5,972	32,750	(26,778)	-81.8%	75,000	131,000	(56,000)	-42.7%
FIXED ASSET PURCHASES (excludes the credit for depreciation)	741,987	578,083	163,903	28.4%	4,315,807	3,618,500	697,307	19.3%
TOTAL BUDGET	**15,535,903**	**17,132,818**	**(1,596,915)**	**-9.3%**	**66,291,295**	**66,649,308**	**(358,014)**	**-0.5%**
FTEs	**188.00**	**192.35**	**(4.35)**	**-2.3%**	**190.73**	**192.30**	**(1.57)**	**-0.8%**

Excluding CRISP, NERC was $107.1k, 0.7%, under budget and is projecting to be $937.0k, 1.6%, over budget at year end due to costs associated with (1) consulting support for assessment studies regarding the Environmental Protection Agency's proposed Clean Power Plan; (2) contract costs for multiple reliability tools and costs of a secure alert system that was anticipated to be replaced by another system at lower costs[1]; and (3) the use of reserves for leasehold improvements in the Atlanta and Washington, DC offices, which were approved by the Finance and Audit Committee at their meeting in November, 2014. The following table and the summary of variances by expense category reflect year-to-date (YTD) actual results and 2015 projected results without CRISP. A summary of results for CRISP is also provided on page 4. It's important to keep in mind that this projection is preliminary and subject to change. This year end projection will be utilized in preparation of the initial draft of NERC's 2016 business plan and budget, which will be posted on May 19th. It will be further refined and updated as part of the second quarter variance report and the final draft of the 2016 business plan and budget which is scheduled to be posted on July 15th.

[1] A replacement system is currently under evaluation.

YTD Actual versus YTD Budget and 2015 Projection versus 2015 Total Budget by Category (Excluding CRISP)

RENT	701,577	746,939	(45,362)	-6.1%	2,987,777	2,987,777	-	0.0%
OFFICE COSTS, PROFESSIONAL SERVICES and MISCELLANEOUS	1,392,316	1,393,991	(1,675)	-0.1%	5,547,871	5,576,108	(28,237)	-0.5%
Other Non-Operating Expenses	5,972	32,750	(26,778)	-81.8%	75,000	131,000	(56,000)	-42.7%
FIXED ASSET PURCHASES (excludes the credit for depreciation)	736,729	553,083	183,646	33.2%	4,115,807	3,518,500	597,307	17.0%
TOTAL BUDGET	**14,788,546**	**14,895,637**	**(107,091)**	**-0.7%**	**58,656,002**	**57,719,003**	**936,999**	**1.6%**
FTEs	**186.9**	**190.5**	**(3.6)**	**-1.9%**	**188.9**	**190.4**	**(1.6)**	**-0.8%**

Following is a brief summary of variances by major categories:

- Personnel expenses were over budget $30.5k, 0.3%, due to higher than budgeted employment agency fees and payroll taxes, offset by lower than budgeted benefits and retirement costs. Personnel expenses are projected to be $188.0k, 0.5% under budget at year end. There were 4.4, 2.3%, fewer FTEs on staff than budgeted through March 31, 2015. The 2015 budget for personnel expenses and total FTEs reflects a 6% vacancy assumption to account for attrition and timing of hiring open positions.
    - Salaries expense, which consists of salaries, incentive compensation, employment agency fees and temporary office services, was $73.4k, 1.1%, over budget through March 31st due to higher than budgeted employment agency fees.
    - Payroll taxes were over budget $73.7k, 10.4%, through March 31st, and are projected to be over budget $132.8k, 7.9%, at year end due to a higher maximum salary subject to taxes in 2015 than was budgeted. Higher than budgeted expense through March 31st was also due to timing related to payroll taxes paid in February in connection with the payout of incentive compensation.
    - Employee Benefits were $61.8k, 7.0%, under budget and are projected to be under budget $167.2k, 4.7%, at year end due to lower than budgeted renewal rates for employee health benefits.
    - Retirement costs were $127.4k, 15.4%, under budget due to having fewer FTEs on staff. Retirement costs are projected to be $196.7k, 6.6%, under budget at year end due to timing of hiring open positions which delays eligibility in the savings and investment plan.

- Meeting, travel and conferencing expenses were collectively under budget $23.9k, 2.7%, through March 31st, and are projected to be $192.8k, 5.5%, over budget at year end. Travel expenses were over budget $14.7k through March, 2015, and are projected to be $145.4k over budget at year end primarily due to increased travel related to implementation of risk-based CMEP and event analysis. Management will be reviewing projected travel and meeting expenses further in an effort to identify opportunities to reduce this projected budget variance.
- Consultant and Contract expenses were $223.5k, 10.8%, under budget, primarily due to timing of the budget versus actual payments for numerous projects throughout the organization. Consultant and contract expenses are projected to be $419.2k, 6.3%, over budget at year end. The following table summarizes existing and projected over budget variances by department.
    - RAPA - Over budget $197.6k YTD and projected to be $145.3k over budget at year end due to costs for consulting support for assessment studies regarding the Environmental Protection Agency's proposed Clean Power Plan. The use of operating reserves received all necessary corporate authorization as required by NERC's Working Capital and Operating Reserve Policy.
    - Reliability Risk Management – Over budget YTD and projected to be over budget at year end due to higher than budgeted costs for multiple reliability tools and costs resulting from delays in the replacement of a secure alert system, as previously noted.
    - ES-ISAC – Under budget YTD due to timing difference between actual expenses incurred and the budget, which is allocated equally throughout the year.
    - Training, Education and Operator Certification - Under budget YTD due to timing difference between actual expenses incurred and the budget, which is allocated equally throughout the year.
    - General and Administrative – The YTD actual and projected year end over budget variance is related to the ERO effectiveness survey which began in 2014 and carried over into 2015.
    - Information Technology, Human Resources and Finance and Accounting - Under budget YTD due to timing difference between actual expenses incurred and the budget, which is allocated equally throughout the year.

SUMMARY OF CONSULTANT AND CONTRACT EXPENSES BY DEPARTMENT

CONSULTANTS and CONTRACTS	2015 Actual	2015 Budget	Over(Under)	2015 Projection	2015 Annual Budget	Variance from Budget Over(Under)

HUMAN RESOURCES	27,911	74,571	(46,660)	298,275	298,275	-
FINANCE and ACCOUNTING	27,126	84,872	(57,746)	339,500	339,500	-
CONTRACTS and CONSULTANTS (excluding CRISP)	**1,855,108**	**2,078,637**	**(223,529)**	**7,064,561**	**6,645,411**	**419,150**

- Other Non-Operating Expenses were $26.8k, 81.8%, under budget through March 31st, and are projected to be $56.0k, 42.7%, under budget at year end due to a lower than budgeted interest expense related to the capital financing loan. As a result of budget under runs in 2014, management did not draw on the loan in 2014 as was planned when the 2015 budget was developed.
- Fixed Asset Purchases, which excludes the credit for depreciation, were $183.6k, 33.2%, over budget through March 31st and are projected to be $597.3k, 17.0%, over budget at year end due to leasehold improvements in the Atlanta and Washington, DC offices, which were approved by the Finance and Audit Committee at their meeting in November, 2014.

CRISP was $1.5M, 65.1% under budget through March 31st, and is projected to be $1.2M, 13.2%, under budget at year end, primarily due to lower than budgeted contract and consulting expense. When the 2015 budget was prepared, it was assumed that all CRISP contracts would be executed and associated expenses would be incurred in 2015. However, as previously reported, a portion of CRISP expenses that were budgeted in 2015 were incurred in 2014. Based upon 2015 contract costs, which were finalized after the 2015 budget was submitted to FERC, contract and consulting expense related to CRISP is projected to be $1.2M under budget in 2015. This will also have the effect of reducing 2015 funding from CRISP participants, since CRISP contractual funding mechanisms match funding to actual costs. As reflected in the projected year-end balance in CRISP Reserves on page 6, we project the change in reserves from current year operations to be $14.5k. Any under runs in actual versus budgeted CRISP costs which are funded by CRISP participants will be credited to CRISP participants pursuant to the terms of the CRISP participant agreements.

OPERATING RESERVE ANALYSIS

As of March 31, 2015, the balance in working capital and operating reserves was $12.0M, which was $6.1M higher than budget. This higher than budgeted reserve balance was the result of two factors that were not anticipated at the time the 2015 budget was approved. First, the reserve balance reflects $4.3M in additional CRISP reserves due to timing differences between receipt of third-party funding for CRISP, which occurs at the beginning of the year, and expenses incurred throughout the year. Pursuant to the agreements with CRISP participants, any excess in funding over expenses is returned to participants per the terms of the CRISP contracts. These additional reserves are reported in the table below under the row labeled Changes in Reserves from Current Operations. Second, the beginning balance in working capital and operating reserves was $1.9M higher than budgeted due to expense and fixed asset under runs in 2014. The actual 2015 beginning balance in working capital and operating reserves was $7.46M, based upon audited 2014 year-end results. The balances in the Future Obligations Reserve, the Operating Contingency Reserve, the System Operator Reserves, and CRISP Reserves as of March 31st, were approximately $3.35M, $2.5M, $1.16M, and $4.97M respectively.

				March 31, 2015 Reserve Balances				
	2015 Actual	2015 Budget	Variance - Actual to Budget	Future Obligations Reserve	Operating Contingency Reserve	System Operator Reserves	CRISP Reserves***	Assessment Stabilization Reserve

**Represents transactions recorded only on the Statement of Financial Position (balance sheet) and do not impact the Statement of Activities (income statement), including recording of capitalized leases, amortization of future obligations and funding the 457f plan.

***Represents 2015 CRISP funding billed, net of 2014 credits issued for budget under runs.

As of March 31st, the projected use of operating reserves includes $597.3k for leasehold improvements, $140.75k to study the EPA Clean Power Plan, and $50k for higher than budgeted costs associated with GridEx III. As explained above, the use of reserves to fund leasehold improvements was approved by the Finance and Audit Committee in 2014. All necessary corporate authorizations have been obtained for reserve funding of these projects. The projected year-end reserve balances reflected in the following table do not include funding to commence implementation of a document management program in 2015. Further information regarding the document management program, including funding requirements, is set forth under agenda item 2 of the Standards Oversight and Technology Committee May 6, 2015 agenda and agenda item 5 of the Finance and Audit Committee's May 6, 2015 agenda. Primarily due to higher

than projected starting year reserve balances, we expect sufficient reserves will be available to fund the projected 2015 costs of the document management program without materially impacting overall operating reserve levels. The projected year end balances in the Future Obligations Reserve, the Operating Contingency Reserve, the System Operator Reserves, and CRISP Reserves, are approximately $3.1M, $2.65M, $826.5k, and $600.0k respectively.

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Southern California Edison Company	**)**	**Docket No. RC15-1-000**
	)	

MOTION TO INTERVENE AND COMMENTS OF THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION AND WESTERN ELECTRICITY COORDINATING COUNCIL

Pursuant to Rules 212 and 214 of the Federal Energy Regulatory Commission's (the "Commission" or "FERC") Rules of Practice and Procedure, 18 C.F.R. §§ 385.212 and 385.214, the North American Electric Reliability Corporation ("NERC") and Western Electricity Coordinating Council ("WECC") move to intervene and comment on the Application of Southern California Edison Company ("SCE") for Factual Determination That the Indicated 115 kV Facilities Are Used In Local Distribution ("Application") filed on April 16, 2015 in the above-referenced docket.[1]

In its Application, SCE seeks to establish that "certain 115 kV facilities are not part of the Bulk Electric System ("BES"),"[2] and that it is appropriately "exempt[ing] these facilities from the Bulk Electric System by filing the instant Application rather than pursuing other less durable procedural avenues."[3] SCE has requested a Commission order in response to its Application no later than December 2015.[4]

[1] *See Southern California Edison Company Application for Factual Determination That the Indicated 115 kV Facilities Are Used In Local Distribution*, Docket No. RC15-1-000 (April 16, 2015) ("SCE Application").
[2] Unless otherwise designated, all capitalized terms shall have the meaning set forth in the *Glossary of Terms Used in NERC Reliability Standards, available at* http://www.nerc.com/files/Glossary_of_Terms.pdf ("NERC Glossary").
[3] *Id.* at 1.
[4] *Id.* at 3.

NERC and WECC agree that SCE's application is an appropriate means to determine that the indicated facilities are local distribution. As the Commission noted in Order No. 743, "to the extent that any individual line would be considered to be local distribution, that line would not be considered to be part of the [BES]."[5] Therefore, NERC and WECC are not contesting the avenue in which SCE is seeking a determination of local jurisdiction (i.e., directly with FERC). Rather, NERC and WECC's comments focus specifically on reliability factors relevant to determine whether SCE's 115 kV facilities should be classified as local distribution and the need for more information regarding the Facilities in question before an accurate determination can be made regarding the material impact of the Facilities at issue on the BES.

II. BACKGROUND

The Commission certified NERC as the Electric Reliability Organization ("ERO") for the purpose of establishing and enforcing Reliability Standards for the Bulk-Power System ("BPS") in the United States.[6] On April 19, 2007, the Commission approved delegation agreements

[6] *North American Electric Reliability Council, Order Certifying North American Electric Reliability Corporation as the Electric Reliability Organization and Ordering Compliance Filing*, 116 FERC ¶ 61,062 (2006) ("ERO Certification Order").

between NERC and eight Regional Entities, including a delegation agreement between NERC and WECC.[7] Pursuant to its delegation agreement, NERC delegated to WECC the authority to enforce mandatory Reliability Standards within the WECC region.

NERC's BES Definition is an integral part of the NERC Reliability Standards and is included in the NERC Glossary of Terms. The BES Definition consists of a "core" definition and a list of configurations of facilities that would be included or excluded from the "core" definition, i.e. Inclusions and Exclusions. Additionally, a case-by-case exception process, to add elements to, and remove elements from, the BES adds transparency and uniformity to the process of determining what constitutes the BES.

Separate from the Exclusion process laid out within the NERC Rules of Procedure, an entity with Facilities falling within the "core" definition or Inclusions may file a jurisdictional application to the Commission as to whether certain Elements are local distribution. This application does not require a prior determination under the NERC Exception process. Rather, the two processes are independent paths for seeking different types of relief. The NERC Exception process grants an exception from application of the BES Definition, while an application to FERC for an individual determination excludes local distribution facilities from FERC's regulatory jurisdiction even if those facilities are BES Elements under the BES Definition.[8]

On April 16, 2015, SCE filed its Application seeking to establish the following: 1) that certain SCE 115 kV facilities are not part of the BES;[9] and 2) that SCE has appropriately sought

[7] *North American Electric Reliability Council, North American Electric Reliability Corp.*, 119 FERC ¶ 61,060, order on reh'g, 120 FERC ¶ 61,260 (2007).
[8] Order No. 773-A, 143 FERC ¶ 61,053 at PP 83-94.
[9] SCE Application at p. 1.

a determination that these facilities are not BES Elements by filing the instant Application rather than through the NERC Exception process.[10]

SCE relies on its application of the Seven Factor Test and the Mansfield test to support its assertion that "the specific design, function, and use" of the facilities supports its claim that the facilities should be designated as local distribution.[11] In addition, SCE provides the results from a technical, "TPL-like" analyses[12] it undertook to determine that the 115 kV facilities at issue have no material impact on the reliability of the BPS. According to SCE, these analyses studied the "loss of all local generation within a system…, steady-state thermal loading and voltage deviation analysis, dynamic frequency, voltage, angular stability analysis, and tests for positive reactive power margin."[13]

III. MOTION TO INTERVENE

NERC has a substantial interest in this proceeding, as it is the certified ERO under section 215 of the Federal Power Act.[14] As the ERO, NERC's mission is to improve the reliability and security of the BPS in North America.[15] No other party can adequately comment with the same level of technical expertise on the reliability of the BPS as NERC. WECC is the Regional Entity for the Western Interconnection, which includes the SCE facilities at issue in its Application. Therefore, it is in the public interest to permit this intervention.

IV. COMMENTS

Neither NERC nor WECC contest that SCE has appropriately applied to the Commission directly for a determination that the facilities at issue are local distribution, which would be

[10] *Id.*

[12] *Id. at* p. 36.
[13] *Id.* at p. 37.
[14] *Supra* n.4.
[15] *See id.*

excluded from Commission jurisdiction. The comments of NERC and WECC focus on the reliability of the BPS and the Western Interconnection and specifically on whether SCE's filing is sufficient to determine if, in fact, SCE uses the Facilities only in the local distribution of energy and whether the Facilities are important elements in support of reliability of the BPS.

The Commission has acknowledged that an analysis determining whether facilities are local distribution begins with application of the BES Definition.[16] In its Application, SCE applies the BES Definition and asserts that although the Facilities fall within the core definition, its Facilities are in fact local distribution. SCE uses the Seven-Factor Test[17] and Mansfield test[18] to analyze whether its Facilities are local distribution, which the Commission noted in Order No. 773 would be relevant to the Commission in making a determination of whether facilities are in fact local distribution.[19] However, as the Commission also recognized, "the factors identified in the Seven Factor Test are not exclusive when determining whether an element is used for local distribution . . . [and] the Seven Factor Test does not resolve all possible issues."[20] The Commission recognized that "there may be *other factors* that should be taken into account in particular situations."[21] NERC and WECC respectfully suggest that these "other factors" should consider whether Facilities purportedly only used in local distribution impact the reliability of the BPS.[22] Thus, in addition to the Seven Factor Test and Mansfield tests, the Commission may also consider whether SCE has provided adequate information to address concerns about the impact to reliability.

[20] *Id.* at P 71.
[21] *Id.* (emphasis added).
[22] *See* Order No. 743, 133 FERC ¶ 61,150 at P 37.

The studies SCE performed may not wholly encompass the entire scope of conditions the Commission might consider to determine the impact on the reliability of the BPS, especially in light of the significance placed on reliability of the BPS in recent years with the creation of the ERO. SCE argues in its Application that several of the Facilities at issue in its Application would merely be a re-affirmation of previous decisions the Commission has made regarding the same Facilities in various contexts, recognizing their unique characteristics and use as part of the local distribution system.[23] However, Order No. 888, which SCE points to as a basis to continue to exclude some of its Facilities from local distribution, was issued in 1996 and affirmed in 2002 – four years before NERC was certified as the ERO for the United States,[24] and *nine years* before the Commission approved the revised definition of the BES.[25]

Since Order No. 888, the Facilities, load, and generation in the SCE service territory at issue in its Application have grown substantially. These areas now contain approximately 4,479 MW of load, with additional load growth also forecasted.[26] Additionally, these areas now have at least 1435 MW of generation, of which at least 772 wind, and 158 is cogeneration.[27] While SCE uses "TPL-like studies" to demonstrate that these facilities have no impact on reliability,[28]

[28] As part of these studies, SCE uses the WECC BES Inclusion Guideline ("Guideline") to support its conclusion that its facilities do not impact the BPS reliability. WECC notes that the industry did not create or intend to use the Guideline for this purpose. The Guideline contains situations where Transmission Planners and Planning Coordinators should give consideration for including sub-100 kV facilities into the BES because of potential BES reliability impacts. WECC members' intent was not to provide guidance for when entities should exclude BES facilities from the BPS.

NERC and WECC assert there may be additional studies and information needed, and more factors to consider, as potentially identified below. Even assuming the technical analyses SCE performed are the appropriate initial set of tests, some important questions remain unanswered or incompletely answered at this time. The following is a general summary of some (not all-inclusive) of the information that NERC and WECC believe SCE should provide before the Commission makes a determination of the impact of the Facilities at issue on the reliability of the BPS and their status as local distribution:

1. A demonstration of the current fault contributions to the BPS from the systems for which SCE is requesting the local distribution designation.

2. A discussion of the potential reliability impact on the BPS for the failure of the local network protection systems, particularly, the protection systems associated with the 500/115 kV and 230/115 kV transformers connected to these networks.

3. An explanation of how the generation and reactive devices (shunt capacitors) are used to provide voltage support or control of the BPS. In Order No. 773, the Commission stated that, if the generator is necessary for the operation of the interconnected transmission network, it is appropriate also to include the generator interconnection facility operating at or above 100 kV that delivers the generation to the BES.

4. The study assumptions SCE uses in selecting the power flow base cases, system conditions, path transfers, as related to the associated facility ratings and nomograms, seasonal conditions, inertia requirements, and emergency ratings, etc., with an explanation of how those assumptions affect the study results and conclusions.

5. Whether SCE used the WECC composite load model in the power flow and stability analyses, and if not, why. At least one of the local areas concerned is susceptible to fault-induced delayed voltage recovery ("FIDVR"), and the composite load model is a better assumption to use in such areas.[29]

6. Whether SCE conducted post-transient studies or voltage stability studies, with an explanation of whether these local systems could become VAR deficient when generator operators do not dispatch local traditional generation resources due to economic conditions.

[29] *See Composite Load Model for Dynamic Simulations Report 1.0, Western Electricity Coordinating Council's Model and Validation Work Group,* June 12, 2012.

7. An explanation of how voltages can be controlled in these areas under light-load conditions, light transfers across the BPS lines in the area, and high renewable generation levels.

8. A discussion of the potential effect of the magnitude of the load, on end-use customers (~600,000 people) all served through one substation.[30]

Neither NERC nor WECC have sufficient information at this time to answer these questions and make an adequate recommendation to the Commission concerning SCE's request for a local distribution designation. Accordingly, NERC and WECC believe additional information is necessary to establish a full and complete record before an accurate determination is made regarding the impact of the facilities at issue on the BPS.

NERC and WECC also have additional concerns as to the potential aggregate as well as individual system-wide risks posed by a decision to designate these Facilities as local distribution. As the Commission has stated in its Risk-Based Registration Order issued on March 19, 2015 when referring to registration matters, consideration of the aggregate risk and possible cumulative effect is "fundamental" to ensuring that decisions do not lead to increased risk to BPS reliability.[31] Regardless of the method an entity may choose to be qualified as local distribution, the reliability of the BPS should remain a paramount concern.

Re: North American Electric Reliability Corporation
Docket No. RR15-_-000
Report of Comparisons of Budgeted to Actual Costs for 2014 for NERC and the Regional Entities

Dear Ms. Bose:

The North American Electric Reliability Corporation (NERC) hereby submits the "North American Electric Reliability Corporation's Report of Comparisons of Budgeted to Actual Costs for 2014 for NERC and the Regional Entities." This filing also includes a 2014 actual cost-to-budget report for Peak Reliability.

This filing consists of: (1) this transmittal letter, (2) the narrative text of the filing, which follows this transmittal letter, and (3) Attachments 1 through 11. The Table of Contents to the narrative text list the 11 attachments.

Please contact the undersigned if you have any questions concerning this filing.

Respectfully submitted,

Attachment 11: Metrics Concerning Administrative Costs in 2014 NERC and Regional Entity Budgets and Actual Costs

I. INTRODUCTION

The North American Electric Reliability Corporation ("NERC") respectfully submits this filing to provide comparisons of actual to budgeted costs for the year 2014 for NERC and the eight Regional Entities.[1] NERC is also submitting a comparison of actual to budgeted costs for 2014 for Peak Reliability, Inc. ("Peak"). The Commission originally directed NERC to file, each year, comparisons of actual to budgeted costs for the preceding year, in an order issued October 18, 2007 concerning the 2008 business plans and budgets of NERC and the Regional Entities.[2] In several subsequent orders, the Commission has clarified and expanded upon the information to be included in the annual actual-to-budget cost comparisons filings.

The following information is provided in this filing:

- A comparison of the actual funding received and costs incurred by NERC and each Regional Entity, and by Peak, for statutory and (where applicable) non-statutory activities for the year ended December 31, 2014, to the budgets of NERC and each Regional Entity for that year, with explanations of significant actual cost-to-budget variances.
- Audited financial statements of NERC, and of each Regional Entity except WECC, for the year ended December 31, 2014.[3]
- Tables showing metrics concerning NERC and Regional Entity administrative costs in their 2014 budgets and actual results.

This filing includes the following attachments:

---

[1] The eight Regional Entities are the Florida Reliability Coordinating Council, Inc. ("FRCC"), Midwest Reliability Organization ("MRO"), Northeast Power Coordinating Council, Inc. ("NPCC"), ReliabilityFirst Corporation ("ReliabilityFirst"), SERC Reliability Corporation ("SERC"), Southwest Power Pool, Inc. Regional Entity ("SPP RE"), Texas Reliability Entity, Inc. ("Texas RE"), and Western Electricity Coordinating Council ("WECC").

[3] As explained below, WECC's audited financial report was not completed as of the date of this filing; WECC's audited financial report is expected to be available in June 2015 and will be provided to the Commission in a supplemental filing.

Attachment 1: 2014 Actual Cost-to-Budget Comparison and Audited Financial Statements for NERC.

Attachment 2: 2014 Actual Cost-to-Budget Comparison and Audited Financial Statements for FRCC.

Attachment 3: 2014 Actual Cost-to-Budget Comparison and Audited Financial Statements for MRO.

Attachment 4: 2014 Actual Cost-to-Budget Comparison and Audited Financial Statements for NPCC.

Attachment 5: 2014 Actual Cost-to-Budget Comparison and Audited Financial Statements for ReliabilityFirst.

Attachment 6: 2014 Actual Cost-to-Budget Comparison and Audited Financial Statements for SERC.

Attachment 7: 2014 Actual Cost-to-Budget Comparison for SPP RE and Audited Financial Statements for Southwest Power Pool, Inc.

Attachment 8: 2014 Actual Cost-to-Budget Comparison and Audited Financial Statements for Texas RE.

Attachment 9: 2014 Actual Cost-to-Budget Comparison (based on unaudited financial statements) for WECC.

Attachment 10: 2014 Actual Cost-to-Budget Comparison and Audited Financial Statements for Peak.

Attachment 11: Metrics Concerning Administrative Costs in 2014 NERC and Regional Entity Budgets and Actual Costs

III. COMPARISONS OF ACTUAL COSTS TO BUDGETS FOR THE YEAR ENDED DECEMBER 31, 2014 – NERC AND REGIONAL ENTITIES

As noted above, in the *2008 ERO Budget Order*, the Commission directed NERC to make annual filings comparing the NERC and Regional Entity budgets to actual costs incurred in the preceding year, "in sufficient detail and with sufficient explanations for the Commission to determine, by program area, the reasons for deviations from the budget and the impacts of those deviations."[4] In its June 19, 2008 Order addressing NERC's April 1, 2008 compliance filing to the *2008 ERO Budget Order*, the Commission provided additional direction concerning the presentation of the annual filings comparing NERC's and the Regional Entities' actual to budgeted expenditures:

> 37. To promote consistency and transparency, the Commission directs the use of certain practices and formats in future true-up filings. In particular, Regional Entities must provide a cover letter discussing major areas of actual cost-to-budget variances for all of the Regional Entity's statutory programs in the aggregate. Regional Entities should also follow NERC's template for the presentation of actual costs and budgeted costs on a program-by-program and line-item basis. Significant variances must be explained on a line-item basis with enough particularized information to clearly support each such variance. Regional Entities should refrain from using generic, program area summaries to support significant variances. The cause for each such variance should therefore be clear on its face. Further, each Regional Entity must provide an explanation of the allocation methods it used to allocate indirect costs to the direct statutory program or functional areas, as well as any allocation between any statutory and non-statutory activities.
>
> 38. Cash reserves are meant to handle expenses which exceed the amount budgeted, as well as unforeseen events that could occur at any time. However, in the future, the Commission expects NERC and the Regional Entities to justify the use of cash reserves as variances in the April true-up. Cash reserves should not become a means to fund expected projects outside of the budget approval process. The Commission expects that as NERC and the Regional Entities develop experience in planning and functioning under their budgets the amounts and number of variance will decrease. In addition, the Commission expects that with

[4] *2008 ERO Budget Order* at P 23.

experience, the explanations for the variances will improve.[5]

In addition, although the following directive in the *2008 ERO Budget Order* was expressly applicable to NERC's compliance filing comparing actual expenses to budgets for the year ended December 31, 2007 for NERC and the Regional Entities, NERC has treated the directive as intended to apply to the annual filings comparing actual expenses to budgets for future years as well:

> 66. . . . [T]he Commission reminds NERC and the Regional Entities that, to the extent funding identified as statutory is used to fund non-statutory activities, those funds must be reimbursed (e.g., to load serving entities or to statutory expenditures). NERC is directed to inform the Commission in the . . . compliance filing the extent to which this has occurred and document that the funds have been or will be reimbursed.

The comparisons of 2014 actual-to-budget funding and expenditures for NERC and the Regional Entities are provided in **Attachments 1 through 9**, as follows:

- **Attachment 1:** NERC
- **Attachment 2:** FRCC
- **Attachment 3:** MRO
- **Attachment 4:** NPCC
- **Attachment 5:** ReliabilityFirst
- **Attachment 6:** SERC
- **Attachment 7:** SPP RE
- **Attachment 8:** Texas RE
- **Attachment 9:** WECC

Each Attachment also includes the respective entity's audited financial report for the year ended December 31, 2014, as prepared by its independent public accounting firm, with the exception of the Attachment for WECC. WECC's outside auditors were unable to complete their audit of

[5] *North American Electric Reliability Corporation, Order Conditionally Accepting Compliance Filing*, 123 FERC ¶61,282 (2008) ("*June 19, 2008 Budget Compliance Order*"), PP 37-38.

WECC's 2014 financial statements in time for inclusion in this filing, due to staffing shortages experienced by the auditors. WECC expects to receive its audited financial report for 2014 from its outside auditors in June 2015, and, when received, NERC will file WECC's audited 2014 financial statements with the Commission in a supplemental filing.

The comparisons provided in **Attachments 1** through **9** conform to the Commission's directives as quoted above:

- Each comparison contains a cover letter or an overview or summary section identifying overall actual-to-budget variances in Funding and total Expenses and in major Expense categories, and discussing reasons for major areas of actual cost-to-budget variances.
- Each comparison contains a summary table, prepared using a NERC-supplied template, showing the entity's 2014 budget, 2014 actual amounts, and the variance, for major line-item categories of Funding and Expenses.
- For those entities that engaged in both statutory and non-statutory activities in 2014, the comparisons include separate summary tables for statutory programs and non-statutory activities, prepared using the NERC-supplied template, showing the entity's 2014 budget, 2014 actual amounts, and the variance, for major line-item categories of Funding and Expenses.[6]
- The comparisons include individual tables, also prepared using a NERC-supplied template, showing 2014 budget, 2014 actual amounts, and the variance, for major line-item categories of Funding and Expenses, for each of the statutory programs[7] (direct costs) and the overhead functions[8] (indirect costs). Explanations for significant line-item actual-to-budget variances are provided following each table, either below the table or on the immediately following page(s).[9]

[6] FRCC, NPCC, Texas RE and WECC had non-statutory activities in 2014 and each has provided summary tables for statutory and non-statutory activities. NERC, MRO, ReliabilityFirst, SERC and SPP RE did not have non-statutory activities in 2014 (although SPP RE's parent organization, Southwest Power Pool, Inc. had non-statutory activities).

[7] Statutory programs encompass Reliability Standards, Compliance Operations and Enforcement, Reliability Assessment and Performance Analysis, Training, Education and Operator Certification, and Situation Awareness and Infrastructure Security (including Critical Infrastructure Protection).

[8] Committees and Member Forums, General and Administrative, Legal and Regulatory, Information Technology, Human Resources, and Accounting and Finance. Some of the Regional Entities report budget and actual expenditure information for some or all of the overhead functions on a combined basis, in order to protect the confidentiality of compensation information for departments that have a limited number of staff members.

[9] Generally, explanations have been provided for line-item variances that are greater than +/- 10% of the budgeted amount and greater than $10,000 over or under the budgeted amount. For ease of formatting the

The Attachments also address (generally in the cover letter or overview section) (i) where applicable, whether any statutory funds were used in 2014 for non-statutory activities (neither NERC nor any Regional Entity reports using statutory funds for non-statutory activities during 2014); (ii) the impact of the entity's 2014 results on its working cash reserve for statutory programs (*e.g.*, whether working cash reserves were used to fund expenditures during 2014)[10]; (iii) how indirect costs were allocated to the direct statutory programs or functions; and (iv) where applicable, whether, and if so how, costs were allocated between statutory programs and non-statutory activities in 2014.

NERC has provided additional information in its 2014 report in **Attachment 1** on (1) actual cost to budget variances for Consultants and Contracts expense, and (2) an analysis and comparison of the major sources of changes in its working capital and operating reserves for 2014, as budgeted and per actual results. The analysis of working capital and operating reserves includes a breakdown of the changes in working capital and operating reserves due to 2014 budgeted operations and to differences in actual funding or expenditures from amounts budgeted, including unbudgeted or above-budget expenditures funded from the Known Contingency Reserve or the Unknown Contingency Reserve. The table on page 4 of **Attachment 1** shows the actual cost to budget variances for Consultants and Contracts expense for 2014 by NERC program area, and is followed by a narrative discussion of the reasons for actual cost-to-budget variances for Consultants and Contracts expense in each program area. The analysis of changes

---

tables, the placement of these explanations in the report has been changed slightly from prior years' reports, so that the explanations are now shown beneath the applicable table or on the page(s) immediately following the table, rather than adjacent to the line items to which they relate.

[10] The summary comparison tables for total entity and (where applicable) statutory and non-statutory activities show the "Change in Working Capital" (or in "Operating Reserves") for the 2014 Actual Funding and Expenditures. A positive "Change in Working Capital" means the entity's total Actual Funding exceeded its total Actual Expenditures for the year 2014; therefore, it was not necessary for the entity to use a portion of its cash reserves balance at December 31, 2013 to fund 2014 expenditures.

in working capital and operating reserves is provided on pages 8 of **Attachment 1**, including a table which shows changes in reserves from current year (2014) operations for the Known Contingency Reserve, Unknown Contingency Reserve, and System Operator Reserve. In addition, in its 2014 report, NERC has provided an actual cost-to budget comparison of 2014 Board of Trustees expenses, detailed by Meetings and Travel Expense (Quarterly Board Meetings and Trustee Travel expense) and Professional Services (Independent Trustee Fees and Trustee Search Fees). *See* page 6 of **Attachment 1**.

Because the NERC and Regional Entity reports in each Attachment identify and discuss major areas of actual cost-to-budget variances, and the individual tables for each direct statutory program and each indirect cost function contain specific explanations of significant variances on a line-item basis, a detailed, entity-by-entity discussion of the actual-to-budget variances experienced in 2014 by NERC and individual Regional Entities is not provided here. However, the list below describes several recurring drivers of actual cost-to-budget variances experienced by NERC and the Regional Entities in 2014, as identified by NERC's review of the comparisons.

- A number of entities[11] experienced under-budget variances in Salary Expense and related Personnel Expenses (Payroll Taxes, Employee Benefits and Retirement Expense), in one or more program areas, due to being unable to fill budgeted positions, due to higher vacancy rates (*i.e.*, higher number of unfilled positions), or to filling budgeted positions later in the year, than was assumed in the budget. Additionally, having fewer personnel on staff than budgeted was a factor tending to reduce Meetings and/or Travel Expense below the budgeted amounts.[12]
- In some instances, due to the difficulty in filling budgeted positions, the entity may have found it necessary to incur costs for temporary staffing services while budgeted

[11] The term "entities" is used in this discussion to include NERC as well as Regional Entities.

[12] In the development of their annual budgets, NERC and some of the Regional Entities have begun to address this "vacant position" variance issue by including an "attrition factor" or "labor float factor" into their budget calculations. The attrition factor recognizes that, as in any organization, a portion of the budgeted positions will be vacant during a part of the year due to delays in filling new or vacant positions and unexpected/unbudgeted departures of existing employees. Nonetheless, variances between the projected and actual attrition factor or labor float factor can result in variances between budgeted and actual Personnel Expenses.

positions were vacant.

- In order to address unfilled positions or emergent needs in particular program areas, some entities transferred one or more employees from one program area to another during 2014, or had shared FTEs who spent a greater portion of their time working in one program area and a lesser portion of time in another program area than was reflected in the budget. This resulted in actual cost-to-budget variances in Personnel Expenses and related Meeting and Travel expenses for the program areas involved in such transfers, although not necessarily for the entity as a whole.
- The inability to fill budgeted positions as planned also resulted in some instances in higher-than budgeted Consultants & Contracts expense, due to either or both the need to use consultants or contractors to perform work that would have been done by employees, or the need to make greater use than budgeted of personnel recruiting services and search firms.
- On the other hand, some entities were able to spend less on Consultants and Contracts than budgeted, as a result of having work budgeted to be performed by contractors and consultants handled by internal staff of the entity. As some entities have increased their staffing over time, they have seen less need to use outside services, due to increased in-house staff capabilities.
- Generally, NERC and the Regional Entities allocate Indirect Expenses to the direct statutory programs on the basis of numbers of FTEs in each statutory program. Therefore, due to differences in actual versus budgeted FTEs during the year in individual statutory programs, some entities experienced variances from budget in the amounts of Indirect Expenses allocated to the individual direct statutory programs.
- Some entities experienced higher or lower Employee Benefits expenses than budgeted due to actual renewal rates from services providers for their health and medical benefits programs being different than projected at the time of budget preparation.
- Some entities experienced lower than budgeted Employee Benefits expenses due to decisions by employees not to participate in the entity's medical benefits program. In some cases employees elected to stay on the health and medical programs of previous employers or of their spouse's employer.
- Some entities experienced either higher or lower costs than budgeted for Retirement costs due to greater or lesser participation by employees in the entity's retirement plan than was assumed in the budget. In addition, some entities increased the employer match component of their retirement plans, resulting in higher Retirement Costs than budgeted.
- A number of entities realized lower than budgeted actual costs for Meetings and Travel due to (i) continuing efforts to make greater use of teleconferencing, Webinars and other virtual meeting capabilities rather than in-person meetings; (ii) scheduling meetings at NERC or Regional Entity facilities or the facilities of stakeholders (*e.g.* at the offices of Regional Entity members) rather than in rented, third-party meeting

spaces; or (iii) overall increased corporate attention to controlling travel and meeting costs.

- In particular with respect to Meetings and Travel expense, several entities which moved to new offices with larger meeting spaces, or expanded existing offices, in 2014 or in recent prior years have been able to reduce Meetings and Travel expense by holding more meetings in the entity's office rather than in outside facilities.
- Some entities experienced lower than budgeted Consultants and Contracts expense due to timing delays or deferrals in planned projects.
- Some entities experienced variances in Office Rent or Office Costs due to new or changed office lease terms (including as a result of moving to a new office or taking additional space in the existing office facility), or due to implementing changes in the manner in which the entity accounted for Office Rent or Office Costs, as compared to the terms or accounting reflected in the budget.
- Some entities which moved to new offices or expanded existing offices to accommodate increased staffing, incurred additional costs for capital expenditures (Furniture & Fixtures CapEx, Equipment CapEx, Computer & Software CapEx, and/or Leasehold Improvements) associated with the move to the new office or expansion of the existing office.
- Some actual cost-to-budget variances within program areas are due to the entity budgeting certain costs in one program area but then recording the actual costs in the program area responsible for incurring the cost (*e.g.*, budgeting all outside legal services in Legal and Regulatory but recording actual outside legal expenses in the program area(s) whose activities necessitate the services).
- Some entities budget Professional Services expense for one or two contested compliance hearing per year (*e.g.*, for outside counsel to handle the hearing or for hearing officer services); if no contested hearings occur during the year, an under-budget variance in Professional Services expenses results.
- For some entities, Information Technology projects or Fixed Asset purchases (*e.g.*, office furniture purchases) that were included in the 2014 budget were either (i) completed, or at least initiated, in late 2013, (ii) not carried out in 2014 (*i.e.*, delayed/deferred to 2015), or (iii) initiated later in 2014 than assumed in the budget and therefore not completed in 2014. This resulted in reduced actual IT costs, Capital Expenditures, and/or Consultants and Contracts expense (where the project was to require the use of consulting services or outside contracts compared to the budget). In other cases, projects that were planned and budgeted for execution and completion in 2013 were not fully completed in 2013 or were delayed or deferred into 2014, resulting in unbudgeted or over-budget expenditures in 2014.
- Some entities budgeted certain expenditures as expenses (*e.g.*, as Office Costs), but then determined that the expenditure(s) needed to be capitalized (*i.e.*, recorded as Fixed Asset additions, such as Computer & Software Capital Expenditures or Equipment Capital Expenditures) based on the entity's capitalization policy or capitalization requirements of Generally Accepted Accounting Principles. In other

instances, the reverse occurred. The determination to capitalize rather than expense these expenditures or (vice versa) also impacted actual versus budgeted Depreciation expense.

- Some entities experienced higher or lower Funding from Workshop attendance fees, or other programs conducted for industry participants, due to higher or lower attendance at workshops or other programs than projected in the budget, holding more or fewer Workshops than assumed in the budget, or making a determination not to charge fees (or charging lower fees) for some programs for which fees had been budgeted.

In addition to the above-described causes of actual-to-budget variances, NERC and the Regional Entities experienced other above- or below-budget variances in actual Funding, Expenses and Fixed Asset Additions in individual line items due to particular events and circumstances impacting the particular entity. These variances are identified in the individual actual cost-to-budget comparisons presented in **Attachments 1** through **9**.

NERC and the Regional Entities are taking the actual cost-to-budget comparisons for 2014, as well as year-to-date actual cost-to-budget comparisons for 2015, into account in developing their business plans and budgets for 2016, which are to be submitted to the NERC Board for approval, and then filed with the Commission for approval, in August 2015.

IV. COMPARISON OF ACTUAL COSTS TO BUDGET FOR THE YEAR ENDED DECEMBER 31, 2014 – PEAK RELIABILITY, INC.

Attachment 10 is a comparison of actual costs to budget for 2014 prepared by Peak. Because NERC included Peak's 2014 Business Plan and Budget in NERC's 2014 Business Plan and Budget Filing in Docket No. RR13-9-000, NERC and Peak concluded that an actual cost-to-budget report for Peak for 2014 should be included as part of this filing. Similar to its approach to reviewing Peak's business plans and budgets, NERC has not substantively reviewed and critiqued Peak's 2014 actual cost-to-budget report in the same manner that it reviews the Regional Entities' reports. NERC has, however, reviewed Peak's 2014 actual cost-to-budget report for consistency in presentation and level of detail of information provided with the report

format used by the Regional Entities.

V. METRICS CONCERNING ADMINISTRATIVE COSTS IN 2014 NERC AND REGIONAL ENTITY BUDGETS AND ACTUAL COSTS

In the *June 19, 2008 Budget Compliance Order*, the Commission directed NERC to develop additional metrics analyzing its administrative services expenses and those of the Regional Entities, and to present these metrics in future annual actual cost-to-budget filings and Business Plan and Budget filings. NERC has provided administrative cost metrics for NERC and the Regional Entities and accompanying discussion and analysis in its annual actual cost-to-budget reports for the subsequent years, through 2013. In accordance with the *June 19, 2008 Budget Compliance Order,* the costs incurred by NERC and the Regional Entities in the following functions are and have been considered to be the administrative services costs: Committees and Member Forums, General and Administrative, Legal and Regulatory, Information Technology, Human Resources, and Accounting and Finance.[13]

On February 18, 2015, NERC submitted a filing in Docket No. RR15-6-000 requesting approval to remove or revise certain metrics components in its annual business plan and budget filings and in its annual actual cost-to-budget comparison filings.[14] Specifically with respect to its annual actual cost-to-budget comparison filings, NERC proposed (1) to continue to provide the same metrics data on NERC and Regional Entity administrative services costs and staffing as it has been providing in the annual actual cost-to-budget comparison filings, but (2) to eliminate the narrative discussion of the administrative cost metrics that NERC has previously provided in

[13] *See June 19, 2008 Budget Compliance Order*, footnote 13.

[14] *Request of the North American Electric Reliability Corporation to Revise Certain "Metrics" Filing Components for its Annual Business Plan and Budget Filings and its Annual Actual Cost-to-Budget Trueup Filings*, filed February 18, 2015, in Docket No. RR15-6-000.

the text of the annual actual cost-to-budget comparison filings.[15]

As of the date of this filing, the Commission has not acted on NERC's February 18, 2015 filing. After consulting with Commission Staff, NERC has decided to include in this filing the NERC and Regional Entity administrative services metrics data, as in previous annual filings, but not the narrative discussion of the data, consistent with its filing in Docket No. RR15-6-000. Should the Commission subsequently deny NERC's request in Docket No. RR15-6-000 as it pertains to the annual actual cost-to-budget comparison filings, NERC will promptly submit a revised version of this filing including a narrative discussion of the administrative costs metrics data.[16]

Attachment 11 provides the following three sets of metrics comparisons for NERC and the Regional Entities for their 2014 budgets and 2014 actual costs. In addition, **Attachment 11** provides a comparison of these metrics values for 2012, 2013 and 2014 actual results.

- Statutory indirect expenditures as a percent of total statutory expenditures, and statutory direct expenditures per dollar of statutory indirect expenditures (top row of tables on **Attachment 11**).[17]
- Statutory indirect FTE as a percent of total statutory FTE, and ratio of statutory direct FTE to statutory indirect FTE (middle row of tables on **Attachment 11**).
- Total statutory expenditures per total FTE, statutory direct expenditures per direct FTE, statutory indirect expenditures per indirect FTE, and statutory indirect expenditures per total FTE (bottom row of tables on **Attachment 11**).

These are the same administrative cost metrics that NERC has provided in its previous annual filings comparing actual-to-budget costs for NERC and the Regional Entities for the years 2008 through 2013.

[15] *Id.* at 21-22.

[16] NERC notes that in Docket No. RR15-6-000, no comments were filed with the Commission concerning NERC's request.

[17] The term "expenditures" as used here means expenses plus capital expenditures (fixed asset additions net of depreciation).

VI. CONCLUSION

The North American Electric Reliability Corporation respectfully requests that the Commission accept this filing and Attachments as compliant with the Commission's requirements for annual presentation of comparisons of actual-to-budgeted funding and costs for NERC and the Regional Entities for the year ended December 31, 2014.

Respectfully submitted,

Gerry W. Cauley

2014 ACTUAL COST-TO-BUDGET COMPARISON

AND

2014 AUDITED FINANCIAL REPORT

FOR

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

North American Electric Reliability Corporation 2014 Audited Results – Actual to Budget Variance Analysis

Based upon audited results for the year ending December 31, 2014, NERC was $1.7M, 3.0%, under budget for total expenses and fixed asset (capital) purchases, inclusive of expenses associated with the Cyber Risk Information Sharing Program (CRISP) which were entirely funded by CRISP participants.

2014 ACTUAL VERSUS BUDGET BY CATEGORY, including CRISP

	2014 Actual	2014 Budget	2014 Variance Over(Under)	%
Funding, excluding CRISP	53,661,497	53,735,382	(73,885)	
CRISP Third-Party Funding	1,587,876	-	1,587,876	
TOTAL FUNDING	**55,249,373**	**53,735,382**	**1,513,991**	**2.8%**
BUDGET - EXPENSES and FIXED ASSETS				
PERSONNEL EXPENSES	32,730,904	34,059,655	(1,328,751)	-3.9%
MEETINGS, TRAVEL and CONFERENCE CALLS	3,486,929	3,789,525	(302,596)	-8.0%
CONSULTANTS and CONTRACTS	7,857,813	6,828,973	1,028,840	15.1%
RENT	2,737,780	2,617,299	120,481	4.6%
OFFICE COSTS, PROFESSIONAL SERVICES and MISCELLANEOUS	5,916,466	5,832,854	83,612	1.4%
Other Non-Operating Expenses	102,181	144,000	(41,819)	-29.0%
FIXED ASSET PURCHASES (excludes the credit for depreciation)	1,859,327	3,117,790	(1,258,463)	-40.4%
TOTAL BUDGET	**54,691,400**	**56,390,096**	**(1,698,696)**	**-3.0%**
FTEs	**177.3**	**189.5**	**(12.2)**	**-6.4%**

Excluding CRISP, NERC was $3.25M, 5.8%, under budget. The following table and summary of variances by expense category reflect 2014 results excluding funding and expenses related to CRISP. A summary of program activities and expenses related to CRISP are provided on page 6.

2014 ACTUAL VERSUS BUDGET BY CATEGORY, excluding CRISP

	2014 Actual	2014 Budget	2014 Variance Over(Under)	%
TOTAL FUNDING	**53,661,497**	**53,735,382**	**(73,885)**	**-0.1%**
BUDGET - EXPENSES and FIXED ASSETS				
PERSONNEL EXPENSES	32,697,006	34,059,655	(1,362,649)	-4.0%
MEETINGS, TRAVEL and CONFERENCE CALLS	3,479,715	3,789,525	(309,810)	-8.2%
CONSULTANTS and CONTRACTS	6,606,569	6,828,973	(222,404)	-3.3%
RENT	2,737,780	2,617,299	120,481	4.6%
OFFICE COSTS, PROFESSIONAL SERVICES and MISCELLANEOUS	5,657,358	5,832,854	(175,496)	-3.0%
Other Non-Operating Expenses	102,181	144,000	(41,819)	-29.0%
FIXED ASSET PURCHASES (excludes the credit for depreciation)	1,859,327	3,117,790	(1,258,463)	-40.4%
TOTAL BUDGET	**53,139,935**	**56,390,096**	**(3,250,161)**	**-5.8%**
FTEs	**177.2**	**189.5**	**(12.2)**	**-6.4%**

As further explained below, NERC was under budget in 2014 primarily due to: (i) lower than budgeted personnel expenses due to staff vacancies and turnover; (ii) lower than budgeted fixed asset expenditures for software application development; (iii) lower than budgeted travel expense due to having fewer FTEs on staff than budgeted; and (iv) lower than budgeted contract and consulting expenses, expenses to support the System Operator Certification and Training programs and consulting support for risk management. These lower than budgeted contract and consulting expenses were offset by higher than budgeted consulting support for the FAC 3 vegetation management project, and higher than budgeted contract expenses for NERCnet and for the secure alerts reporting system.

Following is an explanation of the major factors influencing budgetary performance for 2014, exclusive of expenses associated with CRISP.

- **Funding** - Funding was under budget $73.9k, 0.1%, due primarily to lower than budgeted workshop fees. Although the original budget included fees from attendees of the modeling workshops held by the RAPA program, NERC decided to forego those fees. Additionally, NASPI workshops received funding support from third parties, rather than NERC. Interest was under budget due to extremely low rates of return on invested funds.

- **Personnel Expenses** - $1.4M, 4.0%, under budget
  - Salaries expense, which is comprised of base salaries, incentive compensation, accrued paid time off, employment agency fees, and temporary office services, was $518.8k, 2.0%, under budget, primarily due to having fewer than budgeted FTEs on staff.
    - Base salaries, incentive compensation and accrued paid time off expenses were collectively $686.4k under budget. The company's 2014 personnel expense budget included assumptions regarding timing of new hires and attrition at the time of budget preparation. Management continues to review resource needs and

allocation, as well as assumptions on timing of new hires and attrition, in an effort to minimize significant budget under runs resulting from lower than budgeted FTEs.
        - Temporary office services and employment agency fees were collectively $196.9k over budget due to the increased use of temporary staffing to support NERC's ongoing operations during times of staff vacancies.
    - Payroll taxes were $44.4k, 2.8%, over budget due to a higher maximum taxable earnings cap than the assumption in the budget.
    - Benefits expense, which is comprised of education and training, health and life, workers compensation, and relocation was $337.8, 10.0%, under budget.
        - Health and life benefits were $343.7k, 12.5%, under budget due to having fewer FTEs on staff than budgeted and lower than budgeted renewal costs associated with NERC's health plans.
        - Education and training expenses were $84.1k, 48.1%, over budget due to an increased focus on staff training and professional development.
        - Relocation, workers' compensation and other employee benefits were collectively $78.2k, 17.0%, under budget primarily due to lower than budgeted relocation expenses.
    - Retirement expenses were $550.5k, 19.1%, under budget primarily due to having fewer FTEs on staff, later eligibility dates due to timing of hiring and due to forfeiture of unvested funds related to personnel attrition.

- **Meetings, Travel, Conferencing and Webinar** expenses were collectively under budget $309.8k, 8.2%. Meetings expenses were $59.5k under budget due to third party funding of NASPI workshops as noted above. Travel expenses were $251.1k under budget due to having fewer FTEs on staff and ongoing focus on travel expense management. Conferencing expenses were approximately equal to budget.

- **Consultants and Contracts** expenses were $222.4k, 3.3% under budget. The following table summarizes the over and under budget variances for Consultants and Contracts by Program area.

CONSULTANTS and CONTRACTS	2014 Actual	2014 Budget	Over(Under)
COMPLIANCE OPERATIONS	432,286	400,000	32,286
RELIABILITY ASSESSMENTS and PERFORMANCE ANALYSIS	800,887	638,085	162,802
SITUATION AWARENESS	1,716,750	1,289,108	427,642
CRITICAL INFRASTRUCTURE DEPARTMENT	176,955	190,000	(13,045)
ES-ISAC	516,819	786,450	(269,631)
TRAINING, EDUCATION and OPERATOR CERTIFICATION	417,509	848,830	(431,322)
GENERAL and ADMINISTRATIVE	17,955	-	17,955
POLICY and EXTERNAL AFFAIRS	13,900	75,000	(61,100)
INFORMATION TECHNOLOGY	2,017,016	1,944,000	73,016
HUMAN RESOURCES	298,365	257,500	40,865
FINANCE and ACCOUNTING	198,127	400,000	(201,873)
CONTRACTS and CONSULTANTS (excluding CRISP)	**6,606,569**	**6,828,973**	**(222,404)**

- Compliance Operations – Over budget $32.3k for outside consulting support in connection with the Reliability Assurance Initiative pilot programs and development of the associated internal control evaluation and testing processes.
- Reliability Assessments and Performance Analysis – Over budget $162.8k due to the FAC 3 vegetation management project which was anticipated to be funded from operating reserves in the 2014 Business Plan and Budget.
- Situation Awareness – $427.6k over budget due to higher than budgeted expenses for NERCnet and for the secure alerts reporting system, offset by lower than budgeted expenses for SAFNR.
- Critical Infrastructure Department – Under budget $13.0k due to lower than budgeted expenses to support the ESCC Committee.
- ES-ISAC – Under budget $269.6k due to lower than budgeted expenses related to cyber risk preparedness assessments, communications and software support services.
- Training, Education and Operator Certification –$431.3k under budget due to: (i) lower than budgeted expenses related to the system operator database improvement project and examination development project; (ii) lower than budgeted system operator testing expenses resulting from a new vendor contract signed after the 2014 budget was developed; and (iii) lower than budgeted costs for industry and staff training.
- General and Administrative - $18.0k over budget due to costs associated with the ERO effectiveness survey.
- Policy and External Affairs – Under budget $61.1k due to a reduction in the need for outside consulting to support external affairs as a result of certain duties now being performed internally.
- Information Technology – $73.0k over budget primarily due to slightly higher than budgeted total software development costs.
- Human Resources - $40.8k over budget due to vendor support for benefits enrollment process improvements.
- Finance and Accounting - $201.9k under budget due to lower than budgeted consulting support.

- **Rent** - $120.5k, 4.6%, over budget due to: (i) a reduction in sublease revenue from NERC's former Washington, DC office in connection with negotiation and execution of a sublease amendment as a result of the subtenant's bankruptcy reorganization; and (ii) an increase in property taxes in Atlanta based on an updated assessment by Fulton County. With respect to the sublease agreement, the company received an upfront payment in connection with the execution of its current lease space in Washington, D.C. to offset potential liabilities associated with the sublease. This upfront payment is included in the company's working capital reserves and is being amortized over the term of the lease and is sufficient to offset the reduction in sublease revenue resulting from the subtenant bankruptcy.

- **Office Costs, Professional Services and Miscellaneous** - $175.5k,3.0%, under budget
  - Office Costs were $237.3k, 6.8%, under budget due primarily to lower than budgeted expenses for telecommunications, equipment service agreements, and software licenses.
  - Professional Services were $78.5k, 3.4%, over budget due to: (i) slightly higher than budgeted Trustee retainer and search fees as further detailed below; (ii) higher than budgeted outside legal expenses ; and (iii) fees related to the design and implementation of an executive supplemental retirement plan.
  - Miscellaneous expenses, which includes employee rewards and recognition expenses and costs associated with community responsibility activities were $16.6k, 45.6%, under budget.

- **Depreciation Expense** was under budget due to completion of fewer ERO Enterprise software application projects than expected. The variances in depreciation are not explained in the following summaries by program because the expense has no impact on the budget or assessments.

- **Other Non-Operating Expenses** were $41.8k, 29.0%, under budget due to lower than budgeted interest expense associated with the company's capital financing program. Interest expense is lower than budget due to a lower than budgeted interest rate and a delay in closing the capital financing program loan. The loan closed in January, 2014 instead of the fourth quarter of 2013 as originally planned. Under the loan agreements, NERC pays a variable rate based on certain indices and the rate at closing was 2.9% compared to the 2014 budgeted rate of 3.5%.

- **Fixed Asset Purchases**, excluding depreciation, were $1.3M, 40.4%, under budget primarily due to a reduction in software development and associated hardware expenditures as NERC updated and refined the ERO Enterprise and internal software application development strategies.

Board of Trustees Expenses

As detailed in the following table, Board of Trustee expenses were over budget $11.0k, 0.7%, in 2014. The increase in trustee compensation was approved by the Board on August 15, 2013.

	2014 Actual	2014 Budget	2014 Variance Over(Under)	%
Board of Trustee Expenses				
Meetings and Travel Expenses				
Quarterly Board Meetings and Conference Calls	226,408	256,206	(29,798)	-11.6%
Trustee Travel	168,207	155,000	13,207	8.5%
Total Board of Trustees Meetings and Travel Expenses	**394,615**	**411,206**	**(16,591)**	**-4.0%**
Professional Services				
Independent Trustee Fees	1,010,000	1,000,000	10,000	1.0%
Trustee Search Fees	87,563	70,000	17,563	25.1%
Total Board of Trustee Professional Services Expenses	**1,097,563**	**1,070,000**	**27,563**	**2.6%**
Total Board of Trustee Expenses	**1,492,178**	**1,481,206**	**10,972**	**0.7%**

CRISP

NERC's role as program manager for CRISP was budgeted to begin in 2015, and therefore no funding or expenses for CRISP were included in NERC's 2014 budget. During the fourth quarter of 2014, contracts between NERC and Pacific Northwest National Laboratory (PNNL) and between NERC and participating utilities were finalized and the project began ahead of the planned January 1, 2015 start date. As previously noted, all expenses incurred in 2014 were fully funded by CRISP participants. Pursuant to the master agreement with CRISP utility participants funding is provided in advance. The impact of these pre-payments from an accounting perspective is that the funds are recorded in full as assets on the company's balance sheet, offset by deferred liabilities and are only recognized as revenues on the Statement of Activities as expenses are incurred. CRISP funds are segregated from other statutory funds and are utilized solely to support CRISP. After management review of the monthly variance report, CRISP funds are transferred to NERC's general operating account to offset the actual expenses incurred. With respect to 2014 CRISP expenses, 2014 funding in excess of expenses was tracked and applied as a credit against 2015 CRISP funding requirements[1]. In addition, the premiums for cyber and professional liability insurance policy which was required to be put in place pursuant to the CRISP master agreement were paid in advance but are recorded on the Statement of Activities in equal monthly amounts over the 12 month term of the policy. The prepaid portion of the insurance policy is included in CRISP operating reserves. The personnel costs for ES-ISAC personnel working on CRISP during the month are allocated based upon

[1] NERC issued credits for $1.5M in funding received in excess of 2014 expenses.

the ratio of the time recorded in the month to the time spent on the CRISP activity code by each employee to the total time recorded by such employee during the month.

CRISP expenses recorded in 2014 were approximately $1.6M. Funding for the $500k special insurance reserve fund established pursuant to the terms of the CRISP master agreement is accounted for on the Statement of Financial Position as a long-term liability, and is restricted from use. All 2014 CRISP expenses were fully funded by the participants in the program.

Allocation of Indirect Expenses and Fixed Assets by Program

Total expenses and fixed asset expenditures, net of depreciation for all administrative programs were $92.7k, 0.4% under budget. Total expenses of the administrative programs were $25.4M, which was $919.7k, 3.8% over budget. Direct expenses were over budget primarily due to higher personnel expenses as a result of having more administrative personnel than budgeted due to reallocation of resources to administrative program functions supporting all operating areas. The actual and budgeted allocations of indirect expenses by FTE were $228.5k and $188.0k, respectively, for an increase of $30.5k per FTE.

Total fixed assets, net of depreciation for the administrative programs were ($105.1k), which was $872.0k, 114.6%, under budget. Total fixed assets were under budget primarily due to lower than budgeted purchases of capitalized computers and software in the Information Technology department as explained in more detail in the variance report for Information Technology that follows beginning on page 31. The actual and budgeted allocations of fixed assets net of depreciation by FTE were ($0.9k) and $5.5k, respectively for a decrease of $6.4k per FTE.

The variances in indirect expenses and the allocation of fixed assets reflected in the variance reports by department are the result of the change in costs per FTE and the difference in actual versus budgeted FTE by department.

Use of Statutory Funds for Non-Statutory Activities

NERC does not have non-statutory activities and therefore did not use statutory funds for non-statutory activities.

Operating Reserve Analysis

As of December 31, 2014, the total balance in working capital and operating reserves was $7.46M. The balances in the Future Obligations Reserve, Known Contingency Reserve, Unknown Contingency Reserve, the System Operator Reserves, and CRISP Reserves as of December 31, 2014, were $3.6M, $850.0k, $1.2M, $1.3M, and $585.5k respectively. The balance in working capital and operating reserves as of December 31, 2014 was approximately $1.9M higher than budget, inclusive of CRISP reserves which were not budgeted and are entirely funded by CRISP participants.

A total of $711.0k of Unknown Contingency Reserves were used in 2014: (i) $50.5k for RAI contract support to develop the internal control evaluation and testing processes; (ii) $50.4k for data modeling and change orders related to generation databases; (iii) $25.1k for preliminary work on the development of a replacement for a software application used in connection with the Generator Analysis Database (GADS); (iv) $32.4k to begin preparations for GridEx III in 2015; (v) $43.6k for staff development and HR administrative support; (vi) $18.0k for an ERO effectiveness survey; and (vii) $491.1k for IT consultants, compliance database maintenance, and various IT infrastructure projects, including disaster recovery and network simplification. $150k of Known Contingency Reserves was used for the FAC3 vegetation research project. All uses of reserves received the appropriate approvals pursuant to NERC's Working Capital and Operating Reserve Policy.

OPERATING RESERVE ANALYSIS - as of December 31, 2014

				December 31, 2014 Reserve Balances				
	2014 Actual	2014 Budget*	Variance - Actual to Budget	Future Obligations Reserve	Known Contingency Reserves	Unknown Contingency Reserves	System Operator Reserves	CRISP Reserves***
Beginning Balance Operating Reserves - 1/1/14	**6,264,672**	**8,217,862**	**(1,953,190)**	**3,817,478**	**1,000,000**	**(69,672)**	**1,516,866**	**-**
Proceeds from Financing Activities (non-current portion only)	456,806		456,806			456,806		
Change in Reserves from Current Year Operations								
Generation (Use) from Budgeted Operations	1,418,982	(2,654,714)	3,996,172			1,641,335	(222,353)	-
Generation (Use) from Reserves	(861,009)	-	(783,485)		(150,000)	(711,009)		
Other adjustments to reserves**	181,456		181,456	(247,986)		(156,058)		585,500
Reserve Balance	**7,460,907**	**5,563,148**	**1,897,759**	**3,569,492**	**850,000**	**1,161,402**	**1,294,513**	**585,500**

*The 2014 budget included a $1.2M reduction in Known and Unknown reserves and a $438.3k planned reduction in the System Operator Reserves, for a total budgeted reduction in reserves of $1,660,724.

**Represents transactions recorded only on the Statement of Financial Position (balance sheet) and do not impact the Statement of Activities (income statement), including recording of capitalized leases, amortization of long-term lease obligations and establishing CRISP insurance reserve

***Actual funding received from CRISP participants in excess of year-to-date actual expenses, pre-paid insurance and the insurance reserve fund as of December 31, 2014 was $2.4M. This amount is not reflected in the CRISP Reserve balance because the funds will be used for future expenses or credited back to the participants.

FTE's	21.94	25.92	(3.98)	-15.4%

Explanation of Variances by Category – Reliability Standards

- **Personnel** – Salaries, payroll taxes, benefits and retirement costs were collectively under budget $702.5k, 16.1%, due to having 3.98, 15.4%, fewer FTEs on staff than budgeted. In addition to having fewer FTEs on staff than budgeted, personnel expenses were also impacted by the following:
    - Payroll Taxes – The under budget variance due to having fewer FTEs on staff than budgeted was partially offset by higher than budgeted FICA taxes due to a higher maximum salary subject to the tax than was assumed in the budget.
    - Benefits - The under budget variance due to having fewer FTEs on staff than budgeted was partially offset by higher than budgeted training and education expenses.
- **Meetings, Travel and Conferencing Expenses –** Collectively over budget $2.8k, 0.4%.
    - Meetings – Over budget due to CIP v5 meetings, participation in an Electric Infrastructure Security Council meeting, and a physical security technical conference which were not budgeted.
    - Travel – Under budget due to having fewer FTEs on staff than budgeted and management focus on travel expense management.
    - Conferencing Expenses - $10.0k, 8.1%, over budget due to an increase in the number of webinars related to CIP v5 and development of the physical security standard.
- **Office Costs** – Under budget $19.4k, 21.5%, due to lower than budgeted telecommunications expenses as a result of having fewer FTEs on staff than budgeted and due to lower telecommunications costs for NERC in total as explained above.

Total Budget	9,979,428	9,496,446	482,983	5.1%
FTE's on 12/31/14 - per Original Budget	21.85	23.04	(1.19)	-5.2%

Explanation of Variances by Category – Compliance Operations, Investigations and Organization Registration and Certification

- **Funding** – Under budget $43.0k, 0.5%, primarily because the auditor workshops were held in the NERC offices rather than hotels to reduce costs and as a result, workshop fees were not collected from attendees.
- **Personnel** – Salaries, payroll taxes, benefits and retirement costs were collectively under budget $93.7k, 2.2%. Actual FTEs were 1.2 under budget, 5.2%. In addition to having fewer FTEs on staff than budgeted, retirement expenses were also under budget due to timing of hiring which impacts eligibility in the retirement plan.
- **Meetings, Travel and Conferencing Expenses**
    - Meeting expenses, which are the cost of hotel, catering and audio visual expenses were $8.7k, 12.4% under budget due utilization of the NERC offices for auditors workshops instead of hotels as planned in the budget.
    - Travel was $53.5k, 17.1% over budget due to increased travel related to the Reliability Assurance Initiative (RAI) implementation.
    - Conferencing expenses were $5.7k, 34.4% over budget related to RAI implementation.
- **Operating Expenses**
    - Consultant and contract expenses were $32.3k, 8.1% over budget for outside consulting support in connection with the RAI pilot programs and development of the associated internal control evaluation and testing processes.
    - Office costs were$18.8k, 25.6% under budget due to lower than budgeted telecommunications expenses for NERC in total as explained above.

FTE's	13.52	18.24	(4.72)	-25.9%

Explanation of Variances by Category – Compliance Enforcement

- **Personnel** – Personnel expenses were $473.4k, 17.3%, under budget due to having 4.7, 25.9%, fewer FTEs on staff than budgeted. The remaining under budget variance in FTEs was due to open positions during the year. In addition to having fewer FTEs on staff than budgeted, personnel expenses were also impacted by the following:
    - Payroll Taxes – The under budget variance due to having fewer FTEs on staff than budgeted was partially offset by higher than budgeted FICA taxes due to a higher maximum salary subject to the tax than was assumed in the budget.
    - Benefits – Also under budget because no relocation expense was incurred during the year.
- **Meetings, Travel and Conferencing Expenses –** Collectively under budget $30.1k, 32.4%, due to lower than budgeted travel expenses as a result of having fewer FTEs on staff and in response to ongoing focus on travel expense management.
- **Office Costs –** Under budget $17.3k, 42.1%, due to lower telecommunications expense as a result of having fewer FTEs on staff than budgeted and due to lower than budgeted telecommunications expenses for NERC in total as explained above.

Incr(Dec) in Fixed Assets	(269,197)	(122,854)	(146,343)	119.1%
Total Budget	9,295,779	8,350,597	945,183	11.32%
FTE's	18.71	18.99	(0.28)	-1.5%

Explanation of Variances by Category – Reliability Assessments and Performance Analysis (RAPA)

- **Funding**
  - Fees collected for services and software were $27.0k, 54.0%, higher than budgeted due to increased requests from industry for historical data related to generation availability.
  - Workshop fees were not collected from attendees of the modeling workshops because the workshops were held in the NERC and Regional Entity offices, resulting in funding being $40.0k under budget.
- **Personnel –**
  - Salaries expense was over budget due to increased use of temporary office services to support ongoing initiatives during periods of staff vacancies and due to the reallocation of budgeted FTEs to support RAPA resource needs, which resulted in higher than budgeted average salary and incentive compensation per FTE.
  - Payroll taxes were over budget due to a higher maximum taxable earnings cap than the assumption in the budget.
  - Benefits were under budget due to lower than budgeted renewal costs associated with NERC's health plans.
  - Retirement costs were under budget due to timing of hiring which impacts eligibility in the retirement plan.
- **Meetings, Travel and Conferencing Expenses** were collectively $47.4k, 9.3%, under budget due primarily to lower travel in response to ongoing focus on travel expense management.
- **Operating Expenses**
  - **Contract and Consultant** expenses were over budget $162.8k due to the FAC 3 vegetation management project as explained above.
- **Fixed Assets –** The over budget variance of $47.2k for computer and software capex is related to initiation of the development of a Reliability Assessment Data System (RADS), which was budgeted in Information Technology as part of the total budget for ERO Enterprise software application development. Actual costs are charged to RAPA to match expenditures with the statutory program served.

FTE's	5.99	6.24	(0.25)	-4.0%

Explanation of Variances by Category – Situation Awareness

- **Funding -** NASPI workshops were entirely funded by third parties in 2014, in which reduced NERC funding of $75.0k. When the 2014 budget was developed, it was assumed that NERC might continue to sponsor NASPI workshops.
- **Personnel –** Collectively under budget for salaries, payroll taxes, employee benefits and retirement expenses $152.2k, 12.8%. FTEs were 0.25, 4.0%, under budget.
    - Salaries expense was under budget due to lower average salary per employee than budgeted.
    - Payroll taxes were lower than budgeted due to lower average salaries, offset by the higher maximum taxable earnings cap than the assumption in the budget.
    - Benefits were over budget due to higher than budgeted education and benefit expenses.
    - Retirement costs were under budget due to timing of hiring which impacts eligibility in the retirement plan.
- **Meetings, Travel and Conferencing Expenses –** Collectively $158.9k, 78.3%, under budget primarily due to lower than budgeted meeting expense. In addition, a portion of the quarterly meetings of the Operating Committee, Planning Committee, and Critical Infrastructure Protection Committee, were budgeted in Situation Awareness but actual costs were charged to the departments with the personnel and activities supporting these committees.
- **Operating Expenses**
    - Consultant and Contract expenses were $427.6k, 33.2%, over budget due to: (i) higher than budgeted expenses for NERCnet; and (ii) higher than budget expenses for the secure alerts reporting system due to delays in a previously scheduled replacement system, as noted below. These higher than budgeted expenses were offset by lower than budgeted expenses for SAFNR.
- **Fixed Assets**
    - The planned development of a new secure alerts system was deferred pending further review of alternative systems and as a result, there were no expenditures for computer and software fixed assets.

FTE's	8.59	9.60	(1.01)	-10.5%

Explanation of Variances by Category – Event Analysis

- **Personnel -** Collectively under budget for salaries, payroll taxes, employee benefits and retirement expenses $173.1k, 9.1%, primarily due to having 1.0, 10.5%, fewer FTEs on staff than budgeted. In addition to having fewer FTEs on staff than budgeted, personnel expenses were also impacted by the following:
    - Payroll Taxes – The under budget variance due to having fewer FTEs on staff than budgeted was partially offset by higher than budgeted FICA taxes due to a higher maximum salary subject to the tax than was assumed in the budget.
    - Benefits – There were no relocation expenses in this program in 2014 and due to lower than budgeted renewal costs associated with NERC's health plans.
- **Meetings, Travel and Conferencing Expenses**
    - Meeting expenses were $17.7, 26.5%, over budget due to partial allocation of costs associated with the quarterly OC-PC-CIPC meetings that were budgeted in Situation Awareness, as previously noted.
    - Travel expense was $30.8k, 19.9%, under budget due to having fewer FTEs on staff and management focus on travel expense management.
    - Conferencing expenses were $17.7k, 55.4%, under budget due to no major events that required use of the service.
- **Operating Expenses**
    - Office costs were $10.3k, 26.6%, under budget due to lower telecommunications expense as a result of having fewer FTEs on staff and lower than budgeted telecommunications expenses for NERC in total as explained above.
- **Fixed Assets –** The $8.8k in computer and software is related to beginning development of an event analysis software application that was budgeted in IT.

Total Budget	7,393,087	9,611,484	(2,218,398)	-23.1%
FTE's	13.91	20.20	(6.29)	-31.1%

Explanation of Variances by Category – Critical Infrastructure Department (CID) and ES-ISAC

- **Funding –** Workshop fees were $40.6k. 90.1%, over budget due to higher attendance at the Grid Security Conference than budgeted.
- **Personnel** expenses were collectively $1.2M, 28.2%, under budget due to having 6.29, 31.1%, fewer FTEs on staff than budgeted as a result of staff vacancies. The under budget variances in salaries, benefits and retirement expenses are generally consistent with the under budget variance for actual FTEs compared to budget. The under budget variance in payroll taxes is less than the other personnel expense categories due to the higher maximum salary subject to the tax than was assumed in the budget.
- **Meetings, Travel and Conferencing Expenses**
  - Meeting expenses were $32.9k, 22.7%, higher than budget due to higher costs of the Grid Security Conference. This higher than budgeted expense was offset by higher workshop fees collected from attendees as described above.
  - Travel expenses were $71.7k, 21.8%, under budget due to having fewer FTEs on staff than budgeted.
  - Conferencing expenses were $10.5k, 32.2%, under budget for no specific reason other than having fewer FTEs on staff.
- **Operating Expenses**
  - Consultant and contract expenses were $282.7k, 28.9%, under budget due to lower than budgeted expenses to support the ESCC Committee and due to lower than budgeted expenses related to cyber risk preparedness assessments, communications and software support services.
  - Office costs were $11.6k, 13.4%, over budget due to higher than budgeted software maintenance costs partially offset lower than budgeted telecommunications expense as a result of having fewer FTEs on staff than budgeted and lower overall telecommunications expense for NERC as described above.
- **Fixed Assets** – Over budget $12.2k for equipment purchased for the ES-ISAC portal that was not budgeted.

FTE's	6.63	8.16	(1.53)	-18.8%

Explanation of Variances by Category – Training, Education and Operator Certification

- **Personnel –** Salaries, payroll taxes, benefits and retirement costs were collectively under budget $170.6k, 15.5%, due to having 1.53, 18.8%, fewer FTEs on staff than budgeted as a result of staff vacancies. In addition to having fewer FTEs on staff than budgeted, personnel expenses were also impacted by the following:
    - Payroll Taxes – The under budget variance due to having fewer FTEs on staff than budgeted was partially offset by higher than budgeted FICA taxes due to a higher maximum salary subject to the tax than was assumed in the budget.
    - Savings and Retirement – Also under budget due to timing of hiring which impacts eligibility in the retirement plan.
- **Meetings, Travel and Conferencing** expenses were collectively $14.2k, 12.6% over budget.
    - Meetings expense was $34.4k, 95.5%, over budget as a result of having quarterly meetings of the Personnel Certification Governance Committee, which oversees the system operator certification program, in hotels instead of stakeholder facilities. All expenses of the system operator certification program are funded by fees collected for testing and certification.
    - Travel expenses were $31.2k, 61.3%, under budget due to having fewer FTEs on staff and in response to ongoing focus on travel expense management.
    - Conferencing expenses were $11.1k, 43.4%, over budget due to an increase in webinars to support NERC staff training and education activities.
- **Operating Expenses**
    - Consultant and contract expenses were under budget $431.3k, 50.8%, due to: (i) lower than budgeted expenses related to the system operator database improvement project and examination development project; (ii) lower than budgeted system operator testing expenses resulting from a new vendor contract signed after the 2014 budget was developed; and (iii) lower than budgeted costs for industry and staff training.
    - Office costs were under budget due to: (i) lower telecommunications expense as a result of having fewer FTEs on staff than budgeted and due to lower than budgeted telecommunications expenses for NERC in total; (ii) lower than budgeted dues; and (iii) lower than budgeted copying costs due to use of in-house equipment.

Total Budget	-	-	-	-
FTE's	14.48	10.56	3.92	37.1%

Explanation of Variances by Category – General and Administrative, Executive, and Policy and External Affairs

- **Personnel –** Salaries, payroll taxes, benefits and retirement were collectively $894.8k, 35.4%, over budget due to having 3.92, 37.1%, higher FTEs allocated to general and administrative support than budgeted for this department. During 2014, budgeted FTE positions were transferred from other programs to provided added support for NERC and Regional Entity operations coordination and NERC external affairs department.
    - Salaries were $907.3k, 44.7% over budget due to: (i) having more FTEs on staff than budgeted; (ii) higher temporary office services utilized to support the administrative staff in all departments; and (iii) an increase in accrued but unused paid time off applicable to all departments.
    - Payroll taxes were $57.4k, 64.3%, over budget due to having more FTEs on staff than budgeted and due to a higher maximum salary subject to the tax than was assumed in the budget.
    - Benefits were $37.8k, 15.4%, over budget due to having more FTEs on staff than budgeted, partially offset by lower than budgeted renewal costs associated with NERC's health plans.
    - Retirement expenses were $107.6k, 67.9%, under budget due to forfeiture of unvested funds related to personnel attrition across the entire organization.
- **Meeting, Travel and Conferencing Expenses** were collectively $40.8k, 5.7%, under budget.
    - Meeting expenses were $19.6k, 7.3%, under budget due to lower than budgeted costs associated with the quarterly Board of Trustee meetings as noted above.
    - Travel expenses were under budget due to focus on travel expense management.
- **Operating Expenses**
    - Consultant and contract expenses were under budget $43.1k, 57.5%, due to a reduction in the need for outside consulting to support external affairs as a result of certain duties now being performed internally, partially offset by costs associated with an ERO effectiveness survey that was not budgeted.
    - Rent was $120.5k, 4.6%, over budget due to: (i) a reduction in sublease revenue from NERC's former Washington, DC office in connection with negotiation and execution of a sublease amendment as a result of the subtenant's bankruptcy reorganization; and (ii) due to an increase in property taxes in Atlanta based on an updated assessment by Fulton County. With respect to the sublease agreement, the company received an upfront payment in connection with the execution of its current lease space in Washington, D.C. to offset potential liabilities associated with the sublease. This upfront payment is included in the company's working capital reserves and is being amortized over the term of the lease and is sufficient to offset the reduction in sublease revenue resulting from the subtenant bankruptcy.
    - Office costs were $61.7k, 12.3%, under budget due to lower than budgeted telecommunications costs, office supply costs, copying costs and sales and use taxes.

These lower than budgeted costs were partially offset by higher than budgeted bank fees associated with closing of the capital financing loan in January, 2014.

  - Professional services were $53.0k, 4.5% over budget due to slightly higher than budgeted trustee fees and trustee search fees as previously described and higher than budgeted outside legal fees associated with closing of the capital financing loan in January, 2014.

- **Fixed Assets** were over budget due to $36.4k in leasehold improvements associated with the DC office expansion that were budgeted to occur in 2015.

Explanation of Variances by Category – Legal and Regulatory

- **Personnel** expenses were collectively $262.8k, 7.9%, under budget primarily due to having 1.0, 6.8%, fewer FTEs on staff than budgeted. In addition to having fewer FTEs on staff than budgeted, personnel expenses were also impacted by the following:
    - Payroll Taxes – Higher than budgeted FICA taxes due to a higher maximum salary subject to the tax than was assumed in the budget.
    - Benefits - The under budget variance due to having fewer FTEs on staff than and a lower average cost of NERC's health plan per FTE in this program than the average cost per FTE in the budget.
    - Retirement expenses were also under budget due to timing of hiring which impacts eligibility in the retirement plan.
- **Meeting, travel and conferencing** expenses were collectively $25.1k, 18.2%, under budget primarily due to lower than budgeted travel expenses related to focus on travel expense management.
- **Office costs** were $9.0k, 14.2%, under budget due to lower telecommunications expense as a result of having fewer FTEs on staff than budgeted and lower overall telecommunications expenses for NERC as described above.
- **Professional services** were $59.7k, 7.8%, due to lower than budgeted outside legal fees associated with lobbying and other support services.

Incr(Dec) in Fixed Assets	-	-	-	-
Total Budget	-	-	-	-
FTE's	18.91	18.07	0.84	4.6%

Explanation of Variances by Category – Information Technology

- **Personnel**
  - Salaries expenses were $442.8k, 22.0%, over budget due to the reallocation of additional FTEs to strengthen IT program and software application development, oversight and execution. This resulted in the IT department having 4.6% more FTEs on staff than budgeted, higher average salaries per FTE due to the addition of senior personnel, and higher than budgeted temporary office services to support ongoing operations during periods of staff vacancies.
  - Payroll taxes were over budget due to higher FTEs than budget and due to the higher maximum salary subject to the tax than was assumed in the budget.
  - Retirement costs were under budget due to timing of hiring which impacts eligibility in the retirement plan.
- **Meeting, travel and conferencing** expenses were collectively $21.6k, 31.4%, over budget primarily due to higher conferencing expenses. The monthly fee charged for webinar services was budgeted in general and administrative but was charged to IT during the year.
- **Professional services** was $10.8k over budget due to outside services support of audio visual equipment during staff meetings that was not budgeted.
- **Fixed Assets**
  - Computer and software $1.2M, 54.2%, under budget due to a reduction in software development and associated hardware expenditures as NERC updated and refined the ERO Enterprise and internal software application development strategies.
  - Equipment purchases $127.2k, 59.7%, over budget related to installation of various IT infrastructure projects, including disaster recovery and network simplification which were not specifically budgeted but were approved as a use of operating reserves in accordance with NERC's working capital and operating reserve policy.

Explanation of Variances by Category – Human Resources (HR)

- **Personnel** expenses were collectively $37.2k, 5.2%, under budget.
  - Salaries expense was $56.7k, 9.5%, under budget due to lower than budgeted temporary office services, which were budgeted in HR but charged to the department where services were utilized.
  - Benefits were $16.8k, 33.3%, over budget due to a higher average cost of NERC's health plan per FTE in this program than the average cost per FTE in the budget.
- **Operating Expenses**
  - Consultant and contract expenses were $40.9k, 15.9%, over budget due to vendor support for benefits enrollment process improvements.
  - Professional services were $18.4k, 22.9%, lower than budget due to lower than budgeted costs of the HR information system and various third-party benefit providers.
  - Miscellaneous expenses consisting of employee rewards and recognition expenses and costs associated with community responsibility activities were under budget $13.7k, 53.8%. All costs of participation in 2014 community responsibility activities were funded by NERC employees. A portion of the cost of the year-end employee appreciation events was not invoiced or paid until 2015.

Incr(Dec) in Fixed Assets	-	-	-	-
Total Budget	-	-	-	-
FTE's	15.50	12.48	3.02	24.2%

Explanation of Variances by Category – Finance and Accounting

- **Personnel**
  - Salaries expense was $229.4k, 21.7%, over budget due the addition of personnel to strengthen operating and internal controls, including staff additions budgeted for 2015 which were added during the latter part of 2014.This resulted in 3.0, 24.2%, more FTEs on staff than budgeted.
  - Payroll taxes were $19.4k, 23.9%, over budget due to having more FTEs on staff than budgeted.
  - Retirement expenses were $18.6k, 12.0%, over budget due to having more FTEs on staff than budgeted but the over budget variance was less than the increase in FTEs due to timing of hiring which impacts eligibility in the retirement plan.
- **Meeting, travel and conferencing** expenses were collectively $15.0k, 20.8%, under budget primarily due to lower than budgeted travel expenses related to focus on travel expense management.
- **Operating Expenses**
  - Consultant and contract expenses were $201.9k, 50.5%, under budget due to lower than budgeted consulting support.
  - Professional services were $92.8k, 33.1%, over budget due to higher than budgeted outside legal fees associated with regulatory filing requirements associated with Peak Reliability, and higher than budgeted fees associated with design and implementation of an executive supplemental retirement plan.

REPORT OF INDEPENDENT CERTIFIED PUBLIC ACCOUNTANTS

To the Board of Trustees of
North American Electric Reliability Corporation

We have audited the accompanying financial statements of North American Electric Reliability Corporation (a New Jersey non-profit corporation), which comprise the statements of financial position as of December 31, 2014 and 2013, and the related statements of activities, and cash flows for the years then ended, and the related notes to the financial statements.

Management's responsibility for the financial statements

Management is responsible for the preparation and fair presentation of these financial statements in accordance with accounting principles generally accepted in the United States of America; this includes the design, implementation, and maintenance of internal control relevant to the preparation and fair presentation of financial statements that are free from material misstatement, whether due to fraud or error.

Auditor's responsibility

Our responsibility is to express an opinion on these financial statements based on our audits. We conducted our audits in accordance with auditing standards generally accepted in the United States of America. Those standards require that we plan and perform the audit to obtain reasonable assurance about whether the financial statements are free from material misstatement.

An audit involves performing procedures to obtain audit evidence about the amounts and disclosures in the financial statements. The procedures selected depend on the auditor's judgment, including the assessment of the risks of material misstatement of the financial statements, whether due to fraud or error. In making those risk assessments, the auditor considers internal control relevant to the entity's preparation and fair presentation of the financial statements in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the entity's internal control. Accordingly, we express no such opinion. An audit also includes evaluating the appropriateness of accounting policies used and the reasonableness of significant accounting estimates made by management, as well as evaluating the overall presentation of the financial statements.

We believe that the audit evidence we have obtained is sufficient and appropriate to provide a basis for our audit opinion.

Opinion

In our opinion, the financial statements referred to above present fairly, in all material respects, the financial position of North American Electric Reliability Corporation as of December 31, 2014 and 2013, and the change in its net assets and its cash flows for the years then ended in accordance with accounting principles generally accepted in the United States of America.

Supplementary information

Our audits were conducted for the purpose of forming an opinion on the financial statements as a whole. The supplemental schedule of selected expenses shown on page 15 is presented for purposes of additional analysis and is not a required part of the financial statements. Such supplementary information is the responsibility of management and was derived from and relates directly to the underlying accounting and other records used to prepare the financial statements. The information has been subjected to the auditing procedures applied in the audit of the financial statements and certain additional procedures. These additional procedures included comparing and reconciling the information directly to the underlying accounting and other records used to prepare the financial statements or to the financial statements themselves, and other additional procedures in accordance with auditing standards generally accepted in the United States of America. In our opinion, the supplementary information is fairly stated, in all material respects, in relation to the financial statements as whole.

Cash and cash equivalents, end of year	**$ 38,810,796**	$ 26,182,060

The accompanying notes are an integral part of these financial statements.

Notes to the Financial Statements

1 Organization and Nature of Business

North American Electric Reliability Corporation (the "Corporation" or "NERC") is an international, independent, not-for-profit organization, whose mission is to ensure the reliability of the bulk power system in North America. NERC relies on the diverse and collective expertise of electricity industry participants, subject to government oversight and audit. The Corporation is certified by the United States Federal Energy Regulatory Commission ("FERC") as the Electric Reliability Organization ("ERO") within the United States. In the United States, the Corporation has the authority to levy fines and penalties against any of the individual users, owners and operators of the bulk power system for non-compliance with the reliability standards that govern the bulk power system. The Corporation has also been recognized as the ERO by governmental authorities in Canada.

To achieve the Corporation's mission, it develops and enforces reliability standards; monitors the bulk power system; assesses future adequacy; and educates, trains and certifies industry personnel. Entities subject to the Corporation's reliability standards account for virtually all the electricity supplied in the United States, Canada and a portion of Baja California, Norte, Mexico.

The Corporation is the successor to the North American Electric Reliability Council (the "Council") which was formed in 1968 in the aftermath of the November 1965 blackout that affected the northeastern United States and Ontario, Canada. On October 31, 2006, the Council entered into an agreement and plan of merger with the Corporation, a New Jersey non-profit corporation. At the effective date of the merger, January 1, 2007, the separate corporate existence of the Council ceased, and the Corporation became the surviving entity. All of the property, assets, rights, privileges, powers, franchises and immunities of the Council became the property of the Corporation. All debts, liabilities and obligations of the Council were also assumed by the Corporation. The Corporation is organized and operates as a business league under Internal Revenue Code Section 501(c)(6). The activities of the Corporation are directed by an independent Board of Trustees.

The membership of the Corporation is unique. It is a not-for-profit corporation whose members include users, owners and operators of the bulk power system, eight regional entities, large and small end-use customers, state and provincial governmental authorities and other interested parties.

Annually, the Board of Trustees approves an operating budget for the Corporation that includes a provision for working capital and operating reserves, which are recovered through assessments to Load-Serving Entities ("LSE"). The determination of the annual working capital and operating reserve requirements and the authorization of management to access these funds is governed by the Corporation's "Working Capital and Operating Reserve Policy." The Corporation assesses each LSE a proportional share of its annual operating budget based on "net energy for load." During 2014, the assessments to LSEs made up approximately 87.1% of the total funding for the Corporation. Assessments to U.S. entities in 2014 were offset by $290,000 in penalties received in prior years, but restricted from use until 2014 per the Corporation's policy on the "Accounting, Financial Statement and Budgetary Treatment of Penalties Imposed and Received for Violations of Reliability Standards." The Corporation also generates funding from the collection of fees charged for various services. These services include management of some contracts associated with the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), the maintenance of a certification program for system operators, the development of reports and software programs, and the hosting of workshops to educate the industry on various reliability matters.

The Corporation has entered into separate delegation agreements, which have been approved by FERC, with eight regional entities: Florida Reliability Coordinating Council ("FRCC"), Midwest Reliability Organization ("MRO"), Northeast Power Coordinating Council ("NPCC"), Reliability First Corporation ("RFC"), SERC Reliability Corporation ("SERC"), Southwest Power Pool Regional Entity ("SPP"), Texas Reliability Entity ("TRE") and Western Electricity Coordinating Council ("WECC") (collectively the "Regional Entities"). Through these agreements, the Corporation has delegated certain ERO responsibilities and functions to the Regional Entities.

The Corporation must annually approve the eight Regional Entities' budgets and submit them, along with its budget and schedule of LSE assessments, to FERC for final approval of the budgets and the U.S. portion of the assessments. The Corporation has the sole responsibility to invoice, collect and disburse the monies approved in the Regional Entities' budgets. These pass-through amounts are not included as revenue and expense in the statement of activities (see Note 6).

2 Summary of Significant Accounting Policies

Basis of Accounting and Presentation

The financial statements of the Corporation have been prepared on the accrual basis of accounting in conformity with accounting principles generally accepted in the United States of America. Net assets, revenues, expenses, gains and losses are classified based on the existence or absence of restrictions. The Corporation reports information regarding its financial position and activities according to three classes of net assets: unrestricted net assets, temporarily restricted net assets and permanently restricted net assets. There were no permanently restricted net assets as of December 31, 2014 or 2013. Net assets totaling $3,965,000 and $445,000 were temporarily restricted as of December 31, 2014 and 2013, respectively, to offset future assessments.

Cash and Cash Equivalents

The Corporation considers all highly liquid investments purchased with original maturities of three months or less to be cash and cash equivalents. The Corporation maintains its cash balances with one bank. The accounts at the bank are insured up to certain limits by the Federal Deposit Insurance Corporation. Balances in these accounts may exceed Federally-insured limits from time to time. A total of $500,000 has been set aside for the insurance reserve in current assets and non-current liabilities and is restricted from use for any other purpose.

Use of Estimates

The preparation of financial statements in conformity with accounting principles generally accepted in the United States requires management to make estimates and assumptions that affect the amounts of assets and liabilities and disclosure of contingent assets and liabilities at the date of the financial statements and the reported amounts of revenues and expenses during the reporting period. Actual results could differ from those estimates.

Revenue Recognition

The Corporation recognizes assessment revenue billed to the LSEs on a pro-rata basis over the calendar year. Fees generated for contract management, testing, certifications, services and software, workshops and other services are recognized when the test is taken, service rendered and/or workshops are completed.

Penalty income is derived from FERC's approval of assessment of penalties to registered entities regarding enforcement of NERC's Reliability Standards. The penalty income from a registered entity is recorded following closure of the enforcement matter including exhaustion of appeals. The funds are temporarily restricted due to FERC's requirement that the funds be used to reduce future NERC assessments.

Deferred Revenue

Deferred revenue represents assessments and fees billed and received in advance of the period in which it is earned. Deferred revenue is recognized as revenue in the period in which it is earned.

Accounts Receivable

Accounts receivable are recorded at the original invoice amount, less an estimated allowance for uncollectible accounts. Credit is generally extended on a short-term basis; thus accounts receivable do not bear interest. Accounts receivable are periodically evaluated for collectability based on past experience and an analysis of current accounts receivable collectability. Changes in the estimated collectability of accounts receivable are recorded in the results of operations for the period in which the estimate is revised. Accounts deemed uncollectible are charged to the allowance in the years they are deemed uncollectible.

Property and Equipment

Purchased property and equipment are capitalized at cost. Donated assets are capitalized at the fair market value of the assets on the date of contribution. The Corporation's minimum capitalization policy is for additions greater than $2,000.

Depreciation and amortization is provided by the straight-line method over the estimated useful lives of the related assets as follows:

	Years
Software development	3 years
Furniture and equipment	3-7 years
Leasehold improvements	Term of lease or estimated useful life of the asset, whichever is shorter

Expenditures for maintenance and repairs are charged to operations as incurred while renewals and betterments are capitalized.

Compensated Absences

Employees of the Corporation are entitled to paid time off depending on length of service. At December 31, 2014 and 2013, the Corporation has recorded accrued compensated absences of $565,999 and $543,126 related to days earned, which is included with accounts payable and accrued expenses on the statements of financial position.

Income Taxes

The Corporation has received a determination letter from the Internal Revenue Service concluding that it is exempt from Federal income taxes under Section 501(c)(6) of the Internal Revenue Code. The Corporation is subject to income taxes on revenues from unrelated business activities. The Corporation is subject to a proxy tax related to nondeductible lobbying and political expenses incurred. There was no proxy tax incurred in 2014 or 2013.

The Corporation recognizes the tax benefit from an uncertain tax position only if it is more likely than not that the tax position will be sustained on examination by the taxing authority, based on the technical merits of the position. The Corporation is no longer subject to federal and state tax examinations by the respective taxing authorities for the years prior to 2011. Tax years 2011 through 2014 remain subject to examination by major tax jurisdictions.

Reclassifications

Certain reclassifications have been made to prior years' functional classification of operational program expenses to conform to current year presentation. These classifications had no effect on previously reported changes in net assets.

Subsequent Events

The Corporation discloses material events that occur after the statement of financial position date but before financial statements are issued. In general, these events are recognized in the financial statements if the condition existed at the date of the statement of financial position, but are not recognized if the condition did not exist at the statement of financial position date. The Corporation discloses non-recognized events if required to keep the financial statements from being misleading. Management evaluated events occurring subsequent to December 31, 2014 through May 7, 2015, the date the financial statements were available for issuance.

On January 29, 2015, the Corporation entered into an agreement to expand the amount of leased space in Atlanta, Georgia with an expiration date in 2022, which is coterminous with the term of the original lease. On March 2, 2015, the Corporation entered into an agreement to expand the amount of leased space in Washington, DC with an expiration date in 2022, which is coterminous with the term of the original lease (see Note 8).

3 Property and Equipment

Property and equipment consist of the following at December 31:

December 31,	2014	2013
Software development	$ 4,392,007	$ 2,986,517
Furniture and equipment	6,805,180	6,860,119
Leasehold improvements	1,100,816	1,100,281
	12,298,003	10,946,917
Accumulated depreciation and amortization	(6,368,637)	(5,301,801)
	$ 5,929,366	$ 5,645,116

Depreciation and amortization expense for the years ended December 31, 2014 and 2013 was $1,845,951 and $1,945,946, respectively.

4 Non-Revolving Credit Facility and Line of Credit

On January 13, 2014, the company secured a non-revolving credit facility under the Capital Financing Program that was approved by the Board of Trustees and the FERC as part of the Corporation's 2014 Business Plan and Budget. The interest rate is floating and equal to LIBOR plus 275 basis points, which yielded a rate of 2.91% at closing. The total size of this facility is $7,500,000, with the total authorized borrowings each year limited to the amount approved by the Board of Trustees and FERC in that year's business plan and budget. This facility is collateralized by all existing and future assets and subject to a filing under the Uniform Commercial Code. Borrowings outstanding as of December 31, 2014 were $878,473.

The Corporation has a line of credit with a bank that expires in June 2015. The line of credit provides for up to $4,000,000 of availability to be used for working capital needs. In connection with the non-revolving credit facility secured on January 13, 2014, the line of credit was amended and restated. The line of credit accrues interest at a rate per annum equal to LIBOR plus 275 basis points, which yielded a rate of 2.91% at closing. The line of credit is collateralized by all existing and future assets and subject to a filing under the Uniform Commercial Code. As part of the amended and restated line of credit note, the Corporation is no longer required to maintain the $400,000 non-interest bearing account with the lender. In 2013, the $400,000 was classified within cash and cash equivalents on the statement of financial position as of December 31, 2013. There were no borrowings outstanding at December 31, 2014 or 2013. At December 31, 2014 and 2013, the available amount under the line of credit was reduced by open letters of credit totaling $140,772 which represent security deposits for the Corporation's office lease agreements.

Both loan agreements contain various positive and negative covenants, and the Corporation was in compliance with these covenants as of December 31, 2014.

5 Penalty Income

The Corporation received $3,810,000 and $445,000 of penalty income in 2014 and 2013, respectively, which is temporarily restricted. The penalty income will be utilized in accordance with the timing of the receipt of the income and FERC's requirement for the use of penalty income to reduce assessments. NERC transferred $290,000 of penalty income from temporarily restricted net assets to unrestricted net assets during 2014. During 2013, NERC transferred $2,512,500 of penalty income from temporarily restricted net assets to unrestricted net assets.

6 Regional Assessments Collected in Advance

In addition to the Corporation assessments billed to LSEs or designees, a regional assessment is also billed by the Corporation on behalf of the Regional Entities. The regional assessment is based on approved budgets of the eight Regional Entities and remitted to the Regional Entities by the Corporation. There is a credit risk if the Corporation does not collect the assessments from LSEs or designees before the regional assessments are due to the Regional Entities. However, the risk is minimal since the Corporation has the ability to reassess and rebill in a subsequent period for any uncollected assessments. Regional assessments billed and remitted for 2014 and 2013 were as follows:

For the Year Ended December 31,	2014	2013
Total regional assessments billed to WECC, ERCOT, individual LSE's and designees	$ 92,683,354	$ 113,584,703
Total regional assessments remitted to Regional Entities	(92,648,361)	(113,480,310)
Billings over remittances	$ 34,993	$ 104,393

As of December 31, 2014 and 2013, regional assessments collected in advance and not yet remitted to the Regional Entities based upon the remittance schedule set forth in the delegation agreements totaled $11,438,454 and $9,427,293, respectively.

7 Deferred Compensation

Agreements and Life Insurance Policies

During 2005, the Council entered into a deferred compensation agreement with a retiring executive that provided benefits payable over a period selected by the retiring employee, payable to the retiree or his surviving spouse. The Corporation assumed the liability upon merger with the Council. The original agreement was superseded in 2008 and a variable universal life policy was used to fund the liability. This life policy, including the cash surrender value, was assigned and transferred to the retired executive in January 2009. In accordance with the new agreement, the Corporation will continue to pay the policy premiums through 2015. At December 31, 2014 and 2013, the present value of the unfunded liability, using a discount rate of 0.75% was $14,257. The present value of the unfunded liability as of December 31, 2014 and 2013 is included in current deferred compensation on the statements of financial position.

Deferred Compensation Plan

The Corporation established a deferred compensation plan for certain employees in 2012 in accordance with Internal Revenue Code Section 457. The plan provides that eligible employees may make elective salary reduction contributions in accordance with limitations established by the Internal Revenue Code. In 2014, the plan was amended to allow the company to make discretionary, non-elective contributions to the plan on behalf of the employee. The asset and liability for this deferred compensation plan of $522,756 and $320,660 at December 31, 2014 and 2013, respectively, are included in 457b Plan Assets and non-current deferred compensation on the statements of financial position.

Retiree Medical Benefits

Effective September 1, 2007, the Board of Trustees approved and adopted a policy to provide medical coverage for a limited number of current and transitional retirees and their dependents up to a maximum monthly benefit of $550 paid directly to the applicable insurer. Assumptions used in recording the retiree medical benefits included the 2009 Social Security Administration Actuarial Period Life Table, annual inflation rate of 1.5% and discount rate of 3.8%. At December 31, 2014 and 2013 the accrued retiree medical benefits liability was $256,694 and $276,855, respectively, and is included in non-current deferred compensation on the statements of financial position. The retiree medical expense related to this policy was $9,507 and $26,616, respectively for the years ended December 31, 2014 and 2013.

8 Commitments

Operating Leases

The Corporation leases office space in Washington, D.C. and Atlanta, Georgia under non-cancellable lease agreements, with expiration dates through 2022. The lease for office space in Princeton, NJ expired in 2013.

In 2012 and 2015, the Corporation entered into agreements to expand the amount of leased space in Atlanta, Georgia with an expiration date in 2022, which is coterminous with the term of the lease for the original premises.

In 2015, the Corporation entered into an agreement to expand the amount of leased space in Washington, D.C. with an expiration date in 2022, which is coterminous with the term of the lease for the original premises.

In 2011, the Corporation entered into separate sub-lease agreements for a portion of the office space in Princeton, New Jersey, which expired in 2013, and for one of the two locations in Washington D.C., with an expiration date of February 2017. On June 23, 2014, the Corporation and sub-tenant agreed to amend the sublease agreement for the space in Washington D.C., to reduce the amount of space subleased to sub-tenant and to reduce the rate of rent due under the terms of the sublease agreement.

Approximate future minimum payments on office lease space at December 31, 2014 are as follows, net of rental income for sub-leased space and including lease agreements entered into subsequently in January, 2015:

Years Ending December 31,	Leased Space	Sub-leased Space	Net
2015	$ 3,219,000	$ (206,000)	$ 3,013,000
2016	3,467,000	(213,000)	3,254,000
2017	3,275,000	(36,000)	3,239,000
2018	3,300,000	-	3,300,000
2019	3,386,000	-	3,386,000
Thereafter	9,449,000	-	9,449,000
	$ 26,096,000	$ (455,000)	$ 25,641,000

The office leases are subject to escalation clauses covering increases in real estate taxes and operating costs over the base year. The Corporation had received tenant improvement allowances as of December 31, 2013 totaling $381,632. The difference between rent expense calculated ratably over the lease term and actual payments under the agreements are recorded as a deferred rent obligation on the statements of financial position in the amount of $3,818,761 and $3,999,899 at December 31, 2014 and 2013, respectively.

Office rent expense, net of sub-lease income of $242,589 and $293,000, was $2,534,672 and $2,574,909 for the years ended December 31, 2014 and 2013, respectively.

Capital Leases

The Corporation has entered into capital lease agreements for office equipment. Depreciation expense related to these capital leases was $51,227 and $65,407 for the years ended December 31, 2014 and 2013, respectively.

Assets leased by the Corporation under capital leases are included in fixed assets and capital lease obligation on the statements of financial position and consisted of the following:

December 31, 2014	
Copier leases	$ 280,481
Accumulated depreciation	(5,843)
Net Book Value	$ 274,638

The following is a schedule of future minimum lease payments under these capital leases, together with the future obligation net of interest and maintenance as of December 31, 2014:

Years ending December 31,	Future Minimum Payments
2015	$ 91,000
2016	91,000
2017	91,000
2018	83,000
Total Minimum Lease Payment	356,000
Less: Amounts representing interest and maintenance	(83,062)
Future Obligation Net of Interest and Maintenance	$ 272,938

Contractual Commitments

The Corporation has software license, maintenance support and data management service agreements with varying expiration dates through 2017. The following table is a schedule of future commitments under the terms of the agreements:

Years ending December 31,		Future Minimum Payments
2015	$	222,000
2016		227,000
2017		59,000
Total Service Agreements	$	508,000

9 Savings and Investment Plan

The Corporation sponsors an employee savings 401(k) plan (the "Plan") whereby eligible employees may elect to contribute up to the Internal Revenue Service Code 402(g)(1) limit. The Corporation contributes a 75% match of the first 6% of a participant's elective contribution. The Corporation also makes a discretionary contribution equal to a percentage of the eligible compensation of all qualifying participants. The additional discretionary contributions are determined annually by the Board of Trustees and are subject to the limitation imposed by the Internal Revenue Service Code 401(a)(17). The Corporation's expenses related to the Plan for the years ended December 31, 2014 and 2013 were $2,336,382 and $2,252,973, respectively. The contributions accrued as of December 31, 2014 and 2013 amounted to $1,907,563 and $1,788,624, respectively, and are included in accrued retirement liabilities in the statements of financial position.

10 Concentration of Credit Risk

The Corporation receives a significant portion of its income from assessments, based upon "net energy for load," to LSEs within the eight regions located throughout the United States, Canada and a portion of Baja California, Norte, Mexico. LSEs are assessed a proportional share of the Corporation's operating budget as well as a proportional share of the operating budget of the regional entity in whose territory the LSE is located. The Corporation issues quarterly invoices directly to LSEs or, in some circumstances, designees. With respect to LSEs located within TRE, the Corporation issues a quarterly invoice to Electric Reliability Council of Texas ("ERCOT") which then issues invoices to the LSEs in its region, collects the assessments and remits the funds to the Corporation. The Corporation then remits the regional assessments to TRE. A similar arrangement exists with respect to LSEs located within the WECC. For LSEs located within the PJM Interconnection ("PJM"), the Corporation issues invoices to PJM which issues invoices to the LSEs, collects the assessments and remits the funds to the Corporation. The Corporation then forwards the regional assessment to RFC, the regional entity. The Corporation is extending credit to the LSEs and designees and is exposed to credit risk to the extent regional assessments are paid by the Corporation to the Regional Entities prior to collecting assessments from the LSEs or designees. Based on past history, the Corporation believes that the risk of its trade accounts receivable credit exposure is limited.

11 Functional Classification

The Corporation is required to provide information about expenses reported by their functional classification, which is a method of grouping expenses according to the purpose for which costs are incurred. The Corporation groups expenses by operational programs and by administrative programs as defined by FERC.

The following table shows the functional classification of expenses for the years ended December 31, 2014 and 2013.

For the Years Ended December 31,	2014	2013
Operational Programs:		
Reliability Standards	**$ 4,435,265**	$ 5,429,867
Compliance Operations	**5,011,773**	4,683,625
Compliance Enforcement	**2,347,294**	2,437,377
Reliability Assessment and Performance Analysis	**5,289,551**	4,506,619
Event Analysis	**1,976,454**	2,283,712
Situation Awareness	**2,839,878**	3,845,999
Training, Education and Operator Certification	**1,561,112**	1,696,223
Critical Infrastructure Department	**5,783,518**	4,855,518
	29,244,845	29,738,940
Administrative Programs:		
General and Administrative	**9,331,197**	8,656,304
Legal and Regulatory	**3,946,155**	4,046,516
Information Technology	**8,484,162**	7,815,620
Human Resources	**1,075,167**	1,318,387
Finance and Accounting	**2,829,946**	2,771,726
	25,666,627	24,608,553
Total Expenses	**$ 54,911,472**	$ 54,347,493

Supplemental Schedules of Selected Expenses

For the Years Ended December 31,	2014	2013
Employee costs:		
Payroll taxes (FICA, SUI, FUI, Medicare)	$ 1,615,713	$ 1,527,728
Employee benefits - medical	2,210,021	2,053,703
Employee benefits - life / disability	198,766	173,915
Employee benefits - officers' life	-	33,328
Insurance - workers' compensation	74,343	54,219
Relocation expenses	93,176	149,215
Educational	473,415	402,958
	$ 4,665,434	$ 4,395,066
Travel and meetings:		
Meetings	$ 862,026	$ 741,766
Workshops	130,661	363,969
Travel	2,175,616	2,001,968
On-line meetings	318,627	306,603
	$ 3,486,930	$ 3,414,306
Services:		
Insurance - commercial	$ 126,127	$ 109,765
Contract and consultants	7,857,813	8,293,693
Independent trustee fees	1,010,000	931,250
Search fees	93,239	6,495
Temporary office services and agency fees	181,392	180,924
Accounting and auditing fees	162,167	143,271
Legal fees	1,054,926	845,602
	$ 10,485,664	$ 10,511,000
Office costs:		
Publications and subscriptions	$ 84,296	$ 76,993
Dues	40,862	40,862
Postage	13,854	8,022
UPS, express mail, etc.	20,215	29,509
Telephone	506,292	517,742
Office and equipment repair/services	74,528	86,810
Copying	70,426	44,720
Stationery and office forms	2,080	176
Office supplies	171,176	187,170
Bank charges	42,620	22,967
Sales and use tax	-	3,782
Card fees	82,241	81,782
Internet expenses	363,982	522,100
	$ 1,472,572	$ 1,622,635

True Up 2014
2014 Budget Variance Explanations Based on Audited Financials

Statutory Funding

Total Funding – Favorable Variance $26k

A training program for the new software to support reliability assessments was offered for a fee and was not planned in the budget creating a favorable variance of $21k. The balance of the favorable variance is due to FRCC System Operator Subcommittee (SOS) fees collected that were more than budgeted by $5k. Because these are both pass through items, the expense for both offset the revenue.

Statutory Expenditures

Total Favorable Variance $795k

Statutory Personnel Expenses

Total Favorable Variance $709k

The favorable variance is due to open positions unfilled for portions of the 12 months (see RSD and Compliance below) and less time charged to RA (see Reliability Assessment). The Employer Discretionary Contribution and 401(k) match and fewer health premiums due to the unfilled positions accounts for a large portion of the favorable variance; additionally, health insurance is less than budgeted due to lower rates than budgeted; educational benefits and relocation expenses were under budget due to unfilled positions. These expense reductions are partially offset by the use of contract employees.

The FTE status by Program is:

Reliability Standards Development	**(0.64)**
Compliance Enforcement	**(2.62)**
Reliability Assessment	**(1.16)**
Training & Education	**(0.14)**
Situational Awareness	**(0.04)**
General Administrative	**(0.21)**
Total Statutory FTE Variance	**(4.81)**

Statutory Meeting Expenses

Total Favorable Variance $65k

Less travel by Standards and Compliance **Favorable Variance $45k**

Favorable variance in meeting expense is due to a change in venue for the SOS training seminars at a significant savings and fewer committee meetings with the creation of the Regional EntityCommittee and Compliance Forum (RECCF).

Favorable Variance $18k

Conference Calls costs were less than budgeted.

Favorable Variance $2k

Statutory Operating Expenses

Total Favorable Variance $33k

Legal fees less than budgeted	-$87k
RA Consulting Projects (Short Circuit Databank, Reliability & Security, Data Verification, MMWG and Load Forecast) were less than budgeted	-$39k
RA Consulting by committee members budgeted but not billed	-$32k
Revised allocation for RA activities after the creation of the RECCF	- $12k
SOS Training less than budgeted	-$7k
Amortization Expense for the Compliance Software additions is greater than anticipated resulting in an unfavorable variance	+$45k
Compliance Software maintenance enhancements primarily for support needed to implement NERC's changes in Business Rules	+$32k
Training program fees for the new software to support reliability assessments was not planned in the budget (See Revenue for favorable offset)	+$22k
Strategic Plan Consultant not budgeted	+$19k
Towers Watson Salary Survey Conducted, not budgeted	+$11k
Internal Auditor not budgeted	+$10k
ERAG Fees are greater than budgeted	+$3k
All Other expenses	+ $2k

Statutory Fixed Asset Expenditures

Total Unfavorable Variance $12k:

Capitalized Compliance software enhancements needed for changes to the Technical Feasibility Exception (TFE) process and scoping the Reliability Assurance Initiative (RAI) changes needed prior to implementation of RAI offset by depreciation and computers not purchased	+$12k

Non Statutory (Member Services) Funding:

Total Funding – Unfavorable Variance $56k:

Pass through billing to members for the FRCCnet Sprint MPLS network is greater than expected due to running redundant systems until full conversion to the new backup network was complete. Because this is a pass through item, it will affect the expenses by the same amount.

Total Favorable Variance $53k

Non Pension Post Retirement **Total Unfavorable Variance $109**

Non Statutory Expenditures

Total Unfavorable Variance $463k

Non Statutory Operating Expenses (Reliability Coordinator & other operations)	+$462k
Non Statutory Personnel Expenses	+$28k
Non Statutory Meeting Expenses	-$27k

Other Non-Operating Expenses

Total Favorable Variance $1,090k

Change in Non Pension, Non Cash Post Retirement Obligation of medical insurance to a limited number of grandfathered individuals from an actuarial study was not budgeted

Non Statutory Fixed Asset Expenditures

Total Favorable Variance $4k

Change in Working Capital for the Year ended 12/31/2014:

Addition to Working Capital	**$415k**	
Statutory – Addition to Working Capital		$821k
Member Services Non Statutory – Use of Working Capital		($406k)

Total Net Assets As Of 12/31/2014: Surplus	**$2,820k**	
Statutory –Surplus of		$1,922k
Member Services Non Statutory – Surplus of		$ 898k

Statements Concerning Work Completed in 2014:

Compliance Monitoring & Enforcement Program

Specifically, the Compliance Department verifies that:

1. All O&P Compliance audits (11) planned for 2014 were completed as scheduled;
2. All CIP Audits (11) planned for 2014 were completed as scheduled;
3. Conducted Risk Assessment for eleven (11) registered entities prior to each on-site/off-site audit;
4. The Technical Feasibility Exception (TFE) program related to the CIP Standards completed its fifth year in 2014. FRCC processed sixty-seven (67) requests for material changes of which sixty (60) were approved and seven (7) were not approved.
5. The annual self-certification of all registered entities in the region was completed on schedule;
6. Review, acceptance or rejection was completed for forty-five (45) Mitigation Plans and eight (8) Mitigation Plan Revisions submitted by registered entities in 2014;
7. Verification of entity completion was finalized for forty (40) Mitigation plans during 2014; and
8. Regional Compliance Evaluations were completed for eight (8) entity reliability events during 2014, of which four (4) events occurred in 2013;
9. Conducted one (1) Spot Check in 2014 as a result of an Event Compliance Evaluation.

Reliability Assessment Program

NERC Reliability Assessments (Summer, Winter and Long Term Reliability Assessment) including a Probabilistic Assessment were all completed as scheduled. In addition, the FRCC continues to support the transition to a new Bulk Electric System (BES) definition by processing Self-determined Notifications and BES Exception Requests using the NERC BESnet application.

The FRCC has actively participated in the ERO Events Analysis Process**,** developed the necessary procedures, and worked with registered entities and NERC to provide meaningful reports and Lessons Learned. FRCC continues to support the NERC Alerts process including the Facility Rating Alert efforts.

Method used to allocate indirect costs to the direct statutory program or functional areas:

The FRCC uses standard cost accounting procedures to allocate general expenses (that cannot be directly assigned) to a specific function. The system used consists of directly expensing as much as possible directly to the function (whether that function is Statutory or Member Services) that incurred the expense. This is accomplished by routing to the responsible departmental heads all invoices pertaining to their job responsibility. The departmental head assigns the functional category and returns the invoice to accounting who assigns the General Ledger Account Number (as specified in the FRCC Accounting Policy Manual – Coding of Invoices for Goods and Services). If the expense cannot be directly charged to a

particular function (example rent, payroll taxes, benefits, general office supplies, etc.), the expense is charged to holding accounts by chart of accounts line item to be allocated back to the program areas (to include General & Administrative) at the end of the month. This is done by using the monthly time accounting summarization of FTE by function. So there are two ways expenses are charged to a particular function, either by direct expense or by allocation from the results of the monthly time accounting summarization of FTE by function (including General & Administrative).

The monthly time accounting summarization of FTE by function is calculated using the time sheets that each employee is required to turn in to HR bi-weekly. Each employee allocates eight (8) hours per day to the functions they worked on that day. Their time sheet is reviewed by their departmental head and initialled bi-weekly.

Employees are categorized into 2 groups: Technical Employees – those employees who work directly on functions and have little or no administrative duties (examples would be the Compliance staff and the Engineers) and Non-Technical Staff – those employees who perform support functions that are 80% or greater nonspecific definable by function (examples would be the Accounting staff, the President, the receptionist, etc.). The time from the time sheets are entered into a macro (by employee and function worked on) for the corresponding month being accounted for. The FTE's by program are then calculated and used to allocate the total of the General & Administrative Department back to the program areas on the line "Miscellaneous".

Cash Reserves Statement

For Statutory activities, no cash reserves were used by the FRCC in 2014.

For Non-Statutory activities, there was a planned use of reserves which was used largely to complete projects budgeted in 2013 but not completed until 2014.

Statement concerning the use of Statutory Funds for Member Services Expenses:

No Statutory Funds were used to pay for Member Services Functions in 2014 and no Member Services Funds were used to pay for Statutory Functions.

INDEPENDENT AUDITORS' REPORT

To the Corporate Compliance, Finance & Audit Committee
Florida Reliability Coordinating Council, Inc.

Report on the Financial Statements

We have audited the accompanying financial statements of Florida Reliability Coordinating Council, Inc., (a nonprofit organization) which comprise the statement of financial position as of December 31, 2014, and the related statements of activities and cash flows for the year then ended, and the related notes to the financial statements.

Management's Responsibility for the Financial Statements

Management is responsible for the preparation and fair presentation of these financial statements in accordance with accounting principles generally accepted in the United States of America; this includes the design, implementation, and maintenance of internal control relevant to the preparation and fair presentation of financial statements that are free from material misstatement, whether due to fraud or error.

Auditor's Responsibility

Our responsibility is to express an opinion on these financial statements based on our audit. We conducted our audit in accordance with auditing standards generally accepted in the United States of America. Those standards require that we plan and perform the audit to obtain reasonable assurance about whether the financial statements are free of material misstatement.

An audit involves performing procedures to obtain audit evidence about the amounts and disclosures in the financial statements. The procedures selected depend on the auditor's judgment, including the assessment of the risks of material misstatement of the financial statements, whether due to fraud or error. In making those risk assessments, the auditor considers internal control relevant to the entity's preparation and fair presentation of the financial statements in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the entity's internal control. Accordingly, we express no such opinion. An audit also includes evaluating the appropriateness of accounting policies used and the reasonableness of significant accounting estimates made by management, as well as evaluating the overall presentation of the financial statements.

We believe that the audit evidence we have obtained is sufficient and appropriate to provide a basis for our audit opinion.

Opinion

In our opinion, the financial statements referred to above present fairly, in all material respects, the statement of financial position of Florida Reliability Coordinating Council as of December 31, 2014 and the changes in its net assets and its cash flows for the year then ended in accordance with accounting principles generally accepted in the United States of America.

Other Matter

Our audit was conducted for the purpose of forming an opinion on the financial statements as a whole. The statutory and non-statutory schedules on Pages 19 to 27 inclusive are presented for purposes of additional analysis and are not a required part of the financial statements. Such information is the responsibility of management and was derived from and relates directly to the underlying accounting and other records used to prepare the financial statements. The information has been subjected to the auditing procedures applied in the audit of the financial statements and certain additional procedures, including comparing and reconciling such information directly to the underlying accounting and other records used to prepare the financial statements or to the financial statements themselves, and other additional procedures in accordance with auditing standards generally accepted in the United States of America. In our opinion, the information is fairly stated in all material respects in relation to the financial statements as a whole.

Increase in accounts payable and accrued expenses	48,850
Change in postretirement benefit obligation	(981,356)
Increase in deferred income	381,706
Net cash used by operating activities	$ (529,199)

The accompanying notes are an integral part of these financial statements.

NOTE 1: GENERAL AND SUMMARY OF SIGNIFICANT ACCOUNTING POLICIES

General

Florida Reliability Coordinating Council, Inc. (the "Company") is a group of electric utilities and energy marketers primarily doing business in the State of Florida. The purpose of the Company is to ensure and enhance the reliability and adequacy of the bulk power supply in Florida (which is defined as the general area encompassed by Peninsula Florida) now and into the future. The Company serves as a Regional Entity with delegated authority from the North American Electric Reliability Corporation ("NERC") for the purpose of proposing and enforcing reliability standards within the FRCC region.

On May 2, 2007, the Company entered into a Delegation Agreement with North American Electric Reliability Corporation ("NERC"), an organization certified by the Federal Energy Regulatory Commission pursuant to Section 215(c) of the Federal Power Act. The Company is required by federal law to assess the reliability of the Bulk Power System. The Federal Energy Regulatory Commission ("FERC") empowered the Company through a Delegation Agreement with NERC to monitor, enforce and implement electric reliability standards under Section 215 of the Federal Power Act. The Company is responsible for establishing the process for development, revision, withdrawals and approval of the Company's Regional Reliability Standards for the region. The Company monitors and enforces compliance with NERC and FERC reliability standards through on-site audits, self-certifications, periodic spot checks, self-reports, event investigation, periodic data submittal, exception reporting and through complaints. The initial term of the agreement is for three years and is renewable for five more years upon a successful compliance audit conducted by NERC.

The Company's source of revenue is split into two parts. The statutory functions, defined as those functions being performed for Reliability Standards and Compliance, are funded by NERC. The member services functions are paid by its members who are assessed for costs and expenses of establishing, developing, operating and maintaining the Company.

A summary of the Company's significant accounting policies consistently applied in preparation of the accompanying financial statements follows:

The financial statements have been prepared on the accrual basis of accounting in accordance with accounting principles generally accepted in the United States of America; consequently, revenues and gains are recognized when earned, and expenses and losses are recognized when incurred.

Concentration of Credit Risk

The Company places its cash with high credit quality institutions. At times, these balances may be in excess of the FDIC insurance limit.

NOTE 1: GENERAL AND SUMMARY OF SIGNIFICANT ACCOUNTING POLICIES (Continued)

Use of Estimates

Management uses estimates and assumptions in preparing these financial statements in accordance with accounting principles generally accepted in the United States of America. Those estimates and assumptions affect the reported amounts of assets, liabilities, revenues and expenses. Actual results could vary from the estimates that are used.

Income Taxes

The Company has been approved for tax-exempt status under Section 501(c) (6) of the Internal Revenue Code and is exempt from federal and state income taxes. Accordingly, no provision for income taxes is included in the financial statements. Tax years after 2010 remain subject to examination by taxing authorities.

The Company follows Accounting Standard Codification (ASC) 740, "Accounting for Income Taxes" with respect to accounting for uncertainty in income taxes. A tax position is recognized as a benefit only if it is "more likely than not" that the tax position would be sustained in a tax examination, with a tax examination being presumed to occur. The amount recognized is the largest amount of tax benefit that is greater than 50% likely of being realized on examination. For tax positions not meeting the "more likely than not" test, no tax benefit is recorded.

Due to its tax-exempt status, the Company is not subject to U.S. federal income tax or state income tax. The Company's Form 990 has not been subject to examination by the Internal Revenue Service or the State of Florida for the last three years. The Company has not recognized liability for unrecognized tax benefits as it has no known tax positions that would subject the Company to any material income tax exposure. A reconciliation of the beginning and ending amount of unrecognized tax benefits and interest accrued related to unrecognized tax benefits are not included nor is there any interest accrued related to unrecognized tax benefits or interest expense and penalties in operating expenses as there are no unrecognized tax benefits.

Member, Related Party, and Other Receivables

Management evaluates all receivables annually for collectability. As of December 31, 2014 management considers all receivables to be fully collectible, therefore; no allowance for doubtful accounts is considered necessary and no late fees are assessed. If amounts are deemed to be uncollectible, they will be charged to an allowance for doubtful accounts when that determination is made.

NOTE 1: GENERAL AND SUMMARY OF SIGNIFICANT ACCOUNTING POLICIES (Continued)

Property and Equipment

Property and equipment with a cost over $500 are capitalized and are stated at cost, less accumulated depreciation and amortization. Depreciation and amortization are provided for in amounts sufficient to relate the cost of depreciable assets to operations over their estimated service lives, principally on a straight-line basis. The estimated lives used in determining depreciation are:

Equipment	5 years
Software	3 years
Furniture and fixtures	7 years
Leasehold improvements	5 years

Leasehold improvements are amortized over the lives of the respective leases or the service lives of the improvements, whichever is shorter.

Line of Credit

The Company secured a line of credit from Bank of America, N.A. for two (2) years in the amount of $1,500,000. The line of credit is intended to be used for short term needs that arise between budget funding periods as a bridge between budget years. The covenants call for a funded debt to total unrestricted and temporarily restricted net assets not exceeding 2.0:1.0 and an out of debt period of 30 days each line year. The total charges and fees for 2 year term were paid in 2013 and none were due or paid in 2014. As of December 31, 2014, the company has not drawn on the line of credit and is in full compliance with all covenants.

Postretirement Benefits Other Than Pensions

The Company sponsors a postretirement health care or benefit plan for employees hired before October 1, 2003 (and the spouse of one retired employee) if the retiree meets certain conditions specified in their individual plan at the time of retirement. The breakdown on the plan is as follows: one retiree spouse remains on the original health care retirement plan granted in 2006 which provides for health insurance for life, one retiree converted effective November 1, 2014 to receiving an annual amount funded to a Health Retirement Account (HRA), in the amount of $4,200 per year, in lieu of coverage on a health care policy, and three (3) current employees converted to a plan which provides health care coverage if they retire at age 60 or later from active employment from the FRCC until age 65 at which time they stop being provided with health care coverage and will then begin to receive an annual amount of $4,200 funded to an HRA. These plans cease upon the death of the employee and all fund balances in each of the HRA accounts revert back to the company. The individual plans are noncontributory for retirees (see Note 6).

NOTE 1: GENERAL AND SUMMARY OF SIGNIFICANT ACCOUNTING POLICIES (Continued)

Date of Management's Review

Management has evaluated events and transactions for potential recognition or disclosure through January 29, 2015, which is the date the financial statements were available to be issued.

NOTE 2: FAIR VALUE MEASUREMENTS

Financial Accounting Standards Board ASC 820 establishes a framework for measuring fair value. That framework provides a fair value hierarchy that prioritizes the inputs to valuation techniques used to measure fair value. The hierarchy gives the highest priority to unadjusted quoted prices in active markets for identical assets or liabilities (level 1 measurement) and the lowest priority to unobservable inputs (level 3 measurements). The three levels of the fair value hierarchy under FASB ASC 820 are described below:

Level 1 Inputs to the valuation methodology are unadjusted quoted prices for identical assets or liabilities in active markets that the Organization has the ability to access.

Level 2 Inputs to the valuation methodology include:

- Quoted prices for similar assets or liabilities in active markets;
- Quoted prices for identical or similar assets or liabilities in inactive market;
- Inputs other than quoted prices that are observable for that asset or liability'
- Inputs that are derived principally from or corroborated by observable market data by correlation or other means

If the asset or liability has a specified (contractual) term, the Level 2 input must be observable for substantially the full term of the asset or liability.

Level 3 Inputs to the valuation methodology are unobservable and significant to the fair value measurement.

The asset's or liability's fair value measurement level within the fair value hierarchy is based on the lowest level of any input that is significant to the fair value measurement. Valuation techniques used need to maximize the use of observable inputs and minimize the use of unobservable inputs.

The following is a description of the valuation methodologies used for the Organization's securities invested in the deferred compensation plans measured at fair value as of December 31, 2014:

Cash and cash equivalents: The carrying amounts reported in the Statements of Financial Position approximate the fair value because of the short maturities of those instruments.

NOTE 2: FAIR VALUE MEASUREMENTS (Continued)

Mutual funds: Measured at net asset value within the active market on which the individual securities are traded.

The methods described above may produce a fair value calculation that may not be indicative of the net realizable value or reflective of future fair values. Furthermore, while the Company believes its valuation methods are appropriate and consistent with other market participants, the use of different methodologies or assumptions to determine the fair value of certain financial instruments could result in a different fair value measurement at the reporting date.

The fair values of the Company's securities invested in the deferred compensation plans, classified by level, are as follows:

	December 31, 2014			
	Fair Value	Level 1	Level 2	Level 3
Cash & equivalents	$ 1,968	$ 1,968		
Mutual funds - fixed income	19,409	19,409		
Mutual funds - equities	121,731	121,731		
Total	$ 143,108	$ 143,108	$ -	$ -

The fair value and cost of the Company's securities invested in the deferred compensation plans, as of December 31, 2014 are as follows:

	Cost Value	Market Value
Cash & equivalents	$ 1,968	$ 1,968
Mutual funds - fixed income	20,426	19,409
Mutual funds - equities	96,638	121,731
Total	$ 119,032	$ 143,108

NOTE 3: DEFERRED REVENUE

The contracts with the members of FRCC have a provision in them that provides that they have 30 days from the date of invoice for a new budgetary year (January through December) to withdraw from membership. Therefore, the Company made a decision to invoice all members on December 1 for the first quarterly installment of the 2015 budget, thus at December 31, 2014 it would be known whether all members are continuing with their membership.

NOTE 4: COMMITMENTS

In December 2003, the Company entered into an agreement with Sprint Communications Company L.P. ("Sprint") to provide certain telecommunication services that are passed through to certain members beginning in 2004 for the Company's network. The initial term of the agreement is 36 months and has been renewed for an additional 12-month period each year thereafter. The agreement calls for the Company to make a minimum service commitment of $96,000 for each contract year of the term.

In December 2006, the Company entered into an agreement with Open Access Technology International, Inc. to provide the Florida Transaction Management System ("FTMS") services for the Company's customers. The initial term of the agreement was 36 months at $3,750 per month and has been renewed for an additional 12-month period each year thereafter. In 2014, the Company renewed this contract for 36 months at an annual cost of $61,000. In addition, several enhancements to the FTMS service were agreed upon of which $27,000 was paid for in 2014 for the completion of the enhancements. The Company also has the option to purchase the system for $100,000; however, at this time, the Company has no intention of doing so.

In November 2007, the Company entered into an agreement to purchase Compliance Tracking System software from Guidance Solutions, Inc. In 2008, the Company entered into an agreement with several of the other regional entities to form a consortium and share the cost of future enhancements and program modules to add to the Compliance Tracking System originally purchased from Guidance Solutions, Inc. In June of 2011, the consortium broke up with certain member regions deciding to change software and vendors and go in a different direction for their Compliance Tracking System. The Company decided to remain with Guidance and has agreed to share costs of software enhancements with two other regions that remain with Guidance. The cost of enhancements added or in progress for 2014 was $117,831. The Company is obligated for enhancements in progress as of December 31, 2014 from this regional agreement of approximately $184,000 for enhancements to be completed in 2015. The Company is also obligated for enhancements of their own system for $70,000 to be completed in 2015.

In May of 2013, the Company entered into an agreement with other Eastern Interconnection Reliability Coordinators and created the Interchange Distribution Calculator (IDC) Tools Member Association to manage the IDC Application contract that in prior years was managed by NERC. This tool is used to manage transmission congestion across the Eastern Interconnection. The agreement calls for the Company to make a minimum service commitment of $118,600 for each contract year of the term.

In May of 2013 the Company entered into agreements with Cisco Systems Capital Corporation to provide WebEx online presentation and audio conferencing services. The initial term of the agreement is for 36 months and call for the Company to make a total commitment of $130,500 over the 36-month term.

NOTE 4: COMMITMENTS (Continued)

In July 2013, the company entered into an agreement with TW Telecom Holdings, Inc. (TW Telecom) to provide required redundant telecommunications for the FRCCnet wide area network that provides data to the FRCC reliability Coordinator. The initial term of the agreement is 36 months and calls for the Company to make a minimum service commitment of $68,400 for each contract year of the term.

NOTE 5: OPERATING LEASES

The Company leases its facilities and has operating leases that expire September 30, 2020 at its current location on Bayport Drive. The Bayport Plaza lease required a $150,000 deposit. For all leases, rental payments escalate based on the schedules set forth in the lease agreement. Minimum future rental payments are:

Year Ended December 31,		
2015	$	766,199
2016		787,166
2017		808,832
2018		831,070
2019		854,008
2020 and thereafter		644,842
	$	4,692,117

Rent expense charged to operations during the year ended December 31, 2014 was $812,686, including the effects of lease payment escalations over the term of the leases.

For all leases, the future expense to be recognized including the effects of rent abatements and rent escalations are as follows:

Year Ended December 31,		
2015	$	750,602
2016		750,602
2017		750,602
2018		750,602
2019		750,602
2020 and thereafter		562,952
	$	4,315,962

NOTE 6: POSTRETIREMENT BENEFITS OTHER THAN PENSIONS

The Company adheres to ASC 715-30, *Defined Benefit Plans - Other Post Retirement,* which requires companies to report the funded status (defined as the difference between the fair value of plan assets and the plan's benefit obligation) of their postretirement plan. The current year effect is a $1,090,170 increase to unrestricted net assets.

This substantial change is the result of the conversion of the original plan (by four of the five eligible persons) to other appropriate plans. The census for this benefit is as follows: one retiree spouse remains on the original health care retirement plan granted in 2006 which provides for health insurance for life, one retiree converted effective November 1, 2014 to receiving an annual amount funded to a Health Retirement Account (HRA), in the amount of $4,200 per year, in lieu of coverage on a health care policy, and three (3) current employees converted to a plan which provides health care coverage if they retire at age 60 or later, from active employment from the FRCC, until age 65 at which time they stop being provided with health care coverage and will then begin to receive an annual amount of $4,200 funded to an HRA. These plans cease upon the death of the employee and all fund balances in each of the HRA accounts revert back to the company.

The following table sets forth the Plan's funded status reconciled with the amount shown in the Company's statement of financial position at December 31, 2014:

Accumulated postretirement benefit oligation:	
Plan assets at fair value	-0-
Funded status	-0-
Accrued postretirement benefit obligation:	
Current portion	$ 17,908
Long-term portion	407,558
	$ 425,466

Since the plan is non-contributory, the entire balance of the accumulated benefit obligation is recorded as a liability in the statement of financial position as of December 31, 2014.

NOTE 6: POSTRETIREMENT BENEFITS OTHER THAN PENSIONS (Continued)

Benefits expected to be paid in each of the next five years are as follows:

Year Ended December 31,	
2015	$ 17,908
2016	18,863
2017	23,921
2018	24,670
2019	25,275
2020 and thereafter	116,501
	$ 227,138

The following provides the components of net periodic postretirement benefit cost for the year ended December 31, 2014.

Service Cost	$ (39,983)
Interest Cost	(66,042)
Amortization of unrecognized net obligation	(10,664)
Amortization of unrecog prior service cost/(asset)	
Recognition of net actuarial loss	(25,039)
Net periodic postretirement benefit cost	(141,728)
Benefits paid during 2014	32,914
Net postretirement benefit loss	$ (108,814)
Items not yet recognized as a component of net periodic postretirement benefit costs	
Unrecognized net gain	$ 300,690
Net unrecognized prior service cost	344,780
Transitional effect of ASC 715-30	645,470
Postretirement effect of ASC 715-30 as of December 31 2013	$ (444,700)
Net periodic change in postretirement obligation	1,090,170
Postretirement obligation recognized as a component of net periodic benefit cost as of December 31, 2014	$ 645,470

NOTE 6: POSTRETIREMENT BENEFITS OTHER THAN PENSIONS (Continued)

Amounts included in unrestricted net assets and expected to be recognized as components of net periodic benefit gain (cost) next year include amortization of unrecognized net obligation and net actuarial loss of approximately ($11,000) and ($25,000), respectively. For measurement purposes, an 8% annual rate increase in the per capita cost of covered health care benefits was assumed for 2016; the rate was assumed to decrease to 7% for 2017; 6% for 2018 and remain at 5% thereafter. The health care cost trend rate assumption has a significant effect on the amounts reported. To illustrate, if assumed health care cost trend rates were increased by one percentage point in each year, the accumulated postretirement benefit obligation at December 31, 2014 would be increased $62,079 and the aggregate of the service and interest cost components of net periodic postretirement benefit cost for the year ended December 31, 2014 would be increased by $980.

The weighted average discount rate used in estimating the accumulated postretirement benefit obligation was 4.0%. Mortality was based on the RP-2000 Combined Mortality Tables for Healthy Males and Females. The measurement date of the accumulated postretirement benefit obligation was December 31, 2014.

Glossary

Accumulated postretirement benefit obligation - The actuarial present value of benefits attributed to employee service rendered to a particular date.

Net periodic postretirement benefit gain - The amount recognized in the financial statements as the gain of the postretirement benefit plan for a period.

In December of 2003, the Medicare Prescription Drug, Improvement and Modernization Act of 2003 (Act) was signed into law. The Act includes a special subsidy for employers that sponsor retiree health benefit plans with prescription drug benefits that are as favorable as the Medicare Part D benefit. The Company has not determined whether its plan is actuarially equivalent to the Medicare Part D benefit due to the cost of obtaining such an actuarial computation.

NOTE 7: RETIREMENT PLAN

Effective January 1, 2001, the Company adopted a 401(k) Plan (“Plan”) intended to benefit substantially all employees with 6 months of service and 21 years of age. On September 30, 2007, the Plan was amended to enable employees with one hour of service to be eligible to enter the Plan. Participants can contribute any amount of their compensation for the Plan year, not to exceed the limits determined by the Internal Revenue Code. The Company may make matching contributions with prescribed limits. The Company may also make additional non-elective discretionary contributions to the Plan. The Company made matching contributions to the Plan of $297,473 and a discretionary contribution to the Plan of $409,491 (net of forfeitures) for the year ending December 31, 2014.

NOTE 7: RETIREMENT PLAN (Continued)

Deferred Compensation – The Company implemented an executive deferred compensation plan subject to Section 457(f) of the Internal Revenue Code in 2004. For the year ended December 31, 2014, the Company contributed $8,492 to benefit the participant in this Plan.

In 2013, the Company adopted a Nonqualified 457(b) Retirement Plan ("Retirement Plan"), to be effective January 1, 2014, intended to benefit key managerial employees of the Company. The Company funded the account in 2014 $16,775 for the 2013 liability and expensed $28,736 in 2014 that will be funded in 2015.

NOTE 8: RELATED PARTIES

Various members of the Company are founding members of Florida Electric Power Coordinating Group, Inc. ("FCG") and the organizations, excluding the Board of Directors, were under common management until November 30, 2014. Effective November 30, 2014, The President & CEO of the FRCC resigned from management of the FCG. FCG is a nonprofit organization operating under Section 501(c)(6) of the Internal Revenue Code and is exempt from federal and state income taxes.

The Company has decided to continue providing FCG with administrative and accounting services, including the use of office space. FCG reimbursed the Company approximately 1.97% of the Company's administrative expenses in 2014. The service agreement with FCG is a one-year agreement that will automatically renew unless canceled in advance by either party. The original agreement was renewed for an additional year in February 2014. Currently the company is in the process of negotiating a new contract for 2015. At December 31, 2014, the Company had billed and collected a total of $192,217 from FCG relating to the service agreement and has a receivable from FCG in the amount of $3,174.

The Company is purchasing the services from Florida Power and Light ("FPL"), a member of the Company, to fulfill the responsibilities of reliability coordinator, operations planning coordinator, state capacity emergency coordinator as well as various other services. The Company paid FPL $3,219,144 for these services and at December 31, 2014 had $651,213 of accrued expenses recorded on the books.

NOTE 9: CONCENTRATIONS

Two members make up approximately 54.9% of the member services assessments and dues. The same two members comprise 67.1% of the statutory assessment that NERC bills directly in order to fund the Company for its statutory function.

NOTE 10: CONTINGENCIES

As part of the Company's Delegation Agreement with NERC, the Company has the authority to fine entities within its region for violation of reliability standards. During 2013, six (6) notices of penalty were filed with FERC with settlement agreements addressing alleged violations of reliability standards for the entities within the FRCC region. The penalties totaling $111,000 as of December 31, 2014, were approved by FERC and paid by the entities. The Delegation Agreement Rules of Procedures from NERC stipulate that any penalty monies collected by June 30 of each year, which is between budget submissions, are to be held until they can be accounted for in a budget submission. At year-end December 31, 2014, a total of $256,000 penalty assessment is being held for future use of which $175,000 was accounted for in the 2015 budget submission and will be taken into operating income at the beginning of 2015 to offset funding from all entities in the region. The balance, plus any penalties billed and collected prior to June 30, 2015 will be held and accounted for in the 2015 budget submission.

The Company is the registered entity for the FRCC Region Reliability Coordinator functions and as a Planning Authority within the FRCC region. As a NERC registered entity, the Company must comply with applicable NERC reliability standards. Violations of these standards can result in financial penalties. The Company is involved in various enforcement actions for possible violations of electric reliability standards related to the NERC registered entity functions.

Several of the possible violations were self-reported by FRCC which may result in no penalty. At this time, the Company cannot fully determine the effect of the possible penalties that may arise. Based on the limited information available at this time the Company estimates that it is reasonably possible for a penalty to be assessed ranging from $75,000 to $200,000, however the Company cannot conclude that any amount within this range is a better estimate than any other. At December 31, 2014 the Company had $75,000 of accrued expenses recorded on the books for possible penalties.

NOTE 11: FUNCTIONAL EXPENSES

The detail of functional expenses for the year ended is as follows:

Statutory expenses:	
Reliability Standards Development	$ 256,204
Compliance & Enforcement	4,371,825
Reliability Assessment & Performance Analysis	1,114,642
Training & Education	258,835
Situational Awareness & Infrastructure	14,462
Total statutory expenses	$ 6,015,968
Member Services expenses:	
Planning Committee	$ 908,894
Operating Committee	7,008,204
General & Administrative	(1,090,170)
Total member services expenses	$ 6,826,928
Total Expenses	$ 12,842,896

NOTE 12: NET ASSETS

Unrestricted net assets that are designated are FERC-approved for statutory expense or board-approved for member services expense segregations of unrestricted net assets for specific projects. Since designations are voluntary and may be reversed or redirected by the governing board at any time, designated portions of net assets are not considered restricted.

The detail of unrestricted FERC or board-designated net assets is as follows at year end:

Statutory	$ 1,921,880
Member Services	898,503
Total unrestricted-board designated net assets	$ 2,820,383

The Corporate Compliance, Finance & Audit Committee
Florida Reliability Coordinating Council, Inc.

We are pleased to present the results of our audit of the 2014 financial statements of Florida Reliability Coordinating Council, Inc. (the "Organization").

This report to the Corporate Compliance, Finance & Audit Committee (the "Committee") summarizes our audit, the report issued and various analyses and observations related to the Organization's accounting and reporting. The document also contains the communications required by our professional standards.

Our audit was designed, primarily to express an opinion on the Organization's 2014 financial statements. We considered the Organization's current and emerging business needs, along with an assessment of risks that could materially affect the financial statements, and aligned our audit procedures accordingly. We conducted the audit with the objectivity and independence that you expect. We received the full support and assistance of Florida Reliability Coordinating Council, Inc. (the "Organization") personnel.

At Carr, Riggs & Ingram, LLC (CRI), we are continually evaluating the quality of our professionals' work in order to deliver audit services of the highest quality that will meet or exceed your expectations. We encourage you to provide any feedback you believe is appropriate to ensure that we do not overlook a single detail as it relates to the quality of our services.

This report is intended solely for the information and use of the Committee and others within the Organization and should not be used by anyone other than these specified parties.

We appreciate this opportunity to work with you. If you have any questions or comments, please contact me at 727-324-1241 or lkidder@cricpa.com.

Very truly yours,

Lorri J. Kidder

Lorri J. Kidder, CPA, CFE, CGMA
Partner

As discussed with the Corporate Compliance, Finance & Audit Committee (the "Committee") during our planning process, our audit plan represented an approach responsive to the assessment of risk for the Organization. Specifically, we planned and performed our audit to:

- Perform audit services, as requested by the Committee, in accordance with auditing standards generally accepted in the United States of America, in order to express an opinion on the Organization's financial statements for the year ended December 31, 2014;
- Communicate directly with the Committee regarding the results of our procedures;
- Address with the Committee any accounting and financial reporting issues;
- Anticipate and respond to concerns of the Committee; and
- Other audit-related projects as they arise and upon request.

We have audited the financial statements of Florida Reliability Coordinating Council, Inc. for the year ended December 31, 2014, and have issued our report thereon dated January 29, 2015. Professional standards require that we provide you with the following information related to our audit:

MATTER TO BE COMMUNICATED	AUDITOR'S RESPONSE
Auditor's responsibility under Generally Accepted Auditing Standards	As stated in our engagement letter dated August 29, 2014, our responsibility, as described by professional standards, is to express an opinion about whether the financial statements prepared by management with your oversight are fairly presented, in all material respects, in conformity with accounting principles generally accepted in the United States of America (GAAP). Our audit of the financial statements does not relieve you or management of your responsibilities. As part of our audit, we considered the internal control of the Organization. Such considerations were solely for the purpose of determining our audit procedures and not to provide any assurance concerning such internal control.
Client's responsibility	Management, with oversight from those charged with governance, is responsible for establishing and maintaining internal controls, including monitoring ongoing activities; for the selection and application of accounting principles; and for the fair presentation in the statements of revenue and expenses, and the statements of assets, liabilities, and net assets in conformity with the applicable framework. Management is responsible for the design and implementation of programs and controls to prevent and detect fraud.
Planned scope and timing of the audit	Our initial audit plan was not significantly altered during our fieldwork.
Management judgments and accounting estimates *The process used by management in forming particularly sensitive accounting estimates and the basis for the auditor's conclusion regarding the reasonableness of those estimates.*	Please see the following section titled "Accounting Policies, Judgments and Sensitive Estimates and CRI Comments on Quality."
Potential effect on the financial statements of any significant risks and exposures *Major risks and exposures facing the Fund and how they are disclosed.*	No such risks or exposures were noted.

MATTER TO BE COMMUNICATED	AUDITOR'S RESPONSE
Significant accounting policies, including critical accounting policies and alternative treatments within generally accepted accounting principles and the auditor's judgment about the quality of accounting principles • *The initial selection of and changes in significant accounting policies or their application; methods used to account for significant unusual transactions; and effect of significant policies in controversial or emerging areas for which there is a lack of authoritative guidance or consensus.* • *The auditor should also discuss the auditor's judgment about the quality, not just the acceptability, of the Organization's accounting policies as applied in its financial reporting. The discussion should include such matters as consistency of accounting policies and their application, and clarity and completeness of the financial statements, including disclosures. Critical accounting policies and practices applied by the Organization in its financial statements and our assessment of management's disclosures regarding such policies and practices (including any significant modifications to such disclosures proposed by us but rejected by management), the reasons why certain policies and practices are or are not considered critical, and how current and anticipated future events impact those determinations.*	None.
Significant difficulties encountered in the audit *Any significant difficulties, for example, unreasonable logistical constraints or lack of cooperation by management.*	None.
Disagreements with management *Disagreements, whether or not subsequently resolved, about matters significant to the financial statements or auditor's report. This does not include those that came about based on incomplete facts or preliminary information.*	None.

MATTER TO BE COMMUNICATED	AUDITOR'S RESPONSE
Other findings or issues *Matters significant to oversight of the financial reporting practices by those charged with governance. For example, an entity's failure to obtain the necessary type of audit, such as one under Government Auditing Standards, in addition to GAAS.*	None.
Matters arising from the audit that were discussed with, or the subject of correspondence with, management *Business conditions that might affect risk or discussions regarding accounting practices or application of auditing standards.*	None.
Corrected and uncorrected misstatements *All significant audit adjustments arising from the audit, whether or not recorded by the Organization, that could individually or in the aggregate have a significant effect on the financial statements. We should also inform the Committee about uncorrected misstatements aggregated by us during the current engagement and pertaining to the latest period presented, that were determined by management to be immaterial, both individually and in the aggregate, to the financial statements taken as a whole. Any internal control deficiencies that could have prevented the misstatements.*	None.
Major issues discussed with management prior to retention *Any major accounting, auditing or reporting issues discussed with management in connection with our initial or recurring retention.*	None.
Consultations with other accountants *When management has consulted with other accountants about significant accounting or auditing matters.*	None of which we are aware.
Written representations *A description of the written representations the auditor requested (or a copy of the representation letter).*	See "Management Representation Letter" section.

MATTER TO BE COMMUNICATED	AUDITOR'S RESPONSE
Internal control deficiencies *Any significant deficiencies or material weaknesses in the design or operation of internal control that came to the auditor's attention during the audit.*	None.
Fraud and illegal acts *Fraud involving the Organization Corporate Compliance, Finance & Audit Committee or those responsible for internal controls, or causing a material misstatement of the financial statements, where the auditor determines there is evidence that such fraud may exist. Any illegal acts coming to the auditor's attention involving senior management and any other illegal acts, unless clearly inconsequential.*	We are unaware of any fraud or illegal acts involving management or causing material misstatement of the financial statements.
Other information in documents containing audited financial statements *The external auditor's responsibility for information in a document containing audited financial statements, as well as any procedures performed and the results.*	Our responsibility related to documents (including annual reports, websites, etc.) containing the financial statements is to read the other information to consider whether: • Such information is materially inconsistent with the financial statements; and • We believe such information represents a material misstatement of fact. We have not been provided any such items to date and are unaware of any other documents that contain the audited financial statements.

Accounting Policies, Judgments, & Sensitive Estimates & CRI Comments on Quality

We are required to communicate our judgments about the quality, not just the acceptability, of the Organization's accounting principles as applied in its financial reporting. We are also required to communicate critical accounting policies and sensitive accounting estimates. The Committee may wish to monitor throughout the year the process used to compute and record these accounting estimates. The table below summarizes our communications regarding these matters.

AREA	ACCOUNTING POLICY	CRITICAL POLICY?	JUDGMENTS & SENSITIVE ESTIMATE	COMMENTS ON QUALITY OF ACCOUNTING POLICY & APPLICATION
Fixed Assets	Useful lives of depreciable assets range from 3-7 years and depreciated on a straight-line basis. Leasehold improvements are amortized over the lives of the respective leases or the service lives of the improvements, whichever is shorter.	X	A sensitive estimate for the Organization is the useful lives of fixed assets.	The Organization's policies are in accordance with accounting principles generally accepted in the United States of America (GAAP).
Postretirement Benefits Other Than Pensions	Employees hired before 10/1/2003, also meeting additional conditions, are eligible for postretirement health care. The health coverage includes full coverage from age 60 to 65, if retired, and an annual amount of $4,200 per year funded to an HRA after age 65 in lieu of health coverage.	X	A sensitive estimate for the Organization due to the use of Actuarial calculations.	The Organization's policies are in accordance with accounting principles generally accepted in the United States of America (GAAP).

Clearwater, FL 33765

This representation letter is provided in connection with your audit of the financial statements of Florida Reliability Coordinating Council, Inc., which comprise the statements of financial position as of December 31, 2014, and the related statements of activities and cash flows for the year then ended, and the related notes to the financial statements, for the purpose of expressing an opinion as to whether the financial statements are presented fairly, in all material respects, in accordance with accounting principles generally accepted in the United States (U.S. GAAP).

Certain representations in this letter are described as being limited to matters that are material. Items are considered material, regardless of size, if they involve an omission or misstatement of accounting information that, in light of surrounding circumstances, makes it probable that the judgment of a reasonable person relying on the information would be changed or influenced by the omission or misstatement. An omission or misstatement that is monetarily small in amount could be considered material as a result of qualitative factors.

We confirm, to the best of our knowledge and belief, as of January 29, 2015, the following representations made to you during your audit.

Financial Statements

1) We have fulfilled our responsibilities, as set out in the terms of the audit engagement letter dated August 29, 2014, including our responsibility for the preparation and fair presentation of the financial statements in accordance with U.S. GAAP.

2) The financial statements referred to above are fairly presented in conformity with U.S. GAAP.

3) We acknowledge our responsibility for the design, implementation, and maintenance of internal control relevant to the preparation and fair presentation of financial statements that are free from material misstatement, whether due to fraud or error.

4) We acknowledge our responsibility for the design, implementation, and maintenance of internal control to prevent and detect fraud.

5) Significant assumptions we used in making accounting estimates, including those measured at fair value, are reasonable.

6) Related party relationships and transactions have been appropriately accounted for and disclosed in accordance with U.S. GAAP.

7) All events subsequent to the date of the financial statements and for which U.S. GAAP requires adjustment or disclosure have been adjusted or disclosed.

8) The effects of all known actual or possible litigation, claims, and assessments have been accounted for and disclosed in accordance with U.S. GAAP.

9) Material concentrations have been appropriately disclosed in accordance with U.S. GAAP.

10) Guarantees, whether written or oral, under which the organization is contingently liable, have been properly recorded or disclosed in accordance with U.S. GAAP.

Information Provided

11) We have provided you with:

a) Access to all information, of which we are aware, that is relevant to the preparation and fair presentation of the financial statements, such as records, documentation, and other matters.

b) Additional information that you have requested from us for the purpose of the audit.

c) Unrestricted access to persons within the Organization from whom you determined it necessary to obtain audit evidence.

d) Minutes of the meetings of the governing board or summaries of actions of recent meetings for which minutes have not yet been prepared.

12) All material transactions have been recorded in the accounting records and are reflected in the financial statements.

13) We have disclosed to you the results of our assessment of the risk that the financial statements may be materially misstated as a result of fraud.

14) We have no knowledge of any fraud or suspected fraud that affects the organization and involves:

a) Management,

b) Employees who have significant roles in internal control, or

c) Others where the fraud could have a material effect on the financial statements.

15) We have no knowledge of any allegations of fraud or suspected fraud affecting the organization's financial statements communicated by employees, former employees, grantors, regulators, or others.

16) We have no knowledge of any instances of noncompliance or suspected noncompliance with laws and regulations whose effects should be considered when preparing financial statements.

17) We have disclosed to you all known actual or possible litigation, claims, and assessment whose effects should be considered when preparing the financial statements.

18) We have disclosed to you the identity of the organization's related parties and all the related party relationships and transactions of which we are aware.

19) The organization has satisfactory title to all owned assets, and there are no liens or encumbrances on such assets nor has any asset been pledged as collateral.

20) We are responsible for compliance with the laws, regulations, and provisions of contracts and grant agreements applicable to us.

21) Florida Reliability Coordinating Council, Inc. is an exempt organization under Section 501(c)6 of the Internal Revenue Code. Any activities of which we are aware that would jeopardize the Organization's tax-exempt status, and all activities subject to tax on unrelated business income or excise or other tax, have been disclosed to you. All required filings with tax authorities are up-to-date.

22) We acknowledge our responsibility for presenting the Statutory and Non-statutory schedules ('supplementary information") in accordance with U.S. GAAP, and we believe the supplementary information, including its form and content, is fairly presented in accordance with U.S. GAAP. The methods of measurement and presentation of the Statutory and Non-statutory schedules have not changed from those used in the prior period, and we have disclosed to you any significant assumptions or interpretations underlying the measurement and presentation of the supplementary information.

Communication of Internal Control Related Matters

The Corporate Compliance, Finance & Audit Committee
Florida Reliability Coordinating Council, Inc.

In planning and performing our audit of the financial statements of Florida Reliability Coordinating Council, Inc. as of and for the year ended December 31, 2014, in accordance with auditing standards generally accepted in the United States of America, we considered the Organization's internal control over financial reporting (internal control) as a basis for designing audit procedures that are appropriate in the circumstances for the purpose of expressing our opinion on the financial statements, but not for the purpose of expressing an opinion on the effectiveness of the Organization's internal control. Accordingly, we do not express an opinion on the effectiveness of the Organization's internal control.

A deficiency in internal control exists when the design or operation of a control does not allow management or employees, in the normal course of performing their assigned functions, to prevent, or detect and correct, misstatements on a timely basis. A material weakness is a deficiency, or a combination of deficiencies, in internal control, such that there is a reasonable possibility that a material misstatement of the organization's financial statements will not be prevented, or detected and corrected, on a timely basis.

Our consideration of internal control was for the limited purpose described in the first paragraph and was not designed to identify all deficiencies in internal control that might be material weaknesses. Given these limitations, during our audit we did not identify any deficiencies in internal control that we consider to be material weaknesses. However, material weaknesses may exist that have not been identified.

This communication is intended solely for the information and use of the Committee and management of the Organization and is not intended to be, and should not be, used by anyone other than these specified parties.

Summary of Financials and Resources

MRO staff reports the audited final numbers for 2014 to be 1.34% under budget. Prior to the annual actuarial calculation of post-retirement medical benefit obligation (discount rate, expected rate of return on plan assets and health care cost trend rate), MRO staff reported 2014 expenses to be 2.55% under budget.

While MRO was under budget, MRO staff believes the principal responsibilities under the delegation agreement were met in 2014. Some highlights:

- Conducted twelve audits, including six combined CIP/operations and planning audits and one joint audit lead by another Regional Entity
- Closed 184 instances of noncompliance (violations, remediated issues, or compliance exceptions) in 2014, reducing the numbers of days in CMEP processing from 533 in 2013 to 165 days by the end of 2014, an improvement of 368 days (over 300%)
- Processed 15 revisions to registration
- Completed the seasonal and long-term reliability assessments for the year
- Provided oversight on the analysis of 14 events in the region. Data was collected for the metrics developed on the events and causes, as well as for the performance of protection systems, and assessed situation awareness information provided by Registered Entities.
- Organized and completed several workshops in support of regional reliability, in addition to other outreach activities
- Contributed to numerous NERC working groups, including 3,389 staff hours to the Reliability Assurance Initiative

As requested, the year-to-date variances greater than $10,000 and 10 percent are explained below, as well as expenses not budgeted.

Personnel Expenses (Actual - $166,189 (-2.41%) under budget)
Although total Personnel Expenses were only 2.41% under budget, Savings & Retirement expense was $132,118 (13.63%) under budget because the annual post-retirement adjustment reduced the net periodic cost for 2014 provided by third party advisors.

Meeting and Travel Expenses (Actual - $127,074 (-18.17%) under budget)
Meeting expenses were under budget by $21,283. Staff is able to host more meetings in the new MRO facility. Eliminating the rental costs of meeting rooms and audio visual equipment, as well as lowering catering costs, reduced costs more than anticipated.

Travel expenses were under budget by $106,042. Greater than budgeted internally-hosted meetings reduced travel. Other contributing factors included: shorter duration of on-site audits and participation by fewer auditors; in-person participation in fewer working group meetings; and attendance at fewer NERC Board of Trustee meetings.

Conference call expenses were over budget by $251. Back-up service for conferencing was not budgeted for in 2014.

Consultants & Contracts (Actual – $386,095 (71.09%) over budget)
MRO had an increase in consultant use due to the upgrade of MRO's website, the implementation of SharePoint, and the use of a recruiter for certain positions. The costs incurred for these unbudgeted items were offset by reductions in other areas, most notably a decrease in the need for capital expenditures. By accelerating capital expenditures in late 2013, MRO was able to partially offset the 2014 overage in consulting and contracts.

Office Costs (Actual - $52,756 (-10.49%) under budget)
Training costs were lower than budget partially due to dollars being budgeted in the discretionary tuition reimbursement program that were not pursued by staff in 2014. Additionally, staff is encouraged if possible to take training locally. Finally, when staff has more than one certification or required CEUs in more than one area, they are strongly encouraged to seek training opportunities that can be applied to more than one area.

Professional Services (Actual - $91,030 (-44.40%) under budget)
External professional services are difficult to project because of the nature of these costs. Normally, costs are incurred in response to specific situations that develop. For 2014, the need for external professional services, including legal services and the time of independent MRO board members, was less than anticipated.

Other Non-Operating Expenses (Actual - $241,454 over budget)
The actuarial assessment of the post-retirement medical plan benefit obligation resulted in a reduction of costs of $241k.

Fixed Assets (Actual - $295,792 under budget)
By accelerating capital expenditures in late 2013 there was a decrease in the need for capital expenditures in 2014. Facility reconfigurations were pushed into a future date in order to offset the 2014 excess costs in other areas.

Change in Assets and Year-End
MRO was under budget by $131k as explained above, resulting in a $131k increase in Working Capital.

MRO had no non-statutory activities in 2104; therefore, there were no allocations of costs between statutory and non-statutory activities and no statutory funds were used for non-statutory purposes.

FTEs	**19.8**	**21.3**	(1.5)	**-6.91%**

Explanation of Variance greater than $10,000 and 10 percent; as well as expenses not budgeted

Personnel Expenses

- Employee Benefits: Medical premiums were budgeted at a 5% increase but the 2014 actuals came in flat.
- Savings & Retirement: Annual post-retirement adjustment reduced the net periodic cost for 2014 provided by third party advisors.

Meeting Expenses

- Reduced travel costs due to shorter duration of on-site audits and participation by fewer auditors; in-person participation in fewer working group meetings; and attendance at fewer NERC Board of Trustee meetings.

Operating Expenses

Consultants and Contracts

- Multiple regions shared the cost of changes required in the information tracking applications which resulted in lower costs to MRO. By sharing these costs among the regions, each region benefited from the economy of scale.

Office Costs

- Less office costs related to training. Training costs were lower than budget partially due to dollars being budgeted in the discretionary tuition reimbursement program that were not pursued by staff in 2014. Additionally, staff is encouraged if possible to take training locally. Finally, when staff has more than one certification or required CEUs in more than one area, they are strongly encouraged to seek training opportunities that can be applied to more than one area.

Other Non-Operating Expenses

N/A

Fixed Asset Additions

Total actual fixed costs were under budget; therefore, there were less asset costs than budgeted allocated to this program.

Change in Working Capital (A-B-C)	**414,362**	-	**414,362**	
FTEs	**7.6**	**6.5**	1.1	**16.33%**

Explanation of Variance greater than $10,000 and 10 percent; as well as expenses not budgeted

Personnel Expenses

- More personnel costs associated with the event analysis function than what was budgeted. The additional costs in this program were offset in the other program areas. The variance also reflects the attendance at the NERC level activities previously charged under program Forums (1100) as explained below under Meeting Expenses.

Meeting Expenses

- Due to the increased number of activities in this area there was more travel than anticipated. Activities included but were not limited to BES, RAPA, and Event Analysis meetings at the NERC level. MRO staff attendance at NERC level activities that was originally budgeted under program Forums (1100) was charged to RAPA after 06/30/2013 based on the treatment by the other regions. This impacted the 2014 actual to budget variance since the 2014 BP&B was MRO Board approved in June 2013.
- Back-up service for conferencing was not budgeted for.

Operating Expenses

Consultants and Contracts

- RAPA has three contracts that are budgeted based on an estimated number of required hours; actual hours can fluctuate greatly. Fewer hours were required under these contracts in 2014 than was anticipated.

Office Costs

- Dropped NAESB membership because the benefits of membership did not justify the costs.

Indirect Expenses

- Reflects the higher than budgeted FTE since the indirect expenses are spread on a FTE basis.

Other Non-Operating Expenses

N/A

Fixed Asset Additions

- Total actual fixed costs were under budget; therefore, there were less asset costs than budgeted allocated to this program.

Meeting Expenses

- One staff and two MRO representatives attended NERC CIPC quarterly meetings. These costs were not budgeted for in 2014.

Other Non-Operating Expenses

N/A

6. Administrative Services

Methodology for Allocation of Administrative Services Expenses to Programs

All expenses for the Administrative Services Programs, referred to as indirect expenses, are allocated to the delegated program areas based on their respective number of FTEs. This allocation provides improved financial perspective for the delegated functions.

Eliminated 07/01/2013 to conform to how other regions are recording NERC participation. All other regions and NERC record costs in the program of the participant. We will track NERC time separately. This impacted the 2014 actual versus budget variance since the 2014 BP&B was MRO Board approved in June 2013.

Personnel Expenses

- Actuals are substantially below budget because as of 7/1/2013 MRO stopped recording costs to Member Forums. Please see above comment for details.

Meeting Expenses

- Actuals are substantially below budget because as of 7/1/2013 MRO stopped recording costs to Member Forums. Please see above comment for details.

Operating Expenses

- Actuals are substantially below budget because as of 7/1/2013 MRO stopped recording costs to Member Forums. Please see above comment for details.

Indirect Expenses

- Actuals are substantially below budget because as of 7/1/2013 MRO stopped recording costs to Member Forums. Please see above comment for details.

FTEs	**1.7**	**1.9**	(0.2)	**-10.82%**

Explanation of Variance greater than $10,000 and 10 percent; as well as expenses not budgeted

Personnel Expenses

- MRO staff attendance at the Board of Trustees that was budgeted under program Forums (1100) was charged to G&A after 06/30/2013 based on the treatment by the other regions. This impacted the 2014 actual versus budget variance since the 2014 BP&B was MRO Board approved in June 2013.

Meeting Expenses

- Approximately the same number of meetings at a much lower cost due to hosting at MRO's facility. Savings resulted from eliminating meeting room and audio visual rental costs as well as lowering catering costs.
- The BOT travel that was budgeted under program Forums (1100) was charged to G&A after 06/30/2013 based on the treatment by the other regions.
- Back-up service for conferencing was not budgeted for.

Operating Expenses

Professional Services

- Dollars were budgeted for the Independent Board members whose activities fluctuate based on need. In 2014, the Independent Board members were required to spend less time than was anticipated.

Indirect Expenses

- Expenses related to indirect programs have been allocated proportionately based on FTE count to the direct programs.

Other Non-Operating Expenses

N/A

FTEs		**4.2**	**3.1**	1.1	**35.46%**

Explanation of Variance greater than $10,000 and 10 percent; as well as expenses not budgeted

Personnel Expenses

- Senior management time charged to the IT area was greater than budgeted because MRO began several significant projects: SharePoint, Website and Lync.

Operating Expenses

Consultants and Contracts

- Unbudgeted upgrade of MRO's website and implementation of SharePoint.

Indirect Expenses

- Expenses related to indirect programs have been allocated proportionately based on FTE count to the direct programs.

Other Non-Operating Expenses

N/A

Fixed Asset Additions

- By accelerating capital expenditures in late 2013 there was a decrease in the need for capital expenditures in 2014.
- Total actual fixed costs were under budget; therefore, there were less asset costs than budgeted allocated to this program.

6e. Human Resources

Human Resources costs are included in Finance and Accounting.

Operating Expenses

Consultants and Contracts

- MRO used outside recruiters for certain positions.

Professional Services

- The IT audit scope was charged through the IT program; however, this had been budgeted for in the Finance and Accounting program.

Indirect Expenses

- Expenses related to indirect programs have been allocated proportionately based on FTE count to the direct programs.

Other Non-Operating Expenses

- Trending in higher medical premiums and a 2014 new mortality rate increasing life expectancy increased the required balance for 2014 provided by third party advisors.

Fixed Asset Additions

- Facility reconfigurations were pushed into a future date in order to offset the 2014 excess costs in consultants and contracts.
- Total actual fixed costs were under budget; therefore, there were less asset costs than budgeted allocated to this program.

Section B — Supplemental Financial Information

INDEPENDENT AUDITORS' REPORT

To the Board of Directors and Members
Midwest Reliability Organization
Saint Paul, Minnesota

We have audited the accompanying financial statements of Midwest Reliability Organization (the "Organization"), which comprise the statements of financial position as of December 31, 2014 and 2013, and the related statements of activities and cash flows for the years then ended, and the related notes to the financial statements.

Management's Responsibility for the Financial Statements

Management is responsible for the preparation and fair presentation of these financial statements in accordance with accounting principles generally accepted in the United States of America; this includes the design, implementation, and maintenance of internal control relevant to the preparation and fair presentation of financial statements that are free from material misstatement, whether due to fraud or error.

Auditors' Responsibility

Our responsibility is to express an opinion on these financial statements based on our audits. We conducted our audits in accordance with auditing standards generally accepted in the United States of America. Those standards require that we plan and perform the audits to obtain reasonable assurance about whether the financial statements are free from material misstatement.

An audit involves performing procedures to obtain audit evidence about the amounts and disclosures in the financial statements. The procedures selected depend on the auditors' judgment, including the assessment of the risks of material misstatement of the financial statements, whether due to fraud or error. In making those risk assessments, the auditor considers internal control relevant to the entity's preparation and fair presentation of the financial statements in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the entity's internal control. Accordingly, we express no such opinion. An audit also includes evaluating the appropriateness of accounting policies used and the reasonableness of significant accounting estimates made by management, as well as evaluating the overall presentation of the financial statements.

We believe that the audit evidence we have obtained is sufficient and appropriate to provide a basis for our audit opinion.

Opinion

In our opinion, the financial statements referred to above present fairly, in all material respects, the financial position of the Organization as of December 31, 2014 and 2013, and the changes in its net assets and its cash flows for the years then ended in accordance with accounting principles generally accepted in the United States of America.

NOTE 1 - SIGNIFICANT ACCOUNTING POLICIES

Services

Midwest Reliability Organization (or the "Organization") is a nonprofit organization dedicated to ensuring the reliability of the bulk power system in the north-central part of North America. The Organization is a Regional Entity under the Energy Policy Act of 2005 (United States) and operates under delegated authority from the Federal Energy Regulatory Commission (FERC) via a delegation agreement with the North American Reliability Corporation. Additionally, the Organization operates in the provinces of Saskatchewan and Manitoba through other agreements. The primary focus of the Organization is ensuring compliance with reliability standards utilizing open, fair processes in the public interest and providing assessments on bulk power system reliability. In addition to the Board of Directors, Midwest Reliability Organization has formed four standing committees: Compliance Committee, Planning Committee, Operating Committee and the Standards Committee. The Board of Directors has four committees: Finance and Audit Committee, Governance and Personnel Committee, Dispute Resolution Committee and Hearing Body Committee.

Cash and Cash Equivalents

The Organization considers all highly liquid investments with original maturities of three months or less to be cash equivalents. Cash and cash equivalents are held by one financial institution, Wells Fargo, in three accounts. Escrowed amounts resulting from penalties assessed and collected in the United States are segregated into a separate account and reported as restricted cash on the statement of financial position.

Receivables

Receivables, if any, result primarily from assessments related to load serving entities (members and nonmembers). No allowance for doubtful accounts is recorded based on historical experience and management's evaluation of receivables. Bad debts are expensed when deemed uncollectible. Receivables are generally unsecured.

Property, Improvements and Equipment

Property, improvements and equipment are stated at cost less accumulated depreciation and amortization. Significant additions or improvements exceeding $3,000 are capitalized for the years ended December 31, 2014 and 2013, while expenditures for maintenance and repairs are charged to operations as incurred. Depreciation is recorded using the straight-line method over the estimated useful lives of the assets, ranging from three to seven years. Leasehold improvements are amortized using the straight-line method over the shorter of the estimated useful life or the remaining lease term. The cost and related accumulated depreciation of assets sold or disposed of are removed from the accounts, and the resulting gain or loss is included in operations.

Capitalized Software Costs

The Organization capitalizes software development costs incurred and purchased software in upgrading computer software used internally to serve its members. The Organization begins capitalization of these costs after technological feasibility has been determined. The capitalized software, once placed in service, is amortized on the straight-line method over its estimated useful life of three years. Accumulated amortization totaled $522,839 and $439,510 for the years ended December 31, 2014 and 2013, respectively. Amortization expense totaled $83,329 and $55,411 for the years ended December 31, 2014 and 2013, respectively.

NOTE 1 - SIGNIFICANT ACCOUNTING POLICIES (Continued)

Deferred Assessments

Deferred assessments represents penalty assessments paid by load-serving entities, which will be used to offset budget allocations received from NERC.

Tax Status

The Internal Revenue Service has determined that the Organization is exempt from federal income taxes under Section 501(c)(6) of the Internal Revenue Code. They are also exempt from state income taxes. However, any unrelated business income may be subject to taxation.

The Organization follows the accounting standards for contingencies in evaluating uncertain tax positions. This guidance prescribes recognition threshold principles for the financial statement recognition of tax positions taken or expected to be taken on a tax return that are not certain to be realized. No liability has been recognized by the Organization for uncertain tax positions as of December 31, 2014 and 2013. The Organization's tax returns are subject to review and examination by federal and state authorities. The tax returns for the current year as well as fiscal years 2011 and thereafter are open to examination by federal and state authorities.

Revenue and Assessments

The Organization receives its revenues from NERC through a net energy-to-load allocation for all load-serving entities within its geographical area. The revenue allocation is prescribed under the Energy Policy Act of 2005 in the United States and similar arrangements in Saskatchewan and Manitoba. Any other revenues are collected on a fee-for-service basis at no cost, if applicable.

Use of Estimates

The preparation of financial statements in conformity with accounting principles generally accepted in the United States of America requires management to make estimates and assumptions that affect the reported amounts of assets and liabilities and disclosure of contingent assets and liabilities at the date of the financial statements and the reported amounts of revenues and expenses during the reporting period. Actual results could differ from those estimates.

Subsequent Events

The Organization has evaluated subsequent events through April 2, 2015, which is the date that the financial statements were approved and available to be issued.

NOTE 2 - NERC TRANSACTIONS

The Organization has entered into a delegation agreement with the North American Electric Reliability Corporation ("NERC") to enforce the Reliability Standards as set by NERC within a designated region. In connection with the current delegation agreement, the Organization has the ability to propose Reliability Standards and Regional Variances. The Organization has the authority to enforce the Reliability Standards as set by NERC and approved by regulatory authorities within the geographic boundaries. The Organization is subject to oversight from NERC and applicable regulations in the United States, Manitoba, and Saskatchewan.

To ensure the delegated functions have reasonable funding, NERC is to fund the Organization with the monies necessary to carry out its activities as per the agreement. A formula is devised that equitably allocates charges among the end users within the boundaries served by the Organization, based on net energy for load or through such other formula as provided. The Organization provides NERC with a board approved annual operating budget on or before June 30 of each year. Budgeted revenues from NERC were $8,741,442 and $9,098,927 for the years ended December 31, 2014 and 2013, respectively, which agree with the amounts received.

NOTE 3 - LEASE COMMITMENTS

The Organization has an operating lease for office space in St Paul, Minnesota. Rent expense was $237,745 for the years ended December 31, 2014 and 2013, respectively.

Future expected minimum lease payments under the lease as of December 31, 2014 are as follows:

Years Ending December 31	
2015	$ 266,514
2016	274,537
2017	282,812
2018	291,277
2019	300,058
Thereafter	900,078
	$ 2,315,276

NOTE 4 - PROPERTY, IMPROVEMENTS AND EQUIPMENT

The following is a schedule of property, improvements and equipment as of December 31:

	2014	2013
Equipment	$ 1,795,454	$ 1,731,631
Furniture	429,772	422,802
Leasehold improvements	328,136	321,206
	2,553,362	2,475,639
Less: Accumulated depreciation	(1,675,671)	(1,281,070)
Net Property, Improvements and Equipment	$ 877,691	$ 1,194,569

NOTE 5 - LINE OF CREDIT

The Organization has a revolving line of credit from National Cooperative Service Corporation (NCSC) with an established credit limit of $2,000,000. The interest rate is equal to the NCSC Line of Credit Rate in effect from time to time, not to exceed the Prevailing Bank Prime Rate as published in the "Money Rates" column of the eastern edition of the *Wall Street Journal* on the publication day immediately preceding the day on which an adjustment in the interest rate becomes effective. The Organization is required to maintain a Debt Service Coverage Ratio of not less than 1.00. The line of credit is secured by substantially all assets of the Organization, and expires on February 26, 2017. There were no outstanding balances at December 31, 2014 or 2013, respectively.

NOTE 6 - RETIREMENT PLANS

Postretirement Health Plan

The Organization has a defined benefit postretirement health plan available to eligible current and future retirees. Information regarding the plan as of December 31 was as follows:

	2014	2013
Change in projected benefit obligation		
Benefit obligation at beginning of year	$ 882,395	$ 880,141
Service cost	161,535	169,757
Interest cost	44,340	36,195
Actuarial (gain) loss	163,942	(200,476)
Benefits paid	(4,564)	(3,222)
Benefit obligation at end of year	1,247,648	882,395
Change in plan assets		
Fair value of plan assets at beginning of year	729,224	532,807
Actual return on plan assets	7,851	59,097
Employer contribution	104,841	140,542
Benefits paid	(4,564)	(3,222)
Fair value of plan assets at end of year	837,352	729,224
Unfunded status recognized as a noncurrent liability	$ (410,296)	$ (153,171)
Weighted average assumptions used to calculate the benefit obligation-discount rate	4.01%	5.04%

Net periodic postretirement benefit expense for the years ending December 31 is comprised of the following:

	2014	2013
Components of net periodic benefit cost		
Service cost	$ 161,535	$ 169,757
Interest cost	44,340	36,195
Expected return on plan assets	(46,762)	(35,073)
Amortization of prior service credit	(38,601)	(38,601)
Amortization of actuarial loss	-	8,405
Net periodic benefit cost	$ 120,512	$ 140,683
Weighted-average assumptions used to calculate the net periodic benefit cost		
Discount rate	5.04%	4.12%
Expected return on plan assets	6.00%	6.00%
Rate of compensation increases	N/A	N/A

The expected rates of return on plan assets are based on the weighting of the Organization's asset allocations, the 30-year rolling historical average returns, and recent historical average return.

NOTE 6 - RETIREMENT PLANS (Continued)

Assumed health care cost trend rates used to determine the benefit obligation at December 31 consist of the following:

	2014	2013
Health care cost trend rate assumed for next year	9.3%	9.7%
Rate to which the cost trend rate is assumed to decline (the ultimate trend rate)	5.0%	5.0%
Year that the rate reaches the ultimate trend rate	2025	2025

Assumed health care cost trend rates have a significant effect on the amounts reported for the health care plan. A one-percentage point change in assumed health care trend rates would have the following effects:

	One-Percentage Point	
	Increase	Decrease
Effect on total of service cost and interest cost	$ 57,867	$ (42,703)
Effect on postretirement benefit obligation	304,331	(230,340)

Plan related changes other than net periodic cost included in retirement benefit expense:

	2014	2013
Actuarial (gain) loss arising during the year	$ 202,853	$ (232,905)
Amortization of prior year service cost	38,601	38,601
	$ 241,454	$ (194,304)

The Organization employs a total return investment approach for plan assets with a mix of equity and debt investments used to maximize the long-term appreciation of plan assets for a prudent level of risk. The Organization's plan assets are invested in various funds, which consist of both stocks and bonds. The equity component includes investment in companies of various sizes, with an emphasis on large cap stocks, and represents several investment styles. The equity portion also includes an allocation to international stocks. Investments in bonds are diversified into three portfolios that invest mainly in U.S. treasuries, high quality corporate issues and mortgage securities.

Percentage of fair value by investment category at December 31, are as follows:

	2014	2013
Equity Securities	35%	36%
Debt Securities	44%	53%
Other	21%	11%

NOTE 6 - RETIREMENT PLANS (Continued)

The fair values of the Organization's postretirement health plan assets at December 31, by asset category, are as follows:

	2014 Quoted Prices in Active Markets for Identical Assets (Level 1)	2013 Quoted Prices in Active Markets for Identical Assets (Level 1)
Asset category		
Cash equivalents	$ 8,906	$ 7,490
Mutual funds-bonds	372,528	383,724
Mutual funds-equities	290,396	265,854
Mutual funds-balanced	165,522	72,156
	$ 837,352	$ 729,224

Cash equivalents - Investments in cash equivalents consist of money market funds and are classified as Level 1 as they are traded in an active market for which closing prices are readily available.

Mutual Funds - Investments in mutual funds are classified as Level 1 as they are traded in an active market for which closing prices are readily available.

There have been no changes in the fair market valuation techniques and inputs as of December 31, 2014 and 2013.

While the plan believes its valuation methods are appropriate and consistent with other market participants, the use of different methodologies or assumptions to determine the fair value of certain financial instruments could result in a different estimate of fair value at the reporting date.

Estimated future benefit payments (which reflect expected future service, as appropriate) as of December 31, 2014 are as follows:

Years Ending December 31	
2015	$ 5,530
2016	6,637
2017	11,083
2018	20,405
2019	33,685
2020 - 2024	317,779

It is reasonably possible that changes in these estimates could occur in the near term and that actual results could differ from these estimates and could have a material effect on the financial statements.

The Organization expects to contribute $100,967 to the plan in 2015.

NOTE 6 - RETIREMENT PLANS (Continued)

Defined Contribution Pension Plan

The Organization has a thrift savings plan to replace the terminated multiple-employer plan for the benefit of its employees. The Organization's previous 401(k) plan was converted into the new plan as well as the establishment of a new, non-elective employer contribution plan. In order to participate in the plan, employees must have attained age 20 and have completed one month of service. Employees may contribute up to the IRS limitations for their elective deferral, with a 50% matching contribution from the Organization. For employees to receive the non-elective or employer contribution, they must have worked 1,000 hours during the plan year. The Organization matched $255,776 and $241,044 of employee deferrals as of December 31, 2014 and 2013, respectively. In addition, the Organization elected to make an employer contribution in the amount of $430,111 and $370,263 for the years ended December 31, 2014 and 2013, respectively.

The Organization also has a 457B plan. Eligible employees may contribute an elective deferral, with a discretionary matching contribution from the Organization. Employee contributions were $20,875 and $16,226, for the years ended December 31, 2014 and 2013, respectively. The Organization matched $10,438 and $6,675, of employee deferrals for the years ended December 31, 2014 and 2013, respectively.

The Organization also has a 457F plan. Employer contribution amounts for employees in excess of IRS contribution limits are deposited to the 457F. The Organization contributed in the amounts of $23,117 and $20,950, for the years ended December 31, 2014 and 2013, respectively.

Attention: Mr. Michael Walker

Subject: NPCC 2014 True Up Actual vs. Budget Variance Analysis
True Up Filing Based on Audited 2014 Financial Statements

Dear Michael:

Enclosed is the Northeast Power Coordinating Council, Inc. (NPCC) submittal regarding the 2014 NPCC actual vs. budget variances. NPCC's independent audit performed by Pricewaterhouse Coopers LLP was concluded on March 27, 2015 and forwarded to NERC for its information and provision to FERC.

As you know, NPCC is a Cross-border Regional Entity which provides Regional Entity functions and services through its regional entity (RE) division. The establishment of Regionally-specific criteria, and monitoring and enforcement of compliance with such criteria are provided through the criteria services (CS) division of NPCC. The CS division is funded by assessments to the Independent System Operators/Balancing Authority Areas within the Region based on their respective Net Energy for Load.

No Regional Entity division assessments were used to fund CS division activities. Allocation between the RE division and CS division represents a 95/5 split for 2014 based upon total corporate FTEs of 36.86 in the RE division and 2.14 in the CS division. No indirect costs were allocated from the CS division to the RE division and no cross subsidies exist. In addition, NPCC does not budget for interest income and reports such income apportioned based upon its Regional Entity (RE) and Criteria Services (CS) division full time equivalent (FTE) ratio.

Actual total expenses for NPCC's RE division for 2014 were $13,777,528 (excluding non-operating expenses which represent change in pension liability on a termination basis vs. liability for the plan on an ongoing basis consistent with actuarial review and a Board of Directors approved additional contribution to the pension plan associated with plan termination initiated due to cross-testing IRS rules) which is $493,479 or 3.5% under the 2014 operating budget of $14,271,007. Actual total expenses for NPCC's CS division for 2014 were $1,084,317 (excluding non-operating expenses) which is $4,783 or 0.4% under the 2014 operating budget of $1,089,100. In the aggregate, actual total expenses (excluding non-operating expenses) for the NPCC RE and CS divisions were $14,861,847 which is $498,260 or 3.2% under the 2014 total corporate budget of $15,360,107. Indirect expenses are allocated to the direct programs based on FTE ratio. As approved by its Board of Directors, NPCC used reserves in the amount of $2,500,000 in order to increase the funded level of the pension plan closer to projected liabilities based upon 2014 mortality tables and segmented interest rate assumptions. NPCC filed the IRS required documentation in December, 2014 to facilitate pension plan termination. Operating cash reserves were not used to fund any other activities or services in 2014.

Variances from budget in total for NPCC, total non-statutory, total statutory and total by statutory program area are provided on a line-item basis using the template provided by NERC which presents actual and budgeted costs on program-by-program format. A single consolidated budget versus actual cost comparison is presented for Administrative Services in order to be consistent with the presentation in NPCC's 2014 Business Plan and Budget. Explanations of significant expense variances are provided for the Regional Entity division in total and by program area where the explanation differs from that for the Regional Entity total.

Should you have any questions please do not hesitate to contact me via email at jhala@npcc.org or via telephone at (212) 840-1070.

Sincerely,

Jessica Hala

TOTAL NPCC

Personnel Expenses

In 2014 NPCC experienced several partial year vacancies but ended the year fully staffed. These vacancies resulted in lower salary and associated incentive compensation. Despite not being at a full staff complement at times during the year, NPCC performed all of its 2014 delegated responsibilities as well as its goals and objectives, including:

- Conducted 33 off-site Operations & Planning (O&P) audits, five on-site O&P audits, 31 off-site CIP audits, seven on-site CIP audits and 473 individual spot checks were performed involving 35 registered entities;
- Processed 201 Technical Feasibility Exception (TFE) submittals from 19 registered entities: 123 new TFEs, 59 Material Change Reports(MCRs) and 19 Terminations for TFEs;
- Closed 140 violations;
- Accepted mitigation plans for 72 violations;
- Examined 85 events of which five were category two or higher;
- Processed 20 new entity registrations, 18 deactivations, 8 entity name changes and three certification reviews.

In the benefits area, NPCC was able to trim insurance renewal expenses resulting in significant cost savings. Additionally, a substantial number of professionals continue to waive health insurance coverage opting for superior coverage from a prior employer or spousal insurance coverages.

WECC CEA Revenue and Expenses

WECC CEA related expenses and offsetting revenue of $5,245 were related to the O&P and CIP audits conducted during 2012. The total actual expenses related to the WECC audits were trued up with WECC in 2014, as per the CEA Agreement.

Meeting Expenses

Continued efforts to limit the number of attendees sent to off-site meetings, and to hold more meetings onsite or via webinar where effective, have kept meeting, travel and conference call expenses under budget. Conference calls underage was also based on lower negotiated rates with a new provider and credit negotiated for service interruption.

Consultants and Contracts

Overage is primarily due to additional use of consultants in the Reliability Assessment and Performance Analysis (RAPA) program area related to implementation of the revised BES definition and providing BESnet support to NERC; added use of contractors in the Compliance program during periods of staff vacancy; and additional efforts related to system frequency response and generator governor response and the implementation of the NPCC program for the Simultaneous Activation of Reserve (SAR) in the Situation Awareness and Infrastructure Security program.

Miscellaneous

Under budget due to ongoing cost cutting efforts in all areas.

Depreciation

Over budget due to additional assets placed in service related to CMEP Data Administration Application (CDAA) software development to enhance the efficiencies of compliance activities for both registered entities and Regional Entity staffs.

Non-Operating Expenses

Changes in NPCC's pension liability based on actuarial report are reflected in the non-operating expense line.

Fixed Assets

Computer & Software capital expenditures were under budget due to a portion of costs related to CMEP Data Administration Application (CDAA) software being expensed rather than capitalized based on GAAP. Equipment capital expenditure represents the write off of old equipment during 2014.

Compliance Hearings

No funds were budgeted in association with NPCC conducting compliance hearings and no hearings have been initiated to date in NPCC.

COMPLIANCE OPERATIONS, ENFORCEMENT and ORGANIZATION REGISTRATION

Personnel
Under budget due to temporary vacancies during the year and at risk compensation component based on corporate goal attainment and individual performance. Fully staffed at year end.

Consultants and Contracts
Overage is primarily due to additional use of contractors during periods of staff vacancy.

Office Costs
Over budget due to costs related to CMEP Data Administration Application (CDAA) software ongoing maintenance being expensed rather than capitalized based on GAAP.

Fixed Assets
Computer & Software capital expenditures were under budget due to a portion of costs related to CMEP Data Administration Application (CDAA) software being expensed rather than capitalized based on GAAP.

RELIABILITY ASSESSMENTS and PERFORMANCE ANALYSIS

Personnel

Under budget due to temporary vacancies during the year and at risk compensation component based on corporate goal attainment and individual performance. Fully staffed at year end.

Consultants and Contracts

Overage is primarily due to additional use of consultants in the Reliability Assessment and Performance Analysis (RAPA) program area related to implementation of the revised BES definition and providing BESnet support to NERC.

ADMINISTRATIVE SERVICES

Interest Income
Interest income, while not budgeted, was allocated by FTE ratio between statutory and non-statutory.

Consultants and Contracts
Under budget as a result of judicious use of contractor and consultant services to complement staff functions.

Miscellaneous
Under budget due to ongoing cost cutting efforts in all areas.

Depreciation
Over budget due to additional assets placed in service related to CMEP Data Administration Application (CDAA) software development to enhance the efficiencies of compliance activities for both registered entities and Regional Entity staffs.

Fixed Assets
Computer & Software capital expenditures were under budget due to a portion of costs related to CMEP Data Administration Application (CDAA) software being expensed rather than capitalized based on GAAP. Equipment capital expenditure represents the write off of old equipment during 2014.

Independent Auditor's Report

To the Board of Directors and the Members of
Northeast Power Coordinating Council, Inc.

We have audited the accompanying financial statements of Northeast Power Coordinating Council, Inc., which comprise the balance sheets as of December 31, 2014 and December 31, 2013, and the related change in net assets and cash flows for the years then ended.

Management's Responsibility for the Financial Statements

Management is responsible for the preparation and fair presentation of the financial statements in accordance with accounting principles generally accepted in the United States of America; this includes the design, implementation, and maintenance of internal control relevant to the preparation and fair presentation of financial statements that are free from material misstatement, whether due to fraud or error.

Auditor's Responsibility

Our responsibility is to express an opinion on the financial statements based on our audits. We conducted our audits in accordance with auditing standards generally accepted in the United States of America. Those standards require that we plan and perform the audit to obtain reasonable assurance about whether the financial statements are free from material misstatement.

An audit involves performing procedures to obtain audit evidence about the amounts and disclosures in the financial statements. The procedures selected depend on our judgment, including the assessment of the risks of material misstatement of the financial statements, whether due to fraud or error. In making those risk assessments, we consider internal control relevant to the Company's preparation and fair presentation of the financial statements in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the Company's internal control. Accordingly, we express no such opinion. An audit also includes evaluating the appropriateness of accounting policies used and the reasonableness of significant accounting estimates made by management, as well as evaluating the overall presentation of the financial statements. We believe that the audit evidence we have obtained is sufficient and appropriate to provide a basis for our audit opinion.

Opinion

In our opinion, the financial statements referred to above present fairly, in all material respects, the financial position of Northeast Power Coordinating Council, Inc. at December 31, 2014 and December 31, 2013, and the results of its operations and its cash flows for the years then ended in accordance with accounting principles generally accepted in the United States of America.

1. Background

Northeast Power Coordinating Council, Inc. ("NPCC" or the "Company") is a New York State not-for-profit corporation whose purpose is to promote and enhance the reliable and efficient operation of the international, interconnected bulk power system in Northeastern North America through its regional entity and criteria services divisions. The Company's regional entity division is responsible for the development of regional reliability standards and compliance assessment and enforcement of continent-wide and regional reliability standards, coordination of system planning, design and operations, and assessment of reliability. These responsibilities are pursuant to an agreement with the North American Electric Reliability Corporation ("NERC"), an Electric Reliability Organization ("ERO"), under authority of the U.S. Federal Energy Regulatory Commission ("FERC"), and by Memoranda of Understanding with applicable Canadian Provincial regulatory and/or governmental authorities. The Company's criteria services division establishes regionally-specific criteria, and monitors and enforces compliance with such criteria. In the development of regionally-specific reliability criteria, the Company, to the extent possible, facilitates attainment of fair, effective and efficient competitive electric markets.

The Company is primarily funded through the NERC based on the regional entity division annual business plan and budget submitted to and approved by the FERC and Canadian provincial regulatory and/or governmental authorities. The Company's criteria services division is funded by regional independent system operators or balancing authority areas and operates on assessments to and funded from these entities based upon a "Net Energy for Load" formula.

2. Summary of Significant Accounting Policies

Basis of Accounting

For the years ended December 31, 2014 and 2013, the Company used the accrual basis of accounting in conformity with accounting principles generally accepted in the United States of America.

Cash

The Company's cash balance consists of its operating checking account, as well as a savings account. At times, cash balances may be in excess of depository insurance limits.

Restricted Cash

Restricted cash represents amounts in deposit accounts funded with penalties levied and received for noncompliance within NPCC U.S., which are required to be used for statutory activities in years subsequent to which the penalty was received, and amounts in deposit accounts for collateralizing a letter of credit as security for NPCC's office lease. At times, cash balances may be in excess of depository insurance limits.

Equipment and Leasehold Improvements

Equipment and leasehold improvements are stated at cost. Depreciation of furniture and computer equipment is computed on the straight-line basis over the estimated useful lives of the applicable assets. Amortization of leasehold improvements is computed on the straight-line basis over the estimated useful lives of the applicable assets, or over the term of the related lease, whichever is less.

Revenue Recognition
For the criteria services division, membership in the Company is on a calendar year basis. There are no fees assessed to full members other than those members that are Independent System Operators or Balancing Authority Areas. Assessments received are recorded as income in the year to which the membership applies irrespective of when billed or collected. For the regional entity division, membership in the Company is on a calendar year basis. There are no fees assessed to general members. Funding mechanisms provided through U.S. regulatory and Canadian governmental and/or regulatory agreements provide for quarterly remittances through the North American Electric Reliability Corporation. Assessments received are recorded as income in the year to which the Business Plan and Budget applies irrespective of when billed or collected. Penalty sanctions are recorded as income when levied and the appeals process has been waived or is concluded.

Rent Expense
The Company's office lease which commenced in 2009 contains predetermined increases and decreases in the rentals payable during the lease term. Rent expense is recognized on a straight-line basis over the lease term. The difference between the rent expense charged to operations during the year and the amount payable under the lease during that year is recorded as "Deferred rent" on the Statements of Financial Position. Deferred rent also includes the landlord's contribution toward the cost of leasehold improvements, which is being amortized over the lease term. The unamortized balance of the landlord's contribution at December 31, 2014 is approximately $336,000.

Income Taxes
The Company has been classified as exempt from federal income taxes under Section 501(c) (6) of the Internal Revenue Code.

Use of Estimates
The Company uses estimates and assumptions in preparing these financial statements in accordance with accounting principles generally accepted in the United States of America. Those estimates and assumptions affect the reported amounts of assets, liabilities, revenues and expenses. Actual results could vary from the estimates that are used.

3. Investments

The Company's primary banking relationship is with JP Morgan Chase. Prior to 2009, both regional entity (ERO funded) and criteria services (Regional Independent System Operators/Balancing Authority Areas – ISO/BAAs) revenues were invested in a JPMorgan 100% U.S. Treasury Security Money Market Fund (the "Fund"). The Fund aims to provide the highest possible level of current income while still maintaining liquidity and providing maximum safety of principal. The Fund is a money market fund managed to meet the requirements of Rule 2a-7 under the Investment Company Act of 1940. The Fund is not insured or guaranteed by the FDIC or any other government agency. In late 2008, the Fund was closed to additional investments. Subsequent excess cash is being deposited into a savings account with JP Morgan Chase.

The Fund invests solely in debt securities of the U.S. Treasury, including Treasury bills, bonds and notes. These investments carry different interest rates, maturities and issue dates. The National Association of Insurance Commissioner ("NAIC"), Moody's, Fitch IBCA and S&P ratings signify that the Fund has historically had a superior capacity to maintain a net asset value of $1.00 per share. The ratings do not eliminate the risks associated with investing in the Fund. The NAIC "approved" status indicates that the Fund meets certain pricing and quality guidelines. Management has determined that the likelihood of sustaining losses from money market funds to be remote based on the marketability of the underlying investment of the funds.

At December 31, 2014 and 2013, the Company owned 2,211,002 and 2,210,944 units of $1 par value per unit, respectively. In 2014 and 2013, the funds earned average yields of 0%. Investment income earned on the Fund is reinvested into units of the Fund on a monthly basis.

4. Equipment and Leasehold Improvements

Equipment and leasehold improvements at December 31, 2014 and 2013 consists of the following:

	Depreciable Life	2014	2013
Furniture	10 years	$ 202,906	$ 202,906
Computer equipment	3 years	375,949	435,769
Website	3 years	232,000	232,000
Software	3 years	548,157	397,701
Leasehold improvements	15 years (See note 2)	974,691	974,691
		2,333,703	2,243,067
Less: Accumulated depreciation and amortization		(1,360,479)	(1,100,649)
		$ 973,224	$ 1,142,418

In 2014 and 2013, depreciation and amortization expense totaled $321,986 and $300,260, respectively.

5. Pension Plan

The Company has a trusteed, noncontributory defined benefit pension plan (the "Plan") covering employees hired prior to February 6, 2007. In November 2014, the Company decided, subject to Internal Revenue Service and Pension Benefit Guaranty Corporation approval, to terminate the Plan effective January 31, 2015 and freeze all benefits accruals for the Plan's participants effective December 31, 2014. The plan freeze triggered curtailment accounting, which reduced the benefit obligation by $1,421,349 as of December 31, 2014, and resulted in additional 2014 income statement charges of $139,619. The Company's plan contributions were $3,150,000 and $700,000 for the years 2014 and 2013, respectively.

The following tables provide information with respect to the defined benefit plan as of and for the years ended December 31, 2014 and 2013:

	2014	2013
Components of net periodic benefit cost		
Service cost	$ 281,933	$ 298,867
Interest cost	511,899	477,051
Expected return on plan assets	(712,715)	(599,893)
Amortization of prior service cost	20,532	20,532
Recognized actuarial loss	87,391	310,000
Curtailment loss	139,619	-
Net periodic benefit cost	$ 328,659	$ 506,557
Change in benefit obligation		
Benefit obligation at beginning of year	$ 10,293,237	$ 11,279,973
Service cost	281,933	298,867

Rate of compensation increase	0.00 %	3.00 %
Weighted-average assumptions as of December 31 used for net periodic benefit cost		
Discount rate	4.00 %	5.00 %
Expected return on plan assets	7.50 %	7.50 %
Rate of compensation increase	3.00 %	3.00 %

The accumulated benefit obligation at December 31, 2014 and 2013 was $12,748,523 and $10,293,237, respectively.

The Company determines its expected return on plan assets assumption by evaluating both historical returns of major asset classes and current market factors. Current market factors include inflation and interest rates, as well as asset diversification.

As a result of the decision to terminate the Plan, all investments were liquidated and all plan assets are being held in cash or cash equivalents as of December 31, 2014.

The Company's defined benefit plan weighted average asset allocation at December 31, 2014 and 2013 by asset category is as follows:

	Allocation Percentage	
	2014	2013
Equity securities	0.0%	70.6%
Debt securities	0.0%	28.0%
Cash	100.0%	1.4%
	100.0%	100.0%

Expected employer contribution for the year ended December 31, 2015 is $460,000.

Benefits expected to be paid in cash in subsequent years ending December 31 are as follows:

2015	$ 98,139
2016	13,686,738
Thereafter	-

6. Savings and Supplemental Plans

The Company maintains a 401(k) plan for which all employees are immediately eligible upon hire. Within this plan, an employee can contribute 2% or greater of his or her compensation up to the IRS limit set for this plan. The Company's policy is to contribute on the employee's behalf 100% of the employee's contribution of the first 3% of his or her compensation, and 50% of his or her contribution for the next 2% of compensation. Additionally, for those employees joining the Company after February 6, 2007, and upon completion of a full calendar year of service, such employees become eligible for a discretionary contribution to be considered annually by the Board of Directors. The discretionary contribution for 2014 and 2013 was 8% of base compensation and totaled $239,139 for 2014 and $189,215 for 2013. Company contributions to the 401(k) plan were $201,834 and $185,546 for 2014 and 2013, respectively. During 2010, the Company adopted a supplemental plan for employees who were not eligible to receive the same percentage level of retirement benefits as other employees under the 401(k) plan due to IRS compensation limits. The Company contributed $29,300 and $26,500 to this supplemental plan for 2014 and 2013, respectively. During 2013, the Company adopted a 457(f) plan for the President and CEO to provide benefits not provided under the Pension Plan as a result of the IRS code limitations. The Company contributed $30,000 to this plan for each of the years 2014 and 2013.

7. Leases

The Company is obligated under long-term operating leases for the rental of office facilities and certain equipment. NPCC executed office and equipment leases with effective rental dates starting in 2009 coordinated with its relocation of offices within New York City. NPCC's office lease provides for additional rent based on increases in real estate taxes and operating expenses over base amounts. The office lease expires on April 30, 2024 and includes an option to renew for five years. The office lease provides for security in the form of a collateralized letter of credit in the amount of $500,000 at lease inception and reduced to $300,000 at December 31, 2012, and reduced amounts in future years. NPCC executed various computer and equipment leases with expiration dates through 2017. In addition, the Company rents certain other equipment on a month-to-month basis. Rental expense for office facilities and equipment totaled $747,440 and $775,320 for 2014 and 2013, respectively.

Future minimum rental payments required under the Company's long-term operating leases as of December 31, 2014 are as follows:

	Office Space	Other Leases	Total
Year Ending December 31			
2015	$ 672,392	$ 103,332	$ 775,724
2016	672,392	34,838	707,230
2017	672,392	14,696	687,088
2018	672,392	-	672,392
2019	704,392	-	704,392
Thereafter	3,121,699	-	3,121,699
	$ 6,515,659	$ 152,866	$ 6,668,525

8. Functional Expenses

During 2014 and 2013 salaries and employee benefits consist of the following:

	2014	2013
President, COO and technical staff	$ 5,943,449	$ 5,510,411
Administrative support	183,120	175,493
Payroll taxes, insurance, pension and educational assistance	2,459,542	2,680,048
Total salaries and employee benefits	$ 8,586,111	$ 8,365,952

9. Other Expenses

The Company incurs various costs for administrative, consultant and professional services. Such costs amounted to $3,171,769 and $2,970,235 in 2014 and 2013, respectively, and consist of the following:

	2014	2013
Consultants	$ 1,805,738	$ 1,734,733
Accounting, legal and other services	1,313,535	1,197,113
Pension administration	52,496	38,389
Total administrative, consultant and professional fees	$ 3,171,769	$ 2,970,235

These costs are reflected in “Administrative and consultant fees” and “Professional fees” in the Statements of Activities.

10. Related Party Transactions

The NERC, through agreements with the FERC in the U.S. and Canadian Provincial regulatory and/or governmental agreements within Canada, delegates enforcement authority to eight Regional Entities. NPCC is the cross-border regional entity for Northeastern North America. NERC was certified as the “Electric Reliability Organization” by the FERC on July 20, 2006. As of June 18, 2007, the U.S. FERC granted NERC the legal authority to enforce reliability standards with all U.S. users, owners, and operators of the bulk power system, and made compliance with those standards mandatory and enforceable. NERC relies on the diverse and collective expertise of industry participants to improve the reliability of the bulk power system. These entities account for virtually all the electricity supplied in the United States, Canada, and a portion of Baja California Norte, Mexico. NERC is subject to audit by the U.S. FERC and governmental and/or regulatory authorities in Canada. NERC funded the Regional Entities based upon Business Plans and Budgets submitted to and approved by FERC in the U.S. and Canadian regulatory and/or governmental authorities.

NPCC’s criteria services division was fully funded by regional independent system operator or balancing authority areas and operated on assessments to and funded from these six entities. Dues were based upon a “Net Energy for Load” funding formula. During 2014 and 2013, total assessments billed amounted to $989,709 and $1,139,688, respectively.

Description	2014 Percent	2014 Total Share	2013 Percent	2013 Total Share
Hydro-Quebec TransEnergie	28.82 %	$ 285,198	28.56 %	$ 325,481
Independent Electricity System Operator	22.03 %	218,018	21.94 %	250,013
ISO-New England, Inc.	19.97 %	197,640	20.65 %	235,313
New Brunswick System Operator	2.17 %	21,458	2.12 %	24,185
New York Independent System Operator	25.39 %	251,279	24.91 %	283,927
Nova Scotia Power Inc.	1.62 %	16,116	1.82 %	20,769
Total assessments	100.00 %	$ 989,709	100.00 %	$ 1,139,688

11. Line of Credit

On March 18, 2013, pursuant to an agreement with a lender, the Company obtained a line of credit in the amount of $1,000,000. The line of credit, which had an initial term of 18 months, was renewed on September 18, 2014 for one year. Outstanding borrowings are secured by all of the Company's assets. There were no borrowings against the line of credit as of December 31, 2014 and 2013.

12. Subsequent Events

Management has evaluated, for potential recognition and disclosure, events subsequent to the date of the Statement of Financial Position through March 27, 2015, the date the financial statements were available to be issued.

Re: ReliabilityFirst's 2014 Actual Cost-To-Budget Comparison

Dear Mr. Michael Walker:

As requested, ReliabilityFirst Corporation (ReliabilityFirst) is providing NERC the end of year audited 2014 Actual Cost-To-Budget Comparison. A summary of significant variances are explained in the Introduction Section, while more detailed explanations of variances are provided by program area.

The explanations of variances are provided based on the following criteria:

1. Variances equal to or greater than +/- 10% of budget, and
2. Variances greater than $10,000, or
3. Variances that are considered significant.

For more information, please contact me at 216.503.0600 or jill.lewton@rfirst.org.

Very truly yours,

RELIABILITYFIRST CORPORATION

Jill S. Lewton

Jill S. Lewton
Controller

Introduction

This Actual Cost-To-Budget Comparison includes a summary of significant variances, followed by more detailed analyses by program areas. In 2014, ReliabilityFirst performed only statutory activities, and therefore all funding and expenses shown are for those functions delegated to ReliabilityFirst by the ERO. The financial information included in this comparison is based on the results of ReliabilityFirst's 2014 independent audit that was performed by McGladrey LLP and completed on April 30, 2015.

For the year ending December 31, 2014, ReliabilityFirst Corporation was $1,599K (9%) over budget. This variance included $1,692K of office costs, office relocation, computer hardware & software, furniture & fixtures, and leasehold improvement expenses associated with the March 2014 office and data center relocation, which were not included in the 2014 budget. Without these expenses, the year ending variance was $93K (.51%) under budget.

Funding

The variance in Investment Income was due to the unrealized change in the value of the company's investment portfolio. This variance is reflected in each direct program as a result of it being allocated proportionately based on FTE count to the direct programs.

The variance in Miscellaneous Income was due to the corporate credit card points that were redeemed for cash and used to help offset the office relocation expenses. This variance is reflected in each direct program as a result of it being allocated proportionately based on FTE count to the direct programs.

Budget Expenses

Personnel Expenses

Salaries, Benefits, and Retirement Costs were under budget due to personnel variances below the approved staffing levels.

Payroll Taxes was over budget due to a prior year tax rate adjustment and additional tax payments that occurred at the end of the year.

Meeting Expenses

Meeting expenses were over budget due to a higher than expected attendance and associated costs experienced at the Compliance and CIP V5 Workshops.

Operating Expenses

Consultants & Contracts was under budget as a result of more effective utilization of staff resources, therefore there was less need to utilize contractors for compliance work.

Office Rent was over budget due to the straight line rent for the new office lease which was not included in the budget.

Professional Services was over budget due to the fees associated with the search for a new independent director.

Depreciation expense directly correlates to current fixed asset activities. Therefore, as a result of the fixed assets purchased for the office move more depreciation was being calculated than budgeted.

Non-Operating Expenses

The variance in Non-Operating Expenses was due to the expenses incurred to physically move the office, along with the losses recorded for the fixed assets that were written off or disposed of as a result of the office move.

Fixed Assets

Computer Hardware & Software was over budget as a result of the hardware and software purchases made for the new office.

The variance in Furniture & Fixtures was a result of the purchase of office furniture for staff offices, conference rooms, and common areas for the new office.

The variance in Leasehold Improvements was a result of the improvements made to the new office.

Cost Allocation

ReliabilityFirst records all direct costs to the appropriate program areas. Costs related to the Administrative Services programs (Indirect Expenses) are allocated proportionately based on FTE count to the direct programs.

- Direct Programs include:
  - Standards
  - Compliance
  - Reliability Assessment
  - Training & Education
  - Situation Awareness
- Administrative Services Programs include:
  - General & Administrative
  - Legal & Regulatory Affairs
  - Information Technology
  - Human Resources
  - Finance & Accounting

Cash Reserves

ReliabilityFirst's Operating Reserve of $1,000,000 was utilized in 2014 in the amount of $414K. An inaccuracy occurred during the 2014 assessment calculation that resulted in the assessment being lower than what was necessary. Therefore, ReliabilityFirst had to draw from the operating reserve to fund the day to day operations.

Major Accomplishments

All statutory objectives were satisfied, including these major accomplishments:

- Developed and trained stakeholders in the Internal Controls Evaluation (ICE) and Inherit Risk Assessment (IRA) guides – Reliability Assurance Initiative (RAI)
- Completed 79 audits monitoring CIP, Operations, and Planning Standards
- Performed assist visits at 19 Entities focusing on CIP Version 5 implementation, along with creating and implementing robust mitigation plans, and discussing registered function compliance responsibilities
- Performed three organization certifications
  - Changing a BA footprint into two BA footprints
  - Integration of transmission facilities into an entity's RC footprint
  - BA and TOP certification for a registered entity's newly built control center
- Conducted two Reliability Workshops including over 400 people focusing on RAI topics and guidance on transitioning from the CIP V3 to CIP V5, along with monthly outreach calls averaging 80 people per call

- Reviewed and accepted 124 mitigation plans and verified the completion of approximately 176 mitigation plans
- Worked with Registered Entities on 38 event analysis reports and published four Lessons Learned arising from event analysis reports in the region
- Registered 15 new entities and determined that 17 Entities no longer met the criteria for certain functions and facilitated their removal from Registry
- Processed self-certifications covering 55 Standards, receiving 4,663 self-certifications covering 12,342 Standard Requirements from 342 entities
- Posted 20 periodic data submittals covering 20 Standards and received data from 233 entities
- Performed analysis to determine cause of high misoperation rate including those from events and provided power line carrier misoperation training to the Protection Subcommittee
- Led a successful pilot of the self-logging program with a large entity and the TRE and SPP regions which significantly shaped the current ERO-wide self-logging program
- Identified and established action plans for corporate risks

Explanation of Variances - Compliance Monitoring and Enforcement, and Organization Registration and Certification

Personnel Expenses

Salaries and Payroll Taxes were over budget due to the reallocation of staff to support the reorganization that was necessary to advance the Reliability Assurance initiatives.

Benefits was under budget due to medical benefits being less than budgeted.

Retirement Costs was under budget due to the year end adjustment that was made to reduce the discretionary contribution amount for those employees who did not meet the plan requirements.

Operating Expenses

Consultants and Contracts expenses were under budget as a result of more effective utilization of staff resources, therefore there was less need to utilize contractors for compliance work.

Office Costs was under budget as a result of changing the company wireless plan to a data share plan, along with having less change orders for the compliance portal and lower maintenance fees for the audit management software.

Professional Services was under budget due to the non-renewal of a retainer agreement for a hearing officer.

Indirect Expenses

Indirect Expenses are expenses related to the Administrative Services programs that have been allocated proportionately based on FTE count to the direct programs. As a result, the variance was due to higher administrative expenditures being allocated.

Allocation of Fixed Assets

Allocation of Fixed Assets are fixed asset costs related to the Administrative Services programs that have been allocated proportionately based on FTE count to the direct programs.

Explanation of Variances - Training, Education and Operator Certification Program

Personnel Expenses

Salaries was under budget due to a yearend banked vacation adjustment.

Payroll Taxes was over budget due to a prior year tax rate adjustment and additional tax payments that occurred at the end of the year.

Benefits was over budget due to several workers compensation adjustments.

Retirement costs was under budget due to employees not taking full advantage of the company plan benefits.

Meeting Expenses

Meetings was over budget due to a higher than expected attendance and associated costs experienced at the Compliance and CIP V5 Workshops.

Indirect Expenses

Indirect Expenses are expenses related to the Administrative Services programs that have been allocated proportionately based on FTE count to the direct programs. As a result, the variance was due to higher administrative expenditures being allocated.

Allocation of Fixed Assets

Allocation of Fixed Assets are fixed asset costs related to the Administrative Services programs that have been allocated proportionately based on FTE count to the direct programs.

Explanation of Variances - Situation Awareness and Infrastructure Security Program

Personnel Expenses

Salaries and Retirement Costs were under budget due to the various resource reallocations that occurred during the first quarter of the year.

Payroll Taxes was over budget due to a prior year tax rate adjustment and additional tax payments that occurred at the end of the year.

Benefits was over budget due to additional employee training that was taken along with changes in an employee's medical plan.

Operating Expenses

The variance in Consultants and Contracts was a result of executive coaching services that were not budgeted.

Fixed Assets

The variance in Computer Hardware was due to the purchase of hardware for the Situational Awareness room.

Indirect Expenses

Indirect Expenses are expenses related to the Administrative Services programs that have been allocated proportionately based on FTE count to the direct programs. As a result, the variance was due to higher administrative expenditures being allocated.

Allocation of Fixed Assets

Allocation of Fixed Assets are fixed asset costs related to the Administrative Services programs that have been allocated proportionately based on FTE count to the direct programs.

Explanation of Variances - General and Administrative Program

Funding Source

The ERO Assessment amount was additional funds from the prior year used to reduce the overall 2014 assessment.

Personnel Expenses

Payroll Taxes was over budget due to a prior year tax rate adjustment and additional tax payments that occurred at the end of the year.

Meeting Expenses

Meetings was over budget primarily due to the board meeting costs being higher than expected.

Operating Expense

Office Rent was over budget due to the straight line rent that was being recorded for the new office lease that was not included in the budget.

Office Costs was over budget as a result of the purchase of office furniture for staff offices, conference rooms, and common areas for the new office.

Professional Services was over budget due to the fees associated with the search for a new independent director.

Depreciation expense directly correlates to fixed asset activities. Therefore, as a result of the fixed assets purchased for the office move more depreciation was being calculated than budgeted.

Indirect Expenses

Indirect Expenses are expenses related to the Administrative Services programs that have been allocated proportionately based on FTE count to the direct programs. As a result, the variance was due to higher General and Administrative expenditures being allocated.

Non-Operating Expenses

The variance in Non-Operating expenses was due to the expenses incurred to physically move the office, along with the losses recorded for the leasehold improvements from the old office that were written off.

Fixed Assets

The variance in Furniture & Fixtures was a result of the purchase of office furniture for staff offices, conference rooms, and common areas for the new office.

The variance in Leasehold Improvements was a result of the improvements made to the new office.

Explanation of Variances - Legal and Regulatory Affairs Program

Personnel Expenses

Salaries was over budget due to the additional compensation required to retain experienced and qualified staff.

Operating Expense

Professional Services was under budget due to performing more legal work in house.

Indirect Expenses

Indirect Expenses are expenses related to the Administrative Services programs that have been allocated proportionately based on FTE count to the direct programs. As a result, the variance was due to higher Legal and Regulatory Affairs expenditures being allocated.

Explanation of Variances - Information Technology Program

Personnel Expenses

Personnel expenses were under budget due to a vacant position.

Operating Expense

Consultants & Contracts was under budget due to utilizing the tenant improvement allowance received for the office move to implement new software and hardware upgrades for the new office infrastructure, instead of using dollars budgeted for the implementation of anticipated infrastructure upgrades at the former office.

Office Rent was under budget due to the three months of free rent and the lower monthly rate that were negotiated for the offsite data center.

Office Costs was over budget due to the purchase of the new laptops.

Non-Operating Expenses

The variance in Non-Operating expenses was due to the losses recorded for the fixed assets that were disposed of as a result of the office move.

Fixed Assets

Computer Hardware & Software was over budget as a result of the hardware purchases made for the new office.

The variance in Leasehold Improvements was a result of the improvements made to the new office.

Explanation of Variances - Human Resources Program

Personnel Expenses

Retirement Costs was over budget due to the administrative fees relating to the management of the company's retirement accounts.

Operating Expenses

Consultants & Contracts was over budget due to recruitment fees, executive coaching services, and services rendered for the 457 plans.

Indirect Expenses

Indirect Expenses are expenses related to the Administrative Services programs that have been allocated proportionately based on FTE count to the direct programs. As a result, the variance was due to higher Human Resources expenditures being allocated.

Independent Auditor's Report

To the Board of Directors
ReliabilityFirst Corporation
Independence, Ohio

Report on the Financial Statements

We have audited the accompanying financial statements of ReliabilityFirst Corporation which comprise the statements of financial position as of December 31, 2014 and 2013, and the related statements of activities and cash flows for the years then ended and the related notes to the financial statements.

Management's Responsibility for the Financial Statements

Management is responsible for the preparation and fair presentation of these financial statements in accordance with accounting principles generally accepted in the United States of America; this includes the design, implementation, and maintenance of internal control relevant to the preparation and fair presentation of financial statements that are free from material misstatement, whether due to fraud or error.

Auditor's Responsibility

Our responsibility is to express an opinion on these financial statements based on our audits. We conducted our audits in accordance with auditing standards generally accepted in the United States of America. Those standards require that we plan and perform the audits to obtain reasonable assurance about whether the financial statements are free of material misstatement.

An audit involves performing procedures to obtain audit evidence about the amounts and disclosures in the financial statements. The procedures selected depend on the auditor's judgment, including the assessment of the risks of material misstatement of the financial statements, whether due to fraud or error. In making those risk assessments, the auditor considers internal control relevant to the entity's preparation and fair presentation of the financial statements in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the entity's internal control. Accordingly, we express no such opinion. An audit also includes evaluating the appropriateness of accounting policies used and the reasonableness of significant accounting estimates made by management, as well as evaluating the overall presentation of the financial statements.

We believe that the audit evidence we have obtained is sufficient and appropriate to provide a reasonable basis for our audit opinion.

Opinion

In our opinion, the financial statements referred to above present fairly, in all material respects, the financial position of ReliabilityFirst Corporation as of December 31, 2014 and 2013, and the changes in its net assets and its cash flows for the years then ended in accordance with accounting principles generally accepted in the United States of America.

Member of the RSM International network of independent accounting, tax and consulting firms.

Other Matter

Our audits were conducted for the purpose of forming an opinion on the financial statements as a whole. The accompanying supplementary information is presented for purposes of additional analysis and is not a required part of the financial statements. Such information is the responsibility of management and was derived from and relates directly to the underlying accounting and other records used to prepare the financial statements. The information has been subjected to the auditing procedures applied in the audits of the financial statements and certain additional procedures, including comparing and reconciling such information directly to the underlying accounting and other records used to prepare the financial statements or to the financial statements themselves, and other additional procedures in accordance with auditing standards generally accepted in the United States of America. In our opinion, the information is fairly stated in all material respects in relation to the financial statements as a whole.

Note 1. Organization and Significant Accounting Policies

Organization: ReliabilityFirst Corporation (the Corporation) is a not-for-profit corporation whose mission is to preserve and enhance bulk power system reliability and security for the interconnected electric systems within its territory. The Corporation was approved by the North American Electric Reliability Corporation (NERC) to become one of eight Regional Entities of NERC. The Corporation conducts its activities from leased offices in Independence, Ohio.

The Corporation receives its quarterly assessments from NERC. A significant reduction in the level of this support, if this were to occur, may have a significant effect on the Corporation's operations.

The following is a summary of the Corporation's significant accounting policies which conform to accounting principles generally accepted in the United States of America (U.S. GAAP).

Use of estimates: The preparation of financial statements in conformity with U.S. GAAP requires management to make estimates and assumptions that affect the reported amounts of assets and liabilities and disclosure of contingent assets and liabilities at the date of the financial statements and the reported amounts of revenue and expenses during the reporting period. Actual results could differ from those estimates.

Revenue recognition: The Corporation currently derives its revenues primarily from quarterly assessments. Revenues from such assessments are recognized as unrestricted revenues at the time services are performed and the cost of these services is recognized when incurred. Penalty sanctions are recognized after the entire appeals process has been exhausted and a Federal Electric Regulatory Commission (FERC) order has been issued and is non-appealable. Penalty sanctions received on or prior to June 30 of each year shall be applied as a general offset to budget requirements for the subsequent fiscal year. Penalty sanctions received after June 30 of each year shall be applied as a general offset to budget requirements for the next subsequent fiscal year.

Cash: The Corporation maintains its cash in non-interest-bearing bank deposit accounts. Management believes it is not exposed to any significant credit risk on cash.

Receivables: Accounts receivable are carried at actual billed amounts relating to penalty sanctions and subcontractor receivables. There was no allowance for doubtful accounts recorded in 2014 or 2013. During 2013, the Corporation recorded a receivable of $855,301 from its new landlord relating to lease incentives provided to reimburse leasehold improvements and a termination penalty on an existing lease, which related to 2013. This was collected in full during 2014.

Investments: Investments are carried at fair value. The fair values of marketable debt securities are based on quoted market prices. Realized investment gains and losses represent the difference between the proceeds on sales of investments and their carrying value. Investment income includes interest, dividends and both realized and unrealized gains and losses. All realized and unrealized gains and losses on investments are reported as increases or decreases, respectively, to unrestricted net assets.

The Corporation invests in fixed income corporate bonds. Such investments are exposed to various risks such as interest rate, market and credit. Due to the level of risk associated with such investments and the level of uncertainty related to changes in the value of such investments, it is at least reasonably possible that changes in risks in the near term would materially affect investment balances and the amounts reported in the financial statements.

Prepaid expenses: Prepaid expenses consist of expenses paid for in advance that will be recognized within a future operating cycle.

Note 1. Organization and Significant Accounting Policies (Continued)

Fixed assets: Fixed assets are stated at cost. Depreciation is computed on the straight-line method over the estimated useful lives (generally 3 to 7 years) of the depreciable assets. Amortization for the leasehold improvements is computed on the lesser of the useful life or the lease term.

Accrued expenses: Accrued expenses consist primarily of salaries and related payroll expenses incurred in the current fiscal year but not paid until after year end. An amount of $174,686 has been classified as a long-term liability as it is expected this amount will be paid after December 31, 2015.

Deferred revenue: Amounts received by the Corporation prior to when the revenue is earned are recorded as deferred revenue.

Income taxes: The Corporation is exempt from federal income taxes under Section 501(c)(3) of the Internal Revenue Code and applicable state law, except for taxes pertaining to unrelated business income, if any.

In accordance with the accounting standard on accounting for uncertainty in income taxes, the Corporation addresses the determination of whether tax benefits claimed or expected to be claimed on a tax return should be recorded in the financial statements. Under this guidance, the Corporation may recognize the tax benefit from an uncertain tax position only if it is more likely than not that the tax position will be sustained on examination by taxing authorities, based on the technical merits of the position. Examples of tax positions include the tax-exempt status of the Corporation and various positions related to the potential sources of unrelated business taxable income (UBIT). The tax benefits recognized in the financial statements from such a position are measured based on the largest benefit that has a greater than 50 percent likelihood of being realized upon ultimate settlement. There were no unrecognized tax benefits identified or recorded as liabilities during the periods covered by these financial statements.

The Corporation currently files the form 990 in the U.S. federal jurisdiction. The Corporation is generally no longer subject to examination by the Internal Revenue Service for years before 2011.

Net assets: Of the unrestricted net asset balance, $1,000,000 has been designated by the Board of Directors for its operating reserve fund at December 31, 2014 and 2013. During 2014, the Corporation's Board of Directors decided to reduce the operating reserve to $750,000 in 2015.

Temporarily restricted net assets result from the receipt of penalty sanctions which are restricted based on timing conditions as described in the Corporation's revenue recognition policy. Penalty monies are governed by a restriction by NERC as to when the funds can be used. Temporarily restricted net assets at December 31, 2014 and 2013, were $1,362,500 and $1,843,133, respectively.

Subsequent events: The Corporation has evaluated subsequent events for potential recognition and/or disclosure through the date these financial statements were available to be issued.

Note 2. Investments and Fair Value Measurements

The Corporation previously maintained an investment portfolio which consisted of fixed income Class A mutual funds. In 2014, the Corporation transferred its investments to a new investment firm, and has invested in U.S. Treasury obligations, U.S. Government agency securities, and corporate bonds.

As described in Note 1, the Corporation records its investments at fair value. Fair value is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. The Financial Accounting Standards Board's (FASB) authoritative guidance on fair value measurements establishes a framework for measuring fair value, and expands disclosure about fair value measurements. This guidance enables the reader of the financial statements to assess the inputs used to develop those measurements by establishing a hierarchy for ranking the quality and reliability of the information used to determine fair values. Under this guidance, assets and liabilities carried at fair value must be classified and disclosed in one of the following three categories:

- Level 1: Valuations for assets and liabilities traded in active exchange markets, such as the New York Stock Exchange. Level 1 also includes U.S. Treasury and federal agency securities and federal agency mortgage-backed securities, which are traded by dealers or brokers in active markets. Valuations are obtained from readily available pricing sources for market transactions involving identical assets or liabilities.
- Level 2: Valuations for assets and liabilities traded in less active dealer or broker markets. Valuations are obtained from third-party pricing services for identical or similar assets or liabilities.
- Level 3: Valuations for assets and liabilities that are derived from other valuation methodologies, including option pricing models, discounted cash flow models and similar techniques, and not based on market exchange, dealer, or broker-traded transactions. Level 3 valuations incorporate certain assumptions and projections in determining the fair value assigned to such assets or liabilities.

In determining the appropriate levels, the Corporation performs a detailed analysis of the assets and liabilities that are measured and reported on a fair value basis. At each reporting period, all assets and liabilities for which the fair value measurement is based on significant unobservable inputs would be classified as Level 3.

The Corporation assesses the levels at each measurement date, and transfers between levels are recognized on the date of the actual event or change in the circumstances that caused the transfer in accordance with the Corporation's accounting policy regarding the recognition of the transfer between levels of the fair value hierarchy. For the years ended December 31, 2014 and 2013, there were no such transfers.

Note 2. Investments and Fair Value Measurements (Continued)

The following tables present the Corporation's fair value hierarchy for its investments as of December 31, 2014 and 2013:

	December 31, 2014			
	Level 1	Level 2	Level 3	Total
U.S. Government securities	$ 858,648	$ -	$ -	$ 858,648
Corporate bonds	-	2,682,335	-	2,682,335
	$ 858,648	$ 2,682,335	$ -	3,540,983
Cash and cash equivalents				108,980
				$ 3,649,963

	December 31, 2013			
	Level 1	Level 2	Level 3	Total
Fixed Income Class A Mutual Funds	$ 3,604,721	$ -	$ -	$ 3,604,721

The composition of investment income (loss) is as follows at December 31:

	2014	2013
Interest/dividends	$ 74,977	$ 81,345
Realized loss	(107,682)	(6,309)
Unrealized gain (loss)	77,947	(141,889)
	$ 45,242	$ (66,853)

Note 3. Line of Credit

The Corporation has a $1,000,000 line of credit with an expiration date of July 14, 2015. The line is collateralized by substantially all assets of the Corporation and interest is charged at LIBOR plus 4.199 percent. The Corporation did not make any drawdowns on the line during the year and had no outstanding balance as of December 31, 2014 or 2013. The Corporation intends to renew the line when it becomes due on July 14, 2015.

Note 4. Notes Payable

The Corporation entered into a note payable with a bank on July 14, 2014 for $159,110 to fund the purchase of laptop computers. The note bears an interest rate of 3.950 percent per annum, until paid in full and requires the Corporation to pay the loan in 36 payments of $4,698.51 (including principal and interest). The note is collateralized by the laptops that were purchased.

Maturities of notes payable are as follows as of December 31:

2015	$ 51,795
2016	53,899
2017	32,437
	$ 138,131

Note 5. Operating Leases

On July 16, 2013, the Corporation provided written notice exercising its early termination right for its lease with Bath Springside, Ltd. (Bath). As a result, the Bath lease terminated on December 31, 2014 and the Corporation incurred a lease termination penalty of $200,000, which was reimbursed by its new landlord, Investors Warranty of America, Inc. (Investors), an unrelated third party. The penalty was recorded in accounts payable at December 31, 2013, and was paid by the Corporation in 2014.

On June 14, 2013, the Corporation signed a 13 year lease with Investors. The Corporation took occupancy of the new office effective March 1, 2014. According to the Investors lease, the Corporation was provided with a $1,854,956 tenant improvement allowance for leasehold improvements and other soft costs.

The above reimbursement of the Bath lease termination penalty and the leasehold improvement allowance totaling $2,054,956 was received from Investors in 2014. This amount is being amortized over the life of the lease against rent expense, starting on the commencement date of the new lease (March 1, 2014).

Rental expense for operating leases amounted to $692,003 and $508,704 for the years ended December 31, 2014 and 2013, respectively. Rent expense in 2014 and 2013 includes $72,537 and $32,114, respectively, in accelerated straight-line amortization of the previous deferred rent liability due to the early termination of the Bath lease. The deferred rent liability was $2,419,564 and $855,301 as of December 31, 2014 and 2013, respectively.

The future minimum lease payments relating to the new lease on a straight-line basis are as follows:

2015	$ 595,603
2016	595,603
2017	595,603
2018	595,603
2019	595,603
Thereafter	4,268,490
	$ 7,246,505

Note 6. Employee Retirement Plan

The Corporation has a salary deferral plan under Section 401(k) of the Internal Revenue Code. All employees are eligible for 100 percent match of their first 6 percent of voluntary salary deferral savings and the 3 percent Safe Harbor provision of the plan. Employees who have at least 1,000 hours during the year are eligible for a certain percentage discretionary provision of the plan (7 percent in 2014 and 2013). Therefore, under this plan, the Corporation provided for a potential maximum contribution of up to 16 percent of employees' eligible compensation in 2014 and 2013. The Corporation's contributions to the plan for 2014 and 2013 were approximately $1,580,000 and $1,469,000, respectively.

Note 7. Grant from City of Independence, Ohio

In connection with the Corporation's office move during 2014, the City of Independence (City) awarded a $350,000 grant to the Corporation. The grant agreement provides for the Corporation to meet minimum annual payroll tax requirements as well as a requirement that the Corporation will not re-locate outside of the City during the next 12 years. If the re-location requirement is not met by the Corporation, the full $350,000 will be required to be returned to the City upon default. The Corporation received $250,000 of this grant in 2014, and recorded this amount in deferred revenue due to the requirements of the grant not being met as of December 31, 2014. The agreement allows for the remaining $100,000 to be paid during 2015 (but no later than 2016), which will also be reflected in deferred revenue when it is received.

North American Electric Reliability Corporation

SERC 2014 Budget vs. Actual Variance Analysis

Enclosed is SERC's response to your request for information on variances between the 2014 SERC budget and year-end financials.

Overall, SERC under ran 2014 budgeted revenues by $43,859 and under spent its 2014 budgeted expenses of $16,585,941 by $1,181,316. The net impact was a $1,137,457 positive variance on SERC's cash position for the year.

During 2014, SERC conducted 54 audits and spot checks including 6 on-site and 22 off-site operations and planning audits, 6 on-site and 17 off-site CIP audits, and 3 on-site CIP spot checks. There were no audits of multi-regional Registered Entities. SERC adjusted the planned audits and spot checks pursuant to supplemental guidance provided by NERC and FERC. SERC received 141 new potential violations and closed 253 enforcement actions addressing possible violations identified during the period from 2010 through 2014. In addition, SERC completed all budgeted reliability assessments for the year.

There are several mitigating circumstances, as explained below:

- Workshop fees are lower than budget due to SERC hosted most meetings in house or at a member's facilities, resulting in a savings in costs, and therefore an offsetting decrease in revenue allowing SERC to charge a reduced attendance fee, from when the budget was developed. Additionally, due to a change in format, SERC hosted less meetings than originally budgeted.
- Miscellaneous income is higher than budget due to contractual repayments of employee benefits, and proceeds from the sale of the old office furniture.
- During 2014, total personnel costs were lower than budget primarily due to SERC was not fully staffed by 11.82 FTEs. As an offset, SERC used contractors in lieu of FTEs, causing an over run in Consultants and Contractors.
- SERC moved into a new office space in 2014 with a large meeting space. Most meetings were held in-house or at a member's facilities, substantially reducing the hotel hosting costs and decreasing Meeting and Travel Expense.

- SERC signed a new lease, with a commencement date of April 1, 2014, which included ten months of free rent. GAAP requires rent to be recorded on a straight line basis, accounting for the free rent. SERC did not incur actual rent expense for the new office space. However, due to accounting principles, an entry for the new space was recorded on a straight line basis, causing rent expense to be higher than budget. An off-setting entry was recorded as a liability on the balance sheet.
- SERC engaged an architect and a construction manager to assist with the construction, furniture selection, and coordination of the relocation of SERC's offices; and additional work was performed on various IT projects for compliance and assessments, causing an unplanned over run in Consultants and Contractors.
- SERC purchased office furniture and equipment to furnish the new office space, causing the over run in Office Costs.

SERC has no non-statutory activity, and therefore no statutory funding was used for non-statutory activities.

All personnel costs for the other administrative functions, including Information Technology, Legal, Finance, and Human Resources, are recorded within General and Administrative to protect the confidentiality of individual compensation information of employees in these programs.

SERC allocates indirect or administrative expenses and capital expenditures to the statutory programs based upon the ratio of FTEs in those program areas to total statutory program FTEs. The variances associated with this allocation are the result of the differences in the actual versus budgeted ratio of FTEs and the actual versus budgeted spend in the administrative cost centers.

SERC performs the Compliance Enforcement Activities for FRCC and SPP. The regional entity reimburses SERC for the actual costs incurred, including an overhead calculation. These costs have been recorded separately on the Compliance Enforcement Activity Statement of Activities.

Detailed descriptions of budget to actual variances are provided in the attached file. If you have any questions, please feel free to call or email me.

Yours truly,

Jennifer Kelly

Reliability Standards
Variance Explanations as of December 31, 2014
Variances > +/- $10,000 and 10%

Personnel Expenses (Actual $169,750 under budget)

- Due to turnover and the length of time to fill vacant positions, SERC is under budget in personnel expenses. SERC budgeted 2.31 FTEs in the Standards program during 2014. SERC finished 2014 with 1.15 FTEs in the Standards program, a difference of 1.16 FTEs.
- SERC reclassified 0.2 FTEs of an existing budgeted position from Reliability Standards into General and Administrative, causing a decrease in personnel expense.

Travel Expense (Actual $10,301 under budget)

- Due to the open positions, SERC has had less staff travel. Additionally, SERC has put a greater emphasis on hosting meetings in the Charlotte office, causing a decrease in travel expenses.

Consultants and Contracts Expense (Actual $16,654 over budget)

- To assist with short-term needs, SERC used consultants in lieu of hiring FTEs, causing SERC to be over budget.

Indirect Expenses (Actual $104,476 over budget)

- Expenses related to indirect programs have been allocated proportionately to the direct programs for 2014 based on the number of FTEs in those programs.

Compliance Operations, Enforcement and Organization Registration
Variance Explanations as of December 31, 2014
Variances > +/- $10,000 and 10%

Personnel Expenses (Actual $1,526,840 under budget)

- Due to turnover and the length of time to fill vacant positions, SERC is under budget in personnel expenses. SERC budgeted 42.50 FTEs in the Compliance program during 2014. SERC finished 2014 with 32.00 FTEs in the Compliance program, a difference of 10.50 FTEs. SERC used contractors to assist in completing the work.
- SERC reclassified 2.0 FTEs existing budgeted positions from Compliance into General and Administrative, causing a decrease in personnel expense.

Travel Expense (Actual $88,493 under budget)

- Due to the open positions, SERC has had less staff travel. Additionally, SERC has put a greater emphasis on hosting meetings in the Charlotte office, causing a decrease in travel expenses.
- SERC staff traveled to fewer audits due to a change in the process to conduct off-site audits.

Consultants and Contracts Expense (Actual $48,359 over budget)

- In addition to the use of contractors due to vacant positions, as described above, SERC developed tools for required enhancements for compliance monitoring and data collection methods to support the transition to CIP version 5 and CIP self certification, causing an unplanned over run.

Indirect Expenses (Actual $391,243 over budget)

- Expenses related to indirect programs have been allocated proportionately to the direct programs for 2014 based on the number of FTEs in those programs.

Compliance Enforcement Activity
Variance Explanations as of December 31, 2014
Variances > +/- $10,000 and 10%

There are no variances requiring explanation. The income and expenses recorded relates to the cross regional monitoring activities for FRCC and SPP. The regional entity reimburses SERC for actual costs incurred. The 2014 Budget included $32,000 related to activities for FRCC and SPP.

Reliability Assessments and Performance Analysis
Variance Explanations as of December 31, 2014
Variances > +/- $10,000 and 10%

Personnel Expenses (Actual $92,422 under budget)

- Due to turnover and the length of time to fill vacant positions, SERC is under budget in personnel expenses. SERC budgeted 7.60 FTEs in the Assessments program during 2014. SERC finished 2014 with 6.23 FTEs in the Assessments program, a difference of 1.37 FTEs.
- SERC reclassified 0.2 FTEs of an existing budgeted position from Reliability Assessments into General and Administrative, causing a decrease in personnel expense.
- Payroll taxes and benefits expense are higher than budget due to unbudgeted relocation costs that were incurred in filling the vacant positions.

Meeting Expense (Actual $10,730 under budget)

- The under run in meeting expenses is due to a greater emphasis on hosting meetings at SERC's office and member facilities.

Travel Expense (Actual $16,667 over budget)

- Due to staff transitions, more staff traveled to meetings than was originally projected to gain familiarity with the entities and regional staff they would be working with.

Consultants and Contracts Expense (Actual $42,600 under budget)

- The Dynamic Reduction Study occurs every other year. SERC performed the Dynamic Reduction Study in 2013 as an unbudgeted expense, due to timing causing an under run in 2014, as the study was not performed in 2014.

Indirect Expenses (Actual $143,887 over budget)

- Expenses related to indirect programs have been allocated proportionately to the direct programs for 2014 based on the number of FTEs in those programs.

Training, Education and Operator Certification
Variance Explanations as of December 31, 2014
Variances > +/- $10,000 and 10%

Workshop Fees (Actual $82,325 under budget)

- SERC hosted most meetings in house or at a member's facilities, resulting in a savings in costs, and therefore an offsetting decrease in revenue allowing SERC to charge a reduced attendance fee, from when the budget was developed.
- SERC budgeted for four (4) Compliance Seminars to be held in 2014, however only hosted three (3), causing an under run.

Personnel Expenses (Actual $27,119 under budget)

- Due to turnover and the length of time to fill vacant positions, SERC is under budget in personnel expenses. SERC budgeted 2.81 FTEs in the Training program during 2014. SERC finished 2014 with 2.72 FTEs in the Training program, a difference of 0.09 FTEs.
- SERC is over budget in Payroll Taxes and Employee Benefits due to an overlap of an FTE to ensure continuity.
- SERC reclassified 0.2 FTEs of an existing budgeted position from Training and Education into General and Administrative, causing a decrease in personnel expense.

Meeting Expense (Actual $48,946 under budget)

- The under run in meetings expenses is due to a greater emphasis on hosting meetings at SERC's office and member facilities.

Indirect Expenses (Actual $113,961 over budget)

- Expenses related to indirect programs have been allocated proportionately to the direct programs for 2014 based on the number of FTEs in those programs.

Situation Awareness and Infrastructure Security
Variance Explanations as of December 31, 2014
Variances > +/- $10,000 and 10%

Personnel Expenses (Actual $121,880 under budget)

- Due to turnover and the length of time to fill vacant positions, SERC is under budget in personnel expenses. SERC budgeted 4.15 FTEs in the Situation Awareness program during 2014. SERC finished 2014 with 3.67 FTEs in the Situation Awareness program, a difference of 0.48 FTEs.
- SERC reclassified 0.2 FTEs of an existing budgeted position from Situation Awareness and Infrastructure Security into General and Administrative, causing a decrease in personnel expense.
- Benefits expense is higher than budget due to unbudgeted relocation costs that were incurred in filling the vacant positions and higher usage of SERC's medical and dental benefits in 2014.

Consultants and Contracts Expense (Actual $16,654 over budget)

- To assist with short-term needs, SERC used consultants in lieu of hiring FTEs, causing SERC to be over budget.

Indirect Expenses (Actual $117,677 over budget)

- Expenses related to indirect programs have been allocated proportionately to the direct programs for 2014 based on the number of FTEs in those programs.
